

SHSBC TAPES 301-400

Black/White Version (suitable for print) (BW, Black/White)
Compiled 4. February 2015

a) Table of Contents, in Checksheet order:

1.	63-06-12	ARC STRAIGHTWIRE	1
2.	63-06-13	LEVELS OF CASE	21
3.	63-06-18	BEINGNESS	37
4.	63-06-19	SUMMARY OF MODERN AUDITING	53
5.	63-06-20	HISTORY OF PSYCHOTHERAPY	69
6.	63-06-25	MODERN PROCESSES (ORIGINAL TITLE: ROUTINE 2-H)	87
7.	63-06-26	TV DEMO: LISTING ASSESSMENT FOR ENGRAM RUNNING PART I	105
8.	63-06-27	TV DEMO: LISTING ASSESSMENT FOR ENGRAM RUNNING PART II	119
9.	63-07-09	THE FREE BEING	135
10.	63-07-10	AUDITING SKILLS FOR R3R	153
11.	63-07-10	AUDITING SESSION: PRELIMINARY STEPS OF R3R PART I	169
12.	63-07-10	AUDITING SESSION: PRELIMINARY STEPS OF R3R PART II	193
13.	63-07-11	ARC BREAKS	216
14.	63-07-16	TIPS ON RUNNING R3R	234
15.	63-07-17	DATING	252
16.	63-07-18	ERRORS IN TIME	270
17.	63-07-23	BETWEEN LIVES IMPLANTS	290
18.	63-07-24	ARC BREAKS AND THE COMM CYCLE	308
19.	63-07-25	COMM CYCLES IN AUDITING	330
20.	63-08-06	AUDITING COMM CYCLES	350
21.	63-08-07	R2H FUNDAMENTALS	370
22.	63-08-08	R2H ASSESSMENT	390
23.	63-08-14	AUDITING TIPS	408
24.	63-08-15	THE TONE ARM	428
25.	63-08-20	THE ITSA LINE	446
26.	63-08-21	THE ITSA LINE (CONTINUED)	466
27.	63-08-22	PROJECT 80	484
28.	63-08-27	RIGHTNESS AND WRONGNESS	502
29.	63-08-28	THE TONE ARM AND THE SERVICE FACSIMILE	522
30.	63-08-29	THE SERVICE FACSIMILE	542
31.	63-09-03	R3SC	562
32.	63-09-04	HOW TO FIND A SERVICE FACSIMILE	582
33.	63-09-05	SERVICE FAC ASSESSMENT	602
34.	63-09-10	DESTIMULATION OF A CASE	624
35.	63-09-11	SERVICE FACS AND GPMS	644
36.	63-09-12	SERVICE FACSIMILES	663

ARC STRAIGHTWIRE

A lecture given on 12 June 1963

Thank you. Now, let's see, this is the what? 12th of June?

Audience: 12th of June.

You get an extra lecture this week. That's because I just didn't feel like doing anything with blocking out engrams on somebody for an hour and then leaving them to some other auditor. It seemed unkind. I'll give you a demonstration on that next week probably.

But well, Saint Hill Special Briefing Course, just so you'll know where you are. [laughter] And I want to talk to you now about a fundamental subject which I haven't discussed at length with you, and that is ARC Straightwire. This is very needful material, and it may seem very old to some of you because I'm sure that your earliest introduction to processing in any Academy was sitting down and struggling with ARC Straightwire and having it pointed out that the pc had not cycled to present time but had been left in the middle of the soup. And that was why the pc was cross or some such things. ARC Straightwire is the oldest broad process of a repetitive nature. It is the most ancient. And in actual fact, although I may be in error on this, I think is the first repetitive process.

You'll find the remains of the first version in modern publications of *Self Analysis*. That's the remains of the first version. But this process was based on the ARC triangle, and the ARC triangle was originated in July of 1950 in Elizabeth, New Jersey, and was expanded in its understanding that September or November in Los Angeles at the HDRF there. Now, this was a very important breakthrough on the field of the mind. A very important thing. To this day, there is no other single tool of the auditor that invites quite as much use or understanding and so forth as the ARC triangle.

Now, the best dissertation on the ARC triangle itself is to be found in *Notes on Lectures*. And that is the very best dissertation on that. It was rewritten from a series of lectures given in Los Angeles in 1950, and frankly has not been bettered as a statement.

Now, you should realize that the ARC triangle comprises in actual fact the most fundamental statement of significance. Although it apparently is addressed to the subject of matter, energy, space, time and significance and embraces all those things, it actually is the most fundamental basis of significance itself. It forms, you might say, a bridge between the pure postulate and the significance of MEST. You can make a pure postulate, and it doesn't have to have any relationship to the ARC triangle. But the moment that a pure postulate becomes impinged upon matter, energy, space and time, it is immediately involved with this thing called ARC and ARC is the connecting link between the postulate and matter, energy, space and time.

Now, that matter, energy, space and time may... could be contained in the time track, or it may be contained in the physical universe. It doesn't matter what its location is. You understand, that a time track is actually a picture record of the physical universe and so in itself contains matter, energy, space and time.

Now, ARC of course means affinity, reality and communication. The first thing we run into a cropper on in trying to translate this, is the word affinity. Affinity is so much itself and is so relative, that we get into a considerable, to use a Texas word, hassle, in trying to interpret it in an auditing command generally.

Now, affinity has been very technically defined, and so has reality and so has communication. This is not a discussion of the ARC triangle. But for your information, the word affinity embraces everything from the Know to Mystery Scale. See, it embraces the lot and... as far as these aspects are concerned. But it means – it means the feeling for or the feeling with or the lack of the feeling for or the lack of the feeling with, don't you see, and it definitely contains this connotation of *feeling about*, you see. And it's not enough to say emotional response, because a fellow who feels effortful about effort is still experiencing affinity about effort, see, his affinity about effort.

Now, sympathy, empathy, all of these things come into this, and it becomes one of these very broad subjects. And the word affinity is not an adequate word to discuss these things because the word has not existed in actual fact in any language. Because this concept has not been well embraced by any language. We're up against the semantics of the situation.

But if you take the Know to Mystery Scale and substitute it for the word affinity, and you use emotion and misemotion and such things as that, you're going to find the pc responding to it. Now, some people are only going to respond to the idea of love. They don't respond to emotion at all. Emotion isn't there, you see, and so forth. But nevertheless, love, this expresses affinity for them, you see.

And now when we say the emotional Tone Scale, we're talking about just a fraction of the Know to Mystery Scale. So everything on the emotional scale is under this head of affinity, clear from "hide" all the way on up. And there is your expression.

Now, how many words then can be used in any command containing the word affinity? That's a lot of them, isn't it? So, when we clear this command, we have to clear it in an understanding of what we mean by affinity. And we have this, this is all graphed. I mean, we've got it. That's broadly the Know to Mystery Scale and then part of the Know to Mystery Scale, the middle section, of course, is the whole Tone Scale. So we've got a lot of words there that we can clear.

And we'll find the pc chronically resident at one or another of these levels, and that of course is the level he will respond to in processing.

Now, on the word reality, reality could obtain in significance alone, you know – his reality is poor and so forth – to actual chunks of matter. You see, reality refers to all of these conditions but reality is normally considered to be considerations about something. It'll... considerations about something, or somebody, moving on up into the more solid concepts of just matter, energy, space and time. You see, space is a reality and energy is reality and matter is a

reality and time is a reality. And so on. So, in clearing this word you will have less trouble. This word tends to clear itself with the pc more or less. He can get a grip on this word. He sort of knows what you're talking about. But if you had to vary it and the pc couldn't get a grip on this thing, it would be – it would be much harder to do. Much harder to do.

You would have to clear it something on the basis of whether it was matter, energy, space or time, you were talking about, or considerations about things, if he was totally in a thought response level, don't you see; or evaluations about things, or something of that sort. A harder word to clear, but you understand what you would be clearing.

You could ask somebody, you know, "What space have you rejected," see? I mean... and you're still asking this question of – number two question of the ARC triangle. You should recognize that that is its flexibility.

Now let's take communication. And we have the communication formula. And we mean any interchange, whether it's a bullet or a kiss. See, we have any interchange, with its consequent duplications and so forth. It's anything that fits under the communication formula. So in clearing that you also could move off of the idea of communication to the degree of a type or kind of communication. This is again less necessary. Communication is easy to understand.

But that could also contain the word duplication as well as communication. It could contain the word cause as well as communication, it could contain the word effect as well as communication, you see. What you're doing there is substituting various parts of the communication formula into that third auditing command in ARC.

When I speak then of clearing commands, it is a matter of substituting words in these three ARC commands so that the pc level of reality is met by the auditing command. And when we say clearing the command, we don't mean just does he understand this particular word that we keep hurling at him, but what word communicates what we're trying to communicate to him where we want to communicate at to, you got it?

So you can do a considerable amount of shifting around as long as you continue to hold to the ARC formula. And don't go shifting the thing around so that you ask the first question twice and the third question once and the first qu... you see? So that you say – you say for instance, you ask in actual fact two reality questions and one communication question and two reality questions and one communication question, because this thing is going to become unbalanced very fast.

Now, the fundamental understanding of the ARC process was contained in this: that those three things together equate to understanding – Affinity, reality and communication combined in their three selves, make understanding. And this, by the way, is something I never committed to paper, but I worked it out quite laboriously, mathematically and otherwise, in the autumn of 1950, and they actually do convert mathematically to understanding. It's quite interesting. There is no facet of understanding which falls outside of affinity, reality and communication.

And it takes all three of these things to bring about an understanding. When your pc has cognited, you possibly are not totally aware of the fact that he has reached a point of

ARC. It's just as easy as that, you see. He's reached a point of ARC and this has expressed by a cognition. Well, of course, what is a cognition but an understanding? And the pc suddenly understands something. Well, you have established ARC here. And having established ARC you get a cognition. That tells you then that you're driving straight at it.

Now, oddly enough you won't get a cognition if you omit one of the legs. You just – just omit the A and run nothing but R and C and R and C and R and C and R and C, you'll find your pc, after a little while, no longer comes up with, "Well, what do you know..." That's the whole case there. You've unbalanced his understanding. That is what tends to make this such a powerful process, because it brings up one understanding on top of another understanding on top of another understanding, you see. And ARC should also have preserved with it – any statement about it – this very, very fundamental fact: That if you wish to raise C, which is stuck in the mud, you hit the A and the R. And if you wish to raise the R, which is stuck in the mud, you hit the A and the C. And if you wish to raise the A, you had better work on the R and C.

Now, that is terribly valuable. That is terribly valuable and must be preserved in any use of ARC processes. And the reason I give you this is already the mistake is being made: he can't answer the communication question so therefore we will run it session after session after session. Now, what is the error? The fellow can't grasp the communication side of it, why?

Well, he does the R easily, you see, and he does the other one easily, but this one is stuck. So you'd better do the other two points. So any point which is overrun or more difficult will give trouble, providing you don't preserve the balance of the three questions.

Now, this gives us immediate trouble. It says "How do you know which one is flat?" Well, actually, please look at this: None – not one of those questions will ever flatten. You get that now? Only the three questions flatten, if anything is ever going to flatten, and it's very doubtful if you could even flatten the three. But if you've got three questions, you must flatten the three questions. It's the three questions you are trying to flatten. You are not trying to flatten one question. So then don't make too many problems on when do we come off of this. When do we come off of this leg? Don't make too many problems there.

There are three ways to come off of a process. Three responses of equal length, you know, of equal comm lag, he gives you three responses; he replies to it three times at the same interval, even if it's half an hour each, see. Now, that's enough. That's enough. You can change a process on that shady reasoning. Now, that's the most crude method of changing a process, three responses. Equal length. Usually it's interpreted to mean "He answered it glibly three times, so we're away," see, that's usually interpreted to mean that.

All right, your next method... I remember in 17th ACC, I beat this home in a lecture, and the following day did the unforgivable thing of coming into class and asking the students one after the other what were the three signals which permitted you to leave a process. And not one of them knew. That was a terrible loss for me. I immediately invented the educational processes, which have... we haven't had much to do with.

But these three methods of ending a process become important to you in running ARC because you see you're flattening the triangle, you're flattening three questions, you're not flattening one. The next one is, of course, by cognition. Pc has a cognition, bail out.

I just saw an auditor get in their mid ruds at the end of session, and because there was one more to ask, didn't treat the mid ruds as a process. Pc cognited like mad on the session on the next to the last button, and the auditor got in the last button. The auditor unflattened the process. Get the idea?

This is a – this is a very interesting auditing tool, if it's sensibly used. In other words, pc has a cognition, to all intents and purposes you can consider the thing flat. But you have to leave it right then. You have to hit the silk with a loud "Geronimo," right at that point. Don't hang around monkeying with the ring. Right then, bail out.

"Well, how did you do on this process?"

You've had it, see. Pc says, "What do you know. You know..." You're running a communication process on him. "I hate people. Well, what do you know. I've often wondered about this. And I really basically hate people. I – I – that's what I've suddenly realized."

You say, "I'll give you this question two more times and end this process if that's all..." cut your throat, man.

So when you have to use that cognition process end, it's hit the silk, see? You say, "All right," as he's going on cogniting and talking about it you say, "that was the last command of that process."

See, handle it like Havingness. But when you bail out on a cognition, you really bail out and don't return the pc to the session, because the fastest thing you ever did in your life was unflatten one of these processes. You can flatten them and you just took one breath too many on the next command, you see. You said, "Well, all right, now, we're going to ask this question one more time and due to the fact that you've had a cognition. And are going to ask this question one more..." And that's it. You now have an unflat process.

See, so that one's very delicate. That's slippy. If you're going to use this one to end a process with, you end the process with it right now. You don't wait around. "That was the last command. All right, now we're going to take up the first leg of this which is 'What attitude has been rejected'," see. Pc will be perfectly fine. Just smooth, man, he won't even notice anything is happening.

Your next one of course is tone arm action. Now, this in running the ARC triangle is the least reliable for any leg. The least reliable. It's the most desirable and the least attainable. It'd be marvelous if the pc would promptly come down at the end of forty-five minutes of run on one question, would come down to exactly, the last ten minutes, .25 TA division. And then you would bail it out and you would do forty-five minutes on the next leg and it would come down, sweetly, precisely and obediently to .25 in ten minutes. I – you're saying the rule is twenty minutes. Well, in this one you can't afford twenty minutes to hang around and test, so you'd shorten it down to that much. And you're never going to find this condition.

This is an unrealizable perfection. So you say, well, he's had a blowdown. So running by blowdown is a little more reliable. But you can't count on him blowing down at exactly forty-five minutes either. So your TA motion is your least reliable bail-out although you would look at it mechanically as your most reliable. No, your TA is *terribly* valuable because

you can't come off the process until it's not producing tone arm reaction. But the process is three questions.

Now, you're running "In auditing," and the... running the three questions "In auditing." And one of these legs, oh, man, it goes on up to 4.2, and it comes down and so forth, and the other two don't seem to be producing much action, but this reality, boy, that goes up and it comes down, and you just better continue your process. You've got two that are apparently flat, but the third is not flat. You can't come off of that. Or actually alter the amount of time given to each leg until you get that process flat.

The way to flatten that process on reality is to continue to equally run with reality, affinity and communication. See your trick? Just because he wasn't flat on reality don't go beating reality to death. Because what's going to raise it is going to be affinity and communication legs.

All of this is – seems rather elementary for me to be talking this way. I started out with a very good academic approach, and all of a sudden come off to very fast and factual processing tips. But these are the things which are going to give you the trouble with the process, these little adjudications. "Wha – what – what, uh, what – what – huh uh huh...? What do I do now?" He says he absolutely hates this communication leg; he runs this reality leg like hot butter. Inevitably it would seem to mean that you had to flatten the communication leg when as a matter of fact the thing that'll get him out of it is running the reality and the affinity and the communication leg equally. So therefore, we have a process which can be handled in numerous ways, but which has very firm beginnings and has never really departed from our roster.

The first thing I ever found – to get back to an historical dissertation on this – first thing I ever found this process doing was breaking neurosis. And that's the old one that's registered in *Self Analysis*. I think that's quite interesting. You can take somebody who is strictly fruitcake, you could pour champagne on him or brandy on him and light him up for Christmas, you know, and he'd do all right. And run that process for a relatively short space of time. If it's going to produce this type of reaction that process is going to produce it right now. It's going to produce it fast. And you run it for a short space of time on him and all of a sudden, why he's bright and smiling and quite sane and not worried about something.

Now, I've seen it do that. And therefore the process has very firm grounding, as far as I'm concerned. And the only cases I have ever had trouble with the old process on, were cases that just got the same answers over and over and over and never made a breakthrough. They never broke through into anything else. They apparently just go on getting the same answers.

Now, that's the liability of the positive process of 1950, that on many cases it simply grinds down to a finite number of answers and that is it. Now, what's the matter? Why does it do that? Well, you're not heading in the direction that that case heads. You're heading toward positive ARC and their moments of positive ARC are so few as to be countable on the commands of one auditor. See, very brief period of time. And they quickly run out of these things because you're in actual fact running, if you want to know the truth of it, pleasure moments of some kind or another. And they won't flatten. So you just run the same ones over and over and over. So you have to run the reverse side of it.

I've paid attention to this process and have revived it and done things with it and fooled about with it from time to time, and now and then you'll see records of it as it goes along over the years. But about 1958 we ran into a period there when I was suddenly colliding with some implants and didn't know quite what to do about it, were running a great deal of reach and withdraw type of thing and so forth, and raising IQ of people rather easily, and so forth.

All... you want to raise somebody's IQ, you know, there's a standard process for it, just as a little interjection here. Just say, "What could you withhold? Thank you. What could you withhold? What could you withhold?" Give them another IQ test, and their IQ will have gone up about twenty-five, fifty points. They won't be any better, but their IQ will be higher. Quite interesting. That's a funny phenomenon for you.

Also, plunge them into an engram, run it halfway through and give them another IQ test and they'll be smarter. That works. I'm not kidding you. That... it works. Why? Well, apparently it has something to do with mass. And people who think only on the mass which they have to think with, see, can get mechanical responses required in IQ tests. You understand, I said it was an IQ test that you were trying to raise. You're not trying to make him any smarter. See? And they always get a better IQ test. It's, it's quite interesting.

Now the upsets that you run into, however, on a case, are not the case's pleasure moments. You run up in the upsets on a case of times when they were knocked away from being part of things. The separateness or individuation. Or were forced to be part of things they wanted nothing to do with. In other words, you had a power of choice or of connect and disconnect. And that power of choice is overthrown. And when that power of choice is overthrown you get what you call an ARC break.

He was there but didn't want to be there. He wanted to be there but couldn't be there. Now, those are causes of ARC breaks in their most fundamental form. It actually is an overwhelm of the person's power of choice. Pc wants – you can get an ARC break: pc wants to go earlier on the track and you send him later on the track. Well, that in itself causes an ARC break, regardless of any charge or mechanics or anything else. You've overwhelmed his power of choice. So you have an ARC break.

This is the most fundamental of ARC breaks. And I wondered in 1958 whether or not you couldn't just run Straightwire on (quote) "ARC breaks." Well, the Scientologist knows what an ARC break is, he sort of feels it in his bones, doesn't have to have it designed or described to him any other way than that, and you just ask the question, "Recall an ARC break. Recall an ARC break. Recall an ARC break. Recall an ARC break."

Now, if you were to move on down the line with that process on anybody that could run it, you would find him sitting – and I did on my experiments at that time – find him sitting square in the middle of implants. So an implant was the biggest ARC break. He was being held in a place where he didn't want to be, being told things and, you see, that he didn't want to hear. So this overthrew his power of choice and for numerous other reasons it went against

his grain. But this was the most fundamental overthrow of the power of choice. And this 1958 process – "Recall an ARC break" is the exact process – does some rather interesting things.

So when we got into the Helatrobis Implants here recently, I did a hasty review of all ARC processes and – it wasn't very hasty, I fooled around with it for a couple of weeks, looking over this material, and so forth – and finally exhumed the original version, reversed, and worked it out mechanically and mathematically to fit up to the exact situation of what I knew about these things. And I got quite a bit of information about these things, which isn't only confined to that which works, don't you see? I know lots of things that don't work. And that's very valuable, too. So I knew these had always worked, so I decided to throw together these processes in some sort of form where they would clip directly into and saw out of... saw out pieces of an implant. We needed a process which was senior to any other process we were doing, which was a repetitive process. That was our demand.

We also needed a process to cut through those cases which were at the lower levels of the Reality Scale, and therefore couldn't be directly run on RIs and things of this particular character. What are you going to do, just abandon these people? What are you going to do with somebody who is terribly misrun and mishandled?

And I made an interesting discovery at this time, that the big mid ruds or the 18-button prepcheck, but mainly the big mid ruds, run on an engram, mushed it. It turned it into so much porridge. Messed it up. It tended to spoil the record, not eradicate it. That's interesting, isn't it? An engram frays around the edges and starts turning into pure energy, and that sort of thing. But without returning to the pc, as far as I could tell – although I could revise my opinion of this – without returning to the pc any memory of what did happen. Quite interesting.

In other words, this demonstrated that if you were going to use to a great extent big mid ruds and big Prepchecks on – big lists of buttons on pcs who are stuck in engrams, you weren't going to unstick him out of engrams. You're going to brighten them up and polish it off and straighten up sessions and doing a lot, but this tool is a light tool. It's a light tool. It's the – it's the kid's sand shovel. See? And what we had to have there was that great big Caterpillar tractor-tread steam shovel. And it had to be powerful enough so that it wouldn't buck just because you shoved it into a rocky ledge. That thing had to go on through.

Well, the most there to go through is an implant, and the only thing I knew that would cut through implants is the ARC type process. And so I re-evolved these processes and we came up with the negative ARC processes. That's what these really are. And they call for moments when there wasn't any, or there was minimal, affinity, reality and communication.

Then I made a further discovery about these things. And I found out that a pc was operating on entanglements with the physical universe and all that, and considerations and postulates and all that sort of thing, and it was one thing to bail him out of his intricate entanglements with matter, energy, space and time and considerations, but that there was something else operating which was his consideration of his entanglement, see. And that was the other factor.

Well, I'll give you some reality on that. We walk out here and we find a porter. And this porter's working in this windy, miserable, dust-ridden, soot-drenched station, see. Oh, my God, I mean, it's a mess, you see. And gusts of London breeze are blowing through the places

and throwing the coal dust into everybody's eyes and the tips are very poor and the station-master is a bum that's always coming down on the porters and you know, it's all – it's all very bad. And we find this bird there, and he's happily picking up people's valises and throwing them on trains and walking around and he doesn't seem to have much of a care in the world about it.

And then we turn around and we find another guy right alongside of him, and my God, anybody asks him to pick up one corner of a trunk, *Hwaa!* Majesty has been insulted. If you gave him a ten-pound tip he still would have been undertipped, you see. He is what you might characterize as unhappy with where he is.

Well, here are two fellows in the same environment, same pay, same situation, same everything, don't you see, and they have two different attitudes about what they're doing. All right, we go over to the Ritz Biltmore and we find two bellboys. And actually labor relations in that place are so smooth, they have been taken care of by the union delegates so well and so forth, that even the – even the assistant night clerk who is the most important man in the place as everybody knows, has to say "sir" to the bellhops. You see? The tips, my God – nobody walks into this place, you see, without dropping a fiver in somebody's paw, you see. And it's nothing, nothing there, they get all the chow they want, they get everything they want, they have beautiful uniforms, girls whistle at them, everything is fine, you see.

You get two blokes there and one of these fellows, why, he's just happy as a clam to be there. And the other fellow, every time you hand him a five-pound note he goes back of a pillar or something like that and practically spits his teeth out with rage. Well, you know that these conditions exist.

And you know that people... you may have... you may believe at first glance that if the surroundings are bad, the people are unhappy. And if the surroundings are good, people are happy. There's many people get caught in this. And the most people who get caught in it are by the way your – your sociologists. They have never apparently learned this.

The United States – the United States is having an awful happy time right now pouring billions into foreign aid, so these dirty, filthy, fly-ridden grass huts in Balooga-uga-uga-stan can all be torn down and they can put in nice seven-bedroom ranch houses with hot and cold running politicians throughout. [laughter] And they're just having a ball. And nobody is more surprised or will be more surprised than the United States government at the end of a period of time to find out that the exact proportion of "hate the United States government" and "love the United States government" exists as before. They might even have gone over toward "hate it" before, to the degree that they actually enforced people to live in these seven-bedroom ranch houses, see.

Because you talk to a boy in Balooga-uga-uga-uga-stan and he's liable to tell you something on this order: "Ah, nice house, yeah, nice house. Yeah, reeds, reeds, nice reeds, side of a river, nice reeds. Wife there raise some yams and so forth, and nice reeds, very thin walls." So you say, "What do you mean, very thin walls?" He's kept crooning over this idea of these thin reeds, you know. And you – it doesn't sound like this guy's very smart. And he looks at you like you're crazy.

And he says, "Well, of course, very thin reeds."

"Yeah, but what about these reeds?"

Oh, man! He says, "You can go out that wall, that wall or that wall!" [laughter, laughs] That's his idea of a house. [laughs, laughter]

Now, that factor, that wild, weird factor that keeps rattling around all over the place, gets into the machinery and cogwheels of more social planning and messes up more great schemes and so forth, than any other single factor. In fact it is the only factor that does mess up these things. And that's just power of choice.

Now, you could call it preference, or you could call it this or call it that, but it just happens to be the fellow's attitude toward where he is and what's happening. It's his preference. I use the word "attitude" carelessly there.

It's either all right or it isn't all right, and to that degree it's whether he understands it or doesn't understand it. Don't you see? It's... also could go under the heading of whether he wants it or doesn't want it, and so forth. But in actual fact all of these factors, however you express it, are incomplete statements until you express it completely as affinity, reality and communication.

Now, that's a complete statement of this. And the pc has had all those things present with regard to all these circumstances all up and down the track. And that's an adequate statement of power of choice, and it's not a packaged statement that can be stated in one brief word. That has to be stated in terms of affinity, reality and communication. And if you try to overstate it on one of those corners of the triangle, you're going to mess up the other two corners and you're going to overthrow power of choice, don't you see?

It's quite interesting. It brings up this: is there such a thing as an ideal state? I don't mean an ideal nation, I mean an ideal condition of beingness. Is there such a thing as an ideal state? Well, I was quite amazed. I was quite amazed in looking over the whole track to find out that there was some awful unhappy big thetans on the backtrack. They were bored, they didn't have anything to do. That sort of thing, you'd say, "Well, that fellow was in an ideal state."

No, he wasn't in an ideal state. And neither was anybody else. And the faintest possibility of anybody ever achieving an ideal state exists in Scientology and has never before existed in this universe. That's an interestingly broad and fantastically exclamatory statement but yet is true. What will we mean by an ideal state? A state somebody wanted to be in over which he had full power of choice. See, that would be an ideal state. Well, of course, unless an individual's power of choice is adjustable and his control of his environment is considerable, he could therefore never reach it. Wouldn't matter what his fundamental basic condition was, if this other condition was out, why, it'd be terrible.

So it's all right to erase the thetan's whole time track so he can live in a palace and so forth, but if you leave untouched the idea that his ideal state is to exist as some sort of being who can just wreck the works, you know, this is ideal state. He must be in some kind of a condition where he can wreck the works at any given moment. Why – no matter how you've adjusted his MEST, you haven't touched on this one factor. And he will be unhappy.

So the attainment of happiness for a pc is a parallel road to attaining Clear. I know that sounds very, very odd, but if you recognize that we have two factors at work here, all will become very plain to you about a lot of things in life. It's the environment and situation and conditions of the individual as they exist, the real conditions of the individual. That's one channel. That's one channel. And nobody can get away from that channel. That is the channel. Only trouble is your sociologist and other people trying to adjust that channel do not achieve at the same time any alteration in this other channel. And this other channel has remained unknown in this universe. It has merely been growled about, suspected and reviled and chewed at, but nobody has ever been able to do anything with it, because nobody's ever really made a fundamental statement concerning it.

And that is quite new to this universe. Although you could state all these things and everybody knows them, it happens that it's not a simple statement. It happens to be a complex statement. It's his affinity, reality and his communication with regard to the matter, energy, space, time and postulates of his conditions.

Now, you say, "Well, isn't this ARC? Aren't these things borne out of his postulates?" Not necessarily. These are borne out of an interplay between his postulates and the experiences netted. We're still on an interactive basis between postulates, you see, and conditions and experiences. We still have this other thing. This other nebulous thing, this power of choice. Only if you say power of choice, of course that makes a dictator very right. He says, "Well, I know what right is. It's what I say is right." See? This is the total logic back of the Napoleons and Hitlers of history. He knows what right is, he knows what's wrong. See, he didn't say it so it's wrong. Elementary, my dear Watson.

And so this whole subject has become perverted. In actual fact, it's the person's affinity, reality and communication with regard to a set of circumstances, existences or environments. So you've got this second channel you're walking up all the time. And it's not been hidden from us as Scientologists, but we, frankly, don't pay quite enough attention to it in processing.

But we needed some big, beefy process to match up... and you remember, your reality programming, your programming matters, also depended on the auditor, didn't it? There was one of those scales had the auditor as one of the factors in programming a case. Well, we needed a process that somebody could just sit there and grind out. They could just do it by the hour, and something fantastic would happen with the case.

Now, it unfortunately is not an end-all. It's not an end-all. It won't go the whole line. It won't go the whole route. Well, why? Because it's not actually directly handling the conditions of the pc. It's handling the pc's attitudes toward those conditions, or his – his – pardon me, his attitudes, realities and communication powers with regard to those conditions is what it's handling. But it handles them enough so that it can cut away these lower levels of case – at levels 4 of some use, levels 5 very useful – that's the dub-in. Dub-in of dub – invaluable. And evaluation starting to get a bit questionable, but still of some use, and unconscious, of no use at all. A person who is totally unaware has no use for them at all. But he will have as soon as you bring him up to where he can consult his own evaluations. See, then there's – that minimal use sets in. And he can be moved on up.

Pretty weird that a case can be booted up by shifting that. But you're going to run into a point of no return on almost any case sooner or later, if you don't eventually – I mean, you won't get him to OT because this is not powerful enough to kick up through the last two strata. It only kicks it through the lower strata. You could put up a case with this and some other little touches and polishings-up and so forth, you can put a case up to a point where he's got his time track and is running it. And you can't then use the process to finish off the whole case on up to OT because there's always that upper strata. And now we aren't so much worried about power of choice because the fellow believes now that his power of choice is alterable and that he can do something about it and about his conditions. No, you've got to put him into handling the actual stuff which has aberrated him. Sooner or later he's got to handle this stuff, see. But right up to that point you can put him into a situation where he can get close enough to it to handle it, don't you see? And that's the use of this particular process.

Now, just because I said it's a process can be ground out endlessly, don't get the idea that it's a process... don't go overboard and decide that it requires no skill to use it. Because you will be, any one of you will be setting up some auditor to run this, regardless of your own auditing of it, and setting up one or more auditors under you to run this. You're going to discover to your horror that they can dream up more wrong ways to do this than you could easily count up in a single morning. They can dream up more questions that don't mean anything and you'll have a hard time catching up with it. So there is a right way to do it. Fortunately that right way is easily stated.

Now, I told you about the ARC triangle has to be kept in balance. Well, that's about the first error they will make. I've already covered that. Preclear's having an awful time with the communication leg, therefore you should run it three sessions and run the other two, two sessions, you see. Ow! No, you've got to keep these legs in balance.

Next thing you're going to learn is although cases at level 3 on that programing scale are quite capable of running three questions, *bop-bop-bop*, *bop-bop-bop*, *bop-bop-bop*, see. Question one, question two, question three, you know. Three questions. Three types of question. Although they're quite capable of doing that, you actually produce more tone arm action if you do them one at a time. One, to a place where we can change, and then two, to a place where we can change, then three, three, three, three to a place where we can change.

Now, that's a happy thing, because it only runs that way on the lower cases. So there is no reason to preserve the one-two-three, one-two-three, one-two-three sequence, at all. There is no reason to run it that way at all. It can be run that way, but there's no reason to run it that way. Because the case that could run it that way – first place he doesn't need the process – runs better if you run it one, one, one, one, one, one, two, two, two, two, two, two, three, three, three, three, three, see? He runs better if you run it that way.

So the better way to run it is *always* one leg at a time until it is flat. What's flat? Already covered it. How long? Well, let me give you some kind of an idea of the mistakes you could use by laying down an arbitrary: We say, "Well, one hour for each leg." That's fine, divide it up by time by all means, because that's the easiest way to divide it up. The easiest

way to take it off an auditor's report. But you've got – you've got something standing in your road. The pc takes half an hour per answer on leg one and answers rapidly on the other two legs. All right, so somebody asks you for an adjudication. Well, run it equal numbers of questions. Run each one seventy-five questions. That seems like a pretty good idea.

Mark my words, somebody's going to defeat you on that one, too. They'll find some way to defeat you on that particular thing. I'm an old hand at this. They will get the pc up to four just before the blowdown and leave the process, inevitably. Something like that, you see. The pc's just drawing a breath, just gets a misty look in his eye. Oh, he's about to cognite and that's the seventy-fifth question, don't you see? So you go back to one on the next one.

I'm afraid that you will develop far greater cynicism on this subject than I have. It's better to understand what you are trying to achieve. You're trying to achieve a similar amount of run for each one of these legs and not favor the one that is hardest but handle it by getting the other two.

Now, I noticed on an auditor's report just a short time ago that somebody had made a mistake on this. Co-audit folders that are just done just a few minutes ago. Somebody had found out that reality was not producing much tone arm action and so had run a very short period of reality. Very, very short period of reality compared to the next period of communication which was producing tone arm action. And then gave it practically the rest of the session.

Now, that defeats the purpose of it. And you'll find the pc is going to get wildly out of balance. How often do you change the process? Well, that's how often. There is no answer, don't you see? How often do you shift a process? It's the same answer, how long does it take to flatten the process on each leg? This is one you play by ear, man, it changes from pc to pc.

This pc – this pc grinds away just splendidly as long as you don't leave them more than about fifteen minutes on each leg. That pc just does fine.

And this other one, a real grind-type case, just doesn't do well that way at all. They're just beginning to find out what process it is at the end of fifteen minutes, so again, this idea of cognition monitored against an equivalency of time, you see.

Now, he's having lots of cognitions, but you know that you're going to run this on this particular pc, you know you're going to try to get through all three questions in the one session. That is your hope, see. So when you're coming up toward the end of the period you've allocated for that first one to be finished off, your ear just comes up like a rabbit's, you see, listening for that communication that is a cognition.

Pc says, "Well, I think I'm getting pretty well along with..."

"Oh, you are! Well, thank you very much, that was the last command of the process. It was jus – huh, huh, huh."

That's cutting it awfully thin, isn't it? [laughs] But you'll find out your pc will be happy there.

Now, an arbitrary run exactly against the stopwatch will not find your pc happy. The pc does live, does think, is a living, breathing being.

All right, how many variations are there to the process? Well, I've given you clearing the command of the process, but you would just be fascinated at how many variations there could be of this process. The best stunt is to get the person to run the most fundamental that you can get them to run. Always try to get them to run the most fundamental statement of the question you can get them to run that they will run. Don't go out on the order of get the fanciest variation in the question that they can run, try to get the simplest thing. Try to argue them through. "Attitude" seems to communicate all right on the subject of affinity, see. "Affinity" doesn't communicate, "attitude" seems to. See? That's fine, so you got "attitude" and they seem to respond all right to "rejected." So that's "What attitude has been rejected?" That's a good fundamental statement.

"Now, when or what haven't you really cared to love somebody?" That's about as fancy as you could get, see. Well, if you had to choose between those two, you would take "What attitude has been rejected?" See, and that would bring you through. Because the less you change the auditing command the happier your pc is going to be. And that's another rule.

Because when you change the auditing command too much you run into the old rule of too many processes. Each one is a slightly different process, therefore you never really get a chance to flatten any of the processes. So constant shifts of this process are very poor. So try to settle it down for the long run. Try to settle it down for the long run very early. And if you find the pc is making – is having difficulty trying to wrap his or her wits around one of the legs as a question, if you're going to change it, change it early. Change it soon. And then keep it. You want this one set up for the long haul. So therefore, get it changed early if you're going to change it at all. Preferably in the first session that it's run. Don't let it drift for four sessions and then change it.

It's better to run a wrong question pretty near, that has been run for a long time, than to change it then, don't you see? Pc eventually will get so he can live with it.

Now, there's – there are some of the rules of guidance on this process. And what's the next one?

The keynote of it is muzzled. It is always a muzzled process. Someone shouldn't be feeling that he is being treated as an amateur because he is told to run it muzzled. It's almost the same statement as – "Run the ARC break process" and "Run the process muzzled" are practically synonymous statements. Because you don't run it any other way. There is nothing to pick up, there is nothing to straighten out, there is nothing to do anything with or about once you've got it in the run. The auditor's sole concern is understanding and acknowledging what the pc has said. Sole concern.

The pc comes up with and says, "You know, I've got an incident here that's 8,765 trillion, billion, squillion years ago, and I'm lying here and so forth and so on," well, the answer to that is "Okay." Now, the only variation comes on this is the pc going to blow his brains out when he asks you, or requests you to please date it; find out where he is. Now, there's where the question takes place. Do you refuse to date it and ARC break the pc, or date it and ARC break the pc by eventually messing up his ARC process? See?

Well, that's the little questions that you the auditor have to live with. There are so many of these questions – there's so many of these questions, that to attempt to give you a

solution to every existing condition which exists at that order of magnitude in the session is not only impossible, but it'd be idiotable.

Now, your situation, then, with this process is that it *is* a muzzled process, it is definitely a muzzled process, but sometimes if you don't talk with the pc, a pc will ARC break. But you start offering the pc any Auditor Code break type evaluations and invalidations and that sort of thing, and you'll wish to God you never had. Pc comes up with a still picture. This is one of the traps. Some auditors – still picture, *pssww!* The devil with the routine, see. We don't care what routine we're running.

Pc says, "I've got a picture here, and it's still." The auditor – bang! He's right in there, man, he can't stay out of it, for some reason or other. It acts just like a pole trap to him. [laughter] I actually have seen some auditor – tried and tried to break them of this habit. Because of course you can't audit a still picture. Death and dynamite to touch one of the things. But for some reason or other they would.

Pc comes up and he's just answered this, and by God, he says, "You know, for the last half hour I've had this picture. And it's just a wide plain, and there's nothing happening at all." Well, of course your basic impulse is to help him out. Blow your brains out, man, if you open your yEEP and bust the routine then, because you're asking to plow him straight into the track on a light process. You see, you're not running engrams. And this process, if you really restimulated an engram, you know, by handling it, and then fell off back to this process again, you've had it. Because this process won't handle the engram that's been otherwise handled, see.

So you say, just to be agreeable, "Oh, a wide, still plain, now? All right, okay, yeah. Okay. All right, now here's the next question." But if the process didn't do something to move him on the track, I'd start to get suspicious as to what he was doing with the process. I wouldn't wrack him around, I'd bring him up to some halting point and then as though it's the most natural thing in the world I would put in the big mid ruds on the ARC process. It's very interesting that we can rehabilitate a process with the big mid ruds. We could actually prepcheck this process and get some interesting ways.

Now, this process does not mush an engram. It'll actually push an engram around, it'll open it up. It won't run it. But it'll shotgun engrams. It hits one part of a chain and another part of a chain and another part of a chain, and starts taking selective chunks out of various portions of the engram chain. This doesn't do any harm because it's only picking up those pieces of it that belong to other chains anyhow. Perfectly all right. Nothing disastrous can happen with this process, providing you don't think yourself too much.

Now, if you tried to run this process as a cyclic process until the pc is on present time – in present time on every leg, you have set yourself up a problem that I don't think anybody could ever solve anyhow. And what's this passion for getting the pc in present time? He hasn't been in present time for trillennia. [laughter]

Probably the best way to handle this sort of a situation – you've been chewing away at it, and you've run him this and run him that and he wasn't in PT on this leg and he wasn't in PT on that leg and he doesn't get into PT on another leg and the three legs are parked at different portions of the track. This sounds very complicated, but it isn't going to hurt him any.

And you decide that the best thing you could possibly do is get him to present time and make him a little more comfortable. Why, you get him to present time. But, how do you do that? You just tell him to move to the date of the session. Month, date and year. Or "Move to June 12th, 1963. Thank you." You don't say, "Are you there? Did you move? Did the somatic strip work? Well, what do you know? I didn't think it would." That's not done.

That's the best way to say, "Come to present time" these days, by the way. You can move him to present time at the end of the session, it doesn't matter.

Now, the next time you pick it up you're going to find him parked exactly where you left him on each leg anyhow, so who cares? Theoretically, he would only get to present time on this process when the process was flat. Well, when is this process flat? When it's flat. Actually, now your meter means something. The process is flat when, all rudiments being in on the process, the process run produces no tone arm departure from the Clear read of the pc. That's how flat. That's on any leg. That process is flat. No tone arm departure – mid ruds being in on the process, the tone arm does not depart from Clear read on any one of its legs. Now, when I said "does not depart," I meant "does not depart." It doesn't go to 3.5 to 3 – that's all over.

Now, the one other thing that you probably have to know about this – that is actually as far as you can state "when is the process flat," and "when is the... should the pc be in present time?" Well, the pc should have the process flat and be in present time at that point. You actually are not really trying to achieve this by running the ARC process. You're trying to get some part of this achieved. You're trying to get the best part of it achieved that you can. You're trying to do the most you can with the ARC process in the time of auditing which you have. And all that's – that's... you've gone as far as you could go.

But remember, that because the tone arm isn't operating early in running the process is no signal that the process is flat. Because tone arm action on a pc, particularly who can't be run on any other process, and particularly a pc who has to be carefully grooved in and they're very particular about this meaning and that meaning, oh, watch it man. Because that pc's going to start in, maybe the pc's chronic tone arm position might be 3. See?

And you grind away on leg one and that takes you, well, I don't know, half a session to get it anyplace, still sitting there at 3. Your next leg, still sitting here at 3. Your next leg, moves to 3. ... You can see sometimes auditors in desperation start to decimalize tone arm reads, you see, out to the third or fourth place, you know? [laughter] 3.147, you know? [laughs] It looks good, you know? 3.147. And then it moved back. Then you go another couple of sessions on the thing, and you'll find it's going to 3.5 and back.

A few sessions later this pc will be winding the thing all the way around the dial. Now, the greatest tone arm action I've seen is produced by engram running on a case that can run engrams. That's the greatest tone arm action. But don't think this ARC process won't produce tone arm action. But that action has to be run in to the process and then out of it, on cases that really have to have it.

Oh, it's sticky, you know, it runs up here at 4.25. All you have to do is get to reality and it goes to 4.25. Or get to communication it goes to... the other two are running flat, see, no action to amount to anything. The second you get to this one of the legs, maybe it's aff-

ity, you see, it will be one of the legs, all of a sudden, *bzzzzzz!* And there it stays, for that third of a session you're going to run this, see. There it goes, there it is. And it varies around it, it goes from 4.28 to 4.193. That's the variation of it, see.

And the second you get back on in the next leg, *phhh-boump!* It'll be running from 2.78 to 2.79. You'll watch them. And that will be one of the phenomena, one of the manifestations you'll see on your auditor's report. And, one leg is making it going up and stick it. Well, then a second leg all of a sudden will start sticking it. Then that... starts to look like this case is getting in lots of trouble. This is the time an auditor who doesn't... hasn't been through the jumps on this starts sweating. "One made it go up and stick, one leg, you see, now two of the legs make it go up and stick; I hope the third one won't take off, see." And you realize unless you've got all three of them up and stuck, it doesn't free to an ARC. And all of a sudden the third one goes up and sticks, and the one that was up originally goes to 6. [laughter, laughs]

Well, your main questions are, is the pc answering the auditing command? That's your main – your main worry. Now, does he understand the auditing command? And that has to all be done very early on, and after that, can we keep it smoothly enough balanced up that we can get him plowed through and bring him out the other end?

Now, all of those questions are in that order of importance. Is he answering the auditing command? Now, it doesn't do to hound the pc too much, but you can add a rudiment that takes care of this; it's the old rudiment, but specialize it, "Has any command been not answered?" you see. "In this session have you failed to answer any question or command?" you know? And you should think that is pretty good – pretty good thing to throw in there. So you want to make sure that he stays clean on those answers. Because if he starts omitting answering auditing commands he'll wreck the process. And that's the only thing that can wreck the process.

He starts lying to you about having answered it. And he starts hedging, he starts squirming off on you and that sort of thing. Well, there's something has gone wrong here that you'll have to put right early, and is frankly about all the trouble you have with the process. And you see, that's fairly rare. But if you do have any real trouble with a process, the pc isn't answering the auditing command.

The other phenomena which show up are just meaningless. They're just the phenomena of processing. If you don't expect change on the TA, what you processing him for? See? TA will do all kinds of wild things. You can take these low tone arm cases, and this will crack a low tone arm case up. And it'll also back the low tone arm case clear through 7. This process will do some remarkable things.

The process itself should be run however, very nicely, very neatly, in good balance and so forth. About the only other thing I can tell you about this ARC process that might prove valuable to you, is that it can be prefixed by any combination of words. Prefixed by anything. You can say, "In marriage," "In auditing," "On your job." Some person – you're running "In auditing" and all of a sudden you find out this person's been a D of P and that sort of thing a lot, and they had a lot to do with cases and so forth. Or an Instructor, and it's not "In auditing," it's "On auditing." Your variation of your statement, don't you see, then brings this

out to tremendous, broad usages. And it is much more powerful than a Problems Intensive ever dreamed of being, when used selectively that way.

Now, to do it that way, you don't necessarily have to do an assessment, but you could do an assessment of the various sections of a person's life if you wanted to use this very finitely on a sort of an assist basis. What's he do? He has a job and he has this and he does that and so forth and we finally get it narrowed down to what really worries him. We kind of do an analysis on the case, you see. And we say, what really worries this bird is transportation. Really worries him, see. Look at it fall here. We tell him – we ask him, "What's you – what's your life consist of?"

And he says, "Oh, driving to work, and eating, and well, there's being married, and there's my children, and there's – and well, my job, and there's this and there's that..." And we assess this long list, see. Driving to work. *Psssw!* Well, let's make a statement of this driving to work that we can use. And probably the statement that embraces it is "On transportation," something like that. But that statement has to read, see, transportation has to read as well as "driving to work" or we don't use it, see.

Now, we could cut into this thing and we'd say, "On transportation" and each question is preceded by that. You can cut yourself right straight back right into the Helatrobis Implants or something like that, this guy's hair would be standing on end in no time. But you'd get away with it. There's the general permissive use of it is what you will have most use for. The greatest uses of this thing will be "In auditing," and just the general question, "What... ?"

Now, let me call to your attention the fact that the Helatrobis Implants do contain words such as "remember," and therefore you do very well to avoid those in your auditing commands. Just like you wouldn't ask anybody, "Have you ever absolutely gotten drunk?" See, you just wouldn't use an auditing command that repeated this confounded word, see, because you know you'll practically spin in the pc after a while.

So, you don't even bring anything that's close to that goal "to remember" which is present on every case, which is "recall" or something. Now, there's probably goals about "think" and so forth, because I've run into tremendous numbers of pcs who didn't dare think. "Think" is the great antipathy over here in the UK on putting processes together. You say, "Think of a..." or something, you have to change it to "Get the idea of..." Well, it's odd that you'd change it, so there must be some type of implant sitting around that has the word "think" in it. Otherwise pcs would be able to answer this auditing command. So keep that type of word out of these ARC break Straightwire. See, just keep that type of word out.

You say, "Recall something you have gone out of affinity with." No, no... Let's always make a simpler statement out of it. "What have you gone out of affinity with," see? See, omit those words that refer to the mind and think and so forth from your auditing commands and you'll be away.

Now, this process, as simple as it is, in your hands, actually delivers the rougher cases that you have been worrying about. Because they're always very happy to run it. They don't have to know anything. They don't have to have any evaluations. You don't have to do anything with the case. The case will just sit there and run it. They'll be quite happy to run it.

Now, with little children, and that sort of thing, you've really got to bend these questions around the corner. They've got to get awful simple. In fact, they've got to get so simple that they're liable to become meaningless. You know, you can't quite make them simple enough so the kid can get them and so forth. But this all comes under the heading of clearing questions, and you just remember that you've got to clear the question much more carefully with a child if you're going to run this type of process.

And when you start a case running on this sort of thing give him enough of a run on it so he gets some benefit out of it and he will be very happy about it.

Now, there are those cases which cannot recall, cannot remember, cannot do this, cannot do that, to whom the track is totally blocked off. Recognize that you are dealing with a 7 or 8 level case. And what they need is reach and withdraw on the awareness... the unaware case. And on evaluation they undoubtedly will need some CCHs. Because it just won't bite. Won't bite. Well, there's just nothing there to bite. See?

Now, you can use, however, the same principles of this on discussing whether they want to be here or not. You get the idea? Discussing whether or not they like you, or not. Discussing whether or not they wish to talk to you or not. You're running a present time version of it, aren't you? So don't avoid the fact that you can make a discussing two-way comm out of these processes right in present time without asking the case to recall at all. And that might prove to you a valuable weapon at one time or another. You can talk about present time and you're not asking the person to remember or to think or to go backtrack, and they very often will gradually and gracefully curve into being able to go backtrack, see. Case [Process] has tremendous value for altering case state. State of case alters very rapidly with this.

All right, well, I didn't want to beat the process to death, but I did want to give you a good review of the process because you will be using it and because it's a very valuable process. There'll be bulletins out on this subject but I doubt they will contain much more than what I've given you in this lecture.

Thank you very much.

LEVELS OF CASE

A lecture given on 13 June 1963

And what is this?

Audience: Thirteenth of June.

Oh, unlucky for you! Unlucky for you. The 13th. Pretty grim. June 13th, AD 13, Saint Hill Special Briefing Course and you don't need any information, you got all the information. Getting along very well, getting along just swell, just tied in knots! You know which way you're going, as long as you don't have to go in any direction. Time track is as straight as a ball of yarn that a cat's been at. Got the cases on the scale absolutely pegged – there somewhere. [laughter] I'm being sarcastic, now. Shouldn't be in one of these sarcastic moods. No, actually, we've got it licked. We've got it licked. We even have your case licked, you know? That's fantastic, see.

But, having it licked is a problem in a good rendition as far as technical is concerned. And I ought to give you a direct rundown right now of where we are at, technically. I think that'd be a very good idea.

The operative processes are exactly six in number. There are six types of processes. That's the ruddy lot. If there are any more kinds of processes, I haven't run into them in a quarter of a century of very hard inspection of it all. And if there are any, I've probably found them and thrown them in an ashcan as unworkable or unlearnable.

There have been all kinds of developments of various sorts. I read one the other day from the California Association of Dianetic Auditors, that gave an auditing session, and the way you audit someone. And the auditor puts on the teakettle and says to the preclear, so on... Well, I personally wouldn't think that was very workable. It... they evidently wander about and they don't talk about cases or anything nasty like that and that's an auditing session. So there have been lots of developments of one kind or another. [laughs] You think I'm joking, you know, I really ought to dig out the paper and show it to you. I read it, and I said, is this a gag? You know, no, it wasn't any gag, it was very serious.

Now the... how far people can go to keep from confronting anything that resembles a case or a bank is how many developments there can be under the heading of mental activity or research. And this is almost limitless. Almost limitless. But in the years that have gone along there have been certain things that worked and certain things that didn't work. And the direct processing of postulates is not included in this particular rundown. But remember that you sometimes very spottily can produce some rather interesting results with old Rising Scale Processing.

So there are lots of subdivisions of processes, there are lots of processes that we have had, but what it's actually boiled down to for the working kit of an auditor, and which gives the auditor direct and positive results, and which gives an auditor an invaluable alignment, is the scale of case levels which you received under programming, there are eight levels there, which I won't take up at the present moment. But this six processes happens to cover those levels. And they're the only things I know of, over a long period of time, which make a dent in these levels, and carry them forward to an upper level.

All of these processes are known, their technology is known, how you do them is known, and so on. So it actually doesn't pose a very great problem. But how well they are known, and how reliably they are executed, does pose a problem.

Now, we will work up and develop... Reg's been going around today shoving pieces of paper and questions at people, and we're actually working up here, how do you tell where the pc is, in order to run what on him? In other words we have developing... we're developing old Dianometry, now, forward to a point where you can get an immediate adjudication of what you ought to do with a case, by just giving the case a series of tests. Now, that's getting very fancy indeed. Now, lacking – lacking this data, you still can simply go up or fall back to the pc's level. You see, just with a hit-or-miss process or error, so long as you know case level, and so long as you know the processes that measure them. So exactly how we judge whether or not the case should have this process or not, is only briefly a part of this lecture. The run-down of processes is a very definite part of it.

Now, I'll give you a rundown of this – of this scale, so that you'll have it by numbers, and you'll be getting it in a bulletin if you haven't got it already.

But, what you call Level 1 is OT and that's no time track. Nothing. He's just got potential and action and doingness and capability. And he isn't carrying a mental record of any kind whatsoever.

And 2, has a total time track with nothing aberrative on it, which is a highly theoretical state. If anybody could maintain it or achieve it, I would like to know about it. But that's a theoretical state, you see. Frankly, you will get in actual fact, at Level 2, parts of the time track missing, and those parts that are there still under handling. That's really – it's not an absolute level.

No level is absolute on this whole thing because you can even raise Level 1. Now, quite interesting, yes, you can raise the level of an OT. Guy hasn't got enough sense to stay out of theta traps. You can say, "Well, it's this way, bud. This is the way you handle a theta trap." And he'll say, "All right, that's good. That's a good idea." Get the idea?

All right. He also doesn't know how to maintain a game, so that he actually will deteriorate himself down to a level of where he can have a game, see. He tries not to remain in a state where he can't have any game or communication or association, see. So in absence of knowing how to put together a game, he also is remiss. See, so the only thing you really – that you've got, is just practice and education, at Level 1. That's your process. But that isn't one of the processes which is measured up here.

Two, as I say, well, that's theoretically a perfect time track, and of course that's unobtainable. That time track, long before it becomes perfect, will fold up. But we still have a theoretical level there and once more – once more we're already working on it to separate the time track from the person, and get him over the idea of doing this, and that all comes under the handling of engrams or facsimiles. And you've got the process for that in just blocking out facsimiles, see, he'll discover all if you just continue to run that process. So that's covered, with no special process.

And now you've got 3, which is visible time track but quite aberrated, lots of engrams on it, and so forth. In other words it's not dub, but he can see his time track when it is there to be seen, and you've got that in engram running by chains, and blocking that sort of thing out.

Now, that process, engram running by chains, is a precise activity. The only thing I would improve in it is spotting duration. I'm having just a little bit of trouble getting pcs to sit still long enough to get the duration of the incident spotted, because the incident starts running off, and I've been trying various – various places to try to get the duration of the incident. I've tried to get it before I send him to the beginning of it and tried to get him at the... once I've run it through once, and so forth, and I don't know quite the perfect place to get that at this particular time. Rather than badger the pc, why, with it, and cause the pc to suppress the whole incident all the time, I'd omit it. Rather than do that, or maybe it'll turn up as a flash answer. Or maybe you send him through it once, and say, "How long was it?" But that little point is the only point I know of that isn't settled in that rundown. The rest of it's working well, extremely well.

All right. That's Level 3, and of course that's somebody who can see the time track as it is and who can run it and who can run engrams.

And then you have Level 4, and your Level 4 is for any reason whatsoever, it's just an occluded time track. That's your – the famous black five case. It's the – also the case with an invisible field. It's also the case with a little *wirk-wuks* and *wuk-wuks*.

Now cases below this level on harmonic, down at 7 and 8, also have invisible fields and black fields, so you can be fooled at this. Just because somebody's got a black field is no reason he really is a Level 4, don't you see. Now, it's whether or not you can run an engram on this person. And oddly enough you can do just that. We had somebody here the other day, he's been black five, never seen a picture, never had sonic – never had visio – never had anything – all gone, missing – went. Threw him into the middle of the Helatrobus Implants, the goal "to forget," he's run with full sonic, visio and everything else. See, bang. In other words, there is – there is a real Level 4, see.

Now, what process do you have for this? Well actually, just engram blocking out and 3N. And they overlap at that point. See, you could run either on these. Now you can also run 3N on Level 3. So now, let's drop a little bit lower here, and let's get Level 5 and a dub-in. Well now, dub-in is running... you start running 3N on a dub-in case, in one minute why they're – one minute why they're rocket reading, and the next minute they're not, and you're fumbling around, and they're getting restimulated, and you can't keep your fingers on it and, *aaaaaaaahh* – the next thing you know, the case is all tying up in knots, and you would be much better off to have done a repetitive process in the first place.

Now, the repetitive processes are – the leading repetitive processes are three in number. And you haven't heard of one of them. But just call them repetitive processes. The one that you are using, and is the best and most powerful of these, is the three-question process, ARC Break Straightwire, given one question at a time. That as a repetitive process is – carries all before it. Now, there's two other repetitive processes, though, which are very interesting. And one of those is Duplication, all by itself, "What would you be unwilling to duplicate," and there's another one, Power of Choice, just per se, which also has considerable power. "In auditing, when has your power of choice been overthrown?" Interesting type process.

Now, that's a whole basket load there. Now, if you are going to do – going to throw in Rising Scale Processing, it probably would belong there, but in actual fact – in actual fact it's a Level 1 process, or most any process, if it works, and if it doesn't work, and there's a lot of stuff connected with it, because what are you doing? You're actually flipping the postulate out of the mass consistently with this thing, and although you can achieve considerable changes in the pc by doing this you actually don't achieve case gain. So let's take a look at the difference between a process that produces a change in the pc or produces an effect on the pc and one which advances the case level. See, let's differentiate between these two things right here and now.

I know a lot of processes which will produce a change in the pc. Engram running is one of them. It'll produce a change in the pc. But will not upgrade the pc's case level. Now, that sounds like an interesting thing. Well in actual fact what you're doing is using the power of the process to rather overwhelm the resistances of the pc. And you can change the pc. You can alter the pc around. You can get rid of various things the pc doesn't want, and that sort of thing. But does the pc ever find out you've gotten rid of them? Now, you've heard me speak of this type of case in response before. The old lady has arthritis and you run a bunch of stuff on the old lady, and she all of a sudden doesn't have arthritis anymore and she doesn't mention this at all, she just natters at you about her migraine headaches.

Now, you haven't really produced a change in this person's attitude toward life. You haven't improved this person's reality or confront. You haven't. But you've changed the case. And an auditor should realize that it's within his power to do that. And that only happens when you run a process for a higher-level case on a lower-level case. You can change the case without improving the level of the case. Now, you must know that that can happen. In other words, your object is to move a person up this reality scale, toward OT, that's your object. Not just to make this person more comfortable or with less somatics or something. So they hurt. So what?

It's the most weird thing in the world to have the – I don't know, I'd... there are some ladies present, I'm sure some of these gentlemen have been ladies in the past – and I really can't call the name of this government department in printable English, you see. But it actually is assaulting us for doing something, which, I've been saying, and we've been agreeing, for a very long time, we shouldn't do, which is treat people and heal people you know, and make a big thing out of sickness and health and all of this sort of thing. And they're all upset with us because we say we're doing this. But we've never said so. For years I've been saying what the good of making somebody – you know, getting rid of somebody's wheeze? What's wrong with him is him, not his wheeze. See, I've been carrying on about this for some time,

and all of a sudden they're about to say, "*Whoaa*, let's pull off this here ban, because they're getting in the road of the doctors. And we've got to keep the doctors going, otherwise we won't get our bribes." I'm sorry, I... a little run away with myself there. They've got to live. But we don't know why. [laughter, laughs]

Because frankly it's pure idiocy to cure somebody of an illness. This is idiocy. They just go and get sick again. You talk about a thankless task! It's actually thankless, endless, does nothing for the society, gains nothing for the individual or anything else to amount to anything. This guy's got an earache. So you work like mad to get this guy to recover from this earache, see. And so you cure him from his earache. Well, great day in the morning, he has now not got an earache. Great. How to raise society heroically onward and forward!

Now, if you cure his earache, if you're foolish enough to cure his earache, and work in just – in no direction but to cure his earache, you're working exactly against his hidden standard. And, you aren't really trying to remove the causes of having a hidden standard. So what's he going to do? Well, next day he's got ulcers. See? Well now, if you're just looking for employment, I mean if you've got a medical school certificate or something and don't know what to do with it, and you want to go on forever collecting those – I don't know, it used to be – it used to be two bucks, and then it got to be five bucks, and then the trade union got to work and it got to be ten bucks, and five bucks extra for each shot. You go in now, you know, that five bucks extra for each shot, the nurse just sits there, see, and she writes down, you see, and "Shots, shots, shots, pills, pills, pills, shots, pills, pills, pills. Two hundred and fifty-five dollars, yes, that's the bill." Well, if you're going to... if this is a commercial activity and solely and completely just to provide work for the Works Progress fellows so they can lean on their shovels, yes, by all means, by all means, overwhelm the pc with an upper-level process and cure his earache. But don't expect him or anybody else ever to thank you.

And you see, your object is to advance the pc up this scale. Now, therefore this puts a severe limit on the number of processes that you can run on anybody. See, this tells you that you had better process the pc at his level on the Reality Scale with the process that belongs there, and if you are not doing so you will know it at once, because the pc is not making any signal progress as a person.

Now that progress is very steep today. That progress used to be barely detectable from week to week, see. Well, it's not now. That – it's a steep grade. And you don't see that steep grade happening, you know at once what you're doing. Yes, the pc is making a gain. Now, fortunately for us, that gain is expressed by your tone arm. You're not getting tone arm motion on the pc, the usual thing that is wrong is is you're running a pc at one level of the scale, at a higher level for the process. That's it. And you'll notice you'll be tricked by seeing that the pc gets well and does various other things, but they're not upgrading as a pc. See, their general attitude toward existence, and their communication level and that sort of thing, this isn't improving. See what the difference is here? It takes that – it takes that knowledge right there to know how to apply the processes I am giving you.

All right, now let's take this Level 5, which is your dub-in level, he really never gets a picture of anything that is really there. The picture is always a picture of a picture. Well all right, now that case – that case starts to get very, very, very critically run on your, well, en-

grams, so... They make a copy of the time track as fast as you run it off, don't you see. This is like running on a treadmill constantly. Because you're never erasing anything that is on the case, you're only erasing copies of what is on the case. And it won't give you any tone arm action, but you're liable to do some interesting things by accident. Accidentally clip a somatic out or something like that. And that leaves you your repetitive processes. And these repetitive processes are just tailor-made for that case.

Now oddly enough, the repetitive processes also overlap into Level 4, just above it. So your processes then, that are indicated for that particular case, and so forth, are very simple. You've got your ARC Process or any other of these repetitive processes that are laid down, they're all the same band, and you've got your Level 5 and your Level 4. All right, that's fine.

Now, your ARC Process also handles Level 3 cases that have been monkeyed up in auditing, these repetitive processes, you see, cases that have been butchered up in auditing, cases that are having a bad run of it, or cases which have turned on a sudden chronic somatic of some kind or another that nobody can quite explain, and we're not getting to easily by the techniques we are using. Well you can – the guy's case level isn't down chronically, but has done a skid. And so we can build it back up with the repetitive processes which we have. So they're good.

It doesn't mean that because somebody is run – we have trouble with this – because somebody is run on a repetitive process that he's automatically a dub-in case, see. That'll get around, and so forth, and it is not true.

Now let's go one level down from that. Let's go to Level 6, God help us all. And that level is the dub-in of dub-in and there's nothing distinguishes this case from the dub-in case, except the degree of franticness which the case goes into and the amount of delusion which can turn on. You see, that's just more anaten. So you're running a long way away. Now, what characterizes this case is the terrible automaticity of the bank. This case has got a fluttery bank. You can never get that time track to stay still. Now, this is not a very numerous type of case. But you'll run into enough of them, and they'll just drive you around the bend. Nothing bites to amount to anything because they've got a time track that is in constant motion. That time track – flutter, flutter, flutter. You try to say, "Have you had breakfast?" and they get their last ten breakfasts, only they aren't their last ten breakfasts, they're copies of copies of their last ten breakfasts and, duh!

They can't stay still. The time track doesn't stay still. They no longer have the power of remaining motionless. That's one thing that characterizes this case. And if you called it not the dub-in of dub-in, which is going, but the case of the automatically moving time track, the – or the – grouped automatic time track or something like that, you'd probably have a better diagnosis of the symptoms. Now the – yeah, you try to put them – try to put them in yesterday, and they go into yesterday, the day before, next week. You say, "All right, what's happening here? All right, did you ever fall out of a baby carriage?" This is an actual experience I had with one.

"Well, yes." Trying to run Straightwire on this person. This is Straightwire, I mean just direct Straightwire, see.

"Did you ever fall out of a baby carriage?"

"Yes – yes, I'm sure I must have."

And, "All right, you can recall that?"

Case instantly has ten fallings out of baby carriages at ten different times, maybe to ten different babies. Try to run that case through any lineal line of engram, like say now, "Pick up the moment you walked in the door." And they instantly pick up the last two or three months' worth of doors. And then a few past life doors thrown in. They give you a copy of those things, and so forth, and they walk to a plethora of chairs. Actually, they'd have to come up through blackness before they actually saw their own time track. But that automaticity of track is something that you sooner or later will run into. Don't let it break your heart, you can't even run ARC straightwire on the person, actually. See, you can't ask them to recall anything.

Now the probability is that ARC Break Straightwire would function on this case one way or the other, and cure him of an illness and all that sort of thing. Well, you could be fooled. What actually is this case doing. This case is into an instability of bank, an instability of beingness, a terror which amounts to constant motion, expressed in the time track and so forth. Now that constant motion may express itself in other ways physically. You... it's got a goal, you know. They can't sit down in the chair. I mean, they can't live there. They live in five different hotels in two weeks, you see, I mean, it's terrible. It... just this awful urge to get out, to not be there. Various other expressions and manifestations occur at this case level.

But the only way I've made it a case level is not because it is terribly numerous, but because it's utterly baffling when you finally hit it. You say, "Recall breakfast." And the person can't remember breakfast. Well, that's all right, but on a higher-level case you could keep plugging at them and they would finally remember breakfast, see? Not on this case, man. If you push him at all, they've got all the breakfasts that anybody ate in London, see. They've got everything, I mean – *brrrr-braww-bzzzzz*. It looks like fifteen or twenty different projectors shining on the same screen. That case is nervous.

And that is a CCH case. That is a CCH case. Remember that some processes of a repetitive nature can reach down into this case, and so forth, but he's actually a repetitive process too – too far forward or too far from.

Now, there's something else that works on this case that would be quite interesting to you and that is Sec Checking works on this case. Prepchecking, to a lesser degree works on the case. But Sec Checking does. General O/W works like a ball on that case. Every time they answer the question they get *r-r-r-r-r-r-r-r* of pictures, and so forth. And they gradually will come out of it under General O/W. And you get beautiful tone arm motion with such a case with General O/W. That's another type of process. Of course General O/W is an excuse for Prepchecking. Don't consider it a repetitive process, it's just a – it's a shotgun method of Sec Checking somebody.

Now the overts you get off these people, the overts you get off of them may be very feathery overts. They give you on a silver platter – they give you on a silver platter the fact that they murdered their husband, or something. This doesn't mean anything; this is nothing. But you can find an overt. You can find an overt. And their level of overt is liable to be very feathery. But it means a great deal when you get it off. They remember thinking a hostile thought about their mother. And gee, it produces quite a change on the case. Sec Checking

does work at this level. You have to sweat like mad over it but they will sec check. They ordinarily are sitting in a guilt complex anyhow.

O/W works. And therefore you could say the only repetitive process which is at all successful on this particular case level is O/W, but that is a Sec Check process. And the CCHs work on this case. So that a combination of those two – probably get you there.

Now you're getting down into easy stuff. Getting down into the easier stuff, and you get your next level of case which is they can confront their own evaluations. You would just be amazed how much interest and absorption and so forth they would get in a mildly run CCHs. The mildly run CCHs, you know, they do the process three times and it's flat, you see. And you just coax them along with the CCHs and you'd be surprised, man, they can talk for hours about that book, you know? I mean they – somebody held up that book and they didn't really know whether or not it was... They just go on with terrific absorption on the thing. That doesn't mean that people who get absorbed in the CCHs are all at this level of case. But it does mean that this case can get interested in this. Because that stuff is awful dangerous, see.

And the fact they can come that close to confronting something in present time... you've passed, you see – at the bottom rung of Level 6 you have passed out of the case level that can run the bank. They can no longer run the bank. The bank is not there to be run. It's unhandleable.

So, you've got your – you've got your CCHs there, and you run down to your unawareness, you don't have the CCHs complete at Level 8, you have only Reach and Withdraw. Now oddly enough, the CCHs, Reach and Withdraw, and so forth, will also produce action on case levels above this. They'll produce levels of action up to 6. Or they'll produce levels of action up to Level 5. All of these things. But what I'm talking about is the narrow shot. This would be about the only thing that can produce a reaction on these lower levels. Quite interesting.

For instance, you can run some CCHs – let me give you a difference of case levels. You can run some CCHs on a Level 3. And boy, they're just about as flat, you see, they're just about as flat as an unrepaired road. And they just got chuckholes all over them, you know, the guy never did really flatten "Give me that hand." He still had some cognitions on it, and he was still comm lagging on the wall, and he was still this and that, and you drop him, you see. It never halts the progress of this case. You could even go that far on a Level 5, and although it would be a little more critical never to have flattened the CCHs, you see, it still wouldn't destroy the case, or the ability to run on repetitive processes. But you leave the CCHs unflat on a Level 7, and you have just parked them there to the end of time. That's the only thing that can be flattened on them.

Now, a Level 8, as I say, Reach and Withdraw is simply a specialized mechanism – any specialized mechanism. If you want this case, say – what... let's go into significance. We say to this Level 8, we say, if we can say anything to them, we say, "If – is it all right if I audit you?" And they'll say always yes, because they're usually very mannerly. But boy, that's as far as it went. That's a social conversation, see. Now, you say, "All right, touch my right knee,

touch my left knee. Touch my right shoulder, touch my left shoulder. All right, touch the end of my nose." And they all of a sudden draw back from you, you know.

"*Hu-aah, hu-aah.* What are you doing? Who are you?"

All they would say, you see, "Is it all right if I audit you?"

"Oh, yes."

"You're sure there's nothing you dislike about me?"

"No, no, don't dislike anything about you."

You go on like this for hours, see. Produce no reaction on this case at all, see. But just a few touches there. "This is an E-Meter. All right, reach it. Withdraw from it." They do this quite complacently. All of a sudden they begin to regard it with great caution. And they begin to regard it with considerable hostility and they run the whole emotional Tone Scale on reaching and withdrawing from the back of an E-Meter.

Now, that case you'll also find in a coma in a hospital. And you take their hand and touch the sheet, and take their hand and touch the blanket, and take their hand and touch the sheet, give them the commands each time and acknowledging, and so forth, they come out of their coma. You can take some bird down here who has been concussed in an automobile accident for quite a while, and he's been into... unconscious for eighteen days, or something like that, he'll eventually pass in his checks. You go in, and you start that process of just touch and untouch, reach and withdraw, and if you keep this up, it's so – it's long, and it's arduous, and so forth, and remember that the same laws apply with the CCHs. The person gets the process flat, they start to feeling they've been punished if they continue to run the process. So you have to take their other hand, and flatten that, don't you see?

And that case will come up to a point where they can communicate with you. And it's quite spooky at first – your hand, something like this... have to be very careful what you promise them or say to them because they're in quite an hypnotic state. But you say, "All right now..." They're dead out, see. They haven't expressed anything to anybody for a long time. And you say, "All right, now for 'yes,' squeeze my hand once. And for 'no,' squeeze it twice." And put their hand around your fingers and ask them, "Are you getting good treatment?" or "Do you feel all right?" or something like that and you'll be startled, you'll get a squeeze. See, they haven't expressed themselves to anybody for days, weeks maybe.

They – you put them into rather easy communication. And then they can go on to this signal, they'll start coming out of that – that, by the way, is just two-way comm, it doesn't particularly do them any good except it puts them into communication with their environment to that degree. You can go on running Reach and Withdraw and get some two-way comm this way with them. Next thing you know, they come out of it.

Well, you say, well, that's very spectacular, that's a case in a hospital and anybody can recognize a case in a hospital. Can you recognize somebody that you can never get out of a boil-off? I mean, this case just boils off, that's all, see. They're quite rare in Scientology but they're not rare around in the world. And if you sat them down and asked them a question, they would go into a boil-off. Well you – you pull your missed withholds and they'll come out

of it. And you ask them another question and they go into a boil-off. And you pull your missed withholds and they come out of it. And so forth, and actually the process is working, but the case is not coming up scale. That case will only come up scale on Reach and Withdraw. That case is just as much anaten sitting in that auditing chair as the guy in a coma in a hospital.

And you recognize some of these things about cases and you won't overestimate a case in spite of the case's pride or something. And get yourself a hatful of loses.

Well now, this gives you a rundown of the number of processes which we have. With one exception. And that's Route 1 for Level 1. And you've got old Route 1 with some ramifications of one type or another, and that's Level 1. And that gives you six classes or types of processes which are valid over all these years.

I'll run them off rapidly now for you. They are the... running them from the bottom up – let's run them from the bottom up – is your Reach and Withdraw, is your lowest level. CCH is your next level. Sec Checking is your next level. Repetitive processes is your next level, meaning ARC break and all that. Your next level up from that is 3N – implants. Next level up from that's engram running – by chains. And your next level up from that's Route 1. And that gives you your six – six types of process which are capable of improving a case level.

Now, please understand that you're looking for something very special when you're looking for something that improves a person's case level. Please understand that. "Improves a case level" has nothing to do with healing, has nothing to do with an assist, has nothing to do with any of these other things. Now, almost any case reacts – almost any case reacts to almost any of those processes. Quite remarkable but you can get reaction from a case. So therefore whether or not the case simply does the process, or appears to do the process, has nothing whatsoever to do with whether that case will advance the case level.

You're trying to promote this case from a higher number to a lower number on this case-level scale. That's what you're trying to do. And if you're – if you're using Scientology for some other purpose, such as get rid of people's bunions, or – or something like that, recognize at once that almost any usage of it follows through – well, what is an assist but reach and withdraw? See, that's under – that's the class of it. Reach and withdraw. You could take the guy out to where he fell off the roof and make him reach and withdraw from the point where he landed. And he'll get over having fallen off the roof. I don't care what his case level is, don't you see. You can take almost anybody and increase their perception and so forth, by running some CCHs. You can do things for almost anybody, make them feel better and so forth, by running some Sec Checking on them. Almost anybody will respond to ARC Break Straightwire or these repetitive processes we are using. And you could do something with engram running on almost anybody. Pretty close.

Now, what do you mean, then, by what process applies to whom? See, it's that process which raises the person's level on this case-level scale. That's the process. That is suited for that pc, monitored and moderated by one thing – one thing only: "Fastest." Economy of time enters into this. What would raise his case level fastest. You've got – you've got several choices, and you might be able to get a Level 3 case with just a sporadic track but actual

track, you might be able to get him an awful long ways with ARC Break Straightwire, see. You might get him an awful long ways with that process. At what speed? See, that's your difference.

Well, what are you doing running a Level 3 on ARC Break Straightwire? Well, it's always a good thing to clean up auditing, that's about all you'd use it for, don't you see? And that'd be a bad economy of time. Now let's take – let's take 3N – the usages of 3N. You run too many implants, you run a dozen, fifteen GPMs without ever going on the earlier track or picking up any more basic or fundamental material and you're actually wasting time from that point thereon. But finding earlier material before you've run some GPMs, you're actually wasting time. See, there's two ways of looking at this thing.

It's all right to go hell and back on the backtrack, but remember, why is this guy's time so loused up? You can follow out an awful lot of implants, and you can plot out a lot of implants, and it's very, very nice to find the basic implants, yes. But let's run some GPMs and then let's find the basic implants. And let's get these basics out of the road and then let's finish up running the Helatrobos Implants. Because that's where his time got loused up and that's where his track's wrapped around the corner, or that type of implant. Because, let me tell you something: The implants from forty-three trillion years ago or from that period of time area, start to speed up in number as we approach on into present time. And we take the last billion years, and boy, we're getting one about every seventy years or less. There's Gates of Mars, and so forth. Implants? You want implants?

If you're just looking for numbers of implants, don't – don't go early. See, stick up around present time. Let's take the last few thousand years. Let's get industrious. Because of course everybody's gone practically potty on the subject of implants. See. And there's implants, implants, implants of all shapes, sizes and general descriptions. It'll louse up the time track, and give you multiple pictures, and do this and do that, and the whole Darwinian theory is taken out of one single implant. It's fantastic. So there's lots of implants.

Now the earliest attainable implant from most cases – area that is aberrative, and furnishes the fundamentals for later is the Helatrobos area. Now, there are a few implants of the Helatrobos type of implant that go back as far as three hundred and five trillion. In fact I know of some that don't look too different, but aren't very complete, that go back seven hundred trillion. They're very scrappy, they're very minor. But, nevertheless they form a fundamental – they form a basic. But the only really, thorough, workmanlike job that was ever done on the implant line, was the Helatrobos Implants.

Now, it's all right to strip implant engrams out, it's all right to kick everything out the window, it's all right to run those chains, it's all right to straighten them up. When you come back up you'll find the Helatrobos Implants will run very easily. If you don't get those out of the road, what's going to happen to all those implants between then and present time? Well, you've got to get the pc in such a shape as that this stuff just starts to blow by sight. And if you don't get the pc into that kind of condition, again, his case level won't improve.

Now case level improves to the degree that charge is removed. And if you are running a pc on process Zed and the tone arm just sits there gorgeously – nice, stable case, see – tone arm sits at 4.5. The blowdowns – case really blows down. Case goes down to 4.495. You can

anything like that. It went *pssww*, *pssww*, *pssww*. That's charge going. That's leaving, man. That's never going to come back. [laughter]

Another thing, you get these fuzzy-tailed RRs, dial-wide fuzzy-tailed RR. That's discharge. It doesn't come back at a beautiful RR at all, it starts out like a mad thing, and turns into a fall. Disintegrating RR. And you'll see that and you'll also see that tone arm start working when you're getting disintegrating RRs like that, see. All right, that's... you're running the Helatrobus Implant and you're getting that kind of thing, see. Well, you're blowing charge. What more do you want?

All right, pc says – pc's running implants very successfully. Pc's running implant – two implants, three implants, that's fine. That's fine. The pc says, "I think there's an earlier implant." All right, the rule is you can't stop the pc from running the earlier implant. "You know, I think I've been on a pole trap before," and so forth. Ah, go run it down. Perfectly all right. Go ahead, run down his basic. Go on, run it back as far as he can go. Perfectly all right. Block it out. Watch that tone arm! You're not getting any tone arm action. What's this? Well, you're running engrams on somebody who shouldn't be running engrams. They're not be... they're not getting there. They could run the Helatrobus Implants and get release charge but they can't block out engrams and release charge.

Now, how do you break this news to the pc? Well that's your problem, you're the auditor, the pc's auditor, you don't expect me to audit your pc, don't you? Yeah, that's a hell of a problem. Pc wants to go back early and back early and back early. I'd say I'd be perfectly happy to take the pc back early, and take the pc back early and pick up various things, and so forth. But I would say I would run them minimally through things, and as far as trying to find the basic is concerned, you better have a very specific thing that you're looking for, or you'll just go back onto the endless grind. And watch this running engrams, when you're not getting tone arm actions and blowdowns, man. Watch it! Because all you're doing is stirring up the bank – stirring up the bank – stirring up the bank. Pc's going to get unhappier and unhappier with you. How do you break this to the pc? I'm afraid you have to have a heart-to-heart talk with the pc. Say, "Now look, we'll go back now and we're going to run some more implants where we were getting tone arm action, and we're going to finish off some of those so that we can get this earlier material blown out and discharged. How about that?" Well, pc will be very agreeable to do so.

You haven't told him, "You must never go on the backtrack again because you don't have tone arm action on the backtrack." I don't think this would be diplomatic. I don't think this would be well received. In fact, I dare say the pc would ARC break all over the ceiling.

Now, you depart from the Helatrobus Implants onto the backtrack, you know, you're blocking out engrams, you're finding earlier implants, so forth, you're getting big blowy tone arm action, you're getting tone arm action of one kind or another as you do this. You're seeing these things every once in a while go *psswww*! And that sort of thing. Eh! Go ahead. You'll actually take so much charge off the backtrack that the Helatrobus Implants will start blowing out up to front. See?

But the Helatrobus Implants – and none of these modern implants will blow out unless you're blowing charge off. Another thing: You're going to run some ARC Break Straightwire

on a pc, and you're going to run this on the pc, that's dandy, you're going to run this. No tone arm action? We assume you've already tried 3N, couldn't find the goal. No tone arm action? Well, give it a chance. Tone arm action has to run in on a case. Sometimes takes a couple of sessions to run some tone arm into the case. On ARC Break Straightwire, remember that. You sometimes will sit there with great disappointment, seeing no tone arm action on ARC Break Straightwire at the first run on a pc you'd think should have it. Then all of a sudden, wonderful news, the tone arm action starts moving in on the case. And you run the tone arm action into it and you run the tone arm action back out of it again.

But let's say you got no tone arm action even after a good test of this. Pc's happy with the process, you understand, apparently changing the pc and giving him somatics or something. But you're not getting any tone arm action on this thing. Well, you can drop back can't you? You can drop back to Sec Checking, CCHs, that sort of thing. Because sure as the devil, you're going to find enough engrams relating to Scientology to find no case gain on the pc. It's that kind of thing that's holding up the parade. If they are that bad off you can always go on down scale and run Reach and Withdraw on something. Well, let's not say that you've been so stupid as to make an adjudication of starting out to run engrams on somebody who did nothing but sleep in the auditing chair.

Now, it's better to start low and run high, that is to say, to underestimate the pc's ability than overestimate it. Always better. Because you start a pc going on running engrams and then drop them back into running Helatrobis RIs and then drop them back into running ARC Break Straightwire and then, drop them back to Sec Checking and then drop them back to the CCHs and then sort of start them in on Reach and Withdraw. I think along that line they would have had a few loses. I think their confidence, their confidence would have been interrupted. So it's always better to start them low, and push them higher.

Now, if you can get tone arm action on the Helatrobis Implants, boy, you better run some implants. Now, the pc says, "I'm going early," by all means, by all means, he's spotted something early, by all means, let him go early. And you get no tone arm actions blocking out engrams earlier, then you sure better acquaint the pc with this fact.

Now, there's six types of processes and their uses on various cases. Has to do with programming. The variable that you're confronting here is the ability of the case. That's the variable from the auditor's viewpoint. Ability of case to rise up the scale. That's that ability. Not necessarily just the ability to run the process. So you have got to estimate that one and that to you is a variable. Well, when I tell you that the person has to blow charge on any process he runs, has to feel better on any process he runs, of course the lower the process the slower he'll blow charge – you recognize that, too. It will help you a great deal. And until we produce a machine which you insert the pc's thetan in, press three buttons and it says, "Four, four, four, four" you see, why, until we do that you'll make errors with this. You will make errors with this. Inevitably you will make errors. So don't try to be perfect, just try to be effective.

Okay? Now, whenever – whenever your case is being run in the direction of up, the case will forgive almost anything you have done anyhow, so don't even worry about the consequences of it. Your job is to remove charge which immediately raises the pc's level on that

scale. You can do that and if you aren't doing that you're just turning in a lot of no-auditing and a lot of hard work which all amounts to nothing.

And that is the way to produce fast results on a case.

Now, there's many a case will contest with you, particularly Level 5 cases, Level 6 cases will go into violent rows with the auditor on the subject of being underrun. Quite interesting. We just had one leave the hall a moment ago. On the... because he realized he was being underrun by his own estimation. Let me tell you this, they get into violent upsets on this. Because the lower the case, the more they estimate their ability. They take social pride. It's not as though they're there to be audited at all. It – they apparently have an entirely different mission, which is to show off to the auditor. There seems to be something social about what a person is audited on, which is quite interesting. And that is status. Status-seeking has come to auditing.

Now, let's let tone arm action come to auditing and I think we'll all have won in the long run.

Thank you very much.

BEINGNESS

A lecture given on 18 June 1963

Well, this is the what?

Audience: Eighteenth, June 18th.

June 18th. Good. You made it to June 18th, 1963. I want you to know this. You made it to this date. [laughter] Isn't that good news?

Audience: Yes.

Yeah, yeah.

All right. Well, I haven't anything to talk to you about today. But, the main thing is that the subject is so vast, that I'm just defeated by trying to know where to start in to give you the bad news about it. It's too bad, the time track is long. [laughter, laughs] Now I've... the exact date has momentarily slipped my mind, but apparently the overt-motivator sequence – what is it Suzie?

Female voice: A trillion trillion trillion.

Yeah. The overt-motivator sequence is a trillion trillion trillion years ago, less about a hundred thousand trillion.

Female voice: Less one hundred thousand.

Yeah, less one-hundred thousand trillion. You figure out the date. I sat in session last night trying to figure this date out and I couldn't get it anyway. It's a long track, isn't it? A lot of track. And we got just the process necessary to take it apart. I hate to have to tell you that, but you've been holding on to this track, you know, for a long time, nursing it, caressing it, hiding it, missing it, not-confronting it, and being unwilling to be it. For a very long time.

And, until we could get a basic kick-off for cases that couldn't confront a time track, until I got that unsnarled, I hadn't really been paying too much attention to the time track at large. And the main difficulty with the time track and its use in auditing is the fact that you have so many cases that can't confront a time track or any part of it. So this gives you auditor loses – if the only technique you had was engram running.

So it has taken many, many years, about eleven years, to get an orientation on what we were about. And like all very simple problems, it absolutely exceeds the complexity of one's own wits. By its simplicity. And what we've been doing has been accumulating processes, which brought somebody up scale to a point where they could view the time track.

Now, that's the only thing we've been doing. Now, it's quite amusing when you get down to it that this is a terribly simple statement, isn't it? Well actually, if all we'd done in

eleven years was just be able to make that statement, why, they would have been eleven years well spent. But more than that has been done. A tremendous number of processes have been developed, and accumulated, and only recently were these processes codified. And our biggest breakthroughs, whatever these things appear to be as breakthroughs, have been on a more fundamental front. They – here's the fundamental of what are we trying to do with the case.

Now, here's your ultimate procedure – it's rote – engram running. It's an ultimate procedure, as far as *Homo sapiens* is concerned. But the problem with it was that not everybody could do it. Therefore, the subject itself has had to be very rapidly, but by no means hastily, wrapped up, and we have today rote engram running. It's quite remarkable, and you must understand that this engram running is superior to anything we have ever done in this particular direction. And listen to me now, bears no relationship whatsoever to any engram running we have ever done. You understand that?

Audience: Yes.

Because you will have to make that point stick here, there and everyplace, because you're going to run into an old-timer sitting down in Phoenix, and he knows how to run engrams. You fill somebody up full of peyote and the guy daydreams for a half an hour while you snap your fingers at him, you know. He knows how to run engrams. He's never going to run engrams that way, you see?

Because we're not running engrams, we're running engrams by chain, just to open up and smooth out the time track. And... but the only reason we're doing anything about engrams at all, is because those are the parts of the time track which are least confrontable. And if you get rid of those stretches, then the pc's got a time track. See, that's all. You're just picking the worst parts of the time track to get rid of. But here's the horror of it, is the worst part of the time track denies anyone the best part of the time track. So you see, you have no choice but to do the worst part of the time track, that's the – which is of course, the engram – moments of pain and unconsciousness.

That's the only thing you can address on the time track, because as long as they exist, no time track exists. See, it's one of these things that you don't have any walnuts unless you have some walnuts, you know, I mean, it's one of those idiotic statements. See. If you don't get rid of the engrams, you haven't got any time track. See, because the confrontability of the time track is denied to the pc by the engrams. Unless you get those engrams out of the way, why, he can't confront his track. There you are.

Now, this sets up innumerable problems. Sets up innumerable problems. Because the more heavily charged the track is, the less the pc can confront it. And there is a point when the pc moves out from any confrontability of the engram, and of course, there's nothing now to confront at all. Nothing.

You, therefore have this scale of cases. The 1 to 8 case levels. And you've got your Operating Thetan, and then you've got number two, your – a person with a cleaned up time track, got a clean time track. Then you've got a person with sporadic visio, is number three, and you've got what we call a black five, is number four. See, we're getting further and further now from a – from confrontability of mental image pictures and events. And you've got number five, this guy can't confront it to the degree that if he tries to confront it he makes a picture

of it so that he can confront the picture of it. He's got a picture of a picture. And you've got six, who's got a picture of a picture of a picture. And then you've got another harmonic of no time track at all at Level 7, which is of course evaluation of own opinions. The fellow never confronts really anything.

Now, you noticed that the visio of the physical universe is diminishing. See, all the time you go down that scale, and you get this oddity that people have noticed, is – an automobile accident occurs, and you've got three witnesses, and they all give three slightly different stories. Well now, if these characters were all at Level 7, why, each one would have only a confrontation of what he thought should have happened, see, and you would get... you wouldn't even find out what color the cars were, man. You wouldn't find out what street corner it was on. You'd get a dissertation on laws that should be passed about careful driving, or... don't you see? It's a confrontation of own opinion only.

Now, everybody confronts his own opinion to some degree. These levels are up along the line, as you run engrams on some character, it... somewhere along the line he's going to dub-in. You know, for a moment or two he's going to see *luaaaaaah*, and he's also going to, sometimes, on a very deep anaten proposition have a dub-in of dub. You know, he confronts this thing, he thinks, and after you've run it for a while, and you get some charge off, and he kind of boils off, in for a moment, and *woag* and so forth, and oh, *now* he knows. It was different than what he first thought. Now he knows what it is. And he runs that, and he goes *rruuuh*, and he gets some charge off, and his ears sort of fry for a little while, and he – and then he suddenly wakes up, and it's an entirely different incident. It's got some of the plot characteristics he had before, but now it's a different incident entirely, don't you see. And now this is the time track. See, he's come through two layers of suppositions.

That'll happen quite ordinarily, and that does not make your pc a chronic level. That's one of the characteristics of the engram. But the engram can be so whole-heartedly high and mighty on this, that the whole case, you see, takes on this manifestation, see. Layers of unconsciousness, he's moving further and further off.

Now, if you had anything dividing these various levels – but of course you get your eighth level, which is simply unaware. But if each one of these levels of case states was to be divided from any other level, it would be divided by a layer of anaten. See? So that you get between Level 1 and Level 2, you're going to have a slab of anaten – unawareness, boil-off, unconsciousness – you know, anaten. And between Level 2, and Level 3, you're going to have a layer of anaten. And between Level 3 and Level 4 you're going to have another layer of anaten. You're actually... compartmentations of anaten.

And if you saw this scale, not as a vertical scale, but as a horizontal scale, anybody who is sitting at Level 8, as a chronic fact, as a chronicness, you see, as a... this is – this is not particularities happening in the session. Let's supposing he wasn't going to get any auditing at all, but in life somehow or another he's going to recover by livingness, see. He would have to walk from unaware, to own evaluation, and in order to get from unaware to own evaluation he walks through layers of anaten. He'll go *woag*, and *sluurrrrt*, and he goes real creaky. And then he'd have to get from 7, walking straight ahead, you see, from 7 up to 6 he'd have to go through another curtain of anaten – totally undisclosed, anything beyond that. And then to get

from 6 to 5 he would walk through another curtain of anaten. And 5 to 4 another curtain of anaten. When he got to 4 he'd go through another curtain of anaten before he got to 3, and from 3 to get to 2, he'd go through a curtain of anaten, and then to get to 1 he'd go through yet another curtain of anaten.

Now, these layers are thinner and thinner. Now the reason why they're thinner and thinner is dual. They actually are thinner and they also seem thinner. Because the greater awareness the individual has, why, the greater tolerance he has for unawareness. So therefore, there are two reasons why these seem thinner as you go higher on the scale. Two reasons. One, that they are thinner, and the other, that the person doesn't mind a layer of anaten that much.

Now you're going to see some case in cataleptis. This is a – this is a chronic state. Cataleptis – using a dirty word out of an old and forgotten piece of antiquity. And the guy is just a rigid blank. Or he is just a blank. Or let's take amnesia. Amnesia. He knows nothing. He can remember nothing. Now understand, absolutes are unobtainable. But not only are they unobtainable, but there are lesser and lesser levels of absolute. So that we get down to this sort of a state. What do you think a *Homo sapiens* is doing when he's walking around, thinking he only lived but once? Look at the amount of automatic unawareness there is of time track. So you consider him a pretty unaware character. See, just like that.

Now, what is he going to do when he first goes into this? If you took somebody averagely, that didn't have any perception of anything particularly, and you just wanted to walk him through this first level of anaten, you'll be rather amused to find out that the second you throw into his lap the idea of having lived before, that you'll get a confrontation of his own opinions about it. And this will make him pretty groggy. You got a reality on that? And if you push him up the line, then his suppositional actions will also occur, you know, he'll have a – he'll have a suppositional... And as he goes through from 7 to 6, he'll have some of the wildest ideas of what it is all about, that you ever cared to listen to. See, you haven't run him on anything, you see. You just sold him on the idea he's lived before, see. And he... then he's had lots of opinions of the consequences this would have on the world.

One of the things they do – it's quite interesting. You say, well, supposing everybody really lived forever, and they'd just forgotten that they'd lived before – his first thing is, "Well now, I don't know what this would do to old age pensions." [laughter] A confrontation of his own evaluation, you see. That's the only thing that he can confront about it. He can't collide with the reality of it at all.

So as you walk through it, however, you got him to earnestly discuss the fact that he had lived before, and he'll go through a level of being knocked out cold, almost, and then he'll manage to grapple with this thing – he's going to get dub-in of dub. He'll suppose, you see – this or that, and that is the result of this or that, and you're going to get some very wild ideas.

That's how everybody was Tutankhamen. See, that's how everybody... we... these characters mesh up, and you get everybody having been Julius Caesar or something like this, you see. Because they're just taking a suppositional look at it, and they think "wouldn't it be nice..." and so forth. And they might have been there, don't you see. They probably were somebody that used to serve him wine or something like that, you know, and one day spills

some on him or something like that, and they never quite got over the engram since, you know. There's probably been some kind of a contact with the thing, but their identity will be off, the locale might have some germ of truth in it, don't you see. But the... they're reaching there through a dub-in of dub.

Now, you – if you could force him to look over this thing a little more intimately, you might get him – you might get him, possibly this is all on a discussional basis, not on the basis of running him on the time track, don't you see. You'd get him with some pictures of pictures. He – his next thing he'd collide with – "I think maybe I was an executioner because I've got a picture here of – no, that's out of a movie, I think." "No, I must have read that in a book," you see, and a... there he is, wallowing through this next level, see. And then, horror of horrors – having had some fairly bright pictures, everything goes black. He hasn't got any pictures.

Well now, of course, blackness can be an harmonic lower down, but just pure blackness, he doesn't know what it's all about or anything like that, is about as good as an invisibility. But this is an invisibility of a – of a blackness which is – and that's how you denote a Level 4 – that blackness or invisibility is, you see, *is* part of the time track.

He's looking at blackness, and he were to turn around slightly, he'd see a planet over on his left. Get the idea? Or, if you got him to go through the incident rapidly, skitter-scat one more time, all of a sudden it would cease to be invisible. And it would take – he would realize that he was simply looking through air or something like this. See, the – it's an actual invisibility contained in. He's parked himself, because the details are too terrible to confront, he's parked himself at those comfortable parts of the engram, which are nice and blank, see. Here he is, and there's nothing but black. *Tsk*. Nothing but black, you see, nothing but black. That's all.

And you run him through it one more time, you see, or run him earlier, *aaarrrrrh*, it's good and black – in the direction he's looking. But that's toward the tail of the aircraft. The aircraft is going into the sun. And he can't confront that, so he confronts the tail end. And see what I mean, so he gets very *zzzzzyuuh* in the incident, you know, he goes *guuuuhhh*. Well, that he thought was a good solution. He's in this ship, space ship, something like that, and he's falling into the sun. So it's a fine idea at that moment to go good and anaten, because it's going to take him – it's going to take him the better part of the next year or so to finally reach the sun anyway, and the most confrontable part of the incident when he recontacts it is the point where he went anaten, you see, and went blank, and looked at nothing.

In other words, you're getting now – what are you getting? You're getting a gradient scale of confront, aren't you, as we go up the line here. So he's – the 4 is simply selecting the blankest parts of actual incidents. When he gets to 3, he's getting sporadic visio and he's looking at the more confrontable parts of actual scenery. And when you get to 2, which is more or less theoretical case state, the fellow could look at any or all of his time track. It'd just be where he happened to be in time, mentally, that told him whether or not he could see or he was looking at. This sort of thing.

In actual fact, the Level 2, as we go up to Level 1, the time track disappears. Now why does it disappear? Now there's many reasons why it could disappear, and there are several theories that could still be thought up as to why it should. But amongst these is that the time

track itself – this is a theory, you understand, don't write this down with exclamation points as a great truth, because it's merely something that I suspect. The time track itself is a method of not confronting. Do you see what I mean? Now it sounds – it sounds weird when you first collide with this thing. But it itself is a method of not confronting.

Now, yeah. The guy's got it in his head, and he's just mocking it up, it's good and safe. Because you observe these other harmonics, and you see which way they are tending to go, then you could extrapolate the probability that the time track itself was just a method of not confronting something. Why does he have to have a picture of it? Well, you get then an inversion of confronting it. See, he doesn't want to confront it, and this overwhelms him to the point where, without power of choice, he makes a picture of it. And you have the involuntary picture-making apparatus which is the time track, and how the time track appears and behaves. It's an involuntary create, is what it is.

Now, so the individual, if it's an involuntary create, must have been overwhelmed on the subject of creation, and so therefore to be overwhelmed it must have been by something he wasn't confronting. And although the time track is a very accurate record, it itself is probably the product of a non-confront.

Now as we look this over, then, we see we are doing a confronting scale, from top to bottom, on this state of case, and as we see ourselves involved with a confronting thing, it is then very, very simple for us to bring a wrong conclusion to bear: That confronting will resolve the time track. And although we've tried this, and although confronting has considerable success, and confronting itself is a very interesting idea, as a process, and does produce lots of results and that sort of thing, it is not the common denominator. It is not the common denominator of processes. It is simply the common denominator of reaction.

The common denominator of processes is duplicate. The time track is a duplication of an actual event. And each one of those levels on the case levels is a willingness or unwillingness to duplicate. And Level 2 is probably an unwillingness to duplicate. Which brings about an overwhelming automaticity of making a time track. So your breakdown from OT toward Clear is simply an individual's lack of desire to duplicate what he has to duplicate in order to be an OT. Lack of a desire to do so. And duplication is married hand in glove to the idea of beingness. And as we study beingness, we will see this with great clarity.

"To be or not to be," said the immortal, Stratford-on-Avon's tourist attraction. The old boy – I always thought that was good Scientology. But I began to examine it recently, and I found something very interesting about it. That is not the question. It is not the question! Why isn't it the question? Well, it might be the question for life at large, outside and inside this universe, but once you are in this universe, it is no longer the question. You're damn well going to be something, whether you like it or not. Beingness is no longer part of one's power of choice. You cannot be or not be. You can be or not be something, but only to become something else. Any time you not be A, you will be B. You see that?

All right. Therefore, as the individual enters this universe, he has a specialized problem from there on. And there is a point on the time track... the age of the universe may be infinite. This may be an infinite universe. We don't care about that, because there was a time you entered it. See, we don't care that – whether or not the universe is timeless, that is not the

question. In the first place, as you examine people's time tracks, you find out some very interesting things about these time tracks. You find their tolerance of time is improving as you go back. And time is the single source of aberration. And if tolerance of time improves as you go back, then you must be getting into periods, not only where they're less and less aberrated, but you must be drawing toward the beginning of the time track. And it's easier and easier to run, oddly enough, the further back you go, which is contrary to what we used to think. Easier and easier to run. So... and there's less and less event per unit of time.

So, you're looking directly at – by extrapolation – the fact that the time track has a beginning, and is not infinite. The time track is not infinite; (1) because at one time or another you entered this universe, and (2) because all indications indicate that the time track, the earlier you get on it, is less and less a constant, continual and infinite thing.

The universe, on the other hand, continues at its own rate of vibration. I mean, it's just been here, it's been vibrating for a long time, it's going on and it's going to be vibrating for a long time, and it was, and it is, and it will be, and God help you. Who dreamed it up? But this is the little handy jim-dandy perpetual motion machine from way back.

But the point we're making here is that it doesn't matter if the universe is infinite. (1) you've got a finite period, back on the track, where the pc did enter the place, and (2) you have every indication that there was a point where his time track began. You've got these two things. So therefore, cases are resolvable. You recognize, don't you, that a case would be unresolvable, if the time track were of infinite duration. So that's an important point to us. I've been examining it rather closely.

Now let's get back to this beingness proposition. Once the bloke is in the universe, there is not any such thing as not being. You cannot absolutely "not be" in this universe. You can un-be something, but only to become something else. You always will become something else. The question is *what* to be. That's the question! And that's the only question there is in this universe that really bothers somebody. You want to drive a little kid mad? Say, "Whatcha gonna be when you grow up, Johnny?. Are you gonna be a fireman? Nearly all kids your age wanna be a fireman. Are you gonna be a fireman?" He says, "No, I'm not gonna be a fireman."

"What are you gonna be, Johnny? You gonna go to school and study something in order to be something" Kid will start going *bluuuh*.

You sometimes see some girl who has been very adored by her parents, who had great ambitions for her. And you will try to read into her as a case, the fact she went into a decline because she disappointed her parents. You'll try to read into her as a case that she went into a decline because she couldn't keep up with their ambitions. Or because it crossed with her goals and all this sort of thing, and you can examine it from all different sides, and you still will not resolve her case completely. No, it's just that somebody was after her to be something. And if they were after her to be (blank) – whatever it was, it wouldn't be at all aberrative to her unless she knew that being "blank" was very dangerous indeed. And you're looking now at the hook-up of a postulate-counter-postulate, which makes a continuing problem, in terms of beingness.

Now postulate-counter-postulate is the anatomy of a problem, it's what hangs things up in time, and moves things forward in time, and so forth, and there are many things which can become a problem, as well as this one. But we're looking at something which is fairly basic, and very germane to this state of case scale. And germane state of case scale is what? Well it's just less and less things to be, that are safe things to be. There's a dwindling spiral of beingness. A dwindling spiral of beingness has been entered onto the moment the individual steps into this universe. And it will eventually be proven to him that everything he can be is too dangerous to be. That would be the eventual lesson taught by the universe. Everything you can be is too dangerous to be.

Well, look at us. The characters that laughingly conduct what anybody who knew the subject would hilariously treat as a big joke – government. These characters – newspaper proprietors and such lice as this – these characters – these characters, you see, start in a campaign on us that you mustn't be Scientologists. That it's very dangerous to be a Scientologist. Actually, they just dramatize the game. The Food and Drug Nonsense over there is trying to teach American Scientologists this lesson, that if they succeed in saying that the meter has been mislabeled; it says, "For use in Scientology processing," I don't know how this is a mislabel – if this meter has been mislabeled, then they can go around and arrest every individual Scientologist in the whole of the United States. This is the propaganda line. Pardon my yawn!

These characters have about as much authority as Kennedy. I meant Robert, ¹ of course! Look – it's going to take them upwards to two years just to get their lousy case in court. This – these wheels are going to turn, are they? And this is going to be the eventual lot of it all? No, no, they'd never make the grade. They're the only ones asserting the meter's ever healed anything. See? They're the only ones that are lying about the case. They're confronting their own evaluation. These are characters, man. There's nothing going to emerge out of this thing. Except, they can put out a propaganda line that said it's very dangerous to be, see. It's a lie.

Let me tell you, it's very dangerous not to be a Scientologist in this universe. It's very dangerous, in numerous ways to be a member of the US government. The United States attorney that's handling the Scientology case has just been stricken with aneurysm and is not expected to get well until late autumn, which puts our case off many months. As I was saying, it's very dangerous not to be a Scientologist.

Now let's look at this. Let's look at this. Did that shock you a little bit? [laughter] But man will inevitably try to teach, and beings will try to teach, the danger of beingness. But in actual fact there is nothing to do but be, in this universe. You see, because you are located in a universe which has finite space, which appears infinite, even if you're just a spirit without a body, you still have the beingness of a disembodied spirit.

This gives you the terrific workability of listing in 2-12s. All you were doing is writing out endless beingnesses. And you are giving the individual catalogs of beingnesses, and so forth. So therefore, you had terrific – terrific resurgences, you see. An RI is a potential beingness, a real RI. You can do lots of things with beingnesses. But the basic lesson is that it's

too dangerous. Anything you want to be, the ultimate lesson – pardon me – is that anything you would ever want to be, will eventually be realized by you as being too dangerous to be or as being too discreditable to be – one or the other – discreditable beingnesses, and so forth. There are characters around who actually just work day and night to make certain beingnesses discreditable. You don't for a moment think that Profumo or somebody like that didn't have something in mind? See, I mean this – they get to be something so they can become discreditable while being it.

Now there's all kinds of wild ramifications you could sit and philosophize by the hour. You could philosophize by the hour as to the ramifications of beingnesses, upgrading, downgrading beingnesses, making problems about beingnesses, and so forth. The state's effort to dominate the individual, of course, is simply a jealousy of beingness, of some kind or another.

But the question is not, "To be or not – to be or not to be." That is not the question. The question is *what* to be. That is the question. So if you want a guy to start sorting out his time track at almost any level – well of course, those levels would probably have to be above 7 – you can – you can start in on this question almost at once, and you'll run him into some very interesting categories. Now the time track itself is to duplicate or not to duplicate. But any duplication winds up in a beingness. They're united to a marked degree or they're at least gradients of each other.

So what do – what do we see here? Do you realize that you will have cases which will not become OT until the beingness of OT is demonstrated to them to be not quite as dangerous as it has been. Been very dangerous to be an OT. Very, very dangerous indeed. It's been very dangerous to be a man. It's also very dangerous to be an ant. These... we're getting into various problems and beingnesses. And how about a bloke, how about a fellow who has assigned to all upper states dangerous or discreditable beingness, and all lower states dangerous and discreditable beingness, and to his own state impossibility to be. What case state would he be in? Well, that happens to be the state of any case.

Now for instance, I can promise you very faithfully that if no program exists for the security of this planet, on which we could work with mutual cheerfulness, you'd find people very loath to advance their states of case or do anything or anything else. They'd just start – stay parked in an inertia. Because there's no desirable future, don't you see. This is why hope also works as the most rudimentary therapy. Now you're at the level of hope. You say, "All right, if we do steps one, two, three, four and five, and wind up with this state of society, on this planet, why, this would probably be a good thing." All right. And people look at this, and they say, "Well, yes, and that's feasible," and "Yes, this could be done," and "Mm-hmm, yeah, that would work." Actually it would take quite an idea. I'm boxing around now, such an idea exists, it's sitting on my desk, it's all written up, I just haven't released it for some weeks.

No, you'd have to promise to some degree that an advanced state of case would not then bring about further problems complicated by the political or sociological situation on this planet. You follow that? In other words, the person's case wouldn't advance, you see, if he didn't think that he could fit in to some framework of case advance. Right now you once in a

1 Editor's note: Robert Kennedy, American politician, 1925-1968. He was the brother of John

while find somebody with an advanced state of case and then he gets lonely, there's nobody to talk to, so he downgrades himself somehow or another so he has somebody to talk to. That's the way he explains it. That isn't the exact mechanism, it's the way he thinks of it. He's just advanced to a state of beingness that he considers precarious and dangerous. Unappreciated, he thinks.

Now if there's nothing to do with an advanced state of beingness, it's doubtful if people will try to attain it. So you've got on the one side, you've got the mechanics and technology of processing, and a case, and what's wrong with it, and what forms the ideas and so forth, and you have on the other side, "What's this future going to be like? Look at all the trouble I got into – in yesteryear as a free thetan." Now, is there anything can resolve that problem? Such planning and organization alone would bring about a case advance. In the absence of such planning or promise in the future or coordination in the future, you're not going to get as fast a case advance, you see? This is on the basis of beingness.

All right. Let us suppose I advanced to a state of being able to do this, that and the other thing, let us suppose I advanced to that state. That's all very well. But how will I fit into this thing, and how dangerous will it be? Well, you say, "Well, it won't be dangerous. All I have to do is crack a few heads together and make things snap and pop, and it'll all be well," and so forth. And a little alarm bell goes in the back of your head, and you turn on a little bit of a headache, and you wonder what – what was that?

Well that was the fact that the last time you did this, some other ingenious bloke dreamed up a new kind of theta trap. And somebody else dreamed up a new kind of an implant. And somebody else tried to reassert a mean. In other words, there are people who are on prevented beingness. You can test these people rather easily, just throw them any kind of a beingness, and they will not be it. You know, they'll not-is it. You say, "Well, it'd be a pretty good thing if we had a wise prime minister."

"Oh, I don't know, that would make the government more powerful," you see, just – almost a Helatrobus 1-2, 1-2, 1-2. You furnish the plus, he'll furnish the nix. [laughs] Now, there's certain ideas you could advance that you'd always find people negating them. You just take any of the common Helatrobus goals, and advance this as a good thing to do, and you'll have a lot of people go onto an automatic nix. Quite – quite amusing.

Similarly, you've got people who just negate beingness. Anything you wanted them to be or any beingness which was advanced, they would degrade. Because they know it's dangerous. And they might even think they were doing people a favor by doing this. No matter how it was rationalized.

What have we got here then? Well, we have the idea that if we cannot process and have success with a certain number of cases, we haven't got enough people to form any strata of a civilization. Well, it's perfectly all right to say, "Well, all right, you're making an officer cadre for an army, all right, and you only have to have that many, and the rest of them can be as they are and so forth," that's all very well. But the minute you say that, then you're presupposing that there's a future plan to take care of all this. In the absence of a future plan, of

F. Kennedy and his closest consultant and served from 1961-1964 as Attorney General.

course, then people would not know how they fit in to any part of this, and sometimes Scientists are very puzzled as to how he fits into Scientology, and how he fits in with all this organization and so forth. And I could give you quite a talk on that.

But, we've been, to a marked degree, organizationally marking time. Well, there exists right now a plan for what you would do with this planet in order to produce this kind of a condition on this planet, and so forth, and you'd see that was highly workable. You say, "That's fine, we take care of this planet, that's an afternoon's work, and we get that all straightened out, and we get that game running, and that's all fine, but that doesn't prevent the boys from the next planet coming over here, and suddenly going into a resurgence, and so forth. So all right, the second you advance out on this line at all, you advance into the organizational future. You inevitably advance into the organizational future. Because you've got to continue to solve the problem of beingness because we are in this universe.

So it's not just enough to solve the problem of beingness with regard to a case, and case level. If you don't want a derogation of case, then you've got to continue to solve the problem of beingness. And you've got to make it possible, one way or the other, for certain beingnesses to be safe out into the future. I don't – somebody will say, "Well, perhaps Ron's just making a pitch for – going to have a big organization and so forth, and..." I'm not, actually, because they're usually very hard to run. Right now we're just keeping things burning very, very well, Central Organization wise, and field auditor wise, and so forth, and we're not doing too badly, and we're keeping the sparks lit, and so on. And that form is all very excellent, but of course, that isn't the forward progress. That isn't the point of forward pressure. That is simply the nucleus points for the forward pressure. And we're just carefully preserving those units, and keeping them whizzing, and getting our own house in order, and then when it comes down to presenting any kind of a plan by which this planet is suddenly – be safe from atomic fission, and that sort of thing, we take off from our captured territory. Don't you see? We have occupied a spot. We do exist, in certain areas, then we can take off from these spots and straighten things out.

Now, when you think of the power of an OT, you'll see that there is nothing very much to straightening out these things. But unless you plan to straighten them out, you're not going to have any OTs. It'll be very rare indeed that you would get anybody who would break through to that strata of beingness again. Because he's already been punished down to the ground, man – for hitting that level, don't you see. Well, how could he maintain that level? Well, in the past, he's had a very blind spot, the OT has had a very blind spot. He's been not too bright. Because his own – concept of his own power was so great that he thought he could stand alone. And any time he went up against an organized body, he lost. Because it could furnish more viewpoints than he could. And that's the whole reason.

The individual can furnish only a limited number of viewpoints, to which he can pay attention and coordinate. As long as he's an individual. The individual usually loses to the organization, so you see communism advancing across the world today. It's the plurality of viewpoints. And that plurality of viewpoints makes it possible to confuse the singleness of viewpoint. It's a simple problem of confusion. You can always confuse the individual because there's an organized number of viewpoints which can voice different opinions and he can't quite isolate where these things are, and he's pulled down eventually. And I could say much

more on the subject, but all I wish to give you is some kind of a – of a relationship to these cases.

Now the individual, therefore, the individual OT, does have his problems. And that's because he is an individual. And that's because he has never worked on up the line. He's always – has this conviction that he could do it all himself. That's what's wrong with him. That's one of his biggest Achilles' heels. He could do it all himself, all by himself, and the funny part of it is, he could. He could actually stand off, and take this planet, and go *pow!* And that would be the end of the planet, man. He'd solved it. But let me tell you, the little boys with the airplanes always show up sometime in the future.

May not realize it, but about three hundred and, oh, maybe four hundred – I guess close to five hundred trillion years ago, there wasn't a sun burning in this universe. Do you want to know where these Magellanic clouds come from? You'll strike the period in your processing. Where do the Magellanic clouds come from? Huh? How – what's all this radioactive material that's floating around in space? How has that never been rounded up? Actually it's only been partially assembled – only partially. Universe was ended, absolutely ended – less than five hundred trillion years ago. Finished. What these scientists are doing these days with their carbon-atom deterioration, and I don't know what the devil they're computing. They're pretty wild, man. Matter doesn't go to pieces like that. There wasn't any universe. There was nothing but rubble. But the space was left. Didn't do anything to collapse the space. And that's where you get your planet builders. A lot of you have been planet builders. And a lot of thetans had to flex their muscles and get up there and put some suns together, and so forth. This is actual fact. The whole... everything had to be put back together again.

One of the reasons it all had to be put back together again is in spite of the destruction of this universe, the little men with the airplanes showed up. Where'd they come from? Who made them? Who was out there putting out theta traps, while everybody was trying to put the universe back together again? Where would the space ships come from? Where – what happened? Well, there's no telling what happened. But this has happened repeatedly in this universe. Repeatedly. Make it absolutely impossible for humanoids or doll bodies to exist, wipe out any base or platform of any kind whatsoever – this is making life safe for the OT, you see, [laughter] put this whole thing into some kind of a condition where an OT could be safe, and then one day there are a couple of airplanes with loudspeakers, tying him up in knots. Then one day he steps over toward this funny looking mountain that's floating in the sky, and there's a pole on it. And it goes *tssupp!* – and he says, "Damn, here we go again!" [laughter]

Well the blind spot is that this universe, having space, and being formed in this particular way, surrenders to cooperative action, and doesn't surrender to individual action. And that's the terrible lesson that's taught by the MEST universe. And the OT of yesteryear has never learned it.

Now, you're turning out a different breed of cat today, when he gets back up the line, you're turning out an experienced being. He hasn't learned from his experience that it's all too dangerous to be – which is what his experience has taught him previously – but he has learned now that no matter how powerful you are, you still have some blind spots. No matter how big

and tough you think you are, you can still get on a pole trap. And you've got technology that can straighten somebody out.

Now somebody that's gone around, clanking around in space, in the last few hundred trillion, with pieces and scraps of pole traps hanging to him, and that sort of thing, and no other thetan will have anything to do with him whatsoever, nobody would pull it off of him – see, tolerance of being an Operating Thetan has just deteriorated to nothing. So, what would you do today? Well, you'd say to the guy, "All right, do you remember the first moment that you saw that trap?" And after you run him through it a couple of times there'd be a dull clank and the piece of the trap that's there would go, you see. There's no trick pulling a thetan off a trap. But patching him up after he's been mixed up to this degree is difficult.

Well, that technology exists, but there's greater technology than this to exist. And that is, unless a fairly powerful, beefy being doesn't learn his own inadequacy, but learns that this is a universe of organization and coordination – unless he learns this lesson – he's just going to be back on the pole trap again. And any body of beings that is operating with a coordinated program, can beat him. The Department of Justice, in the United States, could probably beat him. You know, I mean, it's that corny. You've got a situation then where the individual is trying to operate in a universe of cooperation. And of course, that degrades the beingness of the individual, to that degree. And his beingness goes downhill. And the more he fights to be an individual, the less he cooperates, the less he's willing to cooperate, the more enforced is his cooperation, the more he fights against this sort of thing, and the less freedom he has. And the dwindling – that is a description of the dwindling spiral that an individual goes through.

So anybody who has drifted down this scale, has drifted down it on the basis of no confront. That's for sure, that's the mechanical fact. But the healingness of this is going down scale on the basis of discreditable or dangerous beingnesses discarded. He has a facsimile of having been an acrobat. And he knows it's damn dangerous to be an acrobat. His facsimile tells him so. People don't like acrobats. It's not a cooperative action. Nothing to it. He doesn't want to have anything to do with an acrobat. And it winds up that he didn't want to have anything to do with a facsimile of an acrobat. He didn't want anything to do with the beingness of an acrobat to such a degree, that with great surprise he's sitting in the auditing chair – with great surprise he suddenly looks at you, having answered an auditing question, and says, "You know, there's an awful lot of track here that has to do with stages. I never thought of myself as having anything to do with the theater. I think I must have been an acrobat," he'll eventually say. But that's the last thing he'll realize.

Usually in a facsimile, the hardest problem the pc has is trying to isolate is who's him, and what's he. What is he, now that he has located him, what is he? And it's usually the biggest lie in the facsimile. One thing that hangs it up. He's been running this thing through, you see, industriously, as the executioner. You know, he's happy, you know, to run off this overt. He doesn't plainly come out as the victim, he's the victim's wife. And he... they'll say – they finally get this straight, now, "Oh, that's what this is all about." The one thing that rattles around and gets him very upset, is what beingness is he, when? In what? You see, this is what gets him all tangled up. And that's because beingness is a deteriorated subject.

We have something in Scientology – it's dangerous not to be a Scientologist. That's the only honest statement that I could have been able to make for a very long time in this universe on the subject of beingness. You know, I mean, not honest, but factual, you know? That I know, it's very dangerous not to be a Scientologist. But the rest of the beingnesses are mostly a matter of opinion. And the coordination of beingness, and the coordination of beingnesses, and so forth, is one of the better solutions.

Oh, I can see the nearby planet with a Central Organization. The nearby planet, rehabilitation center functioning, but also politically and sociologically under control. You don't put it politically and sociologically under control and if those solutions are not good solutions, once more you've rendered an unsafe-beingness situation. The problem has to continue to be solved. It isn't enough just to audit somebody up and say, "Okay, you're flying." And you wonder why three days later he's back not flying. Well, he found out it was unsafe to be a Clear, he – a thetan exterior – this is one of the lessons they learn consistently. It's not safe to be a Theta Clear. This is not safe.

You go and you park your car and you're wandering off someplace looking at the tops of buildings. And there you are driving your car down there, you see, in a body, and you park your car at the stoplight, and you happen to get interested in this building that you're next to. You know, you're looking at the roof and a girl's sunbathing on it or something, and you get very interested at this point, and you forget to move the car on. You not only forget to move the car on – this is an actual incident – but go follow the girls off. Get dreaming about something, you know, and wander off, and get very interested, and say isn't it nice to be free, and that sort of thing. And then three days later have the embarrassment of coming back and picking up the body in a hospital where it's been dragged because it's in a coma. And of course it's got traffic tickets plastered all over it. [laughter] And doctor's bills. Well that'll teach you. And actually the case came downscale again, you see, to being humanoid, so forth. You couldn't have gotten him out of his head with a crowbar.

You understand why?

Well, there wasn't any conditions arranged by which he could be a Theta Clear. See, he was just going at it in a very haphazard fashion. Well, it's very doubtful if you'll ever be skyscraper-tall again, unless there was some guarantee to you that that beingness will not immediately turn around and wind you up in the soup. See what I mean?

This, by the way, is all allowed for in processing, and I've been working on it for some time. You say, "I'm processing people in order to do this," actually you've got it backwards. If you process people you have to do this, see. So anybody who wants to be the Association Secretary of the nearest planet to Arcturus, apply here. How about – how about somebody who's plowing around, and he gets on a trap, something like that, with a *bingo-bango*. Who's ever going to pull him out? What's he going to do, stay there for the next hundred billennia – hundred billion years? Hundred thousand years, something like that? Or is somebody going to look him up, and say, "Hey! Where's Joe? Haven't had any reports. Where's Joe? Hmm! Bill, you better go find out where the hell's Joe." You see what I mean?

Then of course, there'd be no point in having this unless they had purpose to function, and of course, your purpose is quite fundamental. You've probably had lost crews and won-

dered where this and that went, and that sort of thing, you had undoubted interest in locating that, you've got an expanding game. Unless the game itself is not an expanding game, then processing cannot produce a stability.

Now, the individual who has gone down the Reality Scale all the way through the bottom, he's gone down through the Scale of Beingness, and to get him to be anything at the bottom is impossible – except an unaware being. He goes into a coma. See, he takes no responsibility for any beingness of any kind whatsoever. You've got a dropping beingness all the way down. Now, to move him up the line, he'd have to have some security in being able to be something at an upper level. So your future livingness, always, to some degree, ties in to the rise up the scale. Always to some degree. And the problems that you run into in processing will very often hinge on this interesting thing. That there is no future beingness.

Now, this all resolves itself in processing, and people can think more flexibly along in this line. But the actual fact is that the problem stays unique and isolated outside the field of the time track. Because it has existed. This is the way this universe is. So that's the way the problem has existed, so therefore, you have to do something about the problem. But as cases go down the scale, further and further from reality, they're going further and further from responsibility. Why the further and further from responsibility? Well, you don't dare be responsible for anything because you get in the soup. And it's this continuous repetition of this lesson, and this lesson only, that puts the individual gradually down that scale in livingness. He doesn't want to remember what he's been, he doesn't want to have anything to do with any part of his own past, and so forth. And yet the hideous part of it is that this scale just keeps on going south. Because there are deeper and deeper channels of unawareness. But a thetan cannot become totally, always, unaware. If he could achieve that, he probably would have some time since.

What to be? To be an A or to be a B? That is the question. Can't be an A, can't be a B. There aren't any other things to be. Answer? Anaten.

This is the anatomy of life, and its coordination with case levels, and livingness, and you'll see this sort of thing show up in nearly every case you have anything to do with. Well, in any case you have anything to do with, I said nearly because some cases are insufficiently aware to answer any question to inform you of anything. It's very fascinating what you can do in simply using the technology of secure beingnesses. Using that alone, as a weapon, you can sometimes bring about sanity.

Marital counseling, which we don't do particularly, but we – you always run into some section of this, is simply a husband who cannot be a husband; a wife who cannot be a wife. A wife who will not let a husband be a husband and a husband who will not let a wife be a wife. The average marriage. [laughs] You say therefore marriage is very unhappy. No, marriage is not unhappy, marriage is a difficult beingness. That's all that you could say about it. But you could use beingness processing, oddly enough, to handle it all, providing you introduced bypassed charge. All you'd have to do, is the bypassed charge of the marital partner that causes jealousy, is the bypassed charge in the other person. Not knowing about the other person's past – not knowing about the other person's past adequately brings about bypassed charge on the part of the individual who doesn't know. It's a very funny manifestation. It's bypassed

charge in the other person, don't you see. He gets upset about the fact that that charge is – threatens him to some degree, but he doesn't know what it is. And so you get a criss-cross of bypassed charge. And by that analysis, because we are not bypassing the other fellow's charge, not only the probability, but the certainty exists, that Scientologists will be the first people who can ever be friends with each other in this universe. Because time alone will add up bypassed charge to people who know nothing about the time track or anything else.

So the whole problem of beingness, and the whole problem of case state, all ties up with the problem of hope; all ties up with the problem of expectations; ties up with the problems of confront and all of these various things. And you're looking here on this scale of cases at a crossroads of everything we know as far as processing is concerned. If we want to add up all of these things that we know, and address these various levels, why, we raise the person's scale up the line, increase his confrontability up the line, and raise his level, and we eventually get up to a point where we can run engrams on him. And when we can run engrams on him we can take him all the way. What we lacked were positive techniques applied very directly which graduated the person up to the ability to run engrams.

We had the technology, but hadn't applied it in the exact order, because we didn't know quite what we were applying it to the exact end of since none of these lower technologies will clear. Only engram running will do that. You take the tremendous barrier of the Helatrobis Implants – bars out the whole track. Wildest Confusion anybody has ever walked into. It's all backwards, upside-down, has no beginning and end, and ties up time and rides forward to present time as a result. All right. Why do you have to do anything about it? Not because of the person's conduct, but because it louses up his time track and debars the easy route to running engrams.

Final thing that you're trying to do is run engrams. Why are you trying to run engrams? Reaccustom the individual to various levels of beingness. And after you've got all the engrams run out, you got an OT. And then you've got to have an organization to handle the problems between the OT and this universe. Otherwise he will just slop again.

Okay? Thank you.

SUMMARY OF MODERN AUDITING

A lecture given on 19 June 1963

All right.

This is what?

Audience: Nineteenth of June.

Nineteenth June, 1963. Thank you for putting me on the time track. I'd gotten off of it. Good thing, too. Saint Hill Special Briefing Course. I haven't anything much to talk to you about except modern techniques. And I think I'd better give you a summary of modern auditing as it looks. Might be valuable to you.

There are innumerable processes. There have been processes of all different shapes and kinds up and down the last twenty-five years, and recorded during that period, why, is more or less the work of about fourteen of these years. And these processes fall into very specific categories, of which you have a record in your State of Case Scale. Now, the categories they fall into, however, are processes that handle certain conditions, or... of a case. And if we look this over very carefully, we'll see that cases deteriorate as they go on down along the time track. And they deteriorate against two factors, and the primary factor that they deteriorate against is confront. And the other factor is duplication.

As they become unwilling to confront they become less capable of duplication. Now you should look on confront as a willingness, and duplication as an ability. Now, it doesn't matter that you run "What are you willing to duplicate" or "unwilling to duplicate" – it doesn't matter that you use that in a process too much, but it is not – it's not exactly right. It's not quite right. It's something like the officer of the change of the guards at Buckingham Palace wearing his sword on the wrong side, really. If you were to ask somebody, "What are you able to duplicate?" and, "What do you feel you are unable to duplicate?" you would have a very exact sort of process. And remembering our process rules, and the famous brackets, and so forth, to keep it from damming up a flow, why, you have to get the other fellow in there at least. You know, "What would another – what would – what would you be willing..." – you see, there are a lot of combinations to it, "What would you be – what do you believe another is able to duplicate?" don't you see, and, "is unable to duplicate?" That's your second leg, you see.

Of course you can add up these legs, ad infinitum. And the reason why these legs get added up ad infinitum is the degree of complexity necessary to undercut the case. That's the

purpose of legs. Some case could run practically all the way – he'd have to be a very high-scale case – he'd practically run all the way on a – just one leg, you see. Well, that would be a case not troubled too much by flows. And another case, well you run just what is he unable, and what does he believe another is unable, you see. All right, that's all right. That's fine. Because you've got two-way flows with both viewed from the same viewpoint. Now, what does another believe he is unable to duplicate? Now, that's the other flow from another viewpoint. You get the idea? And the whole thing about flows is how much do you need them, for this particular case, you see. And flows are interesting at this point, because you could always doctor up the flows of a situation, get TA action, when you might not otherwise have it. See, that's quite important.

There... you see, TA action is not totally outside the auditor's control, if he remembers flows and brackets. See, all he has to do is study up on brackets, and you add enough brackets to get TA action, that's the way you handle brackets. And it actually... you see, there is no perfect method of running brackets. There is no absolutely perfect method. If you ran all of the available flows, do you realize that any given instant on this planet alone, there are two-and-a-half billion, or maybe it's three-and-a-half billion today – it was two-and-a-half billion yesterday, the population explosion – there are two-and-a-half billion other viewpoints simultaneously operating at that exact instant.

So that would make something on the order of two-and-a-half billion legs. Plus all the legs which take care of all the intermediate groups and dynamics present at that particular moment, you see. And it just becomes completely ridiculous. I'm giving you an idea that you can become very ridiculous in the numbers of legs that you use in a process.

Now, the idea of flows is something that monitors all case levels, and for some peculiar reason breaks its back at about level 4. In other words, you can get as complicated or as simple as you like above level 4, but below level 4 it goes in harmonics – so that you get down to the person who is almost – almost at the bottom, and you only have one viewpoint, which is self. You see, so it becomes impossible for this person who is well downscale to run more than one viewpoint. You see, even though it's vitally necessary that he run two, he can only run one.

Now, this is a problem of the dynamics at work, in actual fact. It's how many dynamics can a person function on. Now that however... and this I'm trying to give you a look at here, it sounds rather complicated to you – that there are many facets of processing wherein you could match up to an ideal. You could match up to an ideal. What is the ideal process or the perfect process, you see. The one that absolutely matches every single condition extant on a case, you see. Well, I'm trying to make this point with these brackets and legs, you see. The absolute ideal, totally perfect process from the standpoint of... see, I defined "science" today. What was that? Science is a – modern science is a method of precisely determining overwhelming nonsense. [laughter, laughs]

Well, the point I'm trying to make here is that you could go ahead mathematically, you see, and you could figure out some of the wildest combinations that would be absolutely vital to a process. And see, there's two-and-a-half billion people on Earth, so that in any given instant, to run the pc, why, you have to have the viewpoint of each one of these people taken

into account, one way or the other. And then there are various other factors such as their cases, so their case viewpoints and modifications thereof would have to be taken into effect. And what we are trying to do, we completely lose sight of. We're trying to cure the pc's burned finger.

So you have this thing called the ideal and you have this other thing called the workable. Now the workability of a process is what determines its complexity. How complex or uncomplex does it have to be to be workable? And that's how you determine what process to use, that's how you determine how many legs there should be in running out brackets and so forth. In other words, how many do you have to have for it to work?

Now, that factor goes on in to the number of processes you have. Now, there could probably be an infinite number of processes. And sometimes I feel that I have developed an infinite number of processes and you in studying bulletins undoubtedly feel sometimes that you've had to study an infinite number. Well, let me assure you that many more types of processing have been dropped, by a factor of thousands times, of oh, thousands of times more processes have been dropped and discarded than have been retained. Why? They are pretty, but do they work? You see, that's the criterion. They're pretty, but do they work?

All right, so that limits then the number of processes which have survived. And the number of processes which have survived are those processes which have not just workability, but which have very broad workability. And now we come up against this factor: that there are types of cases. Cases aren't GI issue X case, see. It's not always an issue case. So we have to determine the common denominators present in all cases. See, what are the common denominators present in all cases? Well, they happen to be ARC, they oddly enough are the mid-rud buttons, and certain types of incidents common to everyone's time track. Which is to say, the general history of all cases is quite similar.

The reaction of the case, though, to this history, is quite different, because the combinations of history make differences of cases. And when we study differences of cases, we again could get out into the most overpowering library of textbooks you ever heard of. We could have Kraepelin's chart, multiplied by five or six thousand – you know, everybody thinks that's a phoney gag of mine, but you know, it isn't, you know, that chart really exists and it's really called that, and... [laughter, laughs] But this vast number of cases. He had a vast number, and they took it over to America and they added a vaster number. And this became one of the – one of the finest lists of gobbledygook anybody ever had anything to do with. It's totally meaningless. Because they got up – they were getting up to two idiocies. Either there was one case that was supposed to represent a – one case type, that included all cases, see, that's one type of idiocy. You know, everybody is a schizophrenic, you see. That's the way they establish cases these days, is what institute he was sent to. That's actually what they use for case classification. And if he went to Walnut Lodge and they treat schizophrenics, then the guy's a schizophrenic, you see. Simple. This... so that everybody is a schizophrenic. Or, there is a case type for every case. See, these are two idiocies. One case type for every case. There's five thousand patients, so there's five thousand case types in one institution, see.

Well, this type of approach to the problem is completely unreal, because it's not workable – it's not useful. An auditor has no use for it at all. You might as well say, "My pc's name is Betty, so therefore I am auditing a Betty case type." Well, funny part of it is, it has some truth. See? There is no other case that is exactly like this case. But there are other denominators. There are other denominators which are similar. This case has in common certain things with every other case.

Now, you can divide case types up, but again, just for use. You can divide case types up into a few case types. But what is the meaning of this? It would simply be for the purpose of matching them up to processes. That would be the only reason you would get different types of cases today. So you can match them up to the processes. Well, a great deal more work could be done on this than has been done, even. But we would get again probably an excess of what we needed. We'd be getting too complex for what we were trying to do.

So you can go in two directions and err in two directions in trying to classify types of processes. You can get so many case types that nobody under the sun would ever be able to use that scale or chart in handling any case. And the other one is to have one case type without any variation whatsoever.

Now, the first way would lose quite a few cases, because you couldn't find their case type on it, or something. You see, it was not quite a Beta, and was really not an Alpha, so it's a Beta-sub-Alpha case type, but there is no process which has been aligned for this particular type, because it doesn't belong on the chart, or something, and nobody would get processed, you see. And on the other side of the picture, we just sit somebody down, and we say, thud! "This is what you are going to run," and every so often the auditor has a horrendous loss. Because he's got a case type that just doesn't quite fit that process. It's a little bit too grossly out. We can't fit this case type into that exact process. But we have to do something else.

So what we need is a finite number of case types, based on behavior in an auditing session, not behavior in life. See, make it quite real. And then match up processes which do handle and raise the case up that scale. And that is what is needful here, for our purposes.

Now, you can't expect auditors to memorize and perform more than a few auditing types perfectly. If you expect them to, you get a slop over, quite rapidly, whereby they mix auditing types and styles and it gets to be pretty much hash. So you try to keep these things separate. Not because of the limitations of the auditor, but it takes quite a little while to get experienced and grooved in on a type of auditing. Takes quite a little while to do this.

Now, probably repetitive command auditing is so familiar to you that you don't look on it as something that is very difficult to handle. It's pretty easy. There it is and that's all there is to it. Ah, do you remember the first day you ever started to do a repetitive process on somebody? Well, the reason why you look on that easy is you're so familiar with it. For instance, it bears no great qualms to the vast majority of auditors to sit there and give the same auditing command over and over and over and simply acknowledge it, on and on. They look on that as very easy auditing. That's a long sleep. And that's all there is to it, is bang, bang, bang, bang, bang, bang, bang, you see.

So this particular thing is that it is a lesson in common to all types. You have learned it, so you don't regard it with any great horror. Now the CCHs – you take somebody who has

never done the CCHs, and you give him CCH 1, 2, 3, 4. And they can get further afield with this than you could easily imagine. In fact the whole of auditors have gotten completely afield. Over a period of years, it had gradually drifted down to a grind, and there was no such thing as a flat point in the CCH, you see, and regardless of whether the fellow was doing an auditing command or not, you just kept on running the auditing command, don't you see? Actually, repetitive processes has slopped over into the CCHs. When did you end these CCHs? Well, it's much more important to end the CCH properly than a repetitive command properly.

Now, the CCHs have also the frailty of auditing people who are lower on the Tone Scale, that is those who are really going to require nothing but CCHs, something like that. These people are lower on the Effect Scale and therefore are much more easily boxed about than... you know, knocked about. Bad auditing has a much worse effect on them, than it has on somebody else who is upscale. So therefore, it's a type of process which at once looks brutal on cases that react brutally, but is a kid-glove type of process. Well, by the time you've absorbed all these factors and time you've gotten used to all this and time that you can successfully and adequately run the CCHs, why, you've learned quite a bit!

I remember I had to study very hard to learn how to run the CCHs. And I eventually got quite good at it, and went ahead and became quite comfortable running the CCHs. And after a period of about five years – I hadn't done any CCHs – I uncorked the original CCHs as they were done, and as they were getting case results here at Saint Hill, and put on a television demonstration with regard to it and everybody thought that I was running something else, and they had never heard of these CCHs. Vast revelation to me. That they weren't getting results with the CCHs, they were overlooking. But these were the original CCHs. And they were quite calm, and quite delicate, and everybody had gone into the effort band, you know? Boom! You know, and you *grind* it out, you know, and that sort of thing.

Well, these things can slip. These things can slip. Well, how many – how many types of auditing do you care to keep in line? Let's say you're an Instructor, D of T, or something like that, in some district area – how many – how many types of processing do you think you can keep in line? Keep policed and keep well done, if principal types go out? In other words, it's a small number. It's a small number. And by the time you got one of these things all boxed up and written up and delivered and being done, every now and then you have to unpeel the thing and get it reviewed, because it shifted and is no longer producing results. It's variation which knocks out process types.

We stopped accumulating process types when I learned that. People shifting from the original type of process would then apparently bring about a need for a new process type. And that has plagued you more than you'd believe. Because all I would see, that auditors were no longer getting results with the CCHs and I would tend to drop them. But then I got very, very eager beaver on this, and I went into it, because of this experience here at Saint Hill, and I found out that a process type shifts very badly and it shifts out of workability over a period of years. So it has to be put back in again. And you'll find out you don't need a new process, you need the original process type, again. Refurbished. Polish up the old teapot, and get cracking, and you're making tea again, see. Tends to go to pieces.

Now that, by the way, is more of a limiting factor than you would believe. The – how to keep processes in line, how to keep them working, and so forth. It's an important factor. You say, "Well, they used to say that they got results with this process, but we don't see any results in it now. It's called Duplication Processing. Don't see any results with this processing these days. Well, get clever! And go dig up a bulletin from the year zud, see. And you'll find out that the auditing command is not as it is modernly – you'll find out the auditing command is modernly – is, "Duplicate nothing. Thank you. Duplicate nothing. Thank you. Duplicate nothing." You'll find out that wasn't the original auditing command. And as an auditing form, you don't always interrupt the pc when the pc answers the question. The thing is to get the pc to answer the question, not to prevent the pc from answering the question. These little variations will creep in. You mark my words, man!

Now, I don't mean to be sarcastic. You'd be surprised, how technology can vary over a period of years. For instance, we haven't a clue what Buddhism was all about. We really don't have a clue! There might have been some very good processing in there, you know? And just now, I'm almost certain that the planet builders, a couple, three hundred trillion years ago, had some technology. They must have had some mental technology of some kind or another, see. And one of these days when I've got some time casewise, I'm going to get run over that area very carefully, so I can winnow out any technology they might have had, in its original state. And it might have been the planet builders – if they had technology – went downhill, only because the technology got varied out of existence.

So in other words, process types are then also limited by how many you can keep in line, see. So therefore, the simpler process types tend to survive better than the more complicated process types. Now, but even the simpler ones will drift out of line.

So that's a class of processes – the CCHs. The CCHs are sufficiently marvelous that old 8-C was elected as the best case booster by the field auditors in the United States, on a query by me in 1958. It won hands down over anything under the sun. I don't even know how they were doing it today. But it must have been fairly correct, because it was only about a – it was only a few years from its inception. Must have been fairly correctly run during those days.

Well, there's a case type. What is this – what is this case type? Well, it's this case type where you get a duplication going with another person, and a duplicative physical order followed by another person. Another person has a great deal to do with this. You're following the instructions from another person and you're directing your attention at the physical universe and so forth, and this is all quite important to it.

Funny part of it is that as you drop one level, you tend to drop that out. And you get the reach and withdraw processes. Now these are still duplicative processes. These are still following the orders of a person. But you should look on those as limitation. That's a limitation of the process. That is no longer a benefit of the process. The process works on the lowest-level cases in spite of these things.

Now, there's a whole band of processes, which are so simple and so idiotic that everybody would tend to overlook those processes entirely. And here's another reason. Nobody could possibly see that the process would have very much use. So the process dies. And with

it dies the lowest-level cases that you attack, and so you get loses. You need that process. So here's another way a process can go out – is because it is seldom used. Seldom used. Actually, it's the only known way to process a cat or a monkey – and you'd be surprised what happened to Don Breeding's dog one day, when he started to run a sort of a reach and withdraw. He was trying to run 8-C, which was too high upscale, and the dog passed out. That's right, the dog passed out! It was too high upscale. What he needed was the reach and withdraw processes. And you can do remarkable things with the reach and withdraw processes. It's probable that you would not really carry one forward far enough to flatten it. Because it's – another thing is the process works so slowly, even though it works positively, that it tends to be neglected.

Now, I think you could probably get a cat to talk with the reach and withdraw band of processes. I mean it. I mean it. I think you could get a cat to talk. But how would you go about processing a cat, you see? Well, the same way you tend to process children. Sloppily, hunt and punch, no regular sessions, not treating it with the dignity that auditing demands. Don't you see?

You know, a lot of Scientologists' kids are going to be practically unprocessable in a few more years, if people keep hunting and punching processing on them, you know. Grabbing them off as they pass by, and running an assist, don't you see, and never flattening the auditing command and so forth. I'm surprised, every once in a while, one of my kids will yelp when I say I'm going to give them an assist, you know. They yelp! They're usually very pleased, but once in a while I will propose something like this, and I'll get a protest. And I don't know, something's going on, has something to do with it. And they just don't happen to want anything to do with this thing called processing just now. Well, what is it? It's some hunt and punch processing they've had without the dignity of an auditing session or anything like that and that's practically all they get. Well, that's all a cat would get either. See, you wouldn't say to the cat, "All right, all right with you if I begin this session now?" [laughter] "Any goals you'd like to set for this session?" [laughter]

And yet in actual fact you'd have to put the session in some kind of a frame, and you'd be surprised, after you gave the cat about four or five sessions that the cat would know the frame, see. "Start of session," "End of session," you know. They know during that period between those two commands they were supposed to stand there and do whatever you were saying.

Another thing is the idea of power of choice, overwhelming power of choice and that sort of thing. Probably be mishandled. Cat starts to walk off and you say to hell with that, you know, and you herd him back into session again. But in actual fact, if you observed – if you observed these very straightforward rules of auditing, that a session had to have a frame, had to begin and had to end, and if you weren't trying to overwhelm the pc and so forth, and if you were willing to give the cat as much time as you would give a human being – give the cat a fifty-hour intensive, don't you see. [laughter] It's very hard to do, because the attention span of the cat's probably ten minutes. Have to be fifty hours' worth of ten-minute sessions, don't you see? Wow! And then remember that that cat, as a cat, is going to come up Tone Scale. That's another thing that auditors neglect. Oddly enough, a properly processed cat will not claw up his auditor. He just starts clawing up everybody else. [laughter]

So you get – you get a situation here, what will reach and withdraw processes do? Well, actually, you don't know and I don't know. Our experience with them is something like: Joe has been sick for a long time. So we take his hand, and we say, "Touch the pillow," and "Touch the pillow," and say, "Thank you." And we say, "Touch the sheet," and he touches the sheet, and we say "Thank you." You know, we take his hand and make him touch the sheet. And we do between two objects here, back and forth and around, make him touch various things, more randomly than that probably. That is to say, "Touch your forehead. Touch the sheet. Touch the pillow. Touch the shoe" (that you put up on the edge of the bed or something). And the end product of it is, is his eyelids flutter, and he comes to. And then we decide we'd better give him some processing.

So we have another source of the disappearance of processes, which you can put under the head of "disrespect." We don't respect the process and so it tends to vanish from ken. See, it's a process which we use diffidently, in certain ways. Actually, old ARC processing disappeared on that route.

Now – so we really don't know what the reach and withdraw band amounts to because we have almost never carried through a reach and withdraw process. When you were doing Book and Bottle – which is a reach and withdraw process with duplication, it's a band process; it hangs right between Reach and Withdraw and the CCHs. When you were doing that, did you ever flatten it? I almost have no Scientologist I've ever run into, has ever flattened this. They say they've done eight hours of it or ten hours of it or eighteen hours of it or twenty-five hours of it, and I've heard thirty hours of it being done or something of this nature. But I never heard of it being flattened.

And yet, do you know that nearly everybody exteriorizes under that process when it's run over about ten hours? That's something to think about. Now, have any of you ever had the sudden illusion that you forgot to raise your arm from the side in touching the book, but put your theta beam arm up, or wondered what was happening here? You got a confusion between your body and any, quote – excuse me for using the word – "astral body?" Now, what – what's this all about? Looks to me like that's neglected sphere of processing – not respected. It's to make an auditor capable of doing a repetitive process, and that's what we believe it is.

There are enormous numbers of processes in that particular band. Lots of them. One of the most fruitful bands of processing there is, is reach and withdraw. Practically unexplored. And some respectable percentage of the cases which you try to push all the way up are not going to move until they're run on Reach and Withdraw. They won't move on the CCHs. Isn't that an interesting datum?

Now, as I've been winnowing out processes, then, I have come to the conclusion that we have the processes which undercut all cases, which you can lay your hands on, but as we have moved down the lower lines, because we are always pressuring at the top, we kept forgetting the bloke who was at the bottom. And through disrespect of the process, because of its limited use, had not much cared to develop it. All of this is very vital in a summary of modern processing, is to realize why processes disappear. And what processes are all about. Rather than process A, B, and C have survived, period.

You've got ahead of you times when you will practically be in tears over a case. For some reason or other the case has done an off the top of the springboard down to the bottom of the State of Case Scale, for some reason. They've had a catastrophe or something occur in their lives, the problems are too great for them or something has happened, and you just... tone arm action ceases, case stops moving. You say, "All right, we're going to get problems straight. This case obviously has got problems, you know – the case has problems. After all, anybody who marries three wives and so forth and burgles the banks is liable to have problems. So all right now, let's just cut right into this and let's get rid of these problems; we'll be able to get on with our engram running where we were before," – cheerily, cheerily.

Ah! You've overlooked something. Problems belong at repetitive processes. And the bottom of repetitive processes are at case level – at case level 6. That's the absolute bottom of repetitive processes. And this case of yours has done a temporary surge, you see, that your auditing (not your case but your auditing) has done a temporary surge, or a temporary collapse and is sitting squarely at 8. You can't run problems on the case. Yes, it's true that the case has problems. But the case does not respond to running problems.

So our next division in processing is what the auditor knows is wrong with the case and what can be done with the case. And these are entirely different things. So your common denominator of all cases is very well to know in theory, but paralleling this, is what can be done with these cases. What can be done with them.

Yeah, all right, so you say we got a thetan here, and he's got – he's in a body, and he's got a time track, which has got lots of engrams on it. It's got the Helatrobis Implants on it, and goals of that particular character, and it's got – and he's got certain types of things that he's refusing to duplicate, and we've got all these things. His ARC is low, he's been ARC broken. We can say all these things. Yes, that's what's wrong with the case. Yeah, absolutely right, there's nothing wrong with anything we have said. But let's get over to the other side of the thing. What can we do about it? So we get over into the category of what I'm referring to as modern processes.

Modern processes have nothing to do with what is wrong with the case. Unlike therapeutic or curative procedures or something like that, you have nothing to do with these things. They're sort of hand in glove ingrained, because of the Aesculapean school and other schools of medicine as they come up the line, you see. The case has lumbosis. Therefore we give him some trumbosis powder, see. See? See, that is a level of thinking. That is a certain thinkingness and it's a very, very easy method of thinking, it's very comfortable, it's very lazy and very ineffective. We're not in the business of curing things. But we nevertheless tend to, because thinkingness tends to go along the line of "what is wrong with a case has to be righted." And that's not true in Scientology.

You see how idiotic it is – you say, "This case keeps saying 'Vomica, nix vomica. Vomica, nix vomica.' That's all the case says." We say, "Very good, stuck in the Helatrobis Implants. Good. He's got a goal 'to vomica.'" [laughter] Well now, let me assure you of something: If this case is dramatizing something, that something is not real to the case. And you can put that down as one of the guiding rules of running processes. Yes, sir! If the case is dramatizing something, it's not real to the case. And right away, he's got lumbosis, so we give

him some antilumbosis powder, instantly folds up. You've got to bypass that type of thinking-ness entirely. The only observation you have to do of a case is, does it respond to the process which is being run on the case? You can put that down, that's the other guiding rule. Very simple. Does it respond to the process that is being run on the case? That is everything there is to it. Does it respond to the process that's being run on the case?

What do we mean by respond? Well, we're getting tone arm action. Now there can be one thing wrong with this thing called tone arm action. Tone arm action can cease because session rudiments aren't in. Very definitely. Tone arm action can cease because session rudiments are out, so therefore we have to assume in auditing that something like session rudiments are in, or that we run a process which undercuts session rudiments, such as the Reach and Withdraw or CCHs. And to some slight degree Sec Checking undercuts session rudiments. And also: are flows getting out of line?

Now let me give you an example. The Helatrobis Implants, and most of the engrams you dig up are motivators. I don't care how else you look at it, they are motivators. There are some overts running down the line, the nasty things you think or the pc thinks while he's running these motivators. But they are motivators.

TA action will probably cease, sooner or later, on the case. Oh, you run out six or eight goals and you run out fifteen, twenty engrams, and you all of a sudden are looking at no TA action. Where's the TA action gone? It was there, the case was getting TA action on this type of processing, so this really applies to *ceased* TA action – those processes on whom, on which, TA action had been observed. This only then applies to processes on which TA action has been observed.

If TA action has been observed on a process, then TA action will cease only for three reasons: The session rudiments are out, the rule of flows (under which we include the overt-motivator sequence) and the situation is not in accord with the case's forward progress. The case has not got – has not any ability to move on forward because the process is flat. So they're just your three conditions there: Session rudiments are out, flows (under which we include also overt-motivator) has been upset, or the process is flat. And it's for one of these reasons TA actions ceases, but that's for TA action which has existed – TA action has existed.

Now, you can recover TA action on something that has had TA action one way or the other, unless – by remedying one and two of what I just gave you, or the third one is true – process is flat. Now all this is very well, but when you're taking a case apart, putting it back together again, if your goal is to cure a malady – if you're idiotic enough to use Scientology to cure somebody of something – you are going to have probably the easiest run of it you ever heard of. Modern processes result in dropping somatics and that sort of thing with great rapidity. You're running a fellow over his head, he'll have a new sickness every day. A new set of somatics, if they were to be medically adjudicated and diagnosed, would wind up in some of the most horrendous Latinizing you ever heard of. Teeth hurt one day and his skull hurts the next day and he's got spears in his stomach the day after and his bones feel like they're falling apart and terrible exhaustion exceeds the next day. Well of course, for each one of these things – under terrible exhaustion, well he's obviously short of iron. And you get more mel-

ody... maladies than you could easily keep catalog of, just in the line of processing; if you processed somebody very badly over his head, these maladies would be quite acute.

This is not important then. Health has nothing to do with the situation, if you mean by health "care of the body, care of the body," and that's just a bunch of balderdash. The only thing we're interested in – the only thing we're interested in is the continuing forward progress of the case. Is the case more and more capable? And if you want to look at the reduction, and not worry about what – not worry about the capabilities of OTs or anything else, but just look at it – well, is he more and more capable of being audited? That's the shortest look. That's a very unreal look, but it's, you know, more and more capable of being audited.

If you just count case advance on the fact the case is easier and easier to audit, why you'll have it. Because why? Well, that means the case is more and more responsive to exterior orders, which is one of the things he's most allergic to. The case is more and more capable of viewing his track and pictures. The case is getting into less and less trouble; the case is more and more capable of locating bypassed charge. All of these various capabilities show up in auditing sessions. So if you wanted a good yardstick that didn't strain your brains any on case advance, well, it's just – is the case more capable of being audited? I mean, that is not your end view, but it's certainly a good yardstick for the auditor. Because if the case became more and more capable of being audited, and responded better and better and better to auditing and was easier and easier and easier to audit, you'd find out they're making faster and faster changes per session and you're getting more and more and more done per session, you're having less and less and less trouble and that's a good index.

And one of the ways of looking at it, on a case that's on a long haul... Auditors get very dull to the progress of the case by the way. They do. This is one of the short-sightedness of auditors and one of the things that monitors processes and so forth. You can't ever believe an auditor that a process isn't working. It's not that he's being villainous or anything of the sort. But he's looking at a slow gradient and it's just he's there, he's auditing, and the gradient is a slow gradient.

I'll give you a trick for this. This is – it's – there's nothing wrong with an auditor, I'm not being critical of auditors at all. It's just something I've noticed as a frailty that auditors have. They don't notice that a case is winning and gaining. And they sometimes get impatient and want to do something more heroic or something of the sort. They get to pushing and shoving. And the case is already going along just gorgeously. I have a basic rule, by the way, I never change anything on a case's auditing unless the pc squawks. I find out I always squawk before the pc does. I always get more impatient than the pc does.

So I'll just give you – just a short one, to counter this particular fault in other auditors, or in yourself. How was this case a month ago? See? And you can just say that in a snide tone of voice and if a guy says, "Well, I – well, you look at it like that, he couldn't get up the front steps." Something like this. They remember that this case used to have fifteen ARC breaks per session, now only has one or sometimes goes a whole session with none. See, case gains. That's case gains in the direction of auditing. And by the way, that shortcuts a lot of very fancy mental tests and case tests and all that sort of thing. It just puts a complete shortcut on the lot. Case auditing better? All right. There it is.

So much so that regardless of any other rule of auditing, if a case is proceeding satisfactorily and is very interested in what he's doing, I won't disturb the case. I won't do anything else. See, case is happy, so on. And the only objection I'll have to this is sometimes I see a process, particularly a newly started process, and it hasn't produced any result for a whole session and so forth and the pc seems to be happy with it, I come off of it. Or, the pc got some tone arm action on a process and ran it quite successfully for a session, that in the very next session, in spite of session ruds, nothing – I can't get that process to produce tone arm action again. The pc is fairly happy with the process, but I'm not.

But that, of course, is actions that you take in establishing processes. How long does it take to establish a process? Well, that's quite interesting. That's an interesting question. How long is a piece of string?. Sometimes you won't establish the pc's level of processes for several sessions. You keep hunting and punching around on a case and all of a sudden, why, the case starts winning, you get TA action, everything is running. You sit down for the long haul. And you wait for that condition to cease to be ideal before you do anything else. Just keep on with it. Actually, don't even pay too much attention to tone arm action. So it's – so for a series of five sessions the tone arm action's been minimal. It was good, it was good for quite a while, and then now it's minimal for that many sessions and so forth.

I wouldn't do anything desperate with the case, I wouldn't start tearing the case to pieces because he wasn't getting tone arm action. I wouldn't pull a case off a single engram, for instance. Let me show you the *reductio ad absurdum*. Pc doesn't get tone arm action in the last half of the engram. Well, so – you better not let him run that chain any more. See. That would be the most absurd type of thing, you see, that you could do. Pc got two divisions of tone arm action, during the first half of the engram, but didn't get any tone arm action during the last half of the engram, so it must be the wrong engram. See, it could become idiotic with this, you see – TA action.

How long should you sit around and suffer with no TA action? Well, it's an interesting question. Depends on the level of pc, depends on what you're auditing and everything of the sort. But if the pc is happy and you're running a fairly high-level process on the pc and you're getting no tone arm action, the worst I would suspect, that you probably weren't clipping the overt side of it, or your brackets were out in some particular way. See, I'd blame it on flows. And if after a while I... several sessions I just didn't... wasn't anyplace with this and there wasn't any tone arm action but there had been, and there should be tone arm action on the process – I'd start adding, in the ARC process, for instance, I'd start adding another leg. See? Just to make sure.

The pc for instance is answering it, you know, as "What communication has not been acknowledged?" or something like this, see. Well, he apparently is always auditing it as his own communication that hasn't been acknowledged. And he's stuck himself with a flow here somehow or another. Well, I'd just open up the... this is... the auditor's always at liberty to add legs on process, you see, so I'd just open up my kit, and I'd figure out how to word this process, so "What communication of *yours* has not been acknowledged?" and "What communication of *another's* has not been acknowledged?" you see. Something of that sort. I'd open it up. I'd have a six command process, not a three, you see. And you can make that, by the way, into a fifteen-command process. But this would be rather unusual, and you're getting rather ornate

by doing so. But I'd blame that. Pc seems to be happy, pc seems to be getting results, pc seems to be cogniting – just we don't have tone arm action.

And running engrams, I wouldn't bust the pc out of an engram because they weren't getting tone arm action in an engram; that's nonsense. I'd start worrying if the pc didn't get any tone arm action for a couple of sessions. And then the way I would worry is to park the chain that I was running and I'd find the overt of the same chain. You see, because that's another way of introducing flows. Overts flow outward, motivators flow inward. So good. Well, let's run up a – let's run up an overt chain on this. We don't care if it's in the same date periods. You might have a... The overt chain might be back there *myaf-splaff-sprillion-million-brod-quadrillion, hywang-von-zillion-zeeum-zeeumzzmm* years, see. And the chain you've been running is when they were in kindergarten in this life, see. We don't care about the disparity of dates.

But whether we are running overts or motivators, whether we are running overts or motivators, we of course are running with the same severe system of blocking out the engrams by chains. Don't you start departing from that system – I had too much trouble getting that system together. You've got notes on what that system is and I intend to give you a demonstration on it. But I've been working out the exact commands. I've got it down to the exact commands. How do you like that, you know? Exact commands. Interesting. You've got this thing worked out to a point where the pc can predict what the auditor's going to say, he feels more comfortable, too. The only thing you can get in trouble with is you're finding minor incidents inside a major incident. That's what you normally run into when the pc can't see.

Well, there's a set of commands go with that, too. Pc doesn't arrive at the beginning of the incident when told to do so. Use commands A, B, C. You say, "Is the incident we have a small part of a major incident?" You get a read on the meter, see. Date the major incident by saying... And so forth. It's a very precise operation, this engram running today. And is only effective if it is precise. And I'm finding out the precision of the running engrams by chains is adding to the pc's recall and precision on the track. It's quite interesting. So when you start to run overts, you run them exactly the same way, except you ask for overt incidents, which are the same type of thing. And your chain is always characterized. And you have a tendency to jump that characterization if you don't watch yourself. You're running the chain of "sticking to mest." See, that's the chain you're running. That's a good, long, hefty one.

Somebody around here the other day was asking for "the first electronic." They were running the chain of electronic incidents. Oh, blow your brains out, man! The first electronic incident, I don't think you could express it on this wall up here with a microscopic set of zeros following a 1, following from the top of the wall, straight across, next line one millimeter down from the last line, clear on down to the bottom. A thetan *is* an electronic incident! [laughter, laughs] You have to be fairly careful what you ask for.

Pc says, "Well, I don't know, I seem to go into apathy, every time I try to do anything to these people." Well, let's see. Now, you go start running the chain, "doing things to people," – there were people in this universe when you arrived at some vast date back. The mest body, the physical meat body, is one of the standard phenomena of this universe. And so there

you are. You're going to run down the first time they ever did that? Well, that's too much of a bite for the pc, that's all. Let's be more finite. Let's be more finite about it.

"What are these people doing to you?"

"Well, they're shooting at me."

All right, test it on the meter, let's run back a chain of shooting at people. See, Q and A. There are uses to Q and A, and that's one of them. He isn't going to go back very far shooting at people, thetans don't shoot at people. He'll run along a bunch of wars, or something like that. But you take something that he's worried about, and can reach, and sometimes your TA action on running engrams is suddenly – it's you've just bitten off more than you can chew. You're running a chain on "holding still." Or you're running a chain on "being held still." That would be even worse, see. Well of course you're asking for a bunch of still incidents. Well, that in itself will give you a stuck TA. That's rather elementary.

If you were very, very clever, you could make engram running – if the pc could run engrams – produce almost any TA action you wanted. You run stills, you get no TA action. You run masses, you get a rising tone arm. You get how you could throw the question?

"All right, let's run back to the first time you were afraid of mass," see. You're going to get a nice rising tone arm, so forth. I don't know quite what causes a low tone arm, to tell you the truth, because I've scouted it over a few times, but it's some kind of a negative avoidance type of mechanism of some kind or another, but it's something peculiar, that you probably could throw a TA negative, you could probably throw it positive, and you could probably run a chain of pleasure moments as all the times you were Clear. You'd probably produce a Clear, you see, just by running incidents when they were Clear. Get this validated.

What you validate, you produce – to a very marked degree, you see. With this exception: You get them to confront what they don't want to confront, and therefore the production of that then ceases to go on automatic, don't you see. But if you were giving a limited run, and weren't trying really to run anything out, but just giving everything a limited run, you could throw the case anyway you wanted to throw the case. You could run the type of incident that would throw the case that way. Don't you see? I know it sounds weird, but you could. That would be an improper way to run engrams because you're trying to run the chain that will make the pc snap and pop and make him into good shape.

So therefore, you run what he can confront – almost. You're running – you're upgraded his confront. It's just a "not quite." He doesn't know about this, and you find it for him on the meter, but it's real to him because it reads on the meter. Your best test of "is it real to the pc" is: Does it read on the meter? I mean, that's elementary.

Now, the combination of all these processes are based on the factors which I've given you in this lecture. I don't know whether or not this data has any vast value to you or not in putting together processes. I'm trying to give you some kind of an idea of the woof and warp of what makes up a chart or a scale or a recommendation of, "You run Reach and Withdraw on this pc." See, the various things that go into this. And how much you're expected to vary from that or not vary from that or something of the sort. All these things go into action.

So it boils down to the fact that modern processes are built against the degree of withdrawal of the individual into himself and what process will lead the pc out from himself so that he no longer feels so restricted about the thing. Now, that's the most basic action, and that of course is found in Reach and Withdraw. And I told Fred the other day I'd run some of you on Reach and Withdraw from bulletins – been about knocking some of your heads off – not from the significance of the bulletin, just from the bulletin, see. Reach and Withdraw from the bulletin. In one case, why, just wrote the word "Scientology" on a card. Reach and Withdraw from the word "Scientology." Just about knocked the student's head off.

Now that, of course, is literal, see. Reach and Withdraw, see, from something like this. Well, the pervasiveness of these lower-scale processes is something which you as an auditor should have cognizance of. You shouldn't go on expecting somebody to keep putting your foot in footprints all the time, see. Somebody's walked this way and there it is. You could have some knowledge of what makes a process a process, see, and why we have these processes, and which way they tend to go, and so forth. We have just a few basic classes of processes. There's a very few of these. But each one matches its own levels of case. And the total criteria of it is the case will respond under auditing to the process – and that's the only criteria.

Now of course, you can always undercut a case too seriously. You take some bird that's perfectly capable of running engrams and you run Reach and Withdraw, see. Oh, I'm sure you can run Reach and Withdraw for a long time, this character can run Reach and Withdraw, he's perfectly capable along this line. He might even get change, he might even get tone arm action. But that isn't a good enough reason. So the one other factor that enters into it – and this is where the art of the auditor is involved, and it's an art – is getting some estimation of where the case must lie and upgrading the case from that point. And that requires some skill. Because you could run a case too low and give him a lose, see.

And the way to do that is to always run a case a little steep, see. Always run the case just a little steeper than the case thinks it should be run. The reaction of the case to auditing, as to whether or not the case ARC breaks or protests or something like that has practically nothing to do with what you run on the case. You'll find some cases – now here's where you make your mistake on this – the case will go "*Yow, yow, yow, yow, yow,*" you see. Look amongst that "*yow, yow, yow,*" and find out if the case is executing the auditing command. That's what's important. It isn't whether the case is going *yow, yow, yow*.

You told the case to go to streens-skrillion trillion-kajillion years, see, and the case said, "God damn it, you bypassed about eighty thousand incidents all in one bunch," and so forth. That's all he said. And you as a – you look at this protest and you say immediately, well, the case hasn't done it. And you'll be surprised. If you carry out your routine on almost a muzzled basis, you say, "What are you looking at?" You acknowledge what he said, "Yes," and "Now, what are you looking at?" You'll find out that he's at eighty squillion-krintrillion sprinion years, looking at this confounded, cotton-picking camel. Who wants anything to do with this camel, see? And you get the – you get the whole notion on it.

Because protest is the common denominator of the whole track in this universe. And your case goes through phases of protest. Protest is probably more vital to a case than dupli-

cate. It's how he makes his pictures in the first place and there's a terrific amount of technology mixed up in this thing called protest.

Now, the only level of processing which remains as a wide-open level of processing is Level 2. And I'm working very industriously at Level 2. And making very good progress at Level 2. How you amputate total time track, you know. I've made some good progress.

I've already found a theoretical method – haven't tested it out – but I found a theoretical method, where you locate one point at the beginning of the incident – this is very theoretical, see – if you locate one point at the beginning of the incident, you have the pc – you pass the pc through the incident once or twice so he knows what it is, and you locate one point at the beginning of the incident, have him pick up one consideration toward the beginning of the incident, and the engram vanishes. Isn't that interesting? I found it so.

But that's the subject of another lecture. Benefit by this one.

Thank you very much.

HISTORY OF PSYCHOTHERAPY

A lecture given on 20 June 1963

[laughter]

Meat bodies cook! [laughter, laughs]

What's the date?

Audience: 20th of June.

Okay. Twenty June AD 13, Saint Hill Special Briefing Course. I was thinking what I could tell you, that might make auditing easier. I'm not in the position at the present moment to give you a history of auditing on the whole track, that would be a complete history. But I know quite a bit about it and it's pretty stinking.

It all goes along the traditional psychiatric lines, of evaluate, invalidate – you know, the psychiatric code – evaluate, invalidate and so forth.

Now, it might strike you as peculiar that if this universe has been sitting here this long, that nobody ever got very practical about digging anybody out of it. And that's because – that's because – there's a very good reason for this – is the guys who consistently remain in charge are usually in sufficiently good shape that they are not terribly worried about their own condition. You see that?

Audience: Mm-hm. Mmm.

So it makes a continuous authoritative level of not interested. That's quite interesting.

Because new blood comes into this universe, I suppose even today and these boys haven't gone the route and so on. By the time they have, they've usually lost out and so they're no longer in a position of authority. But there have been spells of auditing, of sorts, but you wouldn't call it auditing. But as much as I've been around in this universe, I have never encountered an effective therapy.

That's quite interesting, because it goes contrary to the fondest hopes of the religionists. It rather plows in the legend of the Kahoona Kapuna Kapunas, who... all they had to do was go "Kahoona kapuna," and something – *thaaah!* See? This is an unworkable level. See, there haven't been workable therapies. There've been by-the-bootstraps recoveries which are rather spectacular.

And as you look back over the whole track, you'll find that you've been going on a rolly-coaster. You've spent some time in a meat body and then the next thing you know, why, there you were, Operating Thetan, see. And then for a while, why, you're pushing a doll body around or something like that and then boom – why, you're Operating Thetan. And then you push a meat body around for a while, and then spend a few million or trillion years in a trap or something like that and then you come out the other end of it. And suddenly and mysteriously, why, there you are chucking planets around, or something like this, you see.

This is all – this is all very difficult for a person to reconcile. And it's "What am I doing? What am I doing" Being up, being down, being up, being down. There isn't one of you who hasn't been in meat bodies on the whole track many many times. Many times and places, you see. And, who succeeded this act – who didn't succeed this action by being an OT, you see. Quite interesting. And vitally necessary to your understanding of the situation because it gives you false hope. You say, well, "What – what must have turned? What must have turned the dials on my life like this? What mysterious thing happened that would suddenly make me nine Empire State Buildings tall? And what – what turn of the road did I hit that brought me into a state where I could, well, cut Earth in half and serve it up as watermelon? See, what did I suddenly do that brought this about? And then, also, what did I do that made me suddenly feel so weak? And how come a few trillennia later, why, here I am a professor of medicine in the college of fine arts, or something, in Hoosgow University or something. How – what?" Dizzy. Very dizzying. Up one minute, down the next.

And you go along the track looking for a miracle, because it must have been a miracle; you didn't know anything about it. Very peculiar things went on; you're on a stake trap of some kind or another, and some bird out of the goodness of his heart grabs you by the scruff of the neck and threw you up into the sky or somebody else fortuitously put a charge in the planet and blew it to flinders that you happened to be trapped on, and you fortuitously went flying out into space. And next thing you know, there you are tromping around in your bare feet a light-year tall, see. And you say, "Well, it must have been that I just felt that way when I was on the stake and when I was off the stake, why, then I felt okay. And can't happen to me again." And then the next thing you know, why, there you are pushing a broom at Hoosgow University, feeling very apathetic.

Well, I'd like to point out something to you. The cycle is getting shorter. See, that's the trick. You stay up less long. You go down quicker. And what is this mysterious thing that suddenly brings you into prominence where you're flexing the biceps in all directions and so on? What is this mysterious thing. Well, I can't even now give you a full answer that I would guarantee to stay solid for the next some trillennia – years. But it's the opportunity, more than anything else. And a necessity level. And then you find out you can and there you are and so you can go along for a while. Because you see, you aren't naturally a matchbox tall. You see, that's probably 90 percent of the answer. You aren't naturally only two inches high, see.

You look at it as the ordinary condition of life, now, to be in a meat body and be quite small, you see. Actually, that's not the ordinary condition of life. That's an extraordinary condition of life. Very extraordinary. Takes quite a bit to get a person into that state.

Every once in a while you'll run into somebody and they're allergic to boot polish or something like this, you see. You ask them to recall a time when they swiped or ate their mother's boot polish or something, you see, and bang, they do, and bang, they're no longer allergic to boot polish. And you say, "Well isn't this wonderful, isn't this remarkable, here I have achieved a near miracle."

Oh, yes, you have, there's no doubt about that. But what you haven't looked at is the unnaturalness to have an allergy to boot polish. That's terribly unnatural.

Now it takes a great deal of publicity, takes a great deal of working at to keep everybody down. The enthusiasm that this has to be worked at is rather phenomenal. It does take sixteen-billion-dollar-per-annum appropriations on the part of the US so-called government – with psychiatric treatments for one and all and Siberia slated for anybody who doesn't agree with them politically. It takes that much money, it takes that much effort. It takes that many TV screens, see. It takes that many – it takes that many misguided mothers who said, "Johnny, you must not get your feet wet." See?

It takes this whole operation, has to be *worked at*. You've never looked at it as a worked-at operation. You've looked at it as a rather natural operation. Well not to introduce memoirs into the thing particularly, but you occasionally have not wanted to be pushed around. You've just wanted to go and sit on a cloud for nine thousand years and recover. I almost tore up a valley one time on just this one basic fact. They wanted to give me some treatment. Well, their treatment was no damn good. It was perfectly friendly treatment. Friendly. You know, you – you got knocked out in a crash, see. Well, let's fix him up, you know? Whole attitude is why the hell don't you go off someplace and get lost? I just want to sit here on this rock till my head stops spinning, see? Total ambition.

No, no, they had to hand out treatment. "Oh, ho-ho yeah, ho, we've got to fix him up, see." Ah, well, it's very interesting. Because the funny part of it is, if I just sat on a rock for another thousand years or something like that and admired the sunsets and sunrises, why, I would have probably come out of almost anything I would have gotten into, don't you see? Because I wasn't being trapped there, nothing bad was happening to me. But you never have these opportunities.

The struggle a person has right now trying to get a vacation. And the glee with which some other people [laughter, laughs] say they've just been on one. Now this is a – this is an interesting thing. How come everybody wants a vacation? Well actually, life is a very interesting activity. And if you were going at it hammer and tongs and were not being degraded in the process, why, you really wouldn't feel like you wanted a vacation.

But that vacation is a token payment on the possible opportunity of having a hundred thousand years to sit on Mount Everest and admire the snowfall. Because you know you'd be better. The universe itself, if you delete incident from it, is therapeutic. Although you can look on this universe as a big basic trap, it's mostly a trap 'cause it lets people get at people. It itself is not very operative in that direction.

Now, you could probably turn out, well, let's go way down scale, and let's take the spinbins. Look how busy they are in a spinbin. Have you ever been in a hospital? Ever been in a hospital? You're lying there, six o'clock in the morning, crash, on goes the lights, bang,

the door opens, somebody's standing there – thermometer. Konk! [laughter] Here we go, man! Gotta do, gotta do, gotta do, gotta do, gotta do, you know? I think there's a hospital someplace, they were understaffed and they produced some remarkable cures! [laughter]

At the same time, it isn't true that if you just went on sitting still for any God's quantity of years, that you would necessarily get well. That isn't necessarily true either. It would all depend on what condition you were sitting still in. If you were sitting still in the head of an idol someplace in an abandoned temple for a few trillennia, you might not deteriorate, but you certainly wouldn't improve either. No, a power of choice has got to be there to sit still. And that's what gets upset entirely. The entire economic system that we have now is completely rigged to overthrow the power of choice to sit still. You can't do it, you see. Games are lots of fun, but here are enforced games and well, there's the game of overdraft. Overdraft at the bank. That's quite a game. There's – it's no accident that money keeps inflating and people keep fooling with money because the impulse is there to make the economic noose tighter and tighter and tighter and tighter. Where could you go right now and simply sit down in a meat body on this planet, and be free of the economic clutches? Well, not too many.

Years ago you could go up to the backwoods of Alaska or something like that, or I even know places in Montana. Little Kootenay country, something like that. You'd probably disappear in there, and years, decades would go by and nobody would even know you were around. You know, throw a sod hut or a log cabin together. Ah, these places are disappearing.

And there are no desert islands now where you can go sit under the Pago Pago tree and make love to the local wahines and have nothing to do, see. They've all been atom-bombed or taken over by the Food and Drug Administration. [laughter]

It's quite remarkable – it's quite remarkable, if you come right down to it, how all the progress level is directed toward, at this particular time, tightening the economic noose. And which of course shortens up the amount of available time you have, which of course gives you more problems and which once more overthrows your power of choice. And so there's no chance to rest.

Well now, of course if you're in good shape, you don't want to rest. But bad shape has to be maintained. People have to work at it to keep people in bad condition. That's something that you should take into your considerations as an auditor. You've got the pc – now let me show you how far this goes – you've got a pc, and you audit them up all week, inch by inch, and over the weekend they fall foot by foot. Well, that's an interesting thing. Hardly any of us haven't run into this. Here we go. Somebody is working all weekend to make sure that enough problems are mounted up here and enough time is denied and enough this and that and the other thing is denied and enough arguments and trouble are thrown in the air to continue this type of status quo.

You say, "Well, this person must be crazy to be trying to hold this other person down to this degree." No, they're just dramatizing. They're just – not even dramatizing anything on the back track, they're just dramatizing current trend. "Well now, John, you go off all week getting audited like that," you see, "and what do you think is happening to me here? And the kiddies and so forth – and do you realize that the rent is overdue and the meatballs are overdue and everything is overdue and then, of course, there's installments on the furniture and

there's the – and who – and who do you think has to put out the cat every night and so forth – and you can't go on like this, you realize that and so forth – it's all just your introversion after all, and what are you doing putting out all that money for getting audited?" You know, you've probably had this happen to your pc, see.

Well, you say, "What's going on? This person's keeping this other person down." Well, actually not trying to keep the person down, they're just dramatizing the extant confusion. Then there has to be some feeling that if you leave some guy alone, why, he'll resurge. But it isn't true that if you leave him alone in a trap he'll resurge, because his power of choice is missing.

Now, how long can a person stay in a trap and not get any better? Even though he's not being hurt? Well, I can tell you on very good authority – 13.94 trillion trillion years. Didn't get any better. Why? Well, sitting in a mass. Didn't want to be there. See, the beingness factor is all knocked out. Power of choice knocked out, that sort of thing. You're sooner or later going to find the pc you're going to have incidents on that run up into trillions of trillions – maybe the thousands of trillions of trillions. You see? Maybe they've been sitting – they've been sitting inside this volcano or something. Volcanoes don't last that long; something more permanent. They've been stuck on this sun for trillions of trillions of trillions of years, you see. Big time periods. But all that time they are being harassed by the fact that they are not there by choice. They're harassed also by the engram of their original arrival. How they got into that state. They're protesting, in other words, their situation. And as long as a thetan protests, he is not free. And he won't get any better. That's why you can't enforce auditing on somebody.

Well, you see some guy walking down the street and you say, "Hey, you! You're going to be audited." He says, "What's that?" You say, "You'll find out." Funny part of it is you get away with it with some. They say, "Hey, what's this stuff? Hey, this is all right, you know," on some of them. But the bulk of them, just the fact that you had forced them to get audited on something they didn't even know what it was, eliminates power of choice from the auditing so completely that auditing is just a kind of a trap, you see. Power of choice factor is what has been overthrown there. They don't get better.

Of course, it's a testimony to auditing that even – auditing will even take care of that factor. You got a guy sitting there who's protesting the process all the way along the line – he's protesting the process all the way along the line. Well, unfortunately, he isn't going to get any better – he's going to stick himself in that protest. That protest against the process. That's all; he's going to stick himself. It'd be better to run him on something that was too upgraded for him that he wasn't protesting that was just killing him – try it, see – than to run him up against this continuous protest. You take a pc who's trying to go earlier on the track while you're running a later-on-the-track incident, the pc gradually mounts up to a higher and higher protest against not going earlier, he finally locks himself later on the track. See, it's as simple as that. This mechanic you should take into effect, in auditing.

Now, what you know and what you have in your possession as an auditor is actually data which has not been extant in this universe. And the longer I go, why, the surer I am of that fact. Now, there's been data about engrams in this universe, there's been data about men-

tal image pictures, there's been data about all kinds of things, but there's not been data about auditing.

Now, auditing perforce does not evaluate or invalidate and when you audit a person against a person's wishes – well, momentarily in a session you sometimes push a guy through a CCH command and so forth, and you... that is protesting, so forth – that's not what I mean. I mean he didn't want to be audited, he is being audited, you see. Nothing's going to happen. Or if it does happen, you've got to be pretty heroic in the way you're making a gain. You've got to completely alter his idea that he wants to be there. Old Failed Help was one of the most effective mechanisms by which you did that. He knew he couldn't be helped because all help failed.

Now, if you have this weapon, this tool called auditing, and so forth, what is the limit of its use? Well, I've just given you the reason why its use is limited. You can, to some degree, overthrow a person's protest by reorienting him on his power of choice. He finally, through habit and otherwise, familiarity, recognizes that you are not trying to do him in and therefore comes to want to be audited. Not because he's overwhelmed; because you've changed his ideas on the subject. This is also very possible.

So that really can't be considered a terrific limiter on the subject of auditing. No, auditing is limited only by communication. It's the only thing auditing really limits.

You could imagine yourself going on a horrendous sales talk that everybody on planet Zug is worshipping the god Baal, see, and their idea of really doing their family a good favor is make them feed their babies oftener to this idol, see? And why, you say, it would take a long time to bring them around to any particular way of thinking. Oh, I don't know that it would. You wouldn't do it by suddenly overwhelming the lot of them, and say, "Now look, that's the god Baal, but I happen to be the god Mug, and you're going to get mugged any minute if you just don't sit down and go into a co-audit here and straighten yourselves out."

Well, oddly enough, that might even work, too. But you mustn't get overwhelmed completely cancelled out of your catalog of tricks. Remember that. Don't cancel that out completely. But look on it as an administrative or a political tool, not as an auditing tool. Don't mix up these tools, you see.

Well, one of the ways to do it would just be to say, "Well, if you guys don't stop worshipping Baal and get on the ball and kick its head off and get busy and set up a proper temple here to me, Mug, why, I'm going to scare-ify and scorchify the lot of you. In fact, there goes an acre of wheat right now." And they'd all say, "*Gaw! Coo! Yessir!*" And after you've pulled them along a while, why, you might get them into communication and then you could alter this overwhelm, don't you see.

Force does have its role. Force does have a role. The only trouble is, force has never been a total answer, see. Force is not a total answer. People try to make it a total answer. Right now most of the governments of Earth are conducting themselves on the basis of force. If you don't believe it, look at the appropriation that is given to weapons. See, that's their great belief in force. And yet, none of them can fall back on force and force has become absolutely useless in the field of government. It doesn't settle anything.

One thing I've learned on the whole track has been that force is never the whole answer. But I've also learned, reverse way to, that a total absence of force is not the whole answer. You just try and build a mountain sometime, ignoring force. Heh-heh! I'm afraid you're not going to get much mountain built. But that is constructive force.

So the way force is *used* has an awful lot to do with the value of force. And destructive uses of force has been the basic downfall of one and all. But you've got this whole planet that's feeding its babies to this fire god, and that sort of thing, and you can't get them into communication – well, you can't totally rule out destructive force; at least tip a couple of lightning bolts over there to the temple of Baal and blow his silly head off. And you say, "Oh. You see what happens to the worshipers of Baal, you see." You might get them in communication.

But driving people toward auditing, that's a very difficult thing. But they are driven toward auditing. People are driven toward auditing by their somatics, by their illnesses, by their unhappiness, by their unwillingness to be what they are, where they are – and those things drive them toward auditing. So they are driven toward auditing so you almost never get a pc on his own power of choice just to be audited, see. Very, very seldom. He's driven there, at the best, by his goals, don't you see?

Now, all of these things, then, sort out, well, what is power of choice? Well, power of choice could be many things, but if you're auditing a person in the direction of consenting to be audited, and then follow this by pushing him – auditing him in the direction where he isn't driven to be audited by his own condition and then audit him in the direction, finally, of putting himself in the condition so he can help you smooth things out – this, of course, is a very usable pattern. And I don't care whether your pattern of auditing is preordained to be only on the pc's power of choice or not. Remember there's always something driving the pc.

To restore him to any condition where he's any... feels any freedom or anything else, or is any value to himself or anybody else – to put him back into such a condition you do have to, however, consult his power of choice. You can always make a person well, oddly enough, with auditing, without consulting his power of choice. Isn't that interesting? And it is just to that height only that previous mental therapy has reached. And that's physical therapy, too. That's the height that it reached. It got no further than that. It was all done more or less by force and this thing called "power of choice" was never consulted. Interesting, isn't it?

But in your hands, why, you have weapons which improve a person's power of choice and he finally elects to be audited. You've seen that happen, time after time. Well, that's a very safe route.

So you never, then, find a pure power of choice to be audited. See, it's always monitored by little tiny factors and these factors are more and more other-determined the worse off a person is. See? So there is no absolute power of choice with regard to whether a person gets audited or doesn't get audited.

And he has this horrible feeling that if he just would go sit someplace and be quiet or something like that, he might get well anyway. Well, that's an interesting feeling. I appreciate that feeling. I feel a great empathy with that feeling. It's fine – it's a nice feeling. Even though it's totally, completely impossible. Such a program – such a program, in this universe, will

always be interfered with. Just as today you're not going to find many wilds in which you could go and sit down comfortably in a log cabin of your own construction and get away from it all and remain away from it all from here on out. Just as you could not do that now – I imagine there are a few places you could do that, there are a few bits and pieces left of the world, rapidly being overwhelmed – so this universe, big, broad as it is, actually offers opportunities which are almost as few. Sounds incredible.

Say, well there's a deserted planet up there, and all you've got to do is go up and sit on one of its mountain tops and it hasn't any population for a long time because it had an atomic war a long time ago. Or there's an asteroid spinning around, and if I could just go and sit on this asteroid for a while, why, I'd be cheerful about the whole thing and take a rest and so forth. Well, I can tell you from personal experience, here, you're really betting on one, man! That's very close to the impossible. I'm not going into any detailed private history – old soldiers are always talking about the war that the younger generation has hardly even heard of. And I'm afraid old thetans are always talking about the universes, planets and organizations which have long since gone to dust, but I'll be forgiven by talking about an extant organization, and in the last eighty trillion years, with no change of identity, I've played hooky a number of times. Eighty trillion years, see. I'm playing hooky right now, as a matter of fact. And all during that period of time – of course that's not – that's not any, any great quantity of time. But remember it is the *last* eighty trillion years, ending up with right now, see. I've taken off a hundred thousand here and two hundred and fifty thousand there and five or six million someplace else, and one time even a billion. I always got caught up with – always did! It wasn't that anybody was sending for me. But it just wasn't that quiet!

I remember the last time, I almost gave up on this one. I almost gave up on this one. Found a valley where there wasn't a blessed living thing anyplace in any direction anywhere, period. And the sun was quite distant from that planet. Who the devil would ever want anything to do with that planet, see? It wasn't even very hospitable; there wasn't any living things on it. I sat down and decided to grow some plants. And I thought that would be a nice, peaceful occupation. Just sit in this valley, you know, nothing to worry about with anybody or anything of the sort.

And I finally managed to coax into existence a few vines and that sort of thing, and flowers, and it was getting quite nice around there. I fixed up a lake and it was getting better and better, you see. Rather hard to do because there wasn't much sunshine, you see. And I was just getting on my way pretty well and all of a sudden, zoom-boom, and there was a spaceship. And I got pretty mad about the whole thing, as a matter of fact. It wasn't so much that their blast knocked down plants. I remember bringing a thunderstorm, moved it over the ship, moved it over a range of mountains, and then moved it back over the ship just to show them it was under control. And then let them have it! Well, they were back a couple of years later, we had a conversation and I reported back to base.

I mean, you give up on these things, you know? Apathetic. Apathetic about having a vacation.

But there's – there's a typical sequence, I'd figured I'd had a rough beef about it, for the whole billion years before that, and I figured I ought to go someplace and sit still and just be

quiet for a while; and that was all the good it did me. It's a noble ambition. I commend you for it. But I've never been able to make it work out.

It works out to the degree that you flex your muscles a little bit better, but you're running up against a shortening cycle in this universe. The cumulative fact of the time track is the defeating fact. There is no other defeating fact than that – the cumulative effect of the time track. The more you live, the more pictures you've got. And the more misadventures you have, the more engrams you've got. And the more engrams you've got, the more engrams can be keyed in. And the more engrams can be keyed in, the less events you can associate yourself with, with a free mind. And that is the dwindling spiral. I've just given it to you right there. That is it. There is nothing complicated about it. It's just no more complicated than that.

A thetan is his own trap, and time itself carrying forward adds a cumulative effect. I remember we had a press agent here for a while, I had to think up all of his press for him, and I got tired of having him tell me you couldn't get any publicity, so I finally had to let him go. But I remember one time, his attitude toward "our ideas" in Scientology was, "But," he said, "that just says that it..." – I hadn't told him anything to amount to anything, I just told him that when you had an accident or something like that, you collected an engram – and he said, rather disgustedly, "Well, that's the theory that the more things that happen to you, why, the more cumulative disaster you have." And he said, "That couldn't be true," and that made a total departure between him and Scientology. You see, he couldn't confront that fact. But that's the truth. That's the truth.

So one period you might be able to stay forty, fifty trillion years, sailing around, doing beautiful ballet on the planets, you know? And then all of a sudden this whizzle-bum goes by. And it causes you to feel strange. You go back, you're not feeling so good. And you decide you're not dancing so well. And the next thing you know there would be a whole chain of disastrous event, and bang, there you are, pushing a broom at Hoosegow University.

Only the next time, it only lasts thirty trillion years, see, and the next time it only lasts ten trillion years. There it goes, you see. That's – that is the basic difficulty that you are up against, that any being is up against.

Now, there is another difficulty that you might become very interested in. And that is the difficulty called organization, and the way things should be run. Because Scientology is, at first glance, as any self-idiotic government agency would be the first to scent, death on organization – if organization contains seniorities. Let's look this over. Let's see why Scientology is not looked down on, but "*oooouw-eh-huh!*" – the fear in the chest when somebody looks at this. He recognizes that if Scientology, as little as he could understand of it, was let loose, unlimitedly in this universe, it would end all caste-type organizations of whatever kind.

I was eating breakfast this morning, I was wondering, "How would I go about selling my compatriots in the – in the Galactic Confederation on the idea of kicking out the meat-body psychiatrists and putting nothing but Scientologists in, in that particular line of activity?" It was an interesting mental exercise. Interesting mental exercise.

I could imagine the problems which would be thrown in my lap as a result. There's the hewers of wood and the drawers of water, don't you see – and there's the people who direct the hewers of wood and the drawers of water, and then there's the people – and the beings

who direct the people who direct the hewers of wood and the drawers of water. It never quite occurs to anybody to ask, "What you doing hewing wood and drawing water?" But that's beside the point.

Well, the Galactic Confederation is one of the most successful organizations that this universe has ever had. Basically because it is based on an intermixture. It's composed of meat bodies, doll bodies and free thetans. And it's one of the very few that ever attempted this odd mixture. Of course, you get back on the whole track, you get back – well, I can tell you from personal experience – as short time ago as thirty-three trillion trillion years, practically present time, only it doesn't seem like present time to me – my mind starts creaking a little bit on time when I start adding all that up – but from personal experience, at even that recent date they were quite accustomed to having free thetans wandering around in towns. This was not an unaccustomed action. What kind of a town? Well, oddly enough, about thirty-three trillion trillion years ago there was a society that was not too different from, I'd say, about 1920 – sort of 1920 with the Rococo of the 19th century, see. The potted palm sort of motif, you know, the Fedora hat, same clothes, the razzle-dazzle gent wore a striped shirt, see, a wide striped shirt, see. The various – various signs and so forth, it looked quite odd. The buildings, like modern Gamages or something like that, you know. These things, no matter how much they seem to change...

Ages after that, by the way, in the same locale there was an Arabian civilization that didn't even know anything about automobiles or machinery or anything like that but had lots of minarets and big turbans and baggy pants, you know? And horses.

The universe goes backwards and forwards and upside down, but I'm beginning to wonder, because I'm looking almost in vain for a different type of society.

You say, well, of course you couldn't find a different type of society because the type of society you've been living in at the present time has keyed in the types of society which are similar to it on the whole track, so therefore you aren't going to find any different types of soc... I don't know. I didn't ask for any of these engrams to get keyed in, particularly. I've been getting them keyed in all over this universe. I only find a half a dozen different society types. They're quite the same. And I find no bogies to amount to anything. In some stuff doing last night, I was looking at a Bentley – about a 1916 Bentley. Funny hood, mixed up with a western stagecoach. This was road traffic. And a Greyhound bus. Seven-hundred billion years ago, very modern, you know, all mixed up, all mixed up. Guy looking at this will think he's running dub if he doesn't watch it very carefully, because he gets the repetitive type of society, you see.

So on a couple of implants – and in one of them there was nothing but West Point cadets and in the other one there was nothing but Annapolis cadets. No, it isn't that anybody was doing any dub, it's just that – the fact that that is what a cadet for the army is supposed to dress like. Simple. Where do you suppose man – how does man get this terrific agreement without having experienced it? And that's how he has experienced it.

Well anyway, thetans used to wander around towns – like Gamages, you know? And they had traps and implants and so forth sitting in the town for the unwary thetan to get blundered into. Like, you look into this box and you'll see all your life again, you know? Implant.

Shoplifting, I think, was prevented by wire nets spread across goods on counters. If you could imagine London up here being with nice rigs so that free thetans wouldn't carry off all the hardware and so forth, and you... pretty mad. But no thetan at that time had been so antagonized that he had to consider himself three times as high as the Empire State Building. He'd just as soon be small peanuts along with anybody else. Funny. Funny admixtures of societies. And you'll find a society where there is no such thing as a spirit – all is scientific, you see. There is no soul, man came from mud, the only cure and treatment is a biochemical shot in the gluteus maximus. You find such a society, you even find them that depraved, such as Earth, 1963. Weird beliefs. They shift all over the place, in other words.

But an admixture of social strata – and I do mean social strata, because it falls immediately into the ability and power stratas – that who can – that one who can throw the biggest lightning bolt, of course, is normally considered to be chief, mostly because he'd argue if he weren't. And you get down scale, and you get the more active character, such as dolls, and then you go down scale, and you get the meat body, and then you go down scale and you get the politician. And the situation – the situation which develops is that Scientology injected in any mixed-up society where you have free thetans, doll bodies, meat bodies or any other downgraded – there's also other downgrades that have thetans in them. Some robots have thetans in them. And horses, dogs, cats, game animals, birds, insects: these are social strata.

I don't care if they're not sentient social strata totally, because a guy's pretty far out by the time he's running an ant. But the situation is that you're looking at a scale of social castes. These are castes. And the caste system shatters the moment that you can take a human being and process him up to a level of doll body. Well, what about the self-respecting doll? The self-respecting doll at that moment would be the first one to protest processing a meat body up to the level of dolls. Interesting.

All right, so you take the dolls and you process the dolls and you move them up toward a category of free thetan. Who's going to protest there? Well, the free thetan's going to protest, that's for sure. He's going to say, "Well, who's going to hew the wood and push the spaceship?" See? You know? "Who's going to stand there and rivet this stuff? And how are we going to establish seniority, man?" And one of the first things the Galactic Confederation would ask, "Well, what are you going to do? I mean, what's your seniority rating?" so on.

Well, actually, you could work it out. You'd say, "Well, you've got everybody's records." And they have. So all right, so this character – this character's been a doll body, he's been a sergeant at arms on Planet Zed for quite some time as a doll, and by the time we get him processed we're not going to penalize him or something or other, so we've made a free thetan out of him.

Well, I'm afraid that he would have seniority over somebody who had only been his corporal. In other words, you'd have to leave the status quo. And carefully record the status quo. Unfortunately, this leaves a free thetan pushing a broom someplace or another. But who said that a free thetan shouldn't or couldn't push a broom?

Now the whole argument explodes in the face of this: Well, who says that people have got to be at that level to do those things? See, that's the lie that is introduced in the situation. For instance, in the last few hundred billion, why, the quality of motor or engine being turned

out in space vessels in the Galactic Confederation have been very poor. Why? They blow up every now and then. One of the first questions you ask after you've had an ARC break with a couple of blowups of this particular character is, "What the hell are we doing using spaceships?" "Well, spaceships are necessary to carry the troops." Well, you say, "Well, what are you carrying troops for? Because a free thetan in the first place could go in and swamp up the lot – and usually does, to open up the gates or something like that and let the troops into the citadel." So it looks like a now-I'm-supposed-to chain which is going on here, see. Kind of weird, isn't it?

And after a crash, why, you always have to pick the dolls out of their heads because dolls can't get out of their heads. Human beings can, but dolls can't. Kind of grim thought, isn't it? And a free thetan, to pick one up and salvage him out of a wreck – and here we get back to auditing again – oh, there's lots of patterned auditings. Doll has a head inside a head, oh, about the size of your fist. You know these puppet – these puppet things they turn out, you know, that you put on your hand, like a glove, you know, wiggle the fingers and... Well, a doll without the little hands on the thing and without the head is what the thetan looks like. See, it's just that little skirt. So you take him, take a ball sort of like a trap with a couple of holes in it so he can see out of it, and shove him up into this metal trap thing, see? Then you pick up the head of the doll body and you put him in there, into a cradle inside the head, and he extends into a helical arrangement down into the body by which he can then manipulate, and so forth, the body. They get pretty good at it. But a doll body is actually a trap to end all traps. Because the body's light and because he isn't always being beaten around – they last for a long time and so forth. But a doll is in a trap.

Now a free thetan, to take a doll out of a wreck pulls his – pulls the doll body's head off – you know, like lifting off a diver's helmet – picks this ball out of the dome, pulls the thetan out of the ball, you see, and goes... [blows out air] In other words, throws out a beam that as-ises or erases, eats up actually, burns up, his facsimiles of shock. And says, "Go on home," tells him where the wreck is, and the doll says "Aye-aye," and he's away. As a free thetan. Tiny one. Interesting. Interesting.

But look at that. That's very interesting because that's a therapy, See. That's an outside, exterior therapy where somebody else is doing it, but it gives you an open sesame to what do you do about ants, what do you do about ducks and what do you do about cats? Funny part of it is that a free thetan could pick up a duck and go *fssssss*. There'd be no residue left. The thetan that was occupying that duck would at that moment be free and be Clear. Albeit, cleared by somebody else! What about the facsimile? Well, he'd go on for a short time and start mocking them up again, of course. Because it's not on his own power of choice. But it leaves him momentarily free, do you see that? Interesting, from a standpoint.

There is a wave, then, that can be projected at an individual that would erase his engrams. Quite interesting, isn't it? But would they stay erased for very long? Well, not until the guy kind of himself got restimulated and keyed them in, and so forth. It would just be what was in restimulation at that moment would get wiped out.

Now this was psychotherapy and you'll see some residues of this called picturology. And it consisted of putting a guy to sleep with a ray or a beam – which is simply energy mov-

ing at a certain vibration – nothing very mysterious about that, which induces hypnosis or sleep. You take one of these clapsticks like they have in the front of the Hollywood cameras. They put this guy to sleep, and you know what he's been looking at, see – he's been in an accident or something like that. So you know the scenery he must have in the incident, see. You talk about – this is why some auditors write script, they're probably familiar with the method. They take a picture, see, of what he's been looking at, and hold it up in front of his face, take one of these clapsticks and go *snap!* Like that. Take another copy of it with a different view, hold it up, let him see it, take this big stick and go *snap!* See, he's sitting there, comatose. Hold up another picture of it, another slightly different view, take this clapstick, *snap!* After a while the thetan all of a sudden groggily starts to get the idea, so he takes the pictures that he himself has been looking at and he goes *snap!* and smashes them. By mimicry.

"We want you to smash up this picture," and so the thetan in a groggy state goes ahead and smashes up the picture. Auditing. The most modern and advanced auditing that the universe ever developed is right there. Never developed anything any better than that. You have to select the picture. You select it one hundred percent, down to the scene and viewpoint. Well what if the guy isn't sitting in the picture? What if that isn't the picture he's sitting in? "Well, forget about that." What if – what if you bypass some charge in it? *Ahkahhh!* "Well, we don't know why he's cross." And what happens after this has been done? Well, a Scientist could run the whole incident un... the whole incident from beginning to end untouched, and have the additional bonus of having to run out the erasure of a picture sequence, too. All it actually did was operate as a key-in.

I think this is quite interesting. I'm very interested – now there's other data and... of that character, but look at the evaluation. You choose the picture for the pc one hundred percent. It's all right to say, "All right, we want you to go to a certain part of the track and let's see if we can find anything." Oh, no, no, this is total evaluation: We've got to have a picture of a pine tree over on the right, and there's got to be a rock over on the left. Now you find the picture with the pine tree and the rock. There it is.

Idiotic. Because it might not even be engramic. You talk about a hit-or-miss proposition, man. Well, how did they know, if they were working this on a free thetan – how did they know that he was even sitting in the chair, if this was a meat body psychiatrist doing this? That's an interesting point, but they used to have meters. Some of you are allergic to meters, because you realize that meters are normally used by meat-bodies' societies to detect the presence of a thetan. And in such a therapy room, there'll be a great big dial, not unlike an E-Meter dial – this part of the dial, black dial, and as long as the thetan is in the chair it of course is registering because the chair is hooked up to the meter. There's an aura registering – but somebody's in connection with this thing, and therefore he is detectable. Now in the Helatrobos Implants and so forth, if you're ever unlucky enough to get derailed and so forth in the Helatrobos Implants, you would have seen a workman come up, walking forward with a box pointed toward the pole. You know? Kind of ducked, and scared stiff, but – because you might be a big thetan, you see; you might not have been that little thetan they thought. And walking up toward the pole, see, to find out if you're – if there's somebody on the pole or not. Bad visio. That's what's the matter – their eyes are shot. It isn't that thetans are invisible at all. As a matter of fact they aren't invisible. They are very visible. And – however, if you've cut

that whole top stratum off of your perception, why, you probably couldn't see pink or green traffic lights either. See, I mean, there's people colorblind. Well, people in meat bodies through fear and otherwise, go waveblind, at the wave.

Actually, thetans are very visible. Particularly if you condense one or freeze one. Then he looks like an old, black glove, without any fingers in it.

Now, talking about therapy at large, then, you are actually being asked to grapple then, with something for which you have no historic background. You haven't any track background for this. I've probably given you a sample of possibly the only track background you might have connected with in this particular line, you see? The ideas of being big and little and how did you go over this cycle; the idea of somebody standing up and, perfectly beneficially, without being angry at you at all trying to get you to get rid of a picture by slapping a clapstick in front of your face or something like that. The idea that if you could just sit still long enough and breathe under your own power of choice why, you would somehow or another go free. These are the background music, and as far as a person being a pc is concerned – does he want to be audited, doesn't he want to be audited, how much is he driven to be audited, what is causing him to be audited – all of these various other factors add up into the thing. His power of choice has to be consulted to this degree. And that is, in a nutshell, practically all the background anybody's got pre-Dianetics and -Scientology on this whole subject.

Sometimes people have Freudian background or psychological background, but not to be sarcastic at all because I'd never slap at ol' Papa Freud – but your... the basis is, wow, this is a long way from home, man. Yeah, that's – I don't know, you start counting witch doctor stuff if you count that in, don't you see? That's about the same level of operation.

So there's very little preconception here. Now, you get somebody who's been a psychoanalytic patient and you try to audit them, it shows up at once.

He'll start telling you that he has traumas caused by fixations and he keeps trying to run engrams of having made a pass at his little sister or something like this, you see. And it shows up almost at once what he is looking for, and the thing to do with that rather cruelly is just take him to his first psychoanalytic session, and scan him rapidly through to his last one. Do that two or three times and you won't have any more trouble.

You sometimes also pick up data that the analyst picked up that you can use in running engrams. We've also done that. It of course makes him recover the ulcers and things like that that he's been cured of. That's the cruelest thing I ever did. I was – this poor devil had been five years or something like that, maybe seven, he was the assistant editor of *Collier's* magazine. The poor devil! And he'd been going to that analyst you know, and been eating humble pie and being careful, and digging up these times when he thought lascivious thoughts about the wrong thing, and he'd just been having an awful time, and he'd been... vast amount of money – I think he must have spent ten, fifteen, twenty thousand dollars doing all this, and so forth.

And I got so tired of him trying to pick up his Eudipitus Lipupsis or something of the sort that I finally said in disgust to him – this is many, many years ago – I said, "All right, let's pick up your first Freudian treatment." And we did. Had a little trouble, but we finally got it.

"Scan rapidly through to the last treatment. That's fine. All right, let's do that again. Do that again."

Then I found out the poor guy had been treated for ulcers, his stomach was just – his stomach looked like Swiss cheese, you know, full of holes. And by the time I finished this, he just doubled up in the auditing chair and then doubled up on the floor and I thought he was going into a prenatal. He wasn't; his ulcers had just come on, full bloom. In other words, the only – the only thing that had happened is they'd put him on some kind of a suppress ridge so great that they had managed to suppress the pain of the ulcers. And of course the second you scanned him through all these years of travail, why, there he was with a complete, full-blown set of ulcers.

I'd like to finish the story and go on and tell you that I audited him on up then so that he didn't have to worry about ulcers. But as a matter of fact, he wouldn't publish a favorable article and I never did. Anyway... [laughter, laughs]

But the essence of the thing is, is you have, as a student of Dianetics and Scientology, my sympathy to this degree: is you're going in against a no-background action. I've given you just about the totality of the background of this particular subject.

Now the people who are, and beings who are in the universe that are still communicating and still alive have, however, arrived at a point where they can reverse very easily and start up again. And you'll get more vectors starting them up than you will pressing them down. Governments are forgetting more and more how to govern and that sort of thing. They will be less and less argument posed against processing and so forth.

But in actual fact, what do you have? You have a brand-new trend. And a brand-new trend – it's not necessary they catch on slowly; they don't necessarily catch on slowly at all. Brand-new trends sometimes go faster than old trends. But certainly, to this degree, it gives you no benefit from your own past track, except as a pc you get reality on this and that and so forth – but you haven't got a large quantity of data.

Now, if you were a sergeant in the army trying to teach a private how to shoot on a rifle range, you would be bounteously assisted and... or disastrously held up by the person's past skill. Either a guy can shoot or he can't shoot, and that's just about what sergeants do. They pick out a few guys that can shoot and these guys are, well, we'll keep them in the lines. And these guys over here, they're hopeless, *don't* let them near a rifle and so forth. Well what are they doing? They're just cashing in directly on the training they had before the battle of Bunker Hill and before that the training they had so on and so on and backtrack and when they were a doll. And guy *can't* shoot left-handed because dolls carry their weapons on the left-hand side and he's committed too many overts on that, but he shoots all right as long as you give him a right-hand holster. These things change, but you're cashing in all the time on the person's background. And you're practically training an automaticity.

You take some guy, send him to university and say he's going to be an atomic scientist. "But why do you want to be an atomic scientist?" Well, he doesn't know. He just has a feeling. Wears his hair in the exact design of an atom bomb, you know? [laughter] And there he is. There he is. You're training an atomic scientist whose aggregate training on the subject

of atomic science, put together, would make an IBM computer awful sick in its gears, the figure would be so tremendous.

You take some pilot, you teach this guy to be a pilot, what have you got? You've got somebody there, my God, he's been flying airplanes and flying airplanes and – he either can fly or can't fly. And you'll find most instructors have just come on down to that. What are you doing. You're picking up the whole guy's background, and teaching is then simply a method of restimulation! That's all. We've got a brand-new subject here, there's no – nothing. The more you restimulate, the less the guy's going to learn. I mean, it's quite reverse. Because there's nothing there to restimulate. There is no past training on Dianetics or Scientology.

As far as your pc is concerned, the contrary is true though, as I was telling you about the editor-assistant editor of *Collier's*, you do get a conflict. Because you'll get somebody into picturology. Practically anybody who's been on the whole track has some time or another had somebody smashing a clapstick in front of his face, see. Maybe not often, maybe some of you will find a pc whose Helatrobis Implant series and so forth has been very nicely erased by this particular method. It's all there, you see, and it's totally aberrative on the pc, but after you've finished up running the whole Helatrobis Implant then you've got to take care of the treatment. And it's twice as bad as the implant.

Anyhow – this pc, however, can mistake the auditor for past schools and past actions. He can make a bad mistake that way. Pc's sitting across the auditing table holding... he sees the auditor as somebody maybe who's sitting there holding up a picture, don't you see? Or an implanter or a hypnotist, or something like this. He can get himself screwed up on this particular subject. That's why an auditor has to act more like an auditor than an auditor. Because you can key in, awfully easily, past therapy on somebody that was therapy that wasn't therapy, don't you see?

Now, you tell a guy to go into an incident and he's liable to get the idea that you're implanting him, and, you know, all kinds of weird things, because a pc isn't too bright. He's down there amongst the – amongst the energy waves and the anaten and he isn't thinking too easily, so he gets confusions much more easily. You just remember that all past therapies overthrew his power of choice exclusively as an operation and an action. They were dedicated to this.

The one factor you can alter is not overthrow his power of choice, but rehabilitate his power of choice, if he's very, very difficult as a pc. You've always got that one in your locker.

Now, it's one thing to say, "Never take a pc's orders," but remember that "never" means when a pc is confused, upset, in the middle of an ARC break, he'll tell you silly things. Well, that means don't take those silly things. But sometimes a pc, even though he's pretty ARC breaky can tell you exactly what is wrong. Well, if you don't take those things, knowing yourself that that is what is wrong, why, you're overthrowing his and your power of choice at the same time.

So there is nothing wrong at all with taking a pc's – taking a pc's hints and his – well, his orders, as far as that's concerned. But taking his orders only occurs after you've ARC broken him very hard. He won't give you orders up to that time, he'll just give you data. You ARC break him hard, he starts giving orders. And then the next thing you know these orders

start coming out of the middle of implants, they come out of engramic phrases, they do this and that, and you can just ruin him. That's why you say never take a pc's orders. But that means when he's ARC broken, upset. He'll just give you a confusing bunch of junk.

I know, I myself giving an auditor orders have wound myself around the meter about three wraps, you know? "What you ought to do is go back to..." you know? The auditor didn't realize that I must be pretty confused at that particular point and go back to it. Oh, no! It was... The reason you shouldn't, of course, is what's wrong is totally unknown to the pc or it wouldn't be wrong.

Now, you get different ARC break assessments for different levels – there are different assessments – there's a different assessment for each level on that State of Case Scale. And the engram running one only has a couple. That's just bypassed an engram, earlier engram, an earlier beginning, or have I got the date or duration wrong? That's two questions – got the duration wrong, or the date wrong. And you'll find most ARC breaks in engram running stem from getting the wrong duration for the engram. Nothing more elementary than that. It isn't the earlier incident, it's the wrong duration. That's the bypassed charge.

But that wasn't what I set out to tell you. I just say, well, these are the various problems and this is the history of psychotherapy in this particular universe, given to you on a very limited scale. There could be a much fancier bunch of data connected with it, there could be a lot of ramifications, we could take in the witch doctors, we could take in all kinds of people, we could take in psychiatrists in general. We could give you, probably billions of words of description of the various practices of the Ug-bug tribe along the Moscow River – methods of psychotherapy, see. We could get very, very catalogic – but that is not psychotherapy, that's just dramatization. They weren't trying to do anything for anybody.

The point I'm making is, is you yourself – you yourself have a few points that you can put together and remember in handling pcs and in learning auditing. And they depend to some degree on history, and I think maybe some of the data I've given you might be of some assistance.

Thank you.

MODERN PROCESSES

(Original Title: Routine 2-H)

A lecture given on

25 June 1963

Thank you.

Well, I see we are increasing in size. We are increasing in size and those few of you who are about to go home are ill-advised – very ill-advised for various reasons.

What's the date?

Audience: 25th.

Twenty-fifth, 25 June AD 13, Saint Hill Special Briefing Course.

Now, there's a very happy note today in processing – a very happy note indeed. The differences of processes as they have come out one way or the other have been regulated by two things – the name of this lecture is Modern Processes – two things. One has been the ability of the auditor to do them and the other is efficacy on various levels of cases – in other words, ability of the auditor – efficacy in advancing the state of case.

Now, that is what monitors, by and large, a process. It's not monitored by how bright I am; but sometimes I'm amazed at how I can overlook some few things, you know? But trying to fit the jigsaw puzzle together requires that these two factors be joined. In other words, these two factors have got to mesh. That's very important. Very important.

If we solely went on the basis of efficacy of processes, on that alone and we went on nothing else, we would very soon find ourselves with no auditors. That's very interesting, because they wouldn't apply this material broadly or generally or uniformly enough to give them wins. And I've meant for several lectures to give you the definition of wins and loses; and this you'll find of some value. What is a win, and what is a lose in terms of thetan behavior?

Now, these are very, very diffident type words, these are – these win, lose – this is terrific *thaah!* Wonderful significance, you know. One of these empty-headed significances, you know, that everybody knows. Well, beware of these everybody knows things because they don't open up to an achievement. So you have to get an action definition to these things before you know exactly what is a win, what is a lose, and then you could get wins or know when you hadn't had them.

It's very funny, but it's odd how you have to take some of these things apart – the *reductio ad absurdum* of an idiocy, you know? And if we don't know the anatomy of these

things, what do we mean when we say an auditor has to have a win or the auditor got a lose or the pc got a lose or the pc got a win?

Well, if you don't know the anatomy of a win or lose, how would you know how to give a pc a win or a lose? You might want to give a pc a lose sometime, you might be – find some – you might find the thetan that started the Helatrobis Implants or something like that, you know, and... [laughs]

Now, in these two things, win and lose, we find, in actual fact, a very fundamental fundamental on the subject of entrapment, degradation, all the rest of these things, add up into these definitions. But they're idiot... idiotically simple definitions. Took me a very, very long time to find out what they were. And right away, the second I tell you these, you see, you'll say, "Oh yes, of course," and that will be the end of that. So, of course, I have to give it a buildup. [laughs, laughter]

But a win is intending to do something and doing it or intending not to do something and not doing it. And that is a win. And a lose is intending to do something and not doing it and intending not to do something and doing it.

Now, you notice that a lose gives you a disagreement. You see, there's a ridge forms between those two things – nice ridge, sitting right there. You intend to do something, and what is the consequence of this? Not doing it. Well therefore, intending to do it and not doing it are a statement in disagreement, one with the other, and so you get a ridge. That is a bit of entrapped energy, don't you see, and so that will read on an E-Meter. See, an E-Meter registers disagreements, basically.

All right, there are those four conditions. And they are covered even though you intend not to do nothing and do nothing, don't you see. That – you're adding significance, you see, to the basic definition. All that's included in there, see. Intending to do something and doing it, that's a win. Intending not to do something and not doing it, that's a win.

All right, how do these apply in processing? You intend to improve this case and you don't improve it. That gives you a lose. I notice a sad, little black shadow floats across some of the people present. You intended not to ARC break the pc and you did it. You intended not to make the pc worse and you feel you made him worse. That's a big lose.

Now let's look at it from the pc's side. The pc intends to do something and doesn't do it. The pc doesn't intend to do something and does it. Now therefore, those would be pc loses. Pc loses – bang, bang. Let's say the pc sets goals for the session, "In this session I wish to become an OT," and he doesn't do it. Unreal though that may be, that is still a lose, see? Unreal though it may be.

Now, the question of reality and achievability don't happen to be included in the basic definition of win and lose. There's no effort to modify them to that degree. But when you apply them to auditing you get some additional factors which are quite interesting.

This auditor's idea of a win is not to ARC break the pc. And the auditor ARC breaks the pc. And then that – he realizes then that he's had an auditing lose. Maybe that was all he intended to do was to not do something. All right, so there's auditor attitude or auditor view-

point of the situation, you see? Get through this session without any ARC breaks or blowups, see, that's an auditor intention, you see. Auditor doesn't make it, gets a lose.

You'd be surprised how often that is the auditor's single intention. The basic most quivering intention is to somehow or another get this pc smoothly through this session and out the other side – not to do anything to the pc or anything, but just not to do anything damaging to the pc, see. "Just somehow or another in spite of this stuff get the pc to the other side of the session – *uhhhh*. Made it! Pc didn't have an ARC break. Whew! What a win."

Well, actually, that's kind of unreal. But nevertheless it's within an auditor's frame of action. All right, that's in the auditor's frame of action, see. Short of processing you're not going to do anything for this auditor. Well, this makes a demand of a process that it works regardless of that intention. Well, that's a heck of a thing to have to demand of a process, isn't it? But these are factors which I work with all the time, factors as oblique as this. The process has to work regardless of the intention.

Well, that's sure putting a strain on an automaticity, if you want my candid statement. And you would be very, very surprised how often that is true – how often that is true. And I have eventually begun to carry that as one of the crosses my mock-up has to bear, see. Process has got to work regardless. Now, that's an awful strain to put on a process, isn't it? If the auditor will just do certain actions and not exceed those actions, then certain results will occur. And that is just about the safest base on which you can lay a process. And any process you have today is based and constructed on that base.

Now, that's interesting, isn't it? In the first place, that might seem at first glance to be a downgrade of you as an auditor. But it actually is not a downgrade as you as an auditor. Your skill is in completing an auditing cycle. Your skill is sitting there handling and keeping the form and running the session. You actually do have somebody sitting across from you who has oblique and crisscrossed ideas. Well, I figure it's just about enough for you to do that without inventing a process as you go along. I find that's too much.

Now I myself auditing many, many, many years ago used to actually dream up the process and handle the pc all at the same time. Now this is feasible. This is feasible but is only necessary if you don't have the answers. And I found out that the moment I had the answers, I laid that aside – dreaming up the process while auditing the pc. I laid it aside because it was unnecessary to approach the problem. It put an awful strain on the session and it basically gave me too many loses. See, I ran too many sessions in which there was no vast gain on the part of the pc.

So therefore, I started reducing, even from my own auditing viewpoint, the number of factors of cases and the number of difficulties of cases down to a near-irreducible minimum. And having reduced them, then, adhered to them. Don't you find me today working out a process carefully and then, when I have some confidence in it, using it in an auditing session? There's a great deal of test goes into processes.

Now, the way to get around this problem is to know the fundamentals of cases and to have processes adapted to those fundamentals. Now, there are differences of cases just as there are differences of auditors and what we expect of an auditor is to be able to complete an auditing cycle – you know, with the question and the acknowledgment and so forth – hold the

session form together and take care of this particular pc's session uniformness. See, all pcs are trying to bolt out of a session one way or the other. You know, they do something else besides the auditing command and they fail to do the auditing command and you've got to have the good sense to know when to straighten out a session that is running badly and leave a session alone that is running fairly well, see. This is all in the field of an auditor's skill.

And that happens to be the irreducible minimum for an auditor. You can't go any lower than that – can't go any lower than that. You get any lower than that and you haven't got an auditor.

More, then, of randomness will be introduced into the session and into the pc than order. There's a tremendous importance to this thing called the auditing cycle. It is too often overlooked. If an auditor, (quote) (unquote) "auditor," cannot perform the auditing cycle but absolutely must Q and A – must do this, must do that, gets all scattered and dispersed, gives the auditing command in seven different versions, in seven different commands, you see: "Have... What affinity has been rejected? What affinity's been refused? Has any affinity been refused? Would an affinity be refused? Well, would emotion be refused, then? Well, what would be rejected anyway?" That's an inability to duplicate.

All right, that's perfectly obvious to you, that a person who could never master a repetitive statement of the command couldn't ever classify as an auditor.

Now, that doesn't mean you – when you're upset and tired, something like that, and busy auditing like mad – you suddenly flub, you skid, you skid on the bank, you know? You're supposed to be saying, "What affinity has been rejected?" and you suddenly say, "What affinity has been refused?" See, correct it and so forth. But you notice that the mistakes you make in that department are absolutely minimal. They're very, very few.

We've mastered that in auditing so that you think it's even ridiculous to be touching on that. Well, run a co-audit someday!

Now, your next action of the auditing cycle is to be able to acknowledge. And some auditors get on a very thin edge on this line and they think all you have to do is say, "Thank you" no matter what the pc says. They don't bother to understand what the pc says. They think if they interrupt the pc and make the pc say it again because they didn't understand it, it will upset the pc. They get a lot of considerations of this particular character and vary this, or when the pc says something they're startled out of their wits and justify what they just did, you know? The pc's saying, "Well, I thought you were awf – you looked awfully bad today." And the auditor says, "Well I-I really don't look bad, I-I just didn't have much sleep last night." You see?

Now, he's actually broken down the auditing cycle at that point and the session will suffer to that degree. Again, that isn't very serious and again, every now and then, you make that break. No auditor, including me, is proof against being startled – not absolutely proof against being startled. Because a pc says, "Well, this is why I tried to commit suicide last night," see, something like that. You say, "What?!" [laughter, laughs] Outside of your zone of reality at once, you see, you didn't know anything about this and you've been running half a session and didn't find it out, you know? Blow your brains out, see. Something like that.

And sometimes you're auditing somebody and something awfully personal comes up, or something like this, and you hear yourself – with some horror – suddenly justifying it or something like this, you know, grab yourself tight and... Well, these things happen. We can continue to seek for perfection in these things and we know how it should go, but it doesn't disqualify an auditor as an auditor. That sort of thing will go along.

But if an auditor can't cure himself of Qing and Aing, it gets pretty serious because this is very damaging. The pc volunteers – pc... well, I'll give you the most common action. Meter echoing. The pc volunteers a suppress. "You know, I just realized I just suppressed this engram." And the auditor says, "In this session, has anything been suppressed? Has anything else been suppressed on the engram?" Well, blow your brains out, man. That was an origin: TR 4. Flunk, flunk, flunk, flunk, see? Nothing drives a pc round the bend faster than this echo metering, see. Works in dating. The pc says, "You know, I think the incident was five minutes long." "Oh? Oh, was the incident five minutes long?" That's a Q and A, man. It's an invalidation. The pc says, "I think the incident's five minutes long." You say, "Okay, the incident's five minutes long." That's that. That's the end of your dating. The most precious thing your pc's got is the ability to estimate time. And you'll find out that a pc who's smoothly audited on engrams after a while gets out of dating entirely. Give him a lot of hours of very good auditing on the new running engrams by chains, and he all of a sudden will be – he'll be saying, "Well," and he'll say, "well, the incident's at 84,964,643,972 and one minute – at..." and look at his watch. And you've got to be quick on the ball, see, write it down. Sometimes it takes you by storm. You don't really – you say, "What'd you say again?" Too bad – too bad – that pc might not be able to repeat it in exactly that order and he'll start questioning it. So you have to be on the ball.

You're here – you're over here on your meter, see, you're over here on your meter. "Now, is it more than a hundred trillion or less than..." "Well, it's eighty-four trillion, nine hundred sixty-five billion..." and you've got to be right there, man. [laughter, laughs] The pc – that's one of his most precious abilities. The other one is the ability to go earlier and to return.

Now, that's very interesting, but any echo metering is a Q and A. Pc says, "The duration is – duration's about 725 years. I think it's around 725 years." Well, now you get to the borderline question. Do you now verify it on the meter? No, you don't. It is around 725 years, that is – that is a period. See, it is *around* 725 years. Makes a difficulty. And you say, "Move through the incident to a point around 725 years later," is very imprecise.

So you get around this by saying, "Move through the incident to a point 750 years later," which puts him well beyond the end of the incident. You get the idea? Or you could even say 725. Doesn't matter, as long as you don't Q-and-A.

That's all under the heading of the auditing cycle. That's how far the auditing cycle goes.

You've asked the pc, even though you were dating on the meter, how long ago was this incident. If the pc says how long ago it was, no matter what you're doing with the machinery, the pc has answered the auditing question. So that all you have left at this point is a

record and an acknowledge. That's all you've got left. Otherwise you're Qing-and-Aing and you'll be injuring the pc's ability to date and you mustn't injure that.

It's like in mid ruds, pc says – you're running, you're running protest on the big mid ruds, see. You're clear on out to Protest and the pc all of a sudden says, "You know, I just suppressed – I just realized I just suppressed the whole thing a while ago." Ah! Interesting question. You'll find the auditor who cannot do an auditing cycle asking, "Is there anything else you suppressed?" That is a Q and A. The auditor's action is TR 4 only and go on with his protest. See, origin.

Now, we're getting down to some of the weakest points of auditing. What is a Q and A? It's to question the pc's answer. I'll show you how marvelous a Q and A can be; how adroit it can be; how far afield it can be and still be a Q and A.

You've run the engram on the pc – you've run the engram. The pc didn't get anything so you realize there's an earlier beginning. So you say to the pc, "Is there an earlier beginning on this incident?" It's very interesting because you earlier told him to return to the beginning of the incident – you told the somatic strip to – and the fact that five, ten, fifteen minutes later you say, "Is there an earlier beginning on this incident?" questions the action of the somatic strip ten or fifteen minutes before. Now, we're really getting down to fine points of auditing. We're getting very nice. But it still fits within that same framework.

Even a thing like, "Are you sure you answered the auditing question?" see, an invalidation. It's also a Q and A. The basis of this is you've done something about what the pc has done. You said to the pc, "Spit," the pc spat, you say, "Did you spit?" You've done something, don't you see? The essence of all Q and A is doing something because the pc has done something – departing from the auditing cycle with new doingness because the pc has added new doingness. You then, if you understand that completely, you can break yourself of it. But sometimes an auditor doesn't recognize what he is doing in this and he doesn't realize he's breaking down his auditing cycle.

Now, these are very neat points. These are getting very, very neat. And any auditor goofs on one of these every once in a while. The worst one is the pc is trying to originate something and the auditor continues to answer it. "I said, how long is it going to be to the end of the session?" And the auditor says, "Another fifteen minutes." The pc has alr... – this is something that has gone on before, see. And the pc says, "But I said, I only said, how long would it be to the end of the session." And the auditor says, "Well, another fifteen minutes." Eventually it gets through the auditor's head that he's not acknowledged an origin because it sounded like a question. And he stacks up four, five, six, seven, eight, nine, ten origins right in a row, none of which are acknowledged.

"I said the engram was a long time ago. That's what I said."

"Yes, well, I know. I-I know, I know that's what you said. And we're still trying to get it."

"Yeah, but – but I said – I said – I said that the engram was – I just – that's all I said, was the engram was a long time ago."

"I know, I'm still trying to find it."

"No, no, no. No, you don't understand. I said..."

You get the idea? All of a sudden the auditor says, "Oh, my God! I've missed a withhold here, on the basis that he simply meant it as a comment. And he wasn't questioning the dating or anything, he just – and I ever since that time have never acknowledged it yet."

Boy, you talk about something wrapping itself around the telegraph pole, when that one gets going it has many horrible, cunning covert versions that can crawl out of some edge of the session some place and just drop ink all over everything. And you can really get one of these things going. It's wild. And sometimes they are so adroit. They're so incomprehensible that you don't wake up to what's going on and that applies to any auditor. There's always one so adroit that you won't catch it – always.

You're trying to get some items or something out of a pc and the pc makes some remark that sounds exactly like something else and the auditor takes it up and here we go. Just caught off guard, don't you see? It's – that's only unforgivable if you never catch it. You know, you can miss a withhold on a pc... now to show you how important the auditing cycle is, just about the worst situation you can get into is the immediate bypassed charge in the session. Immediate bypassed charge. The immediate. And that's the same example that I've just been giving you. Pc originated something and you bypassed it as charge by taking it up and doing something else – or do it. You do something about what the pc said. There's only one actual way to clarify this – if you think you're understand... misunderstanding it in some way, ask the pc to clarify it, you know, and in some cases it's enough to say, "Is that a request? Is that a request that you're making?" and so forth. That takes it out of the same... of the category, you see, and you get a clarification of it. Because very often the pc isn't making a request. Pc says, "It's chilly," and the auditor obligingly says, "I'll close the door," or "We'll shut the windows," or something. Well, oddly enough the pc didn't mean that. See, that's then basically a Q and A.

Now, remember there's always a certain misunderstanding can occur between an auditor and a pc. The question is: can the auditor put it right? And that is the final demand of an auditor and that's why you're there. If it goes wrong, can you put it right?

It isn't so much as "are you perfect" as an auditor. We can attempt to achieve that. But it's an absolute which is unobtainable. I can get pretty good on practicing a process of some kind or another. I can get pretty good at it. But I would never strain my brains to the point of trying to get perfect. I can get just as good as you can get and then not go to bed and cry all night because I wasn't perfect, you see.

The question is – is can you straighten it out? Or are you going to sit there in a miserable flub unable to make the thing come out right at session end? And that I should say is the final test of an auditor: Can he make it all come out right anyway?

You know, session wrapped itself around the telegraph pole. Well, can the auditor bring the session off anyway? Well, that comes under the heading of technical skill and observance of the auditing cycle. Now, modern auditing has paid a great deal of attention to this, so that today we have a process known as Routine 2H. Now, this is brand-new – at the moment it's mentioned here. But it very shortly will not be brand-new with you. The main difficulty in the handling of engrams, the main difficulty, is the complexity of the action. It's been

reduced now to a very rote procedure. As you see, particularly when you study the steps one by one, you will see that they don't depart into a lot of "Well, there's always a lot of something else you've also got to do," see, as far as the procedure is concerned. It just isn't in that category. It is a rote procedure. It's as rote a procedure as repetitive processes, practically.

Now, that's pretty much something to demand of processes, and yet there it is. Now, it runs engrams better than I've ever run engrams. So that's all I'm demanding of it and that's plenty because I was never able... I would think there's only been a couple of cases that I've ever had my hands on and couldn't run an engram on; or get him through or straighten him out by reason of running an engram. Sounds pretty wild but this runs engrams better than that. Runs them smoother. It's what I'm using with no variations right now. I've been testing it and testing it and testing it. And this is very george indeed.

And that's quite a triumph. That's been some, thirteen-some years in manufacture. Longer than that, actually. But lots of failures. Tremendous, tremendous numbers of failures in getting auditors to do it. And that became so great, as far as I was concerned at one time, that I abandoned it and it stayed abandoned for many years. The failure there was intending auditors to run engrams and not achieving it. And you go give me another failure like that and I'll turn in your thetan to the local headquarters.

A great deal had to be known data to move the thing into this particular category of a rote engram procedure, which is R3R. That is R3R. That is not running engrams, Book One.

Now, one of the things that is necessary is: running engrams on a pc is no place to learn how to run engrams on a pc. Of all processes, that is the one that is not learned by doing it on the pc. If you have no command of the time track, of knowledge of the time track – doesn't mean your own time track, that's just the basics of a time track; what are these things – you're going to tangle foot inevitably even though you're given a rote procedure. You won't have even a hazy notion of knowing where you are.

But more important than that, dating is an interestingly exact skill. And in engram running dating is combined with – as another dating, a meter action, with time in it – duration. The hardest step is duration. And that is the only one that is left in actual engram running to learn while you are running engrams, if you've got dating down first. Duration is hard to get. It is tough to get duration. You will succeed in getting the proper duration for an engram time after time and then all of a sudden you will hit a bearcat. You will lay yourself a gorgeous ostrich egg and get all tangled up and not know whether you're coming or going. And on that rote procedure, duration is everything.

So I should think any nervousness that you have in running engrams should be relegated just to this one department of duration. And your skill should already be very great in the other departments before you tackle it. Some of you are learning this the hard way right now.

Well, I'll give you some problems of duration. Had one the other night – almost knocked me own head off. The duration of the engram was a split second. Please note that that is not covered by the question, "Is the duration seconds, minutes, hours, days, weeks, months, years?" Please note: nothing reaches a split second. The auditor was working on it for

an hour. Meantime the pc skidded into another engram. See? Fantastic problems can occur under the heading of duration.

If your pc doesn't know what the incident is all about, you've got the duration wrong and that's how – that's all there is to that. There are no, no, no variations to that. Why? Now you're right here in present time. Let me call to your attention that you cannot at this moment tell me the total length of your time track. But you can tell me the length of this life. Notice that? All right, very good. You can always see the back end of the incident, then. In other words, you can get the duration of the part of the incident that is pointed toward PT. In other words, the later part of the incident is always durationable. You see that? So, you've got this fellow and you've got this fantastic situation where he's sitting there in the dark and he can see the light coming in from a window. And you run the engram again, by rote, and he's sitting there in the dark with the light coming in the window. And you run it again and he's sitting there in the dark with the light coming in at the window.

Well, fortunately for you, we don't have to depart from rote engram running. I finally got this – I just got this cracked. In all such cases the duration is wrong. He could reach, in terms of reality on meter reading, the last fifteen minutes of the ten-hour engram, which was sitting in the dark with the impression of a window. And this is quite interesting because, you see, that's the part that's closest to present time. So he can see the back end of it. So you get the duration of the back end of it. You get the minor incident inside the major incident which was sitting in the dark looking at the window.

So every time you find the pc sitting in the dark, and having been run through it once, cannot tell you about it, the duration is wrong and you simply redo the duration step. Isn't that easy? You don't vary from rote procedure at all. You don't have to do anything at all. You just redate your duration. You tell the pc, "Go to the beginning of the incident," all by rote, see. All right, "Move through the incident to the point – whatever it was – fifteen minutes later." Bang, that's all. Pc comes up at the other end and he says, "What happens?" – and you say, "What happened?"

And the pc says, "I don't know. I was sitting in the dark and I see this impression of the window."

And you say, "All right, thank you very much." And you say, "All right, we're going to see if we can't get a better duration on this incident now." Get another duration.

All right, you've got a duration now of five hours. Had a duration of fifteen minutes before. Got a duration now of five hours. Don't consider that your first duration was wrong, you've just got more incident now. So, you say, "All right, return to the beginning of the incident," he goes to five hours. He goes five hours from the end. "Move through the incident to a point five hours later."

"Ynnnaaa – some trees and then there was this window and that's all I know about it."

"All right, thank you very much." So much for that. Going to redo the duration of the incident, see?

"Seems like it's about a thousand years." And you say that's fine. Don't nag the pc; don't introduce any other commands; you don't have to do anything else. You just say, "All

right. Move to the beginning of the incident. All right." The pc's there – bang, you'll see your meter go when the pc arrives at the beginning of the incident – it always goes bang. Your meter flicks. He doesn't have to say he's there.

And you say, "All right. Move through this incident to a point one thousand years later." Zoom he goes. "Oh, well, you see, it's like this. It's like this: I was an aeronaut and I got tangled up with these astronauts, you see? And they were trying to plant ostriches on this planet." And you finally find out the end of it, he – telling you the end of it – he was sitting in a dentist's chair, he was saying, at the end of it. No, he wasn't sitting in a dentist's chair at the end of the thing. That was a ship spinning quietly down into a very hot sun, you see. That sort of flash that he kept reporting on the end was the crash. Didn't have anything to do with anything he thought it had anything to do with until you finally get the beginning of it. You got it?

All you're... you just redo the duration step. If the pc doesn't know about the incident, you redo the duration step. That's – it's just simple. It's very easy for you and a very good thing for you that it worked out that way, so I can now, of course, release the procedure. And it was... not – wasn't that so much I was waiting for, but I thought we'd have to doctor this up, you know, minor incident inside of a major incident and all this sort of thing. Well, that's too much. Fortunately it works out mechanically to be the pc will always go to the beginning of that part of the incident which he can now reach and he always goes to that. Always. And he always goes to the beginning of the duration from some point at the end. So you don't have to worry about it at all. You just repeat the duration step.

Very lucky for you, says I, says I; and you will say so, too. Very uncomplicated. Of course he's gotten charge off the end of it by moving through it once. See, every time he moves through the end section, just that little end section one more time, he's unburdened some charge. Whether he likes it or not. You could stay there and grind and put him through it about nine times, and you could turn it all bright and he'd have visio on it. Engram running no longer is barred out by the black case. Not at all, not at all.

Now, that's quite interesting. That's quite interesting because it opens the doors. It opens the doors to a lot of things. Been a long and arduous task trying to get pcs to... up the line because the only thing there is there to run is engrams. Whatever else they think there's there, there's only engrams and the machinery and so forth connected with them.

Even a GPM is just an engram of a peculiar type which needs a form to run it with, but it's still just an engram. So all this is very interesting.

The main trouble an auditor is going to have then is dating and curing ARC breaks. Because ARC breaks occur in engram handling and if you don't handle them and if you continue to give the pc orders after the pc has expressed an ARC breaky action, you are going to mess up the case. And that's the only way you can mess up a case running engrams.

I found one other thing that may be of some importance to you, before I tell you some more about that. You know most people think the mind is a very confused affair. Well, IBM does not build a computer of the same reliability or comparable accuracy of the reactive mind. It just doesn't build one that good. And far from being a confused affair, when addressed by the proper technology, the mind is an automatic card-file system of incidents all stretched out

on the track beautifully, which has no comparable counterpart in the physical universe. It is not a confused mess at all. If there's anything, it is too idiotically orderly. You *always* get the engram you ask for. The pc *always* moves to the point. There's nothing confused about it. That may be a brand-new point of view for you. You've looked at the mind as being a mass of confusion. No. Confusion isn't in the mind. The pc looking at this file system and unable to grab onto the proper file catalog thinks it looks *very* confused.

But how would you like to go into the archives of some space opera society, all of which is delivered to your hand – and these, by the way, are quite interesting as archives. Operated one about 612 million years ago, something like that, which was quite interesting. Card-file systems were all stored in a basement. And I think the basement of that computer room was about the size of Chicago. And the machines which read that occupied an area – just the machines which read it – that's, you know, the final results appeared on and so forth – looked like seven or eight Grand Central Stations. You know, just the banks of machines. And the reanalysis machines on that were all composed in a little hut that was about a thousand feet long by about four hundred feet wide.

And everything was all done on automatic card shuttles, and pneumatic tubes and comparisons. And these IBM machines down here look something like a child's hurdy-gurdy or something, compared to one of these other machines. These machines could get the finest, tiniest difference between a umph and a umph. And then they could get all things that had the tiniest association with umph and umph. You talk about your smallest and your largest magnitude of comparison – tremendous, see.

If you'd wandered into that without knowing how it worked, seeing these tremendous rows of varied-colored machines and buttons and tapes, and the wastebaskets around there just used to flood. And you would have said the devil himself can't operate this thing. Actually, all the operation it required was one single machine on a little platform and you simply asked what you wanted to know on that machine, and then it mastered the master machines which mastered the master machines which mastered the files. It's very simple.

You wanted to know how many stripes does a zebra have on the planet Xnu in the year Brfrumph of Wuf. Zoom! "How do you make a zebra?" "What is the name of the OT who originally designed zebras for this particular consolidation coordination and what were the basic faults of the design? How many zebras survived after 10,000 years in the environment of the planet Path? Are lions actually the best answer to zebra overpopulation?" All of this is statistical information, don't you see? All statistical.

Well, if you tried to build machinery that would answer up, you've got it in *Dianetics: Evolution of a Science*. The size of the machinery – something like that – it'd take Niagara Falls to cool the vacuum tubes. It would. It'd burn up enough fuel to light a city if the mind was on a computer basis. Fortunately it isn't. It achieves this fantastic and marvelous accuracy because you are quite fantastic and quite marvelous and so is the pc. That's about all there is to that. It's simply the – it's the recorded protests of time. And this stuff all wheels off and it's all timed beautifully and so forth.

And you're looking not at necessarily complicated arrangement. You're looking with the procedure, you're just looking at the master keyboard. And all you've got to do is punch

the master keyboard, it always delivers the answer. The most things wrong with engram running is auditors don't think it's delivered the answer. How many auditors say, "Go to the beginning of the incident." [pronounced very childishly:] "Are you there?" [laughing] What the hell's the matter with him? Doesn't he think he's in charge of the machine – I'd hate to have that guy driving me, you know? He gives the wheel a big yank, you see, and gives the wheel a big yank, and then he says to the automobile, "Did you turn the corner?" I don't know why he's asking the automobile if it turned the corner! The automobile can't tell him if it turned the corner. The automobile can only turn a corner.

Some people try to treat the reactive bank like an Ouija board. And you'll find some of the darnedest Ouija board questions being addressed. "Will you be clear after I've run another 300 engrams?" [laughter, laughs] See, it's a misapprehension of the device you're operating. It's not an Ouija board. You tell it to move – well, you can get your dates quite grossly, you can say, "Move to the incident at approximately 84.9 trillion trillion years ago." And the pc says to himself – says, "Eighty-nine point four? Jesus!" You know? "What a laugh," you know? "Gosh, that's a terrific date, though" and so forth.

And you say, "All right." It doesn't matter what the pc did, see, and you say, "All right. What's the duration of the incident?" And you finally get it on the meter and it says eighteen trillion years, and the pc says, [in a shocked voice:] "Eighteen trillion years!"

And you say, "All right. Move to the beginning of the incident." Clank, the meter goes. And you say, "Okay, now move through the incident to a point eighteen trillion years later," and sit back and quietly make your notes and so forth. [laughter]

Pc says, "Jesus Christ! Eighteen trillion years! God almighty! *Yaaww!*"

You don't do anything else and you're not excited about it, and so forth. Pc finally says, "Oh, well, hell, I might as well look at it!" and shuts his eyes. [laughter] "There it is, going by, man! There it is, going by!" It's only when you say, "Go to the beginning of the incident," which is at the end of the incident because the incident is eighteen trillion years long, "Move through the incident now to a point two seconds later," at the "end" of the incident. And the machine goes... [lot of laughter from audience in that paragraph]

I had one the other evening: "Move – move thirty seconds before the incident begins. Move through the incident to a point thirty seconds later." [laughter] You can't do it, you know! You can't do it. It's not possible! Wouldn't have mattered if the incident was a thousandth of a second long, you still couldn't have executed that auditing command. And the somatic strip will not execute that auditing command. It'll lock up at that point. Now you're in real trouble. You've done something extraordinary.

No, this is a very, very orderly machine you're operating – very orderly – idiotically so. Only the pc gets in your road. The pc very often says, "Eighteen trillion years long! In this goddamn thing? No!" See, you know, and the pc says, "Oh, no, that's – that's terrible."

"Well, close your eyes and watch it go by." You don't even have to say that. He will, inevitably. It's almost beyond his power to stop a properly managed somatic strip. He couldn't stop it. He sometimes keeps on chattering at you. The incident is running right on off.

No, you're actually handling a very easily handleable thing, providing you don't get incomprehensible about it, you know? Like, "Move" – double command – "Move twenty years later to the end of the incident." Pc, you'd be surprised, very often does this – tries to do it. Imagine your embarrassment a short time later when you redate this thing, reduration it, and find out that it's eighty-two years long. So you see, he just can't manage that – double orders – that sort of thing.

Well, this is all taken care of in your rote handling of engrams. The biggest problem that an auditor has – the biggest problem that an auditor has is one, dating, including duration, and the other one is ARC breaks.

Now, most auditors are afraid of ARC breaks, to some degree. And if he tries to learn dating on a pc or handle ARC breaks of a pc who is in the middle of the living lightning, you know, these two worlds – and because the pc has made a mistake and pushed the wrong button – these two worlds are now at war and he's just now being shot, having been court-martialed while the whole place is being bombed at the same time, this is not – he's in the middle of all this, you see – this is not the time, definitely, to learn how to assess an ARC break if he ARC breaks. "Let me see, how do you assess an ARC break? You say you're in the middle of this and guns are going – "Yes, I know. Let's see, how – where's that bulletin? Let's see, it says here, it says here – I don't know, I don't seem to have the assessment sheet and so forth. Where's the assessment sheet?" I'm afraid that's not the time to learn that.

No, you'll get loses. You'll get loses. Your loses will be so catastrophic that you, next thing you know, won't run engrams anymore. That's what I've got to watch, you see? Dating is difficult – finding the times of things and dating – and if you can't pick up the ARC break quickly, why, you're just licked. If you can't do an ARC break assessment for engram running you're just licked right there.

And the violence of the ARC break while the pc is running engrams is catastrophic as far as the auditor's concerned – if the auditor is at all allergic to ARC breaks – because he is now being taught that he has had a lose. He meant to have a session with no ARC breaks and here he's got an ARC break or he intended to get the pc through two more engrams and the pc isn't going through two more engrams – here's the pc with a horrendous ARC break. See the difficulties? The auditor loses.

And there's where Routine – now understand, it's designated Routine 2H – comes in and it's ARC breaks by assessment. And you're going to consider this a training process until you've run it or had it run successfully on you and then you all of a sudden won't consider it a training process anymore. You will realize that it is superior to ARC Break Straightwire. Quite interesting. And you will have that bulletin tomorrow.

Now, I'm not going to try to give you an outline of that process because the bulletin is coming right out. But what it does is just ask the pc for an ARC break – you take the ARC break and you find the bypassed charge. And then you ask the pc for an ARC break and you find the ARC break and you assess for the bypassed charge – locate it and indicate it and give it to the pc. And you'll find all of a sudden this pc starts to fly. Very complex auditing but it's very simple in its result line. And you very rapidly discover then that finding ARC breaks is very, very easy and puts you as a master of ARC breaks and so you no longer need to be

scared of them. And it gives you dating, lots of dating practice on stuff that the pc isn't necessarily very nervy about.

You know, the postman scolded them. He said, "You always are asking why I don't bring you mail." See, that's the totality of the incident. Well, the pc can hang around that for a long time without having anything happen to him. And yet you can find its date and you can find the bypassed charge by assessment. And there is a special assessment for that type of ARC break which I dreamed up and run. I've tested and gotten this thing organized and gotten the bulletin written before I'm telling you about it.

Because there's the best – the best news you've had in some time. There's practiced skill and you'll all of a sudden get very, very cocky on the subject of ARC breaks.

Now, the action of handling an ARC break during engram running is just another assessment. It's simply got other questions connected with it. And if you've already got this dusted off then the biggest liability to engram running is shut right off, right there, right now. In other words, ten minutes later you haven't got any situation at all. The pc's happy and carrying forward and you know exactly what went wrong. There isn't any dragging the heels on this. The pc isn't left in the middle of an ARC break and your sessions don't end in a debacle. That is the most damaging thing. Not being able to handle an ARC break, not being able to date and not being able to handle the time track, nobody can handle engrams; nobody can run engrams.

Now, who can engrams be run on? Well, we have our scale of cases that I've been telling you about. And then, of course, a case that has level 6 type bank – pretty difficult to run any engrams. But you can run ARC breaks on that pc. And you can boost them up and stabilize the bank one way or the other. You can do various things with this pc, and so forth, but factually engram running goes a long way if you don't necessarily call it engram running but call it R3R. Don't keep specializing in engrams because a couple of you, unbeknownst to you – to my shame I'm sure you don't know what it is – are running secondary chains on your pcs. You're not running engrams on your pcs; you're running secondaries. You assessed for secondaries and you're running secondaries. Perfectly all right, perfectly feasible. Nothing wrong. Except please don't think you're running engrams when you're running secondaries, see.

Because that's the misemotional moment that depends on the engram for its charge. So here's the engram chain and you're running the chain right up here. Perfectly fine. Wonderful. Your pc's getting off a bunch of misemotion and that sort of thing, marvelous. Set the pc up most remarkably well. Great. Nothing wrong with that. Except if you think you're running engrams you're, of course, making a basic technical error which is going to make you very puzzled sooner or later about all this.

Some others are running chains that haven't been assessed properly. At least one other. And of course the thing they're being running, not being assessed, is now branching, trying to get over to the proper chain. You know, you've taken an arbitrary chain – you're running an arbitrary chain on the pc. And this thing is trying to go around the corner and get over to the right chain. So you're not really running a chain of engrams at all. You started out on one chain and the meter is pushing it over to the chain you should be running.

Well, that's perfectly all right, but don't think you're running one chain. You're running... two chains happening, don't you see?

So to prevent this sort of thing, and to make – to put engram running into the hands of far more pcs, you shouldn't, in the first place, believe you can run engrams until you can run engrams. Just because it's awful simple, and so forth. Got a training process for it now – you'd better master some of these points and get cocky about the thing before you tackle this, because you're going the whole hill and there's no process beyond this. And you don't want to tie somebody's time track up.

So running of engrams, however, has a great deal more flexibility because you can also run secondaries; you can also run locks and they all run on the same procedure. So this gives us very shallow – shallow looks at cases. You can take a case, then, that can't stand up to an engram and you can still use R3R. And you can get marvelously forward with the whole thing providing you do your assessment properly.

Now, a proper assessment, of course, is a list, a completed list under the rules of listing of 2-12 and 2-12A. Those rules of listing are observed in that first list. Don't get an incomplete list. Not a forever list, but just list it until you've got a clean needle.

And you can dip further by assessing the eighteen buttons of the old Prepcheck. You assess the eighteen buttons and you'll be able to get people who are not-ising – who are far beyond being able to protest, they can't protest – and you'll get such things as suppress. And then you'll get a list of what they've suppressed and your list is in this lifetime. And you make a complete list out of what they've suppressed in this lifetime. And you will get a chain of something – whether locks, secondaries or engrams, we know not which – but you will get a chain that you can go down and it will release charge and will give you tone arm action. And then it reaches a lot further south than you might suspect.

Of course, when you run into the Helatrobis Implants with a dull crash, you've got to shift off R3H and go on to R3N. And if you run into some other type of GPM goal that nobody ever heard of, you've got to shift over to R3N2, see? So you've got the types of processes that handle those. And you're all of a sudden dimly aware of the fact this pc is saying, "Let's see, there's something here that says, 'Nix-nix vomica.' Yes, 'vomica, nix vomica.' I think there's some poles; they go crack. A funny engram. My head's getting very hot."

You say, "Oh, well, yes, that's very fine. That's – that's good." That was a near one, because you're going to have to run that engram with your specialized procedures which run GPMs. Get your difference? Thing for you about it is to be smart about the dates of those. The dates go from 38 to 52 trillion years ago. The earliest one I know of like that is at 315 trillion. There were some little early gags, some of the early eager beavers were in there trying to do – not the same pattern, but a positive-negative type of GPM. You don't find many of them, but you'll find that as basic on the chain on some pcs; some earlier positive-negative thing. You know, create-not create.

That seemed to get into fashion some time about then – about 315 trillion years ago. Anyway, to make up what I'm telling you here, your modern process depends to a very marked degree on the auditor and the pc both getting a win and if the auditor and the pc both can't get a win with the process, then the process is not with us long. So I've been working

very hard to make these two points mesh with one another and I think I've got it in there pretty close and I think that you will have some good runs on this sort of thing.

And I want to make this point very strongly. Processing has not necessarily done a tremendous change or shift on its know-how. But it's being rearranged because of its target area. I want to make sure you understand that. The approach of processing – the approach to processing – has been upgraded because its target has been upgraded. We're shooting the moon. We're shooting the moon, to use a colloquial expression. We are not interested in clearing anybody; we're only interested in OTs, and that's what you had been watching here for some months. My problem was simply this: The United States government – ha! – and the government of Australia – huh – decided to cut up rough. And you have some crazy lunk-heads in the Kremlin and some other birds on the other side of the world who are trying to form a dichotomy expressed with atomic fission. The time is narrowing down rapidly. The ability of governments to govern is degenerating at a great rate of speed. You're going to see nothing but chaos here in a very short period of time. I'm an old hand at watching these things go to pieces and I start to watch the square of the deterioration, *thah!*

So when *das* federal fascist state jumped us for E-Meters, I jumped them with OT. And I said the only thing we could do was hold the ground legally, which we are doing very successfully – even winning a bit. Hold that line and then upgrade the processing target. And I've been working since January to do that and this has been a very rough period. It's particularly rough on you students because it's given you a shifting quicksand of checksheets, stuff – the ink is dry on it so it must be out of fashion, you see? [laughter] But I've been moving you up very, very rapidly, and I've been holding on to you more or less for the good reason I did not want your training to be antiquated as rapidly, you see – you just no more than get trained, you go home and your training is out-of-date.

So I've been holding on to you on a stable plateau basis, and this has been a bit of touch and go. What I needed was something that could run engrams very successfully and include all of these GPMs; and a training procedure that could do that – could lead a person up to being able to run engrams, that was still a therapeutic process – and then processes which got to cases which weren't making advance on the upper-level things, but which would move those cases up to those. And what I'm announcing here is I've achieved this definite goal of mine with regard to this, and it's – the only target, the only target that I accept as an auditing target now is OT, and it's right within your grasp. It's coming straight up the line, and our campaigns for planet Earth I'm afraid has had to be speeded up considerably. And although some of you may shudder under that consideration, others will probably say, "Well, thank God, Ron finally woke up," you know? That sort of thing. We'd probably get a mixture of answers about the whole thing, but the shells and shellfire that's been coming our way is not just coming our way, it's coming in the way of this civilization. Its lights are going out very rapidly.

And sitting back and reading the newspapers, which tell you very little, you might not recognize this quite as clearly. So as far as I'm concerned we've beat the run. A lot of this now is up to you. So don't fool around with it and don't be lackadaisical about it. Let's press on, let's get the job done.

Thank you.

TV DEMO: LISTING ASSESSMENT FOR ENGRAM RUNNING PART I

An auditing demonstration given on 26 June 1963

Here we are in the upstairs studio here. This is the 26th of June, 1963 and I'm going to give you an auditing demonstration of an assessment for engram chain and will give you several of these demonstrations as we go along here in the coming weeks.

But what I want you to pay attention to, basically, is simply the simplicity of the auditing, the uncomplex nature of auditing. And you've been given so many rules in auditing about all the things you must do and so forth – of course, one must do all of these things but they're in their right place and one does these things only in their right place.

Now, the difficulties which you run into in doing this are absolutely minimal. And if you'll notice the exact auditing skills of 2-12 are used here in this assessment for engram running. The rules of listing apply and so on.

The keynote of any fairly high level case of what makes an incident an incident is protest. And to that degree we're not on terribly solid ground because I don't know that these other buttons will uniformly produce the type of engram that protest will. You see, by protesting the individual shoves his face toward something and resists it, which of course makes a very heavy mass of energy and it makes a heavy enough mass of an engram to cause that engram to be very plain and to persist. So therefore, you get a much better engram under protest than otherwise. Nevertheless, a lot of people are not up to protest, so we're going to do an 18-button assessment and use the standard 18 buttons. And then we're going to do a list – a short list – to see if on that list we find anything – we will of course – to assess for the type of engram the pc should be running.

LRH: Okay. All right. Your chair's all right there. Pick up the cans. And your chair's all right?

PC: Yes.

LRH: Is it all right if we audit in this room?

PC: Yes.

LRH: All right. Very good. All right. Squeeze the cans. All right. Your havingness is a bit down here, isn't it? Huh? Very good. All right. Thank you. Now, what we're going to do in this session is I'm going to do an assessment of these buttons, omitting Create...

PC: Uh-huh.

LRH: ...because that'll land somebody in the middle of a GPM.

PC: Right.

LRH: If we don't get anything that is banging enormously, why, we will take protest just as a matter of course. And then I'll go on and I will do a short list and assess that list and we'll see what is your proper engram chain.

PC: Right.

LRH: I've been wanting to do this with you anyway.

PC: Thank you.

LRH: All right. Is it all right with you if I begin this session now?

PC: Yes.

LRH: Very good. Start of session. Has the session started for you?

PC: Yes.

LRH: Very good. What goals would you like to set for this session?

PC: To work well.

LRH: Right.

PC: And feel the benefit of the session at the end of it. To find out what it is on this chain, what the assessment is. That's it.

LRH: That it? All right. Thank you. All right. We're going to go into this immediately here and find out what we've got. And we're just going to assess these 18 buttons, less created. Okay?

PC: Right.

LRH: I'm just going to read these off to you rapidly and see what we have here. All right. Okay?

PC: Yes.

LRH: All right. In this lifetime, have you mainly suppressed things?

In this lifetime, have you mainly invalidated things?

In this lifetime, have you been careful of things?

In this lifetime, have you mainly suggested things?

In this lifetime, have you mainly withheld things?

In this lifetime, have you mainly protested things?

In this lifetime, have you mainly protested things? All right.

In this lifetime, have you mainly hidden things? Have you mainly hidden things?

In this lifetime, have you mainly revealed things?

In this lifetime, have you made mistakes? All right.

In this lifetime, have you mainly asserted things? In this lifetime, have you mainly asserted things? All right.

In this lifetime, have you mainly changed things?

In this lifetime, have you mainly damaged things? In this lifetime, have you mainly damaged things? All right.

In this lifetime, have you mainly withdrawn from things? All right.

In this lifetime, have you mainly destroyed things?

In this lifetime, have you mainly agreed with things?

In this lifetime, have you mainly ignored things?

In this lifetime, have you mainly decided things? Have you mainly decided things? All right.

Now we have a few left in here. I'll go over this rapidly.

Now, anything you'd care to say or have you thought of anything with regard to this you'd like to tell me?

PC: I just thought when you were going... started, I was thinking blimey, I've done all these things.

LRH: Oh, I see.

PC: But...

LRH: Yes.

PC: ... nothing else.

LRH: All right. Now let's go over this list again. In this lifetime, have you mainly suppressed things?

In this lifetime, have you mainly invalidated things?

In this lifetime, have you mainly been careful of things?

In this lifetime, have you mainly suggested things? All right.

In this lifetime, have you mainly hidden things?

In this lifetime, have you mainly damaged things?

In this lifetime, have you mainly decided things?

All right. We have two left in here. In this lifetime, have you mainly invalidated things?

In this lifetime, have you mainly decided things?

All right. I have to ask those two again. Any thoughts with regard to them?

PC: No, I know you've always said um – you once said to me, "Decide" is your button, rather heavily. I do – I'm inclined to decide. This seems more real than the other one, anyway, to me.

LRH: All right. Very good. Any protest on the other one? Little bit.

PC: Well, what I thought of, I just wondered whether there's any protest on it; and, of course, there would be. But then in that case I would have thought the protest button would have stayed in as well, that was the thought I had.

LRH: Oh, all right. Very good. Thank you. All right. In this lifetime, have you mainly invalidated things? Have you mainly invalidated things? Still there a tiny bit.

In this lifetime, have you mainly decided things? Well, Decided is really – really staying with us a bit here.

PC: Uh-huh.

LRH: Now let me sort these out, again. In this lifetime, have you mainly invalidated things? Latent.

In this lifetime, have you mainly decided things? All right. In this lifetime, have you mainly decided things? Yes sir, that's your button. Very good. All right?

PC: Yes, well, your adjudication must have been very good.

LRH: [laughs] Well, is it just because of my adjudication?

PC: No, no, no.

LRH: Doesn't read. All right.

PC: It's very good.

LRH: I just didn't want anybody to think that I had simply evaluated you into that position.

All right. Decided. Now we're going to do a little list here.

PC: Uh-huh.

LRH: You're accustomed to these. [LRH is writing down some notes for around 35 seconds.]

All right. We've got a question here. Let's see if it reads. In this lifetime, what have you decided? Doesn't read very good. In this lifetime, what have you decided? That's got a little tick. Anything wrong with that question?

PC: Just the things I have decided – um – I think this goes back to when – on the boat, when you said something about decisions, that there was no... I was asking you... self-determined changes that you – and, you know, we sort of came up with you wouldn't – you couldn't really decide these things, you know. There's very little we decided. I think I'm on the right button here; I may have got it mixed up.

LRH: Oh, well, all right.

PC: Something like that.

LRH: All right. Very good. In this lifetime, what have you decided? All right. Let's see if we can't get a slightly better question here.

PC: Can I just say one thing here. It's possible – I'm just wondering whether I use the word "decided" as "emphasized." "It's a decided change," you know? People use this word "decided" in that way, or I – in my circle, it's been used quite a lot.

LRH: Oh, I see.

PC: Instead of to make a decision. It's used, you know...

LRH: Hm.

PC: ... it would be an emphatic or quite distinct change.

LRH: All right. All right. Okay. Well, we're going to use this question anyway.

PC: Uh-huh.

LRH: In this lifetime, what have you decided?

PC: All right.

LRH: All right. So just answer the question. In this lifetime, what have you decided?

PC: I decided to get married.

I decided to change a job.

I decided to join the scouts.

I decided to leave school.

I decided to go into business.

Um – I decided to – um – leave home – I meant my childhood home as it were, parents home.

LRH: Uh-huh.

PC: Just a little cognition here, that a lot of my decisions are made as a result of a – of an ARC break of some sort. Um – you know, there's been an upset and then I'll decide to do something. Normally I just go along placidly. But then when I'm stirred up then I'll make these decisions.

LRH: Uh-huh.

PC: Um – decided to go to camp once, that came up, with the scouts. Um – decided to gamble on occasion. Decided to invest money. Decided to buy a car. Here's a big decision: decided to – uh – get a commission in the army. Decided to join the army.

LRH: All right.

PC: Well, there's the old goal come up: decided to leave my wife.

LRH: Uh-huh.

PC: Um – decided to have – um – children.

Decided to go into business on my own account.

Decided to come into Scientology.

Um – decided on people's characters.

I've decided people's motives.

I realize I use intuition a lot for decisions, what I call intuition.

LRH: Uh-huh.

PC: Um – conclusions and so on. Yes, that's another meaning of the word "decision" is a – is a conclusion, rather than something to do – an action.

LRH: All right.

PC: Um – oh – decided – this was quite a big decision – decided never to have a dog again. That was following the loss of a dog.

I decided I was capable, but that wasn't a decision – I don't get the decision to be capable, if you see what I mean.

LRH: Uh-huh. Uh-huh.

PC: Um – decided to leave the scouts.

I've decided to eat.

LRH: Right.

PC: Decided not to drink. I might have tried not to drink much or not do it ever – but there were decisions on that.

Um – I decided to be honest.

I decided to be truthful.

I decided to be generous, I remember.

LRH: Uh-huh.

PC: And then – then on occasion I've decided to be mean.

Decided to grow sweet peas.

Decided I'd have an electric organ.
[laughs]

LRH: Very good.

PC: Decided to have – um – um – good clothes.

Decided to have a good appearance.

Decided to go to America – to visit.

LRH: Uh-huh.

PC: Decided to play tennis.

Decided to try to – to try my hand at golf.

Decided not to play cricket. That's not in the colloquial phrase.

Uh – um – decided not to play team games – that's interesting.

Decided to play cards.

Decided never to keep chickens.

LRH: Never to keep chickens.

PC: Yes.

LRH: All right. Thank you.

PC: My mother used to keep them in the First World War and I used to have to feed these blasted things, and in the cold of the morning go down in the garden with flocks and flocks of the crazy hens. Ah, I decided...

Decided never to be poor. Um...

Oh, many a time as a boy I decided to give up masturbation.

LRH: All right. Got it.

PC: I used to think I was the only boy who did it, you see. Nobody ever else – nobody ever told me.

Um... well, I decided to pull strings, particularly when I was in the army I used to do this.

LRH: Uh-huh.

PC: And with some success.

LRH: Uh-huh.

PC: Um – then there's a decision somewhere that I would not like to – not to go to a tropical country.

And a decision not to go to a very cold country. It flashes across here – I must have been very careful where I landed on this planet because the climate of England suits me very well. I must have, you know.

LRH: Uh-huh.

PC: Other people seem to be able to move around quite happily. But I like the English climate. Uh...

At one stage I decided to take up politics. That's a decision I didn't carry out.

LRH: Uh-huh.

PC: I realize that many of my decisions I've – most of my decisions I've achieved. Whatever I've decided, I've carried out.

LRH: Uh-huh.

PC: And I was just looking through to see, well, there must be some, you know, that I haven't. Probably suppressed them or something. But...

LRH: Uh-huh.

PC: ...there don't seem to be many.

LRH: All right. In this lifetime, what have you decided?

PC: Well, I decided to go to – I think you used to call it the clinic at – for auditing.

LRH: Uh-huh.

PC: Then I decided to go with Pearson privately afterwards.

I've decided to audit, on many occasions.

LRH: Uh-huh.

PC: Decided to be a preclear on many occasions.

Um – I've decided to drive a car carefully.

I've decided to sell a house.

I've decided to buy a new house.

I've decided to treat myself – um – to – um – well, luxury on occasions.

LRH: All right.

PC: Uh – this is possibly the one – decided not to bother on occasion. Decided, decided it wasn't worthwhile. Decided it was no use.

An early decision not to get angry.

Somebody dislocated me arm on the one time I did get angry; that taught me.

LRH: Okay.

PC: Um – well, there was a decision early in life to make a lot of money. I – I remember making it. Um – there was a decision to be apathetic – I think I may have given you that already.

LRH: Hm?

PC: I think I gave you that one.

LRH: Uh-huh.

PC: Um – decided to tolerate things.

Uh – decided to look at things.

Oh – um – decided to know where to find out.

LRH: Okay.

PC: Um – decided never to be hasty – a point of judgment there. Decided to "look before I leap" is the saying to cover that. I've decided not to bother with detail. Decided to have many things. Must be a decision knocking around not to sell – um – things I've used. Um – well, there's – a very big decision was – to deci... I decided to disobey an army order. Which I did, too – got away with it. Um – I suppose, really, that was in contradiction to the decision to obey in the army, there was – there would be a decision to obey that I've made. To be disciplined, in other words – decided to be disciplined. Uh – I decided to discipline. Uh – decided to control and decided to be controlled. Um – decided to laugh. Decided to cry. Uh – decided to ride a bike. Uh – and I think there was a decision not to ride a motorbike. I never got on with a motorbike. Uh – decided not to work – not to be a manual worker. Decided at one time to be a chemist, but it never came to anything. Oh, yes, and decided to be a policeman. Decided to get up early. Oh, yes, there's a decision to be punctual. Just thinking I was writing a goals list, but it's not a – it's not the – it's not quite the same as a goals list because this is something you can think about to do immediately rather than a goal is something that's for the future.

LRH: Mm.

PC: There are goals – there is an element of goals mixed up with this.

LRH: Mm.

PC: Oh, decided to make batteries at one stage in my life.

Um – decided to print a magazine.

Uh – decided to build a brick wall once.

Well, I've decided to go for a walk.

Decided to go to bed.

Decided to sleep.

Decided to write.

Decided to write a book.

Decided to organize things.

Decided to manage things.

Decided to be clean.

Oh, I decided to take a drink – first alcoholic drink – quite a decision on that.

LRH: Okay.

PC: Oh, I've decided to do cross-word puzzles.

Decided to read the paper.

Decided to live.

Decided not to die.

Let me just blow my nose.

LRH: You betcha. [Pc blows his nose.]

PC: Well...

LRH: Hm? Go ahead.

PC: I was – must have decided to – uh – sell, uh – um – hm, I forget the name – the sphinxes – they weren't actually sph... big idols.

LRH: Yeah. All right.

PC: Um – decided to be obstinate.

LRH: Okay. In this lifetime, what have you decided?

PC: Oh, sorry. I'd forgotten the question.

LRH: That's quite all right.

PC: There's only one – one that I'd missed out on there.

LRH: Yes, I got it.

PC: Well, I decided to sell insurance.

LRH: All right.

PC: Um – I decided to fly, I mean travel by airplane.

Um – oh, decided to be good.

Decided to be loyal.

Decided to be unselfish. That decision was for a selfish point of view because I realized that, even this – at a very early age, that if you're unselfish you're being very selfish, really.

LRH: Oh, yes.

PC: But I made that decision.

Decided to go and have me head examined; I once went to a phrenologist.

Um – oh, yes, decided to play the drums. Oh, you never heard of that. I once had a set of drums I used to play.

LRH: Is that so?

PC: I never got very good.

Um – decided to play the piano.

Decided to try to write a decent hand.

I say, this is very therapeutic. I feel very bright and pleased with myself. I mean, I realized what a busy bee I've been. Um – I can well see this is my button, too. I was just – just looking this over, what

would life be without, you know, decide things! That's life, man, you go around – you go around deciding things, that's what you're supposed to do.

Um – I decided to buy a new tennis racket.

I decided to open a bank account.

I decided to close a bank account.

I decided to have a checkbook.

Uh – decided to have a blazer.

Decided to have a telephone.

Oh, I decided to be extravagant.

Decided to forgive... people.

Decided I hate people, some people.

Um – decided to be a teetotaler or a total abstainer.

Decided to be thorough.

Just remember running a preclear on decide and – uh – with this preclear, decision always – always carried with it a choice. You decided either to go home by bus or you decided to go home by car. You see? This was a decision, there was always a decision of that nature. There was always a choice, as we say. I found this rather strange. Well, didn't you just decide to go home, was the decision that I thought was right. And – uh – I just had a quick look at that – I was wondering was I screwy on this or was it a choice?

Um – I decided to put up a building. Started to make another building – add another building to it.

Decided to have – um – account-card equipment.

Decided to have a car. This was a specific car, it was quite a thing.

Oh, and on one occasion – this was after this phrenologist had worked me over a bit – decided to buy a book.

Decided to have a holiday.

Decided to go on a holiday.

Decided to come home from the holiday.

Decided to have glasses.

Decided to have teeth out.

Decided to have false teeth.

Decided to have drip-dry shirts.

LRH: All right.

PC: Um – decided to be – to pretend to be ill once.

Decided to talk to people.

Now, at one time, I dec... no, that was a realization, it wasn't a decision.

Well, I've decided to talk in public.

LRH: All right.

PC: Now there is a decision that comes on that has to do with the last one: it's a decision not to talk in public. And this comes on just when I started to talk in public.

LRH: Oh.

PC: Now, let's get out of there.

LRH: All right. In this lifetime, what have you decided?

PC: Decided not to go bathing.

I suppose I've decided to get cross with people on occasion.

Decided to be persuasive on occasion.

Decided to have a nice office.

Decided to have a good looking secretary.

LRH: Okay.

PC: Um – well, I decided to sell a building.

I decided to buy and sell some land.

Decided *not* to sell some land immediately – not to immediately sell, some land.

Decided to be active.

Oh, decided to have a nice garden.

LRH: Okay.

PC: Um – there was a decision as a boy to be a very competent pianist. That was too hard work – that was a decision that I didn't achieve.

Hah! I once decided to learn to play the cello.

LRH: Uh-huh.

PC: Forgotten about that one – I used to sit with the old cello between me legs, scraping away! Um...

You – you see, all – the whole of your lifetime there you decide. You decide to go out to the car, you decide to open the door. And it's just – life is just one – one damn decision after another.

LRH: All right.

PC: So it goes on. Um – decided to dig up the garden.

Um – there's a decision not to be beaten – I don't mean beaten physically – not to be beaten in a contest or anything, not to give way to adversity, in other words.

A decision to persist or be – no, not – to be persistent is the...

A decision to try to understand people.

Oh, I decide to take a bath. Um – to not take a bath. To stay at a hotel. To live in – on the Saint Hill Green. To be uh – good mannered on the road.

Some of these decisions sound, um – I want to say, goody-goody. I'm not apologizing for them. They – um – some are very selfish ones. I mean, you don't get far by being angry when you're driving on the road. I mean, you get much farther by being polite.

LRH: Uh-huh.

PC: At least I've found so. Ought to be polite.

This one will amuse you: to be a gentleman.

LRH: Well, okay.

PC: I think I've decided on occasions to be eccentric, but not very much or often.

Um – to run an efficient business.

To be efficient.

LRH: Okay.

PC: Hm. I know Je... Anne's running me on a chain of "to be critical." But I can't – I would have said the decision of this life was not to be critical.

LRH: All right.

PC: I – I probably am critical – I think the decision would be – sort of found meself that way – um – on occasions.

Um – to observe – could be I decided to observe.

To win. And I've decided to lose on occasions.

LRH: Okay.

PC: To be a man of integrity, I think, was one of my childhood decisions.

LRH: Okay.

PC: I once – I once – once, long – long – long while ago, I decided to put on weight and I was even drinking milk by the gallon for a long while. It had no effect. Uh – Decided to have a camera. Decided to take photographs. Golly, what a list.

LRH: All right. All right. Want me to check this off?

PC: If you'd like to.

LRH: All right. In this lifetime, what have you decided? Well, that seems awfully clean.

PC: It ought to be.

LRH: Well, it's just gone clean in the last couple of minutes.

PC: Uh-huh. Good.

LRH: And it looks like the list is nullable. All right. Okay. Now we have completed the list, which is all we have any time for. How do you feel – how do you feel about all of this?

PC: Well, it's fascinating. It's – uh – I never thought I'd have got so many. It's uh...

LRH: All right.

PC: I feel very – I – I don't know why, but I feel quite clean. It seems this is quite a cleansing operation.

LRH: All right.

PC: Uh – there you are.

LRH: All right. Well, we'll nil – null this list or get it nulled.

PC: Uh-huh.

LRH: And everything will be fine. Okay?

PC: Right.

LRH: Anything you want to say here before we end the body of the session?

PC: No.

LRH: All right. Well, that's the end of the body of the session. Okay.

Have you made any part of your goals for this session?

PC: What were they?

LRH: To work well.

PC: Yes. It worked very well.

LRH: All right. And feel the benefit of the session at the end of it.

PC: Certainly.

LRH: Yes. All right. And find out what is on this chain.

PC: Well, something I haven't – we haven't made a lot – we found out a whole – the whole list is on the chain of course, yes. All right.

LRH: All right.

PC: Yes, we completed that.

LRH: All right. Very good. Now, thank you for making your goals for this session.

PC: All right.

LRH: All right.

PC: Very good.

LRH: Any gains you'd care to mention?

PC: Well, as I say, I feel a lot brighter. It's uh – an excellent scan over one's lifetime and several cognitions, as

you know, en route, which I told you about. And I've enjoyed doing it.

LRH: All right. Is that it?

PC: That's it.

LRH: All right. Well, thank you for gains in this session.

PC: Right.

LRH: All right.

PC: Thank you.

LRH: Okay. We had a rather clear fall on havingness a little bit earlier. Let's see what we've got here now. All right. Squeeze the cans. Ah, you're having a time here on havingness. We'll have to run a moment's Havingness now. What is your Havingness Process these days?

PC: Touch.

LRH: All right. Thank you. All right. Put down your cans. Okay. Touch that sign.

Thank you. Touch the tablecloth.

Thank you. Touch that can.

Thank you. Touch that can.

Thank you. Touch the top of the telephone.

Thank you. Touch the table.

All right. Very good. Pick up the cans. Let's see how we're doing with this. All right. Squeeze the cans. Ah, yes, well, that's increasing a bit. Squeeze them again. Yes, that's increasing it a bit. All right. Put your cans down and let us run some more of it. All right. Touch that ashtray.

Thank you. Touch that telephone.

PC: This one?

LRH: That's right. Thank you. Uh – touch the cord to the cans.

Thank you. All right. Touch that gold inky.

Thank you. Touch that ashtray.

Thank you. Touch your necktie.

Thank you. With your right hand, touch your left hand.

Thank you. With your left hand, touch your right hand.

Thank you. All right. Pick up the cans. All right. Squeeze the cans. Oh, that's fine. That opened it up and your havingness is now more than it was at the beginning of the session. Okay?

PC: Good.

LRH: You all right?

PC: Yes. Feel fine.

LRH: All right. Is there anything you'd care to ask or say before I end this session?

All right. Now, you've seen a listing demonstration. I wish to call to your attention that I just kept listing until I got something like a clean needle.

Now, some of you can exaggerate this and get your rudiments out or get an argument going with the pc and keep your needle dirty. But in actual fact, the needle ought to clean up in relatively few pages of listing. And as you saw it, this one did. Now, that might possibly require a few more items listed there, just to make sure – something like that. It all depended on how easy that list is to null. If that list is very easy to null, why, of course, you do – just go on and null it right on down. And it should null down rather easily.

Of course, when you get that list item, when you get the item on the list, well, you ask for engrams which decide so-and-so, or cause of such a decision and you run the chain and you find the pc would be able to run these things.

If you noticed, some of these items were fairly hot. You noticed also I was not looking for rocket reads. I wasn't looking for rock slams. I wasn't looking for any peculiar needle phenomena. You'd find most of that would pass away. These things will not continue to rocket read just because they are goals.

You also noticed the pc gave several goals out of the GPMs. Well, that's all right, because if they did read as the final item on the list, I would simply do Routine 3N and clean it up. And it's as simple as that.

PC: Yes, thank you very much.

LRH: All right. Is it all right with you if I end this session now?

PC: Yes. Thank you.

LRH: Okay. End of session.

PC: Right.

LRH: Right. Has the session ended for you?

PC: Yes.

LRH: All right. Tell me I'm no longer auditing you.

PC: You're no longer auditing me.

LRH: Very good.

PC: Thank you very much.

LRH: Okay.

All right. I want you to notice in particular the general lack of strain on the Model Session, the simplicity of it more than anything else. And notice the addition of the fact – this may be new to you – that the pc was carefully acknowledged when he made his goals – that was, after each goal was acknowledged, and then after he'd given me the gains, which were all acknowledged, why, he was then acknowledged for having made gains in the session.

Well, what if he hadn't made his goals at all?

Well, I would have said, of course, I'm sorry you did not make your goals in this session and if he hadn't given me any gains – I'm sorry you have no – had no gains in this session. That's still an acknowledgment and you'd found... would have brightened the pc up in either case.

Well, what if he made some of his goals and didn't make some others of his goals?

Well, I'd just say, thank you for making some of your goals for this session. I'm sorry you didn't make the others. Similarly with gains if you have a mixed bag.

All right. Well there – there you have a demonstration of finding an engram chain on a pc using the 18-button Prepcheck list with "Created" omitted, naturally, because it goes straight back to a goal and – possibly, you'd even get away with it, you know – what would you find? You'd just find the goal and you'd have to run 3N. And there we have a Model Session. And this, of course, is the first step of Routine 3R.

All right. Thank you very much.

Good night.

TV DEMO: LISTING ASSESSMENT FOR ENGRAM RUNNING PART II

An auditing demonstration given on 27 June 1963

Okay. Here we are on 27th of June, 1963. Almost didn't remember it without you to tell me. And surprise here today – I'm going to finish up this demonstration on the preliminary step of R3R. And as you know, we already had a list and we listed this list more or less to a clean needle. May have to add to it, but maybe not. And we will carry on from that point.

Now, the listing step, as you can see, is not dissimilar to any of the other listings that we have been doing. My only fear is that somebody will get a big protest or the rudiments madly out on the pc through very complicated sessioning and do one of these eighty-nine-page lists, down to God help us. But in some cases it may be necessary to do rather a long list. All right. So there it is.

LRH: Okay. Move ahead a little bit there. Good. Thank you. All right. Is it all right if we audit in this room?

PC: Yes, yes.

LRH: Very good. Pick up the cans. All right. Tone arm seems to be up here higher than we had yesterday.

PC: I think I was a bit harassed yesterday getting the TV room ready by the time...

LRH: Hm?

PC: I was quite a bit harassed yesterday getting the TV room ready and chasing around on it. I had to do that so...

LRH: All right.

PC: ... without any comfort.

LRH: Okay. All right. Squeeze the cans. Thank you. Your havingness is up. All right. Now, what we're going to do here is complete this assessment on R3R, which we did yesterday. Okay?

PC: All right.

LRH: All right. So is it all right with you if I begin this session now?

PC: Yes.

LRH: Okay. Start of session! All right. Session started for you?

PC: Yes.

LRH: Okay. What goals would you like to set for this session?

PC: Well, to complete the list quickly, if necessary. To work well. Not get in the way of the assessment.

LRH: Yes?

PC: And feel the benefit of the session at the end of it.

LRH: Okay. Very good. Got those. All right. Now I'm going to do my missed withhold step here because we're going to be assessing.

PC: Mm-hm.

LRH: All right. Have I missed a withhold on you? All right. May have.

PC: Oh, yes. Um – yeah, it was in the – oh, yes, it was to do with an auditing folder you looked at today. And you said that the instructions hadn't been carried out carefully.

LRH: Oh, yes.

PC: But I was responsible for the instructions not being carried out carefully because I misled the auditor slightly by suggesting this was what he should do.

LRH: I see.

PC: And I didn't say anything to you at the time.

LRH: Oh, all right. Very good.

PC: I just let it go.

LRH: Okay. All right. Have I missed a withhold on you? Well, there seems to be some disturbance on this.

PC: This is to do with uh – what I thought of then was um – the man you were talking about downstairs at work. Um – I just wondered whether – wondered what you thought about my using him.

LRH: Hm.

PC: As you know, didn't know whether you were really pleased about that or not.

LRH: All right. Okay. All right. Have I missed a withhold on you? Well, it bangs on missed withhold. What about missed withhold, just in general, just the idea of missed withhold? Protest?

PC: Possibly that um – uhm – I think this is a situation that I'm in – peculiar situ... auditing situation that I'm in, inasmuch as being an instructor out on the course that there are certain withholds one has from the students and uh – that one, you know – don't want to bring them up. And I think that is possibly – might be a bit concerned and why I'm protesting and worrying about that.

LRH: All right. Very good. Very good. All right. Missed withholds. Missed withholds. Yes, there's something about missed withholds. I'm talking now not about what missed withholds you've got...

PC: Uh-huh.

LRH: ...but some upset, perhaps, connected with just missed withholds. Any upset connected with them? Not that you have, particularly, but just...

PC: Well, I know it might be that on sessions that I've had before that I've known missed withholds have been around and I didn't want to spill them on the – on the air.

LRH: Uh-huh.

PC: Not so much that I wouldn't tell you about them, but that uh – possibly committing overts in the session in doing it, you see.

LRH: I see. I see. All right. I got that now. Now let me check this question here again. It'll probably be all right. Have I missed a withhold on you? Well, I do have a tick here. You get what the question is, it's have I missed a withhold on you?

PC: Yes, I do. I'm looking, too. Um...

LRH: There. There.

PC: Well, that I was thinking of the um – track map that I – you know, the track map I showed you today...

LRH: Uh-huh.

PC: The only thing I thought of was I suggested doing this on a continuous roll of paper and you suggested doing it on a cylinder. Do you...

LRH: Um-hm.

PC: And I didn't know whether you had thought that I'd thought of the cylinder or whether you hadn't really understood that I'd suggested it on a continuous roll of paper.

LRH: Uh-huh.

PC: The cylinder was the better idea. And uh – that's all I thought of there.

LRH: All right. Very good. Have I missed a withhold on you? Oh this is getting into heavy wire here. The thing is ticking there.

PC: Hm.

LRH: There. There.

PC: Well, I've only seen you a little since our last session. I mean it was clean – presume it was clean last night.

LRH: Yeah.

PC: So, um – I only saw you for...

LRH: There. There.

PC: Well, I was thinking of when I came in just now and uh – you and Nick had had a Coke and I hadn't and uh – I don't think that there's – I wasn't upset about it, I just thought – and...

LRH: All right.

PC: I don't know what the missed withhold – what you missed there, actually. I was wondering – I know, I was wondering whether you were going to offer me one and uh – I thought, well I don't really want one just now before I go up for session. And uh – I just wondered whether you'd noticed it, I suppose. That's the only thing I could think of there.

LRH: All right.

PC: If that would make the meter bang, I don't know.

LRH: All right. Okay. All right. Very good. We'll get you one after the session. [pc and auditor laugh]

PC: Thank you.

LRH: Okay. Now let me ask you this question again and make sure it's clean. Have I missed a withhold on you? Well, it dirties up the needle. Is there some fear or anxiety here? There's an anxiety.

PC: Hm.

LRH: All right. On this question, is there anything you've been anxious about?

PC: Well, I'm anxious that it doesn't hold up the session. And, uh – so on.

LRH: Uh-hm.

PC: Actually what I thought of was that, uh – well, I came up to get the session ready...

LRH: Uh-huh.

PC: ...and uh – I checked over it and I thought you got everything you want – wanted. And then – blow me down – you want some paper, you see, at the end, and I wondered whether you thought I'd been lax in not seeing you'd got some paper to write on. I did go and get you some auditor's reports that I noticed you hadn't got.

LRH: All right. All right. Very good. All right. Have I missed a withhold on you? Bang.

PC: Well, it's these cans again then. I brought these cans up, they're different from the ones I had last night.

LRH: Yes.

PC: And when you said the uh – um – when you said the uh – meter was – reading was different, I thought perhaps the cans had made it different. You know, that they'd been...

LRH: Oh, I see.

PC: ... different cans.

LRH: I get you. I get you. All right. Okay. Have I missed a withhold on you? Still bangs.

PC: Well, I feel...

LRH: Is this question being protested? Yes.

PC: I feel particularly clean. I don't – I'm sure you're...

LRH: When did you start protesting the question?

PC: I think I started at the beginning of the session. When you said you were go-

ing to start pulling the missed withhold. My thought then was, well, perhaps it's the list that is make – roughing up the needle and not – not uh – the missed withhold.

LRH: Oh, all right. Very good. All right. Does the missed withhold have to do with the list? Seems to be. All right. Have I missed a withhold on you? I've still got a bang. There. There.

PC: Well, that is that I – in the session yesterday I was saying that I didn't get many withhold – many decisions that I didn't carry out. Since... just our – in between sessions I've thought about this and there have – and I have realized there's quite a number of decisions that I haven't carried out.

LRH: Oh?

PC: And just before the session began – I think I was sitting here – and these came to mind. You see? And it's the sort of thing I was going to tell you was that – that I thought would probably come up. Well, I've often downstairs – something's happened, you see, on the course, "I'm going to see Ron about it, I'll do this that and the other and I'll decide to do all this," you see, mock up everything I'm going to do and then, of course, the next time, a few hours has elapsed, the thing is all sorted out and there's nothing to it anyway and I don't. So I sort of decide – there's another decision not to do that.

LRH: I see.

PC: But it was a bit of a withhold inasmuch as you would not know I sort of get into this state sometimes and try not to take you by storm.

LRH: All right. Very good. Okay. Let me check this question again. Have I missed a

withhold on you? All right, that's clean.
Okay?

PC: Good.

LRH: All right. Very good. Now, we have this list here. And I'm going to go into this now.

PC: Uh-huh.

LRH: And what we had here was a question "In this lifetime, what have you decided?" All right. And I thought this list was probably complete. And I see now that the question bangs.

PC: Uh-huh.

LRH: So why don't you give me just a few more items here. In this lifetime what have you decided?

PC: Well, here's one that I – that was complained to me. That I hadn't decided – that I deci... I decided to live with Jenny in the Saints. This was complained about. It's probably the missed withhold as well. Probably a missed withhold.

LRH: All right.

PC: Um, well, I've decided not to row with people.

LRH: Yes.

PC: To um – decided um – to take things in their stride.

LRH: All right.

PC: Um – to accept things as they are.

Decided to um – handle problems.

Decided not to solve every problem that – not to solve every problem that came along.

Uh – decided not to overfinance my children.

LRH: Not to...

PC: Overfinance my children.

LRH: Good.

PC: Um...

LRH: Good.

PC: Oh, yes. Decided to – yeah – see, decided to use a – to use smiles. That's right.

LRH: Good.

PC: Uh – this is one I made in the first job: was decided to have a clean collar and a clean pair of shoes, always. This was um – a bit of advice that a manager gave me. It was quite good, actually, because you do that and the rest of you seems to get tidied up.

Decided to audit.

To run.

To play table tennis.

[laughs] To take my organ to a party. [LRH laughs] Perhaps somebody will ask me to play it.

LRH: Oh, dear.

PC: Oh, dear.

LRH: All right.

PC: Um – decided – I don't know if this counts really – but decided that I was a bad handwriter.

No, these seem to be real, they don't seem to be dreams, but, anyway, decided that I was shy.

LRH: All right.

PC: Decided I couldn't uh – talk in public.

And decided I could talk in public.

Decided I was more able than most (conceited pup).

Um – decided that I was right um – more often than I was wrong in business.

And then earlier on – this makes it sound silly with what I've just given you – decided not to be conceited.

LRH: Okay.

PC: Want some more?

LRH: Well, yeah. In this lifetime what have you decided?

PC: Yes. Uh – decided uh – that when I had nothing to say, to say it.

Decided to go camping.

Decided to be an analytical chemist once.

Decided um – that um – on the whole people are honest.

Decided I didn't like bathing – swimming, in that sense.

Decided to play golf.

At an early age, I decided to do something about making the world a better place to live in.

Decided I was a good teacher.

And also decided to teach.

Decided to um – go on a B.Sc. Course. And Scientology courses, anyway, would cover that.

I once decided to build a radio set.

LRH: Okay. How are you doing.

PC: All right.

LRH: Let me get the brief mid ruds in there on this question.

PC: All right.

LRH: All right. On this question, has anything been suppressed? Yes?

PC: Well, what I suppressed was, I said – I gave you, decided to audit and uh – there was a decision before that not to audit a particular individual. And then decided to audit. I suppressed that.

LRH: Mm-hm.

PC: Um – I don't get anything else in the way of suppressing anything in the session.

LRH: All right. I'll check the question. On this question, has anything been suppressed? It's equivocal. On this question, has anything been suppressed? No, apparently not. On this question, is there anything you've been careful of? Yes?

PC: I've been very careful to give everything that came up. And sometimes I suppose I've given unnecessary ones, but anything that's come up I've given you.

LRH: All right. Very good. On this question, is there anything you've been careful of? All right. That's clean.

On this question, is there anything you've failed to reveal? Yes?

PC: I've failed to reveal people's names sometimes.

LRH: All right. On this question, is there anything you've failed to reveal? All right. Latent. Is there anything you'd care to say about it?

PC: Just wondered whether it was clean.

LRH: All right. Very good. On this question, has anything been invalidated? Yes?

PC: Probably invalidated Jenny by bringing that one up, the first – uh – the first question I – first decision I gave you today.

LRH: All right. Very good. On this question, has anything been invalidated? All right. It's latent.

PC: I was just thinking then about uh – I was saying I was conc... I gave you one and said I was conceited. That was invalidating myself to some extent.

LRH: Oh, all right. On this question, has anything been invalidated? All right. That's clean.

On this question, has anything been suggested? Yes?

PC: Well, that answer – the first answer was suggested to me out of session by Jenny.

LRH: Oh, all right. All right. On this question, has anything been suggested? All right. That seems clean.

On this question, has a mistake been made? Yes?

PC: Uh – I wondered where the – I'm not quite sure what the um – actual meaning of the word decide is. I was trying – I did come across this when I was giving you "decided thats" instead of "decided to."

LRH: Mm-mm.

PC: Looking at it, I thought well, in both cases it's sort of making up one's mind – either about something or to do something.

LRH: Hm-mm.

PC: But I was just wondering whether I was mistaken in doing the – answering the question on the – rather "about," rather than "to do."

LRH: Very good. All right. On this question, has a mistake been made? Yes? Another one.

PC: I made a mistake yesterday by uh – going – getting something off – outside of this lifetime.

LRH: All right. Okay. On this question, has a mistake been made? Another one?

PC: I can't think of one.

LRH: Question being protested? Yes.

PC: Is it? I hadn't realized. I hadn't realized I was protesting the question.

LRH: All right. Let me check this again. On this question, has a mistake been made? There is a mistake.

PC: The only thing I can say is that one answer I've given you must have been a mistake, but I can't recall the actual question or the actual answer.

LRH: All right. Very good. On this question, has a mistake been made? We've roughed it up here. Am I cleaning a clean? In some way? Do you think there must have been a mistake?

PC: Well, it's the only thing – I'm groping there. I can't – I can't see how a mistake could be made. I'm find – having difficulty finding out how a mistake could be made on this question. It could only be in my answer. I don't think you'd have given me the question wrong or made a mistake.

LRH: Oh, all right. Very good. Let me check the question again. On this question, has a mistake been made? Is this question being protested?

PC: It's being puzzled about.

LRH: Being puzzled about. All right.

PC: New rudiment for you.

LRH: Okay. On this question, has a mistake been made? We're going to leave that. It uh – was much cleaner that time.

PC: Mm-hm.

LRH: We're just going to leave that. Not worry you to death with it. I'll recover it if necessary.

On this question, has anything been protested? Yes?

PC: Possibly protesting the length it's going on. It seems to be going on – there's a lot more items coming out. And uh – I decided there shouldn't be many more items.

LRH: All right.

PC: That was a decision that was...

LRH: All right. On this question, has anything been protested? All right, that's clean.

On this question, is there anything you've been anxious about? Apparently.

PC: Anxious about the number of items – answers I'm giving and whether I'm – I was answering correctly.

LRH: All right. On this question, is there anything you've been anxious about? All right, I didn't get a read then.

Now, on this question, has anything been decided? Yes. Like mad.

PC: Well, it's been deciding – well, I decided to give you some of these other form of – form of answer to the question.

LRH: Oh, I see. All right. On this question, has anything been decided? Looks clean. All right.

Now, let's check the two that we messed up on here. On this question, is there anything you've failed to reveal? Yes.

PC: Oh, I did s...

LRH: There.

PC: Well, I didn't go into detail on uh – some of – some of the answers I gave you. I didn't go into detail on what sort of thing I was coming to storm into your office protesting vigorously.

LRH: All right. Okay. On this question, is there anything you've failed to reveal? All right.

I didn't get a read that time. This thing seems to still be hot.

PC: Uh-huh.

LRH: "Question" seems to be hammering here. Is there something wrong with this question? "Question" reads, just the word question all by itself. Not taking up interim, minor thoughts.

PC: Mmm.

LRH: But that's what's dirtying up these rudiments here. What about question? There it is.

PC: Well, the only thing I thought of then is – perhaps I'm not sure exactly what the question means. Um – does the question mean... The question on the question is, uh – is it decisions to do or decisions about, is it a case – a case of what opinions has one formed or what has one decided to do?

LRH: Mm-hm.

PC: That's the only thing that I could question on the question as it were.

LRH: All right. All right. Question. Question. Still a little bing here. Now we won't worry about that: I have no business doing this. I could... bad form.

PC: All right.

LRH: I'm trying to get this clean if I can. All right. On this question, is there anything you've failed to reveal? There is a failed to reveal.

PC: Well, um...

LRH: There.

PC: Well, there must be lots of decisions that I haven't revealed to you.

LRH: Uh-huh.

PC: To answer the question. Some possibly – I don't think I've monitored my answers very much – but possibly some minor things that I've done, some of them seem ridiculous things to put on the list, anyway, that I haven't given you.

LRH: Ahhh!

PC: And uh – so on. And I was just wondering, you know...

LRH: That cleaned it.

PC: All right.

LRH: All right. On this question, is there anything you've failed to reveal? All right. Equivocal. On this question, is there anything you've failed to reveal? And now I roughed it up by saying it was equivocal.

PC: Oh? Is it?

LRH: It was tiny latent. Were you worrying about whether it read or not?

PC: No, I was just stuck – just looking at uh... I was sorting – I was figuring, I apologize, I was looking to see what – how I'd given you a failed to reveal and then I realized that I had given you a failed to reveal and I hadn't revealed that in the session.

LRH: All right. Very good.

PC: The fact that I'd given you some apparently unimportant or insignificant decisions.

LRH: Mm. Mm. All right. Very good. Clear the question again – I mean – I'll ask

the question. On this question is there anything you've failed to reveal? There is a bang now.

PC: Hm-mm.

LRH: What does this mean: an incomplete list? Is this list incomplete? All right. In this lifetime, what have you decided? Actually, it isn't the question that is reading.

Now, while you were listing here, did you at any time say, oh well, no need to put that on the list? Oh no, no need to put that on the list? Is there any of that?

PC: I possibly did it. I can't recall doing it.

LRH: You don't recall doing this. Well, there's no sense in harassing you to this degree.

PC: Some of them that I gave them to – when I gave them to you I – no, I gave them to you – that's silly putting that on the list.

LRH: Oh, all right.

PC: It wouldn't have been – I didn't know – giving you things that I didn't think need be on the list.

LRH: All right.

PC: Not that way.

LRH: Okay. In this lifetime what has been decided? All right. Good. We are going to try to null this list. If we get into trouble we can always add to it. Okay?

PC: Right.

LRH: All right. We're just going down the line here, one right after the other, see what we've got. Okay?

PC: All right.

LRH: To get married. Change a job. Join the scouts. To leave school. To leave school. To go into business.

All right. This list is not complete. Okay.

PC: All right.

LRH: Sorry. Gave you all that trouble and the list simply wasn't complete. Okay?

PC: All right.

LRH: In this lifetime what have you decided?

PC: To be uh – to do well at school.

LRH: Okay.

PC: To cross the road.

LRH: All right.

PC: To ride a bike.

LRH: Okay.

PC: Uh – to look after my dog. Um – to get my dog better.

To earn some money.

To have sex. To masturbate. To stop masturbating.

Oh, not to swear in front of my parents.

To obey the scout law.

Oh, to be a chauffeur.

To be a teacher.

To win a scholarship.

To have fun.

To go to school.

To be independent.

To help others.

To be gentle.

Uh – to bluff.

LRH: Okay.

PC: To get up early. To gather conkers.

LRH: All right.

PC: To gather horse chestnuts, which is a terminal that was run on me for ages on an ACC.

Um – to see my father regularly.

LRH: Okay.

PC: And to stop seeing my father regularly.

To paint pictures.

To draw a church.

LRH: To what?

PC: Draw a church.

LRH: Okay.

PC: Oh, to kill a chicken. Poor chicken. I did it on one.

Um, oh, to um... Something's happened. This room's gone very much brighter all of a sudden.

LRH: Hm.

PC: To uh – hm, oh, to foster spiders.

LRH: To foster?

PC: Yes.

LRH: Good.

PC: Or to let them thrive. Rather – let them run alive, that's right.

LRH: All right.

PC: Foster describes it.

Um – to act.

To learn to play the piano.

To join the air force.

To listen to music.

Um – not to read too much.

To be entertained.

LRH: To what?

PC: To be entertained.

LRH: Got it.

PC: And to entertain.

LRH: Right.

PC: To be a good host.

That people make themselves unnecessarily ill.

LRH: I didn't quite get that.

PC: This is...

LRH: Oh, that people.

PC: That people make themselves...

LRH: Got it.

PC: ...unnecessarily ill. One of these "that" decisions.

To have a nice office.

Um – to have a nice flat in Telesurance building.

To live in nice surroundings.

To have a good garden.

To make a carpet.

To make a cupboard.

To build a terrace.

To plant some trees.

To grow roses.

To have a nice car.

Not to have a Bentley.

Not to go fishing.

Not to hunt.

Not to ride a horse.

To go to church.

To join a choir.

To have this session.

LRH: All right.

PC: To answer your questions.

LRH: All right. How are you doing?

PC: All right.

LRH: All right. Let me take a crack at this now. And see what we've got here. Okay?

PC: All right.

LRH: I'll ask this question.

In this lifetime what have you decided? Yes, clean as a wolf's tooth. Okay. Now, let's see if we can't get a bit of this nullled here, shall we?

PC: Mm-hm.

LRH: All right. We'll go over it from the beginning again. To get married. Okay. Change a job. All right. It's jumping on each one: Is there anything you've thought about this nulling or listing?

PC: Well, on the – it came up last time that on "to get married," you know? Which is – I've got strong views on marriage now. And uh – I just thought that was a damn silly decision, you know.

LRH: Oh, all right. All right. Very good. Okay. Change a job. To change a job. All right. Join the scouts. All right. You had another thought regarding this list?

PC: I saw you move the tone arm right around and I wondered what on earth had happened: had I gone right round off the meter or something?

LRH: Yes, you've done it twice, if not three times.

PC: Have I!

LRH: You've cut the pie all the way around.

PC: All right.

LRH: All right. Join the scouts. To leave school. Any other thoughts?

PC: Well, I'm still – sorry – um, I'm still on this one, "to get married," for some reason or other.

LRH: Yeah, that's right.

PC: That's very interesting, because this was the goal when I arrived on this course originally, was to leave my wife and so on. It's a terrific thing on this marriage thing.

LRH: Hmm.

PC: Hm. All right. I'm sorry, I'm sort of uh...

LRH: No, that's quite all right.

PC: ... dwelling on it a bit.

LRH: No, that's quite all right.

PC: Uh-huh.

LRH: It's okay. To leave school. To leave school. All right. We'll still – banging on everything here. You still got the marriage or are you suppressing that? No.

PC: No, I was – looked at "leave" on that time.

LRH: All right. To go into business. All right. To leave home. To leave home. All right. To leave home. To go to camp. To go to camp. To gamble. To gamble.

PC: I had a bit of a cognition that may be fouling things...

LRH: All right.

PC: Uh – on "to leave," again, the – a decision to leave is always very difficult...

LRH: Hm.

PC: ... for me. I just realized that when you were going through.

LRH: All right. Very good.

To gamble. To invest money. To buy a car. To buy a car. To get a commission in the army. To join the army. To join the army. To leave my wife. To leave my wife. To have children. To have children. To go into business on my own account. To come into Scientology. On people's characters. People's motives. Never to have a dog again. Never to have a dog again. I was capable. I was capable. To leave the scouts. To eat. To eat. To eat. Not to drink. To be honest. To be truthful. To be generous. To be mean. To grow sweet peas. To have an electric organ. To have good clothes.

All right. Well, this list is incomplete.

PC: Uh-huh.

LRH: This list has to be added to some more. That's quite all right. There's nothing wrong with that. Except that everything is banging. I thought I might possibly pass through a period when it wasn't banging.

PC: Yes.

LRH: But we have got an incomplete list here, which is perfectly all right. And although the question tested clean, that doesn't always make it so. Okay?

PC: Uh-huh.

LRH: All right. Now we'll have to get that list completed.

PC: Uh-huh.

LRH: All right. But it is not complete yet.

PC: Understood.

LRH: But you've done a total twice, if not three times.

PC: Uh-huh.

LRH: All right. Is it all right with you if that's the end of the body of the session today?

PC: All right.

LRH: Okay.

Now, have we made any part of our goals for this session? To complete list quickly.

PC: Well, we tried hard. We didn't make it completely. Because it's incomplete.

LRH: All right. Work well.

PC: Oh, yes.

LRH: All right. Not get in the way of the assessment.

PC: Yes.

LRH: All right. And feel the benefit of the session at the end of it.

PC: Well, I certainly – I feel very bright. And I told you, the room – place suddenly – everything's gone – something's gone. I mean...

LRH: All right.

PC: ... something's shed.

LRH: Very good. Very good. We went through it again. All right. Nothing wrong with that at all. All right.

Thank you for making your goals for this session. I'm sorry you didn't make the first one. Okay?

PC: Okay.

LRH: All right. Are there any gains you'd care to mention?

PC: Well, it's this feeling some – so bright and – well, it's extraordinary – I just can't really get it over to you – over in words. It's...

LRH: Hm.

PC: Certainly mass has gone. That's uh...

LRH: Ah!

PC: That's what's happened.

LRH: All right. Very good. All right. Thank you for your gains in this session.

PC: Thank you.

LRH: Okay. All right. Now let's see if we can get a can squeeze here. Squeeze the cans.

All right. Your havingness is down. Put your cans down please. We'll run a little bit of Havingness.

PC: Right.

LRH: Okay. Your Havingness Process is "Touch that." Okay?

PC: Yes.

LRH: All right. Touch that sign.

Thank you. Touch that ashtray.

Thank you. Touch that can.

Thank you. Touch the other can.

Thank you. Touch the top of the telephone.

Thank you. Touch this neck of the lamp.

Thank you. Touch the table cloth.

Thank you. Touch the table underneath the table cloth.

Thank you. All right. Touch the gold lettering.

Thank you. Pick up the cans.

All right. Squeeze the cans. Okay. Let's do that again, squeeze the cans. Very good. Your havingness is well up. That's fine. All right. That was the last command.

Okay. Now, is there anything you'd care to ask or say before we end this session?

PC: Yes. Thank you very much.

LRH: All right. Good enough. Is it all right with you if I end this session now?

PC: Yes.

LRH: Okay. End of session.

PC: Thank you.

LRH: All right. Tell me I'm no longer auditing you.

PC: You're no longer auditing me.

LRH: Very good.

All right. There we have that session demonstration. And – finish up my auditor's report here – and you saw a pc go through seven, approximately four or five times. Very interesting. I call that to your attention. The TV set was jumping there for a little bit: I had to hold it still. Now, sorry.

But the trouble here is simply routine. Of course, with these very short sessions it's very unfair to the pc. It very often requires more than one two-an-a-half-hour session to finish a list. And this list is not complete. And you saw me – and I did this for your benefit more than the necessity to do it – but you saw me put in all the mid rud buttons, you saw me chivvy around with the question – with the word "question," which, by the way, you would not ordinarily do in a session. But I wanted to show you the source of the reads. All right.

We cleaned all that up, didn't we? That was all clean, everything was fine and this pc was still going tick-tick here a little bit. But we went back; we tried to null and everything was in and so we added to the list and we got to another clean period. And then we once more tried to null and I nulled further than I ordinarily would have, just to show you how extreme it is. Actually, a list ought to be in a condition – it ought to be in such a condition that everything just goes out, out, out, out, out, out, out, out, out, until you leave one in.

Now, there is the demonstration. And I tried to show you the – that if you haven't got a complete list, it doesn't matter how many mid ruds you put in, how much you harass the pc, you won't get yourself a clean needle by which to null. And you don't go on with this kind of nonsense of harassing the pc because everything is staying in and nulling everything down, you see, leaving everything in and then going over it again and going over it again. Well, the list is not complete.

Now, actually that means, essentially, that the item is not on the list. And as far as speed of nulling is concerned, you could almost finish up this list and then just take the last pages after this session that were done – I'm telling you an extreme step now – and just null those and you would find that it's on it. In other words, he hasn't put on the key word yet. And that's what this is all about.

So, anyway, you saw a dirty needle and that dirty needle was caused, as I demonstrated to you, purely, totally and only by just the one thing of a incomplete list.

Now, if you fail to complete a list on a pc, don't be surprised if your pc ARC breaks and so forth. Now, the reason the pc doesn't ARC break between sessions when you have an incomplete list on the pc is very elementary, because the pc expects the list to be completed. So the charge has not yet been missed. But if you tell a pc that the list is complete and you

start nulling endlessly without completing the list, of course you get the ARC break right in the teeth.

Now this is – this list is, as I said, incomplete. It needs completing. And when it is complete, why, it'll null very, very easily. I don't know how far this list will go. We do happen to be treating a button which is peculiarly susceptible to a long list.

All right. Now, there is your demonstration. And you are still watching a preliminary step for engram running. Okay?

And our thanks to the pc. Give him a hand. Thank you. And thank you very much. And good night.

THE FREE BEING

A lecture given on 9 July 1963

Thank you.

Well, I'm glad to see you, too. The horizon is looking wider open; all you've got to get is good. Well, let me – let me put it a little more mildly, I'm afraid I might have frightened you there. All you've got to get is perfect. [laughter] That's all.

This is what? This is the 9th of July?

Audience: The 9th.

All right, 9 July AD 13, Saint Hill Special Briefing Course.

Now, this is the place you've been coming to, the last few trillion trillion years. [laughter] That's right. That's right – been heading down the track, right for the Saint Hill Special Briefing Course.

Last time you were on that pole you said, "There must be someplace." [laughter, laughs] And here you are – here you are.

And it's my job to make something vaguely resembling a successful auditor and make it possible for that auditor to do a good job of clearing – clearing up the track and straightening up. And if we hadn't waited so long, we'd find it much easier – quantitative proposition. If we just hadn't waited quite so long, we'd find it much easier.

But the state of civilizations, and the general combat that has occurred here and there and every place, has rather put things in abeyance. I can't imagine us doing anything practical in the middle of the Roman civilization, can you? And about the only psychotherapy they had in medieval times was the rack or the lead boot. And general attitudes have been pretty poor.

Furthermore, I don't think any of us have been brought to a point that we realized we had failed and that there had been a failure. That's sometimes necessary for somebody to do something about something.

And what we're doing, actually, so you won't be in the dark, is we're closing out a very long cycle, of – a long, losing cycle, tremendous length – of the OT. The cycle of loss, of the OT. And a being, now, had come to a point where he believed – and couldn't do otherwise – the only safe place to be was in one of these meat-body civilizations, complete with airplanes, and that that was the more or less winning side of the ledger, and there was no real possibility of being free of that economic duress, be these two-bit games, these accelerated aberrative conditions, as they march forward. There was no going and sitting on a mountaintop quietly

for a few thousand years and catching your breath. The fight had been lost, in other words. In other words, a strata and quality and character of life had been lost. That is a defeat.

You don't see any OTs walking around right now. Well, it's very peculiar that they reach almost to modern times – almost to modern times. As you audit pcs, you'll be quite surprised now and then to find one that was OT, five hundred years ago.

You look on this normally as something that occurred on the very, very far backtrack, something that occurred in the dimmest beginnings of history, but in actual fact, this is not true at all. These reach right up practically to present time, but losing all the way.

There was no method of retaining and maintaining a stability.

The condition of OT in this universe became looked upon as highly dangerous and highly unstable. You could stand around an airfield batting the airplanes down as fast as they rose, you know, and so they couldn't serve as theta traps and all this sort of thing – and walking all over the buildings and that sort of thing. And the next thing you know, a sleep light was going and somebody was saying, "Sleep. Sleep. Sleep. Create. Be solid." And it was a losing war. And a very interestingly losing war, because it was lost by the most powerful. That's what's peculiar about this war.

Any one of you within a relatively few hundred trillion years, probably could have taken this planet and touched the north pole lightly and that would have been that. You'd probably even show me the proper stance you would use to slow a planet down, as well as to take one, throw it out into the freezing dark and put it back on its orbit again without any meat bodies to clutter it up. Interesting study: How do you knock off all life on a planet but trees and plants? Just how do you pull an air cover?

Well, these are studies of the greatest magnitude – the greatest magnitude possible of *force*. There has not been any force wanting at all.

And eventually here you sit, and what are you doing here? Well, what you are doing here is you're in a meat body, and you see the airplanes flying around overhead, and you realize that the continuous association with a meat body is just a continuous concatenation of collecting engrams like mad and keying in things like crazy and it is the downward spiral with accelerated jets behind it.

What made that condition? How come this took place?

Well, all battles are won by a combination of two elements, and these are force and intelligence. And given enough force, of course, there is no opposing side – everybody hopes. The United States, in World War II eventually got up to the idea of a small task force had to practically raise the level of water of the Pacific Ocean before they would make an attack. Tremendous – tremendous force. Tremendous force.

And, of course, you take something like an atomic bomb that can obliterate an entire country, that is tremendous, tremendous force. And it succeeds in short-term wins – short-term wins. And that is all you ever get from tremendous force, is a short-term win, never a long-term win. Never.

The long-term win is achieved by a balance between force and intelligence. Now, intelligence alone in active action is not enough. The wise men of Tibet, were just a few years

ago driven out of their mountain fortresses by the dumbest infantrymen the world has known for some time. Isn't that interesting They were infinitely wise, and their infinite wisdom brought them total defeat.

So, when you take these two elements, if you are sometime trying to solve the problem of whether you did right or whether you did wrong, take these two elements and look them over in relationship to what you did, and you'll find out that there is an imbalance in any defeat. There was an imbalance of intelligence and force, and these two things were out of gear. You're either using all force and practically grasshopper-intelligence or you're using monumental intelligence and saying "God will protect me," forgetting at the same time that you were the only god around to do any protecting.

It is sort of pathetic, this OT sitting down on the Vatican steps saying, "God will protect me," when he may very well have started the whole myth. Where does he think he still is?

Now, all of your losses were contributed to by these two elements out of balance. And any coordinated civilization plowing forward, using technology, combining that technology with force, keeping some sort of balance between these two things, can make a monkey out of an OT, literally: There was an implant four galaxies over that taught you you came from apes. Darwin – that's the whole of the Darwinian theory is implanted there in the course of about a day, and everybody bought it. You know, you come up through the mollusk and sloth and ape and all this sort of thing, and there's not a damn word of truth in it, see. It has nothing to do with it.

You want to know what happened to these intermediate forms? Well, thetans have different tastes and there are fads of one kind or another. And some OT, he sort of liked this idea of cave-men society, and you get these *huge jaws*, you see, and *hairy bodies*, and women being hauled around by the hair of their head, and all that sort of thing. It's rather barbaric taste, but exotic, you know. [laughter] Exotic. They get a whole civilization moving forward like this, you want to call it a civilization, you know.

You want to know about the evolution of man from treetop to cave. Well, there was a... there's one form of that civilization in treetops and there's another form in caves. There's no evolution between the two, although you can draw these things very carefully. It all depends who was here and who was putting the bodies in the place. That's your evolution. Therefore, these things would baffle an archaeologist if he suddenly started comparing it all and if the carbon-atom deterioration factor had anything to do with time, which it doesn't.

I'm watching this with the greatest – with the greatest of interest, how they have made up some kind of an artificial winging gimmick by which they can measure a nonexistent time. And this planet, you see, is brand-new and it's only a few million years old, and you know that ain't old. That's a lie, you know, that's a lie. Used to run the biological survey in here 612 million years ago and, you know, get reports on this place. But that was the style then, see. And they start digging these things up and looking for this and that.

The deterioration of matter is not as fast as they think it is, nowhere near as fast as they think it is. You can sit for a trillion trillion years and watch the ebb and flow of seas and geological formations and various things happening, one kind or another. And when you scan through it very rapidly, why, there's a sea, there's a desert, there's a sea, there's a desert; there's

a mountain range, you see; there's a canyon that goes through the mountain range, now there's no canyon going through the mountain range. See, get the idea? *Flick-flick-flick-flick-flick-flick-flick-flick!* But that matter is still there and it is still the same sand.

We haven't got a deterioration of matter and the vanishments of suns. And the... these suns up here have been burning since – wow! I know they have been burning to my own personal knowledge, they've been burning for the last two hundred trillion, the existing collection of suns in this immediate vicinity; two hundred trillion years is looked upon as a fantastic length of time.

But I remember in grade school, in this lifetime, they used to teach us that the sun was full of hydrogen and sooner or later the hydrogen would burn out and the sun would go out, you see. Well, this thing about the sun going out is just a way to scare kids to get them to go to sleep, see. It's a lot of nonsense.

They say, "Well, look over there, there's a sun that did go out." No, it was never lit! [laughter, laughs] Or whoever made it got distracted that day or was working on union hours or something; he just never finished it. He went off – he went off to pick up a new bank of Magellanic radioactive particles to throw at it and ignite it and got distracted by a butterfly or something, you know, and never came back and turned it on. These things don't go out.

In other words, we're looking at a – we're looking at a tremendous number of misconceptions and we're looking at a vast number of unintelligences, see. These are pure stupidities. But these stupidities themselves form a kind of trap, and they're intelligent in their application in cohesing a society. If everybody remains ignorant in the society, nobody can get out of it, can they? So there's nothing left for them but to cooperate somehow or another, or keep that society going one way or the other. So, ignorance itself is used as an intelligent mechanism of entrapment, and to this is added force, and you get all sorts of odd combinations.

So, we have a sort of a medium structure floating along through this particular universe. And that medium structure is a balance of intelligence – if very warped intelligence – and a balance of mediocre forces. And these two are a sort of a mean level, and they make these meat-body societies and the automobile and the airplane, and they get up as high as the spaceship, and they don't progress any further than that; they go right to there and that's it. If they progress much further than that, they disintegrate, and if they fail to progress at all, they disintegrate. And you've got various factors influencing it.

But the societies repeat themselves over and over continuously. You have Roman societies and medieval societies and Elizabethan-England societies. And these pattern societies thetans get on a kick of, one way or the other, and they build these things up.

There's Arabian societies – I was on a kick on Arabian societies one time or another. Never build anything without minarets and turbans, you know. You got to have the minarets, turbans and harems. Then you got it all set, you see. Oh, marvelous.

And those things – those things appear in sequence or they – just one sits there and it lasts for a long time.

But beware of a planet in which there is as much progress as you find this particular planet. This planet has gone through the phase of the prop aircraft in something like twenty-

five or thirty years, see. It's gone all the way through the era of locomotives until they are now in a terrible decline. Various forces are at work on this particular planet which are unusual, in the extreme. They are very unusual and that makes this planet very restive.

One of the reasons for this – and I won't say it's the only reason for this, but the only reason I can lay my hands on at the moment – is this planet is being used as a dumping ground. If – you'll find this Sun 12 is very distant. It's way out on the rim of a galaxy. And it's very handy to other galaxies, and it's very handy to the center of this galaxy. Nothing against anyone's character and it's nothing really that anybody did; he just happened to get picked up in that scoop that day and that was it. And it's been used as a dumping ground – a rather consistent, continual dumping ground – and it's being used as a dumping ground right up to this minute.

Now, this of course gives you a very heterogeneous type of society; you have enormous elements of one kind or another – all of them running relatively uncontrolled. There is no master hand guiding all this, but everybody feels that there must be a master hand guiding all this because there's so much trouble. No. When a master hand is guiding things, there isn't any trouble; things are calm. It's only when the master hand doesn't guide things that there is trouble.

And, for instance, a society normally has some thetan around someplace, and he's kicking some mock-ups together one way or the other, and he's kind of figuring on things, and he's playing a game one way or the other, and it keeps going for a long time. And he gives it some indifferent attention and it never changes; he doesn't see any reason to change it particularly. Some other thetan comes along and he says, "Well, we'll have a fight." So he makes up some mock-ups and he makes up some diseases to feed to the mock-ups that the thetan has already mocked up, and so on. And they get these two in collision one way or the other, and they have some wars and battles and so forth. It's rather mildly interesting and they don't pay too much attention to it. Eventually, they both go off and forget about it, and the whole thing goes to pieces.

That's the normal, crudest look. You could say they're very dedicated, earnest, severe looks, but I am afraid the attitude has been quite comparable to a child's making up a little play town – the attitude quite similar to that: meat bodies and mock-ups.

Well, when you take bodies which have been mocked up and thetans who have been indoctrinated in very definite lines – to fight, to do this, to have certain types of societies; to do this, to do that, to do the other thing – and then they get scooped up from this galaxy and that system and this star and here and there and the other place and are dumped in on one system as unwanted merchandise, you have these tremendous impulses which are at work, one against another. And it works up a lot of heat of friction. You have such a society here at this particular time.

This society belongs nominally to the Espinol United Stars. This is Sun 12, and it is one little tiny pinpoint. Their whole title is Espinol United Stars, pardon me, Espinol United Moons, Planets and Asteroids, this part of the Universe is ours, Hup!

But this, yeah, "This quarter of the Universe is ours," it translates better. "This quarter of the Universe is ours." And it's so much quarter of the universe, and this is so lost in the

middle of it that there's been no command post occupied for this system now since 1150 A.D., at the time when a group on Mars was finally abolished and vanished, and so forth, and nobody took any interest in this system. This system has been running wild since that time.

You notice at that time we had a sudden resurgence in (quote) "science," we had a sudden resurgence in this, that or the other thing. It became an uncontrolled civilization. And since that time has been used (and was used before this, of course) consistently as a dumping ground because nobody pays any attention to it. You don't have scout ships coming out to meet your transport that is dumping ice cubes in the Pacific Ocean, you see. There... it's a very handy place – it's like the city garbage dump with no cop to tell you, you can't dump there, see? And there's nobody alert, there's nobody doing anything on this planet to debar this sort of thing. And it's quite interesting that you have represented here samples of many societies in many times and places and impulses which are quite fantastic.

Probably the most basic impulse on the planet is simply the basic impulse of thetans, who have been reduced to more or less a meat-body level, which is total cooperation – total cooperation with one another. Total, as you see in the communist thing, as you see in democracy. "We are all equal," you see. "We are all equal: there must be no personalities of any kind, the cult of the personality must be banished, what we really are is equal." And they've sort of come back to this because that is a common denominator of their indoctrination. They are indoctrinated to the idea that they have teammates, and from this, you see, you get this other equality factor. You might not agree with that particularly, but I'm just giving you some kind of a sketch here of the things as they are.

Now, why did you arrive in the condition you are in? This is all this leads up to. It wasn't actually that... anything specific that you did. Yes, you have overts; yes, these overts combined into certain motivators being more forceful upon you than otherwise. But even if you hadn't had overts, you still would have gotten the motivators. You would have dreamed up something as an overt, don't you see?

The oddity here is simply that if all this has happened to you and you've been punished, then you must have had – been punished for some reason. See, you're still trying to be reasonable and intelligent about it, and this doesn't happen to be true at all. The only reasons you were ever punished was for being you, for being powerful and for not being quite intelligent enough. And that's – that's the only reasons you were ever done...

The exact crimes were to be there and to communicate. Those were the two crimes.

Now, what happens – what happens? You can look way back on the backtrack and you can find that some OT came along and decided that he'd put together a civilization of some kind or another, figured it all out to the last notch, you know, and had total curbstones and the hairdo and everything else. He had this perfect, you see. And, some other thetan came along and started chipping away at him, or something like this, or started talking to him, or started putting up mock-ups on the other side of the planet, see?

So this would go on. And to get even – to get even with the other thetan who was attacking his pet society, something like this, he would indoctrinate his pet society in how to trap a big thetan. So this became the most accomplished skill that a meat-body society has, is how to trap a spirit.

No OT was so ever out of his mind as to depend upon any of his men or troops to trap him. He never indoctrinated them to do that, because at the time he was doing this he never thought he would be caught. I consider this as – huh! singularly unintelligent.

For instance, Frankie the Limper, over there, during the 30s, he wrote out a big check. He wrote out a big check. He only thought in terms of billions and things, and he wrote out this three billion dollar check and he handed it over and he says, "Build an atom bomb, and there you are, wipe out cities and so on."

Well, the knucklehead, he had Congress under his thumb, he had everything under his thumb, it was all set and roaring to go. He could have written out another check for three billion dollars and given it to another group and said, "Build a defense for an atom bomb." But you notice he didn't do that. See what I mean?

He said, "Build an atom bomb. Here's three billion dollars." He didn't say at the same time, "Here's three billion dollars, build a defense for an atom bomb." So, you lay into a meat-body society the skill to trap a thetan. Why don't you teach him how to free one, see?

It isn't this universe, it isn't that you have atoms, it isn't that this has happened and that happened and the other happened, or that you weren't right thinking and didn't join the OTs' YMCA when you had a chance. That's all irresponsible thinking. You were just knuckle-headed. I mean, let's face it. You had unlimited force but there was not as much intelligence invested as there was force invested.

Now, you say it's a very intelligent thing to be able to put together an atom, be able to make matter, being able to make almost ever-burning radioactive fire for suns and all this sort of thing; to be able to erect tremendous space, to be able to figure out the biological cell perpetuation on the second dynamic – all of this – seeds, how do you make them? All that. See, this is terribly complex.

You had to figure out how to make the various things, the various enzymes and things like that, that cells convert to become this and... very complicated. Very! Well, then you say, all right, that's a fantastic amount of intelligence – the intelligence of doing things that is usually assigned on this planet to God.

There's a film. The film shows you the vastness of the universe and the miraculous works of God and the greatest things and the smallest things, and that sort of thing. Simply a tribute to the workings of an OT, nothing else. Not sacrilegious: fact.

Now, yeah, you say, "Well, that was very intelligent, very intelligent." Completely knuckleheaded. You never worked out how to unbuild anything. Do you get the – get the unbalanced action.

How do you pull the plug on this complicated made atom? How do you pull the plug on it, see. How do you say, "Proton negatron nuncus," see, and it goes boom. It ceases to exist. Well, the whole thing was an insistence on enduring matter – enduring matter that was to endure forever. Well, that's not smart. Eventually some of that stuff was made into a theta pole; that's the pole you've been on. Confounded things last forever.

You know, it's possible, I can tell you that it's possible to be trapped for over thirteen and a half trillion trillion years. That's interesting, isn't it?

Well, all the technology of entrapment – my God, the technology of entrapment is just, oh, a vast catalog! I could tell you ways of trapping thetans and oh, and so on – just taken off the track, you know. Technology. Oo-ooh! You run into it running the whole track; it's quite a technology. How do you fool a thetan? How do you make him curious? How do you do this? How do you do that? You know? How do you soften him up? How do you do all these things? A vast amount of work put in on this subject. And no work – no work put in at all on how do you free one, see.

Total technology of freeing one: You reach over on the trap and pull the guy off of it and throw him out in space to cool off. That requires a what? That requires an OT. What if there isn't any? That's an interesting question, isn't it?

So, here you had the atom bomb with no defense for the atom bomb, which was continuous matter, and continuous technology of entrapment and teaching civilizations to entrap and so forth, on and on and on endlessly, teach-teach-teach; force-force-force; more matter made, more endurance to the matter, more lasting qualities to the matter. Some space opera societies make any metal that appears here on this planet look pale. Even the society has worked on the refinement of elements to a point where... Well, a spaceship – trying to dent a spaceship, it might have an almost paper-thin looking hull, and the stuff sheds asteroids and so forth – little meteorites and space dust, and so forth, it just sheds them.

A space wagon travels in the terms of the trillions of light-years in a day. Einstein's nonsense is just some more of the ignorance by which you get trapped: You can't go faster than the speed of light. I don't know, I'm never in contest with a photon myself.

The teleportation is a pipe dream, too. It's usually... it's the way you mock something up here and then make it disappear there and then mock it up over there and say, "See, I've teleported it from here to here, see, without going through the air." And it's marvelous, you see. Very clever, except it never happened.

The reassembly of atoms at some distant place and that sort of thing, that's an OT skill. It can be done rather easily, but it's not the same atoms. So, aside from vanishments of that particular character, to carry out a stunt for teleportation and baffle everybody, the skill of making matter disappear, and so forth, has been grievously neglected. The technology of how do you free a thetan has been grievously neglected. These are all neglected technologies.

The failure to teach a meat-body society equally to be able to free or to trap, that was just unintelligent, it was stupid – leave out half of the equation.

Now, if you ever want to see a society get into rich trouble, trouble that is just blooming in all directions and so forth, go on one of these all flows, see. Don't ever run the other side, see. Don't ever touch the other side.

You see it in processing. You can make the guy flow, flow, flow, flow. Actually you run motivators just so long on somebody, he'll give you an overt, unless you prevent him actively from giving you an overt. You keep – you keep running outflow-outflow-outflow on somebody and he eventually will jam and he won't run any further. You've got to run some inflow for a while, that's all. You've got to balance up these flows. Now, that's quite important to you. That's quite important to you, because it says where you sit, both as a being at this

exact moment, and why your interest in the technology which is before you, and why, strangely enough, this technology is appearing really for the first time in this universe.

It's impossible that – everybody will tell you the technology is impossible. No, it isn't impossible, it's just totally neglected. They think it's impossible because they've outflowed the reverse technology.

Now, it's very embarrassing. It isn't that it didn't cause societies trouble, it caused them lots of trouble. The Galactic Confederation right now is in trouble because of this. It has this problem on its front platter all the time.

The Galactic Confederation operates on a limited OT basis; its hierarchy of command is that of a limited level of OT, and it goes down to the doll body as the ship captain and the post captain, and that sort of thing; and that goes down to the meat body. And it's one of the few civilizations which has ever endured over any great span of time – just for the reason that it uses a limited OT, a doll body and a meat body, and works out the hierarchies of cooperation in that.

And their space wagons are very stylized, I don't think they've changed in – oh, they haven't changed in fifty trillion years. They haven't moved a bolt. They... every time you say, "You ought to increase your firepower or do something intelligent about it," and "These things blow back every once in a while and wreck the ship. Why don't you increase the thickness on those jets a little bit?"

"Oh, well, we've done that before." They'll prove it, too. They'll take out an ancient file cabinet, you know, and here will be plans that were submitted, you know, trillions of years before by the most learned architects. And they built this at vast expense, and they tested it, and it crashed, you know.

The weariness with which they defend their no-change is quite remarkable, but they do have change. They cannot maintain a no-change. A society either goes up, even if only slowly, or goes down; it never stays completely static. That's something for you to remember when you've got this society. And you say, "Well, we've reached a state of perfection now. We're not going to change anything. We're not going to change a thing from here on out." Oh, how dangerous can you get, because if you don't improve, you decline. There is no staying exactly that way.

That's quite interesting, because the Galactic Confederation is up against a problem of great magnitude. It's run out of OTs. Their basic technology says that the problem of conquest – the problem of conquest; the problem of maintaining our position; the problem of maintaining our commitments; the problem of power and the cohesion of the Galactic Confederation does not depend on ships; does not depend on fuel; does not depend on size of armies; does not depend on organization; technical know-how, doesn't depend on any of these things. It's the availability of OTs to command units. And that is the limiting factor of how much and how broad and how big the Galactic Confederation can be. And this is taught, taught, taught; this is pounded into everybody's head. And not once in eighty trillion years, has anybody ever said, "Well, if that is the case, why don't you repair some of your limited OTs and keep them patched up and up to snuff? Why don't you know *something* about it?" See, they know this is

a pressing problem, but they have no such technology. It doesn't exist; there's no technology like that.

OTs get peculiar. They get fitful. They get moody. I remember one time about twelve trillion years ago. It was, some comedian on a stage, vast theater, pulled a gag about create and that sort of thing, and made a wisecrack of one kind or another. An OT had to be subdued – he was up in the box, alongside the royal box, and he had to be subdued, one way or the other, but not till after he had torn down all the curtains and knocked down a four or five hundred-ton chandelier on the assembled meat-body multitude. Why? It just keyed him in. What could they do about it? Turn a sleep light on him and tell him to get solid and take him down to the hospital. That was their total – total ability to put this boy back together again. I consider it fascinating; I know – I was there. I was the guy they did it to. [laughter, laughs]

But the crux of the situation here – I'm not talking through my hat on this material, although it might sound very strange to some people. I think it would sound hauntingly horrifying to a great many people if they were to listen to it. They'd feel quite overwhelmed; they wouldn't understand it. They would be trying to say, "Well, it probably isn't true. He seems to be making sense, but we're not quite sure, and this..." Or, "My reality on this is very bad, but it fills me full of slight chills... What's this somatic in the back of my neck?" you know.

All right, if the technology is that vital, of how do you untrap somebody, how do you push somebody back to battery after a horrifying experience – if it's that vital, why hasn't somebody worked on it? Basically, they're afraid of the technology.

For instance, if I were to go back to the Galactic Confederation in any kind of a mood of a punitive sneer, and they would listen raptly as I talked to them about gunnery. "You know, you've got to improve the ability of a gun to penetrate the hide of a spaceship," you see. "Got some new data on this," you know. "Listen, man, that..." All ears, see. They would just listen with their tongues out where it came to anything that had to do with this strata of action. They would listen probably to means of preventing blowbacks; I'd probably even shatter them and move them over on that particular point. Tips on political interference learned out amongst the colonies, you know, that kind of thing. Listen, man.

And I'd say, "Well, also got a way to put OTs back together again." Brother, I would meet probably the greatest silence – you could drop a space fleet into and it would just vanish. And it wouldn't be fear, and it wouldn't be ridicule, me being me – it'd be horror, because they'd instantly think, "How are we going to hold the society together? How do you maintain the strata of the society? How do you maintain this fixed organization which we have, if every janitor can be an OT? You realize that you say this is just going to be applied to OTs. That's all right if you kept it buttoned up. Ah, but the next thing you know, you are going to take sergeants amongst the doll-body class. I can see it now. And those guys are going to start hauling people out of meat bodies. They are going to destroy this social organization which we have built up here with such care and which has gone so long." And they would say to me, "Oh, you've gone too far. We know you took a course in scientific improvisation some years ago, but we never thought you would put it to this use." [laughter]

And then would ensue a minor revolution of one kind or another where some were all for it and some were all against it and that sort of thing, but there wouldn't be much of a fuss about it, but everybody would still be saying, "Keep it reasonable. Take it easy."

You'd have to give them a political solution which was as great as the political threat. You cannot give them a technology without taking responsibility for the technology, or nobody would listen to it.

The people on Earth here don't think that Scientology doesn't work. They've been trained, however, against the vectors of it. They've been trained to destroy, to set something up – a fixed status of something – and then work a destructive means with it and to work out techniques of entrapment so people cannot leave certain social strata and economic strata of the society. This is the whole level of training. And you're not up against Pavlov, Freud or any mental technology. You're up against the social structure of the organization in which we exist at this moment.

And you pose a tremendous threat to that social structure. You could tear it to *pieces!* In two different ways, one by the rehabilitation of tremendous power and force. That's one way. That's pretty easy. You make somebody OT and he's good and mad on account of what they did to him in Chicago, and he pulls the air cover and that's the end of this planet.

Don't think it hasn't happened. Those mammoths that are up in the frozen tundra, with quick-frozen vegetables in their stomachs, must have been reduced down to about two hundred degrees minus, in a split second, because to freeze vegetables they have to be frozen in something like sixty seconds for them to preserve it. And here these millions of years later, the Explorers Club serves those things with fresh mammoth steak at its annual dinners! They serve them as vegetables-deep-freeze-quick-freeze; they've been packed up there in the ice ever since. They're tropical! What are they doing under all that ice, man!

It must have been done in sixty seconds. Can you think of any natural cataclysm that could take place in sixty seconds? They couldn't have been transported from point A to point B. [laughter]

Somebody was good and mad and they pulled the air cover and gave the planet a reverse spin. They changed its axis just like that – bang! Bang! There was just... somebody got mad. That's all.

So, that is the most direct force that is posed to this civilization by any technology such as we have. See, that is a *real factor*. People don't even have to get mad. We just get together and say, "Well, I guess it's best for the greatest good for the greatest number of dynamics that this planet be de-aircovered." *Pfsst*. That's it. Frozen vegetables.

Well now, then there must be a great... a factor involved here in intelligence; that's just the use of total force, isn't it? All right. Now, if we admix intelligence into this total force, what do we get? We get some other solution. We get a solution like the greatest good of the greatest number of dynamics, and that is an optimum solution always: The greatest good for the greatest number of dynamics.

In fact, that is the definition of an overt act.

Most of you think an overt is harming something. Brother, that is the most unlimited piece of nonsense ever. Doing something damaging, destroying something; you think that is an overt act?

No, that is not an overt act. It is sometimes an overt act, but that is just an unintelligent look at what an overt act is.

Let me give you a much... a very, very low-level thing. Baby keeps going over, turning on the gas jets, you see, on the stove. All right. What is the damage? They blow themselves up and kill themselves dead, and knock themselves out and mess up the whole house and spoil that. That's the end of that, if they are permitted to do this. So, if persuasion doesn't work, you paddle their britches. Well, that is "damaging a child." You can't reason with the child and you paddle his britches just hard enough to make him realize that he mustn't turn on those gas jets. Now, that of course can unintelligently be carried too far. But you immediately have departed from the greatest good of the greatest number of dynamics. It is actually an overt not to spank the child in that particular characteristic.

An overt act is flaunting "The greatest good for the greatest number of dynamics." And if you start working on the equation of the greatest bad for the greatest number of dynamics, you've got a real series of overt acts.

Now, it's very hard to adjudicate something like this. It'd take a Solomon, then, to figure out what an overt act is. Well, that's why you're so puzzled. You never can quite figure out what an overt act is. Well, you'd have to look on it from the various angles and you'd have to have, usually, more data than you have.

But you'll find the real overt acts – was maliciously and viciously setting out to damage, for no good reason, some beings or people, or start a trend or something of the sort. It was a lie or a piece of nonsense; you knew very well it was a lie and a piece of nonsense and keep going anyhow.

Sometimes you get an unintentional overt. I'll give you an overt that works out this way – the greatest good for the greatest number of dynamics. There was a very shabby thetan hanging around and there were some new theta traps that had been built in the neighborhood. Well, they wouldn't trigger, you know. I mean, they just weren't running all the time; they had to have a thetan in them. So, I took this guy and threw him in, intending to reach over and pull him out. Yeah, well, we got... That was quite something.

He sure made me guilty on this thing, and so on. But that wouldn't really have amounted to much as an overt act. When I pulled him off the pole, the fact that I put a beam into the place activated the trap. It wasn't necessary to throw him in. All I had to do was kind of stick my finger down there and it would have gone off automatically and fired itself straight on through, see.

Now, he says, you're guilty, and you shouldn't have done this and look how you've ruined me, and all of this sort of thing – which wasn't the case. I could agree with him. Yes, it was an overt act. It was an omission on my part not to be able to predict the fact. I was stupid. See, I didn't realize that it wasn't necessary to kick him off into that particular glade to activate the trap so we could find out what it was. Why, it wasn't necessary at all. In fact, that was a mean thing to do, and we never would have done that if he hadn't gotten on everybody's

nerves. But it was a mean thing to do. But then to find out that it was quite unnecessary – that made it an overt act.

So, overt act – an overt act can occur almost unintentionally by the realization that you haven't been very smart about it. An overt act is often realized after the fact by the realization that you could have done it some entirely different way that would have been much smarter, and then you get regret and so forth, and then you get a hung-up overt act.

But somebody who sets out to do things which are definitely against the greatest good for the greatest number of dynamics, wind up committing a lot of overts. And somebody who simply goes out here in battle and shoots somebody through the coco or throws a doll out the window, as commander of the ship, because the doll is starting to mutiny or something like this – those are not overt acts; they don't even classify, you see. Yet they come under the heading of damaging something. They're not overt acts.

The... it's not any specious figuring. It's... you'll find out it works out. And when you hit a real overt on the track – that the pc is going "Oh, my God, why did I do it?" – you'll find these other elements are present. A lot of elements.

Now, it has a lot to do with Sec Checking. Your lack of success in Sec Checking is a misdefinition of the overt act. You're looking for something he did that was irresponsible or damaging or something like this. No, you're not looking for the *very harmful* action to the greatest number of dynamics. Somebody took a very completely wrong course on something, and, do you know, you almost never find one in this lifetime. People haven't been big enough or tough enough in this lifetime to have committed one.

Sometimes you see some thetan bragging. See, some pc is bragging about all the overt acts he's committed. And you assess them out and you find out he stepped on an ant, and he spanked a baby, and he betrayed a girl, and – that was asking to be betrayed – and you assess this whole thing out and you can't find any overt acts, you see. He just wasn't tough enough, but he's sort of bragging about these tremendous overt acts he has committed, and you'll find this combination. Actually, he hasn't committed an overt for probably a long time.

You run off a long chain of engrams in three hours and all of a sudden one of these overt acts will suddenly show up – bang! in a very strategic locale that meant a great deal to one and all in all directions. And you'll see that thing all grouped up and that thing followed by a chain of motivators like mad. And if that overt hadn't been present, those motivators might never have followed at all. And then you'll know what an overt act is, and you can analyze it, and you'll find out – it was "The greatest good for the greatest number of dynamics," was violated – wittingly or unwittingly – was violated, either because the guy was a complete knucklehead at the time or just because he had gone clean vicious.

This is somebody that is an American citizen, has been an American for a long time, and he hasn't got anything else. And all of a sudden hands everything out lock, stock and barrel – the code books and so forth – to the Russians, well knowing that the Russians will also be destroyed when they destroy America. Well, you say, "Well, that's very interesting."

And you'll once in a while get a thetan smelling around the edges in processing, thinking he has committed something like this, and he'll take upon his shoulders far more than he did commit. He was the – he was the unwitting cause of a whole concatenation of destruction

somehow or another, and sometimes his feeling for that will cause a dub, and he will hold himself responsible for the confoundedest things. And you say, "Well, it's a dub..." but he'll hold himself responsible. Oh God, he's the fellow who did this and did that, and so forth, but you notice as you run these, his case doesn't get any better. You haven't got the real overt, but there is one there. There is one there, see. There's a real rough one lying back there someplace. He's just trying to run it out, but he can't confront it or come up to it, see. And running out a bunch of false ones isn't going to get the real one.

Now, what's this all amount to? The intelligent use of intelligence and force. You've got to have force and you've got to have intelligence. If you don't have these two things you haven't got anything. And imbalances along that line have occurred over such a long period of time that we find ourselves reduced to a rather static civilization, and the free powerful being, at war with the organized society as an adventure and an action, can be looked upon as a lost war. You've lost. You're here, aren't you? You've got a meat body, haven't you?

So, you might say with this point that a phase – not of us, but a phase of this universe – has taken place and has ended: the phase of the free being. And the free being lost, and he lost to solid, unintelligent but mediumly lying, not totally forceful but not unforceful, mean-level societies; he lost.

Just a few trillion years ago the whole confounded place was all blown up, the suns were disorganized, planets all thrown to hell and everything else. Well, the little guys with the airplanes showed up again, and they still could put up theta traps for this boy.

Well, that was because war had occurred – war of magnitude. And you could work out how this has been occurring, and over the long period of time that it has been occurring, but here you are – here you are. Your fight as a free being of total force and power, and so forth, has finally ended. And that fight in this universe is ended, it's no more, it's over, done. And that cycle is lost.

But another cycle opens up. An old mystic friend of mine would say, "When a wooden door closes an iron door opens." It's been a very unlovely and to a large degree very unpleasant phase, over this vast and long period of time, the free being losing more and more to guile and treachery, losing more and more to medium force and organization in spite of his ability to knock everything kicking – he's nevertheless lost.

What sort of a society opens up toward the future? Well, in the first place, you won't have that kind of free being again. You will never be – never be the same as you were; you can't be the same as you were because you are now an experienced you. Oh, yes, you can be as strong as you ever were, but I don't think you could ever be that stupid again.

You see, you come out at the other end of the cornucopia knowing what the score is. Furthermore, you probably never before had any political or social contact internally to many of these meat-body societies. You've been in and out of them from time to time, but you've never taken a look at them with a worm's-eye view in one of these things to amount to anything.

You realize that they have sociological frailties, they have political frailties of one kind or another. And, that the total destruction of them amounts to nothing, because guys totally dedicated to starting up another one, and so forth, appear elsewhere and do start up an-

other one; you always get this phenomenon occurring. They cannot be obliterated. And I don't think you'll ever again just try to just obliterate, because we've learned it can't be done.

But they can be managed; they can be handled. It takes intelligence and force. They can be managed, they can be handled, they can be helped and they can be thrown on a reverse vector.

Now, you say, what does this mean for the future? Does this mean that there will be no more free beings? Oh, I'd hate to think of that, man. I reserve my right to go sit on a mountaintop for a few trillennia and take a long breath, you understand? Particularly after these last thirteen years. Anyway... [laughs]

The point I am making here – the point I am making here is the use of intelligence with force can maintain a freedom of action, and so on, without racking up a new bank, without racking up new overts, without the war again turning entirely against one.

There's never been a lasting or intelligent society of free beings. You say, how could you have a society of free beings? Well, in the first place, you can't do without a society of free beings. That is to say, it's all very well for everybody to be totally on his own, but look where this gets everybody. It gets everybody downscale in the long run so that it doesn't work. And if you mean a totally irresponsible freedom – if that's the definition of freedom, see, total irresponsibility all up and down the line – well, you're not talking about freedom, you're talking about catastrophe.

What it takes – what it takes is know-how and force – not know-how in how to play the force. You probably know how to mock up a body, you probably know how to do this, that, the other thing; these tricks are pretty easy. That isn't the missing intelligence. The missing intelligence is: a balanced technology. If you know how to enslave people, everybody knows how to enslave people, then they equally should know how to free people. If they are going to make up matter, matter, matter, and so forth, well, fine, let's not be quite so insistent on the matter being totally indestructible. And let's also specialize in being able to as-is matter as easily as we make it. In other words, let's bring the thing back into a little bit better balance.

When these meat-body societies start whizzing along, well, don't just disorganize the whole thing like stirring into an anthill. That's a silly thing to do. Why? Why is it silly? Well, the laws of life are against it. These ants kicking the bucket go over and make a society over there. Look, while they're there in the anthill, you can – you still got them, you can do something with them, you understand? But every time you just totally disperse them, boom! you see. Oh, they're just going to make another anthill, and it's going to be mad as hell at anything like you, you see. So the war is begun, right there.

No, it... the universe can do a lot of growing up. It can do a lot of growing up.

At this end of the line we have technology; we have technology that can make an OT. The technology has to be very skillfully applied. That's mostly because everybody has skidded so low, they are rough to handle as cases. We needn't have let it go this long, but it had to go this long because no opportunity offered itself.

Now, the war of everybody on his own, everybody responsible, everybody total force and everybody with the brains of a peanut: that cycle has ended, that cycle's got to be ended. It's not because I say it'll be ended, but because you'll think twice before you start it rolling again.

No, I think we – I think – as free beings, that any freedom, to be maintained, has to be maintained. Freedom is something you work at, and freedom is something you work at intelligently. If you think you are going to stay Clear or OT simply by never destroying anything again, you're nuts. You're going to destroy lots of things from time to time, and so forth.

How do you build up a building unless you take down the building that is sitting in the place where you're going to put up the building'.? You can't do it, you see. Well, there's always inevitably a bit of destruction.

And let me assure you that total mental treatment of criminals in a society doesn't work. The only way to handle a criminal is to give him mental treatment – you never do anything but give him mental treatment. Well, you needn't hang him or burn him or do other things of this particular character, but just turn him over to the psychiatrists as his total punishment, who turn him loose in three days – gives you nothing but a criminal society. You got your hands on the boy, why don't you use it? There are limited technologies for straightening the kinks out on somebody without making an OT out of him. There's a lot of technology lying around one way or the other. But for sure, if somebody robbed a store, I'd be very likely to tell him, "Well, as soon as you can pay the storekeeper for his loss of goods and trouble, why, you can go free, boy." You know, there's compensation.

You see, freedom without barriers of any kind whatsoever is an insupportable freedom. In the first place, there's nothing for you to push against, nothing to be free of. So it makes a very interesting problem. It's an interesting philosophic problem which I'm not in this lecture, in any way, intending to solve for you. I am just pointing out that a long cycle of this universe has come to an end, not because you're here, particularly – it happens to be at an end all *over*.

The free, ferocious being versus the meat-body society. That's over. And the battle was lost and that free being doesn't exist anymore. All right.

So, at this point of the line we're shifting gears on the whole game of the universe. That's an adventurous thing to do. This is a noteworthy time, and the only way we're doing it is, quite simply, we're just putting some intelligence along with the force. We've got the know-how and the technology necessary to handle the problem which has never before been handled: Indoctrination in how to make things that always last forever inevitably and never go away, and no indoctrination in making things disappear, painlessly and without chaos. These two points are singularly unintelligent. And I just thought I had better say something about them, point them out and so on, with regard to this.

From here on out you will find that your attitude toward a being who is getting up in power and who's acting loopy as the devil will very definitely be different than it was before. You normally would say to that bird, "Well, just get away from here and don't bother us anymore." I rather think sometime in the future you'll say, "Hey, you..." Huh-huh!

Well, I'm reminded of an engram I ran out of my pc. She saw this black thetan sitting there and she decided to do something for him and help him. So she poured him all over with white energy to wash off all the black energy, and that didn't work and he wouldn't get white, and she got very mad and stamped him into the ground. Now, that's – [laughs] – that's a processing lose, and that wasn't my engram to give you but I think my pc will forgive me. But that's an exasperation, isn't it? A thetan has always had the impulse to help but not the technology to do so.

This is all highly esoteric and theoretical. But the composition of what is an overt act contains omission – seldom looked at. It's omission not to do things for the greatest good of the greatest number of dynamics; that becomes an overt act. And one cannot maintain his freedom in the face of an overt act of that magnitude.

All intelligence and force are not good by a long ways, but it requires a combination of force and intelligence to continue any position or status in this universe. It requires both of them. Unbalanced, why, it all goes to pieces.

Total force without intelligence, total intelligence without force, are equally myths. They do not make for anything but disaster.

When you're getting up along the line, you will ask yourself these things and you will say, "Well, now, does this person deserve to be free? Do I dare push this person – he's been a bad boy – do I dare push him any closer to OT? " You'll find out, oddly enough, that you can't push him any closer to OT than he can accept the definition of an overt and his responsibility. It's a very limiting factor.

Now, technologically, aside from your skill in doing a very few things and doing them very well, I know now of no other barrier to OT, I don't know of any barrier. Hence, I'm talking about this subject to you not on the basis of, "Well, what you ought to do is get yourself all freed up and take the top off the Empire State Building or pick your teeth with the Chrysler Building." This... I'm not talking to you along that line whatsoever. I'm talking to you quite in another way now. The goal is quite assured – the goal is quite assured, on the exact technology which you are using at this moment, and your skilled application and intelligent application of it will make you arrive there. Some be quite a time on the way, and some will be a shorter time on the way, and so forth. That's all taken for granted. Some are worse off than others, and so forth, that's taken for granted.

When you finally get down to the final action of OT, well, just what are you making? This will occupy your minds in the very near future, just what is the end product of all this?

And if I could tell you – if I could tell you that, yes, each person, just irresponsibly by all of us, is just let free to go and wander and do anything he pleases anyplace – not that we would discipline him particularly – but just let free to go anyplace and do anything he wants, and it's all up to him and that sort of thing... I'm telling you that this is a shortsighted irresponsibility, which will again almost immediately wind us up in the soup.

We have to continue to take our responsibility for our fellows, we have to go on with that. And we can't continue to exist on an irresponsible line of just forgetting and abandoning everybody and anybody and "leave them on the theta pole, so what," you know, this kind of

an attitude. Because that kind of an attitude breeds for each one of us entrapment in the long run.

We have to learn to take care of our own because we will have made that own with our own lily-white E-Meters.

Thank you very much.

AUDITING SKILLS FOR R3R

A lecture given on 10 July 1963

Thank you. Well, this is what?

Audience: The 10th, the 9th.

The 10th?

This is the 10th of July AD 13, Saint Hill Special Briefing Course. I have a lecture today on R3R and 3N.

But before we get onto these – these technical matters, it's a remarkable world we're living in. Very remarkable world. How can anything be as idiotic at some lines and places as they can be is quite marvelous. I have a banker today who is arguing with me and the only thing I could make out of it – he's just arguing with me vociferously not to reduce any loans I have with the bank or reduce overdrafts and he's trying to make me realize that he's – I don't need any overdraft account, since he's perfectly willing to extend me all the overdrafts that I possibly want anyplace, and not – please not reduce my loan account, you see. [laughter] It was quite remarkable. This is – Scientology credit-wise apparently has arrived. [laughs] Marvelous. Never had it happen to me before! [laughter] "Please owe us money, Dr. Hubbard." [laughs, laughter]

It's very funny, you know, at the times when you need this money, they're never in that frame of mind. You know, never in that frame of mind. But when you get to a point where you don't need any money, you see, you've got everything taped in all directions and so forth, they couldn't be so liberal. Marvelous, isn't it? It's the law of supply and no demand – demand and no supply.

Anyway, you are confronting some horrible facts today, talking about R3R, you're confronting some horrible facts. I have some very bad news for you. Very difficult for me to impart this to you and so on, but we have the exact number of skills necessary to make an OT. That's – I'm sorry to have to tell you that – this, because they are not simple skills. And that is the bad news. That is the bad news. They are not simple skills and they are numerous.

Now, I brought the bulletin out yesterday which is being run off today in order to talk to you from my notes. But following in my tradition of having no notes and so forth – I brought the bulletins I don't need today, and the ones that I had yesterday which I should have today, you see – that's being run off, so I don't have it today.

The number of skills – the number of skills which you have to master in order to make an OT are numerous. And I'm not going to go into a list of these because you'll shortly have it in HCOB, I think, 8 July or 9 July. But these skills are going to make you gasp a little bit when you first look at them, unless I give you a good piece of news. And that is that they

break down to about five skills which you have been taught for a long time and which unfortunately you have to have perfect. And those skills are: the ability to follow an auditing cycle – can you give an auditing cycle? That auditing cycle is quite important.

And the next one is: can you give it repetitively? Can you repeat yourself? That's quite important, too. That's a special skill. You see, you could sit down and give one auditing cycle, but can you give the next auditing cycle and the next auditing cycle and the next auditing cycle? Now, you say that isn't very hard. Years ago we had to master that one, so we've got that one taped. Got that one taped.

And the next one is: to read a meter. And I do mean read a meter. You have to be able to read a meter – and do very well with a meter.

Next one is: you have to be able to read, understand and follow the procedure of a bulletin. That is a training skill all by itself.

The last one is somewhat debatable and I don't know what I said in the bulletin on the last one, but it's something on the order of: Keep a pc in-session. Handle a Model Session.

And those, actually, are the basic skills – those are the basic skills that we go down to. And any time – now hear me, hear me now – any time that you find an auditor unable to handle one of these upper procedures, you look back at those five I just gave you and there is something wrong with those five. This character just can't seem to run something like R3R or 3N – just can't seem to handle it. Can't seem to handle 2H, can't seem to cut it, you know? Just can't seem to do anything with the pc in CCHs, just can't seem to – and you look back at that small list I have just given you and you will find that the fault lies *there*. The fault does not lie in the complexity of the skill.

Now I give you this with great – a great margin of warning on this because this is whether you can train people or not train people. This is whether you personally as an auditing supervisor can get auditing done or not get it done – completely aside from getting result on the case that you are doing.

When you see an auditor who is getting no results and you've told him to run technique Z and he just can't seem to cut it, you're just going to break your heart if you then get ahold of technique Z and wrap it around his head and expostulate and scream and pound the desk and shove technique Z at him and technique Z at him and technique Z at him and then send him back into an auditing room to audit technique Z and you're going to get hash. And then you're going to conclude that technique Z doesn't work. But you have followed the wrong procedure.

I don't say don't teach him technique Z – but if you have to get very extreme in teaching him technique Z or if there's anything hard about teaching him technique Z, it isn't technique Z that you are up against. You are up against the five I just gave you. One or more of those is as wrong as Khrushchev. That's awry! It is awry, man.

Now, do you understand what I mean when I tell you that no amount of persuasion is going to take an auditor who can't do these basic skills and make him do a complicated skill?

Now, no amount of persuasion on an upper level or complex technology – no amount of persuasion, is going to overcome these basic technologies. The difficulties which you're up against are the difficulties of basic skills.

Now, you like to think sometime that you're up against case level. To some degree that is true. But all case level does is make it harder for you to teach the basic skills. It does not make it impossible for you to teach the basic skills. And if you ever proceed on the basis that case level makes it impossible for you to teach the basic skills, then you are going to lose. You're not going to lose on just one person, you're going to start losing on pc after pc after pc after pc.

I've had the most remarkable people audit. My belief in their ability to audit amounted to more than their case level. I've had a girl who was mostly throbbing away at the lower lip as she gazed out the windowpane fixedly most of her life, headed at a pc, and, "Now, you can do this," see, and so on.

"Oh, can I? ... Maybe I can."

And they go ahead, and I've had her go ahead and turn in a job. Oh, yeah, you had to keep your eye on it. That gives you a slightly different look at training.

You see, you get so involved with a Q and A on training that you can't train. And the Q and A is this: The guy is saying, "I can't," and so you Q-and-A and say, "Okay, you can't." That's Q and A on the part of an Instructor.

Look, if he can't, he's awful wrong. If you make him do it, you make him right. And this is one of the few instances where that is the case. He becomes right if he can do this. And it's only his aberration that you're Qing-and-Aing with, if you say he can't.

I know this is a very extreme view. But I have recently begun to look on it, not as an extreme view of "just because we couldn't do otherwise," which is what I've said before – I've become to look at it as fact. It's a fact. I don't care what the case level is. Discount it as far as the auditor is concerned. The lower the case level, the more horrible time he'll have. All right. But he can get auditing done. The more brutal it'll be to face up to a session, the more horrible it is to face up to the ARC breaks, the more worry there is between sessions – "Oh, my God, what am I doing? I've already ruined him. Look at there, he's got a cold, and – and he's all caved – oh, oh ho! *And – oh oh!*"

All right, that's... aspect of auditing multiplies – but it doesn't forbid it. Now, the moment you let the door open on "aberration forbids it," you've let the door open on "no auditing must occur." Oh, yes, because look at the *reductio ad absurdum* of all this. "Only OTs can audit." Where does that leave you? It leaves you with no OTs to audit. Every once in a while you get it going in an Academy. Do you know that you daren't – you daren't let a D of P or a D of T, either one – D of P of course can say, "We can't audit this person because the person has an insane history, or is illegal" or something like that. But we can't let them get too extreme on who they accept for processing or training. But particularly the D of T. The D of T, honest, must never be permitted to refuse a student.

Aw, that lets some awful things occur in Academies. It makes the job an awful headache. But immediately that you say, "This student can't be admitted to the Academy," then we

upgrade our classification of who can study Scientology and then we upgrade our classification – casewise, see – and only this case level, and then only this case level can study, and *wuuuhh!* And there's all of a sudden nobody in the Academy and nobody learning how to do anything. And look, I've seen it happen. I've sat right there and watched it happen.

And I've taken the very people that they said couldn't audit – sometimes with malice aforethought – and made them turn in an auditing session. Oh, brother, it takes some doing! As your Instructors can sometimes tell you here; they probably could expound on this at some rate. But the truth of the matter is it's a Q and A. This guy's aberrations are saying, "You can't." So the moment that the Instructor says, "All right, you can't," the Instructor is then Qing-and-Aing with the reactive bank of the student. And the student's ability deteriorates at a square the like of which I'd hate to see.

It's quite remarkable how fast this will occur. Now, one time I remember, one memorable ACC – in the last week and a half I decided that no results had taken place in this ACC to amount to anything, so I just went around and all the auditors sitting there and auditing pcs and so forth – each unit as they flip-flopped and so on – and I said do so-and-so and so-and-so and I said, "You can do it all right," and gave them a very complex technology to go ahead and do, but I told them they could do it. I didn't tell them they couldn't do it. And they brought off some remarkable results and all the auditing results that occurred in that ACC occurred in the last week and a half. It was on the basis of "You can do it." And the guy said, "Oh, I can't do it, it worries me so much," and so forth.

"But you're standing here, you're not auditing. Now go on back and audit." It's quite remarkable.

You see, I myself know all about your qualms and horrors and jitters on the subject of taking apart somebody's head. I know all about these things. I've held my breath more often than you ever will. And I can sympathize with you. But it's something you can get over. And I have seen auditors who couldn't audit at all, couldn't follow an auditing cycle, just had to Q and A and so forth – took a while, but they eventually got to a point, said, you know, "Hey! I mustn't Q and A this way. Nearly all of my trouble is in this auditing cycle. Nearly all of my trouble is right here in this auditing cycle. Every time the pc opens his face, why, I do what he says in some particular fashion or I question his answer or something like this. And I'm just going from bad to worse. I never stick to procedure." You know, crash! A great big exclamation point occurs in the sky like they do over comic strip characters, you know? You know, "Hey!" you know. "No, I shouldn't do that." And he wakes up to it and he starts right on the situation.

Therefore, it takes some a little longer to get these basics down than others. Now, all the training that has been given in recent years is pointed toward those basics. So no training is lost. And it takes you a while to learn to shift gears with shifting technology and that sort of thing, but you will find good news in this. Nearly all of the things which you have learned how to do now have their place in Scientology. And if you've learned how to do these things – if under some different procedure name and so forth – well, you're that much further ahead.

When we get down to a complex technology such as Routine 3R, it's a complex technology. Now you join 3R up to 3N and run them all on the same team all with the same

reins... And my God, a one-armed paperhanger with the hives – isn't going to [laughs] – couldn't be in any worse shape than this.

No, you'll only get into bad shape if while you're trying to do this complex technology you haven't learned which side of you the E-Meter goes on. Don't you see? While you're doing this complex technology, all of your weaknesses in the other five show up. If you're still busy Qing-and-Aing, 3R3 can get you into – I mean, R3R can get you into more difficulty in less time... A Q and A isn't just an innocent accident that can be passed over and cleaned up in 3R; it can be a catastrophe! It won't kill the pc, you can recover the session, but boy, it's that whole session is gone.

Now, why? Because he's particularly vulnerable? No, it's what you Q-and-A on. You say, "All right..." Let me give you an actual instance – actual instance. You say, "All right. Now we're going to date this implant."

Pc says, "Well, I've got the picture right here, why don't you take the date of the picture."

"All right, what is the date of the picture? Is it less than, greater than _____?"

An hour later the whole bank goes into a grouper, reality goes by the boards, the pc explodes and his skull flies in pieces through the ceiling. Well, that was an innocent Q and A, wasn't it? The pc just offered up the engram in a muddy sort of a way and thought it was the implant. But the auditor said that he'd been looking for an implant there and he never dated the implant. And some four-thousand trillion trillion years intervened between the picture the pc had and the implant the auditor wanted to date. So he was running the implant with a date error of four-thousand trillion trillion years. Quite an interesting date error, isn't it? Don't you suppose that wouldn't tend to group up some bank? Well, I think that's very interesting.

And yet that isn't much of a Q and A, don't you see? See, I'm not even berating that particular accident. You have to be very slippy about this sort of thing, you see. Well, the auditor just doesn't make his own intention stick in the session, which is the basic reas... how things happen in Q and A. He's trying to locate the date of an implant and the pc gives him an engram which is on an entirely different chain, but which he thinks, muddily, is the implant and then the auditor says, "Well, to make the pc happy, why, we'll just say, 'Well, that's the engram.'" Pc says he has it, so we just Q-and-A about the whole thing.

In other words, the auditor doesn't carry out his intention originally of dating the implant he was looking for in the first place. All he had to do was simply carry out the intention he started with in the first place and he would have been all right. Don't you see? But his tendency to become the effect of the pc slips his gears, see, and he just gets into a cross-eyed situation where he has no business being.

Now, carry out an auditing cycle – carry out a repetitive auditing cycle let's look at how this influences it. The auditor says, "I'm going to date this implant." You see? This is carrying out an auditing cycle. You might not look at this as being an auditing cycle, but it is. "I'm going to date this implant now." And the pc says, "I have an engram here which I have been looking at which is the implant." And the auditor never gets his question answered,

which understood, the question is, "When is this implant?" No, no, he gets, "When is this engram?" Do you see how that is?

In other words, he intends something and he never gets it answered. He wants to know when is the implant, see. No matter if he has to go over the meter and do a lot of things in order to determine this thing, this is still his auditing question. And the pc says, "It's a picture," so he dates the picture and he never finishes off his auditing cycle. And then a couple of hours later you're still picking up the pieces scattered around the room and you wonder, "What the hell happened?" Well, frankly, nothing happened to R3R at all. The error was not R3R error. The error is that the auditor wanted, and knew he had to get, the date of a certain implant. And he didn't get it. Ha! Elementary, my dear Watson, isn't it? You want to know what happened to the auditing session.

Well, whatever else might have occurred as an error in the auditing session – you could be very technical about all this – the auditor's question, "When is this implant?" is answered by "Here is an engram, get its date." And these things can slide by so innocently that you can't even recognize them as a Q and A. Too delicate. You say, "Well, I've got to take the pc's data," you can say, muttonheadedly. Well, you've got to take the pc's data.

All right, the pc says, "This was the engram in which the implant occurred." Well, he didn't actually, in this case, say that. But even if the pc said that, the auditor has to choose between invalidating the pc and getting his data straight and all this sort of thing, you get into judgment, you get into an involvement of one kind or another. You say, "Well, all that's very complicated." No, it is not very complicated because never at any time did the auditor ask if it was the date of the implant.

In other words, you just derail the whole procedure. He started running Routine 3R.

Now, here's what's amusing about this anecdote: is the auditor wasn't running R3R, but 3N. And mysteriously found himself running – or found it in progress – R3R. And did the ARC break assessment on 3N. But was in actual fact doing R3R. Now, look at that as a further complication.

Now, you wonder where we are here. I notice you all looking very puzzled. Well, an implant is an engram. And the auditor in this case went to the lengths of getting the date and duration of an engram, which had nothing whatsoever to do with the implant. You don't get durations of implants. Ninety percent of the time you don't even have to bother getting their dates. And if the auditor had just omitted dating this implant, everything would have run off like a well-oiled dream. Because they knew what chain of implants they were looking for and the session – to be very factual with you – was actually a 3N session. And they found themselves doing R3R. Now, how involved do you think that can get?

Well, how do you possibly differentiate between these two things? It's horrible. Well, I might have added to the five, "To run the process they're running." But I consider that inherent in the auditing cycle.

You get the level of error? This is the only thing I'm trying to get across to you – the level of error is all very, very stupidly elementary. Always! You're really not getting into errors which have anything whatsoever to do with R3R or 3N. This auditor apparently has diffi-

culty running the process which is started on and has a tendency to weasel off into other processes. That tendency existing, then doesn't hold the line on a very precise process. This is not meant in a spirit of criticism; I'm just showing you something, see. Start in running CCHs, see, and then just kind of weasel off into Reach and Withdraw. Be the same thing, wouldn't it? All right, well, that's a gross tendency that any of you could notice. But how about the tendency of – carried out... no matter how faint this tendency is – it still expresses itself in not adhering to a procedure. Not starting and finishing an auditing cycle. Because an auditing cycle also includes completing the process you are running. Part of the auditing cycle; that's the major auditing cycle. You flatten the process you're running.

I want to make these points with you, not in a spirit of criticism or any derogation. And I want to make these points with you for just this reason: You're colliding with something which on the surface looks very complicated. 3N and R3R look very complicated. Got all kinds of steps and has all about time track and... Have to list, assess, find right levels, watch the TA like a hawk. And you're not going to have any trouble with those at all if you can do the basics of auditing. Actually, it really isn't complicated. If anything is wrong with R3R, it's too idiotically simple.

We have here a process which after all these years runs engrams by rote. Well, that's fantastic! But you can't run an engram by rote if you can't read and execute a bulletin. You say, "Well, oh, yeah, yeah, well, that's Book One and so forth, and I think there was something about implants in Book One. Aw, yeah, well, I understand implants all right, I – di – implants... And so forth. We had a technique one time, we had a pc sit down and he flowed the energy from the top of his head down around his shoulders and that must have been 3... Oh, yeah, I guess that's 3N. Yeah. Very easy. All right. All right, sit there and have the energy flow from both of your temples down over your shoulders. Yes, well, all right. What's the matter? You say there's kind of – something going on? Well, it's all right, just" – and so on.

Pc says, "Well, it's – this is absolutely terrible." [laughter]

"Dear Ron, I was running 3N the other day, and it doesn't work."

Aw, your level of error – your level of error is fantastic. It's never slight. I never find these gross audit... that's why you call them "gross auditing errors," because they're never slight – never slight.

All right, so somebody comes along and he does 3R3 and he dates these engrams and he gets these engrams all dated and so forth and the pc keeps getting groups of engrams and thinks he's running dub-in, and you say, "Well, study your 3R3 and do those steps better and learn how to move the pc on the time track better and don't get things confused the way you're confusing and moving the pc on the time track."

And the pc gets his engrams further grouped and he's ARC breaking more often and you say, "Now, confound it, study that bulletin! Study that bulletin! Learn to say 'move to the beginning of the incident,' and 'move through the incident to a point so forth years later.' Learn how to do that!" Pc is getting worse and worse. Eyes getting black, you see, getting to look haggard, crunched over, you know, starts withdrawing from life. And you say, "Well, this 3R3 is a pretty dangerous process. Look what it can do to somebody."

Ah, but if... now here's what I'm telling – telling you to do. This you might not do – is look into these basics with regard to this auditor. Look into the basics. You may find something like can't read a meter; never has been able to read a meter. Well, let me tell you, the greatest crimes that you can pull and the only thing that'll give you any *real* trouble in R3R, the only *real* trouble you will have, will come from wrong date and wrong duration. And that trouble is so far in advance and so high above any other trouble that you can have in doing R3R, that it looks like the sun looking down upon some space fragments. I mean, the order of magnitude is absolutely fantastic.

Meter reading. The guy wasn't having any trouble with R3R, he was having trouble with his meter. He had some misconception with regard to a meter; his practice with regard to meters was bad. Or, better than that, he just didn't understand dating. He couldn't ever use a meter, really, on dating, and he couldn't get his durations and so forth.

Now look, it's very difficult for an expert meter reader to get the dates and durations of engrams or incidents or anything else. You understand? That's tough; that's hard to do. Let's now add to that difficulty an inability to read a meter! Now you see what I mean. Pc will never chop at you for moving him all over the time track unless you've already laid in the bypassed charge of a wrong date or a wrong duration, because time is the single source of aberration. Wrong date, wrong duration.

Now, when I say a wrong date, you've got this incident at 9.5 trillion years ago. And it's actually 9.49 trillion years ago. That's not a wrong date. Look for your gross errors – *gross* errors! Well, this incident is 900 years ago. And it's really 9.45 trillion. Ah, boy! You start running errors in dates like that into R3R and boy, that time track looks like an accordion after a hot night in the – in the polka parlor. *Zzzzzzzzzzzz*. You say, "What's this?" Used to be a time track. The bypassed charge is fantastic! You've missed the whole incident, put it in the wrong place; and then you'll say, "Well, this pc is actually a dub-in pc because they – here he's got this picture of going down to the growler – or rushing down to the – to the local corner saloon and getting a growler for his old man, see – this is – this is the – the whole incident. Next thing you know, halfway down to the saloon he meets this dragon and finds himself mounted on a horse and the pc will say, "Well, the old man must have had DTs, and I must have gotten some of his engrams and so forth." And you run a little bit further and you say, "Well – well, let's see, what's the scenery look like around there?"

"Well, I don't know, like the 1890s or something like that."

And you say, "Well, 1890s. Let's redate this thing. Oh, 1890, all right." Pc just said it so it ticks, see.

You ever notice that you can pick a date off the coach that the coach is thinking of? Well, a dating always will. It'll always – all the guy has got to do is said the date and you'll get some tick on it. He'll say a date and it – for an instant it flicks. Or you can't get a date. You don't have to do anything about it, but he says, "1890" and so on.

Now, this actually is true that a pc does have the date, and the right date does read. But then he told you the date of the incident, don't you see? I'm saying, well, he just said the figure's 1890. 1890 will get a faint, vesperish tick. It'll only do one tick. It won't do two ticks, three ticks.

Say, "All right, it's in 1890." Well, he gets – he doesn't get the dragon anymore, but he gets going up in this airplane, you see, to deliver the beer in an airplane and so forth, but he says there's something wrong about this because there were no airplanes in 1890. Orville and Wilbur didn't commit their crime until a few years later, so therefore there's something wrong with this – and the auditor's in perfect agreement; he says, "Well, this pc's running dub."

No, he's not running dub. The auditor is running "can't read a meter." That's what's the matter. Now, you eventually get this all tangled – untangled and you do an assessment and you find out you have a wrong date or something and you find that this is 9.45 trillion years, and he did go down to the saloon to get his old man some beer, but halfway there the atom bomb hit. And you get a complete incident and it all unrolls and it's all fine, pc's happy with it and it reduces and so forth.

You might say that a dub-in case is only somebody that's got his dates mixed up. You could probably cure a case of dub-in just by accurately dating. Start into this lifetime and keep going back and just date, date, date and you probably could close up a case that was doing dub, because the only time you get time track closure and other things happening and so forth is when you have wrong dates.

Now, that's very important, then, isn't it? Let's take a look at this wrong duration. Nothing drives a pc battier than to have a wrong duration. You say, "All right, this incident is two days long." It's actually a trillion years long. He tries in vain to find the beginning of the incident. He can't. Because he's looking at something that happens two days before. So it stays all black and gruesome and he can't make sense out of it and he's all anaten and that sort of thing.

Well, after a while – because whenever you get this phenomenon you re-duration – that is the rule – if you have any trouble and you can't find the beginning of an incident – this is what made R3R. I haven't released this, by the way, before this moment. But what made R3R workable is this datum: That a pc has perception on any incident that is properly dated and durationed. That's the most important factor we've learned in many a year. There's where perceptics lie.

Now, there's only three reasons why he doesn't have perception on the incident that you're trying to run. There are only three reasons. You have the wrong date or the wrong duration or it's got a GPM in it. And those are the only three things that can close an engram out so the pc can't run it.

Now, you can add another thing to it – and actually that doesn't close out his perceptions and it becomes very junior. But you can add this other thing to it, just for fun, and you could say it's a wrong assessment, but all that does is give you TA action. Or the chain you're running has vanished; you've flattened the chain you are running. Once more, you won't be able to assess – pardon me, you've got a wrong assessment. And you're now running him on the wrong chain. The chain he was running is flat.

But that all represents itself in tone arm action and actually doesn't really always express itself in nonperception. The whole secret of perception – the secret of perception in an engram is: *right chain, right date, right duration equals perception. Period.* Every time, man!

And the only thing that can get in the road of that thing is a GPM, and you pass the pc through it once – and because he resisted all the way through it – he had a lot of black energy in there, you see. The black energy goes up, *bzzzz!* – and of course obscures the incident.

I found the other day an engram that had a GPM in it. I didn't know it had a GPM in it before I ran the pc through it a couple of times. It registered and then didn't register that it had a GPM in it – so I said, "Well, we'll just run the pc through it." And I didn't really know that the thing had a GPM into it until the lights in a tunnel went out. A moment before there had been lights in this tunnel. But now this time through there's no lights in the tunnel. So the old maestro knew at once that we had rekindled those items and made the black energy off of the items go *bzzzzt* and of course it put out the lights. So I got the incidents – I got the... took the pc to the first pair of items, and it was a wildcat GPM and you've got to learn how to run those. That's another skill you have to learn – ha-ha – sorry! [laughter] But the basic ones and the real tough ones, we've got them clear back to the beginning of time. We know their patterns all the way back. I haven't released them completely, but actually the April 17th bulletin covers some vast period of time. That's the Gorilla Implants and the Bear Implants, and they cover a vast, vast period of time – trillions of trillions of years. And that only changed just once. They dropped a couple of items out of it in the middle of all of this.

Otherwise we've got all that. We got the – an earlier implant, the Glade Implants, we've got those; we've got the earlier Fairgrounds or Circus Implants before that; we – we've got the lot, see. And that's all very helpful. And you'll say, "Thank God, Ron got these things." But every now and then you'll be running an engram in R3R and one of the things which you have to watch out for is, does it have an implant in it? Before you scoot the pc through it, be a good thing to find this out about it. So, did it have an implant in it, see, while you're durationing it.

And heh-heh! It has an implant in it. *Augghh*. Well, the proper procedure is not to throw the pc through the incident, but to take him through the first pair of items in the implant, if there are any. And finally fool with it until you finally find out what it's all about, discharge the items out of it. Sometimes there are only a half a dozen items. And get those, you'll see them fire, rocket read, you clean it up and then just handle it as an engram and you'll get the rest of it. You get motion and that sort of thing out of it, get some of the emotion out of it and so on. Pick up two more items that you missed and clean it up. It's a wildcat implant, see, and they're never very long – they are never very, very difficult. The pc, if it's on his chain, can reach them for sure.

But there's a point in running where 3N and R3R cross. And frankly, as far as programming is concerned, I would always start a case on R3R and pick up those implants which turned up in the normal progress of running R3R. I found myself going heigh-ho down the Helatrobis Implants, get the lot! Don't just pick his chain up, you know, just get everything you can lay your paws on in that series of implants. Heigh-ho. Clean them up, man. Got your paws on them. Then go on and handle it as an engram. You've got it clean now.

Now – then you'd always find the engrams that are on the pc's chain that are obscuring the implants. Of course, we're asking you to drive the 20-mule team Borax mules, you know, out there, with reins wrapped around both hands and, you know, and around your shoulders

and driving with your toes – because at any minute, you check up this thing, got an implant in it. Well yeah, it's an implant, and what... You'll have a table of dates eventually to tell you when all these implants occur. And you say, "What's..." And you – suddenly dawns on you, "43 trillion, 980 billion, 706 – that's Helatrobos. Zzz!" "You know, I've been betrayed." We have the level "Failed to die," and you've got the goal "Failed" in the Helatrobos Implants. You're sitting right on it, see. Which is preceded slightly by "To die." Ha-ha.

Now, you have to know how to shift that transmission, that – with a smooth shifting of gears right over to 3N. And you just go ahead and handle the whole thing, right there. And forbear tracing back up the track and not handling any more engrams and scattering everything around. Just finish what you're doing. It landed you there, you found the engram, you found the computation in the engram, you just got whatever you could get your hands on, cleaned up as much of it as you could and then you jolly well went back to running what you were running, of course, because you've never stopped running it. You have just used 3N as an adjunct to R3R, which is all it is anyway.

That's all 3N is; it's just an adjunct to R3R. It gives you how to run implants – implant engrams the easy way, by pattern. And when you get onto a wildcat one, you've got a few more headaches but it's just because you haven't got a pattern; you've got to take the pattern.

Now, when we go into this and study this over, we find out that there are a lot of technical details you have to know. Such as, how do you assess for an ARC break. "We did a half-a-page list on the pc and the tone arm went from 3 to 5.5 to 4 – and the moment it got back to 4 we had a sort of a blowdown so we ended the list. And I – I null the list and pc just seems to be awfully ARC broke and we just don't seem to get anyplace on R3R after this." Well, you have to know such things as pcs ARC break if you do not run the tone arm action out of the list the pc is doing.

You're going to do a list, you got to do a list. A list is a list! I don't care what it's for – and if you leave a list half-finished you not only won't find any item on it that is any good to the pc, but your pc's going to ARC break. The most frequent source of ARC breaks in the old days was incomplete lists. The guy never finished the list. Or overcompleted lists. You know, the list was complete at fifteen pages and they're just now passing page 75 and the – and the pc hasn't been able to think of any new items since page 20. But they've still been grinding on, the auditor keeps getting in the mid ruds and asking him, "In this lifetime, what have you failed about?" On and on and on and on until you get – list's been complete forever.

Most frequent source of ARC breaks is – around any listing action – is simply an incomplete list, that's all. You could take any arbitrary list and assess the pc on it. Because the pc didn't do it, it is therefore not incomplete because he never started it. You know, it's like your Prehav levels and the preliminary step list of items – I mean levels to be to run. Well, you can do all of those that you want to and you're not going to ARC break the pc unless you get a completely incorrect level.

And that can be very embarrassing to the pc. And I've given the source of this list so that if you ever run into it and you just can't find anything on this list – or if you're – the auditor doing it can't find any level on this list at all, I've given you where these lists came from so you can get ahold of some of the old lines and put a "failed" to it; put it and a "failed" to it and

a "not" to it and you can go on and extend this list considerably. I've given you the sources for this list and you have all those. They're about every thought or combination of anything that man and life has. But this is adequate for most pcs and it doesn't matter whether the level list is complete or not, because it's an arbitrary list. Pc didn't do it, so therefore it doesn't stand as an incomplete list. Ah, but the other list – now you – you're up against all the rules of Listing. And that's quite a skill; Listing and Nulling is quite a skill. And what does it do? It goes back to meter reading. Get your auditing cycle completed.

When you confront these complex processes, make sure that your nerviness does not stem from an inability to place the pc's chair. You get the idea? See? You're saying, "I'm having all kinds of trouble with R3R." Well, before you conclude anything about R3R – oh yeah, go on and study it and learn it and so forth – but you just can't seem to make it work. Before you conclude anything catastrophic with regard to this whatsoever, let's take a look at what you are doing that makes up R3R that makes you nervous. And you'll probably find out that listing makes you very nervous, or something, and you find out, "Well, why does listing make me very nervous? Oh, well, I..." It'll be something like this: "I've just never mastered the art of writing things while I was looking at a meter to see if they read. Yeah, something like that." And you say, "Oh – Oh well, no wonder we're having such a hell of a time in this assessment."

In other words, go back to basic things like your meter, your session, auditing the pc. Auditing cycle. Q and A. Pc keeps getting ARC broke – you can't figure out why he's getting ARC broke and every time you try to find it out – well, you didn't accept something the pc said. You had better conclude sooner or later that you must be doing a Q and A of some kind or another. There must be something wrong with your auditing cycle. Otherwise your pc wouldn't continue to get ARC broke. Look it over and patch it up.

Now, therefore, learn to play this game called auditing on its fundamentals. And when you feel very competent with its fundamentals, why, then I don't think that you will have much awe of a procedure which is simply a complex application of these fundamentals. There really isn't very much to R3R. Guy has got a time track and you're going to run him through these things and you're going to come a cropper sometimes – going to come a cropper sometimes with it. Why? Well, it isn't because you didn't tell him to move to the beginning of the incident – it isn't anything elementary like that – or you didn't follow your procedure – it isn't anything involved. You'll find out, well, you had something like a wrong duration. You just continued to get wrong durations. And eventually, running this pc, you finally get it through your knucklehead that this pc just won't date on this chain that you are running.

And you finally say... trace this thing back. "Well, let's see. Let's trace this thing back here. Now, what did I do? So-and-so and so on and so on and so on and so on. Oh, we must – he – he doesn't have any tone arm action either. Oh, we must not have the right assessment. Something is wrong with the assessment. Well, how could there be anything wrong with the assessment?" And it suddenly dawns on you that you have absolutely no confidence whatsoever in being able to clean up a pc's needle so you can assess. Nothing wrong with R3R, see. You're having trouble – you're having trouble handling a session and handling a meter.

So on this pc, without going back and putting yourself through a course or something like that – on this pc right then, you decide, "Well, all right, to hell with it, this thing has got no tone arm action so I must have a wrong assessment. That's it. So there's something wrong with the item or there's something wrong with the level. That's all. All right, now what could be wrong with those? Well, I just must not have done what I was supposed to do to find the item – or to find the level from which I got the item. Now something is wrong in that department.

"Well, how come I could – would get a wrong assessment on this pc? Well, I've – let's see. Let's see, his needle was awful dirty. As a matter of fact, his needle is still dirty. As a matter of fact I've never seen a clean needle on this pc! Ahh! Hey, hey – I think I've got it. I think I got it. I think this pc – I've never had this pc in-session. Ha-ha-ha-ha-ha. Excuse me!" [laughter]

"Ah," so you say, "Well, now let's – let's put this pc in-session. This pc has been roughed up a few times and so forth; let's just run 'in auditing,' eighteen-button Prepcheck." Something elementary. Only in this particular case, why, we're just going to run them until we've got a bit of a clean needle and we're not going to bother the pc and so forth because that seems to be a weak spot, here. So let's just kind of – let's run a sort of an eighteen-button Prepcheck on auditing and let the pc answer it any way he wants to, and we'll say it's clean when it's clean and we'll just kind of ease this thing out and so forth. Boy, we find out all kinds of things. This pc has been withholding, and he's been suppressing and he's been upset with this and he's been in disagreement with that and so forth, and you know? You thought you couldn't run R3R. Well, no, you just didn't have the pc in-session. See, elementary, my dear Watson. How can you do an assessment on somebody who isn't in-session?

So you trace this – always trace this back to these stupid fundamentals. And your main danger as an auditor is – the main danger that you run into – is that you're too complicated. You're not – you're insufficiently idiotable. See, if you would just – if you would just recognize that the simplicities of the game make it hang together and work – if you'll just recognize that, why, you'll have some fantastic wins here and there. Look it over. And eventually you'll get very cocky about these things and it'll all fall into line with you and so forth.

But the reason you're not achieving a result here or there on a complex technology goes back to these early ones. You either aren't doing it, you aren't doing it in an auditing session because you haven't got a session, or you suddenly discover that there's something wrong between you and the pc and this meter. This pc does not register well on this meter. Why? Well, I'll let you in on something. The greatest errors that you can make in R3R – the greatest errors that you can make – are wrong date and wrong duration. Those outshine any other error. You can even make progress with a wrong assessment, you understand? Those are just enormous. They ride up there at the umpteen skillion light-year level, see? And way down below these things is wrong assessment.

Well, there's two ways we can get a wrong assessment. We can have had a wrong assessment in the first place, and we could actually have run it out so that we are now running on a wrong assessment, because you see, we flattened the first assessment. In which case – both cases, the TA will remain without motion. You won't have adequate motion in the TA.

Now, the only other thing that can kill TA motion, as far as R3R is concerned, is this astronomic fact of wrong date, wrong duration – they'll kill TA motion. Wrong date, wrong duration, bang! No TA motion; that's it.

I've been studying TA motion here, lately – what makes it and that sort of thing, and I finally found these facts out. And so there's this enormously important fact – just cannot be overstressed. Wrong date, wrong duration. Those are crash. Anytime you're really having any trouble with it you've got wrong dates and wrong durations. I mean, that's all. You understand? I mean, that's *waaay* up there.

The other point here, wrong assessment, well, the only thing that leads to is just no TA action and not much pc interest and you're not getting much done on the case and so forth and so on. It's not going to ruin the case, don't you see?

And flatten the chain – you flatten the chain, and you said, "Well, a chain couldn't flatten in one engram." Yet you did. You flattened it in one engram. What you found was basic on that chain. You know, it flattens in a hundred or it flattens in one or... it's no point – has nothing to do with where the engram is on the time track. The engram can be yesterday; just yesterday. And it's basic. Well, you ran – run this engram that you date as yesterday. And you clean it all up and the pc's fine, and the somatics reduce and everything's gorgeous about the thing and you look for an earlier one, you can't get any date, you can't get any...

"Let's see. Is the earlier incident we want gr-gr-greater-greater than 10 days ago? Less than – I don't get any read. Just a minute, get some better light on this..." [laughter] "Now is – is the engram – is the engram, the earlier engram which reduces to absurdum that chain – is the earlier engram earlier than 20 days ago? Is it later than – I mean no, no. No. I mean is it *more* – more than 20 days ago? Le-le-less than 20 days ago? I don't get any read here at all." [fumbles with meter, clears his throat] "Now, maybe it's the wrong order of magnitude. Ah! Is the earlier engram we are looking for on the re – to re-fail to reduce to absurdity, is this more than a hundred trillion years ago? Is it less than a – that doesn't read. More than a hundred? They're both reading. Did you think of something?" [laughter] "All right, let's have another crack at this. Is it more than a hundred trillion years ago? Less – I got a dirty needle here. You thinking of something?" [laughter]

Four sessions later: "Say, I wonder something." Lights dawn, you know? "To fail to reduce to absurdity... fail to reduce to absurdity – it doesn't read." [laughter] "We flattened the chain. Oh, excuse me!" [laughs]

Pc says self-righteously, "Well, I told you I thought that was all there was to it." Pc didn't say a word about it! [laughs]

Well, that's some of the troubles you run into, when you get a wrong assessment. Man, the devil himself with telepathy! The Russians have heard that the Americans are now using telepathy to communicate to the atomic subs – so they now have a Professor of Telepathy who is studying telepathy and he wants to telepath to a group at Oxford University. Only he won't do it because he doesn't think telepathy works. I mean... Our scientific world marches on.

But the point I'm making here is wrong assessment is contributive to wrong date and wrong duration. Because even if you have the right chain, getting a date to read and getting a duration to read is hell. It's horrible! It's very hard to do. With the pc in-session, needle clean, right level, right item, next engram coming up dead-easy, it's difficult. It's not easy to get the right date and the right duration.

Why? Because you've got the date, which is usually the last moment of the engram toward present time. So your duration extends that earlier, see? And if you don't get – and the pc has no reality on how early this thing went because he's only got the last tail of it, which is the part toward present time, so duration doesn't read worth a nickel – dating is easier to do than duration. And brother, I have dated something twice and re-durated it ten times trying to find the beginning of it. When I finally did find the beginning of it, *zing!* Of course, I had to redate it by that time. Because it had now become unreal.

See, its end was so much further away that it made about a – well, it made about a hundred years of error in the date when we finally found the beginning of it. And it was dark and it was terrible and the pc couldn't run it and nothing could be done about it and nobody could find anything in it and it was all a mess and all a mess and all a mess and all a mess, and re-duration, re-duration, re-duration – and then finally got a more proper date, and then duration, and then durated it, and then all of a sudden had the right duration, and bang, pc got to the beginning of the thing, went through it zip-zip-zip, all of the somatics reduced, everything was fine, fine, fine, fine, fine. That pc was running all right, on the right chain. How many re-durationings? Ten.

God help you someday, when you get somebody who has an engram fifteen trillion trillion years long. Try to find the beginning of that! Before you've gone halfway through, of course, your date is so wrong that it's jamming the track anyway. And just time after time, you find the earlier part of it and you find the earlier part of it and you find an earlier part of it – and finally, you finally get it all worked out and you find out that this thing which first registered as one and one-half hours long was actually 15 trillion trillion years in length. Somebody stuck in a mountain that long; couldn't get out.

That's rough. That's hard to do. It's hard to do when everything else is correct. So you've got to have everything else correct and then it can be done. But it is not easy to do when all signs and portents are favorable. Got that?

Now you get a wrong assessment and add it to this. Oh-ho, you've had it. Or you over-run a chain. You've run five engrams on this chain and they don't – no TA action on the last two. The thing was sitting at 5 on the TA and you're getting no TA action, so you just say, "Well, maybe the TA action will pick up. Maybe I've got wrong dates and durations on this thing, maybe the TA I..." Actually pick it up and you say, "Now, is it more than..." You know, "Is the next incident..." You know, "What's the date of the next earlier incident?" See? Get your head back on. TA's up there, hasn't moved for two incidents; 3R3 says that you're supposed to find the basic on the chain. Maybe you did. Maybe you've run two more incidents than you needed to run to flatten it. Maybe the thing's been flat.

But you can't go into esoterics as to whether something is flattened or not flattened or anything else, if you can't even put a pc in-session. How can you run an ARC break when all

your sessioning on the pc is an ARC break? When you won't answer anything the pc tells you, how can you do an ARC break assessment – because you're laying in ARC breaks faster than, of course, you're picking them up by assessment. That's something like the frog that crawls up two inches and falls back three, and he never gets to the top of the well that way. What's in error then? Just your auditing cycle – nothing more elementary than that.

So I'm saying it's not terribly good news that taking somebody all the way to OT requires a number of complicated procedures; this is not very good news. But it is good news that all the errors of these procedures, when they really get erroneous, fall immediately back down to just a very few basics. You can learn how to do those basics, get confidence in that line, recognize that your disabilities in handling other things fall back to those simple basics. Therefore you can always improve those basics so you'll be able to do it, and you've got a clear road ahead of you.

I'm not at all dismayed as far as you're concerned in being able to do these procedures, but I'm looking at what difficulty you are having here or there, and I recognize they're all elementary difficulties; they're not complex difficulties at all. You can do these things – you can do them easily and you can bring off the show. Because, I'm telling you, you're right – you're right here within handshaking distance of making OTs. OT is on the sunny side of a thousand hours right this minute for any pc.

The length of time it'll take him to go OT has intimately to do, much more intimately to do with the auditor's command of basics than it does the state of his case. Because I have made a new discovery which will hearten you a great deal. And that is that case levels VII, VI, V – all of them – have a channel which, if properly assessed, give them clear-running, TA-moving engrams, with no dub. There's always a little channel lies through the bank which is straight, that the pc has a reality on. And that doesn't matter if you're running "brushing teeth." See? He's still got that one. Win on that one, flatten that chain, reassess, get another chain, and he goes up, up, further, further, ability, better, better, better, better. The next thing you know, you've got it made.

You're not up against difficult cases. You're up against rather difficult procedures. And all that your difficult procedures are up against are your ability to handle the basics I've been talking about.

Okay? Thank you.

AUDITING SESSION: PRELIMINARY STEPS OF R3R PART I

An auditing demonstration given on 10 July 1963

LRH: Okay, July 10, 1963. All right, honey. Okay. Your chair's a little aslope – bring that arm up a little bit, would you? Thank you. Now, the room all right?

PC: *Mm-hm.*

LRH: Okay. Is it all right with you if I have a recorder running here?

PC: *Yeah.*

LRH: Is it?

PC: *Mm.*

LRH: Doesn't bother you?

PC: *No.*

LRH: Not making any electrical squeak or anything?

PC: *No.*

LRH: You can hear it?

PC: *It's making a hiss, but it isn't squeaking.*

LRH: That upsetting to you?

PC: *No.*

LRH: Sure?

PC: *Yeah, it's all right!*

LRH: Huh?

PC: *It's all right.*

LRH: All right. All right, put your hands in your lap. Squeeze the cans. Thank you. Havingness is up pretty good.

Tone arm's here at 4.75.

Now, what we're going to do in this session is the preliminary assessment, R3R, and we're going to find a level here, if we can.

PC: *Mm-hm.*

LRH: And start to list if we find a level. Okay?

PC: *Mm. All right.*

LRH: Anything wrong with that?

PC: *No that's all right. It's all right!*

LRH: Not upsetting you in any way?

PC: *No!*

LRH: All right, very good. I have the listing ARC break sheet here, so forth.

PC: *All right.*

LRH: All right, let's hope we find an interesting level. Okay. Is it all right with you if I begin this session now?

PC: *Yes.*

LRH: Okay. Start of session. Has the session started for you?

PC: *Yes.*

LRH: Very good. What goals would you like to set for this session?

PC: *To have a good session.*

LRH: All right.

PC: *To find an interesting level. To have the nulling go easily. Get over this ARC break uh – sore throat!*

LRH: To get over this ARC break?

PC: *Yes, I just said it. I meant sore throat.*

LRH: You got a sore throat?

PC: *Yes.*

LRH: I'm sorry – to get over this sore throat.

PC: *Mm-hm. It's interesting. I don't have any ARC break.*

LRH: All right. All right, how is that?

PC: *That's all right.*

LRH: Okay. Now, we'll put in our "since" mid ruds.

PC: *Mm-hm.*

LRH: All right. Now, when was the last time I audited you?

PC: *Monday night.*

LRH: All right. Since the last time I audited you, has anything been suppressed?

PC: *Concern about um – Janie.*

LRH: Okay.

PC: *That's about all – um, the sore throat.*

LRH: All right.

PC: *Um – that's about all.*

LRH: All right. I'll check that on the meter. Since the last time I audited you, has anything been suppressed? All right, I didn't get a specific read there. All right. Since the last time I audited you, is there anything you've been careful of?

PC: *No.*

LRH: All right, I'll check that on the meter. Since the last time I audited you, is there anything you've been careful of? All right. Doesn't read. Since the last time I audited you, is there anything you've failed to reveal?

PC: *No. I don't think so.*

LRH: All right. I'll check that on the meter. Since the last time I audited you, is there anything you've failed to reveal? I've got a disturbed needle here. Yeah, what's that?

PC: *Well, I thought um – I failed to reveal that I didn't want the children taking Cokes from the front refrigerator.*

LRH: Front? You mean Winter Garden?

PC: *Winter Garden refrigerator, mm-hm.*

LRH: All right. Very good. All right. Since the last time I audited you, is there anything you've failed to reveal? All right, I didn't get a specific read on that. Okay?

PC: *Mm-hm.*

LRH: All right. Put this on the meter now. Since the last time I audited you, has anything been invalidated? All right, I didn't get a read. Since the last time I audited you, has anything been suggested? Yes, there's a suggestion.

PC: *Well I suggested that – um, that – um, 3N, at – you know – an implant run,*

gets more gain and benefit to a pc than an engram run.

LRH: Hm-mm.

PC: *Hm.*

LRH: All right. Since the last time I audited you, has anything been suggested? Seems to be still something here.

PC: *Oh, that we, uh – put a new lineup in the X Unit. Yeah.*

LRH: All right. Don't quite see how...

PC: *Well, the new lineup of procedure – of auditing – in the X Unit. You sent it on through on a note for them, you know, saying this sounded good for XI. It was the suggestion that uh – that all the missed withholds be listed down and then cleaned up one by one. This was from – this was suggested by Pesco to you and you said this sounded like a good thing for XI, it was...*

LRH: Uh-huh.

PC: *... you sent it on to Reg and then Reg sent it on to Herbie and then Herbie sent it on to me.*

LRH: Oh, I see! All right, very good. I remember now.

PC: *Hm.*

LRH: Sorry. All right, since the last time I audited you, has anything been suggested. You protesting the question?

PC: *Hm!*

LRH: Hm?

PC: *Yes.*

LRH: All right. Since the last time I audited you, has anything been suggested? There seems to be another suggestion here.

PC: *Oh, I've suggested that I would like to find an interesting level and I thought*

about different levels that I thought might be interesting.

LRH: Oh!

PC: *Hm.*

LRH: All right, thank you!

PC: *Hm.*

LRH: All right! Okay. Since the last time I audited you, has anything been suggested?

PC: *I think I'm protesting the question. It never reads. I don't know why it's reading.*

LRH: All right. Okay, very good. Since the last time I audited you, has anything been suggested? I'm afraid there is a suggestion here. There. There.

PC: *I just was wondering, is it something I suggested or something someone else suggested? You know?*

LRH: Hm! What's that? That.

PC: *I suggested that – um – that – um – that I get off that withhold to you prior to the session, because it didn't sort of involve me, except my reaction to someone else.*

LRH: All right, very good. That's what had your TA high here. That's what had this high. Okay. All right. Since the last time I audited you, has anything been suggested? And that's smooth. Very good. And your needle cleaned up and you dropped half a tone on the tone arm. Okay?

PC: *Good.*

LRH: Since the last time I audited you, has a mistake been made? Did you think of a mistake?

PC: *No.*

LRH: Let me check that again. Since the last time I audited you, has a mistake been made? All right, that's clean. Since the last time I audited you, has anything been protested? Did you think of something? It was a latent read.

PC: *No, I didn't think of anything.*

LRH: All right, very good. Check it again. Since the last time I audited you, has anything been protested? And that is clean. Do you agree that's clean?

PC: *Mm-hm.*

LRH: All right, very good. Since the last time I audited you, is there anything you've been anxious about? I got a bit of a slow.

PC: *We'll about that – trying to get that date, last night, in the session...*

LRH: All right.

PC: *...I gave you.*

LRH: All right. Since the last time I audited you, is there anything you've been anxious about? All right, that seemed okay. And since the last time I audited you, has anything been decided? Yes.

PC: *Well, I decided to – um – get some of the paperwork done before the session tonight.*

LRH: All right. Very good. Since the last time I audited you, has anything been decided? I'm – see another read here.

PC: *I decided to get Janie and Mrs. Milchert some auditing.*

LRH: All right. Since the last time I audited you, has anything been decided? All right, that didn't read. Okay, very good. Do you agree that's clean?

PC: *Mm-hm.*

LRH: All right. Now let's check something here. All right. Have I missed a withhold on you? What did you think of?

PC: *Well – uh – the only thing I thought of there is that it wasn't the children taking Coca-Colas from the Winter Garden, it was the children taking Coca-Colas out to other people from the Winter Garden, you see, that I didn't – that I was objecting to.*

LRH: Oh, I see. All right. Okay. Have I missed a withhold on you?

PC: *Well, I'd like to – certainly like to get this head and throat cleaned up. You know? I don't like the – um – aches around in my head and my sore throat, you know.*

LRH: Hm.

PC: *Fixed up. That's about all I can think of.*

LRH: All right, very good. Have I missed a withhold on you? I don't get anything reading. Tone arm went up kind of high here. You upset about anything?

PC: *No, just sort of waiting, till the body of the session.*

LRH: Well, all right. Very good. Now, uh – okay. Now, we abandoned a chain on you. What about that chain? Is that what your sore throat is?

PC: *I don't know.*

LRH: Any consequences here on this?

PC: *I don't think so.*

LRH: You don't think so? All right, we had a nice clean needle for a while and then it roughed up. Have I asked you questions that you protested?

PC: *No, just was surprised that you asked a withhold question after the rudi-*

ments, you know. That's understandable, but I just was a bit surprised.

the Routine R3R assessment, shall we?

LRH: Okay. All right, thank you. Anything else? Uh, your needle's nice and clean now. Okay. Now, let's carry on with

PC: *Mm-hm.*

LRH: Let's see what we can do about this and see if we can get you a level.

[Editor's note: the following was obviously later inserted into the tape recording of the session.]

This is an interjected note to whoever is listening to this tape. This, of course, was just an ordinary, run-of-the-mill session. This session is not done for demonstration purposes. A few small errors creep into it one way or the other. It's a rather tough session. It's pretty tough and go – touch-and-go, and the – you cannot, of course, see the pc's meter, as you're listening to this on just a tape. But the facts of the case are that you can follow this fairly closely, as to what the meter is doing.

The reads throughout this right down to the end, and just before the end, continue as very, very small reads – rather hard to follow, which you'll see, that the rudiments are gotten in every time the thing dirtied up. Every time the needle dirtied up, why, it was cleaned up. In other words, the assessment was done on a thoroughly clean needle. The needle was throughout very nice, smooth, sweeping clean. And no attempt was made at any time here to do it on a dirty needle.

And occasionally you can hear paper rattle there, as the assessment sheet is handed over to the pc on two or three occasions, to see if she's had any thoughts about these levels, as the sheet given to her, of course, might refresh her mind.

The breath which you hear in this is due to the quality of the microphone more than anything else. It just happens to be well tuned to breath and it's a pretty breathy recording.

This note is interjected just for your interest. You can follow this assessment fairly closely. The TA was high most of the assessment, right up to the point where something interesting happened.

LRH: Have you mainly suppressed? That's correct.

PC: *Not particularly, I thought.*

PC: *Hm.*

LRH: All right, thank you.

LRH: In this lifetime – in this lifetime, have you mainly failed to suppress? In this lifetime, have you mainly not suppressed? Okay. In this lifetime, have you mainly invalidated? All right. In this lifetime, have you mainly failed to invalidate? Okay. In this lifetime, have you mainly not invalidated? Okay. In this lifetime, have you mainly been careful? You had a thought there, what was it?

In this lifetime, have you mainly failed to be careful? Okay. In this lifetime, have you mainly not been careful? All right. In this lifetime, have you mainly not been careful? What did you think there?

PC: *Perhaps I could have been more cautious, I thought, or more careful, in this lifetime.*

LRH: All right. Good. In this lifetime, have you mainly not been careful? All right.

In this lifetime, have you mainly suggested? All right, what thoughts did you have on that?

PC: *No, I thought.*

LRH: All right. In this lifetime, have you mainly failed to suggest? Okay. In this lifetime, have you mainly not suggested?

Okay. In this lifetime, have you mainly not – have you mainly withheld? Okay. Sorry for the stumble. In this lifetime, have you mainly failed to withhold? Okay. In this lifetime, have you mainly not withheld? Okay.

In this lifetime, have you mainly protested? All right, what was your thought there?

PC: *I thought that that was someone else's level. I always think of these levels as someone else's, you know. That's the first one you've hit that I've known was someone else's level, you know. Like...*

LRH: Oh!

PC: *... that's Joe's level or Pete's level or something like that.*

LRH: Oh! Oh, all right. Okay. Okay. In this lifetime, have you mainly protested? In this lifetime, have you mainly protested? Anything else on that?

PC: *No.*

LRH: All right, it's in. In this lifetime, have you mainly failed to protest? Okay. In this lifetime, have you mainly not protested? Okay.

In this lifetime, have you mainly hidden? Okay. In this lifetime, have you

mainly failed to hide? Okay. In this lifetime, have you mainly not hidden? All right. Well, any thought on that?

PC: *Just thought those were all amusing.*

LRH: All right. Any other thoughts that you've got there?

PC: *No, just – like "In this lifetime have you mainly hidden," you know. Oh, dear!*

LRH: All right. Okay. All right.

In this lifetime, have you mainly revealed? Okay. In this lifetime, have you mainly failed to reveal? You got another thought here, what was it?

PC: *Well, I thought, why yes, some people would react on hidden, you know. Take a criminal or something like that, he would be hiding from the police, and so forth.*

LRH: Hm. Yeah, all right. In this lifetime, have you mainly failed to reveal? Something about that?

PC: *No.*

LRH: All right. In this lifetime, have you mainly not revealed? Have you mainly not revealed? Okay. In this lifetime, have you mainly made mistakes?

[PC laughs]

LRH: Accusative, that wouldn't... See many a pc taking umbrage at that!

PC: *Yeah.*

LRH: All right. In this lifetime, have you mainly failed to mistake? I don't get that at all! Failed to mistake.

PC: *Failed to make mistakes, hm?*

LRH: Hey, that's – that's probably right! Maybe that was a typo, huh?

PC: *Hm!*

LRH: All right. In this lifetime, have you mainly failed to make mistakes? All right. In this lifetime, have you mainly not made mistakes? All right, you had a thought a moment ago, what was it?

PC: *Uh, I thought it would be very interesting – somebody you know.*

LRH: That's real...

PC: *That was – I don't know...*

LRH: All right. In this lifetime, have you mainly asserted? Flying needle here. In this lifetime, have you mainly asserted? All right. In this lifetime, have you mainly failed to assert? Okay. In this lifetime, have you mainly not asserted? In this lifetime, have you mainly not asserted? All right.

In this lifetime, have you mainly changed? Okay. In this lifetime, have you mainly failed to change? Okay. In this lifetime, have you mainly not changed? Okay.

In this lifetime, have you mainly damaged? Okay. In this lifetime, have you – that's an awful accusative one, too, isn't it...

PC: *Hm, yes.*

LRH: ... when you get right down to it? All right. Any thought on that you didn't utter?

PC: *No.*

LRH: All right. In this lifetime, have you mainly failed to damage? Okay. In this lifetime, have you mainly not damaged? Have you mainly not damaged? All right. Well, we've only had a couple in so far.

PC: *Hm!*

LRH: All right. In this lifetime, have you mainly withdrawn? All right, that banged. What did you have to think about that?

PC: *That this is one of the students' levels. One student had that level assessed.*

LRH: All right.

PC: *It was the wrong level.*

LRH: Hm?

PC: *It was the wrong level.*

LRH: Oh, all right. Check it again. In this lifetime, have you mainly withdrawn? Okay, it's still in. In this lifetime, have you mainly failed to withdraw? In this lifetime, have you mainly not withdrawn? All right. In this lifetime, have you mainly not withdrawn? All right, any thought on that? All right. In this lifetime, have you mainly not withdrawn? All right, not in.

In this lifetime, have you mainly convinced? Okay. In this lifetime, have you mainly failed to convince? You have had a thought now.

PC: *Had a thought. I noticed that we were in on the – uh – on some of the Pre-hav level levels, now. You know?*

LRH: Hm, hm! In this lifetime, have you mainly failed to convince? Okay. In this lifetime, have you mainly not convinced? Okay. Anything else? All right.

In this lifetime, have you mainly proven? Okay. In this lifetime, have you mainly failed to prove? All right. In this lifetime, have you mainly not proven? Any thought there?

PC: *No. There's not much I haven't not proven. The only thing I have not proven are all the scientific experi-*

ments. I never could get them to work out in the laboratory.

LRH: Uh-huh.

PC: So you might say I – I failed to prove conclusively all the principles of physics and chemistry.

LRH: All right.

PC: That's about all I've not proved.

LRH: Okay. All right. Let me ask you that again. In this lifetime, have you mainly not proven? Have you mainly not proven? Have you mainly not proven? Nope. Out.

In this lifetime, have you mainly been right? In this lifetime, have you mainly failed to be right? Okay. In this lifetime, have you mainly not been right? What did you think about all that? That's in.

PC: That's in? Hm!

LRH: Hm?

PC: Well, I just remembered, along back there, that one of the students has "failed to be right" as their level. You know? And so I sort of perked up my ears on it. That's all.

LRH: Oh, all right. Very good, thank you. In this lifetime, have you mainly not... What's that?

PC: I don't know. I didn't think of anything.

LRH: All right. In this lifetime, have you mainly not been right? All right. In this lifetime, have you mainly not been right? All right. Anything more to say about that?

PC: Uh-uh.

LRH: That's out. Not been right? Not been right? No, that's out. Okay. Thank you.

PC: Mm-hm.

LRH: In this lifetime, have you mainly been wrong?

[PC laughs]

LRH: Accusative, isn't it?

PC: Oh, dear!

LRH: All right.

PC: Hm.

LRH: All right. In this lifetime... I can see it now – some HGC pc really cutting and running on that!

PC: Yeah, ha.

LRH: ...have you mainly been wrong. All right. In this lifetime, have you mainly failed to be wrong? Okay. In this lifetime, have you not been wrong? Okay.

In this lifetime, have you mainly won? Okay. In this lifetime, have you mainly failed to win? Okay. Failed to win? Okay. In this lifetime, have you mainly not won? Okay.

In this lifetime, have you mainly lost? Okay. In this lifetime, have you mainly failed to lose? Okay. In this lifetime, have you mainly not lost? All right.

In this lifetime, have you mainly agreed? Okay. In this lifetime, have you mainly failed to agree? Okay. In this lifetime, have you mainly not agreed? All right.

In this lifetime, have you mainly disagreed? In this lifetime, have you mainly disagreed? In this lifetime, have you mainly failed to disagree? You had a thought here of one kind or another.

PC: I'm suppressing a sneeze a little bit.

LRH: Hm?

PC: *I was suppressing a sneeze, but it didn't. . .*

LRH: Well, go on and sneeze.

PC: *No, it won't sneeze.*

LRH: All right. Okay. In this lifetime, have you mainly not disagreed? Have you mainly not disagreed? Something wrong with "mainly"? You keep binging a little bit on "mainly." There it is. There.

PC: *Oh, isn't that part of the saying right there, the plains, and the something or other and you know, the saying, you know, and mostly on the plains, mainly on the plains, the...*

LRH: Oh! All right. All right, very good. In this lifetime, have you mainly not disagreed? Not disagreed? In this lifetime, have you mainly not disagreed?

In this lifetime, have you mainly ignored? All right. In this lifetime, have you mainly failed to ignore? Okay. In this lifetime, have you mainly not ignored? Okay.

In this lifetime, have you mainly decided? Okay. In this lifetime, have you mainly failed to decide? Okay. In this lifetime, have you mainly not decided? All right. Any thought on this?

PC: *Uh-uh.*

LRH: All right, in this lifetime, have you mainly propitiated? Okay. In this lifetime, have you mainly failed to propitiate? Okay. In this lifetime, have you mainly not propitiated? Okay.

In this lifetime, have you mainly held off? All right. In this lifetime, have you mainly failed to hold off? All right. In this lifetime, have you mainly not held off? Okay.

In this lifetime, have you mainly pulled in? Okay. In this lifetime, have you mainly failed to pull in? All right, what was that?

PC: *I thought – it sounded like getting into a bit of physical exercise type of business here, you know, pull in, push out...*

LRH: Ha – all right.

PC: *... push up and...*

LRH: All right. In this lifetime, have you mainly failed to pull in? Failed to pull in? Any more thoughts on that? That seems to...

PC: *No, you know, about the only thing I could think of, you know, like failing to pull in the anchor, or something, only I haven't had any anchors to fail to pull in. But uh...*

LRH: All right.

PC: *It doesn't make sense to me, frankly.*

LRH: Oh, it doesn't?

PC: *No.*

LRH: All right. In this lifetime, have you mainly failed to pull in? All right. In this lifetime, have you mainly failed to pull in? All right. In this lifetime – in this lifetime, have you mainly not pulled in? Okay.

That's better. A few more to go here, we're doing fine. Well, we've got three more columns of them, to be precise.

PC: *Hm-hm.*

LRH: In this lifetime, have you mainly remained? Okay. In this lifetime, have you mainly failed to remain? All right. In this lifetime, have you mainly failed to remain? Okay. In this

lifetime, have you mainly not remained? Okay.

In this lifetime, have you mainly prevented? In this lifetime, have you mainly prevented? Okay. In this lifetime, have you mainly failed to prevent? Oh, what are you thinking about there?

PC: *I got a bit of the thought, that "endure" is on this list, you know.*

LRH: Oh, "failed to endure"?

PC: *That's right. After having been run for hours and hours and hours on the terminal, on that "endure," you know, I thought, oh, dear! That might be coming up soon!*

LRH: All right, very good. All right. In this lifetime, have you mainly failed to prevent? Okay. In this lifetime, have you mainly not prevented? Okay.

In this lifetime, have you mainly pressed on? Okay. In this lifetime, have you mainly failed to press on? Okay. In this lifetime, have you mainly not pressed on? All right.

In this lifetime, have you mainly avoided? Okay. In this lifetime, have you mainly failed to avoid? Okay. In this lifetime, have you mainly not avoided? All right. You're having a big think here, of some kind or another.

PC: *Oh, I was thinking that, yes, I suppose those levels – you know, I was trying to think of what people might answer to these sort of things. I found myself thinking about it. You know, a level like that...*

LRH: Oh, all right. All right, very good. In this lifetime, have you mainly blocked? In this lifetime, have you

mainly blocked? All right. Some thought about that level? That's in.

PC: *No, I thought of Arthur's blocks and children's blocks, and that sort of thing.*

LRH: All right. Okay. In this lifetime, have you mainly failed to block? There's something here.

PC: *Ah [laughs] – it just seems like an – a funny level to me. You know, I suppose it means putting barriers up. But, uh – every time you say blocked, you know, I think of blocking out incidents.*

LRH: Mm-hm.

PC: *And I think of – uh – blocks. And I think of failed to block.*

LRH: All right, very good. In this lifetime, have you mainly blocked? In this lifetime, have you mainly blocked? Okay. In this lifetime, have you mainly failed to block? All right. Those are not in. In this lifetime, have you mainly not blocked? Okay.

In this lifetime, have you mainly retreated? In this lifetime, have you mainly retreated? In this lifetime, have you mainly failed to retreat? All right. In this lifetime, have you mainly failed to retreat? In this lifetime, have you mainly not retreated? All right.

In this lifetime, have you mainly reached? Okay. In this lifetime, have you mainly failed to reach? Okay. In this lifetime, have you mainly not reached? Okay. In this lifetime, have you mainly not reached? Okay.

In this lifetime, have you mainly attacked? In this lifetime, have you mainly attacked? Big thought on this someplace?

PC: *Attacked stayed in one time before. And then went out. I just remembered that.*

LRH: All right. In this lifetime, have you mainly attacked? All right. It's – it's staying in this time. In this lifetime, have you mainly failed to attack? In this lifetime, have you mainly failed to attack? That's not in. In this lifetime, have you mainly not attacked? All right, there's a read on that. Anything else you care to say about it?

PC: *No.*

LRH: All right. Those two stayed in. All right.

In this lifetime... You got a thought going here.

PC: *Well, I thought it was interesting, that one could attack, it would – both attack and not attacked are in, you know?*

LRH: Hm.

PC: *I suppose one can get a ridge built up on attacking and failing – not – not attacking, you know.*

LRH: Hm.

PC: *And that's why both levels could read.*

LRH: All right.

PC: *Otherwise it sounds rather paradoxical.*

LRH: You what?

PC: *Otherwise it sounds rather paradoxical, you see.*

LRH: All right. Okay. Anything else on that?

PC: *No.*

LRH: This needle's gone mad.

PC: *Oh, I suppose, yes, I was thinking, I wonder if "to attack" was part of the Helatrobis goals.*

LRH: Ah! All right. Thank you. Sorry to pester you about it. In this lifetime, have you mainly stopped? All right. In this lifetime, have you mainly stopped? Okay. In this lifetime, have you mainly failed to stop? All right. It's not now in.

PC: *Mm-hm.*

LRH: In this lifetime, have you mainly failed to stop? Well, what happened?

PC: *I don't know! I ha... I just – oh, I thought, that people would probably wonder why you said "That's not in – failed to stop" because they won't know that – that was uh – a lower level.*

LRH: I'm not particularly making this for anybody else.

PC: *Oh, I see. All right.*

LRH: All right. In this lifetime, have you mainly failed to stop? It's not in.

PC: *Hm-hm.*

LRH: In this lifetime, have you mainly not stopped? All right. We've picked up a hell of a dirty needle here, all of a sudden.

PC: *It's getting sort of long, wondering when we're going to – sort of get through. I know we got two more columns.*

LRH: Well, it'll be over in just...

PC: *Hm.*

LRH: ... just a moment. Thank you.

PC: *Hm.*

LRH: In this lifetime, have you mainly confronted? Well, you've got something more than that worrying you, lady.

PC: *Oh, I suppose I'm wondering what level it would be... All I can think of.*

LRH: All right, very good. That cleaned it up quite a bit. All right, in this lifetime, have you mainly confronted? In this lifetime, have you mainly confronted? In this lifetime, have you mainly failed to confront? In this lifetime, have you mainly not confronted?

In this lifetime, have you mainly communicated? Have you mainly communicated? In this lifetime, have you mainly failed to communicate? In this lifetime, have you mainly not communicated? All right. Thought here?

PC: *I thought – possibly. Mm.*

LRH: Hm. All right. In this lifetime, have you mainly not communicated? Not communicated? Not communicated? In this lifetime, have you mainly not communicated? No, that's in with a touch here. All right, we've got about five levels in, now.

All right. In this lifetime, have you mainly been prideful? Okay. In this lifetime, have you mainly failed to be proud? Any thought here?

PC: *I thought then – that's the first time I've heard of that one. You know, and what's that? Mm-hm.*

LRH: All right. In this lifetime, have you mainly failed to be proud? Some more challenge on this of some kind?

PC: *I had a – was my itch.*

LRH: All right. In this lifetime, have you mainly failed to be proud? Boy, that reads! Nothing else about it?

PC: *Uh-uh.*

LRH: All right. That's in. In this lifetime, have you mainly not been prideful? Mainly not been prideful? You mainly not been prideful? You've got something going here, man. Look at the number in all of a sudden.

PC: *Mm. Well, it sort of began with "attack." And how could it be attack and not attacked, I thought. And then I was surprised when you said "been prideful," I thought, you know, prideful. I've never heard of prideful! I suppose it's proud. You – you mean you've been proud!*

LRH: All right.

PC: *You know? And it started with some of these staying in, and I just didn't understand, or dig, you know, like "failed to pull in," and "blocked" – blocked! You know, the instant thing I thought of there was the children's blocks.*

LRH: Hm.

PC: *You know? And um – that's about all!*

LRH: All right, thank you. I'm sure that cleaned up the needle quite a bit here.

PC: *Hm.*

LRH: All right. In this lifetime, have you mainly not been prideful? In this lifetime, have you mainly failed to be proud? All right. In this lifetime, have you mainly not been prideful? Okay.

In this lifetime, have you mainly sympathized? In this lifetime, have you mainly sympathized? In this lifetime, have you mainly failed to sympathize? In this lifetime, have you

mainly failed to sympathize? In this lifetime, have you mainly not sympathized?

In this lifetime, have you mainly recovered? In this lifetime, have you mainly failed to recover? In this lifetime, have you mainly not recovered? All right. Two columns to go!

PC: *Good!*

LRH: We'll be over this – very few...

PC: *Very good!*

LRH: ... moments. Okay?

PC: *Hm!*

LRH: In this lifetime, have you mainly helped? In this lifetime, have you mainly helped? In this lifetime, have you mainly failed to help? In this lifetime, have you mainly not helped? All right.

In this lifetime, have you mainly known? In this lifetime, have you mainly failed to know? In this lifetime, have you mainly not known? Okay.

In this lifetime, have you mainly caused? Have you mainly caused? All right. In this lifetime, have you mainly failed to cause? All right. In this lifetime, have you mainly not caused? All right.

In this lifetime, have you mainly believed? In this lifetime, have you mainly failed to believe? In this lifetime, have you mainly not believed? Okay.

In this lifetime, have you mainly cured? Cured? In this lifetime, have you mainly failed to cure? All right. In this lifetime, have you mainly not cured? All right.

In this lifetime, have you mainly liked? In this lifetime, have you mainly failed to like? In this lifetime, have you mainly not liked? All right. Have you mainly failed to like? Have you mainly not liked? Have a thought there?

PC: *No.*

LRH: All right. What's the matter?

PC: *I just was thinking, that was amusing.*

LRH: What's that?

PC: *That – that was amusing, I thought.*

LRH: All right. Very good. In this lifetime, have you mainly endured? In this lifetime, have you mainly endured? In this lifetime, have you mainly failed to endure? In this lifetime, have you mainly failed to endure? In this lifetime, have you mainly not endured?

PC: *Only thing I can think of is who's that and what have you endured? I've endured, endured and failed to endure in this lifetime. What have you failed to endure? "Endure!" You know?*

LRH: All right.

PC: *Aw!*

LRH: Okay. In this lifetime, have you mainly failed to endure? In this lifetime, have you mainly failed to endure? In this lifetime, have you mainly not endured? Okay. They're not in.

PC: *Good.*

LRH: In this lifetime, have you mainly abandoned? Okay. In this lifetime, have you mainly failed to abandon? In this lifetime, have you mainly not abandoned?

In this lifetime, have you mainly given up? In this lifetime, have you

mainly failed to give up? In this lifetime, have you mainly not given up? Okay.

In this lifetime, have you mainly been sane? In this lifetime, have you mainly failed to be sane?

PC: *[laughs] Oh dear!*

LRH: All right. In this lifetime, have you mainly not been sane? Okay.

In this lifetime, have you mainly been curious? In this lifetime, have you mainly failed to be curious? All right. In this lifetime, have you mainly not been curious? Okay.

In this lifetime, have you mainly desired? All right. In this lifetime, have you mainly desired? In this lifetime have you mainly failed to desire? Failed to desire? In this lifetime, have you mainly not desired? All right, anything you care to say now?

PC: *Uh-uh.*

LRH: All right. In this lifetime – in this lifetime, have you mainly enforced? Okay. In this lifetime, have you mainly failed to enforce? In this lifetime, have you mainly not enforced?

In this lifetime, have you mainly inhibited? In this lifetime, have you mainly failed to inhibit? In this lifetime, have you mainly not inhibited? Okay. One column left to go.

PC: *Hm.*

LRH: Okay? Hm?

PC: *Good.*

LRH: All right. Any comments you care to make here?

PC: *Have a terrific somatic on an – on my arm. I don't know where it turned on. But...*

LRH: Yeah?

PC: *Uh...*

LRH: Is that so?

PC: *Yeah. It's been on for some time.*

LRH: All right. Anything else about it?

PC: *Uh-uh.*

LRH: All right. In this lifetime, have you mainly had? In this lifetime, have you mainly failed to have? In this lifetime, have you mainly failed to have? In this lifetime, have you mainly not had?

In this lifetime, have you mainly looked? Give me a little rundown.

PC: *Mainly I was suppressing moving my arm. It's quite...*

LRH: Hm?

PC: *...it hurts quite bad.*

LRH: Is that so?

PC: *Badly. Yes. Hm. Oh, "looked!" That's an interesting level – I thought about being in Spain and...*

LRH: Hm?

PC: *... doing what the Spaniards do. And oh, how the look!*

LRH: Yes. All right. In this lifetime, have you mainly looked? In this lifetime, have you mainly looked? In this lifetime, have you mainly failed to look? In this lifetime, have you mainly not looked?

In this lifetime, have you mainly been serene? In this lifetime, have you mainly failed to be serene? Okay.

In this lifetime, have you mainly been enthusiastic? All right. In this lifetime, have you failed to be enthusiastic? All right.

In this lifetime, have you mainly been conservative? Okay. In this lifetime, have you mainly failed to be conservative? All right.

In this lifetime, have you mainly been bored? All right. In this lifetime, have you mainly not been bored? Okay.

In this lifetime, have you mainly been antagonistic? Okay. In this lifetime, have you mainly not been antagonistic? Okay.

In this lifetime, have you mainly been angry? Have you mainly been angry? Okay. In this lifetime, have you mainly failed to be angry? Okay.

In this lifetime, have you mainly resented? Okay. In this lifetime, have you failed to resent? All right. Failed to resent? In this lifetime, have you mainly not resented? Any thoughts here? No thoughts at all?

PC: Just trying to hold still...

LRH: All right.

PC: ...in spite of my arm...

LRH: Still hurting you?

PC: Still hurts! Hm!

LRH: All right. In this lifetime, have you mainly not resented? I roughed up your needle now. Why is that? [*PC moves*] How's that?

PC: That's better.

LRH: All right. In this lifetime, have you mainly not resented? Mainly not resented? Okay. In this lifetime, have you mainly feared? All right. Have you mainly feared? What's the thought on that?

PC: I thought that that – I know two people who've had that as their level. Hm!

LRH: In this lifetime, have you mainly failed to fear? In this lifetime, have you mainly failed to fear? What's the big thought here? Failed to fear?

PC: I don't know!

LRH: All right. In this lifetime, have you mainly failed to fear? Reads. All right. In this lifetime, have you mainly feared? In this lifetime, have you mainly feared? In this lifetime, have you mainly not feared? Oh come on, what do you got here?

PC: I haven't really been thinking of a thing, except I know that "feared" is two other people's level. One level, I know, it didn't run on them, and another level on another pc, I know, it didn't run on this pc, another pc I know is being currently run on it.

LRH: Well, all right. Anything else about that?

PC: No, I just puzzled over "failed to fear." I haven't failed to fear.

LRH: All right.

PC: I haven't feared much either, but I certainly haven't failed to fear!

LRH: Okay. All right. In this lifetime, have you mainly failed to fear? Failed to fear? Okay. In this lifetime, have you mainly not feared? In this lifetime, have you mainly not feared? All right. They're both out.

In this lifetime, have you mainly been in grief? Okay. In this lifetime, have you mainly failed to cry? All right.

In this lifetime, have you mainly been apathetic? Okay. In this lifetime, have you mainly failed to be apathetic? All right.

In this lifetime, have you mainly in-flowed? All right. In this lifetime,

have you mainly failed to inflow? Okay. In this lifetime, have you mainly stopped inflow? All right.

In this lifetime, have you mainly outflowed? In this lifetime, have you mainly failed to outflow? In this lifetime, have you mainly stopped outflow? Okay.

In this lifetime, have you mainly...

PC: *Sorry.*

LRH: What?

PC: *My foot was itching.*

LRH: All right. In this lifetime, have you mainly stopped outflow? Some...?

PC: *No, I just noticed we're down near the bottom, and I'll be glad to get through with the list.*

LRH: All right, very good. In this lifetime have you mainly stopped outflow? All right.

In this lifetime, have you mainly thought? There must be something else, everything is reading.

PC: *No, I just would like to get on through, you know, and that's a few more.*

LRH: Oh, you're on your "press on."

PC: *Yes, I'm on my "press on," you know.*

LRH: All right, very good. Well, you've only got another half a dozen.

PC: *Hm.*

LRH: All right. In this lifetime, have you mainly thought? In this lifetime, have you mainly thought? In this lifetime, have you mainly thought? All right. In this lifetime, have you mainly failed to think? In this lifetime have you mainly not thought? All right. In

this lifetime, have you mainly thought? Okay.

In this lifetime, have you mainly evaluated? All right. ... In this lifetime, have you mainly evaluated? Something going on here?

PC: *No, just wondering what the pause was. What the pause was all about.*

LRH: Hm. All right. In this lifetime, have you mainly evaluated? In this lifetime, have you mainly evaluated? All right. In this lifetime, have you mainly failed to evaluate? Something's going on here.

PC: *Hm. I'm – just can't understand why we suddenly started going so slow! I said that I'm getting near the end of the list and I want to complete, you see.*

LRH: All right. I don't care if you are – that needle suddenly – you've pressed your needle into a complete...

PC: *Yes!*

LRH: ... crash.

PC: *I was just wanting – come on! You know? We're almost through.*

LRH: Why?

PC: *Because I just would like to get a level, that's why! You know? We're almost through with the list!*

LRH: All right. We bypass some charge here?

PC: *No. Except it seems like an awful long wait!*

LRH: All right. Have I gone across your level? Have I abandoned the right level?

Mm-hm. All right. In this lifetime, have you mainly evaluated? All right. In this lifetime, have you mainly

- failed to evaluate? All right. In this lifetime, have you mainly not evaluated? All right.
- In this lifetime, have you mainly had opinions about? All right. In this lifetime, have you mainly failed to have opinions about? Okay. In this lifetime, have you mainly not had opinions about? All right. That's it. Take a break!
- LRH: All right. This session is resumed and we have about – oh, a very few of these levels in – only three or four. Four or five. Six, maybe. All right.
- Anything you care to say before I start doing this? All right. Well, let me give you a fast one here. On this list has anything been suppressed? Yes? Hm?
- PC: *I suppressed – uh – impatience in getting through the list.*
- LRH: All right. On this list has anything been suppressed? Seen the read again.
- PC: *Some eagerness to get the level now.*
- LRH: Hm?
- PC: *Eagerness to get the level now, you know?*
- LRH: All right, very good. On this list, has anything been invalidated?
- PC: *Well, some of the ones I didn't quite understand, you know, like "blocked" and pulled in – "pull in," and uh – you know, like those.*
- LRH: All right, very good. Okay. List. A little something left on it.
- PC: *I've got some, you know, feel, got – feel somaticity, you know.*
- LRH: We ran across something here, didn't we?
- PC: *Yes, and my head hurts, and, ooh! So...*
- LRH: A rough go.
- PC: *Hm!*
- LRH: All right, let's see what we've got here, okay?
- PC: *Hm-hm.*
- LRH: Your ears sensitive?
- PC: *No, bit chilly. The room got a bit chilly. It's warming up, I've turned the burner on.*
- LRH: You'll be all right?
- PC: *Hm! Be okay.*
- LRH: Want to put a bathrobe over your legs?
- PC: *No, that's fine.*
- LRH: You sure?
- PC: *Hm!*
- LRH: All right, anything else you care to say here? Yes?
- PC: *No.*
- LRH: All right.
- PC: *Felt like I was going to sneeze.*
- LRH: Hm?
- PC: *Felt like I was going to sneeze again, but I didn't.*
- LRH: All right. Something else?
- PC: *Just my head hurts and I really don't... Well, that's all.*
- LRH: All right. Okay, let's take up these levels now. And the first level we have – I've got a very dirty needle here.
- PC: *Well, I thought of, in the break, Panorama, the South African information...*
- LRH: Ah!

PC: ... book, and I thought that the government put out a very nice, interesting magazine, there, you see.

LRH: Hm-hm.

PC: And um – I thought that – uh – and also they show pictures of the – of the 1948 German – uh – war orphans, who arrived and were adopted by South Africans, you know? And I thought that that was – um – you know ...

LRH: Mm-hm.

PC: ... an interesting gesture.

LRH: Hm! All right, good. Anything else happen in the break? A little something. You jumped a half a tone arm high.

PC: Can't think of anything else that happened in the break.

LRH: All right. Anything else upsetting you here? Is it trying to get on? Yes.

PC: Hm!

LRH: Press-on type.

PC: Press on! Charge!

LRH: All right.

All right. Now, in this lifetime, have you mainly protested? Protested? In this lifetime, have you mainly protested? All right. Anything you care to say about that level?

PC: Hm, that's one of the students' level.

LRH: Hm?

PC: I know it's one of the students' level.

LRH: Yeah. All right. All right, good enough, it's in. In this lifetime, have you mainly failed to reveal? In this lifetime, have you mainly failed to reveal? In this lifetime, have you mainly failed to reveal? In this lifetime, have you mainly failed to reveal? In this life-

time, have you mainly failed to reveal? In this lifetime, have you mainly failed to reveal? All right, on this level has anything been suppressed? Yes – very badly.

PC: Well, it's a button in the rudiments and, you know.

LRH: Hm-mm.

PC: I have – I know I failed to reveal. Whether that's mainly what I've done in this lifetime, I don't know.

LRH: All right, very good. In this lifetime, have you mainly failed to reveal? All right, that's in. Okay.

All right. Your needle's pretty awful dirty.

PC: Well, I don't...

LRH: And your tone arm went up – way up during the break.

PC: Uh! Yeah, that's all I did, I saw that South African magazine, and I thought that and I – and I thought about the blankets, and I thought... I didn't even wonder about the levels, I didn't even think about them. I just noticed that somatics had turned on, and I was feeling a bit, you know, bad.

LRH: Hm, hm-mm.

PC: And – um – that's all. I hoped it came out to an interesting level – that's about the only thing I'm worried about.

LRH: All right. In this lifetime, have you mainly withdrawn? Have you mainly withdrawn? That's in.

In this lifetime, have you mainly attacked? In this lifetime, have you mainly attacked? They're all in!

PC: *Hm! I'm not thinking about them or saying well, that – you know, I'm not doing anything like that.*

LRH: In this lifetime, have you mainly not attacked?

PC: *The only thing I can think about is I am anxious, and – uh – you know – and hope I can get an interesting level, and hope that – uh – it'll run all right, and hope that it'll get a chain that will produce tone arm action and, you know, sort of getting down toward the bitter end, I would like to come up with something that is the level, you know?*

LRH: All right. In this lifetime, have you mainly not attacked? In this lifetime, have you mainly not communicated? Have you mainly not communicated? Oh. Whoa, man – just whoa!

PC: *Well, what do you want me to do?*

LRH: I will take care of it.

PC: *All right.*

LRH: All right. In this session – in this session has anything been suppressed? Yes?

PC: *I've suppressed impatience, on getting on with it and getting my level.*

LRH: All right, very good. In this session, has anything been suppressed?

PC: *I suppose I suppressed levels that I didn't – was – wasn't particularly interested in or didn't think I had anything on them, or something like that. I can't really say that. I suppressed thinking about other things, during the session, and I suppressed my horror of waiting in the session.*

LRH: Waiting?

PC: *Waiting. Yes.*

LRH: All right. We're going to assess three things here. Felt bad. In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad?

In this lifetime, have you mainly waited? Have you mainly waited? All right. In this lifetime, have you mainly failed to wait? Have you mainly failed to wait? All right.

Now, all right. Let me finish these rudiments. All right. In this session, including the break, has anything been suppressed? All right, I'll check it on the meter. In this session, including the break, has anything been suppressed? Yessum?

PC: *My hand moved. I suppose I suppressed somatics.*

LRH: All right. In this session, including the break, has anything been suppressed? All right, did you think of anything else? In this session, including the break, is there anything you have been careful of? Yes?

PC: *To hold still.*

LRH: All right. In this session, including the break, is there anything you have been careful of? Yes?

PC: *Not to ARC break.*

LRH: All right, very good. In this session, including the break, is there anything you've been careful of? All right, in this session, including the break, is there anything you've failed to reveal? Yes?

PC: *My level.*

LRH: All right. In this session, including the break, is there anything you've

failed to reveal? I got another one. What was that?

PC: *I don't know – I suppose I thought that maybe South Africa, in accepting the German war orphans, they liked – liked Germanic stock of people, you know, that kind of people.*

LRH: Hm-hm. All right, very good. In this session, including the break, is there anything you failed to reveal? Yes ma'am?

PC: *Well, if it is, I don't know what it is, I failed to reveal it to myself.*

LRH: All right. In this session, including the break, is there anything you've failed to reveal? All right. What – what's the rest of the gen on these war orphans? That's what's had your tone arm up.

PC: *Nothing. It's just I saw a picture in the magazine of war orphans who came to South Africa in 1948. And I thought that was a very nice gesture, you know, because the rest of the Western world, and the rest of the world were putting them practically in concentration and DP camps, you see. And I thought that was a jolly decent thing; and I thought that they'd probably thought that – uh – German racially were a good stock to bring to the country, you know, as – uh – and then I also thought that they, with the scarcity of white population, naturally they would want a greater proportion of white population. And that's all I thought about it!*

LRH: All right, thank you.

PC: *Hm.*

LRH: All right. In this session – in this session, including the break, is there anything you've failed to reveal? All

right. Is there anything you've failed to reveal? Something?

PC: *Well, "failed to reveal" is one of the levels that we have in that's reading.*

LRH: All right, thank you. In this session, including the break, is there anything you've failed to reveal? Good, that appears to be clean. In this session, including the break, has anything been invalidated? Has anything been suggested? All right, has a mistake been made? All right, what's the mistake?

PC: *Well, waiting, now, will always dirty my needle up. So sort of when I get the f... when I see you sort of looking at the needle, you know – and I'm waiting for something to happen in the session, I think, oh dear, my needle is going to get dirty.*

LRH: Well, all right, very good. In this session, including the break, has a mistake been made? All right. In this session, including the break, has anything been protested? In this session, including the break, is there anything you've been anxious about? In this session, including the break, has anything been decided? All right. I don't get any reads. How's that?

PC: *All right.*

LRH: Your needle's now clean. And you've lost your half-a-tone gain.

All right, let's do these things again, huh?

PC: *All right.*

LRH: All right. You still haven't got an ARC break?

PC: *No.*

LRH: Got an ARC break? A bit?

PC: *No, I just was hoping let's – let's get on, you know? Before the needle dirties up again. If you've got a clean needle, make the most of it, you know?*

LRH: All right.

All right, in this lifetime, have you mainly protested? In this lifetime, have you mainly protested? All right, that's out.

In this lifetime, have you mainly failed to reveal? All right, that's out.

In this lifetime, have you mainly withdrawn? In this lifetime, have you mainly withdrawn? All right. In this lifetime, have you mainly withdrawn? All right.

In this lifetime, have you mainly attacked? In this lifetime, have you mainly attacked? Okay. It's out.

In this lifetime, have you mainly not attacked? Have you mainly not attacked? In this lifetime, have you mainly not attacked? All right.

In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated?

All right, there's something else going on here, now.

PC: *It's mostly facial pressure and somatics.*

LRH: Hm?

PC: *Around my face.*

LRH: Something about your face?

PC: *Noticing facial pressure and somatics.*

LRH: All right. In this lifetime – in this lifetime, have you mainly felt bad? In

this lifetime, have you mainly felt bad? Anything about that level?

PC: *Hm.*

LRH: In this lifetime, have you mainly felt bad? All right.

In this lifetime, have you mainly waited? In this lifetime, have you mainly waited? In this lifetime, have you mainly waited? All right.

In this lifetime, have you mainly not liked? In this lifetime, have you mainly stopped outflow? Well, what thoughts have you had there?

PC: *"Waited" – I thought, well, yes I certainly have waited around a lot. Well, I just noticed them going out and then I hoped they weren't going out because I – because of suppress, or anything like that.*

LRH: All right. Good enough. In this lifetime, have you mainly stopped outflow? All right. In this lifetime, have you mainly stopped outflow? Have you mainly stopped outflow? Stopped outflow? Stopped. Stopped.

Now, all right. In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad? Have you mainly felt bad? All right.

In this lifetime, have you mainly not communicated? Have you mainly not communicated? All right. In this lifetime, have you mainly not liked? In this lifetime, have you mainly not liked? In this lifetime, have you mainly not liked? Yes – all right.

PC: *That reminds me of a Prehav – hav – uh – level that we used to run on 3D Criss Cross. That was dislike and, you know, what have you disliked? And I think we came up with so-*

mething, I forget what it was we came up with.

LRH: We did what?

PC: A 3D Criss Cross line on that. It was disliked. What have you disliked?

LRH: Hm.

PC: You know?

LRH: You listed this at one time...

PC: Yeah.

LRH: ... or another? Similar.

PC: Hm.

LRH: All right. Very good. In this lifetime, have you mainly not liked? In this lifetime, have you mainly not liked? Still with us.

All right. In this lifetime, have you mainly not communicated? All right. Now, on that level has anything been suppressed?

PC: I suppose communication.

LRH: Hm?

PC: It was communication and I know we've had that in reading, sometimes, you know, before.

LRH: All right. On not communicated has anything been suppressed? Yes, a tiny bit.

PC: Oh, I think it would be easy to list, I suppose, I suppress thinking that.

LRH: All right. On this level, has anything been suppressed? Yeah, another suppression?

PC: Listing on it.

LRH: All right. On this level has anything been suppressed? I got another suppression. You don't think so?

PC: I don't think so.

LRH: The level itself kind of is a suppress.

PC: Yeah.

LRH: All right. On not communicated has anything been suppressed? All right, that seems clean. On not communicated, has anything been invalidated? Apparently a bit of invalidation.

PC: Well, I suppose the other level being in invalidates it.

LRH: All right, what level?

PC: The other level that we have that's in, on the list. Because there are two level – two levels in, or something like that, so each one invalidates the other. Um, um, also when we got to that point before and it was in, you said, "Ah, there's something wrong here." And you got in all the rudiments. So that tended to invalidate the read that was on that.

LRH: Oh, all right. Now, okay. Now, on this level has anything been invalidated? Another invalidation?

PC: It seems like it almost came out on the list before on the Prehav Scale. I'm not sure whether it is or not. It got invalidated in favor of something else.

LRH: All right. On this level has anything been invalidated? I got another read here.

PC: Well, I'm protesting the question now, I really don't have...

LRH: Are you protesting.

PC: Yes...

LRH: All right.

PC: ... I am.

LRH: Very good. On this level has anything been invalidated?

PC: The rudiments! And invalidate!

LRH: All right, very good. On this level, has anything been invalidated? Anything been invalidated? All right. In this lifetime, have you mainly not communicated? Have you mainly not communicated? In this lifetime, have you mainly not communicated?

Are you suppressing this now, or anything? In this lifetime, have you mainly not communicated? Have you mainly not communicated? All right. Now, on this level, has anything been suppressed? On this level, has anything been suppressed? All right. What did you think of?

PC: *Oh, the buttons tend to suppress it because they're going on and on and on and on and sort of a protest on the – on mid ruds.*

LRH: All right. On this level has anything been suppressed? Okay. In this lifetime, have you mainly not communicated? Mainly not communicated? All right. That is to some degree still with us. Not communicated? All right. Anything been invalidated here? Mistake been made?

All right, here's the other level that's in. In this lifetime have you mainly not liked? In this lifetime, have you mainly not liked? That level is out. On this level has anything been suppressed? Yes?

PC: *Yes, I realized I was alter-ising it every time you said it. Not liked, I would think disliked.*

LRH: Oh, all right. On this level, has anything been suppressed? Another tick.

PC: *I couldn't think of what it was we got assessed out on the 3D Criss Cross line, on disliked.*

LRH: Hm-hm. All right. On not liked, has anything been suppressed? All right, on not liked, has anything been invalidated? Okay. In this lifetime, have you mainly not liked? What have you got – what are you thinking about?

PC: *I keep thinking that – I keep objecting to "not liked." You know? It's disliked. You know?*

LRH: You're trying to alter-is this thing?

PC: *Trying to alter-is it. But I suppose I can accept it as "not liked," and let it be "not liked," instead of trying to change it to disliked. But I would never say I not-liked something, you know.*

LRH: I see, there's a continuous protest on this level.

PC: *Hm!*

LRH: Is that right?

PC: *Hm!*

LRH: All right. In this lifetime, have you mainly not liked? In this lifetime, have you mainly not liked? Not liked? In this lifetime, have you mainly disliked? In this lifetime, have you mainly disliked? In this lifetime, have you mainly disliked? There's a slight stick on disliked.

PC: *I keep thinking, well, if it does assess out then I've already done a list on it, and I won't have to do any listing.*

LRH: Oh? Oh – yeah? All right. Good. In this lifetime, have you mainly disliked? In this lifetime, have you mainly not liked? Not liked? Not liked? All right. What gives with this level?

PC: *I don't know.*

LRH: All right. In this lifetime, have you mainly not liked? In this lifetime, have you mainly disliked? In this lifetime,

me, have you mainly disliked? On this has anything been suppressed? I didn't get a read. In this lifetime, have you mainly not liked? Not liked?

All right, on this level has anything been suppressed? On this level, has anything been protested? On this level, has anything been decided? All right.

In this lifetime, have you mainly not liked? Not liked? In this lifetime, have you mainly disliked? In this lifetime, have you mainly not liked? Got any thoughts about this level?

PC: No, just seems a bit derogatory – like in this lifetime, have you mainly not liked. It's like I've been going around mainly not liking. You know?

LRH: Oh, you think it is critical?

PC: I think it's a bit critical. Yes. You know?

LRH: All right. Very good. Thank you.

In this lifetime, have you mainly not liked? Have you mainly not liked? All right. In this lifetime, have you mainly not liked?

All right. We'll try the other level. In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated?

All right. In this lifetime, have you mainly not communicated? All right. Not communicated is out and not liked is in.

All right. Just a minute. I'll straighten this out. Why? You protesting the assessment?

PC: No. I just – I – I had a feeling like it would come out to be something that I wasn't particularly interested in. You know. I could see myself getting a

chain on when's the last time you disliked or not liked – you know – cabbage or something like that.

LRH: I see. You've been thinking about this since we...

PC: No, I just thought of that.

LRH: All right.

AUDITING SESSION: PRELIMINARY STEPS OF R3R PART II

An auditing demonstration given on 10 July 1963

LRH: Okay, the session is resumed. All right.

PC: *Hm-mm.*

LRH: Anything you care to say about these levels or this situation?

PC: *No. Uh-uh. Not at the moment.*

LRH: You're protesting this, you told me.

PC: *Yes, I think it's staying in because I can't remember what it was we assessed out on "dislike" on the 3D Criss Cross line. I keep racking my brains and I can't think of it. I remember the list...*

LRH: Did you ever null it?

PC: *Yes, I think we did. We got something off of it.*

LRH: Hm. All right. Now let's check these two levels, again, huh?

PC: *Mm-hm.*

LRH: All right, in this lifetime, have you mainly not communicated? All right. Now, on not communicated, has anything been suppressed?

PC: *Yes, I thought when we were on it, I thought well, this one will probably go out. And uh – that will be that. I'm not plugging for it, either way, you know.*

LRH: Hm-mm.

PC: *But I thought, well that will probably go out, you know. [laughs] I always end up protesting the level.*

LRH: All right. On not communicated, anything been suppressed? All right. On not communicated, has anything been invalidated? All right. On this assessment, has anything been invalidated? All right, has anything been protested? Yes?

PC: *The level.*

LRH: All right. On this assessment, has anything been protested?

PC: *Just protested having to do mid ruds when the needle was dirty and when some of the items were staying in. And I hope that some of the items just didn't go out because I sort of*

went on a suppress to get a clean needle.

LRH: All right. On this assessment, has anything been protested? All right, on this assessment, has anything been invalidated? On this assessment, is there anything you have been anxious about? All right. On this assessment, has a mistake been made? On this assessment, has anything been decided? All right.

All right. In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated? All right. Didn't read. In this lifetime, have you mainly not liked? In this lifetime, have you mainly not liked? All right. In this lifetime, have you mainly not liked? All right. In this lifetime, have you mainly disliked? Disliked? What's that dislike tick?

PC: *It always restimulates – well – well, what was that thing that we assessed out? You know? I've done a "dislike" list and I already have it, you know?*

LRH: Hm-mm. All right.

PC: *I remember I had all sorts of murderers and criminals and thieves and crooks and you know?*

LRH: Hm.

PC: *Soldiers...*

LRH: All right. In this lifetime, have you – what have you mainly disliked? Just as a question. Well, it would list, because the question reads!

PC: *Oh!*

LRH: But you told me you were out of luck. You haven't mentioned that and that you were out of luck, that you

always get a level that you don't care anything about, so forth.

PC: *Hm.*

LRH: You still feel that way? You still feel apathetic about this?

PC: *Uh...*

LRH: Yes, what's that?

PC: *Well, I must say, dislike is a sort of a mild, pasty emotion. You know. I mean, it sort of just – my antipathies are not strong, so I can't sort of – you know, it's sort of a bland distaste, more or less.*

LRH: Hm.

PC: *And so, I sort of can imagine something – some very weak watered chain – being run on this. Except perhaps on the track, I might have expressed my dislike more violently. But uh – just thinking of the chain, that's all, you know.*

LRH: Mm. All right. In this lifetime – lifetime, reading an awful lot – in this lifetime, what have you mainly disliked?

What have you mainly disliked? All right. In this lifetime, what have you mainly not liked? What have you mainly not liked? In this lifetime, what have you mainly disliked? All right, there are neither of them reading now, anything wrong? What's the matter?

PC: *Nothing.*

LRH: All right. In this lifetime, what have you mainly disliked? All right. In this lifetime, what have you mainly not liked? All right. In this lifetime, have you mainly not liked? In this lifetime, have you mainly disliked?

All right. Neither of them reading. In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated? All right. On not communicated, has anything been suppressed? Yes?

PC: *Oh, I was wondering a little bit what the question would be, in this lifetime, what have you not communicated, I guess.*

LRH: Mm. Mm. In this lifetime – on this level, not communicated, has anything been suppressed? Yes? There.

PC: *Rudiments.*

LRH: All right. On this level has anything been suppressed? Yes?

PC: *I always have the fear that when the mid ruds are dragged out, that's going to knock out a level, you know.*

LRH: Hm.

PC: *A bit.*

LRH: All right. In this lifetime, have you mainly not communicated? All right. On this level, has anything been suppressed? Yes?

PC: *Communication, I suppose.*

LRH: All right. In this lifetime, have you mainly not communicated? All right, on this level has anything been suppressed? Yes? We've left suppressed hot on it before, so we might as well clean it up.

PC: *Hm.*

LRH: I told you it was a kind of a suppressed if you...

PC: *Communicating. [yawns] Communication tends to run one's havingness down. Knowing that is a factor, and I do know that times when I have*

communicated, sometimes I will feel, you know, exhausted from having done so.

LRH: Mm-hm.

PC: *Um, I don't particularly like writing letters, I've suppressed writing letters...*

LRH: Mm-hm.

PC: *And I'm always in a continual state of feeling guilty because I haven't written my mother or my family or my – you know.*

LRH: Mm.

PC: *Or my friends, for that matter!*

LRH: All right. On this level, has anything been suppressed? Yes?

PC: *Well, I just was thinking, I've lost contact with a lot of my – a lot of friends I – I knew, you know, at the university, and around and about. Mainly through my own noncommunication.*

LRH: Yeah, all right.

PC: *And they simply got tired of writing, or something, and getting no – no answer.*

LRH: All right. On this level, has anything been suppressed? Tick.

PC: *Well, sometimes in an auditing session, I suppress, uh – communicating, trying to find out what's happening. I don't understand what's going on. But I feel that uh – if I do, simply say well, you know, look, um – I don't dig this, I'll put the – take the pc's attention off of his case and put it on the auditor, you see. So I'll sort of – won't step in when I myself get confused about something, you know?*

LRH: Mm-hm.

PC: *As long as the pc is not confused, you see, I won't sort of step in and unconfuse myself.*

LRH: All right, very good. Now on the level "not communicated," has anything been suppressed? Oh, yes. This thing has now dev... it's now developed tone arm action and read.

PC: *It has? [yawns]*

LRH: There.

PC: *Well, I don't communicate about things that I feel are – are possibly embarrassing to other people.*

LRH: Mm-hm.

PC: *In other words like um – you know, sort of chiefly on the basis of the fact as the – uh – you know, like you have a box of candy and you walk into the room and the maid has just finished stuffing two of your pieces of candy down her throat, you see. Well, I prefer not to notice or communicate about the fact that she has, you know, has my candy box in her hands and sort of chocolate dribbling out of the corners of her mouth. I sort of, well, totally not-is it, because I – I feel that she will feel dreadfully embarrassed if I say, you know...*

LRH: Mm-hm.

PC: *... you know, if you want some of – some candy, why don't you ask for it, or something like that. You know it's sort of – sort of like uh – I think uh – I can walk into a room where someone has just stabbed someone, you see, and the knife is dripping blood, and I will sort of, in order not to embarrass the murderer, I'll sort of – I will just sort of not-is the whole thing*

and ask him the – the time of day, you know.

LRH: Well, all right, very good.

PC: *I sort of don't like to make people guilty.*

LRH: All right. On the level "not communicated", has anything been suppressed? Seems to be clean now. All right. On this level, has anything been protested?

PC: *No. [yawns] That it went out.*

LRH: All right. On the level "not communicated," has anything been protested? Seems to be another protest.

PC: *That the other level was in.*

LRH: All right. On the level "not communicated," has anything been protested? All right. Has anything been decided? All right. Very good. Is there anything you have been anxious about? All right, very good. Let me ask the question now. In this lifetime, have you mainly not communicated? All right. In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated? All right, any question about this? You wondering if it's in?

PC: *Yeah, I'm wondering if it's in or out, or what.*

LRH: All right, in this lifetime, have you mainly not communicated? Well, that's in. We didn't clean all the suppress off of it.

PC: *Oh. [yawns]*

LRH: I noticed that. But I wasn't going to harass you – early. Now, let's take a look at this other level.

PC: *Mm-hm.*

LRH: In this lifetime, have you mainly not liked? All right. On this level, has anything been suppressed? All right, no reaction. In this lifetime, have you mainly not liked? Have you mainly not liked? All right. Now on this level has anything been protested?

PC: *I suppose I've protested things I haven't liked. You know. Uh, I don't like the behavior – I don't really not like people, but I don't like sometimes their behavior. And there's a lot of food as a child I didn't like. And I protested things I haven't liked. I haven't particularly liked the government or governments. And I've protested things I've disliked about them. [yawns] And I dislike some peoples reality – hum!*

LRH: All right. On this level "not liked," has anything been protested?

PC: *Oh, I suddenly remembered another thing is I dislike some kind of certain beingnesses, you know, you know – that people assume, like murderers and criminals and thieves and – and robbers and that sort of thing.*

LRH: Mm. All right. On this level has anything been protested? Think of anything else?

PC: *Mm-mm.*

LRH: On this level, is there anything you've been anxious about? On this level, has there anything been invalidated? On this level has anything been suggested? On this level is there anything you've failed to reveal? All right. On this level is there anything you have been careful of? Okay. In this lifetime, have you mainly not liked? In this lifetime, have you mainly not liked? All right.

On this level, has anything been suppressed? Yes?

PC: *Oh, I am suppressing sort of thinking of things I'm not – I've not liked, in order to sort of clean the – the rudiments on it, you know. Um... [yawns]*

LRH: What's that?

PC: *Well, I suddenly thought of another sort of thing is, that uh – certain types of books and literature and things I've not liked. And I've not liked certain causes, you know.*

LRH: Mm-hm.

PC: *And at times I've deliberately decided to not like some things so that I could sort of – um – you know, have something to not like! [laughs] I sort of decided well, simply gotten up in the morning and suddenly decided, well, today I'm going to um – not like um – something or another, you know.*

LRH: Hm.

PC: *Hm! And um – particularly on the subject of food. I used to, uh – I used to – to go into, certain, sort of fits and starts on that. At one time I had the – all – practically all of the food, various kinds of food were all in the category of "not liked," and we were – I was totally down to ice cream. Then I ate nothing but ice cream for about – you know, half a year or something and didn't eat anything else but ice cream.*

LRH: Well, all right. On this level "not liked," has anything been suppressed? Think of anything else? I haven't got a read here.

PC: *Uh-uh.*

LRH: All right. In this lifetime, have you mainly not liked? In this lifetime, have you mainly not liked? In this lifetime, have you mainly not liked? All right, that level's not now reading. On "not liked," has anything been suppressed? All right, I've got no reads there. In this lifetime, have you mainly not communicated? All right, on this level – on this level, has anything been suppressed? Yes?

PC: *Yes, well, while I was doing this level I sort of got interested in not liked. I sort of felt, oh! You know? I guess there are a lot of interesting things I've not liked, you know? And uh – I had decided – deliberately decided to not like. And I sort of found myself getting interested in it. You know, I sort of get interested in one and then the other. It's sort of a – you know.*

LRH: All right, very good.

PC: *I'm afraid the E-Meter will have to make the choice! You start getting the rudiments in, you've persuaded me of the interesting qualities of both of them!*

LRH: All right. On "not communicated," has anything been suppressed? All right. In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated? All right. On this level, has anything been protested? Yes?

PC: *Well, I have protested – uh – I remember this, I've protested, um – communication being forced upon me when I did not personally want to communicate with someone. You know. And uh – of course, communi-*

cation being such an important factor in Scientology, why, quite a few Scientologists forget this – what the Code of Honor is, you know – one can communicate with whom one wishes to communicate. And so they go into a factor of, well, you've got to communicate, you know. And uh – sort of overwhelming one's power of choice.

LRH: Yeah, all right. Very good. On this item, has anything been protested? All right, in this lifetime, have you mainly not communicated? All right. On this item, has anything been suppressed? All right, think of a trifle? Something been suppressed?

PC: *I just had the thought that I – sometimes I failed to not communicate. You see? You know?*

LRH: All right.

PC: *Like I've decided that I'm going to – I used to decide that I was going to uh – go home and study you see. And I was going to – I was going to the library or something like that and – uh – to do my work or something like that, and on the way to the library, why, I would meet some friends and that would be the end of that and I never would arrive at the library and never would get my homework done or something like that, you see?*

LRH: Hm.

PC: *Hm.*

LRH: Well, all right. In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated? All right. On this item, has anything been suppressed? Yes, this is another suppression.

PC: *Oh, I'm getting worried, we – well, my two items both going out on me.*

LRH: Hm.

PC: *You know? And I thought, oh dear, it's all like – like, you know, you get a bit of understanding of the le... of the level and you begin to sort of look at it and it goes! Which is unfortunate.*

LRH: Well, all right.

PC: *I don't want them to disappear, you see.*

LRH: Oh!

PC: *I want something to read, so I can get a chain on something, so I can be run on engrams.*

LRH: All right. On "not communicated," has anything been suppressed? Okay. Didn't read. In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated? In this lifetime, have you mainly not communicated? All right. On this level, has anything been suppressed? In this session, has anything been suppressed? You're suppressing something on it. Has anything *not* been suppressed? What's the matter?

PC: *Nothing. I can't think of anything that's not been suppressed.*

LRH: All right. In this lifetime, have you mainly not communicated? All right. On this level, has anything been suppressed? On this level, has anything been suppressed? All right. That's out. In this lifetime, what have you mainly not liked? What have you mainly not liked?

PC: *I had a thought – uh – I had a thought about um – "felt bad." I felt*

bad on "felt bad," and suppressed telling you I felt bad on "felt bad," and just the thought came up.

LRH: Is that so?

PC: *Hm!*

LRH: All right. All right. Let me read this again. In this lifetime, have you mainly not liked? Have you mainly not liked? All right. On this level, has anything been suppressed? On this level, has anything been protested? On this level, is there anything you have failed to reveal? All right. In this lifetime, have you mainly not liked? Well that is ghostily in.

PC: *Hm!*

LRH: What's the matter? It's had an alter-is, and it's had a this and it's had a that and it's had a lot of other things.

PC: *Hm!*

LRH: In this lifetime, have you mainly not liked? Now you've got something else going here, what?

PC: *I was just thinking about "felt bad" a bit.*

LRH: All right. Good. In this lifetime, have you mainly not liked? No, it's more than that. All of a sudden this is reading like crazy and it wasn't before. Did it upset you when "not communicated" went out?

PC: *Originally it did.*

LRH: What?

PC: *Originally it did. Doesn't anymore.*

LRH: All right. In this lifetime, have you mainly not liked? It's reading.

PC: *I'm suppressing "felt bad," you know.*

LRH: Hm?

PC: *I'm – keep suppressing "felt bad."*

LRH: Yeah. As you were going down this column, you know, you had an arm somatic.

PC: *Hm.*

LRH: Remember? Right in this area.

PC: *No, it was much earlier when my arm somatic turned on.*

LRH: Huh?

PC: *It was much earlier when my arm somatic turned on.*

LRH: Much earlier?

PC: *It was earlier than this.*

LRH: Well, I marked this column when you told me.

PC: *Hm.*

LRH: All right. Felt bad. Felt bad. Well, that sure bangs! Felt bad. Felt bad. On this item has anything been suppressed?

PC: *Yes! When the – when you first hit it. You know, I was just suddenly thinking, you know, what I – what came up there is the pc sort of, you know, uh – has an emotional reaction or something like that, you know, mark it carefully and go back over those. And I suddenly reali... remembered that on "felt bad" I felt tremendously bad! And I forgot to say anything about it. But I had a sort of a gloominess come over me, you know?*

LRH: Hm-hm.

PC: *On "Felt bad."*

LRH: Well, it was one of the last ones out, and I'm going to have to shake all of this down here, in a minute.

PC: *Hm.*

LRH: All right, very good. On "felt bad," has anything been suppressed? Yes? There. There. There.

PC: *Well, I feel bad, right now, in the auditing session you know, sore throat, ohhhh, somatics, and so forth.*

LRH: All right. Felt bad. All right, well our favorites went out. Both of them. They're gone.

PC: *Oh!*

LRH: And uh – we will now rapidly review the remaining ones that was – stayed in, last out...

PC: *Hm, hm.*

LRH: All right, and the one that stayed in quite a while here... We only had about four that stayed in quite a while.

PC: *Oh yes, okay.*

LRH: So, let's check these rapidly, shall we?

PC: *Mm-hm.*

LRH: I must have missed something here. In this lifetime – in this lifetime, have you mainly protested? Have you mainly protested? Have you mainly protested? All right, on that level, has anything been suppressed? I didn't get a read. All right, in this lifetime, have you mainly protested? That's still out. In this lifetime, have you mainly failed to reveal? Failed to reveal? In this lifetime, have you mainly failed to reveal? All right, on this level, has anything been sup-

pressed? Anything been suppressed?
Yes, something has been suppressed.

PC: *Yes, I thought about uh – Jenny's goal, you know, "to not be found out."*

LRH: All right. On this level "failed to reveal," has anything been suppressed? I think there's another suppression on it.

PC: *Well, it certainly would be one way to clean up all of one's missed withholds or something or another, or withholds as just the list – that! You know?*

LRH: Hm!

PC: *And list it and list it and list it. [yawns] That's all.*

LRH: Very good. In this lifetime, have you mainly failed to reveal? On this level has anything been suppressed? In this lifetime, is there anything you have failed to reveal? That is now reading. Or is it "failed" reading? In this lifetime, is there anything you have failed to reveal? All right. On this level, has anything been suppressed? On this level, has anything been protested? On this level, has anything been decided? All right. Thought of any answers to that?

PC: *No, but I felt a bit sort of uh – [yawns] of a very dreadful monotony, of some of the things people fail to reveal. Having – uh – and uh – it gets a bit monotonous. They're mostly only interesting to the person who's failed to reveal them. And very rarely interesting to someone else.*

LRH: All right. On this level – on this level has anything been suppressed? All right. In this lifetime, have you

mainly failed to reveal? All right, that's out. I'm taking notice of the last ones out, here.

PC: *Hm.*

LRH: All right, in this lifetime – in this lifetime, have you mainly withdrawn? Now on this level, has anything been suppressed? Do you think of anything?

PC: *Well, it's uh – at the moment we are using it for my havingness command. Yeah.*

LRH: Hm. Yeah. All right. On this level, has anything been suppressed? Yes? It's just dancing around like mad!

PC: *I thought you were going to ask the one at the top. And I was surprised that you asked that one.*

LRH: Oh, I see. On this level, has anything been suppressed? Yes?

PC: *Well, it would have limited answers, I thought.*

LRH: Hm?

PC: *I would have a limited number of answers.*

LRH: All right. On this item – on this item, has anything been suppressed? Yes-sum? Withdrawn? Suppressed?

PC: *Oh, I was just thinking that uh – a person would have to be sort of um – a joiner, you know, in order to be a withdrawer. You know? And the person who is withdrawn, they wouldn't be – that level wouldn't read on the person because they – they're – it would be – they're so completely withdrawn, they aren't withdrawn. You know what I mean?*

LRH: Well, all right. All right. Very good. All right. On the level withdrawn,

has anything been suppressed? I didn't get a read that time. In this lifetime, have you mainly withdrawn? All right. On this item, has anything been invalidated? On this level, has anything been invalidated? On this level, is there anything you have failed to reveal? All right. On this level "withdrawn," has anything been suppressed? You got a suppression?

PC: Yes, it was – as I told you it was found on a student. And they listed on it. And they got "spending money." And I told the auditor, said, "All right, now we want the first incident – um – involving your withdrawing from spending money." And that sort of was the end of that chain. The pc up and had an ARC break. And that was that. So I sort of view that level with sort of a – a cold eye.

LRH: All right. On this level, has anything been suppressed? All right. In this lifetime, have you mainly withdrawn? All right. In this lifetime, have you mainly withdrawn? In this lifetime, have you mainly withdrawn? On this level, has anything been suppressed? All right. That is out.

I'm sorry, I've missed this one up here. Let me get these two lower ones.

PC: Mm-hm.

LRH: In this lifetime – this lifetime, have you mainly attacked? On this level, has anything been suppressed? Okay. Out. In this lifetime, have you mainly not attacked? On this level, has anything been suppressed?

PC: No, not that I can think of.

LRH: All right. In this lifetime, have you mainly not attacked? On this level, has anything been suppressed? Have you mainly not attacked? Some disagreement with this level?

PC: Uh...

LRH: What's that?

PC: Well, that's just sort of just thinking there, thinking about attack and not – not attack. And uh – sort of my tendency has been not to attack, you know, until provoked to the extreme, and then attack, you see. But um – I wouldn't say it's sort of a particular characteristic, but...

LRH: All right. Very good. In this lifetime, have you mainly not attacked? What – what else – what's the matter now?

PC: I was just sort of thinking about – um – that sort of reminds me of – sort of passive resisters and – um – and – um, you know, what are those fellows that won't fight? Who won't fight, you know – conscientious objectors, yes.

LRH: Hm!

PC: I've hardly been one of those! That's all I thought of.

LRH: All right, very good. In this lifetime, have you mainly not attacked? All right.

In this lifetime, have you mainly not attacked? In this lifetime, have you mainly not attacked? On this level, has anything been suppressed? All right, that's out.

Okay, now let's take a look at this top one up here. In this lifetime, have

you mainly felt bad? On this level has anything been suppressed?

PC: *I come into it. I may be selling it. Just so I can have a level.*

LRH: All right. On this level, has anything been suppressed?

PC: *I felt bad on it. When you said "felt bad."*

LRH: All right. On this level has anything been suppressed? Okay. In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad? All right. In this lifetime, have you mainly felt bad? I had a read on one out of three there.

PC: *Mm-hm.*

LRH: All right. This been invalidated in some way? Yes.

PC: *Um. I feel that I might have suppressed a wee bit of grief on it. You know?*

LRH: Well, yeah. Reads here.

PC: *Not that I particularly felt grievous, but I think I might have suppressed feeling that way. Not – not crying, but grief, you know what I mean?*

LRH: Mm-hm.

PC: *Hm.*

LRH: All right. In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad? All right. Two reads out of three. On this level, has anything been suppressed? Got a read here.

PC: *Well, feel bad, and – or felt bad, and it sort of goes into two characteristics – to me means physically to feel bad and it means uh – to be some-*

what morose or gloomy about something, you know.

LRH: Hm, hm.

PC: *Hm.*

LRH: All right, very good. On this level, has anything been suppressed? On this level, has anything been invalidated? Yes?

PC: *Oh, I suppose when it went out...*

LRH: Hm?

PC: *...invalidate – it was vali... invalidated. It went out and so was invalidated.*

LRH: All right. On this level, has anything been invalidated? All right. On this level, has anything been suppressed? Yes, there's a suppress.

PC: *Somatics.*

LRH: You got a somatic on this level?

PC: *Hm.*

LRH: All right. On this level, has anything been suppressed? Yessum?

PC: *The body feels worser and worser and worser, as we do it.*

LRH: Mm-hm. All right. On this level, has anything been suppressed? Did you think of anything? All right. You got a dirty needle now, you thinking about something?

PC: *No, just noticing my somatics, feeling them.*

LRH: Oh yeah?

PC: *Hm.*

LRH: All right. In this lifetime, have you mainly felt bad? All right. On this level, has anything been suppressed? In this lifetime, have you mainly felt

bad? What's going on here? I got a real rackety needle here, suddenly.

PC: *Wondering if it was reading or what. Wondering about it.*

LRH: All right. In this lifetime, have you mainly felt bad? Yeah. But I got a dirty needle going along with it. All right. Anything been suppressed here, in the session? Anything you're upset about in the session?

PC: *I sort of feel I have a dizziness coming on from this, you see? I'm a little bit suppressing that. It's in the back of my head and it's sort of...*

LRH: Does this match any of the somatics which you had there, at the beginning of session?

PC: *Yes.*

LRH: Hm?

PC: *Mm-hm, yeah. Yes.*

LRH: All right. In this session, has anything been invalidated? Is there anything you've failed to reveal? Yes, what have you failed to reveal?

PC: *I suppose I'm getting a bit tired.*

LRH: All right. Very good. In this session, is there anything you've failed to reveal? All right. Has anything been protested? Yes, something's been protested.

PC: *Well, I'd like to get a level.*

LRH: All right. In this session, has anything been protested? In this session is there anything you suppressed? Perhaps.

PC: *Somatics.*

LRH: All right. In this session, has anything been suppressed? Yes ma'am!

PC: *Uh, I want to get a level. You know, I'm suppressing – goodness! You know.*

LRH: All right. Very good. In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad? All right. On this level, has anything been suppressed? Yes?

PC: *Feeling bad!*

LRH: All right. Very good. In this lifetime, has anything been suppressed? Yes? I'm sorry!

PC: *I'm – Yes. Thaaah!*

LRH: Hitting me, too! All right. On this level – on this level, has anything been suppressed? Yes'm!

PC: *I just had the thought that – uh – since when we used to do, you know, uh – Problems Intensives and this sort of thing, and uh – you know, and Prepchecks on auditing and so forth, but no one ever sort of did an eighteen-button Prepcheck "in this lifetime," you know...*

LRH: Hm!

PC: *I thought that was interesting.*

LRH: All right. On this level felt bad, has anything been suppressed? All right, I didn't get anything. In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad? Now, you sure suppressed something between the moment that I started – huh?

PC: *Wondering if it was reading. Wonder if it was reading and what was happening on the meter.*

LRH: All right. In this lifetime, have you mainly felt bad? There it is! In this

lifetime, you mainly felt bad? There it is. In this lifetime, you mainly felt bad? All right, you got somatics on this?

PC: *Hm!*

LRH: All these...

PC: *Do we have any other levels that stayed in? That's it?*

LRH: No. On all these levels tonight do you – this is the only one you've had somatics on, correct?

PC: *"Dislike" I had a bit on; "not like" I had a bit on.*

LRH: What?

PC: *"Not like" I had a bit of a somatic on.*

LRH: All right, what – what was the somatic?

PC: *Oh sort of um – not really somatic, sort of a bit of dizziness, um...*

LRH: It wasn't somatics?

PC: *No, oh, I'm sorry. [yawns]*

LRH: All right. Then – what – what somatic, too, but what's going on with this one, "felt bad"?

PC: *Well, it's been my head and it's been my throat.*

LRH: And you've had somatics off of this thing.

PC: *Hm.*

LRH: Well, you've had some tone arm action with this level. You probably wonder where this level had come from.

PC: *I said it and you wrote it down.*

LRH: Yes. Did you know that – and so on?

PC: *Hm.*

LRH: Doesn't make any difference about it – as a level?

PC: *No.*

LRH: All right. Let me try something else here. In this lifetime, what have you mainly felt bad about? In this lifetime, what has felt bad? In this lifetime, how have you felt bad? How have you felt bad? Hm?

PC: *That's unanswerable to me.*

LRH: Hm?

PC: *That's unanswerable. If I knew how, I certainly wouldn't!*

LRH: All right, I'm just kicking it around here, to see what it is, because that isn't what we have to have anyhow.

PC: *Hm.*

LRH: All right. That was just balderdash. Okay. Felt bad. Felt bad. Now on this level has anything been suppressed? In this session, has anything been suppressed? All right, something suppressed in the session?

PC: *Hm. How I felt bad. Hm.*

LRH: Oh, all right. That's kind of – gave you a heavy suppression?

PC: *I suppressed that. I thought, goodness, if I knew, I wouldn't feel bad!*

LRH: Oh, all right. Okay. In this session, has anything been suppressed? Think of something? All right. In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad? All right. On "felt bad," has anything been suppressed? All right. Anything been protested? Anything you've failed to reveal? All right. Something you've failed to reveal? There.

PC: *Getting all exhausted.*

LRH: Hm?

PC: *Getting exhausted.*

LRH: All right. In this session, is there anything you failed to reveal? All right. In this lifetime, have you mainly felt bad? In this lifetime, have you mainly felt bad? On this level, is there anything you have been careful of? Anything been suppressed? Got anything else to say about it? We had it reading!

PC: *Hm?*

LRH: Why would it stop reading? Because I alter-ised it?

PC: *I don't know.*

LRH: Felt bad about? Asked you a question? Wrong question?

PC: *Could be.*

LRH: Hm?

PC: *Could be.*

LRH: Anything like that? All right. In this lifetime, have you mainly felt bad? All right. In this lifetime, have you mainly felt bad? Felt bad? Felt bad? Something has happened here. When I varied that question around, you must have done something, you must have protested my asking that question – yes! There it is. There it is. There it is!

PC: *What I thought then, is I had one of the students who listed "In this lifetime, how..." rather than "In this lifetime, what..." you see? And "how" goes into doingnesses, and uh – so one gets a level which is a doingness...*

LRH: Mm-hm.

PC: *And one gets a doingness of a doingness, and it's impossible to get a chain, you see, with, and – and there was a bit of a confusion with regard to what he had done. And anyway, I told, you know, Herbie about this and then – to watch it, you see. And I thought he had changed from "what" to "how," and instead he had changed from "how" to "what." You know? He'd started out with "how." And some... so I told him, gave him an infraction for having changed, you see, when I thought he'd changed from "what" to "how". "And he'd changed really from "how" to "what." So this made a terrible confusion. But I told Herbie that now he'd done this, you see, and the "how" wouldn't run and he'd better stand over him and see that he got this... Anyway, Herbie read my directions and because the auditor writes very tiny and I didn't see what he'd done, which he'd listed first. But he had a real terrific long list there, you see, of "how." And I thought that he had tried the first one, "what," and then changed to the second, you see.*

LRH: Mm.

PC: *So anyway, it made a dreadful mess-up. And then – then Herbie read my directions and then he followed the written directions and not my spoken directions, were – which were "how won't run." You know?*

LRH: Mm. Hm. Very good. Let's take a look at this now. In this lifetime, have you mainly felt bad? On this level, has anything been suppressed? In this lifetime, what have you felt bad about? In this lifetime, what

have you felt bad about? How is this dizziness which you had a moment ago?

PC: *It's eased off, I don't have it at the moment.*

LRH: You don't have it? Did you suppress it?

PC: *No.*

LRH: All right. In this lifetime, what have you felt bad about? In this lifetime, have you mainly felt bad? Felt bad? And that is the end of that level.

PC: *Wasn't there some on another page that stayed in?*

LRH: Hm?

PC: *Wasn't there some on the other...*

LRH: Well, we did a tremendous one on you on the early Prehav, and I happened to remember the level. Ordinarily I would simply cook up a – from the other scales I would cook up an extended list here, because...

PC: *Hm.*

LRH: ...we haven't got where you live. But I'm going to take one that we had on another level that we never really ran.

PC: *Mm-hm.*

LRH: And that was "prevent knowing."

PC: *I knew you'd drag that cat out! [laughs] I've said to myself, "I bet you he brings up..." We did run that and it didn't go anywhere.*

LRH: Didn't, huh?

PC: *Mm-hm.*

LRH: All right. Let's see how that combines. In this lifetime, have you mainly prevented knowing? In this

lifetime, have you mainly prevented knowing? All right, we only had one in here, that would have done a duck-out of any kind of thing. And that might have been suppressed, by reason of your similarity of level on dislike.

So, in this lifetime, have you mainly disliked? In this lifetime, have you mainly disliked? Have you mainly disliked? All right. On disliked, has anything been suppressed? Yes.

PC: *Not communicate.*

LRH: All right. On dislike has anything been suppressed? All right. Check it again, on the meter. What did you think of?

PC: *I thought noncommunic... not communicate being a suppressive type of thing, would be the one that would suppress.*

LRH: All right. In this lifetime, have you mainly not liked? All right. What did you think of?

PC: *Get tired.*

LRH: All right. In this lifetime, have you mainly not liked? All right. On this level, has anything been suppressed? All right. Disliked. Crash! What's that? I had a half-a-dial fall!

PC: *I thought of tired. Maybe my level is "In this lifetime, what have you been tired of" Ooch! Aach! That's what I thought of.*

LRH: All right. In this lifetime, have you mainly disliked? All right. On "disliked," has anything been suppressed? In this lifetime, have you mainly disliked? All right. In this lifetime, have you mainly not liked? All right.

Now, we'll try this "communicate."
In this lifetime, what have you
mainly – have you mainly not com-
municated? In this lifetime, have you
mainly not communicated? On that
level, has anything been suppressed?
Nothing.

PC: *Try tired! In this lifetime, have you
mainly been tired – of things? I keep
getting this saying, sort of, you know.
It used to be sort of an old – sort of –
I don't know – saying, it used to be
sort of a joke, you know. When you
were tired of something you'd say,
"Get down, Albert, Ma's tired!" you
see. And uh...*

LRH: All right. [PC yawns] In this lifetime,
what have you mainly been tired of?
In this lifetime, have you mainly
been tired? Doesn't read.

Well, I am very sorry, madam.

PC: *Hm!*

LRH: I am very sorry, but that is the scoop.
Okay?

PC: *Hm!*

LRH: Give me a Prehav level. I'll do a
short list here.

PC: *Mm-hm.*

LRH: Give me a Prehav level.

PC: *Angry.*

LRH: Angry?

PC: *Mm-hm.*

LRH: All right. Good. Give me a Prehav
level.

PC: *When you ask me to give you a Pre-
hav level, I can't think of any! Uh.
Fault. Fault.*

LRH: I'll change my question, give me a
potential Prehav level.

PC: *Potential Prehav level.*

LRH: What Prehav level should there be?

PC: *Oh, I see.*

LRH: Put it that way. What should be a
Prehav level? Otherwise you, you
educated person, will simply start
quoting.

PC: *Um – Retired. Distrusted. Smashed.*

LRH: Hm?

PC: *Smashed.*

LRH: I beg your pardon?

PC: *Smashed.*

LRH: Okay. Give me another potential
Prehav level.

PC: *Done, done.*

LRH: D-o-n-e?

PC: *Mm-hm.*

LRH: All right. Something that really
should be on the Prehav Scale, now.
That you think should be.

PC: *Mm-hm. Done nothing. [laughs]*

LRH: All right, very good.

PC: *Eaten.*

LRH: Eating?

PC: *Eaten. Eaten, e-a-t-e-n.*

LRH: e-n?

PC: *E-a-t-e-n! eaten!*

LRH: Oh! All right, good, good. Okay.
Sorry.

PC: *Worshipped. Repulsed. Frightened
of. Hasn't existed. Hasn't existed.*

LRH: All right, very good.

PC: *Considered.*

LRH: Okay.

PC: *Had opinions about.*

LRH: Okay.

PC: *Forced.*

LRH: F-o-r-c-e?

PC: *Hm!*

LRH: Right.

PC: *F-o-r-c-e-d. Worked.*

LRH: W-o-r-k-e-d?

PC: *Mm-hm.*

LRH: Good.

PC: *Struggled – Struggled with.*

LRH: Okay.

PC: *Given up.*

LRH: All right.

PC: *Made guilty. Mistreated. Hurt. Rejected. Lied about. Refused. I'm trying to think of a word of "Dug your heels in on," you know, like in just "Got plain stubborn," you know? Been obstinate. Defended. Protected. That's already on.*

LRH: That's all right.

PC: *Was that on the list we did today?*

LRH: Hm?

PC: *Was that on the list we did today?*

LRH: Mm-hm.

PC: *Oh.*

LRH: It read, too.

PC: *Broken agreement with. Been selfish.*

LRH: Been?

PC: *Selfish about. Taken away. Is that all?*

LRH: All right, how is that?

PC: *Mm-hm.*

LRH: How are you doing now?

PC: *All right.*

LRH: Okay. Let's take a rapid fire over these things, all right?

PC: *Hm.*

LRH: Anything you care to say before I assess these things?

PC: *No.*

LRH: Okay. Angry. In this lifetime, have you mainly been angry? All right, we've got a needle reacting on "angry."

PC: *Hm.*

LRH: A bit dirty.

PC: *Mm-hm.*

LRH: Suppose this list is complete? This list incomplete? You thought of something else to put on this list?

PC: *I thought, oh, how horrible! How could I pick them – I could never complete the list!*

LRH: All right. Okay. In this lifetime, have you mainly thought? In this lifetime, have you mainly retired? Have you mainly retired? You had another thought going here, now. Have you mainly retired? You know, "mainly" reads, reads, reads, reads.

PC: *Is that right?*

LRH: What is the matter with "mainly"?

PC: *I don't know.*

LRH: That's...

PC: *The main, you know. That's the only thing I can say, you know, "mainly speaking," or "the Main, the Spanish Main," and all those "mains." And "Maine" in the United States, the state of Maine.*

LRH: Very good. In this lifetime, have you mainly distrusted? "Mainly" is kicking something, I'm going to change this to "chiefly."

PC: *All right. Or "mostly"?*

LRH: Hm?

PC: *"Mostly."*

LRH: All right.

PC: *Either one.*

LRH: Mind if I use "chiefly"?

PC: *Fine.*

LRH: It's all right?

PC: *Mm-hm.*

LRH: In this lifetime, have you chiefly distrusted? In this lifetime, have you chiefly distrusted? In this lifetime, have you chiefly smashed? In this lifetime, have you chiefly done? Have you chiefly done? All right. We've got a slow halting, periodic needle, here. You don't suppose you've had an objection or anything here?

PC: *Uh-uh.*

LRH: You got an objection to something?

PC: *I was thinking of "chiefly," you know. Hope I didn't start having thoughts about fire chiefs and police chiefs and...*

LRH: Oh God!

PC: *Petty chiefs and chiefs and Indian chiefs and, you know? And chief chefs. Oh!*

LRH: How about "mostly"? As you suggested?

PC: *It's all right! I mean "chiefly" is okay. I just had thought when you said "chiefly," I had a little bit of an*

automaticity started popping off on it, that's all.

LRH: All right, let's use "mostly." Okay?

PC: *Hm-hm.*

LRH: Mostly. All right. In this lifetime, have you mostly thought? In this lifetime, have you mostly retired? In this lifetime, have you mostly retired? In this lifetime, have you mostly retired? Okay. In this lifetime, have you mostly distrusted? Okay. In this lifetime, have you mostly smashed? All right. In this lifetime, have you mostly done? Okay. In this lifetime, have you mostly done nothing. All right. In this lifetime, have you mostly eaten? Okay. In this lifetime, have you mostly worshipped? Okay. In this lifetime, have you mostly repulsed? Okay. In this lifetime, have you mostly been frightened of? Have you mostly been frightened of? All right. In this... Anything you've got to say?

PC: *Mm-hm.*

LRH: In this lifetime, have you mostly "haven't existed"? Have you mostly "haven't existed"? The level is "hasn't existed." Hasn't existed. Isn't in anyway. Got anything to say about that?

PC: *Mm-hm.*

LRH: All right. Anything been suppressed on this list? This list?

PC: *Well, the thought that if something came out, one would be hoisted by his own petard, you know, that sort of thought occurred. I thought, well, if I come out with a level I don't like, I put it on the list! [laughs]*

LRH: Oh, I see! All right. All right. In this lifetime, have you mostly considered? All right. In this lifetime, have you mostly had opinions about things? In this lifetime, have you mostly had opinions about things? All right. Have you most – had opinions about? All right. In this lifetime, have you mostly forced? All right. In this lifetime, have you mostly worked? All right. In this lifetime, have you mostly struggled with? Okay. In this lifetime, have you mostly given up? Okay. In this lifetime, have you mostly made guilty? In this lifetime, have you mostly made guilty? Okay. In this lifetime, have you mostly mistreated? You had a thought a moment ago, what was it?

PC: *A sigh.*

LRH: All right. In this lifetime, have you mostly hurt? Okay. In this lifetime, have you mostly rejected? Okay. In this lifetime, have you mostly lied about? Have you mostly lied about? In this lifetime, have you mostly refused? In this lifetime, have you mostly been obstinate? In this lifetime, have you mostly been obstinate? Have you mostly been obstinate? In this lifetime, have you mostly defended? Have you mostly defended? Had another thought?

PC: *No, I wondered if it read.*

LRH: All right. In this lifetime, have you mostly protested? Have you mostly protested?

PC: *That's "protected."*

LRH: Oh, protected. I beg your pardon. In this lifetime, have you mostly pro-

tested? Have you mostly protected? Now I've roughed it up. What...

PC: *Well, I thought when – when you said before that – that it was on the other list, and you didn't – you almost didn't write that down, you see. And I thought, well I'm su... thought sure it wasn't on the other – the other list we just did. And then I thought, well, I guess I just didn't notice it, you know, when you said it went out. You see? So, now I see what you wrote down there. You wrote "protested," you see.*

LRH: Oh, I see.

PC: *And I meant protected.*

LRH: Oh, all right. Good enough. Any other thoughts here? Yes'm, yes'm, yes'm?

PC: *Well, that was the one I couldn't ever remember out of the old Prehav Scale. Protect.*

LRH: Oh, yes! That's so, isn't it?

PC: *Hm.*

LRH: All right. Any other thought here on this? Perhaps?

PC: *Well, I notice everything's going out, you know? And I thought, dear! You know? Even my own little list is going. You know?*

LRH: All right. Very good. Okay. Anything else about it? Anxiety setting in here? Anxious about? Protesting? What are you anxious about?

PC: *Just getting the level.*

LRH: All right. In this lifetime. In this lifetime. In this lifetime, have you mainly protected? In this lifetime, have you mainly protected? In this lifetime, have you mainly broken

agreement with? Ow. Mainly broken agreement with? In this lifetime, have you mainly been selfish about? Have you mainly been selfish about? In this lifetime, have you mainly taken away? Have you mainly taken away? Well, that's "mainly" I'm using again, I'm very sorry.

PC: *Oh.*

LRH: It fires. In this lifetime, have you mostly broken agreement with? In this lifetime, have you mostly taken away? Mostly taken away? Mostly taken away?

PC: *I'm puzzled about what I meant by it! Mostly taken away? [laughs]*

LRH: All right. In this lifetime, have you mostly taken away? All right. In this lifetime, have you mainly taken away? All right. On this item has anything been suppressed?

PC: *I don't think so, no.*

LRH: Go ahead!

PC: *Well, just things that I have taken away. You know. Interest, concern, that sort of thing.*

LRH: All right. On this level, has anything been suppressed? Yes?

PC: *I don't think so. [laughs]*

LRH: What's the matter?

PC: *There's nothing I've suppressed on it. I can't think of anything.*

LRH: All right. On this level, has anything been suppressed? I see a suppress here.

PC: *Oh.*

LRH: A bad one.

PC: *Noncomprehension, for a while. And then the fact that I don't think it can be a very long list. But uh – I could – I could list on it.*

LRH: All right. You got an ARC break here? A little bit of an ARC break? Now what might it be?

PC: *No. Just, uh...*

LRH: You don't have to suppress anything. Honey, you don't have to... Say what you please! I don't care!

PC: *No! I don't – I'm not just – suppressing anything! It's just that it – it's a bit weird. I'm suppressing that.*

LRH: Oh! All right. On this level, has anything been suppressed? That's clean. All right, on "taken away," has anything been suppressed? All right. In this lifetime – in this lifetime, have you mostly taken away? All right. On this level, has anything been invalidated? Okay. All right. Do you have an ARC break?

PC: *Uh-um.*

LRH: You upset about anything?

PC: *No.*

LRH: Are you suppressing anything.

PC: *No.*

LRH: All right. In this session has anything been suppressed? All right, are you upset about anything?

PC: *Mm-hm.*

LRH: Okay. Now what are you upset about?

PC: *I'm not. I just want a level.*

LRH: All right. Well, we'll have to get your level in the next – well, let me check one thing. You told me, during the

break, that you had suppressed "not communicated." Right?

PC: *Mm-hm.*

LRH: All right. And I checked it, and we've got a... Have we missed your item? Have we gone over the top of your item? Have we...?

PC: *Does that read?*

LRH: Have we bypassed your item?

PC: *Does that read?*

LRH: Hm?

PC: *Does that read?*

LRH: Well it has read. Have we bypassed your item? Have we bypassed your level? Have we bypassed the proper level here? Have we bypassed the level? That reads. Now, what uh...

PC: *What was "taken away"? In or out?*

LRH: Let's see if it did: Taken away. Taken away. Taken away – that has not gone out. In this lifetime, have you mostly taken away? That reads.

PC: *Hm!*

LRH: That reads very heavily.

PC: *Hm!*

LRH: Okay?

PC: *Hm!*

LRH: All right?

PC: *Hm! I think that's my level.*

LRH: All right. Very good. That is your level. Okay, now let me check the question again. All right. In this session – in this session, have we missed your level? In this session, have we gotten a wrong level? In this session, have we missed your level? All right. In this session, have we

missed your level? I don't get a read on it now.

PC: *Hm!*

LRH: All right, very good. Do you feel better suddenly?

PC: *Mm-hm!*

LRH: Hm?

PC: *Hm!*

LRH: All right, that is your level. And you also have a large speed drop of your tone arm, on getting that as your level.

PC: *Hm.*

LRH: Very good?

PC: *Hm-hm.*

LRH: All right, that's the end of the body of the session.

PC: *Mm-hm. All right.*

LRH: Okay. Now, have you made any part of your goals for this session? Have a good session?

PC: *Yes.*

LRH: Yes, all right. Uh, to find an interesting level?

PC: *Yes.*

LRH: All right. Uh, to have nulling go easily.

PC: *Yes, it went all right.*

LRH: All right. And to get over this sore throat?

PC: *It's much, much, much, much, much less!*

LRH: Is that so?

PC: *Hm-hm.*

LRH: All right, very good. All right, any gains you care to mention?

PC: *Well, got rid of some somatics.*

LRH: Hm.

PC: *Got a level.*

LRH: Mm-hm.

PC: *I feel I have a level I can uh – run a chain on.*

LRH: Mm-hm.

PC: *Had some cognitions.*

LRH: Mm-hm.

PC: *And in general feel...*

LRH: Hm?

PC: *And in general feel I'm on my way to another run down the bank.*

LRH: All right. Anything else you care to mention in the way of gains.

PC: *Uh-um.*

LRH: All right. Thank you very much for making your goals in this session.

PC: *Mm-hm.*

LRH: And thank you very much for these gains in this session.

PC: *Right.*

LRH: Okay. All right. Put your cans in your lap. Squeeze your cans. All right. Once more, squeeze your cans. All right. How do you feel – your havingness?

PC: *I feel fine.*

LRH: Do you feel it's okay?

PC: *Yeah.*

LRH: Squeeze the cans again. All right. I'm going to have to run a little bit of havingness.

PC: *Mm-hm.*

LRH: All right. Withdraw from the desk. That's the first command – withdraw from the desk.

PC: *Hm.*

LRH: Okay. Withdraw from that post.

PC: *Mm-hm.*

LRH: Very good. Withdraw from the window.

PC: *Mm-hm.*

LRH: Very good. Pick up your cans. All right. Squeeze your cans. Once more – squeeze your cans. Squeeze your cans. All right. That's loosened it up a little bit – I'll have to give you a few more. Okay. Withdraw from the ceiling.

PC: *Um-hm.*

LRH: Very good. Withdraw from the bed-spread.

PC: *Uh-huh.*

LRH: Very good. Withdraw from this table.

PC: *Yes.*

LRH: Good. Withdraw from the desk.

PC: *Mm-hm.*

LRH: Very good, pick up your cans.

PC: *All right.*

LRH: All right. Squeeze the cans. All right. Once more – squeeze the cans. Squeeze the cans.

Do you feel your havingness is dropping?

PC: *Maybe, why?*

LRH: Because I don't think it's doing anything.

PC: *Oh.*

LRH: All right.

PC: *Can tr... can we try, oh, "feel that?"*

LRH: Hm?

PC: *Can we try "feel that?"*

LRH: Yeah, put your cans down. All right, feel that bedspread. Okay. Feel that post. All right. Feel that desk. All right. Feel the arms of your chair. Okay. Feel your cans. All right. Put your cans in your lap. Squeeze the cans. Hey, your havingness came up. All right, that was the last command.

PC: *Right.*

LRH: Okay, is there anything you care to ask or say before I end this session?

PC: *Thank you very much.*

LRH: All right. Is it all right with you if I end this session now?

PC: *Yes.*

LRH: Okay. End of session.

PC: *Thank you.*

LRH: All right, tell me I'm no longer auditing you. Hm?

PC: *You're not now auditing me.*

LRH: All right, very good.

Meter notes on this session: The session, as you noticed right there at the end, was spliced. Actually I ended the body of the session, the pc looked ARC broke, and I opened the body of the session again and for lack of tape, ran it back over the point where the session had been ended.

Now, the final test on the pc's level was longer than it was actually shown on the tape – two-three minutes longer. But the significant fact is that the meter read practically not at all on any level anywhere, and they all went out, and the needle had to be cleaned up several times. And they would all go out, eventually, when the big mid ruds were put in on the levels. And "no communicate" did produce some tone arm action, but this disappeared when the mid ruds were put in.

The clue to the level "taken away" came with the tremendous reads which were being given... which were gotten there on the mid rud questions. Mid rud questions were reading very tremendously. And when I finally checked it out and told the pc that it was her level, I got an immediate steep tone arm fall and a considerable look of relief on the pc and the level was reading very nicely. Read very, very well. But the clue was that it was reading extremely well on the big mid rud buttons. And so I knew it would eventually clean up and read, and so it did. The pc immediately began self-listing very happily on this level and considerably improved in state of mind, so this is obviously the level.

I'm glad that I recorded this particular session because it exemplifies a problem which many auditors are going to run into. Never be dishonest and give the pc a level which doesn't read very well and which doesn't give a tone arm drop.

[The tape ends abruptly as did the original master recording]

ARC BREAKS

A lecture given on 11 July 1963

All right, this is 11 July, and AD 13, Saint Hill Special Briefing Course. Haven't a thing to talk to you about, you know everything there is to know. And that would be all right except you know some things also that aren't true! [laughs, laughter] My mission is trying to point out the essentials.

All right. A lot of things I could talk to you about. But the thing you're going to have the most trouble with is ARC breaks. So I better start telling you something about ARC breaks.

You have just received an HCOB concerning assessment for ARC break and, frankly, that's a rather marvelous piece of stuff. You get so you can wheel and deal with those ARC break lists, why, you're right in there kicking. The only difficulties with these ARC break lists – the only real difficulties with them – is the fact they're always assessed on a dirty needle. And although you want a clean needle for all listing and assessment, the auditor should be banished to Siberia, or the American Psychiatric Association, who tries to clean up the needle before he gets the ARC break straightened out.

I can see it now. Somebody's going to do this! I just know somebody's going to do this! They're going to – they're going to see that the needle is dirty, and they're going to have their ARC break assessment list in front of them and they're going to say, "How in the name of common sense can I possibly assess this because the needle is dirty," and then spend the next ten or fifteen minutes trying to clean up the needle so they can do the ARC break assessment. Now, I know that is very sarcastic of me and very unbelieving of me and all that sort of thing, but the truth of the matter is they would be missing this interesting point: All dirty needles are ARC breaks and the only thing that will clean up an ARC break is the list.

So, what you're doing there, you're faced with the problem – you're faced with the problem of having to shoot down this bird in flight, this ARC break, this black crow, with a gun that's got four ripples in the barrel. You see, it's difficult. And that's what is difficult about ARC break assessments. There really isn't anything else is difficult about it.

But even this isn't difficult if you very, very sharply and definitely follow the rule of instant read. And that will save you a lot of eyestrain and myopia and worry. Now, this makes an auditor who can do an ARC break assessment accurately, every time, a paragon amongst auditors. And that is why it's the most marvelous training process there could possibly be.

We say – we got a – I'll give you – I'll give you an idea, see. We got a nice clean needle, there it is, flowing cleanly, flowing cleanly. We say, "Recall an ARC break" and it goes *bzzzt-bzzz-bzzz-dzzt-dzzt-bzz-bbzz-bzz*. It starts to fall the other way, *bzzz, bzzz-bbzzzz*. See,

we've said, in essence, "Turn on a dirty needle." There is no reason for you to worry about it, because that's in essence what you've said. Let's put it this way. This is metaphorical, but nevertheless, might stay in your minds a little bit better. It's, "What makes life rough?" See? It's ARC breaks! If you didn't have any ARC breaks anyplace, why, life would be very smooth, wouldn't it? Well, the way to not have ARC breaks, by the way, is to be in a total coma [laughter] or be able to handle the environment! Now, therefore, the whole idea of running ARC breaks is smoothing out rough needles. Got the idea? If you got rid of somebody's ARC breaks, you would have a smooth needle. Let me put it this way – you understand it much better.

Now, if there were no ARC breaks on the person's track, then a button going out would not cause a dirty needle. So, there is another echelon, shallower, on the subject of lists, than lists, and that's buttons. Let's take a look at Suppress. How come you can get a kick out of the button "Suppress"? Well, it is sitting on a series of ARC breaks. A chain of engrams is actually a chain of ARC breaks. See, there's the combinations of matter, energy, space, time and thought. The combinations of these and a thetan's reaction to them in their combinations. His reaction to one or another combination of matter, energy, space, time and significance, see? And then you have the matter, energy, space, time and significance.

Let's divide that up very sharply. There are two things at work here, one which we'll carelessly call the thetan's reaction, and the other which we will group as a whole class of its own: matter, energy, space, time and significance. Now, you see, you could have matter, energy, space – I think ... Who was it – I don't know – Delacroix, he's a painter; Deschamps, he's a prize fighter. Who – who was it that invented that... Descartes! Yes! Yes, yes! I can remember some of the people on this planet, heh-heh! Yeah, he – he had a bunch of junk going – excuse me! It was some philosophical rendition – [laughter, laughs] where if a tree fell in the forest, and there was nobody there – maybe this was Locke or Hume – the tree fell in the forest and nobody heard it, would it have made a sound?

Well, this – this is a bunch of nonsense, you see? In other words, this is an entirely different school of thought. This is a school of thought of, "Is existence?" see? "Is existence? And if you're not there, does it exist?" I wrote a story one time, maybe you read it, named *Fear*. And as the guy walks down the street, he knows they're taking the scenery down behind him and putting it up in front of him. And he knows there is no other scenery except the scenery which exists for him. Well, I'm afraid that's – that philosophy is the same order of magnitude, see. If a tree falls in the forest and nobody is there, does it make a sound?

Well, in other words, something has to be observed in order to be. Well, that isn't true at all. Nothing has to be observed in order to be – you can just forget about that. For all practical purposes, if you ever get entangled in on it – I probably shouldn't ever have mentioned it! I might now have tangled you in something you might not otherwise have ever confronted! But it's a basis of this: If there's some matter, energy, space and time lying out on the lawn out there, then it is simply there, isn't it? And you're here and it's there! All right, that's fine, that's fine, that's two different orders of action. You're not looking on it, or otherwise.

Now, for a reaction to exist, you have to look at it, know about it, hear about it, confront or not confront it in some gradient of some kind or another, see. Now, that's what I mean

when I say, "Your reaction to matter, energy, space, time." A thetan's reaction to matter, energy, space, time and significance, see. So you've got the reaction here and you've got the matter, energy, space, time and significance over here. And we don't – we're not even slightly involved with the question of whether or not it doesn't exist if we don't look at it and all of this sort of stuff. You get into the goal "To experience"; "In order to experience it, it has to be there." The truth of the matter is, do you know that you can't – it can be that you just don't know about something and it goes to pieces and you still don't know about it and you see, you've never seen it, never had any experience with it, never confronted it or anything else, and you then don't have any reaction to it. You neither have a not-knowing reaction or a knowing reaction to it. You don't have any reaction to it at all. Because as far as you were concerned it didn't exist. So, the relationship between the thetan's reaction and matter, energy, space, time and significance as a package, you see, is communication.

And to be affected by something, one must communicate with it or not communicate with it, knowingly. You can actually shed a tremendous amount of philosophic balderdash if you just lay it out along those crude lines. There's an automobile accident taking place four miles from here, let us say, at this moment. If we don't communicate with it, we don't see the remains of the accident, we don't know the people involved in it, we don't know that it has occurred, we don't even read about it in the paper, see, there is no interaction. We are not in some esoteric fashion influenced by this automobile accident. It requires a communication to be influenced by the automobile accident.

But! But! Remember, if we knew the automobile accident was going to take place and we carefully didn't know it was going to take place, that, no matter how obliquely or how well forgotten, is still a communication. It's this type of communication that gets a thetan in trouble. You see, he's been there and he didn't communicate, and – carefully! And he made a picture of it, or put up a wall against it or protested it or something like that, and he's got this picture and then doesn't want to confront the picture either because it's – the significance in the picture now has been added to by his reaction. And his reaction was that he didn't want to communicate with it.

So, a thetan's reaction becomes part of all observed or carefully not-observed matter, energy, space, time and significance. In other words, the reaction factor adds to the matter, energy, space, time and significance; and this, then, with the new significance of the thetan's reaction time, made into a mental image picture, becomes the time track. So the matter, energy, space, time and significance has added into it the thetan's reaction. See? So, past is different than present, in that the picture of the past has had added into it the thetan's reaction to it. You follow that?

So you see, past is different than present time. Now, in the future, we add hope or hopelessness. So, therefore, the future also has in it a reaction to it. But in view of the fact that it's not often made up into pictures – although sometimes it is. They're just whole-cloth dream-ups, you see, they're not pressures against the physical universe, or actual pictures. But, you know, you can – you can cause somebody to run future track. You want to horrify some pc sometime, scatter him out of a GPM. See, GPMs tend to remain as present time, you know; that's their best forte. They get you all mixed up because they seem to be in present time and you see, the dichotomy has destroyed their time factor and made an instantaneous-

ness and made them drift on the time track instead of staying anchored down where they should be on the time track, you see. And of course, a thetan thinks it's right there. And you can't get a date on something. I don't advise you to do this, because it's upsetting to the pc, but I'm just telling you a phenomenon. This is not a practical or a workable thing, perhaps, but you might like to do something with it, just to give you an interesting thing.

You can't get a read on this facsimile and you know doggone well it's there, ask if it was tomorrow or yesterday. It shakes it out of present time and you all of a sudden get a read on it. In spite of the fact the pc usually ARC breaks. [laughter]

Now, that, of course, is a past which seems to be the present and requires a reaction to it in the present, but has already got a reaction in it. So a thetan takes his reaction out of this and wears it in present time and you have the factor of restimulation of reaction. You got a restimulation, then, of what he has already reacted to. So his reactions of the past become his reactions of the present.

If you want to have a time, sometime... I won't take up your time right now, but maybe – and box this thing around one way or the other, because of course it becomes very complicated. When you have audited an engram, the reaction to the engram in the session becomes part of the session time track, even though the facsimile itself has been erased off the main time track and you still have a little, tiny cross-reaction. It hasn't got any teeth in it to amount to anything, but you've got this little, tiny shadow of an incident, riding in PT, at that session moment. And I use this occasionally, by trying to find out what was the needle reaction at a certain period of an auditing session. All I have to do is momentarily return the pc to that exact instant of the auditing session and there's just enough needle reaction left to give me one kick. It will give me one small kick.

It doesn't really represent charge. All it represents is the action pattern of the observed present. You might even be able to get another rocket read out of a Helatrobus Implant series, out of PT; but boy, would you have to sweat at it. And it wouldn't have the force or power, you see, of the original rocket read at all, but you could actually get it to react on the meter if you really worked it over and got the pc at that exact moment when the meter is reacting. In other words, at any given instant of the time track, you can rekindle any given instant – or any given reaction. The time track has reaction added to it, as making it different, then, than present time.

Present time really doesn't have reaction in it, except as it borrows it off the time track, or it is added to present time by the thetan. Let's take the luckless fellow who is looking for happiness. And never puts any happiness into his reaction to present time. Heh! Look that one over for a moment, see! Now, the only reactions to matter, energy, space, time and significance that exists on the whole track is the thetan's reaction to, added to the matter, energy, space, time and significance as a mental image picture. So now he goes back on the track, trying to be happy about something, but if he, of course, did not have the reaction of happiness to the matter, energy, space, time and significance at the time it occurred, he will then have only an unhappy reaction. This is quite – this is quite horrible!

You could actually... very funny – very funny experiment with the mind, see? You could lay out twenty-four hours, or twelve hours, or eight hours or something, in which you

are going to put a happy reaction into everything. And you go out and see the garbage pail and you say, "Oh, how happy I am," you see, "about the garbage pail!" [laughter] Rain's coming down, "Oh, beautiful rain!" I mean just – just with malice aforethought, you know. Bark your shins, "Oh, wonderful pain!" you know. Just rack yourself up a few hours of this, see? And then, as the few days go by, why get somebody to audit you through it, you see. And you'll have the most idiotic feeling of happiness, you see. How happy! "I was certainly happy that day!" Quite remarkable.

Now, we've agreed that certain things should be reacted to in certain ways. There's certain things we are *supposed* to be horrified about, we're *supposed* to be happy about, and one of the things that almost breaks your back sometimes, trying to live and exist and be cheerful in present time, is – ah – "things you're supposed to be happy about" is pushed in your lap, see, by your fellows or life, only you don't happen to be happy about these things and you never have been happy about this, but you're *supposed* to be happy about this thing, you see? And actually your reaction is quite horrible, do you see. And, you know, a birthday present, or something like this, when you're – something, and... "Oh, thank you!" You know? [laughter, laughs] You're building up a ridge between your past reaction to the clown that they gave you for your birthday present, you see, or birthdays in general, or the fact that you're really getting on and you don't like to think about it; various things of that character, you see. And you build up a ridge between your present, forced reaction, for social purposes, you see, and your past reaction to such things, and it makes you feel wog, grog, what-what's-what's going on?

So, this can become very involved. The thetan's reaction to matter, energy, space, time and significance then enters into upper-echelon complications which are simply the back and forth interplay of favorable and unfavorable reactions, don't you see. All complicated by the "now-I'm-supposed-to" reactions. This gets quite confusing after a while. And the reality of the situation goes by the boards. It just gets to be too strenuous to get this many reactions through your noggin, so you just say, "Well, it's all unreal." And you put it behind you and you want nothing more to do with it and then it can chew on the back of your neck without any interruption from there on.

Well you say, "Well, I would feel all right if we just didn't keep stirring up these en-grams." And so forth. Well, I don't know that you would or wouldn't. Because they're all there, ready to be stirred up, and if you're not going to stir them up, life's going to. And what do you want to do, leave it on total automatic? So you can square away these things and take care of them and you can handle this various situation. But sometimes these reactions rather get in your hair. And the only errors that can be made in an auditing session which are upsetting at all, actually, are wrong date, wrong duration. Those are very upsetting, very upsetting.

They tend to louse a case up. I don't know anything else that louses a case up. Well, now let's talk about this smooth needle. None of – none of the immediate past is in restimulation, see. Needle's smooth, so forth. Talking about 2H now, see. Nothing – nothing's in restimulation, there's no miscommunication going on here, there's no reaction to the reality, you see, of the matter, energy, space, time and significance contained and recorded in the bank, you see, and this needle's sweeping, beautifully, everything's going along, and you say, "Recall an ARC break." Well, you're asking for a moment of miscommunication of some kind or

another. By definition, an ARC break is affinity, reality and communication gone wog. So of course, that expresses itself in a dirty needle.

Well, it normally became an ARC break because it bypassed some charge which was restimulated. It restimulated some charge and this became unknown to the individual and he attributed the reasons for the ARC break to something else and introduced a lie into the situation and then went on feeling bad about it because the lie gave it persistence. The only way you get persistence is with a lie. Unless you just postulate "It will persist."

All right. Let's look at this phenomena again here, now. The reaction of the thetan can be phrased as his concept of affinity, with regard to something, whether his I'm-supposed-to-be or natively postulated right on the spot; his reaction – his reaction on the subject of reality; and his reaction is, of course, a form of communication. And the reaction is *about*, you see, is *about* reality, and results in a feeling of affinity or misaffinity of some kind or another. There's how you get the bridge between thetan at point A and matter, energy, space, time and significance over here at point B. And the reaction which takes place between these two things is expressed in terms of affinity, reality and communication concerning the matter, energy, space, time and significance which he is confronting, monitored by past affinity, reality and communication concerning similar matter, energy, space, time and significances of the past. You got that? Complex!

Actually very simple. It's simple as long as you can retain a somewhat detached outlook. You get involved in the middle of the battle and there's so many swords clashing against so many shields and helmets, there's so many hoofs belonging to so many different horses involved in all this, and arrows intended for elsewhere landing nowheres, or in you and so forth, you don't have time to retain a detached attitude. You tend to put it on a total reaction. Total reaction.

But that is caused by a condensation of time. So that what we really get the brunt of, in this universe, is an insufficiency of time. Now, you get an insufficiency of time by staying on the time track. You think that's an idiotic statement; it's just very, very factual. You start protesting time. Somebody incarcerates you, and gives you a couple of hundred years in the jug. And you're sitting there, jog, jog; and instead of using it to clean up your engrams or something like this, why, there you are with too much time on your hands. Oooh! That's your consideration! Your reaction to the time in the jug is actually unwanted location. You don't want that location. And you blame it on time. And you confuse location and time and blame time. So the basic lie on the track is, of course, to confuse time and location. And curse location because of time or time because of location. And you get these two things mixed up, and you've had it.

Now, the truth of the matter is, very few years ago, actually, practically yesterday – a few trillion trillion years ago, in actual fact – you probably didn't stick on the time track. Now, the further back you go, the less accurate you were with positioning yourself in present time. Now, I shouldn't use the word "accurate." The less – the less you *were* fixed into present time. You were slippery on the subject. You would slide around, without thinking about it. And you could, at will, go yesterday and go tomorrow. See, time is a very artificial consideration. We see this sometimes in science fiction where somebody has mastered a time machine.

There aren't any time machines, except an OT. He's a time machine. And he actually can't carry stuff back into the past or restore it in the future without simply creating it again in the past and creating it in the future. Of course, I don't know that the past isn't there, in some instances, if it's been fixed to stay there. But this is a very interesting consideration. You didn't necessarily find yourself totally surrounded by the environment of present time! You could go yesterday; and that of course was a very short jump. More likely it was a hundred years. You go back a hundred years for a short nap.

This was very useful. This was very useful. You could slip around all over the place. You wouldn't necessarily find MEST there; but you began to be cursed and to curse this proposition, because nobody was sufficiently fixed and you couldn't stay in communication with people very easily, who kept sliding a hundred years ago! And a certain impatience would generate one way or the other. But that impatience was not destructive and ordinary living was not destructive; it had to be quite cataclysmic. Somebody had to louse up time and louse up location before living became unbearable. You know, there had to be such things as jails and protested time and couldn't-get-out-of's, and miserable circumstances and all of this sort of thing, before you started getting wound up in a circle. And the only thing that was capable of doing this, by the way, was implants. GPM implants – about the only thing that could louse this thing up. You would probably be like that today if you didn't have a few of these implants. All right.

Now, the point... I mean you would have lasted through, processing or no processing. This can get into disrepute very easily. You go yesterday, you see. You see them building a new courthouse, see. So you throw yourself back down the time track one way or the other and choose the location where they're going to build a courthouse, dig a hole in the ground and roof it over with a very thin coat of shale. They build so much weight in the future, on this spot – you see, they build just so much weight in that courthouse and it eventually falls in. You're not even there the day it falls in. You got an alibi.

Well, nonsense of this sort of thing proposes itself, but in actual fact – in actual fact, you didn't have too much trouble with time. And you could slip around on the subject of time very easily. If you have fixed time, you get a fixed reaction. You get a presence of self and the matter, energy, space and time which necessitates a reaction. You've got to have a reaction, now. This is an enforced reaction. You – there is no way of escaping a reaction. You can't drift back a thousand years. Just sit this one out.

Now, you slip back a thousand years because you dare not confront something, you find yourself popping up those thousand years in a hurry, because you got a reason why. You got a no-confront going, of some kind or another. But anyway, to be very uninvolved about the situation, here you are with a very thin, fixed present time. And of course you have very little time. And it is the absence of time, or the presence of time – that's the unwanted absence, unwanted presence of time – which gives problems. The source of all problems is time. If you want to take apart somebody's problems on a very esoteric level, you just start scouting time down. You start taking his time apart on the subject of his problems. This is quite amusing. You say, "Tell me a problem you have had," see?

"Well, so and so and so and so and so and so."

And you say, "All right. Now, what time was awry there? Where was there too much time? Where was there too little time?" And – now, don't mistake me – this is not a one-way road to glory, because it has a tendency to become a little bit limited and is slightly esoteric. And it's the quality of reaction, you see, is ARC. But I'm just showing you here that you could just choose one of these points, the most important one of matter, energy, space and time and significance and you can just change that time. Reactions to that time, as a point – which you normally wouldn't – wouldn't explore at all. On the single subject of problems, you know, "Tell me a problem you've had."

"So and so."

"All right, how was the time awry? What was the matter with time at that point?"

"Well, I didn't have enough time," or "I had too much time."

This is the normal reaction. You could do some shredding of the bank. You could knock the guy around in the bank. You would tend to move him on the time track. You could do some interesting things and he sure wouldn't have the problems that he had, you see? And one of the problems you have with study, for instance, is insufficient time. One of the problems I have with teaching you is insufficient time. Time is made insufficient by the economic status of the thing or the dear loved ones who keep pestering you. And you – we wouldn't have any problem at all with any student, you see, if it just weren't for these two factors. They're very simple factors, the factors of economics and the factor of familial or organizational relationships, you see.

These factors kicked out would only then be monitored by the factor, well, you can get old! You know, sitting around in a body. I didn't mean any particular student! [laughs] But the point – the point I'm making here, is that problems, the peculiar thing called a problem, is quite different than a reaction. And the peculiar thing called a problem is adjusted by simply an adjustment of just this one little part of matter, energy, space, time and significance. Just adjust the time and you do something. Now, oddly enough, you can also adjust problems by location. Less effectively, but you can still adjust them by location. Location is a part of matter, energy, space and time, because by space and energy or mass, we, of course have it understood that it is someplace, or is going through a certain location in space. So we say you could adjust that by that. Well, spotting spots in space – just that, all by itself, produces some remarkable reactions because it's handling just this one little thing called location. And that, of course, will handle some of these problems.

Now, if somebody goes out here and runs into a tree with a car, about your fastest process – not necessarily the best process, but the process which would go all the way down and fit his case level at the moment, which could be quite low – would just run Reach and Withdraw on the tree. Go out and find the actual tree! See, that spot in space, see? And go Reach and Withdraw on the tree and then go find the car, wherever it is, and run Reach and Withdraw on the car, and Reach and Withdraw on the tree, and Reach and Withdraw on the car. I don't care if the car is up in the garage someplace. Flatten it with the car, you see, flatten it with the tree, touch all the ground around there and so forth, and then you say, "Well, what's the time factors involved?"

"Well, if we hadn't been going so fast, we wouldn't have hit so hard!"

That's the obvious factor. All impact is based on a scarcity of time. There's too much happening in too little time. Now, every time you as a thetan have rendered some horrendous and damaging impact, you of course have scrunched these things up. That's not necessarily aberrative, in ist... there's nothing you do, by the way, that is very aberrative over a period of time. You've committed overts and damaged people and you'll commit overts against the greater good of the greater number of dynamics and then you will consider that you don't deserve to go anyplace or be up, but that's holding yourself in the own – in your own trap. In just the normal course of, well, there's a war, and you shot some soldiers and you got shot at, you lost a couple of buddies, and your wife turned into a barfly. Something like this, you know; normal course of existence of the war. And so forth. That's about as aberrative as blowing your nose, see.

That's nothing, see. Nothing. You lose three or four boyfriends and that sort of thing, that's nothing, see. Not on the long line of aberration. Because none of that is sufficient to stand forever in space, or completely shut off the whole line, you see.

You have to get some very interestingly complicated mechanisms making these facsimiles of people stay in present time, bothering them all the time, with them reacting against them all the time, to build up a tremendous lot of reactions, which then becomes the personality of the individual. See, that trick had to be introduced to it. There's only that trick, by the way. That's why you can run engrams today and why you suddenly got engrams today, because that's the chief engram. That's what makes engrams unrunnable. That's why we couldn't run engrams, you see. Well, we can handle that, why, we can run engrams and we can clear up the track.

All right. Now, let's get back to this thing called a reaction. Your reaction to matter, energy, space and time is couched in numerous ways. But where those reactions tend to not communicate or tend to obsessively communicate, you rough up energy. Energy gets roughed up and then it stays in the picture and so forth. In other words, the energy is flowing at one foot per second and you get in a hurry and you make it flow at three feet per second, but it isn't really flowing that way; or you prevent it from flowing at one foot per second and make it flow one inch per second. In other words, the normal course of flows is interrupted because of the existence of a problem or an obsession to be at it or a feeling you've got to get away from it or, you know, it's bad or it's this or it's that. And all of these things result in the fact that you bypass charge.

Charge is there, so you go into this thing, crunch! And you restimulate some charge. Or you try to get away from – *zzrrmmm!* And so forth. Well, what's dictating this? It's former reactions. What gets kindled there is a former reaction of some kind or another. And that former reaction throws into restimulation some earlier engrams, some earlier ARC breaks, some earlier this, some earlier that, see? You get how this – how this works? In other words, you confront matter, energy, space, time and significance in a certain way and there will be a picture of similar matter, energy, space, time and significance confronted in a certain way, which is reactivated by your reaction to the present matter, energy, space, time and significance.

In other words, you take package B and you react to... well, you – one of you girls sees a mouse on the floor, see? Here's one of the things drives women mad! That's because it's an

I'm-supposed-to, see? And you see a mouse on the floor and reaction to the mouse is, "Yaaoww!" See? All right. Now, the last mouse you saw before this, you see, your reaction was duplicate. You went, "Yaaoww!" And with the mouse before that, that you saw, see, your reaction to that was, "Yaaoww!" So, you've got three "Yaaowws." Now, those former ones – those former ones, you understand, are in picture form and the present one is in matter, energy, space and time form. See? But the others are copies of this same thing, so your reaction here rekindles the reaction then, so you get that picture pulled in; now that reaction intensifies this reaction.

It's like hooking two locomotives up, to where one was only pulling before, see? Now, because you never scented the second locomotive, you wonder, "Why did I 'Yaaoww' so hard here?" Becomes inexplicable. It's a missed charge. See that?

Now, the auditor comes along and he says, "The reason why you went 'Yaaoww' here is because formerly you went, 'Yaaoww'." "

And the person says, "Oh. Oh, yes! Yes, of course!"

We – we don't even really have to spot when we formerly went "Yaaoww," because what we've done is just kick off not the facsimile, we handled the reaction factor of the facsimile. Got it?

We just handled one little piece of this. We handled that piece most intimate to the thetan, which was his reaction, his ARC. So, when we handle that, that as-ises fast, so the other charge drops out and you cease to have bypassed charge. Follow this? You be – you better get a good grip on this, I can see some of you a little floundering on this. I've given you a lot of data here, all of a sudden.

Now, the only thing – the only thing that caused a restimulation of yesterday's charge was the fact that you reacted the same way today that you reacted yesterday. The devil with the situation. The *reaction* was the same. So when the reaction was the same, you pulled in yesterday's situation; unwittingly pulled in yesterday's situation and didn't even know it. It's because the *reaction* was the same. You're not even vaguely interested in running out yesterday's association as a facsimile. You're just interested in clipping out of it, *tsk*, this one little piece of it which is *reaction*. You just want to do a reaction-ectomy. Because your reaction today restimulated your reaction in the yesterday incident, see?

Now you say to the guy, "Well, the reason you reacted to a mouse today was because you reacted to a mouse same way yesterday."

"Oh, similar incident yesterday. Oh, yes! Of course!"

He doesn't even know about it. All of a sudden he feels all right. It's a very strange phenomenon, unless you understand what you're kicking out. All you're doing is you're saying, "Reaction today – reaction yesterday." You've actually matched terminals, two things, and they go *bzzt!* See, you're handling reactions.

Now, this is quite different than handling the facsimile. Now, let's go back and go all over this thing again. Very short, sweet, simple. You got a thetan at point A, and you got matter, energy, space, time and significance at point B. And the *reaction*, or the *interaction* be-

tween these two things, I should say, is the thetan's reaction to the matter, energy, space, time and significance at point B. See? You understand? The reaction *to it*. And that reaction to it is expressed, in our language, in ARC. His ARC with regard to it.

Eighty-nine cars pile up in a horrendous pier on the freeway. See? I think it's the real reason they have freeways – they can pile up more cars on them more suddenly! And here you have a facsimile of eighty-nine cars piled up on each other. Now boy, there is – there's matter, energy, space, time and significance! Eighty-nine cars piled up on the freeway, crunch! See? Now, there's another thing here, and that is a thetan's reaction to this. Didn't matter whether he was part of it or observed it or read it in the paper or something like this, you understand. His reaction is a different thing. Now, your – your quarrel with many things that are wrong in the world, and my quarrel with many things that are wrong with the world, is because our reactions are quite different to the other peoples' reactions to the same thing. Now, you understand, it's just eighty-nine cars piled up on the freeway! Now that, in present time, is. And as it becomes yesterday, is a facsimile of what had been, you see? Now, that is a thing. That's a facsimile.

Now, we're not talking about taking apart – this is running engrams, see – we're not talking about taking apart these eighty-nine cars piled up on the freeway. That's not what we're talking about. See, we're just talking about the guy's reaction to it. And that's all you handle on an ARC break. You get yourself so involved with these eighty-nine cars piled up on the freeway as matter, energy, space, time and significance, that you never can sort out the guy's reaction to it. You say, "Oh, well, you've got an ARC break because you were driving down the street, and you saw two cars almost hit. And you started cursing the police department or the highway department or drivers. Oh, yes, now, is that – did that restimulate an earlier, similar incident?" And he says, "Don't know..." But your meter says, "Tsk!" Earlier, similar incident. You say, "It restimulated an earlier, similar incident." And he says, "Oh?" All of a sudden he doesn't have an ARC break. He doesn't quite understand why or how or anything else. See, pure magic!

All right, now, if you didn't understand that you were just supposed to handle his reaction, you're liable to be doing this: "Well, let's see, similar incident, huh? Earlier, similar incident – when was this earlier, similar incident?" Let's handle the time of the earlier, similar incident. Ohhhh! "All right, when was this earlier, similar incident, huh?"

"Nineteen forty-eight."

"Oh! In 1948. Well, what was it that happened in 1948?"

"Oh, eighty-nine cars on the freeway piled up."

"Which car were you in?" [laughter]

You're running R3R, man. It isn't that you can't run it, but, you're now in for a long, arduous job, because this is basic on automobile accidents for this thetan? Nineteen forty-eight? Ohah-ha-ha-ha! I can see it now, on that monocycle, eighty-nine trillion years ago, engaged on his eight-billionth personal, private accident! You got a long chain, see? And you're going to cut into it at the end and cure an ARC break? No, you're not going to do anything at all. What you want to handle is his reaction!

Here's the way to handle it, see: You say, "Oh, you're down the street, and you had an ARC break with other drivers and you had an awful argument. Is that right? All right, was it a this? Was it a that? Was it a this? Was it a that? Was..." You know, you're trying to sort out, "In the incident itself, was anything missed?" You see. "Was it – any affinity in the incident missed? Any reality? Communication?" So on and so on. And, "Earlier communication break? An earlier incident restimulated?" *Pang!* You say, "Well, it's always an earlier incident restimulated." Well, it doesn't always show up that way, see? And you say, "Well, it was an earlier incident restimulated. You had an earlier incident of a similar kind restimulated there on the street when you had that upset."

"Huh! Huh! Oh, what do you know!"

It's all right with him. The needle quiets out.

Sometimes the eager beaver says, "What was it? What was it?" Perfectly all right. Let him do it. "What was it? What was it?" Let him do it! Don't help him out!

He says, "Oh, let's see, earlier incident, earlier incident, earlier..." "Oh!" he says, "it's that eighty-nine-car pileup on the freeway! Yeeass! Oh, yeah, I was upset the same way!"

And you say, "Thank you very much. Recall an ARC break." Because if you do another thing, you're walking – not on eggs – much thinner and crisper than that! All you have to do is direct his attention, direct his interest, and he passes over from point A, and now, straight over to B and jumps in without the benefit of swimming trunks or anything else. He's just in and gone! You understand?

The way to get somebody in an incident – you don't use this technique anymore – is just ask him for the largest object in the incident. Pc's mentioned a house recently. You say, "All right, the house. What kind of a house was it?" There he is! He's right in the incident. You can push him over there, using matter, energy, space, time and significance. Well, actually, you can peel these things off by doing a reaction-ectomy with ARC.

You understand those mechanics, you'll see them work out. You'll see them work out in yourself. You'll recognize eventually that the only time you fail to put your finger on it is when you didn't have the requisite item on your ARC break list. Your ARC break list is insufficiently complete.

Let's do some ARC breaks in auditing. "All right. Recall an auditing ARC break, in the last month." All right, you've got what? How many processes? How many process might have been done? Let's look them over. How many lists would you have to run on this ARC break? Or you'd have to say, "All right, what process were you doing? In that ARC break you just recalled, what process were you doing? What was being done on you as a process? All right, very good. Your item – or the reason for the ARC break – is on that list." See, because you've got a listing ARC break, you got a session ARC break, listing ARC breaks, engram running ARC breaks, you see, and implant ARC break lists; you've got all these lists! Because there's a number of combinations that can cause – and these are empirically worked out, not just intellectually, see? And you normally will find these things. The only thing I would add to both 3N and R3R because auditors are switching between them unintelligibly some day – times, is on each one, "Wrong date, wrong duration, earlier wrong date, earlier wrong dura-

tion." And I put those four questions on both the 3N and the R3R ARC break lists. That's a correction of the lists. I put those on just to make awful sure! Because people do an awful lot of illegal dating, I'm beginning to find out, and durationing and so forth, while running 3N. They do an awful lot of it, see. It isn't necessary at all and yet they do it, and so they make a mistake in it, and then everything goes blooey on it, and then they do a 3N ARC break assessment form, and of course, the wrong date, wrong duration are on the R3R assessment form, so they don't find the cause for the ARC break.

Now, all ARC breaks become because of – I've left you adrift here, some way or another. You recognize that any pat procedure would have its ARC break list, which would give all types of charge that might get bypassed. Because these are just lists of charge, that might get bypassed. Possibly it's bypassable charge. And that's all an ARC break list is. And when you go and make one up, as you may well do, one fine day, you make up an ARC break list, all you'll have to do – you find yourself sitting someplace without any materials, you see. You haven't got any lists with you and so forth. You can sit down and make them up, by just figuring out, "Well, what's all the kinds of charge I might bypass in this particular procedure?" Or, "What are all the types of charge I might bypass in a session?" And then, of course, we remember that it's the – it's current in the session, or earlier in some other session, or earlier someplace else, so we always say... we've got the item that might get bypassed. And then we've got the same item with "earlier" in front of it, see? See, it's always double. See? The wrong date. We always, of course, then follow it up by saying, "Was an earlier wrong date found?" You see? Because we might have just kicked in yesterday's session and unwittingly had a wrong date in yesterday's session – not suspected it until today.

Now, the trouble with ARC breaks is they never rekindle until they're keyed in. And an ARC break is always a key-in. It is never the fact. It is always the follow-up from the fact. So, you would almost always get missed withhold to read on an ARC break list. Inevitably, missed withhold is going to read. Because that's, of course, the common denominator of all ARC breaks and it requires a missed withhold to key in the ARC break. So you sometimes find, grandly and gorgeously, missed withhold, and tell the pc it's a missed withhold, and the ARC break doesn't diminish.

No, the missed withhold, you see, just keyed in the thing. And if I had my way about it, in actual fact, I would omit "missed withhold," because it might be a trap. It requires a missed withhold, and you're liable to find the "missed withhold," and tell the pc it's it, while having a date a trillion years wrong in an incident.

See, the missed withhold keyed it. Therefore, he's so fixated on the key-in that he does... you don't get the other on the list. And you say, "Well, is there a wrong date in this session?" And it's null. Everything's null. "Do you have a missed withhold?" See? Bang! "Yes, oh yes, I so on and so on – you said so-and-so and you did me in, you dog!" See? And that's a funny reaction to an ARC break. That isn't the curative reaction. You'll very often say, "Well, we found a wrong goal." You'll say very innocently, solving your ARC break, you see, "We found a wrong goal."

"Goddammit, I told you that goal was ...

No, you didn't find it! *Tsk, tsk, tsk!* Not the right bypassed charge! You found the key-in, and you very often find the key-in, which just simply keys the bypassed charge in again. You sometimes will see this happen. You give this list, right on out, down the line, and you say, "Well, I've got a – we found a wrong goal on you, see? Found a wrong goal."

"Ohhh yes!! I said that goal was wrong!! Goddamn *yaaayaaayaa!*"

Don't be upset. You didn't do a wrong assessment, you've just found the key-in. Now let's go back and do another assessment and find the bypassed charge. First thing you do with something like that is to find out, let's see, am I assessing the right list? That's an awful good thing to ask yourself, because you're liable to get kind of rattled in the middle of an ARC break as an auditor, see? You all of a sudden find with horror, no you're not. You thought you were doing 3N but you just remembered that early in the session you dated and durationed an engram. You dated and durationed something early in the session. Oh, that's – you've run some R3R. Ah, let's get that R3R list out. Don't do the 3N one again and work yourself to death, you already did that. Have some confidence in your own assessing! Nothing read, so it isn't on it. Get another list! Get another list, and you go down the line.

"Well, we restimulated finding a wrong goal, in an earlier session, on you."

"Oh? Hmmm. No kidding! That's why I was so ARC broke last month! Yeah, that's why I was mad at Charlie! Yeah, that – that's the wrong goal! 'To be a titwillow,' that's the wrong goal!"

You didn't even tell him what one it is, and he brightens up all the way along the line and he goes along just fine, you see, everything is fine now! Get the idea?

You understand the mechanics of the thing, you can handle it. There are various types of charge that you can bypass. What do you mean by bypass a charge? Well, kick it without revealing it. Set up a reaction between point A and B without disclosing it to the PC or yourself! And when a violent reaction exists between point A and point B, in a session, which is totally unknown to both the auditor and the PC, it will continue to be a violent reaction until the reaction is spotted. You don't have to spot the incident, you have to spot the reaction.

Now, what you want to do is get rid of that reaction just by assessing it out and indicating it. You don't have to be fancy about it.

Now, one of the things which you make a mistake on, on ARC breaks, is this. It's very short and very simple. And something I hope you'll remember. It only requires that you locate and indicate the bypassed charge. And if you are called upon, because the ARC break didn't clear up, to go further into it and date the incident and get the PC to remember it and some Straightwire and get it all patched up and get it all glued together somehow or another and go to a lot of work after that assessment, you didn't find the bypassed charge. You got that? And any time you're sitting there and say, "Well," the PC said, "well, I didn't see it – did you say it's the wrong goal – do you suppose it's this goal we're working on right now? I don't think it's this goal we're working on right now. Doesn't seem to be this goal we're working on. I just suppose – suppose – well, it may – may be an earlier goal and so forth. Well what-wha-what's the – what's the date of this bypassed goal? Wha-what's-what's the date of this goal that we've

missed? What's – what's the – what's the date – wha-wha-what's the *date* of this goal we've missed?"

You say, "Well, aaa – *wuuwawuuuwa* – all right, I try to find the – find the goal I mean – uh-hh – to find the date of the..." Knock it off, man! The PC – that the PC has to do something else now means you didn't find the bypassed charge! Maybe it isn't on the list you're using. Ever think of that?

You see, you'll be doing 3N and you get a session ARC break. And you do a 3N assessment, thinking the error is totally in 3N – as it usually is – but you say, "Well, there's a little tick here on, uh, missed withhold. You had a missed withhold. Well, wh-wha-what was the missed withhold? When did we miss this with – withhold?"

"What – what – what – where – where? Say wait – what – whoa. Uh, what what *missed withhold*? Well, why didn't you catch it earlier in the session, I don't have any mis... ! You keep nagging me, nagging me and nagging me with these mid ruds but – wha – why and so... "

Well, why spend any time on it? Let's get – let's get another sheet and assess it. Let's add to our list. Let's do something. Because this is *invariably* wrong in the presence of that reaction: is you have not identified the bypassed charge! That's all. If you don't know that, you'll discard this system, because you'll get loses. You'll say, "Well, it cures up most ARC breaks." No, it cures all ARC breaks, providing you can identify the bypassed charge.

If it didn't cure the ARC break, either it isn't comprehensibly on the list – see, the PC didn't understand it when it was read – or it isn't on the list which you are using. Now, I've seen two instances of this, very recently, very skilled auditing, and the ARC break was not cured, but was totally available, simply because it was forgotten, the little piece of another thing was run in this session, besides what was being run in this session, but the ARC break assessment was made on the main thing being run in the session. But the ARC break bypassed charge was on those three minutes of other process, which both auditor and PC had completely forgotten.

You feel like a perfect jackass sometimes on this, because three or four days after you've had – rough three or four days, and you accidentally pick up the right sheet or you add something to your list, and you're doing another assessment on the same pc, and you all of a sudden find ever since Tuesday, we have had a wrong goal. But we're not running goals. How could we have had a wrong goal since Tuesday? We're not running anything but engrams. How could it be? Yet, there it is. Go into it sometime. Session goal.

I know it doesn't sound very strenuous. But he set a session goal "to not be afraid." That was all it took. Heh-heh! Yet you haven't been running 3N. But there was a goal. These things are sometimes very wild. You're not running R3R, you're running 3N. And you're not dating anything, and you're not – you can date, but you weren't dating anything, and you'd just been going on and everything's been perfectly happy, and... Pc nattery and nothing getting done and the RR disappearing and accidentally you trigger something and you decide that you better do this 3R3 [R3R] assessment form. And you find out you've had a wrong duration! You've had a wrong duration. And the wrong duration has been sitting right there. But what's the wrong duration? Oh, well, the week before – the week before, in the very area you're run-

ning, you tried to find how long this implant series had required. And you'd gotten four hundred and sixty-seven trillion trillion years. And it was a wrong duration. Since it only happened particularly forty-three trillion years ago! [laughs] No. You see? And you said, "Well, we just kind of can't make it out," you said to yourself, but you kind of never bothered to tell the pc and so forth. Well, this might lay doggo. For a whole week the pc felt fine and everything was going along fine! And then all of a sudden, *browww*! See? Some session ARC break, a missed withhold in the session keyed this other one. And there that other one was, lying around your neck like a casket, see?

You feel like a perfect blithering idiot sometimes on these things. Sessions later you suddenly collide with one, you know, and it's been there all the time. Pc's been hard to audit, you've industriously assessed everything you could think of, you did your very, very best. And it'll have some weird little curve on it of some kind or another, that really isn't a curve at all, it's staring you right in the face. And it should have been right there all the time, you should have recognized it, the pc should have recognized it, everybody should have seen it, but you didn't. They're sneakers, some of these things, real sneakers. And it cuts right down to the wrong date, wrong duration, wrong incident. You find out, much to your horror, that you've been running five implant serieses, simultaneously. Five implant serieses, simultaneously.

The poor pc has been going, the first two items out of implant three series, you see, and the next two items out of implant five. And the next two items out of implant one. And of course, this makes the other items restimulated in each one of the other implants. Makes you feel kind of green, sometimes, you look at it. And yet it was apparently all running all right, and you said, "All right, is this just one series?" And he coughed at the moment, or something, you know. And you never worried about it when you went over it. And then all of a sudden you're – or you're running a series which is misdated by God knows how long. You've got a whole GPM and it took place a hundred years ago. And you say, "How the hell did it get up this close to present time? What the hell's this all about?" Well, some wildcat area someplace or another, and they just never got the word that it's passé, you use psychiatry now. And they're still at it, eager beaver, and they're putting in "to be dead," do you know? "To be dead, to be dead, to be dead," you know. And so forth – and you said, "Oh, look at this! Look at this, boy! 'To be dead.' Pow! Man, man! He's right there at the beginning of the Helatrobis Implants." Says, "All right, let's get this, let's get this, all right. To be dead all right, that's fine. Now let's get dead! Nix dead! Well, nix dead doesn't fire. Well, let's random list on this. Let's random list. No dead, not dead – fires! Oh, well, all right. Nix dead – doesn't fire. Oh..."

You sweat yourself green. Try to get in there, you see. All right, well you finally manage to persuade him to get nix dead to fire, you've said it often enough or some such. [laughter] And you say, "All right, now let's get absolutably dead. Absolutably dead. There's your line plot right there, there it is, there it is. Absolutably dead – doesn't fire, doesn't fire. Nix absolutably dead, that doesn't fire. Aw, I guess he can't run GPMs."

"Well, let's come off of this goal, let's get onto some other things here, let's try you out on assessment R3R."

Halfway through your assessment on R3R, all of a sudden puts "death" down on the line or something like that. And blows his head off! See? A volcano never erupted as fast or as furiously or as inexplicably. And you say, "What the hell happened?" And you get out a listing – because you're listing, see – and you get out a listing ARC break list, and you say, "All right. All right. I chopped a communication of yours in the session."

"All right! All right! But you shouldn't do it!" he says.

"I guess ARC break assessing doesn't work!" No. No, the ARC break was when you were doing 3N. It's on another list. Heh! And like, one day, you're plowing along, you suddenly have occasion to do a 3N assessment, and you find a wrong goal. Find a wrong date! 3N. Wrong date! What the hell could it be? Wrong date? – You just keep missing, and all of a sudden he says, "I get the idea it's had something to do with 'Death'." And you said, "'To be dead?' Well, what – is it the wrong date of that? Is that it?" You're trying to follow through and understand this thing. "Well, what is the date of that?"

"Eighteen sixty-two!" [laughter, laughs]

Wasn't a GPM, it was a doctor and a hospital corpsman in the Civil War arguing over the top of the corpse! And you thought you were running a GPM! [laughs] They rocket read! So that was it!

That gives you some idea. Now there's where you tangle up. You just don't use the right list for the right action. But if you do find the bypassed charge, you've got it and it's on – the bulk of them are on lists. And you can locate them, and so forth. And if they don't take care of the whole ARC break right now, you haven't found what it is. Now, that's the one thing I want to impress you with, because otherwise, you're just going to tear yourselves wrong side out trying – because the pc now will want to remember, and the pc will want this and the pc will want that and the pc will want it dated and so forth. Well, what's all this reaction? It's just you haven't found the bypassed charge, that's all. And you've found some cousin to it someplace or another, and you've just keyed in something else. Follow it?

No, ARC breaks consist of bypassed charge, they always go out of line the moment you get the reaction, which the reaction, of course, is the pc's regard toward an incident, or his reaction to an incident. When you get that spotted, when you get what kind of a reaction it was, in a general classification to what, your ARC break blows up. If your ARC break doesn't blow up, you haven't found the bypassed charge. And the reaction between A and B therefore is not explained.

Okay? Well, I wish you lots of luck with it.

Thank you.

TIPS ON RUNNING R3R

A lecture given on 16 July 1963

Okay. This is Saint Hill Special Briefing Course, 16 July, 18 – AD 13. Thank you.

All right. Now, I really ought to – I really ought to give you some good dope here today on the subject of auditing engrams and GPMs. And although I haven't particularly organized this material or separated them out, there are a few things that you could profit by knowing in these two departments. This is a strange new world to a lot of people and actually is a stranger world to some old-time auditors than they think it is yet.

Some people haven't realized that we've made a tremendous forward start in the running of engrams, and they're still staying with the idea of this, that and the other thing, and are doing strange and unexpected things in the middles of sessions and so forth, you know. And I know the impulse, because I myself can run into a block of some kind or another in the thing, and not be able to sort something out, and say, "All right, when I snap my fingers the item will flash!" See. Sometimes it works. But it's very upsetting to the pc.

Now, auditing here has stretched out into a very fine, neat package, where the whole track is concerned. You must realize that this doesn't invalidate the auditing you know how to do, doesn't invalidate yesterday's auditing and so forth. Those techniques are themselves, they stay themselves and they're still useful. As a matter of fact, in very short order you and other auditors in the world will be receiving a questionnaire from me on research. Not for testimonials, but research, to put together the whole field of healing. Anything that you have ever healed, with what. Or anything you've ever had cured on yourself, with what. Because the AMA has raised its ugly head, and the only way that you can really get in trouble in this universe is neglect an area of responsibility – and we've neglected that area of responsibility too long, and sure enough, it's the only avenue through which we're being attacked.

There's a comedy team called Keaton – you remember Buster Keaton and Fields – you remember W.C. Fields, you know? Well this isn't the same pair of comedians but this fellow Keaton at the AMA, and this fellow Field at the AMA are the sole authors of bad publicity for Scientology in the world. We have finally walked them carefully down, and we're looking right down the throats of a couple of mangy polecats. [laughter]

Now, I know I could be sued for this because I have inferred they were human beings. [laughter] And I could be sued for it by the human race. But the point – the point I'm making is we've neglected that zone of responsibility and we can heal things and so forth. And without immediately stating that all auditors are in the field of healing, I think it would be a very good idea to gather all the materials of healing and publish them in a popular book as *A Process a Day Keeps the Doctor Away*. [laughter]

So we have a tremendous amount of valid material in the past and this is not discounted. As a matter of fact, if you wanted to make somebody very, very happy that you grabbed in off the streets, totally raw meat, why, just do some of the old 2-12, 2-12A, something like that. And they get fantastic results. "What is this stuff?" you know, and so forth. On the other hand, it does not particularly land them on the high road to running GPMs, finding goals and doing other things, that it should do. And on the other hand, if you carry it forward and do too much of it on a pc without departing on to the whole track, you can get the fellow in the soup.

It has to be classified as a limited process. And as long as you remember that it's a limited process and you don't do more than four oppositions on one item or something like this – get one RI and do two or three oppositions on it, see, anything you get. And be happy, you see. Be happy. Leave it alone after that, you see. You've shot your bolt as far as this pc is concerned on 2-12. But you've done some remarkable things to him. You might very well have brought him out of a great deal of insanity and upset and worries of one kind or another. And remember, he doesn't have – you're different than he is – he doesn't have your breadth of comprehension of the situation. He doesn't have any forward look to attainable states. He doesn't have a lot of things. And he thinks that if he could just get this pain in his rib shifted – it doesn't even have to be gone, see – but if it would just shift a little bit, why, he's made remarkable progress. Or it isn't any longer in his rib, then that's fine, see. That's marvelous. That's marvelous. You're a wizard.

Well now, when you – when you deal with these low-level attainments and apply Scientology to obtain these low-level attainments, you see, such as, "Well, I'm not so mad at my daughter now." You know, that's fine. He's worried about the fact that he gets angry at the child and so forth, and you've done something about that. Why, he becomes very happy with auditing. And you're dealing – you're dealing definitely in a humanoid level of expectancy. A character is beaten down by his experience on the whole track and he realizes that nothing good can possibly happen in the universe. And when a tiny, little goodness occurs, and so forth, it's almost too good to be true, don't you see, and he can hardly have it at all and it's very miraculous that this occurred.

Now let's take a look at that as a very low level of expectancy. Very low level of attainment. Now let's move over into an entirely different zone and area. And let's move over into the zone of clearing, Clears and OTs, see.

Ah, well, now here's an entirely different zone of expectancy. And this is so tremendously beyond the humanoid reach that if you were to just talk to – well, if you were to talk to people about OTs and try to hand this out to them and so forth, they wouldn't think you were mad because they would they would try to do something about it. They would try to tell you this was awfully dangerous, they would try to sort of try to key you in. They would go into a *nyaaah* state. And they would try to ridicule you, while believing you, you see. And all kinds of weird mental currents would set up. Because you've struck at the very core of their own basic unrest and you have stimulated bypassed charge, see? Promptly.

And they can be very cross with you. Now, these are your approaches.

And in all auditing – now there is a rule – there is a rule, now, in all auditing – is don't stir up more charge than you can handle. Now that's a rule in auditing. Now, if you apply that rule to any process you run or any programming you do on a case, you will always have happy pcs. And that is the monitoring factor in programming which says which process you run. But you can take the processes which lead to OT and you can misuse these things by disobeying that rule.

Now, the worse off a case is, the more you walk on eggs. In other words the less you stir up. The worse off the case, the less you want to stir up. You got it? See, this is subsidiary to this other rule. Don't stir up any more charge than you can handle. And the subsidiary rule to that, that fits right below it is, the worse off the case, why, the more careful you have to be.

Now, this goes directly in the teeth of a Q and A. Here is a homicidal maniac, screaming around and walking on the walls, you see. So the Q and A of past – ha! – torture sciences, mental sciences of yesteryear, the kind that really get the appropriation, are a Q and A. A desperate cure for a desperate state. Now, the Effect Scale goes directly in reverse. The more desperate the state, the more featherweight the cure. Got that? Now that's dictated sensibly by the Effect Scale, because the person cannot have much of an effect. See, they cannot receive much of an effect. So you have to featherweight the effect. And the more desperate condition the person is in, why, the more featherweight your approach should be. You yourself should get a good reality on this. You've got this boy who's *tough*, you know, he's *tough!* Going to chew you to pieces, you know? And yeah, he's going to – *row!* And so on and so on. You better not talk to him that way, you know, this kind of a character. And I'm talking now practically institutional type action, you see. And you say, [whispers] "Hello."

God, you might have shot him with a bullet, you know? And he'll look at you, he'll puzzle this out, he'll consider that. Whereas actually, you probably could take a megaphone and scream at – at uncounted numbers of decibels and he'd never receive it. He might spin in, but he'd never receive it. You get this? Now, that old Effect Scale is terribly important when applied to processing. If you want to get an effect on a pc, then the worse off the pc, the lighter the process.

Now, we've already turned loose some technology now in the preliminary assessment step, which takes R3R and lowers the level on which it will be effective. Now, that bypasses the ordinary defenses of the mind. And that means that when you do an assessment, the rule I've just given you of don't kick up more charge than you can handle, flagrantly and definitely applies when you are using R3R on a case at level 7, 6 or 5. This person does not easily run engrams. You have actually forced this person into the only tiny, little channel, by an assessment, that the person can find some reality on the time track on. Oh, yes, they can run engrams on that little, tiny, narrow channel. That's quite remarkable. The development of the process has been on this basis: that in all cases there is some little, tiny channel that can be approached and on which you will not find dub-in. Understand?

Now, you take a case level 3 – you can enter the case on almost any assessment that you dream up. You'll find sonic, visio; you can run any engram you think of, anyplace on any chain. Now, on that case also you could misdate, you could misduration, you could abandon

chains, you could skip around like a cat on a stove and you're not going to damage the case any.

Now, let's compare this to a case level 6. Dub-in of dub. Now, instead of looking at the wide Atlantic, which you can travel across at any direction you care to, you are now looking at a barge canal, which is one-sixteenth of an inch wider than the barge you're trying to get through it. And which is very curvaceous, and which is full of roots, mud, sandbanks and old stoves. And somehow or another you can navigate it with R3R.

Now, it's a good thing that channel exists. On that channel there is no dub-in of dub, there is no dub-in and actually, if you've got the correct date and the correct duration, you will have visio and you will have perception. Now, do you see this as a narrowing aspect of case? Level 3, oh! Take any kind of a motorboat, ship, sailing ship, head it in any direction and you will be able to make the other side. Down to this narrow, tortuous, difficult passage. And that's quite remarkable. But because you can do this gives you a certain responsibility. If you've got a barge-canal case and you're just able to push things through, boy, that case really has to be carefully handled. Really carefully, carefully handled on this rule – don't stir up more charge than you can handle. Because remember, you won't be able to handle any of the charge you stir up off that barge canal. You won't be able to handle any of it at all, with anything. There will be no process which knocks it back into place. Now, do you get the idea?

So, man, you navigate that one on tiptoe, carefully. You don't suddenly go crashing back there. Bang, bang, bang. You don't expect this chain is going to survive, either. Now, the lower the level of the case, the less incidents you will find per preliminary step. One, two, three and that's about it. Or one. One incident. That's your chain. And after that – after that, your level and your item don't read.

Now, if your level and item – you've run one engram, and that was yesterday, and you ran it with full sonic and visio, and it was dropping a fork at breakfast. And with tremendous relief and case gain and tone arm motion, you erased it. And the name of the chain was, "frightened of having trouble at the table."

Now, you mock it up in your head – you're going to go back there to childhood. You're going to go back there to the days of cannibalism. You're going to go back there to the sacrificial altars of the Aztec civilization. You're going to have a ball, see. No, no. It's an incident of dropping a fork at the table and feeling embarrassed. And you ran it and you erased it.

Now, you can almost diagnose this on the basis of the wilder they sound on the assessment – the weirder they sound on the assessment, the more offbeat on the assessment, the narrower the channel and the less incidents will be on it. Perfectly all right to have, "not wanting to be upset about my Aunt Mary." And the chain is two engrams long. Being spanked by Aunt Mary and hiding Aunt Mary's pills. That's that. Now, after you've got this chain, after you've run an incident – now this is part of your R3R, see – after you've run an incident, test your level. Does it read? Pc had any cognition about it? If it doesn't read and pc's had some kind of a cognition about it, you can't get any response out of this level, this is not the time to go back and find an incident eight hundred trillion trillion trillion trillion trillion years ago, of destroying the physical universe – because Aunt Mary might be in it. [laughter] Because, listen: Having stirred up that charge, you won't be able to handle it.

It doesn't necessarily mean that these charges are all close up to PT. You'll be very surprised sometime to take a case that's got one incident to run, there's one incident and that finishes the chain you have assessed so painfully; and that incident lies at eighty-five trillion trillion years ago. And the incident is two and a half days in duration, and you ran it and flattened it, and the pc had a bit of a cognition, and the level won't read anymore and the item level question doesn't read – that's it! You ask for any more incidents on this chain, you get no read. Well, this is not the time to roll up your sleeve and start sweating to find an imaginary incident by ARC breaking the pc so that he will read on protest when you say "incident." See, that's no time to be a knucklehead. See, pc's real happy they've run this incident – doesn't matter where it was, you understand – they've run this incident, maybe two incidents, maybe three incidents, something like that. The tone arm action suddenly ceases. Your tone arm goes up there at five. Now what? Now what do we do?

Well, we had better find, if we flattened the incident, if there was a GPM in the incident, if we had the right date, and the right duration. If our assessment was right. And if all of those things, squared around, still don't remedy this TA at four and a half or whatever it is, you've got another assessment coming up, right now. You've had your chain.

Now, of course you're thinking basically on the theoretical. Of course, the theoretical as aimed at a 4 or a 3 case level. That theoretical is very simple. The chain ought to run back to basic, and basic ought to be quite a ways back and when you run basic then the later incidents vanish and so forth. All these mechanics are true of the lower case levels.

Now, a misassessment, even on a higher case level is liable to give you a dead end or cul-de-sac; it behaves in the same way. And you straighten it out, consider that you've run the basic on it and unload. Get out of there. You're trying to flatten the chain. And the clue to it is tone arm action. It's not number of incidents, it's not how basic-basic looks, it's not this, it's not that, it's not the other thing. None of these things. None of these things at all. It's, did you run the tone arm action out of it, and to find out if you've run the tone arm action out of something, you then have to find out, make sure, that the tone arm action didn't cease because of one of three things: Wrong date, wrong duration, had a GPM in it. Tone arm action ceased, all right. If the date's right, if the duration's right, there's no GPM in it or if there was it was flattened, and the tone arm is still high and your tone arm action has ceased, then that chain's flat. No other criteria.

You don't have to think yourself to death, trying to figure out is a chain flat. Now let's say you've had five incidents. The way to verify a flattened chain is to make sure that all of the dates you have found were the correct dates, all the durations you've found are the correct durations, the level no longer reads and there's no tone arm action; and one other thing is, you don't get any reaction on asking for another type of incident. Which of course is the same thing as checking your level item. And that's a flattened chain. And that's the only criteria there is to a flattened chain. There is no other criteria at all. I consider that elementary. That's very elementary. And it happens to be very sweepingly true!

If you go into this more positively and more analytically, you can say, "Tone arm action ceased," as opposed to "No tone arm action." Well, "Tone arm action ceased" implies there has been some tone arm action. Well, if you haven't had anything that you could call

tone arm action – you know, you only had an eighth of a division or something like that of shift; when the pc threw the cans down you got an eighth of a division shift, something like this – then you assume these things. That tone arm action wasn't present. Wrong assessment, which consists of wrong level or wrong item; wrong date or wrong duration. Or you collided head-on with a GPM and were too knuckleheaded to ask if it was one. And you've been trying to scan this poor pc through double-firing items. And that will make a tone arm go up and stick every time.

And that's the extent of it. You frankly can't ARC break a pc hard enough to cause a cessation of tone arm action. Isn't that interesting? Actually, an auditor auditing a pc – you know, the auditor as a pc, then becoming a pc – cannot have become sufficiently keyed-in or ARC broke enough to have stopped tone arm action. I think that's an interesting thing to know. I've seen a lot of this. In other words, tone arm action doesn't stop for other reasons. Tone arm action won't even stop because of an ARC break.

Now, I have seen tone arm action stop by trying to run the pattern of the Helatrobus Implants in the Gorilla Implants. But what is that? That breaks down to a wrong date, doesn't it? And I've seen tone arm action come to a sudden and horrendous halt at 5.

You get down to the level of where the goal appears as an oppterm in the Helatrobus Implant pattern and I've seen the tone arm go straight up to 5 – bang. From very good tone arm action. Just stop, right there. Up to that time, why, there was enough charge on the GPM to actually run that wrong a line plot. Your 17 April 63 bulletin, the line plot it gives goes waaaaay back. And a lot of those goals reappear in the Helatrobus Implants. And if you've got a wrong date and you've actually got an earlier goals series, you've got a different pattern.

Well, you mistake the date. You mistake the date. You say, well, you get there, you're so sure it's a Helatrobus Implant – it's "to be alone," you see, or something like that. You're sure it's a Helatrobus Implant, so you date it, cross-eyed fashion, and you get forty-three trillion years ago. You say, "Ha, obviously it's a Helatrobus Implant," so you get this, "'To be alone,' all right, let's get the top oppterm..." Funny enough, the thing will run. It'll run pair after pair. You get some little fire off of them, some kind of fire, the pc is kind of nattery and ARC breaky, you have to scream at the pc every once in a while to get them to random list, or something like this, to get something. You can work at it awfully hard, you know. And you're getting down the line here, and you may not find it out until you get the goal as an oppterm. All of a sudden your tone arm will go *zzzzuuu – clank!* You can almost hear it settle on 5 or something like that. There's now going to be no RR, there's not going to be anything.

And you say, "What do I do?" Well, this is not the time to turn in your thetan. This is a time to look for wrong date, wrong duration, whether or not GPM existed in the incident, see. Now if – if during this entire month, I could only beat, persuade, whisper, cajole these two data – I mean, this – these two data at you, and get you to accept them, I would consider it a very well-spent month. Very well spent. And that is the worse off the case is, the easier you take it. And a high tone arm in running the track results from wrong assessment, wrong date, wrong duration or a GPM present where you suspected none. I've actually said the lot, you understand? Any other data that I can now give you is actually so junior to these screaming truths, you see, that it's something like, "There is the sun," don't you see. And now somebody

brings out a small flashlight, which you get at the dime store and turns it on, and says, "Now, do you see the difference? You see that this light is the same as sunlight, and it is as bright as sunlight." This would be an outright lie, don't you see? This is big stuff that I'm giving you. These two departments are the only departments that are going to get you into any real trouble. And they're going to get you into plenty of trouble if you don't know these things.

Let me give you an idea: You're running this person, and so help me Pete, they've had an enormous win. They've run this engram out at eight trillion years ago. And it's an engram of being executed in some weird way. It'll – pardon me, that's too simple. It'll be, if it's this kind of a case – you can tell the kind of a case because the more – the worse off a case is, the more outrageous the assessments look to you. The weirder the assessments look. This guy – this guy for instance, has – he is – you can't find him on the Prehav Scale, you see, you have to do your own. And so on, and you finally get "leery," see, l-e-e-r-y, as the level. And then you get the item, "Leery of chocolate served at 2 o'clock in the morning in Sweden." You can absolutely count on the fact that you've got a case level 7.

Well, look at the finite time, subject matter, see? It's even got the location in it – it must spot it down on time track so there can't be more than one or two incidents on this subject, you understand? But it doesn't mean that they're necessarily present time. Don't get the idea fixed in your head that because a pc's having a hard time to run, or is having a hard time running, that they only run in modern time, see. Now comes the dangerous part of it.

You do your ordinary magnitude of how long ago this incident is and you turn up something that has horrendous magnitude. See, it's long time ago; and you find this incident and you run this incident and that's it. The incident flattens and so forth. And it has some esoteric aspect, see, like, "Leery of stepping on cat's tails." And the incident took place a hundred billion trillion years ago. And we find some witchcraft society or something, as we would suspect, don't you see? And it's something involved and fantastic – or very ordinary, but there it is, and we clean it up and we have some tone arm action while we're cleaning it up, see. And we don't have any tone arm action, tone arm isn't free or anything, see. But we just don't have any more tone arm action and we can't – bang – find another incident just like that, don't you see. The dating on it, oh, man! – If you did find another incident it would just be, "Is it more than a trillion years ago? I have to repeat that, that was equivocal. More than a trillion years ago? Sorry. Turn this thing up to 128. Is it *more* than a trillion years ago? Yeah. Is it *less* – *less* than a hundred trillion years ago? Well, I didn't get any read there." [laughs] When you find yourself doing that kind of dating, you're mixed up with GPMs, which of course are timeless; that's one of the things, but you're also off the heavy reading chain of the individual. And that you're goi... you could get tone arm action going on with this, don't you see. But it's a hard fight all the way. You've already gone by a lot of charge and so forth. In running a case level 3, you can do this very easily. You can get – you can get a tremendous quantity of charge bypassed.

Case is still making progress, see, case is still sweating it out. You're having ARC breaks and that sort of thing, but the case is still pressing on and so forth and your dating just becomes very microscopic. It's *huuh*. So there's tremendous opportunity to make wrong dates. Well, you've just gone too far up chains without cutting any of the unburdening charge off, see. You've gone by and by and by. And it won't be a secret that you've gone by things. Don't

interpret that, that it's a secret. It's neither unknown to you or the pc. You have just passed by eighteen series trying to get to the first series of these GPMs, see. Well, don't blame yourself if you find your meter very difficult to read at that point. Why is it so difficult to read? One, you're handling GPMs and they are timeless and so are very hard to date anyway, and the other is you've left so much charge on the confounded thing, you've bypassed so much in the interest of economy of auditing time, that you've actually built yourself up a big problem.

And that problem is, is the pc can probably get to it, the pc can probably run it, but the pc is staying in it just about the way a marble would do if put down on the top of a sphere. He just feels that way. He "*Vauh! Heuh!*" Don't – nobody breathe in the session and he'll be able to hold his position on the time track, see. If you breathe out of the wrong nostril, bang! You'll bypass some charge, don't you see. And this is queasy stuff, see. Well, you're already running somebody that is – is being pressed too hard. Well, there's no particular reason why you shouldn't, on a case level 3 or somebody that doesn't have too much trouble. I'm not saying you mustn't do it, on your upper-level cases, but by God, you do it on your lower-level cases and you will be in trouble you will never get the pc out of. You understand me?

So you see, if it can happen in cases that run well and easily – and a good test of the case, does it run easily, does he RR all over the place? Do you get three or four RRs, nice, great big crashing RRs, bang, bang, bang, bang, off a GPM item, see? That case is running like a flying bird, see. Next item, bang, bang, bang, bang, bang, see. Next item, *bong, bong*, see. Case is running poorly, or off-chain, or misassessed or something like that – "All right, give me the next item."

"Absolutably implanted."

"Well, let's see, give me some variations on the item. All right. Anything there been suppressed? Well, let's random list this for a little while. Ah, there's the RR! Ha, ha. Half a dial. Whew. Made it. All right, repeat the item. All right, give me the next item."

Case is running implants that way, boy, watch out. That's all I've got to say. You watch out what charge you stir up on that case without doing anything about it. You watch it! First place, you haven't got the case running in the area of the track the case can run, there's a lot of things wrong with this.

Now, of course, you say to somebody arbitrarily, run the goal "to forget" out of the Helatrobis Implants and to hell with the assessment or anything else, all right. So he can run it and they make it by the skin of their teeth and so forth, and it isn't RRing well and they have an awful time getting the next goal and so forth. Case is still making progress. Case is still making progress.

Now, you assess the case, you're liable to find it's another area that is hot on this case, see. There is a case running badly by gross assessment. See why? Heavy gross assessment. You've seen all this. All right. Now that you've got a preliminary step, there's another way to find GPMs. Did you know that most of your preliminary steps, on a case that's at all advanced, on a case level 4 or 3, your preliminary steps lead inevitably to a GPM. In fact, the preliminary step is about the fastest way to find a goal you ever heard of. Marvelous method of finding a goal. You get "afraid of" or something like that as your level, you see. "Afraid of other people." And, something like that. And everything that this guy – everything this guy's

saying the next session is rocket reading. He says, "Well I had lunch," – rocket read. You'll see this occasionally.

You just do it, just routinely – you're not looking for a GPM and you just date this thing back and you all of a sudden find yourself with the goal "to be alone." What else? And there it is and you say, "Does this thing contain a GPM?" I don't know why you'd say that, but you do – and... All right, let's talk about the way of running these later, the interchangeability of this – I'll mention this in a moment. But you get the items out of the thing and so forth, and that level is flatter than a flounder. Gone. Doesn't read now. Get the idea? It'll take it back to the goal, which is ready to be run. All too many times. See, that's in a case that isn't running badly at all. They go back to it; and some cases that are running rather difficulty. They go sailing right straight back to a certain series of implants and run a specific goal out of a chain. When you get back there, you've got your choice. Are you going to do that whole series, or are you just going to kick out there? It'll very greatly depend on the kind of – the difficulty you had running the case.

If the case was running very easily, you'd amputate the whole series right there. The devil with it. So, it was "to be alone," well, the adjacent ones are probably just as important. And so, just run it all the way through and back. Get the first goal of the series to the last goal of the series and just cut that section of time track, right there – bang. But if this case was having a very hard time in running, I'm afraid we would just stay with the assessment.

And we now test it. We say, "All right, 'fear of being together with other people,'" you know. No read. That's it. Tone arm action has disappeared, everything else. Do a new assessment. You're liable to find yourself with another goal somewhere. Handiest little goal finder you ever heard of in your life happens to be that. If a goal is ready to be run, and if it is a goal necessary to resolve the case, the preliminary step of R3R will find that goal without you doing anything about it at all. All you do is do the ordinary preliminary step. You get the assessment, ask for the first incident to be run on it. Well, maybe you find the first incident and you run that and that's all fine and you ask the next incident to be run and bang, you're sitting right in the middle of a GPM. That was it. That's the one. And you run it and you maybe can find another one. That's an earlier GPM. Same GPM. Repeated earlier. Run it out again. Find out if there's another one. You can't get anything to read, let's get a new assessment. See how you tackle the thing.

You can be far more complicated. Far, far, far more complicated, in auditing, on these upper-level processes. You can just work yourself into a fit. And then you'll drop it back to some idiotic simplicity.

The reason you're having trouble running a case and the reason a case ARC breaks and all of that sort of thing all comes down to wrong assessment, wrong date, wrong duration, or a GPM in the incident you're trying to run. And it's as simple as that. Simple as that. And you can catalog the case out.

Now, you understand that wrong assessment includes something – running something that hasn't been assessed, see. So that makes a wrong assessment. Now, let's say you were able to run out two incidents – you were able to run out a couple of incidents; that's fine. The level no longer reads particularly, so forth. And then you go chasing down the track to some-

where else. Just for the hell of it, one way or the other, you decide to see if there's an earlier incident. And the pc protests – you're trying to find an earlier incident or something, so you start getting reads. In other words, you're being awful complicated. You weren't happy to have flattened the chain, now you're going to find some more on this chain. In other words, you're now, from that point on, running on a wrong assessment. Because you flattened the assessment you've got. And they sometimes flatten with the most fantastic rapidity. Sometimes they run a long time, session after session after session after session after session. If the case is doing pretty well, they will. The case that isn't doing well, they run very briefly.

You almost spend twice as much time assessing in the early stages of a case as you do auditing engrams. Doesn't take any time to run the engram after you've got it assessed. Pc ran it like a startled bird. There was nothing to it. It assessed back to a goal in the Bear Implants, of all places. That's where you landed: "To postulate." And you ran it and boy, you just never saw such RRs. Flying tone arm, and everything is going down, you finish up with that, and complete the thing, and that's it. Level is flat, tone arm action rather tamed down, nothing left on the thing.

Now you decide to see if you can't find an earlier mention of "postulate." Oh, blow your brains out, man, it's much less painful. In other words, you've exceeded – you've exceeded your assessment. So you're now running on a wrong assessment. And the worse off a case is, the more *deadly* this action is.

You run a case level 3, you wouldn't even think there's any deadliness to it at all. You can run all over the confounded track, don't you see. But you take somebody that you *very, very* carefully had to run and you flattened the level the pc was on and you got rid of the GPM and you got everything all squared around and everything was fine and all was well... You shouldn't repeat that goal "to postulate" – it's pretty early. Anyway, you got all the way back to whatever you got and that was the end of the chain.

Now, it never occurs to you to test the level. Look at your TA to find out if it's going to run. And you run two engrams further with no TA action, no gain of case, tremendous difficulty in dating, fantastic difficulty in getting the right duration. Well, my God, you have enough trouble getting the right duration, without trying to get the duration of a chain that isn't available to be run. From there on, you see, you're just manufacturing trouble for yourself. And there's more and more and more trouble.

Now, you see in the first place you're trying to shoot the moon. Well, the moon, the devil – you're trying to shoot this universe with the pc, as far as this. Of course you know, you can – you can do other things with these routines on a run-of-the-mill pc. In fact, that's very fine. This pc's got sciatica, and you want to do something about their sciatica or something like that, you run these processes. You'll see something very interesting. You'll see their sciatica disappear one chain later or something like that. Then have enough sense to get out of it, because his level was sciatica. He doesn't have any desire of attainment beyond this particular point. And although he will swing around into it, he can get awfully drowned trying to read-just his sights.

Maybe he's trying awfully hard to be normal. And you tell him you're going to make superman out of him, see. I'm afraid this is not very agreeable. He knows that's dangerous. Well, you're just running bypassed charge like crazy, you see?

So that doesn't say that you shouldn't run GPMs and R3R on cases that want only limited gains, but it's saying you can use them to attain limited gains. Remember there, particularly it applies when you flatten the chain, consider you flattened the chain. Don't go ramming on around all over the place and *boomity-bang*, up one side and down the other, tearing all over the track and getting the chain going, and it's still hotter than a pistol and abandoning it, and going on to something else.

Well, all this is all nonsense to handle a case in that particular fashion. But the worse off a case is, why, the more it moves from nonsense to murder. Case is in real rough shape. Can't run very much. Why, man, you're muddying up that one little, tiny, silver thread that you could get through the mess. And it has to be done accordingly. And the pc says, "Oh, I think there's a bunch of stuff here, at a hundred skillion billion quadrillion years. Yes, I heard this date; it's times ten to the nth is the proper date and so forth, and we really ought to run that, because that's very interesting, I'm sure. Because I was God then, and I..."

There's one question you should ask. Is it on your assessed chain? It's perfectly all right for you to indicate it, or date it for the pc or something like that, but even that gets very queasy. Because they don't date or duration well. And you just added an ample opportunity to make a wrong date and wrong duration, haven't you? So I'm afraid I'd sit and listen to all that, and give him a cheery aye, aye. And I'd follow it carefully. And when I wasn't getting tone arm action on the chain, when I wasn't easily able to ask the question and get a response: "All right, is there another incident on this chain?" and we get no reaction, and so forth, well, I'm afraid that I would not run the risk.

Oh, if this pc could run everything like – from one end of the track to the other, with only a mild level of agony or something like that, but your meter was reading; you had no trouble getting TA action and so forth and he said, "There's an incident sitting back here at eighty skrillion skrillion billion years," and so forth, "and I'm looking straight at it and it has something to do with the chain that we were running, but I don't think it has very much. And I'd like to run this." I'm afraid I might be very guilty of Q and Aing with him and let him run it. I might not do anything more than that, you understand, because I know it isn't going to damage him. It isn't going to spoil his case; it isn't going to upset anything.

But little girl I'm auditing, trying to get over her blind staggers that she gets every once in a while, and she has an awful lot of trouble sitting in session or holding the cans or has an awful lot of trouble concentrating, and difficult – doesn't answer auditing questions well, tone arm action's sort of minimal – and probably ought to be on the CCHs anyway. I'm running an engram on this character and I've got a chain and I've flattened this chain; I can't get any response from the level or the item now. Person starts giving me a big sales talk about being the princess Zazu, in the lower Archipelagian peninsula eight lives ago, I'm afraid I would give them an awful cheery aye, aye and assess a new chain. I just would not take the chance. I just wouldn't take the chance, that's all.

And when I can't find an incident easily and I can't find a duration easily, then I'm very careful to get the proper date of what I am looking for, even though it's impossible, you understand? And I'm awfully careful to get the right duration to what I'm looking for, all the time cursing to myself that I ever *asked* the ruddy question in the first place. See, I've got an incident half-found, and I can't really date it, can't really duration. I know now what's happened. I haven't departed from the chain. No, there's no esoteric, weird or strange or exotic reasons. The chain is flat. I am looking in a completely clean ballpark for a nonexistent baseball. There's none there. And that's why I'm having a lot of trouble.

I can get vaguely associated things, see? Vaguely connected things. Very tiny connections. Yeah, I can get them to read, I can make a meter talk, I can get the pc interested, and I can get him restimulated, I can run something of the sort. But inevitably, after I've gone to all this work and so forth, my tone arm continues to sit there at four and a half and doesn't move and I shouldn't have been there in the first place.

The way you create work for yourself as an auditor is doing things you shouldn't be doing. And if you persist in this course, you will be a very hard-worked, worried auditor. I can guarantee that the labor that you will go to is utter slavery. You're always doing things that you shouldn't have been doing in the first place, then you will always have things to do that nobody can do. And you just cut yourself out the most cluttered-up career you ever heard of.

Now, when you're shooting anything like R3R, 3N, you're shooting the whole track. And brother, that is the whole track. Now, there's good news on this: I actually was able to attain a period on the whole track for a half an hour or something like this, where there was a total cutout of all mass of all GPMs which followed after. In other words, I did a complete thing. I was sitting there for about half an hour or something like that, with no GPM mass of any kind whatsoever. That's rather fantastic in that there's several thousand GPMs, see.

We had a wrong date and a wrong duration and I skidded on the track shortly after that. We got a wrong date and a wrong duration on something or other, accidentally, by mixing 3N and R3R. Now, in the middle of 3N, you give an R3R command, I can tell you that it is dynamite. These are two separate processes. And the commands of 3N are quite different from the commands of R3R, but the two processes mix. They mix. This isn't – it sounds to me like I ran into a catastrophe. I didn't run into any catastrophe, I'm just saying I slid back down the track after a while. But it was a rather remarkable feeling to have no GPM mass of any kind whatsoever, you know, and all you had to do was put your foot against the back of your head, and if you gave a push you'd probably not only knock your body through the wall in front of you, you – see, but you'd probably knock down the wall back of you. I've had some interesting experiences recently as a pc exterior, or cleared up along certain channels. These are quite interesting experiences. Rather rough on this body, but I'm not worried about that. Mock myself up another one shortly.

Anyway, the point I'm making here is that there is a point on the track, unbelievable though it may seem, where you can actually get back of and find the basic of all GPMs. I've hit that point. I haven't got it so I can hold it steady, because there's too many GPMs following it. But by discharging those GPMs which have been bypassed and straightened up and so

forth and getting those things shucked off... Got there, by the way, by keying out. I found a little trick method of keying out whole GPMs. When I approached the area and I could hear the distant firing of items, why, I just ran those distant firing of items and it keyed off that, see, so therefore I had the earlier GPM. And then I'd pick out of it the distant firing of items, the moment when I would first approach the area and could hear those items firing, I'd say, "Oh, it's this again." And the very fact that I was saying, "again" keyed me up to the point that I already had an incident on it. So, you see, I'd find in that incident the distant firing of items.

All of a sudden found myself sitting at the beginning of all GPMs. And then, of course, having reached it in that illegal fashion, don't consider it strange that about half an hour later with a slight – just a slight auditing error, why, the roof fell in. But it's easy to get back there again; there's nothing to that. All we got to do is discharge some of those things that I carefully keyed out. Very trick method. I've had an awful time recently working out the most vicious series of GPMs on the track. And they're way back. And they've got an invisible picture – they've got five pictures, but one of the pictures is – the first one is invisible. So that you get twenty items firing at you; there are four different items, they fire twenty times. The group of four fires five times as a group which gives you twenty RIs. And then you get twenty RIs with picture one, twenty RIs – same ones – with picture two, twenty RIs with picture three, twenty RIs with picture four, twenty RIs with picture five, you see. Very simple. There's no goal connected with them. Back earlier than when somebody dreamed up the idea of goal, see. And just – they're just opposing items in dichotomy. Positive, negative and a dichotomy, see, like "wake" and "sleep," see. "Wake – never wake, sleep – never sleep." That makes you a dichotomy, don't you see, but also makes you a positive-negative. Nice package.

Well, that fires five times in a row for each picture. This thing was driving me batty; I just couldn't figure this thing out. And I had – ran into myself on the track trying to figure this out. And I had given up. Ages and ages ago I had given up trying to figure this thing out. I just finally went smack, smacked them all together and hoped I wouldn't be bothered with it, you know? [laughter] And then got caught in the mass of the smack.

Anyway, this took us two sessions to get these things unwound. And we had to run enough of them and get them enough discharged and so forth. And I finally got the thing unwound. And the first picture's invisible! It's a picture, but it's a picture of invisibility. So of course, you always afterwards tried to put a picture there. And there are twenty firing items that could never be run. And you could think you could run it out, don't you see, but you can't run it out because the first picture is always missing. And that's the basic on it, so the rest of the fires are therefore reinforced by the presence of the basic and they won't discharge either, they'll just charge up again. It makes a vacuum. You try to put pictures there and your whole bank starts pouring into this and this is why a GPM afterwards tends to accumulate pictures. Even a simple GPM tries to accumulate pictures after that. Because you get in the habit of it.

You've got this missing picture. "What's there," see? "What's there?" And you just get pictures, pictures, pictures, pictures. *Bah!* Went through about two sessions trying to unsnarl this thing. Finally, oh, my God, of course! It's an invisible picture! That was it. Followed by four very nice pictures, you see. And the trick is – and the reason the GPMs wouldn't discharge fully – is because of those twenty RIs sitting in front of that invisible picture, right up to the front of the parade, see. If you can't get the basic off the items, why, what can you do?

And I finally couldn't figure out which is the first pair. How do you get the first two firings? Because all the rest of them are supported on these two firings. On each new goal c... or each new GPM combination, see.

And I finally found that there was a click in the floor occurred as they stopped you to get the business. In other words, there was a little dog on the track, so when they moved you into position for the first picture, you got that click. See? And I could perceive the click, and I'd get the instant of the click, and then of course, give the first two and then the next two, very rapidly. And move myself back and move up to the click, see, and then get the first and second two. All of a sudden the whole lot fell apart. Got basic off of it by reason of the fact that there was an additional different sound, invisible picture or no invisible picture. There was just that tiny difference outstanding. So you could find the first two items. Very rough. Very rough.

You've heard about vacuums, well, this is the vacuum. That was the vacuum. And that's – holds the whole bank together, and I could see my bank shred way out, a light-year or two, you see, just start going off in shreds. Pieces of it could suddenly no longer support themselves – you know, just going. Just disappearing. Because this is fundamental on the install-type GPMs, you see. Even though I hadn't run the first of the chain it was falling apart. When I ran this one last night, I could hear the items releasing all the way toward present time, see. I could hear these items going on and GPMs coming apart, you see. Every place I had found a basic pair, why, through the GPM series you could hear these things go off, see – no longer supporting, I mean everything's getting sort of – well you know, like Kleenex. It's all tearing apart. Up to that time, it's the difference between Kleenex and solid steel. Nothing could dent it, up to then. Rather remarkable experience.

Well now, of course, I'm actually to some degree running over my head doing this sort of thing, by skipping a series of sixty – a series of sixty – not sixty GPMs but sixty serieses of GPMs, you see – without touching any part of them. And then cutting in ahead of this and then just cutting enough off of that, you see, to make it possible to go a little bit earlier. And of course the moment that – moment a pin dropped, why you can expect that bypassed charge to hit you with a thud. But it's all right, I can take it.

You do this thing to somebody that you don't get any tone arm action on, something like that, you don't clean up where you were going, you don't straighten up what you've got, you're not very thorough and very workmanlike on the thing, he'd just spin, man, he'd just spin right where he sits.

Take this little girl and she's totally capable of running a time when she stuck her tongue out at her teacher. And you say, "Well, we've gone that far, let's run out her past death." Oh, well, yes, you can get the past death on the meter, but you haven't assessed for it. You can get a little, vague tick and you follow this down, you very, very carefully date it. You can't read the meter, but you date it somehow or another. The next thing you know, why you've got her right in the middle of roaring brimstone. Your technology has been able totally to overthrow or overwhelm the pc. You're good enough so that you can turn his bank loose on him, or turn her bank loose on her. She'll just practically spin. *Baww!* Key out in four or five days, we hope.

What have you done, you see? Here was a case that couldn't run – couldn't run anything. A little Straightwire or something like that, about all the case can stand. And you slammed him in on a big charge. Well, because the case – such a case is always in desperate condition, some auditors, unfortunately, will Q-and-A and get the idea that you'd better find a desperate engram. These desperate conditions are very hard to remain as desperate conditions. Sometimes you can straightwire them right out of existence. Desperate conditions are very easy to handle. I know, we've got a couple of boys in class here that have been in mental hospitals handling people and that sort of thing. And they've always seen this Q and A. Patient is being desperate, so you do something desperate, see?

Well, there's no wins along that line; the only thing you can do is knock the guy down into apathy, see. It's a therapy comparable to hitting somebody in the jaw because they are too excited, see. If it were only that light, that would be all right. But they cut out their prefrontal lobes and do other interesting things to these people.

But the point – the point I'm making here is, is if you could get one of those desperate people to get just one origin on your part, like "Hello," and they really heard it and really saw you, or if you could get them to find one real object in the room, that desperate condition tends to evaporate. It's very hard to maintain this desperate condition. And it's little feather touches that knocks it apart. Similarly, in handling R3R and 3N, you have got to pay attention to the fact that you're using tools that are capable of just jack hammering their way through solid concrete forty feet thick, don't you see. Take it easy – take it easy.

Now, you see that your pc is ARC breaking heavily and hard and that sort of thing, always assume that you've gone just a little bit too steep. Regardless of the fact that you can find the ARC break. You've run your R3R too steep or you've run your 3N too steep. You've bypassed too many goals, don't you see. You knew you were bypassing some, but you've just bypassed too many. You haven't unburdened the track. You know that you've got several half-discharged GPMs scattered up and down the track that you just left or something like this. Well take it easy, man, go back and finish those things up.

See, pc is just going "*Ylaahh*." You know, you've stretched it too thin. It's always all right to push a pc a little bit heavier than they can go, you understand? But you can also push them at acceleration of the speed of light, don't you see? It's just a little bit faster than anything could go. And the worse off a case is, the more they can be pushed in over their heads. You've got to be careful about this. ARC break is a marvelous method of handling this. ARC break is a marvelous test. Pc is ARC breaking, consistently and continually, in spite of careful auditing, so don't blame yourself as an auditor all the time. You know you're not all that bad. The only thing that you're bad about is you don't – you don't make a careful appreciation of your cases. The only other thing that's been poor is not all the technology has been in your hands so that you could.

But the point I'm making here is the ARC break is a wonderful test. Not if the pc ARC breaks once or the pc ARC breaks twice or something like that. So that doesn't mean anything. Carry on, see. There's a lot of time being spent on ARC breaks and there's a lot of upset because of ARC breaks and that sort of thing. It doesn't necessarily mean you're running too high a process. Don't always translate it into that. But it means you're running the process

you're running too doggone steep. That's all that means. You're trying to run Helatrobus Implants on this person. And they're ARC breaking all over the place. Well, obviously there must be a chain there of not-unburdened GPMs or incidents of some kind or another that lead to the Helatrobus Implants. You must be running Helatrobus Implants at a point they can't be run. Not necessarily that you've got to run stuff later on the track, or earlier on the track, you understand, but there is material there that should be unburdened before you come near the Helatrobus Implants. So you're obviously going past charge. Different than bypassing charge. You're leaving known charge someplace else. You're not finishing up something. Or charge exists someplace else. Because otherwise, look: It wouldn't go into restimulation if it didn't exist. And if the pc wasn't to some degree trying to run it, it wouldn't go into restimulation, right? And if the pc's bonging around on the time track like a Ping-Pong ball and so forth, something's pushing him. Well, what's pushing him? Too much charge, of course.

So the thing to do – the thing to do if you're running a pc on arbitrary actions like 3N, Helatrobus, Implants, pc ARC breaking heavily, RR very hard to get – the thing to do is to do a preliminary step assessment. It may lead you to an entirely different GPM; or it might lead you to a specific GPM in the Helatrobus Implants that you've missed. Or it might lead you much earlier on the track or it might lead you much later on the track or it might lead you to a dental operation in this life that looked just like the Helatrobus, Implants. You're not quite sure what it'll lead you to, but it will for sure give you what should be unburdened so the pc will run well.

And there is really no excuse for running a pc not well. Let me interpret that again: There is no excuse for running a pc poorly or having an awful hard time running a pc. See, there's no real excuse for this. I let you do it; it's good for you. You run a pc the hard way, you'll sure be able to run one the easy way!

But you set a pc into a channel for which the pc has tolerance, and the pc'll run like a doll buggy. Any pc will run well, providing you run the pc on the available channel. But the worse off a pc is, is the less available channels they are, and the trickier it is to find the available channel, you got that? And then the less careless you can be in running that channel.

It's actually quite a joy to run R3R and 3N. There is no real difficulty running them, right up to the moment when you're handling somebody just a little bit too far. A little bit too rough. It's just a little bit beyond them. All right, the way to compensate for that thing is by careful and continuous assessment. And watch it, when you've got – the TA suddenly goes motionless – you ran one engram, TA went motionless, all right, that's good. Let's make sure that you *had* the right assessment. Well, that's beyond the point now, it's too late, isn't it? You've already run an engram. Did you have the right date? Is the final duration correct? This is all all right. Was there a GPM in it? No, there's no GPM in it. Well, what have you got left? You've got a new assessment.

Now, also – also, pcs who peel off into special categories or aren't easy to assess on the standard scale and so forth, well, you can always get them to do a scale, don't you see, and assess them on that scale. In other words, you complete the Prehav Scale and you'll get the pc's level. Very often it isn't just necessarily a low case you have to do this with; you sometimes have to do it with other cases, too.

Pc wouldn't think of these levels, by the way, is why you have that scale at all. But if they don't obviously live at some level on that scale, no sweat to find it, don't you see? If they don't obviously live somewhere on that. For instance, the tape you heard last week was, in actual fact, a research tape, to establish this point. How hard could you work to make a level stay in, don't you see? And they don't stay in, that's all. They're gone. So you'll have to do yourself another – another list, because you didn't have any level the pc could be found on. So if the level isn't obvious, if the pc doesn't cognite, if the tone arm doesn't blow down, if this isn't a God-awful wonderful level, why are you straining at it? Get the pc to add to the Prehav Scale and assess him on that level. Got the notion on the thing?

And you'll get these things. You'll see a level there, pc says, "Oh!" you know, "My God, how did I ever miss that, man?" You'll see the tone arm go down, you'll also see a very successful chain come off of it and so forth. All of these things add up to the fact that auditing is as easy – type of auditing you are doing is as easy as you assess, as easy as you prepare a case. Auditing is as easy to do as it is real to the pc. And you run types of auditing which is unreal to the pc, you're going to be in trouble all the way. All the way.

Okay, I've talked to you for a long time, but I considered the subject was fairly important.

Thank you very much.

DATING

A lecture given on 17 July 1963

Thank you.

Well, you had your demonstration last week, so I thought I'd better give you a talk this week on the subject of meters, and so forth. This is what?

Audience: 1 7th.

Thank you! Thank you. All right, 17th of July, AD 13, Saint Hill Special Briefing Course. The subject of this lecture happens to be dating.

We haven't had any material on dating for some time. And the situation is a lot grimmer than it looks, on the subject of dating and the need for accuracy in dating. Accuracy in dating is the single most important function of the auditor. Period. Single most important function of the auditor. And I'll tell you why and you might be very intrigued with this.

Since October, last year, I've been engaged in a study of unusual intensity. We took a new departure on the subject of auditing when we went into Routine 3 on the subject of goals. Took a very long time to sort that out – took a couple of years, actually – and to find out that all of these mental phenomena and so on come down to the time track and engrams. Now, we had already been over this in 1950 – the difficulties of running time track, and so on, consisted of the number of cases, mostly, the number of cases who could not do it. We had lots of cases who couldn't run on the time track and run through engrams and erase engrams and that sort of thing.

So therefore, a vast number of years were spent in accumulating evidence and data on the subject of, well, case improvement without running the time track, and so on. But a great many years were spent in that and they were not ill-spent. We have tremendous numbers of processes of one kind or another which accomplish these things.

In October it became apparent that something else was at work here on the subject of the time track, that the time track – well, the time track started to swing in with greater and greater importance right up to the time when it was discovered that the GPM was an implant and that its items were all implanted.

Now, at that point – at that point, whatever the date of that was – a great decision had to be made here – a big find-out. We had to discover whether or not an individual could go clear and get out of the mud, again, without running the time track and engrams. And recently I saw a perception on the subject and it made it possible for people to run engrams and etc., on the time track.

Now, all this boils down to is this: The problem is very serious when you realize this one little point here. Already had a great deal of experience of failure on trying to run people

on the time track. Great deal of failure attends this, you see. Nineteen fifty, I never ran into cases that couldn't run engrams up till the time I started to teach people to audit, and that sort of thing. And then cases started showing up that couldn't run engrams and they amounted to a considerable percentage of the number of cases presented themselves.

I've always gone on an "all" basis. There's no particular reason to leave – to leave Pete behind, you see, just because of some peculiarity that Pete has that Joe and Bill don't have, don't you see? So therefore, you'll realize the seriousness of the situation when I tell you that a few weeks ago I sat down and had to consider this, this one point: Was it possible that only about 50 percent of the people around could be moved through to OT? I actually had to consider this point. I'd never considered it before. I had just gone ahead on the basis of, well, we just will do it, don't you see? But I had gotten down to a point where I had me doubts! And I would say, since October, we have been through very harrying, harassing and upsetting re-search channels. These have been very rough, very rough.

And they've been made very rough by the fact that I had to catalyze research and do it far more rapidly per unit of time than it had been done before because of the – a review of the situation demonstrated that we didn't have much time left. This was quite obvious to me. We just didn't have much time left. That was proven, by the way, in January when the attack was made on Scientology in the United States; and we've gone ahead on that.

But my answer to that situation was (1) hold the line legally and impede the progress, and even win if possible, but not go into a complete spin on the subject and just fight that battle on that line, you see? And (2) make OTs and get this job wrapped up in an awful hurry. You understand? Bypass the state of Clear and move into the state of OT. You see, Clear is a comfortable, human end product. I must tell you why this is that way. A Clear has no difficulty living around or society has no difficulty accepting this state of Clear. He has no difficulty living around human beings. You get the idea.

He's still carrying along. He simply is not aberrated in the state he is in at the human level. You understand?

Well, OT: that is something else. That is something else. That's probably the difference between making a playground supervisor and a commando – if you want to go at it militarily, see? And if – it isn't that we needed this desperately, but it was the only possible answer for two reasons. We had to wrap the whole thing up all the way. There wouldn't be any comfortable margin of after we'd wrapped up Clear nicely then go ahead and wrap up OT. See, we didn't have that comfortable margin – had suddenly been cost us – and we had to go straight ahead and wrap up the problems of OT just like that.

Well, this is an awful steep hill to climb. If you listen to lectures and read papers and that sort of thing of mine, of ten years ago, you'll find me saying, "Well, we don't know much about the ways to OT," and occasionally I'd release a little process, probably an OT process, you know. This – little comments. I'd reply to letters, "How do you make an OT" "Well, we'll find out in due time," you see. It's a comfortable state of mind.

That comfortable state of mind shifted. It had to shift. The two bases on which I was basing the future survival of Scientology, and your personal future, was just this: We'll hold the line legally and do all we can along that line, but put all of our strength and action and so

forth over into the technical line. And push it forward on research right up to the point of Operating Thetan with no way stops of any kind. We'll just wipe them out. We won't talk about them any more particularly. We'll say – well, if somebody's running a goal out, we'll just call him, courteously, he's a one-goal Clear, see, ten-goal Clear – we don't care, see?

Now, you can apply that to R3R. You can run a chain out of somebody he's a one-chain Clear, see? Different kind of Clear. You'll find out that'll hold good. But the point I'm making here is all that got bypassed. I've had to accelerate this up to a tremendous level.

Now, when you start accelerating research to this degree, you're going to make problems because you've taken time out of the places where you need time. And right away you get lots of problems. So I had to wrap this up in a hurry. And I believe in the last few months, the work which I've done in the last few months, per unit of time, exceeds anything I've ever attempted. And I've slowed down you, as far as that's concerned. I haven't let some of you out of here, and so forth, until I felt that there was – that you would have something to operate with stably, and so forth. It wasn't that I needed your case for research. It was that I needed you out there with a fairly stable attitude of what you were going to do, you see?

I let some go because they could run GPMs and they had an idea of how to do this, and so forth, and they could audit basically and they could handle meters and stuff of this character, and so that was all right with me, knowing they could catch up with it. Remember there were a couple of problems that weren't solved.

And one of those problems was the most basic problem: Do we sit still and say, "All right, some people can go to OT and some can't?" Is that the way we handle this? No, I'm afraid the psychologist, the psychiatrist, the Pavlovist, I'm afraid they'd handle it this way, with all too much glee. But I didn't care to handle the problem like that. But I was almost beaten to my knees on this particular line because this horrible fact had emerged – I'd suspected it but it had emerged in all of its grisly visage: If you can't run the time track, you'll never get to OT. That's it.

Well, that's pretty grim. Now, I'd already found out that all you had to do with R3R – which is what makes R3R R3R – all you have to do is get the right chain, get the right date, get the right duration and the person will have visio and even sonic, and so forth, on the chain. Now, this was a fabulous discovery. But I'd already made that discovery when I'd gone into the blues on the subject and wondered if 50 percent wouldn't be left behind anyway. So that discovery didn't make all that difference.

You can run an engram on almost anybody if you've got the right chain and the right date and the right duration, as far as sonic and visio is concerned. Ah, but there was one more impeding factor: Could you run it with tone arm action?

Now, let's go back and look this over. If an individual – if an individual is going to make case progress – this has already been established, you see – this individual's going to make case progress that is real to the individual, it will be in the presence of tone arm action. Tone arm action is the key to all of this. That's very important. He maybe can run an engram, you understand, but if he can't run an engram with tone arm action he's not blowing any charge and his reality will not improve. If his reality doesn't improve he can't go any earlier on the track. He isn't making any case gains. No tone arm action – no case gain.

So the bug in running engrams was not just forcing people along a certain chain where they had sonic and visio if they had the right duration – and you'll always get it, I don't care if the guy has a black field or anything else, you get the right duration of something, he's got pictures. I mean, we've got that whipped. But can he do it with tone arm action? There was this one other bug which I, of course, knew nothing about in 1950 – one other bug: Could he do it and blow charge or were you just going to go on endlessly stirring up the muck?

No tone arm action – you're just going on endlessly stirring up the muck. Oh, you can release some somatics and you can do some various things. It doesn't look terribly grim, except the case isn't really making any progress. You want to know the test? You look through a case that is running engrams, and we have some on record, and they setting – they're setting the same goals for every consecutive session. They never change their goals for the session. You look at the gains. They're just lukewarm gains. There's how you'd sniff 'em out, and there they go. Watch the pc – we know this of old – who sets the same goals every session. You get no change of goals; you get no change of case. I don't care what you're doing with a case. I don't care how much time track the fellow is running; and that coordinates with no tone arm action. No tone arm action – no change of goals. Case isn't blowing charge. No tone arm action.

So it comes down to not does the person have sonic and visio, but does the person have tone arm action? He must also, of course, have sonic or visio or something, you see, in running the engram... I give you... to improve – they nearly always had visio. Sonic is not very vital to run an engram with. They must be able to move through it. But if they're moving through these engrams, with no tone arm action, you are not getting a case improvement. And that was what caused me to sit down and say, "Well, are we going to leave 50 of – 50 percent of them behind?" No tone arm action. Couldn't produce tone arm action. Yes, we could go back – go back on the case to a lower level process; to reach and withdraw, to this and that, and hope that it got enough tone arm action and blew enough stuff off so that sooner or later the fellow could run an engram with tone arm action, see? Well, let me tell you something; that is just a thin hope. You understand that? That's a thin hope. Oh, you can improve him as a being. But that's the route to Clear, not the route to OT.

You can key out a Clear this way. He'll go free needle and everything else. It's quite interesting. We abandoned these Keyed-Out Clears, and so forth. They postulate themselves into the soup anywhere between one and three, four, five years afterwards. So the devil with it. That wasn't doing us any good. Made them feel fine, and all that, and they'd never be so bad off again, and all this sort of thing. But these are human goals. See? Guy now doesn't have lumbosis. So what? Do you think not having lumbosis or being able to cure lumbosis is going to put you any place into a position where the United States government won't be able to spit on you every twenty-four hours? Let me tell you, no.

A government that is so minded as to produce an appropriation of sixteen billion dollars for men who can do nothing except butcher their fellow man, is not going to be held off with feathers. That's not going to be held off by being good little boys and girls. You understand. That's not the way to fight that battle. You understand? If you say, "Well, all right, all right, other organizations have done it." No. This world is going into a very interesting rolly coaster slide. It's going down, man. It's going fast.

The ethical level of government, these various other factors that you see, the preponderance of weapons, the little sense being used – look for a new solution. Look for a new solution in international affairs. Just to give you an idea of it – I kept an apartment up in London for some time and I hadn't been up there for about a year. It's closed now. But I hadn't been up there for about a year and a man taking care of it had laid out some magazines: *Time*, *Life*, junk like this. And I went up there – I hadn't been up there for about a year. I'm trying to get myself in condition, you know, to stand the smog, smoke and fire, carbon monoxide, you know. And I got myself in condition and went up for a visit to London.

Anyway, I sat down in this apartment and I was waiting for somebody. I picked up a magazine to see what was going on in the world. And I read the magazine. It was all about Red China and about atomic conferences and Geneva, and all this. And I said, well, same things are going on, and then with great shock I suddenly realized I was reading a magazine which was about eighteen months old. There hadn't been any change in international affairs in eighteen months – same news. I don't know why they publish new editions.

That's an interesting thing. You're looking for new solutions, you won't get a change in international situation unless you get some new solutions around some place. They're still discussing the same things. The only new news you're getting is a few more riots, a few more conference failures, don't you see? And when you're used to reading the time track to predict, such as I am, you read that kind of thing with a "Oh?" and you can draw a pretty accurate estimate of about how long it's going to go. And there's no new factor in the world but us.

Now, that's a very interesting, maybe a self-centered or maybe a stupid adjudication or maybe it's this. You could criticize it from a number of lines but it still holds true. It still holds true and I see no slightest chance of the Scientologist in the United States going on the way he is going. I see no slightest chance at all unless some other factor is entered into the situation which reverses the tide. He'd either have to be able to get very spectacular case results or he will be able – have to be able to – and even that isn't good enough – produce a spectacular being. One or the other in order for the situation to imbalance and be resolved.

Now that's a pretty sobering estimate of the situation. And yet it's a coldblooded estimate of the situation. It isn't a hopeful, propagandist estimate of the situation. If I wanted to propagandize you I certainly would be able to do so, never doubt that. But I don't. I usually tell you the truth. Sometimes it's very unpalatable. But as far as I could tell, this was about the only way we could meet the situation.

Now, all that background music I'm giving you right there is – just shows you that we were at a serious crisis. Because without tone arm action, even though the person could run the track, he would never make the grade.

Well, this is pretty heroic to get it sorted down that well. I got it sorted out to where he could run the track with perception. And then got it sorted out to the fact that you – if you didn't get tone arm action it didn't do any good to run the track, even with perception. See, this is getting more and more interesting because it's an isolated point. Now, give this point, tone arm action, the stress that it deserves. Without tone arm action you do not make any case progress, period! Give that – give that the stress that it deserves. You wake up to that and don't you go around looking hopeful.

The reason I haven't lowered the boom on this, particularly, because I didn't want to throw you into the doldrums because I thought I'd probably lick – be able to lick the problem and wrap it up. And I have. So I can lower the boom on this other fact. And that fact is you process somebody without tone arm action and you might as well take him for a walk in the park! It'd probably be more therapeutic. See, it's that important to have that old tone arm waggling!

I won't go into what is tone arm action; there's a bulletin on it. It still holds good. Good tone arm action, poor tone arm action, no tone arm action; these things have all been classified. That tone arm there tells you how much mass you are discharging off the reactive bank. And when that thing isn't wiggling, you're not discharging any mass off the reactive bank. And that is all there is to it.

So my problem then became, and has been with me now for many weeks, horribly – a haunting nightmare of a problem: What is tone arm action when it's absent? Not what is tone arm action. We know that. But what is *no* tone arm action? What is no tone arm action? Now, my God, if it's assumed, the importance of the fact that you've got to drop 50 percent of the people you process just because they don't get tone arm action – regardless of what else they do while running engrams – that becomes a very important question. What is no tone arm action? Wow! And boy, if that hasn't been a conundrum!

Well, I've been able to sort it out. I've been able to sort it out to this degree – it's sorted out. I won't – it isn't a modified sort-out, it has been sorted out: The tone arm action disappears off a case to the degree that time is in error. And there is the answer. This is very important and this wraps up an awful lot of packages for you.

Tone arm action does not cease because you've run a wrong goal. That's quite interesting. It'll slow down and monk up because you fail to run out a GPM, because of this, because of that, because of something else. No, it doesn't cease because of these things. Oddly enough it doesn't cease because of ARC breaks. You may think it might cease because of ARC breaks – only because it accidentally falls over also into the other time consideration. ARC breaks are mostly caused by wrong time, you see, so you could have read that reversewise.

The old Dianetic Axiom, "time is the single source of human aberration" could have stood a lot more punch-up. I knew it was true, but I knew a lot of other things were true. That's the truth! You get the difference between, you know "We know it was true." "*That's the truth!*" See? Time is the single source of aberration. The GPM is totally devoted to scrambling somebody's time. The double-firing items. So if you can't get the GPMs off the case, if you can't get those particular engrams off the case, the guy will never make it. They are geared 100 percent to be aberrative.

By the way, they're very hard to date. And you want to know where dating is in this, I'm going – I'm talking to you about dating right now – time. Now, one of the things that your pc who is – hasn't got any sonic and very little visio – one of the reasons he can't get a rocket read, and probably the chief one, is because he never contacts the speed of the item or the fire. He never contacts it and so he gets very poor rocket reads on the thing. You know how one of those things sound? I won't use one here that is very aberrative. Because, it'll stir you up.

Let me think of something. We'll use "spat" as the goal and we'll use "nonsensically" as the part of it. So with "nonsensically spat" as the RI, we actually get something like this: "Ppppppffffffsssssss!! Crack! Nonsensically spat." [the last two words are spoken extremely slowly and in a dull voice]

That's the way a GPM sounds all the way up the track. That's a hissing type on the earlier track from the Helatrobus. The Helatrobus goes: "Crack! Nonsensically spat. Clang!" ["nonsensically spat" are spoken in the same way as before] They put a clang in after it to make you think that a pellet has hit the other pole and you've been shot at.

A lot of you have been run on these things and didn't know that, did you? Running them without sonic. Now how does a pc normally react to this? How did a thetan normally react to this – particularly the hissing type which is earlier and more germane to a thetan – the "pppppffffffsssssss! Nonsensically spat." And he'd just go, "Geek! Why doesn't it get over with?" See? So part of your aberrative factor is he's rushing it. Have you ever had a pc get very, very, very speedy on the GPMs, you know? Speedy? You know? Trying to get it off in a hurry! Get another one off in a hurry! Give him four items at once! You know? Did you ever have anybody doing this? Well, that person is just dramatizing the natural reaction to this, man! It feels – in the incident it felt like he was walking under water at enormous restraint, see? And he's just going mad! Why can't this thing get over with? Because he's a fast – he's a fast cookie, see?

The double-firing principle of item one versus item two – this double-firing principle again messed it all up. It hung him up in time, don't you see, because it gave a positive-negative charge to two opposing sentiments. It hit him from the right and it hit him from the left. And made him feel like he couldn't move, but that he had to move to get out of the way of it. And he'd get into all kinds of time scrambles. The total purpose of the GPM was to scramble time. This is represented by the fact that they're the hardest engrams to date. They float. They float in time, and they're based on the problems activities I was talking to you about. All the rationale of the GPM, as given in early lectures on the subject, and so on, is all valid. These things are all the laws of life. They're not the laws of GPMs. I had to figure them out and synthesize them, then I found out somebody else had taken a shadow of this thing, and they'd made false ones all over the track. And that was one of the reasons why. That was one of the reasons why people couldn't run engrams because you can't run through them. You have to run them out with repeater technique, because of the opposing items. A pc cannot go through them, just scan, scan, and that's out. Don't you see? You scan somebody through a GPM and it all goes black. Why does it go black? Well, he protested it all the way through. And what you do is rekindle his protest when he got it. And of course that turns the engram black, and then you can't see anything in it. And then he can't move on the track, and he's all frozen up in the thing, and so forth. So it's remarkable that we can run these things. Now do you get the idea?

The important truth was that time *is* the single source of aberration. Now, all that is very interesting; all that's very interesting – the GPM and its aberrative character on time. But actually we don't care so much about its aberrative character on time, we can neglect it because we can resolve it. It isn't that that keeps the tone arm from moving. We can louse one of these things up and we still – we still don't cure – I mean, don't stop that tone arm.

You can run a person through a wrong goal with a flock of wrong items and still have tone arm action. It'll mess it up a bit because he's not moving as fast, and that sort of thing, but it won't stop it. So what is this thing called stopped tone arm action? What is it?

All right. It is simply wrong dates. That is all it is. Wrong time. That's all. Now, you go and forget this – that I've just given you as a datum – and I won't wish you any bad luck like getting on a pole trap, but you'll have a hard time. You'll have a hard time with pcs if you forget those two data. The two data are, of course, that a person cannot run track successfully – even with sonic, visio and everything else – unless he also has tone arm action, see. Don't lay that one aside, and get that under the – don't get that one parked, because that's a very important datum. Terribly important, technically. No tone arm action; come off of it, man!

I don't care how pretty it's running. Finish the cycle so the pc won't be upset, don't you see, and then unload – hit the silk. No tone arm action.

Now, the source of no tone arm action – well, there are other contributive sources because they all contain in them this other factor. And you could say that there are an awful lot of them, but you isolate what factor it is in each one of those and you'll find out it all comes back to the same thing: wrong time. No tone arm action equals wrong time. Reverse it now – wrong time equals no tone arm action. Now I'll go over these again. If you're running a person with no tone arm action, you won't make it. I don't care what you're running and how promising it looks. You'll see and you'll do it someday and you'll notice the pc setting the same goals, every session, and the same gains, and so on. They're doing all right. Well, they lost a somatic, and they had a little bit of this... And you say, "My God. How long can this go on?" Oh, it could go on for the next three or four thousand hours. You're not getting the job done, see? No tone arm action equals no processing. Fascinating but true!

And the other one is, is no tone arm action equals wrong time; and the solution is – to that is – wrong time equals no tone arm action. Now, if you can just get those things straightened out, why you've got it made. These are terribly important data. I fought for these, as I've been telling you, since last October. And particularly in the last few months. And these have been giving me a bad time. I haven't worried about anything for a long time but when you figure the number of factors that could have gone into this problem, I've been throwing them away in avalanches. You know, stripping the problem down to essentials and working it back, and so forth. And finally made it and there is the result of that work. Very important. Very important. Because there's – there's the cases that wouldn't have gone to OT, see? And there's an occasional case that was running all right but suddenly isn't running all right. How do you put that case back together again? Here's the answer to 90 percent of your auditing problems – 90 percent.

What about the other 10 percent? Well, that depends on you. If you never follow an auditing cycle, and so forth, why, you're going to have a lot of trouble. You can still get auditing done. You're just going to have trouble. It isn't, by the way, going to stop the tone arm from moving. A no moving tone arm is – cannot be cured by being a perfect auditor. That's an interesting fact. That's how important this datum is, see. It looms, man, it looms!

All right. Let's – let's get now, hammer pound, right to the whole business of dating. If wrong time equals no tone arm action and if no tone arm action equals wrong time, then we

have a lot of data that we can figure out, zing-zing-zing, with regard to any case we're auditing. This tells us that if we don't know how to date accurately, we are soon going to have a case which isn't producing any tone arm action. Well, there's the importance of dating. The greatest importance of dating is accuracy.

Now, this doesn't mean accuracy down to the last microsecond. You can still do approximate dating. Of course, it makes my brains creek a little bit when somebody says 10.5 trillion trillion years to me.

I can see this enormous span, don't you see, of – Lord – the life term of this planet, according to modern science, can be dropped into that date at random! Approximately 10.5 trillion trillion years ago. You could just drop this solar system's whole history, you see, into that date several times and never miss it! Well, is it 10.51? 10.52? Oh, my God. Do you know what you've got there? 10.52, and the difference between 10.51 trillion trillion years ago, and 10.52 trillion trillion years ago – trillion trillion years ago? You go figure it out some time, and you see what I mean. That's a lot of years. Vast panorama. And your brain will go "creak" underneath this sort of thing.

Nevertheless, even that crude a dating pattern is successful in auditing. You can date that crudely and that grossly and still make it without lousing up the tone arm action. So your errors are usually gross, not minor – gross errors. You dated this thing at 545 years ago and it's actually at 91/2 trillion. I mean that's what we're talking about errors, you get the idea? We've dated it at 15.9 trillion trillion years ago and it's actually 115,000 trillion trillion ago. You get the idea?

When I mean a wrong date, I'm talking about a wrong date! The slight error of a decimal place, or something like that, is not going to cause the cataclysm ordinarily. But that should be guarded against, too. No, we mean when we say, "All right, is it later than 115,000 trillion years ago? Earlier than 115,000 trillion years ago?" and we get earlier than because the pc thought it was later than and therefore protests earlier than. And then we don't clear up the needle or the reaction and we go to, "Well, is it more than 100,000 trillion years ago? Less than 100,000 trillion years ago?" And again he says, "But I'm sure it is later," to himself; and we get a protest of earlier, so we get a bigger read on earlier. So we say, "Well, is it more than 50,000 trillion trillion – I mean 50,000 trillion years ago, or less than 50,000 trillion years ago? And he says, "Good God, it's much later on the track than that!" He isn't talking, don't you understand, he's just thinking all this. And you say, "All right, well, is it greater than one trillion years ago or is it less... more than one trillion years ago or less than one trillion years..." getting quite a read now. So you say, "Well, is it – we get a tremendous read now at... Is it greater than 100 billion years ago? Is it less than 100 billion years ago? 100 billion years ago?" And by this time his protest is so great and he's so enturbulated that you get steep drops, falls and skyrockets and smoke coming out of the meter. So you say, "All right! That's – that's – that's 100 thousand – that's 100 billion years ago! Yes! That's – that's the date!"

Well, he doesn't know anything about it, he says, "Well, that's what the auditor said so that's all right." Now we're going to go to the beginning of the incident. Now, we're going to get its duration, and that sort of thing – it's very hard to get its duration. But we manage to get something, you know, and so on. We run the pc through all this muck and the next thing you

know – you had a good running needle. And the needle was all right before you started all this and then the state of the needle sort of tightens up. The next thing you know, why, your tone arm gets up here to about 4.75, 4.5 and you run through the incident, the pc talks about the incident and the odd part of it is he'll get something there, you know.

And you go through it, and so on, and your tone arm's – well, well, you didn't get much tone arm action out of it. Well, this next one we're going to get good tone arm action on, so let's date this next one. All right, now we're looking for the earlier incident, the earlier incident of that. So naturally we're going to look at 500 billion years ago, or something like this, and he – by George, he finds something there that has very little to do with any part of a chain or anything of this sort. But suddenly he says, "You know, I've been thinking," he said, "the incident you've got now, it is much later. I think it's in the trillions of trillions, actually."

Oh, you accommodatingly date it in the trillions of trillions, so it finally comes out that this incident that you have just now found, you see, this incident is at 50 trillion trillion years ago. That's the way it dates. Well, actually, it was at 500 billion years ago. You get the idea? So you've got the late one that should be early, and the early one that should be late and this tone arm now starts looking like something that's cast in concrete. It isn't just still, it has a stillness in perpetuity about it! It's quite intriguing.

All right, so much for that. So much for that. How do we straighten out this case? How do we straighten it out? We clean the question: wrong times in auditing; wrong time; wrong dates. And if you want to clean up a case all the way on it, you give dating, "On dating, has anything been....," you know. And a girl comes up with the fact that she doesn't like dating very much with certain boys and you clean that, too, you understand? See? Anything dating means to them, give it a big 18-button Prepcheck on the subject of dating and then come around and say, "Wrong times and wrong dates," any way you want to phrase it: "You had any wrong dates?" Well, we don't care whether this person answers it in auditing or not in auditing or in your auditing or somebody else's auditing or anything else; as long as that thing ticks, we clean it. As long as we – that needle is rough on this subject, we clean it.

And what – how do we do it? We date the wrong dates. No, no, you-you-you – you got that wrong, see, I mean, I – you don't redate the wrong dates; you date when the wrong dates happened. You understand? Was it in last week's auditing session that you got some wrong dates? Do you understand? This becomes very involved, you see, because you're getting times when things were wrongly dated – not correcting the wrong dates.

And now when you've got the time when it was wrongly dated, then you run down what was wrongly dated and clean it up with the pc even if you have to redate it. You say, "Well, that's quite an activity. You could go on like that for some time." Ha-ha, yes, I guess you could! I guess you're going to! [laughter] And you will mysteriously see tone arm action restore to the case. Quite an activity. It might take you a session or two to accomplish the whole thing.

You want wrong dates that the pc guessed at or assumed in 1950, while running an engram. You want the – all the time the pc assumed that the time track was only 185 trillion years long. That's a wrong date. Wrong time, isn't it? You want the times when the pc assumed almost anything on the subject of dating, particularly dating on the meter and – thing –

but you just clean up anything you can find until, talking about wrong dates, asking about wrong dates, asking about wrong times, or anything like that, you get a perfectly smooth needle. And you keep on going on it until you've got a smooth needle. Not because that needle's suppressed but because there aren't any more uncorrected on this case which are now in resimulation. Okay? And after that your dating is a ball.

You get reads! Marvelous, you get reads! I mean, your dating reads easily because you're not reading it through the fog of a bunch of wrong dates. You're not reading it through upset about wrong dates, don't you see? On some pcs all you have to do is ask – just say, "We're going to date this," and you've got a dirty needle. See? Well, what's that dirty needle from? That dirty needle is exclusively from a bunch of wrong dates.

Now, the funny part of an auditor is, is you also will find his finding wrong dates on the pcs will produce a reaction, so you clean that off, too. You just clean anything off that – it is nowhere near the reaction of what's been found on him as a pc – wrong dates found on him as a pc. But you may find it in there ticking and kicking – worries about datings, upsets about this. I'm not giving you a process now, I'm telling you: clean it up! See? Just clean it up. I don't care how you clean it up. Just get all the wrong dates off of this thing, see? Get all the anxiety off on the subject of dating. Now you'll be able to go back and pick up some of the things that tone arm action ceased on and all of a sudden have tone arm action.

It may change the programming of the case. You may find the goal, "to be alone" in the Helatrobus Implants wasn't. It's in the Gorilla goals. A small error of about 10 trillion trillion years. It isn't that it had a different line plot, which it did – [laughter] that wouldn't have stopped your meter cold. It's just in the wrong place. Oh, the line plot – wrong line plot will of course jam up and slow down and raise hell, you understand. But it really won't do a good job of it unless the date's wrong.

Now, you find a Helatrobus Implant item at 10 trillion trillion years ago, Gorilla goals, and you've got what for that item? You've got a gorgeously wrong date, haven't you? The goal "to be alone" is in both of them. That's what stops the needle. That's what stops the TA, rather. That's what kills your rocket read. It's not the mechanics of the fact there's a wrong pattern. It's that the pattern is being used at the wrong date, you understand?

This is marvelous – because you'll find everything starts running – it's as almost as though you had a totally motionless world and somebody pushed a button on and all the clockwork dolls all of a sudden start moving, see? How did that happen?

Your barrier to OT, on 50 percent of the cases you'll ever come near, was they couldn't run the time track with tone arm action. Not that they couldn't run the time track with perception, but that they couldn't run the – because you give us tone arm action, we can run the time track with perception, that's not even a problem. You get the right date and right duration, you get perception – bang! That's all there is to that. And you do 3 – R3R right according to the book with the right date and the right duration – you get perception. If you haven't got perception, you haven't got the right date or you haven't got the right duration. And sometimes you haven't got either the right date or the right duration. So you find the right date and you find the right duration and you send the PC to the beginning of the incident and a new world opens. He's now got perception.

If it's got a GPM in it and you scan it through him, you no longer got the perception. The lights go out. Why? Because you brushed past the items, and restimulated the black protest of the PC and you – that's that. But as soon as you pick up the items out of it, the lights turn on again. This is all very remarkable. Right date, right duration equals perception. Wrong duration or wrong date equals no perception. Now there's some other thing that happens. Dub-in itself is simply a phenomenon of wrong dates. Marvelous. It's just a phenomenon of wrong dates. That's all it is. Nothing else. Prove it: Get loud and clear on your meter – get loud and clear on your meter that the incident is 500 years ago. Tell the pc – this is a good running pc – tell the PC that it is 100 trillion years ago. Get on the meter that the duration is 2 ½ days, tell the PC that it is 9 ½ years. Tell the PC to go to the beginning of the incident. And you will have a collection of pictures from all over the track which appear to be dubbed.

And he won't be able to move – he won't be able to move on the time track. He'll just have pictures and it's all kind of *blaa*, and he's not going anyplace and he doesn't get through anything. In that way you could take a very good case that was running well and produce this phenomenon we have called dub-in.

Now correctly date the incident at 500 years ago, say, "I gave you a wrong – wrong date. The date now is 500 years ago. Got a wrong duration here," You have to do this in such a way that he isn't betrayed, "This incident is not years long, it's actually 2 ½ days long. Now move to approximately 500 years ago. Good. Move to the beginning of the incident at approximately 500 years ago. Very good. Move through the incident to a point 2 ½ days later." [snaps fingers] Visio, [snaps] sonic, [snaps] no dub-in, *and* tone arm action. Got it?

This is remarkable. You'll see this happen before your eyes. Remember that you can make some corny errors that will include time in them like use the wrong pattern, get a lot of wrong items, start crumpling up facsimiles. You'll see normally that these don't interrupt tone arm action. They upset the pc but they don't interrupt tone arm action. Pc's still getting something like tone arm action.

But don't go diving overboard when you see that tone arm action cease on the basis of straightening out items and getting in – getting in a bunch of Prepcheck buttons on wrong goals and all kinds of other rationale. Na-ha. You go to the basis of wrong dates and figure out how it made a wrong date and then correct that and all of a sudden your tone arm action is restored. And until you do that, you won't get any tone arm action! You run the Helatrobus Implant plot on a Gorilla goal. It's obviously a wrong date. It's not the wrong plot. It's the wrong date. You'll find that the same goal also occurs in the Helatrobus Implants or some similarly worded goal. Well, you've got to straighten that out, otherwise your pc will be upset.

It's wrong time, however, that will restore your tone arm motion. You got it? Straighten out wrong items, don't let me downgrade those things because they're very tough on a pc and they leave a lot of mass all over the thing, and so forth. When that tone arm stops moving, there it is.

Now, one of the things that you will run up against, you'll occasionally flatten a chain and your tone arm action will go up. This has something to do with wrong dates more deeply seated in the case than you have power to overcome without reassessment. The guy's got stuff

all wrongly dated himself. He had a bunch of stuff wrongly dated. What he did was exceed his level of reality.

Now, let's look a little bit further at this whole subject of wrong time. Now let's use wrong time to get a case that cannot run engrams. Let's get the subject of wrong time here and let's get this case into shape to run engrams. In other words, let's reverse the whole magic and let's take the guy who is dragging bottom and let's use the subject of wrong time to give him tone arm action and put him on the time track. How would you go about that?

Joe Blow: He can't run engrams because they're unreal. Goes into any past life – they're unreal. He'll tell you this right away. Everything is unreal and he can't believe it and he doesn't believe in that sort of stuff anyway. What's his wrong date? Life began at birth. So let's just strip off of his case every consideration that life began at birth. And all of a sudden up will go his reality and he can move onto the backtrack. Or whatever else wrong time you can find associated with that subject, don't you see?

His error on wrong time is the length of the time track. He thinks the length of his time track is his age, 32 years. Well, that's a hell of an error! Look at it, though, as a trap mechanism. "We have only lived but once." Look at that as a trap mechanism! Isn't that fascinating? You wonder why is this so popular with the savants of science. Oooh! Why do they insist on this? Why do they raise so much fuss with somebody saying he's lived before? Well, they wouldn't raise that much fuss unless they had some idea of entrapment in mind. Nobody ever protests against truth unless he has a vested interest in falsehood. Yeah, I'm afraid this one-life proposition is a method of tying everybody down to the ground. It's much more important than you'd think!

Let's take this case: he can get back fifteen or twenty, thirty lifetimes; he can get back to the Roman Empire let's say. Now that – beyond that it gets pretty unreal. He just got a wrong time someplace. But remember, you can run him within the span of what he considers right time. You can run him in that span. So you've got to clean the dates out of what he considers right time and you will find that you're gradually extending his time track backwards.

Now, this happens to any case, it isn't just one lifetime. I'll confide in you that the first time an incident was spotted on me, in the four trillion bracket, four trillions, you see, trillion trillion trillion trillion bracket, my immediate thought was, "I'll never get back there! If that exists, and I did get back there, there's – would be nothing there anyway." It just – just was too big. I was running with great happiness at the time, I was running hundreds of trillions. This was – this was a ball, I mean, this was – I was getting so I was running this with better reality than I used to have on this lifetime, you see.

And when I found myself one time at, I think, about eight trillion trillion, the incident I was in seemed awfully long ago and very, very unreal. It was just an awful long time ago. I didn't have any reality on it. There was somebody pulling some caper of putting horrible looking hands in the sky in order to intimidate people, you see, with the coming of God, or something. And I didn't know, I said I must be back at the beginning of the time track, or I – something or other. I just couldn't make head nor tail out of the thing.

And then we found the beginning of the incident. We found we'd had a wrong date all the way along the line. And all of a sudden this all brightened up and the reality factor came up.

So any case is going to hit a ceiling of reality on the subject of dating. Some people can go back trillions and some people can go back minutes, some can go back years, some can go back this lifetime, some can go back a lot of lifetimes. Some can go back millions, some can go back trillions, hundreds of trillions. When you get up into trillions of trillions, why, you could expect almost anybody to creak one place or another. But they only creak to the degree that there's wrongnesses on time – time wrongnesses. That's the keynote, and that's the key to that situation.

Now, you're not working particularly to increase the person's reality. You just go along in the general course of running R3R or R3R plus 3N or just 3N or anything that you're running – whatever you're doing – date correctly, duration correctly. If you're running into trouble, you're not getting tone arm action, pc's ARC breaking and so forth, the first thing you suspect is not a beautiful significance but a wrong date, a wrong duration, see? 3N, you're not using durations, but you'll have a wrong date.

Now, a wrong date can sneak in on you without doing any dating. You just supposed the engram – the GPM you were running, you see – you just supposed that this thing must be in the Helatrobis Implants because you've heard of the goal in the Helatrobis Implants, and that sort of thing, and all of a sudden your pc's tone arm is up there at 5 and he isn't RRing. Well, you say, "Well, how can I have a wrong date because I've never assigned any wrong – any dates at all to this?" Oh, no, you never assigned any dates at all, don't you see? And, oh, no, you never assigned any dates at all. The goal takes place much closer to PT than the Helatrobis Implants. By saying even the Helatrobis Implants and give him that pattern, you wrongly dated the goal, didn't you? The second you straighten out where it is, whether you run the goal or not, you'll suddenly have restored your tone arm action.

So there is the boulder on which the bark flounders. First you have to know what a foundering bark is. That is cessation of tone arm action. When you see tone arm action seceded, from the session, you know that the bow of the vessel has run on a large jagged boulder and is going to sink from here on. It'll sink slowly! It'll sink for sessions before you suddenly find there's water around your feet. Your pc isn't talking to you now. You wonder how this ever happened. And then the pc is not only not talking to you in session but also is not talking to you out of session.

And you want to know what happened. "I must have had an ARC break" – figure, figure, figure, figure, see. Oh yeah, he probably had an ARC break, but that won't do it very permanently. When the bark really went up on the rock was when the tone arm ceased. And you can go back and look for the last session in which you had tone arm action and look for the wrong dates in that session and the next one.

Now, never leave a wrong date on a case. Just don't leave one on a case, that's all. There's several things that you don't audit a case with. One of them is a wrong goal. You've got a wrong goal on a case, you clean it up – first order of action. But this takes seniority even to that, now, we found a more important level. Don't pick up a case that has had a bunch of

R3R, or something like that, and is now not getting tone arm action without cleaning up the whole subject of wrong dates. Just straightaway clean it all up. Whole subject of dating – let's get that all cleaned up and then proceed. Because the cessation of tone arm action on the case came from wrong dates.

Now, I wouldn't pester a case that had good tone arm action unless the case started to ARC break more often. I would tend to assume – I would tend to assume that we were running the case on a wrong assessment or we're pushing the case too hard or going uphill. I would also assume these things, you see.

But I would make sure that all this wasn't happening because of a wrong date. No matter what else I was doing, I would throw this in, you see. It was like the fellow – the fellow who repairs the airplane, you see. He repairs the airplane, he fixes up the motor and does everything else to it, you know, and then throws a – and then puts a rabbit's foot in his pocket, you know. Same type of action. See, you've done everything that you can do, that you can see on the surface of it, well, also do this one, don't you see? Just throw it in. I don't care where you throw it in. You see that it's quite important.

Now, a case which is getting tone arm action from 3 to 4, if you got all the wrong dates off would probably get tone arm action from 2.5 to 4.5. So it isn't something you just use on stopped TA action. You can also speed up your TA action by cleaning up this thing, see?

Now, some cases are so unreal on the subject of time that they almost stop if you misdate a little something – it isn't even an important date. You say, "All right, I see here that you have an engram," or he's got a lock or something of this sort, "in 1952," and it's actually 1953. You try to run the pc through it and the tone arm will go clank and stick. Redate. "Oh! 19 – heh-heh – 1953." All right, we straighten that point of dating out. All of a sudden your tone arm action is restored. That's because the case has got built-in wrong time. In other words, this case has been so overwhumped with wrong times, one way or the other, so many GPMs, so much this, so much that, and so on, they're pretty woggy. And you start auditing them, they can hardly take it.

So that gives you a point of approach as far as processes which can be audited on the meter, which is a dating point of approach. Now, how much good could you do a case that otherwise couldn't run engrams and had no track just by sitting down and doing a good accurate job of dating anything under the sun, moon and stars on the case? Interesting! Because it would produce a real time track at least in this lifetime. Just find the date of everything. Don't run anything, see. Don't run anything, just find the date of everything. See, "When did you go to school?"

"Well, I think it was about 1943."

"Well, all right. Good, good, we're glad of that." And so forth. "Let's see, let – let me check that now." We have to have a certain reservation on the amount of invalidation we do of rechecking the wrong date, don't you see? The best way to do it is just to check periodically in the session for a wrong date. Minimal invalidation, don't you see? Normally, on such a case we say, "When did you go to school?"

"Well, I don't know, I thought... if that was 1932, no it was 1951, no it was..."

You know? Say, "Well, let's date that."

Well, let's get very fancy. Let's get very fancy and nearly always date in "years ago" because you can be too often thrown for a loop by dating on Earth time. Pc hasn't been here but about two lifetimes, see, and you're trying to date 1776 – A.D. 1776. Where did that come from? A pc will be falling all over A.D. 1776, whereas he responded on years ago. And then you finally find out if you're running engrams, that, why, he hasn't been here on Earth, he's been in some other planetary system. They had another time.

Now, in the – in the final analysis here, as a final word on this subject, this has been an interesting sprint. And it's toward OT and it's been an interesting thing, which has closed the door – has kept the door closed. It's just been wrong time – wrong time – that's kept the door closed and that is what will basically close the door on anybody.

Now, let's take a reach and withdraw process and I'll show you what I mean. A reach and withdraw process – I'll give you another talk about this, all about reach and withdraw some other occasion – but we've got this person walking from point A to point B in the room and they're walking through facsimiles. Now do you see that as a wrong date proposition? Matter of a wrong date!

They're walking through the room and they're stepping between maypoles and eventually the experience of walking through the room brings them to a realization that this is this date. You don't necessarily find what's the date of the maypoles, you understand? But it brings them the accuracy of this date which cures some wrong dating to that degree.

Now supposing – now let's get fancy, this is not necessarily a recommended process or anything, because that other process I'm just giving you is very successful. Let's take a look at this. We walk them through the room and they keep running into ship capstans. And the second we find they're running into ship capstans as they walk through the room, we grab our meter and date the ship capstans accurately. Got that? We don't run the incident. Let's just date the ship capstans and then let's return them to walking back and forth across the room until they run into something else. And there's some beautiful black-eyed maidens, all of a sudden, that they're walking through and trying to avoid. You know they're aberrated if they're trying to avoid them! [laughter] Let's just date these beautiful black-eyed maidens. Got the idea? That hasn't even been tested – I'm just, you know, that's just off the cuff. I'm just showing you how can you use this principle called wrong dating.

Now, I've taken the lowest level process we have that produces results, you see, how you could apply it to that? One, it applies to that naturally because it shows present time is present time, but you also could use dating in the thing and square that around.

You could probably take a case that couldn't remember half of this lifetime and cook up some means of dating this lifetime and making it accurate. Accurately dating this lifetime and getting it in line and getting things in sequence, and that sort of thing, and all of a sudden you'd find mysteriously that he had a tremendous reality on all of this lifetime. There are many other ways of producing this, but this is very direct – very direct method of doing so.

This data I've given you in this, is the make-or-break point on about 50 percent of the cases that you will ever audit – it'll be the make-or-break point. You'll get a lot of people through by the skin of their teeth and panting and huffing and – but you'll make it, you understand, it's rough. But this is the other 50 percent that wouldn't make it at all.

To that we must add, however – we must add, however – good auditing and all the technology. Okay?

Thank you very much!

ERRORS IN TIME

A lecture given on 18 July 1963

Well, glad to see you all here, dry. Summer – summer's gone now, you know? I find out when summer is gone by watching the banyan tree. It's on the other side of the house there. And when its leaves start to turn brown, why, we know autumn is amongst us. So break out your boots and dogsleds. [laughs]

This is what?

Audience: Eighteen July.

Eighteen July AD 13. Saint Hill Special Briefing Course, and another lecture on dating.

Now, I've already told you – I've already told you that dating is a very high-caliber activity, very important in auditing, and that the tone arm sticks only because of wrong dates. Got that? That's really the real reason tone arms stick. Frankly, it's the only reason tone arms stick.

And you might have asked yourself, some time or another, "If you do have this much track, why does everybody around believe so implicitly that they have lived only once?" See, it might seem rather odd to you that the insistence on this fact that people have lived only once; the near-psychotic frenzy with which people go into, insisting they have lived only once. It must really take something to shut off somebody's memory to that degree. It really must take something. Actually a GPM doesn't account for it. The goal "to be dead" in the GPMs is not enough. Because that doesn't say you've lived only once, that just tells you to be dead.

So you might ask yourself, why is it that man is so wrong-dated? Now, when I was able to run down the common denominator of people who can't run on the time track, I found out that the common denominator was not whether or not they got sonic and visio, but whether or not they got tone arm motion. Very good, we've just covered that in a lecture. And the reason they don't get tone arm motion is wrong time – wrong dates. All right, so much for that.

Behind all aberration there must be a lie. And you can mark that down in letters of fire. Aberration cannot exist in the presence of truth. Aberration can only exist in the presence of a lie. If somebody is hung with lumbosis, you can make very sure that there is a lie connected with the lumbosis. Elementary, my dear Watson. That is one of the common denominators of Scientology.

That is one of the truisms, one of the maxims, something that weaves through everything. There are others of similar nature. For instance, don't talk to a pc or a person, or talk

around a person, who is unconscious. You know, and it's that sort of thing. And want to know something about aberration, that's a better contribution than anything "Wuff Wuff" Pavlov ever dreamed up. Didn't you know that was his name? Later part of his life, you know. His papers, as far as I'm concerned, go "Bark-bark-bark-bark comma, bark-bark-bark comma, bark-bark-bark semicolon."

Reg was kind enough to dig me up some Pavlov. I wanted some Pavlov. I was studying how not to write up technical data. I didn't know that was why I wanted Pavlov; I just knew it must be important to do some study on this, and that's what I found. I didn't find that dogs were very informative; I know more about dogs than he does. But – I mean just as dogs. Dogs are friends of mine, and he didn't like them. But, "Wuff Wuff" Pavlov gives us a marvelous example of how not to write up technical information. It's heroic, man. Try it sometime. He wanders all over the pastures and the fields and dales, and so forth, and he finally gets down to his something-or-other.

It's much more important to him that he used "surgery comparable to that applied to human beings" when operating on dogs. And he goes on at great length about the surgery precautions taken on his dogs. And he was taking perfectly healthy, happy dogs, and cutting out half their bladder or half their esophagus or half of something. He never could go all the way, you know? He... And he admitted that this more or less damaged his laboratory animals, and therefore he had to take surgical precautions. And it isn't a textbook on surgery. He's giving, of course, the conditions of his experiment. He never gets around to the experiment.

But anyway, "Wuff Wuff" Pavlov is a marvelous example of a lot of things. He is a man who is totally dedicated to the dramatization of one engram: the Darwinian Theory – man from mud. He's a physiologist turned psychologist. And he's in wild protest against the psychologists. Because remember, the psychologists of his day believed in the soul. Some of them were still around who did. After all, psychologist means "psyche"-"-ologist." And he's the great physiologist. And you want to look at how you get aberrated because your neurons have turned into morons. [laughter]

I was there trying to ask a question – I'm not wandering afield from what I'm talking about here – I was trying to ask – I was asking a question. Why is it that the Russians know nothing about some of the basic laws of social behavior? Why is it that they overlook these laws? And I thought, they have Pavlov, and Pavlov stresses the salivation of the dog – not his salvation, his salivation; that's all he was interested in – the salivation of the dog when stimulated by beefsteak, and the whining of the dog when beaten with clubs. So they would – he would mix these two stimulus-response mechanisms up, and so on.

And I wanted to know if Pavlov had ever drawn the conclusion – I haven't found this out yet; I can't wade through the stuff – but if he'd ever drawn the conclusion that a reward was also part of existence. That was what I was trying to draw. Do the Russians know this? Is this part of the Russian mental technology? And apparently it is not. And apparently that fact reads through Pavlov without being punched up, as near as I can tell. He doesn't say "existence consists of reward and punishment." See? That is not the thesis.

Now, thee and me, knowing more about this, would immediately conceive that if somebody had a dog salivating or whining under punishment or reward that he would con-

clude that there were two stimuli, and one was reward and one was punishment. But this is far too simple, and Pavlov never made these comparisons, apparently, as far as I can tell, wading through the stuff. Isn't that interesting?

I consider that extremely fascinating, because the whole Russian system is caving in because they haven't got this little factor of reward. That is what is wrong with the Russian communist system. Frankly, thee and me could probably sit down and figure out a communist system that would be a gee-whizzer, that would probably work. The – probably the fault is not with communism; the fault is the lie which lies behind communism, which is the physiological nature of man.

Now, with that lie back of communism, communism becomes a scourge. See, it becomes an aberration. There are probably many things about communism that aren't aberrative. You could probably do lots of things with the idea of the communal activity of man. You could probably do a lot of things with collectivism. We do things with collectivism. We try to make it work. The Russians are not interested in making it work because they've misunderstood the nature of man. And this is not a lecture on Russia; I'm just showing you the lie back of aberration.

So communism becomes fought, and communism becomes very disastrous when practiced. And the poor sods that are walking around with communism wonder where their next *muzhik* is coming from. They don't know. And that's because when Pavlov did his work, he never said that life consisted of reward and punishment. He does a total anatomy of punishment. And here's this drifting factor, reward, which is apparently on automatic. The reason capitalism works is because nobody has analyzed it, and people want pay and they give them pay.

I almost started a riot amongst Bantus by telling them that if communism came to South Africa – this was real mean of me – why, they wouldn't – they wouldn't get paid, that communisms didn't pay you for your work. And they thought this was terrible. And they were spitting on the street and stamping and damning Khrushchev, see? I mean it was very upsetting to them. Because the one thing – the very, very commercial little culture the Bantu has... And boy, you talk about the importance of debts! Some guy owes some money, why, that debt will be passed down, and next generation – and next generation somebody's great-great-great-great-grandchildren are still worried about those two cows, you see, that Uncle Zidd, or something, is owed. They just – the idea of commerce and money and that sort of thing is very deeply ingrained in these people.

And to tell them that communism was a system of getting them to work so they didn't have to be – so they wouldn't be paid, that just about finished it.

Now, if capitalism was earnest about fighting communism, and so forth, it would dig up a few salient truths and let them have it, see? Because that is the lie back of communism. The lie back of communism is man is a physiological animal going forward on the basis of a punishment stimulus-response. And of course, man does not – does not – respond to punishment stimulus-response. Very un-uniform response.

You've had the experience yourself. You take somebody and you say, "If you don't so-and-so and so-and-so, I'm going to *raow-rrf-rrr-rrhh-rrrhhh!*"

And A, that you told this to, cringed and said, "Oh yes! All right, all right. Don't beat me." And B, C and D said, "Why you s... Knock your block off, see?" You'd knock their heads in, and they'd get back up and they still wouldn't do it. And you knock their heads in, and they get back up and they still wouldn't do it. And it's not a constant, don't you see?

In other words, not all living beings succumb to the stimulus of promised punishment. The whole Roman Empire caved in because a sect, called the Christians, moved in, who didn't stimuli or who didn't "respo" when they got the stimuli of punishment. The court said, "We're going to burn you at the stake." And they said "Burn away! We will become martyrs." And the Roman Empire couldn't handle them! [laughter] That was it! That was it. See, they'd met their – they'd met their match. Very important. Extremely important.

Now, stimulus-response, then, is half of the picture, don't you see? Man does not go as a total stimulus-response mechanism. Down in various homely locales I've heard "Ya kin ketch more flies with honey then ya kin with vinegar!" You've heard that sort of thing. Well, they're talking about the reward part of existence, see? That's very important, the reward part of existence.

Now, the Christian had a greater reward promised him than the punishment. In the first place he *had* to die in order to go to heaven. And he simply considered this very accommodating on the part of the Roman Empire and its courts. It got him there that much quicker. And so the Roman Empire could do nothing with the Christian, the Christian overthrew the Roman Empire, and it became the Holy Roman Empire. Literally, factually, yes, you see?

Well, there was a lie. There was a lie involved, then, in the Roman Empire. So it didn't – it didn't survive. And what was that lie? Well, they must have been subscribing to the same thing Pavlov was writing about: that man is a stimulus-response creature who responds to punishment and threat of punishment; and that to get something done, you threaten or you punish; and if you threaten and punish enough, you will get things done.

Well, I will – give it to the Roman Empire, they got quite a ways. They got further than anybody else. But there was a lie involved there, in that there wasn't a whole statement of the proposition. There was also reward. And the funny part of it is that men will do more things for reward than they will for punishment. So they had just cut out three-quarters of the pie, and then said that the remaining quarter of the pie was the totality of the pie, and tried to carry an empire along on that basis, and of course, it folded. And what do you know! After all these years – you think things change – actually, in this very finite period of time since the Roman Empire, and the equally religious fervor of the communist Russian Empire, you get the same fault cropping up.

So you have the philosophy which they adopt is the one which assures them that punishment is all. They adopt this philosophy, and they have immediately adopted something which gives them a commercial upset, economic upset. And although they're very clever people and have a great deal on the ball on the subject of economics – they say economics are nine-tenths of life; life is only one-tenth political. They've got a lot of things like this.

They have a terrific propaganda machine. They have practically every newspaper editor in the world working for them. Khrushchev has more press agents than any other single ruler in the world. And yet, in spite of all this, on one of their collective farms, they go around

and take a look at the tractor, and its wheels have fallen off. And they want to know where's the tractor driver, and they don't know where he is. Well, he's down in the woods. "Well, where's the woods? What's – who else is in the woods," this manager will be saying. And, "Well, he's down there, and they're picking berries." "Oh, they're picking berries. Well, all right." And he goes down and he says to the guys down in the woods, "What are you doing picking berries?" And all the old women and everybody down there says, "Well, got to do something to make a living!" And they found out that they can pick berries, and put them in boxes and sell them in the local town, and they can make a couple of quick rubles. See? To hell with the collective farm. See?

Half-a-ruble reward for sweating it out in the woods picking berries is much better than a no-ruble reward because they're going to get their heads blown off if they don't drive the tractors and plow the fields. See? You get the idea?

So they're running into this all the time. This causes them then to go into a terrific campaign of some kind or another, you know. They go into this terrific campaign, "What you want to be is the 'new man,' 'the total communist,' 'the this,' 'the that,' 'the...'" Those guys are just sweating themselves to pieces all the time. And they're trying to compensate for this lie.

They think capitalism produces, in some peculiar and mysterious way, more goods than a communism. And they don't know why this is. They've never analyzed why this is because Pavlov didn't tell them. Capitalism has many – many things wrong with it. But it hasn't clipped off totally – not until they invented internal revenue, anyway – the total, the totality of award. So you can still – you can still – if you're very, very clever and so on, you can still keep some of your pay, if you're careful. But it's still a reward system.

Now, as that reward system dwindles, so dwindles the actual health of the society. And the more internal revenue and the less reward, and the more threat of punishment, and the more you can go to jail if you don't turn over all your pounds, shillings, dollars, francs or something, to the local income-tax people, you see – the more that works, why, the more difficulty their society gets into. See, you're not spending any time to work out how to – how do you go about making a healthy economic society? They never spend any time on that. They're just chipping away at this award and punishment. So actually they're starting to borrow Pavlov, too.

So, here is a lie. Here is a lie: The statement that man acts totally because of punishment and only because of punishment; that man is a driven animal. That lie, all by itself, is destroying the social structure of man. Because man doesn't go like that! You see? But we enter this lie upon the stage, and here we go. All you've got to do is have a great big lie floating around someplace and you have trouble.

Now, it is perfectly all right to have difficulty isolating the truth, as long as you are continuing to try to isolate the truth. That's the difference. You sit down hard on one lie, and say that now is the truth, and you've done the trick, you see? You say, "Pavlov has written all there is to know about the human mind," and at that moment you've had it. Because he hasn't. He hasn't even written about the human mind. And the reason I mentioned his prose is because it's obvious why nobody has ever read him; you can't. So a sort of a tradition has grown up as to what Pavlov's work is all about. See? And we have not even the work of Pavlov mo-

tivating this kind of thing. We've got a superstition about what the work of Pavlov is about. It's never been properly presented, you see?

We've got a lot of lies around, and so forth, but we're not betting on those lies to carry us through, see? That's perfectly all right. You can have a whole bunch of misconceptions and still not do your nut. But the second you settle completely on a lie, and say now that that is the truth, from that moment on you've had it. And you've had it to the degree that that truth can be pervasive in your life. You can say, "Joe is a good man" when you know – when really the truth is he's a bad man, and this may cause you some inconvenience, but it won't destroy your sanity. It'll cause you some worry. But you say, "I have lived but once," and then believe it, defend it and contest it, and of course, you're going to have trouble from there on out. It takes a lie of this magnitude to continue the aberration of man. It takes a magnitudinous one.

Now, to maintain such a lie must at the same time take a fantastic amount of duress. I mean you'd have to work at it to maintain that lie. And whenever you find a maintained lie, you'll find somebody is working at it. This guy has got a headache... Well, I don't know that you could do an all-therapy on this basis. This guy has got a headache; you find the lie connected with the headache, and you could probably resolve the headache. That very well might be an open sesame to all psychosomatic healing. You know, you could probably work a whole parade of stuff out: "Let's find the lie connected with..." See? "Recall a lie about a headache," see? Something like that. And bang, the guy's headache is gone. You see, you're working now with one of these first principles, when you're working with a lie. You got that?

Now let's carry this just a little bit further... I didn't mean to get off into communism. I thought you might be amused. Now, carrying this off a little bit further, let's find a lie about what. See, now that we've found out a lie is this pervasive, see, now, what would be the most disastrous type of lie? And the most disastrous type of lie as a common denominator – although there are many disastrous types of lies – would be about time.

So let's combine these two things, you see? You see what a lie can do, all by itself, that has nothing to do with time. All right, now let's combine it with something which has the power to freeze a tone arm on a pc, that no matter – a big mid ruds on what bad things you've done to him in the session, no matter what horrible this-a's and that-a's, and what processes you were to run – without paying any attention to lies or time, you see – no matter what you do to correct this tone arm, if you do not pay attention to wrong time it will not correct. You got that? See? This is the only one capable of putting a total freeze on a tone arm.

Well, a total freeze on a tone arm is a total freeze on a case. So this gets fantastic. This gets very, very, very, very dreary indeed. So we must be looking here at something like a pervasive common denominator of aberration when we say "a lie about time."

This immediately brings to view processes by the ton. You start thinking up processes, you can just string them out by the hour. "Recall a lie about time," you see, "Recall a lie about time. Recall a lie about time. Recall a lie about time," see? This kind of a – this kind of a process would just string on and on and on and on and on and on, don't you see?

Now, it's interesting that if you – if you – oh, you can think of others. You can think of others. Let's just date everything in somebody's life. That's an ordinary one. He believes he's lived but once, well, let's date everything in that life that has lived but once. Soon as we got

that thing kind of dated up you're liable to find out that he'll fall through.

Now, just think of – think of this approach, see? You might even apply this on an institutional level to just getting the whenness of things. The whenness of things, you know? For instance, "when is this E-Meter?" Guy would have to think for a long time. He'd finally decide it was now, see? Might be quite deaberrative; might straighten out his time track most interestingly. Of course, that's highly experimental – not advanced as something that is proven. But I'm just giving you an idea that you can extrapolate this idea of lie about time almost anyplace you want to look, and you will have some interesting results on a processing line.

See, because that combines then the single action that is the most aberrative action – which is an alter-ism of truth or a denial of truth – with the one thing which if aberrated brings about, then, the greatest mess-up from the viewpoint of a person. We won't call it anything technical, but it just messes him up most. Time messes him up the most. And we get these two things in combination, of course we get a lie about time, and we're off to the races.

Well, having recognized this situation, I looked it over very carefully. We have the GPMs, and we have things of this nature, and looked those over and then I said to myself, I said, "Well now," I said, "Ronnie, if you've gotten this far, this sort of thing, let's just take a look at this now. You suppose some peculiarly and particularly brilliant blankety-blank somewhere on the track has also discovered this and used it to aberrate? Ah well, if that's the case, then there must be such a thing as false time track, complete with times. Let's see if we can find some." And I found some.

Give somebody a false past. Implant him with a false past, complete with pictures, complete with times; and times in the order of magnitude of the thetan's actual existence – trillions and trillions of years. We could also give him some weird and incomprehensible dates. That'd be a little fillip on the thing, you know; that would be some way to throw a new curve into it. Give him one thousand and sixty-nine times trillion to the tenth. Let him chew on that for a while. And he never can find out what date that is.

And you would effectually have blocked out the past by making it so confusing to be entered, and so dreary and so terrible and so awful that nobody would want to have anything to do with it. Now, nobody ever would spend any time enhancing the powers of the thetan, unless he was more diabolical than is believable. But they'd certainly – tend to make them derogatory. They'd make the life as a thetan seem very, very dangerous, very unpleasant. Because look! Look at the horrible things that can happen to you. And therefore, if all these horrible things can happen to you, why, then of course, you don't want to have anything to do with it.

And you could get a guy fixed up with sufficient number of false pasts, that he'd even dramatize a false past. He'd become a fiction writer or something like that. He'd even – he'd even automatically give you a false story of his past, don't you see? He could get quite loopy on this subject, if he were driven in with enough explosion, enough bang, and so on. And if the incident itself were hung up with a double explosion, you know, left-right bang-bang, sort of a double-RI of the thing, you see? Plus and minus RI of the thing; hang it up on the track real good. And just give him a good, long time track. Let's give him – let's give him a few

trillion years to chew on, or a few trillion trillion years to chew on. And let's give him some incident on that track. Let's give him a nice history that goes along with that track. Let's give him pictures. Let's even give him some times when he's been implanted.

Of course, we couldn't give him much of an implant, but we could give him a clue that he might have been implanted at this point. You know, let a couple of the pictures leak out – looks like they're implant pictures. That'd sort of keep him tacking that point of the line, wouldn't it?

And by giving him enough false track, and maybe giving him four or five or six false tracks, he would rapidly get of the opinion that the one thing he shouldn't do is to return on the time track. Because if he does it is far too painful and confusing.

And you'd have him saying at last, in self-defense, "I've only lived but once." Yes, that is one of the tricks that has been pulled. Now, you say, "a false past." That's good terminology, by the way. Find some auditors may trip it around on their tongue, but you can learn how to say it. "A false past" is better than "phony pictures," or something like that. In discussing this with a pc, you say "a false past." Well, he understands this.

And R3R is good enough to be able to find a moment when a false past was installed, date it and get its duration. Really takes some doing. Now, having dated it and gotten its duration, to actually run it out. Now the incident pretends, let us say, to be many trillions of years long. And the actual duration of it is seldom more than three or four hours. So you get the appearance of enormous durations, and you get the appearance of tiny durations. You know, two or three hour duration, or eighty billion trillion squillion, to the nth *tex boonk*, see – years. You'll get two durations on the thing – some vast duration and some little duration. And the incident can be run out. But don't get mad at the pc if he keeps stepping in the mud, you know, and finding himself going to the beginning of the incident, and wondering whether or not he saw it.

Now, these incidents have as a common denominator – these incidents have as a common denominator – and the very few of them I have – the few I have seen. I expect there are other kinds. I have seen some of them and they are confused to this degree: The point where you approached and the moment when you approached is quite commonly repeated in the incident. So you walked up a set of steps to get there, so you now have a visio that looks like you're walking up a set of steps *in* the incident. Same set of steps. So you've got two walkings up the steps. One is in the incident, one is the actual one.

And there'll be two departures. There's the actual departure, in which one was usually anaten and didn't know whether he was going or coming, and the picture of his departure. And thetanwise, of course it'd be a picture of exteriorizing from the area; it's getting dim in the distance.

In other words, there are two beginnings and two endings on such an incident. Now, they also occasionally have a mechanism that shows troops marching away and troops marching to you. This is how they communicate the beginning and end of things. The beginning of things, of course, troops marching to you. The end of things, troops marching away from you. And these incidents usually start with the troops marching away from you and end with the troops marching to you. This was the common action – I mean, that set of pictures was ther-

apy, at one time, and is used consistently in therapy, so they copied this therapy device in this other action. Only in therapy they show you the beginning of something by, I think, the troops marching to you, and in the end, they show you the end of thing, about the troops marching away from you.

Sometimes they're sailors. Sometimes they're sailors in pompon hats. Sometimes they're people who look like West Point cadets. But, you'll see these two marchings connected with it sometimes in these incidents.

So knowing these things you actually can find beginnings and ends of it. But it's very confusing, of course, because the couple of hours there that *aren't* taken up give you a whole time track. They give you some catastrophic accident that happened to you, you see, and then you remained dormant for a long time, and things were very mean, and so forth.

Well, the way you can tell false track is it really doesn't move. You've got motion to such a limited degree that it doesn't make very much sense. Let me show you what I mean.

As you walk in this – that door back there, you see the front of this room, don't you? When you turn around you see some more of the room, don't you? And when you sit down, you see some more of the room in front of you, but from a different viewpoint and level, right? And then when you look down, you have a scanned area of passing your eyes down, toward a book or a meter or something like that, you see? And you have the continuous sound channel that goes all the way along that accompanies this; any sound in the room is continuous. Well, that is a proper sequence – very proper sequence.

Well, false track never looks like that. They've not got the time for it, don't you see? They're crowding all – this thing. So you get a picture – if the picture is in motion, and they can be – you get a picture of the front door, then you get a picture of the front of the room, then you get a picture of the book in front of you, see? And they seldom add the sound that goes with it. Many a pc who doesn't think he has any sonic is simply running false-track incidents where there is none. Diabolical, isn't it? Makes you go wog just to think about it.

Now, coupled with this is the fact that there is actual track. You have actual track. And this track, of course, is more sequitur, but again can be in segmental pictures if there's points of anaten. You'll get the pictures right up to the point where you knocked yourself out, see? And then you'll pick up pictures after this point. You don't have a complete series of pictures, but they don't go chop, chop, chop. Let me give you a – let me give you an actual one.

Thetan is lying on the ground. Airplane comes overhead. Thetan sees airplane come overhead. It just sort of moves into view. Airplane falls apart. We stand up and take a look. But that's simply a picture of the parts of the airplane falling, you see? And then airplane parts are all over the ground, only they're plastic parts. It's not a wrecked airplane, see? We just get jump-jump-jump-jump. See? It's something like the movie director would cut when he was making a documentary. You know, typical modern documentary.

Children starving in Armenia. Children starving in Egypt. Children starving in Washington. Children starving. See? You know, cut-cut-cut-cut-cut. This is typical of one of these false incidents.

Now, why does the thetan look at the false incident? Why is he more likely to be on

false incident than he is on true incident? Well, false incident is safe. There's no bite to the stuff. There's a hell of a bang – now, don't think it isn't aberrative to get one of these bangs, at the beginnings and ends and the somatics that went with it. But once you've got those somatics under control, it's much easier to look at false track than it is... just like you'd rather – a lot of people would rather look at a movie of life than live, see? See, it's safe, because one really never lived it.

They're usually a derogatory or unhappy state of affairs of some kind or another. And they're often quite – they're not well plotted. There isn't anything very good about it. It's messy. But in running the incident out, of course the false track is part of the incident you're running out, right? So the pc in running these two and a half hours gets the sensation of running several million trillion years of track, very often, except it doesn't take that long to do it.

Only he would gasp, if he thought he was having to scan through many trillions of years of track. This would just fill him with "*Uhhhhh!* Oh, no!" you see? The time factor is too great. When he really thinks of the number of pictures there could be on just one trillion years of track, you see? He'll say, "Well, am I going to be here the rest of the night?" You know? This is the idea he gets in session. Well, the longest it could take if it were one for one would be a couple of hours.

Anyway, the somatics being wrong, and the scenery being wrong, and the character of the scenery being wrong, the whole thing is therefore a lie. This is a lie about time. It tells him where he has been, when. When he wasn't there. It puts trillions of years into two hours. There couldn't be a fancier lie about time.

Now they very often have wheels running over to the side with numbers on them. So you can get all the dates you want on the side of the picture. Sound familiar? But a thetan also can do this. He also can visualize numbers to give himself – "years ago," and that sort of thing.

Now, the one thing you can be absolutely sure of – one thing you can be absolutely sure of, with false – with – on a question of false track and dates on false track, and that sort of thing, is that there are no GPMs that I know of – there might be signs of them implanted on the false track, but no actual, runnable GPM could possibly be on a false-track implant basis. That would just be totally pointless. In the first place, you can't, on a false-track gag, get a guy to go over the top of the Ferris wheel several times with the full kinesthesia and motion, don't you see, and have him struck from both sides with all kinds of firings and that sort of thing. So you know – you know that if you're running a GPM, that you're not on false track. Otherwise, beware.

Now, it would be adventurous to say that you know you are not on false track if you are running this lifetime. I'm afraid that'd be an adventurous statement, however, because I've seen some false track with brownstone houses on it that I could never account for in this lifetime.

Now, many a pc – many a pc starts to recover his sanity by just getting him to run, entering the room. See, he can verify that that is the picture. He walks in the room and sits down in the chair, and then you have him close his eyes, and he walk – he runs the incident of walking in the room and going and sitting down in the chair. Now he knows that's his picture, and

he knows that is present time, and he knows it isn't an implant; makes him feel pretty comfortable. Kind of a weird – a weird operation. But don't discount it as its value in this sort of thing. Because of course, a total swamp of a memory is the target of this, and a desire not to go back into the past – these are the immediate fruits of it.

Now, let's look at actual track. What about actual track? Can you also find actual track? Oh yeah, that's pretty easy to find. It's pretty easy to find. GPMs are very easy to find. The dates of GPMs, this sort of thing. That's all perfectly accurate, don't you see? But you're always walking there with the possibility that you've got some false track may turn up on this pc. So there's two things you want to know when you're – when you find an incident and date it. Two things you really want to know is one, does it contain opposite-firing items? Like – that is to say, is it a GPM? And the other thing you want to know about it, does it contain false track?

Not, does it contain any pictures? This very often will not register. When I say, "false track" I'm using a term that we would use but not necessarily on a pc. Better to say, "false past." Does it contain any false past? Because all these picture implants have the ambition of teaching somebody a false past.

Now, you need all this data. You need all this data, as discouraging and as upsetting and as miserable and as disheartening as it is. And I know you will go home tonight and lie down and say, "God, that's terrible. *Ooooo! Aaaaah!* Are my pictures real? Am I really real?" Remember the old lady that the robbers caught, and cut her clothes up, and when she finally got home her dog barked at her, and nobody knew her, and she finally decided when she sat down, "Can this really be me?" you know? She herself didn't know her after a while. Well, there's no particular reason to get in that state, and it's perfectly all right if you do, because it's simply a restimulated state. And the cure of the state is, when dating, just make sure that you don't have any GPMs in it, or if you do, maybe you're looking for GPMs.

That's – none of the – neither of these things debar you from running the engram. But let's just make sure we know what we're running. You scan somebody through a GPM, and you're going to go blang-bang-bang, and he's going to stir it all up, but he can't see the pictures, and you don't know what's going on. It's much easier to just – not move him to the beginning of the incident but move him to the first pair of items. And you don't move anybody anyhow. You just say, "Give me the first pair of items in that GPM," see, after you've – if you want to establish what it is, you haven't got a pattern, it's off-date, and that sort of thing, just what are the first pair of items? He'll give you something. Work it out. Muddle through.

When you've got it all straight, why, you can scan him through the whole incident. It's perfectly all right if you do that, also. But on false track, what it tells you is be very, very alert to getting a wrong date for the incident, and a wrong duration. Because any incident which contains false track is of very short duration.

How long does it take to give somebody a feature-length picture in 3-D, with complete somatics hitting him in the breadbasket, of several trillion years? If you only give him a few pictures of each? See? Doesn't take very long. Well, that's the criteria.

Now the Darwinian theory – now, I'll give you some idea of the influence of false track upon this society. The Darwinian theory, which probably influenced Pavlov to the

greatest degree, is just an implant. That is an implant from man to mud. And it starts out oddly enough with the goal, "to persist." Starts with the goal "to persist," which I consider very, very interesting, because there's not another item in it. There isn't even, "not persist." There, you see, they didn't have the word, you know? They didn't have a double-firing item.

And then they show you your arrival, which you... See, actually they have you in a cell for a while, so they show you being in the cell, and then show you arriving in the room to be implanted. Got that? So you've actually – if you were conscious when you went in the room, it – you've got now two arrivals in the same room, see? And then they show you – complete with pictures, not unlike a modern motion-picture screen – they show you all that has happened to you, very briefly; they give you background on how mean you are, and then they show you getting implanted.

And actually the implantation takes place – the picture never touches the pc – I mean, never touches the person being implanted, but simply stacks mass around his body. All the time he's looking at the picture he's having hell knocked out of him many feet away from the picture by electronic mass stacking around his body. See, he's being hit with waves around his body, you see? So he – this mass gets associated with the – you know, it holds it in the picture, and so forth. And there isn't another thing said. There's not one word said.

And one of the things you've got to be careful of in running false past is getting the pc all mixed up with giving you a fantastic number of items, or something like this. You understand? But in this particular Darwinian one, nothing is said. You occasionally do get something said in one of these things; you do sometimes get sonic in these false past lives, or you get conversation or you get this, or you get that.

But beware – beware of running things in incidents which aren't there. It's almost more deadly than missing things which are there. Don't overrun these incidents. You know, you can take a GPM and you could just pull conversation out of it by the hour. Did you know that? And every item is wrong.

Did you realize that? The guy is sitting there in the middle of the GPM and you don't know what the goal is, and you don't even know that it's this type of GPM – you might have landed by accident in the middle of the Helatrobis Implants, or something of the sort. Maybe the goal is "to leave." And he just gives you item after item of goodbye, farewell, adios, you know? And you know, he just gives you item after item of goodbyes and farewells – it's just the goal "to leave."

It's just "leave," "nix leave," "absolutably," see, "left," "not left" or "nix left," "absolutably."² You know? He's giving you wrong items. And you'll pay the penalty for getting wrong items sooner or later – the whole incident tends to fold up. If you want to see an incident get crunchy, get a wrong date, a wrong duration, or run things out of it that aren't in it. So this is a point that you have to watch.

Now, this incident – this incident, now with a wheel dating device which gives you a

² Editor's note: The Helatrobis line plot had an established pattern in which the goal appeared in different forms in the items. The above examples are based on such items from the known pattern. More about it can be found in the lectures and bulletins of May and June 1963.

series of numbers that gives you – gives you the time of these events, shows you being implanted, shows you finished implanting, shows you leaving – being pushed out of the implant room, even shows you a couple of your fellow crew members, or something like that, there, who are tied up ready to be put into the room, shows you being put aboard a spaceship, shows you being taken to another planet, shows you being dumped in the sea, and shows you start from the sea and become seaweed and become this – and to work up stage by stage – giving the millions of years which elapse on each step, see? And you go on and on up the line, each step – each step – each step on an evolutionary channel, and you run all the way through on these evolutionary channels. A lot of this stuff starts looking awfully 3-D after you've been looking at them for a while, and shows you eventually arriving at the state of being a man. See? Gives you a bit more louse-up in the way of pictures ending – pictures beginning, something of this sort.

And then they push you out through that exact corridor, past the exact two dummies that are tied up, to the exact spaceship, put you in the exact capsule, drop you into that exact sea, and expect you to make some seaweed and go on up the beach. We were fooled only to the degree of some of the incidents of *What to Audit* are actually out of that. Some of the incidents of *What to Audit* are actual, some are out of that Darwinian implant, see?

Now, that's very interesting, to recognize how they can make you live your life twice. Because that one pretends to go into the future, not into the past. Gorgeous louse-up, see? I know, I caught this with myself, but after they dumped me down at the bottom of the sea, I said "Ho-hum, skip it!" And went over and picked up a young fisherman's baby, and so forth, and hung around there for a while, catching my breath. Didn't bother to go through all this, seemed pointless. [laughs]

But, the idea... that's very finite. That's a very short time ago. That's only a couple of hundred million years ago. A lot of characters around here got this, most of them become scientists. That actually is the sole foundation of the Darwinian theory. That's the lot. Evolution: there's no such thing. Bodies don't evolve. They deteriorate, but they don't evolve. You can trace all kinds of reasons how they evolve, and why they evolve, and you can figure it all out, but the truth of the matter is when you get horses on a planet, somebody came along and mocked up some horses! Now, they also mocked up these horses with the capability of growing hair or not growing hair. You've got adjustment factors, but not evolution factors. So you confuse the adjustment factors and prove the whole theory of evolution. And now you know man came from mud, and you can write a book like Pavlov and get the whole world poisoned. You see how this one goes?

All of this is based on what? It's based on errors in time. Errors in time. Because an individual has this incident: It's a wrong time, wrong place, going wrong the whole way, and it took up two hours and actually looks like it takes up seven million, see? There are such incidents.

Just before the Helatrobis Implants they were practicing these. Just before the Helatrobis Implants, you're liable to pick one up on a pc, within the few hundred billion years earlier than the Helatrobis Implants, or perhaps even after the Helatrobis Implants, you're liable to pick up one of these false-track incidents. So they last – they're liable to be found

almost any place.

Now, if you know that these things exist you can whip it. See, it's all in what you – what you know exists. When you first collide with one, you're going to be "Gee-whiz!" you know, and you're going to be much more nervous than you need to be. If you know there is such a thing as a false-past incident and you check up for these things – at the risk of invalidating the pc's actual track – you get yourself sailing along there, and you got this incident, and it's at forty-four trillion years ago, perfectly valid date, you see?

The reason I'm talking to you so strenuously about this is you're just about to be correcting somebody's dates. As a matter of fact you were at it today. You start correcting the dates of incidents and you're going to run into this other phenomenon. It's going to drive you mad, man, if you don't know it exists. You can't correct dates on a case unless you know this other phenomena exists, because it's full of false dates, see?

Pc and you could work at it, correcting false dates – I don't know, another couple of hundred hours, all out of one two-and-a-half-hour incident. The thing to do is to, when you start correcting dates of incidents, the first thing you should look for is an incident that contains a false past. Not an incident contains false dates. Don't worry about false dates so much. You just want false past.

But, remember that it can also contain a false future. So that mustn't be totally dismissed as a possibility. Fortunetellers practice that to this day; it's very popular – false futures. They get you sitting over the crystal ball, you know, and they say, "I see a dark man coming into your life. And he'll be six feet tall if you give me two bucks, and he'll only be five foot eight, if you don't give me..." They're tailor making future. And most fortunes depend on the fact that pcs have future implants that they dramatize, and tend to dramatize. They want to always know about the future. They're really not nervous, they're just dramatizing an implant.

You must ask for false past. That'll give you the most loused-up, because future doesn't, too often, contain dates. But also check for false futures – an incident about false futures. And between the two of these things, why, you're all set. False present, well, everybody knows it's false anyway.

The task is not a very difficult one, providing you know this information. As far as GPMs are concerned, you go back on the track on GPMs, and you got GPMs at eighteen trillion, trillion years ago, and ha-ha, they start banging you in the head and firing left and right, and you're going over the rolly coaster, and you're doing this and you're doing that. Yes, there's always the possibility there could be an implant that also refers to this GPM, but that cannot be done.

What type of equipment is used now, in order to implant false dates, and so on? It's usually quite – it's quite varied, but it really never moves off the basis of something you look into or something you look at, attended by electronic blasts. And that's the common denominator of all such equipment.

In other words, you can have a room, and the person is put on a bed, and the screen and so on, is at a diagonal up in front of them or at the other end of the room, and it shows a

three-dimensional view of events or something like that. Meantime the person is being hit with this and that. It could be as simple as some kind of a scope that has a movie running in the back of it, you put your face or your face is put up to this scope and anchored there with some electric blasts, and at this close range, why, the thing runs off at a mad rate, and there it goes, with appropriate jolts in the right places.

It could also be – it could also be a full set which is lugubriously and... this is earlier track when they didn't mind mass so much. If you find any back there they probably have full sets connected with them. They move them like a stage set. One of the trick ways of building these things, you take these two crayons here, you notice that it – that they are not a consecutive line if I hold them like this. And if you pull them down like this, they look like they're a consecutive line, don't you see? But there's a hole between the two of them. So the set moves up and then goes this way around the person. You understand? If a person is anchored there on a stake, or something like this you see, when they – when the set moves then, why, they just jog the set. And he passes through this slit, which he can't see.

Looks very mysterious to him. He's in one environment, total 3-D environment, he's in the next environment, total 3-D environment. After his sonic and visio picks up a little bit, however, he can hear the scene shift. They really make a lot of noise. And that type of thing, by the way, is used in some very early implant serieses types of pictures of this kind.

The Helatrobos, the Bear and Gorilla and Glade Implants, none of them use pictures. They sometimes – there's only – the only picture I know of used in the Helatrobos Implants is on a railroad on which you travel sideways at a vast rate of speed. And when you meet the railroad, when you come down to the railroad, you'll see that there's a section house right at the point where you're put on the track. There's a house there, see? And then as you move down the track, just before you move down the track, a board goes up in front of you, and it's the same section house. So actually you're moved at sixty miles an hour sideways with the same section house sitting in front of you. And this is supposed to confuse you enormously. But almost any thetan, no matter how anaten he is, can see that it's just a board shoved up in front of him.

In the Gorilla and Bear GPMs, and so on, they do put a figure on the cart with the thetan. They've – there's a guy in a pink shirt with a monkey peeking out from behind him, put on the ride carts. A guy in a pink-striped shirt – very, very interesting. That's their – that was their badge, the hoi polloi. And you'll see this bird with a pink-striped shirt. Sometimes you have a gorilla in front of you. Sometimes it's the gorilla who is spitting things at you, and that sort of thing.

They use figures. But this is not the same thing I'm talking about. Don't think you're mixed up in one of these things just because in an implant, why, somebody jumps up with a picture, see, or something like that that's just a momentary picture. This is not the same intention. That's just to get you to make pictures, or louse up your pictures, or something like that. No, we're talking about another type of incident, another type of incident entirely, where you're hit with electronic blasts, at the same time you're hit with a series of pictures, which purport to be a past or a future for the individual.

And when you run into that one – when you run into that one, why, if you don't recog-

nize that these things can exist, why, you've had it. Now, this also gets in the road of running an actual incident. You've got an actual planet-builder incident, and it looks pretty wild to you. And it doesn't look like the pc could possibly have done it, and so forth. And you date it, and it's got a perfectly right date, and so on. And you've got no read of any kind on false pasts or anything of this character, and yet there's that picture and it seems very incredible to you that the pc could be running this at that particular level or line, and that sort of thing. You can get tangled up on this, but just don't forget to run the incident. Get tangled up all you please, but run the incident. If it's a right incident, it's a right incident. If it's a wrong incident, you'll never be able to find the beginning of it.

About the most maddening activity you can get into is get into one of these false-past things, and go whirring along at a mad rate trying to find the beginning of the incident. Of course, you never make it. You eventually will find a beginning of an incident, but it'll be an incident of such fantastic magnitude that you've got yourself... Aw! The hell with it! You know? It could take you four, five, six sessions, just to try to find the beginning of that sequence of events. Well, there's no sense in beating your brains out. If you can't find easily the beginning of an incident, you better get interested in whether or not this thing has got a false past or a false future in it.

That all depends of course on having your date right. Now, how do you clean up somebody – how do you clean up somebody with something like this? Your approved technology at the present moment is clean up his wrong dates.

I'm giving you this material because right now some of you are engaged in running a Prepcheck on wrong dates. And it's a very good thing you are. You're getting tremendous tone arm action, you're getting results on this sort of thing, and this is all a very happy thing. Remember this: When you start correcting dates, the first thing you're going to run into is any false-past or false-future incident that you have triggered on the pc. And you're going to run into it head-on. So you beware of redating. Don't redate incidents endlessly.

The first order of business is get in there and pitch on the subject of an incident containing a false past. And when you've got that found – because it'll be there – when you've got that found, and when you've got it run... Don't just find it and date it and walk off, because look, you're not going to date anything else from there on except the track that is in it! You can date endlessly. You could run a pc maybe thousands of hours, cleaning up this false track which didn't exist. They can see it and so forth.

So, look, if you got your hands on an incident, now, here's one of your rules of the game, when you've got your hands on an incident – even though it's hell to run and upsets the pc, and everything else, and so on – when you've got your hands on an incident which contains a false past or a false future, you finish that incident. You understand? Finish it from one end to the other. Do anything necessary to get it the hell off the track.

The best way to handle it, of course, is with R3R. You just do standard R3R on the thing. And remember that its pretended duration will be in the millions or billions or trillions or quadrillions. And its actual duration is probably in the matter of hours – at the most a day or two.

So I have to give you all this data now, and it's a good thing that it's turned-up, be-

cause you just start correcting dates on a pc and about the first thing you're going to trip into is the phenomena of false past with all its attendant false dates. And the moment you get collided with one of those things you've had it. You want to do a pc an awful lot of good, however, get rid of one of them. Don't mistake me, they're hell to get rid of. You take the pc to the beginning of the incident, and he goes to the beginning of the incident. Only the beginning of the incident is also inside the incident, as well as at the beginning of the incident. You get the idea?

He finishes up – he finishes up the incident, he leaves the incident at the point where it says he left the incident, but that's a picture of his leaving the incident, and you haven't run out his leaving the incident, you got the idea? These things usually have a minimum of two beginnings, identical, and two ends, identical. If you know that, why, you can sometimes pull the fat out of the fire. This thing – you don't do anything with it, unless it starts running badly. If it runs badly, why, re-duration the actual incident itself, and square it around, and just do a routine, workmanlike auditing job. It doesn't need anything extraordinary about this thing. The pc will eventually plow on through it. All you need is very standard auditing. Very standard R3R, just its usual steps.

You get into a fight with the pc about the thing, however, it's always perfectly kosher to tip him off and say, "Well, are there two beginnings?" Ask on the meter, "Are there two beginnings to this incident?" *Pang! Pang!* Well, you know you got a false past incident, see? "There are two endings? The reason you're having trouble with reaching the end of the incident, are there two endings to this incident?" *Pang! Pang!* "Yeah, you got your two endings on the end of the incident."

Pc says, "Huh! There are!" As well as another beginning and ending of the incident that merely says it begins and ends at this point, which is inside the point when it really begins and ends. Talk about confusion.

These things are confusing to handle. But standard processing, right as of this minute, handles them. And you're going to run into them head-on, the instant that you start correcting anybody's dates. It's one of the first things that'll raise its hand, and elect to fall in your lap as an auditor, is one of these incidents.

Well, what if you're – what if you're in X Unit, and you've been ordered to do a Prep-check on wrong dates on the pc, and so forth, and the pc starts sliding all over the track, and you're not supposed to do anything but correct that? Let me tell you the wrong thing to do. Let me tell you the wrong thing to do: Get your hands on one of these false-past or false-future incidents that's full of dates, get it dated precisely and then walk off and leave it and try to do something else. You're not going to get anything else done. I can tell you that's wrong. I won't tell you what else to do, because I'll probably contradict the orders your Instructors will be giving you. But I can tell you what not to do. Don't walk off and leave it.

Because you have run into, restimulated and excited thousands of dates. Hundreds or thousands of dates have been excited, just like that. And if somebody didn't have that pc's auditor's report, and that pc ceased to be audited in some way, somebody would be wading through that for a long time trying to find the actual incident again.

One of the rules of auditing, one of the little rules that goes along with: don't talk to

people who are unconscious, you know – around people who are unconscious, and don't – and all aberration is at the bottom of the aberration a lie; a lie causes aberration – along with that is the fact that when you got your paws on something, you handle it. That's a maxim that I go by in my own auditing. When I find that lying under the needle of my E-Meter is something that's bothering the living daylights out of the pc – not because he put it there, but because it arrived there in the course of auditing – I handle it.

I don't expect the pc to go on struggling with this thing as a PTP while I do something else because "I'm supposed to." When I get my hands on something in a case, I handle it. You understand? It makes for a little – much less trouble with a case. You get your hands on something, your – this thing is going crash! on wrong dates, crash! on wrong dates. Well, *rrrr!* What the hell! You got the pc right there on wrong dates; what are you going to do now? Are you going to skip that? You see? Walk off and leave it? Well, you know it's top-level stuff. How come wrong dates? What are these wrong dates all about? Let's deal up a few of these wrong dates. Let's find out what this wrong date thing is. You're unfortunately liable to find yourself in a process you're not permitted to run.

Just remember this. If you louse up your pc – well, I always make sure that you get two thousand words! And remember this: I never ask how it was done. That's good enough, see? Somebody loused up a pc, why, bang. I'm very interested at that point. He loused up the pc. I'm not interested if he loused up the pc because the Instructor said, or because he did, or because the bulletin said, or the this said or the that said, or something else said; I'm just interested in that he loused up the pc, see? I have a very short-circuited view of the whole thing. Because auditing is auditing. You're supposed to do auditing. I can lay you down thousands of rules on the subject of auditing. I can guide your footsteps very directly. I can give you information on the subject of auditing. I can do everything else. But I can't sit in that chair and audit your pc. You understand?

And auditing, from my point of view, is supposed to produce beneficial results on a pc. That's my narrow-minded attitude. You understand? So that here's the – here's the pc – here's the pc, and we're supposed to produce good results on the pc. Well, if you don't know how to do this or how to do that or something else, I can show you how to do this or how to do that. Well, you can't ever tell what is going to come up in this case. When it's going to come up. You're not – you can't tell.

Now, when you're auditing a pc – when you're auditing a pc, very often a pc comes into session in no fit shape to go on with what you're running on the pc. It's very heroic of you to try to keep on running what he's on, but remember that you can sometimes not accomplish anything by doing just this. You sometimes have to handle the pc, right there in front of you.

Now, similarly, you innocently set forward to do a fundamental action on a case, like straighten out his dates. And you suddenly see yourself staring down the barrel of the incident responsible for the wrong dates.

Now, remember, there's your big auditing cycle. Your big auditing cycle is to accomplish what you're trying to accomplish with the case. And you better figure out what you're trying to accomplish with the case that you're auditing. In this case you're trying to straighten out the pc's dates, right? All right, that's your big auditing cycle, right? All right. So, you're

trying to straighten out the pc's dates. Now, if you go ahead and handle his lumbosis, God help you, see. I mean that has nothing to do with it. You're trying to straighten out his dates. That's a Q and A or a mess-up, see?

You're trying to straighten out the big auditing cycle on this pc – we're going to get the wrong dates off this case – and suddenly you are presented with something which is outside the perimeter of the permitted process, or something like that. What do you do with it? I can tell you what not to do with it. Neglect it. Now that's what you must not do with it. Because you very often can't get your paws on it again. You've made a big problem for somebody else. You can't straight – when you've f... listen: When you've found the source of the pc's upset, what other source is there to find? See? You got that? So if you're supposed to be running, "Which ruddy rod have you stuck between your ears?" and you all of a sudden find yourself staring at the source of his upset about ruddy rods, I can tell you how not to help the pc: Ignore the fact that you have found the source of it. This results in an invalidation of the source, and nothing happens. You understand?

You have to ask yourself, why are you running this thing about ruddy rods between the ears? That's the big auditing cycle. Don't ever subordinate your big auditing cycle to the minor auditing cycle. You understand? See, there's your big auditing cycle, and then there's your process auditing cycle – you're supposed to flatten this process, see? But your big one is what you're trying to – intend with the pc. And then you're – what process you're running on the pc, and then you've got your other auditing cycle, which is your repetitive give and take of auditing commands, don't you see?

All right, the second that you... some auditors can just get on this give and take of auditing commands and neglect even the process they're trying to flatten, see? And some, running the process they're supposed to flatten, actually can run into the denouement of the big auditing cycle. That's the end, see? The big auditing cycle – they've collided with the thing.

This person has been terrified of ghosts. This person has been terrified of this particular subject. Every time they go to bed at night, why, they won't turn out the lights. You see? They've been this way since childhood, or something of this character. And all of a sudden, you're running this process of some kind or another, you're straightening out something, and the big auditing cycle turns up and drops into your paws. See? They say, "No! Not really! I'm a ghost! Ha-ha! Me! Ha-ha-ha! What do you know! I've always been afraid of myself." Now, what are you going to do from this on? What, are you going to be a complete knucklehead? Going to be a complete jackass? Having found the source, now you're going to try to do what? I'm just bringing it to your attention, what else is there left to do? There isn't anything else left to do.

Somebody cognites his chain level – his level item assessment³ out. "Say! What do you know! It's a so-and-so and it's a *th-lul*, and it's a *du-du-ddl*, and *fa-dt-d-d-dt!* And, ha, well, ha-ha! What do you know! That's in the bag! That's why that level operated!"

And you say, the level. You say the level, "be leery of cats." Tone arm is down. Now,

³ Editor's note: refers to the preliminary step of R3R where the chain to be run was assessed out. See HCOB 1 July AD13, Red Volume V, p.299 for further reference.

what are you going to do? Flatten the chain? You have to ask yourself this question. What chain? What chain are you going to flatten? Where? It now isn't! That is known as your big auditing cycle. That's what you're intending to do with the person.

If you don't know that, I can see you someday auditing a person up to OT, and they arrive at the point of OT. And you get very upset, because you haven't completed your auditing cycle! You understand? So that's present in all auditing. Having found the source of the aberration in wrong dates, what you going to do? Look for another source?

What you haven't got in your mind, then, is the big auditing cycle: What were you intending to do with the pc? What does this process intend to do with this pc? Wrong dates? Well, it's supposed to straighten out the pc's wrong dates, what else? And all of a sudden – you didn't even ask for it, and you possibly in a lot of cases won't get it right away, unless you're running R3R work – all of a sudden you've got your paws on the source of the pc's wrong dates! What you going to do? Run the process, of course. What nonsense.

You're going to go on and say, "Give me another source for wrong dates. Give me another source for wrong dates. Give me another..." He's just given you *the source* for a wrong date, see? What – the second that you say, "Give me another source for wrong dates," what are you looking at? You're looking at invalidation of *the source* for wrong dates and from that point on you have thereafter defeated your auditing. See that? So there's where it'd go. So all of a sudden this guy suddenly says, "Hey! Hey, hey, hey! There's a *bup-ut-ut-it* and a *zu-zuz-up* and all that track I thought I – *uh-mmmulp!*" You speak about wrong dates, well, there it is, see? What are you going to do?

Now, you make your peace with the Instructors, but remember I count on you to handle the pc.

Thank you very much!

BETWEEN LIVES IMPLANTS

A lecture given on 23 July 1963

All right? Okay. What's the date?

Audience: 23rd.

Twenty-third? Well, what do you know!

All right, 23rd July AD 13, Saint Hill Special Briefing Course.

I had two choices here. I'm working on an assembly line process for you. I'm trying to smooth out your dating problems and that sort of thing. I'm collecting a lot of information on that, all of it very important as far as tone arm action is concerned. I followed through that wrong date or bad dating or misconception of date is the reason the tone arm action is... and I found out that the pc's time sense is his basic aberration. And therefore I'm working like mad to get you processes that rehabilitate a pc's time sense.

Of course, the most exaggerated statement you could make is the time for a pc to run engrams is when he can call the date. And if you did that – if you did that, it'd be absolutely sure that the pc would be getting tone arm action on R3R, see. And discovered a new run-down of R2H. You're using an R2H in a training pattern right now. Well, R2H exists, of course, as a highly therapeutic process, too, prac... more or less the way you're doing it.

But I've been refining it. Refining it. Getting it down to about a ten-step action, which gives the maximum tone arm action. Aims straight... I looked around for something I could use, you see, to rehabilitate a pc's time sense, and there it was lying right in our laps. And so I'm refining that to just rehabilitate a pc's time sense. And it does wonders for a case. And finally found that I may be looking at a one-shot OT process. And simple as though it – as it is.

Actually, it becomes much simpler as a process to run than the one you're running right now as R2H. But that is not quite ready to release. There are a couple of questions that are being – still kicking around about it, such as what happens when the pc gets into an engram and you say, "When was that?" and he is very surprised indeed to be in this engram. And then you say, "Well, its bypassed charge is so-and-so and so-and-so." And he has to put that together for you while sitting in the middle of one engram – all very interesting. I've got to answer a couple of questions like that and then I'll release it.

The common denominator – which is what I've been looking for – of case levels is simply that and no more. It's just the time sense of the individual. That doesn't mean it's how well-timed he is, or this doesn't mean that Gene Krupa and so forth – that's rhythm sense. But just time sense. The whenness of things. And the deterioration of this sense is what gives you the case levels. And that is about the end of that.

There's tremendous ramifications to this. There are lots of other things that can make the pc unhappy or aberrated or significances by the ton. But a common denominator of case levels is time sense. And knowing that, then you could probably establish case levels, which we were trying to do by test a short time ago, by some kind of a test of time sense. The whenness of things. As simple as this: "What's your earliest memory in this lifetime?" you see?

And the pc says, "Well let's see, I can remember back to when I was twenty-nine," and so forth. You've probably got a case level – probably a case level 7 or something like that, you see. We got a case level 6, something like that.

And you say, "Well, what's the farthest back you can remember?" and so forth. And he's trying to puzzle around and he looks awful cloudy and you wonder what he's puzzling about so hard. And he's trying to find out if he can remember back to breakfast. Well, you've got a case level 8, don't you see? Or, if he can't grasp what you're asking him. No, but it is an indication here, of this type of thing. Your best – your best case programming, however, is a discussion with the pc about what process – because you're dealing mainly with long-time pcs – what process have they been most interested in. And you're liable to get a very interesting ramification out of the pc, is that they have never been interested in the higher-level process. They were really making gains when they were running – and they will give you some other process.

And that merely gives you the class of process, you know. That doesn't give you just – don't continue to run the process, necessarily, that they were running, that they were interested in. But it tells you where the interest of the pc is along the case levels and therefore you can run the pc and he will feel that he can do these processes. And you may be running a pc who is, uncomplainingly and actually unaware of it himself, running processes he doesn't feel he can do. You understand? You may be doing something like this, you see.

And the pc's sitting right there slugging and trying, and sweating at it and that sort of thing, and you just start being – just a discussion of interest, see. Interest discussion, that's all. And the pc says, "Well, they so-and-so and so-and-so" and they were really interested as they were doing some 8-C at one time or another and they found that was terribly interesting, and actually there's no process more interesting than that 8-C. Don't you see? You've got your answer right there. Now, they've done an objective – an objective type process is one that they feel they can do.

These are all on the lines of estimation of cases, don't you see? But right now I have a little assignment for you, is just have a discussion with your pc on this basis.

There's a bulletin will be out tomorrow on this subject that's scheduled to go to HGCs. But you will find it considerably interesting and it tells you more about this discussion, but actually more or less just what I've just told you. Just have a discussion with your pc as to what process has been the most interesting to him and what does he consider an interesting process and all that sort of thing, and put it down in your auditor's report. And don't necessarily shift his gears, but this is – might be very revelatory to you and also to the pc.

Now, I have a reality on doing a process that is too steep. I've never had this reality before and – this is the subject of today's lecture – and I got confused and – didn't much appeal to me. Process was just a bit too steep. That's a brand-new experience for me, but I can sym-

pathize with the guy who's wading along now and doing that sort of thing, running something that's a bit over 'is 'lead.

And I had some adventures recently that I'm going to tell you about in this lecture. And if any of you faint or anything like that, why fall straight back in the chair, not into the aisle and so forth. And if you start screaming or anything, why the – I think the pavilion speakers are on, aren't they? You can go out there and scream. Anyway, the difficulties – the difficulties of exploration are based on the fact that you can most easily go when you know.

And I think the British motorist deserves the gold medal amongst all gold medals for knowing before they go. I remember one time getting a routing from the Royal Automobile Club for an African trip and they gave me little cards. And everything was measured off in tenths of a mile. And I read these cards all over. You went over the top of a brow of a hill, you see, and there was a small cairn of stones to the right and that was 1.7 miles from the point you had just left, you see. And then down at the bottom there was a small bridge and it had a barn on the right, you see, and that was 1.85 miles you see. And that – going along and – I read all these cards and didn't bother to take the trip because it was ... [laughter, laughs]

But exploration has its disadvantages. Definitely has its disadvantages, because more than once, why, one finds himself out at the end of a ridge and there's no way back – he can't get up the sheer surfaces he's come down – and he looks in front of him and he finds there's no way down. And that is it. And so it can be too much of a good thing, not knowing before you go.

You actually can't know too much about where you're going before you go when you're doing anything like exploration of the time track. And I've been fronting up on this for some little while and I find very few times have I had any faint heart or upset along that until just recently. And I got the creeps, frankly.

And well, it starts like this – it starts like this: I was up in the Van Allen belt – this is factual, and I don't know why they're scared of the Van Allen belt, because it's simply hot. You'd be surprised how warm space is. Get down amongst the clouds and so forth, it can get pretty cold and damp. But you get well up and sunlight shining around and that sort of thing, it's quite hot. And the Van Allen belt was radioactively hot. A lot of photons get trapped in that area and so forth. And I was up there watching the sunrise.

Well, that was very interesting. And my perception was very good, and I was taking a look at Norway and Essex and the places around, you know, and getting myself sort of oriented. And then something happened to me that I didn't know quite what had happened to me. I thought some facsimiles must have appeared in front of me, but they didn't look like facsimiles. And some other things happened and I had a feeling like I might possibly go into the sun. And a few other little uncomfortablenesses there where... That wasn't what awed me. But I got confused. I got confused because the sun was suddenly larger and then it was smaller and somehow or another I was doing a change of space process that I myself was not familiar with. And it made me sort of bite off my thetan fingernails just a little bit, you know?

And I said, "Well, I'd better look this over a little more thoroughly." And proceeded to do so. And a bit later that day, why I did some reach and withdraw on the polar cap and so on – orientation. And we got quite a bit out of this because I was able to establish some reach

and withdraw process – I knew how the world must look to somebody who was in a body and had pictures appearing in front of them and that sort of thing. I knew they could get kind of queasy about this situation.

Well, that wasn't what overawed me. What overawed me was when I found out I hadn't been looking at pictures. That was upsetting, because... I was invalidating my own perception. It didn't look like pictures, don't you see. And I was busy invalidating my own perception and so on, and I wondered why I was nervous. That was what was really puzzling me. What was this all about? And I couldn't quite figure out what had happened and then I finally did find out what had happened. And I had actually appeared in a dispatcher's tower on Venus and had appeared back where I was above here. And had done it like that. With no volition on my own part at all. That was upsetting.

You start doing appear and disappear, you see, automatically and you say, "What's happening? What's happening? You mean to say I'm going to be prowling around in the stratosphere and all of a sudden find myself appearing and disappearing elsewhere without any volition on my own part?" Actually, I didn't think all this through until later.

But I thought, "Well, prowling around up here is a little bit over my head just now. And I'd better know a little bit more before I go."

So, that was some weeks ago, and since that time I've been exploring around and finally found out what I was looking at. And you talk about a fellow – he's brought home this nice pet, tame variety of snake, you see, and he's put it in a box. And then a snakeologist comes along and he says, "Good heavens, man! Where did you find that king cobra?" [laughs] That's the way I felt. I'd been looking at where you go every time you die, see? And I finally found out what this planet is and why life is so loopy.

Now, we've got some of this back in 52. Dishing it out intellectually; I had a good intellectual reality on it. We'd talk about between lives area and we'd dished all this off the cuff. This is not data which is unknown to us, don't you see? But that isn't the same as going there. That isn't the same as going there with your eyes wide open. And realizing that all you had to do was to be there at the exact point which you're supposed to appear at and willy-nilly you would have gone over Niagara Falls through the implant, you see? And that is what has happened to me last few weeks, and... So I've been studying this situation very hard and, as I say, I've come up with the data with regard to it.

Of all the nasty, mean and vicious implants that have ever been invented, this one is it. And has been going on for thousands of years. It's the most complete memory wipeout system and the biggest bunch of lies that anybody ever had anything to do with.

Now your understanding is that when you die, why somehow or another about fifteen minutes later you appear in another body. Let's look at this thing from a time disorientation basis. That is a lie. It takes sixty-nine days plus. More than sixty-nine days. And you very often go – see, this has upset some of our calculations. We've wondered what has happened to some of our people, why they didn't show up again immediately, that sort of thing. You've gone as long as eight or nine years between death and birth.

Now what happens – I'll just give you a fast rundown on this situation – what happens is, is you've got a compulsion to appear; this was why this yo-yo, see? You got a compulsion to appear at the between lives return-point.

And, of course, you just do a disappear at death and an appear there. You don't travel to there, see. It's all nicely implanted and you're supposed to arrive at this exact point. And having arrived at this point you go through the works. And the works consist of a false death given to you in pictures. You're caught there and beamed in, and you get a bunch of pictures which they have taken – these aren't your pictures – and it tells you all about the death you just died. Only that's not the death you just died. They give you a completely false death.

Now, this gives us a moment of pause, right at this point. This is alleged by the way, to be a fifteen-day time track. It isn't. It isn't. It's days, but it isn't fifteen days. And it says it's a fifteen-day time track, see, and this is fifteen days from where you last were. It starts with a repetitive picture which gets you good and lost. In other words they keep giving you this same picture and this same picture and this same picture so that when you try to back out of the incident you keep running into the same picture, and you keep thinking that you've got the beginning of the incident and you haven't. You've got a picture in the incident, see, and then you go to an earlier picture and you think you've got the picture now that starts the incident, and that's wrong, too. So the trick is to get ahead of it.

But that is – can be varied one way or the other, and I needn't go on about this, but usually you see an actual scene and then you see a picture of a scene. So then you can't really get outside the pictures in order to begin the incident, see, so you can't find basic on the incident. That's all that amounts to.

All right, well this whole series of pictures represented as happening in the space of fifteen days, counted off day after day, gives you your death which is a false death. And it's not the right death at all. Matter of fact, in scouting this in session, I found a death whereby I got me 'ead blown off about 1150. And they showed me a picture of a death by exploding bombards. It was very interesting, because they didn't have bombards in 1150. Get the idea? They didn't have them for another couple of hundred years, see. They weren't common. So they slip.

But these pictures they show of your death are all Earth pictures. I don't know how we explain this. It could be explained by them coming down and taking some pictures. I'd hate to explain it so esoterically as they pick up somebody's photograph and photograph his facsimiles, because in this particular character it wasn't possible. Either that or they, in some fashion, preordain the destination of the society at that point and expect your pictures will be concerned with that, don't you see? But they are Earth pictures, and they compare to the historical periods of Earth. For instance, a death at 750 – you get knocked off your horse, or something of the sort or die in bed with your boots off, and you go up there and find yourself having died in a battle amongst knights. And have a helmet sitting on a cross as your grave and so forth. That's not your grave, but it's a Norman helmet. Interesting, you see. Messed up like fire drill. In other words, they give you the wrong death. That's the way it begins.

Now, you move up to a point called the year zero. And thank God they've got a year zero, because you can always date the incident by dating the year zero, because there is no

year zero on your time track. So, when you want to look – take one of these incidents apart for dating, always look for a hole. Look for a hole in the incident, you see, and you'll find something like, well, there's a year zero there. Well, good – date the year zero. For God's sakes, don't date the incident! And I'll show you why in just a moment.

Because they give you a future history of your life: This is going to be *your* life. Television program "This Is Your Life" has no bearing on the thing at all, but I often wondered why I could never bear the stinking program. But this is "This Will Be Your Life." And they now give you from the year zero, which they communicate to you as the year zero – this is given in another room. This is given in a room alongside – another chamber. See, your first fifteen-day period, that all finishes up, see – alleged fifteen days, see?

Then you go to the year zero, and this is a great big room – great big room. And this screen is a whitish colored screen – surround – a whitish surround to a copper grid. This copper grid is many feet long. I wouldn't – haven't tape measured it; didn't have a tape measure! I'm not really up there very high yet, I can't carry things around with me. Anyway, it's – oh, I don't know – at a guess, seventy-five feet, hundred and twenty-five feet, hundred and fifty feet, something like that, copper grid. And it's very long and high, but it's much narrower than it is long, don't you see? Be on the order of about three feet high and seventy-five feet long, or five feet high and a hundred and fifty feet long, something of that sort, you see.

And this has some compulsive effect upon the thetan, and the whole thing is to make him make pictures. And they don't show you your future life at all. They show you your – what happened to you at the year zero, at the time you entered the universe. Now it so happens that there are a lot of incidents where people have told you you entered the universe, and some happened not so long ago and some happened a long time ago. And there can be such a thing as a guard room or something like that, and there's a bunch of angels sitting around in the guard room and you walk in in a doll body – at the beginning of the universe, you walk in in a doll body, you see? Slight discrepancy there. You're madly out of valence, you see. That's you over there. But it's a facsimile of some kind or another. And the year zero usually takes one of these facsimiles.

Now, there isn't really a picture in the whole sequence of the next section of this. There aren't any pictures, you understand, except yours. So what actually happens is from the year zero to the year one trillion trillion trillion trillion trillion years in the future, you're given a compulsion to mock up your own track on this screen. And date by date by date by date by date, from the year zero forward to one trillion trillion trillion trillion trillion years, you're given a compulsion to put your time track up there. And all that's very interesting.

You finally come to the second significant date, which is one trillion trillion trillion trillion trillion years in the future. This is the wrong date, the wrong date cake if there ever was any. But you actually have put your own facsimiles from your own year zero forward to that far from what you considered the year zero. Of course, this makes a scramble, too. But they're just your own pictures. Remember, there wasn't a single picture in the whole thing except what you put there. But what did you put up there? Man, you put up the early implants – you put up the Glade, the Bear, the Gorilla, the Helatrobis Implants. You put up the whole lousy lot; entrapments and everything else. And you just did that, and this was probably in the

course of the next sixty days. Not fifteen minutes – sixty days. Long time, isn't it? Sixty days of restimulation. And wrong dates.

Those are all your pictures. You scan somebody through that sequence and what are you scanning him through? You're scanning him through the misdated Helatrobus Implants. You're scanning him through anything and everything that you can think of, all misdated. So you'd say, "Well, all right, you can't scan through these things, so it's impossible to get through it." And this was about the time I started to feel queasy and felt that I was just being run just a little bit over my head. I was scanned through it twice and I felt that was a little bit over my head.

Because to take at a gulp a scan through all of the goals of the Helatrobus Implant in one single pass, it made me feel just a little bit odd. And I felt, "This is a little bit too steep for me. I'd better find some way to take this thing apart so it can be taken apart."

All right, so there's this middle period. That's in the main room, the middle period. And how a thetan is moved through there I don't know yet. I think he must be moved there – through there on a very slow endless belt proposition. Very slowly. Fantastic slow speed! Because he spends sixty days going past this cotton-picking screen, see? It's not that big. Putting his pictures on it.

Now we get to the third sequence. And this is far more interesting because they furnish all the pictures, which I think is very sweet of them. They don't now try to pick up any pictures. They throw you, usually – nearly always the same sequence. This is a very, very stable sequence. It's a bunch of pictures, and they have some – there's a... they use a wavelength communication system, by the way. Thought-concept wavelength communication system is all I can make out of it. Not words. But you do hear some sound, and part of it is a baby crying, and they show you picking up a body and so forth. And then they show you departing. And of course you depart and then you get another picture of departing and you get another picture of departing, so you really never get out of that one either, see.

And then they show you a picture of being sent directly down to Earth and channeled straight into the body of a newborn baby. I think it's awfully nice. And you even hear the baby cry. I think that's good. That's good, it's very clever. And part of this – and all through this thing, you've got a false emotion of "We're just good Joes and we're doing our best for you." And you get the feeling, "Well, we've..." I can imagine – there's one thought concept in there which is terribly interesting, which I imagine you girls have occasionally been startled at, which is "We've treated you like a gentleman. Remember, we've treated you like a gentleman."

Anyway – you want to know why the girls are always wearing men's sweaters and so on. But the whole idea and the whole emotional tone that's shot at you all during the rest of this duress, knock-about, restimulation, misdating, scramble-up washout is, "We're being nice." See? As a matter of fact you'll find that this – I'll bet that you'll occasionally get a pc who will say, "Well, they treated me well. I couldn't get along without this." You know, that sort of thing. Because that's the prevailing emotion. No anger, there's nothing there. The light touch, see. The most effective possible touch.

Anyway, you then see a picture of yourself separating from this planet. And how they explain that I don't know, but it's sort of – it's just thrown in for good measure because it said so on the blueprint, I suppose. You've already been sent to Earth, you see, in a... the thing is kind of mixed up. And you even get a picture of yourself being scooted across a desert on Earth with yucca trees down under you and that sort of thing. And there you are. You're on your way and you're going down to pick up this baby and everything is fine.

See, you couldn't pick up a kid without them, you know? Ha-ha-ha-ha! You couldn't do that, so on. Magic, you see, they have all these babies beamed, you know. And all they do is ride you down the beam and you pick up the baby and you're all set. And there you are and so forth. And this thing, then, with the multiple end so that you can't find the end of it easily (you know, the end and then the end and then the end and then the end – which is the end? and so forth) finally winds up with what actually happens to you: you're simply capsuled and dumped in the gulf of lower California. Splash! To hell with you. And you're on your own, man. And if you can get out of that and through that and wander around through the cities and find some girl who looks like she's going to get married or have a baby or something like that, you're all set. And if you can find a maternity ward to a hospital or something, you're okay. And you just eventually just pick up a baby. You're strictly on your own, man. In a state of total amnesia and *gahh!* Having been lied to to this degree with your track all scrambled, see.

Well, in this sequence you're given a compulsion that the next time you die you must appear on the landing stage. And that's it. That's the whole ruddy, lousy, cotton-picking lot. This is an interesting – an interesting thing, because this is the most vicious engram I have ever seen set up. To scan through that thing is asking you to scan through a restimulation of a trillion trillion trillion trillion trillion years of your own time track. Just asking you to do it like – just like that, see. "Oh, that's all right, just scan through it, you know. Ho-ho!" Can't do it, man.

And to find the beginning of it – well, there are other ones with false beginnings and false endings so that you can't get out of them easily, but the time lie: this is specifically fifteen days. This is your last fifteen days, you see, on Earth, you know? Only it isn't. And it's not even fifteen days. And then the last section tells you that it's a hundred days long. You get a hundred days counted off to you in there. But it isn't a hundred days, it's more like about nine days. And then having channeled you squarely into the head of your new body, they dump you in the gulf of lower California.

Very interesting. Because by the time you get out of that, this is a type of facsimile that can't be run. Nobody has ever been able to approach even looking at it, so it gives you enough queasiness so that you just tend to back right straight off from the thing – how the devil can you undo that.?

Now, because you've been given such a – such a compulsion to appear there... Here I am up in the Van Allen belt and I take a look around and I see the sun and I get myself oriented and I'm just spotting myself around, you know, getting ready to flex a bicep or something like this, and I just glance in the direction of Venus and I go – I'm on the landing stage. See, the compulsions shift me in space. I didn't stay on the landing stage. Still, I went up and around the airport, took a look around the airport. I found, oddly enough, that I'd gotten curi-

ous about this place before, some hundreds of years ago, and had simply hung around for a while and hadn't gone through the implant.

But this has been going on for as long as you've been on this planet. There's lots of these – they run somewhere in the neighborhood of two to three per century. If you've been on this planet ten thousand years you've got – what? Quite a few of them. Figure it out for yourself. That's how many of these confounded things you got. And as far as I know it hasn't changed an iota. I could... I'm saying a little bit more than I know now. But I think it – it apparently was simply set up and it's continued on. There's been no vast change of pattern, as far as I know. But I'm prepared to amend that when I start looking at a few early facsimiles on it, which I haven't yet.

The point is this: the Helatrobos Implants, the Gorilla Implants, the Bear Implants, way back thetan fights and all of this kind of thing – you got through all that. You got through all that and you were still OT. They used to say about me that I'd never been the same after the second Helatrobos, you know? I used to occasionally snarl at people more than I used to earlier. But before I hit this place I was on the same post for eighty trillion years, same post, same name. Give you some idea of stability of identity.

Mary Sue gave the cue on this thing. She said, "Look at how hard they have to work to keep you from being OT!" Hey, now, that's quite a thought! Isn't that quite a thought? Hm? Now you look at this. You look at this, now. The complete idiocy of it. Somebody sits up on Venus – there are probably some other stations around up in the system. This one's on Venus. I notice that we all believe that Venus has a methane atmosphere and is unlivable. I almost got run down by a freight locomotive the other day – didn't look very uncivilized to me. I'm allergic to freight locomotives, they're always running into you.

Now we notice that Mars doesn't have any atmosphere either and won't support life. In spite of the fact that it turns green and red and purple with the seasons, it doesn't support life. We understand – there's lots of things we understand about this system – heh-heh! Isn't it? [laughter, laughs] But this is a carefully maintained station. And a space-opera, meat-body type society maintains it very carefully. They have a hospital, there's space craft hanging around there, dispatcher stations, landing platforms, this type of thing. It's all highly civilized, but they carefully maintain this one. And it's very interesting, they maintain this one. They've maintained it for thousands of years without any change. Why, it's fascinating. Why are they maintaining this thing? Why? Why is it so important to them?

Don't be deluded by the atmosphere they pump into you – the emotion they pump into you during the implant, that it's all for the best in this best of all possible worlds, man. It might be that, "We've treated you like a gentleman," but the fact of the case is, I classify that as a dirty trick. Why is it so interesting whether or not somebody gets off this planet? Well frankly, your answer is practically as good as mine. I could make a few guesses on this, but that's about all.

But the rest of this universe isn't run this way. It's a question of where *are* we? Why? Well, I know this: that onto this planet there's a great deal of dumping has gone on. Stuff from the nearby galaxy – not this galaxy but from the next galaxy over and so forth, is going on here. I know they take political prisoners and guys who they don't want around, but it's less

personal than you think. They just have excess population so they start to get rid of their excess population, you see? They've got a revolt, or you're on the wrong side of a war, or something like that, and they pick you up in droves and ice-cube you and throw you into a sea someplace.

I know this planet has been subjected to that and several planets in this immediate end of this galaxy have been subjected to that – that I know. But somebody must have taken a great deal of interest in this fact. And somebody must be awfully afraid. Somebody must be awfully afraid. You could almost say it isn't so many – how many are here, but it might also be a question of who's here. Think of the cost – now let's think of it in terms of just a society, you see – think of the cost of maintaining a huge station or several stations – its maintenance, light, power, wages. Think of maintaining it on a basis of hard work, because it is. Look at the volume that station handles. How many people die on this planet in any given day? Well that's how many guys are started in on the beginning of that line in any day. That's a lot of people, man! That's something on the order of two and a half billion implants every half-century. That's quite a volume. Of course somebody may not say that's a great volume, but look at the length of the implant.

Now, if it were a two-second implant, I would say well, yeah, anybody could handle that. But it – I know that it's more than sixty-nine days. And I know the stuff is ferried back here. Why, I think that's all very interesting. That this is a – this looks to me like a very expensive proposition. And remember this has been going on since before the days of Egypt. Way back. Without any change. What industry! What enthusiasm!

So we ask these various questions: Who's here, and who are we? See, we can ask a lot of questions out of this. I don't pretend to have the answers to these questions. There's no interpretation I'm giving it particularly beyond the interpretation – same interpretation I'm telling you about the room you live in. I've seen the room. And you're just beginning to look at it.

Now, the amount of duress necessary to produce a continuous degraded state can be measured thereby. Look at the hard work to keep people aberrated. Now, a few months ago I was telling you about if you were just left alone for a while, you'd snap out of it. Remember? If you were just left alone for a while, you'd snap out of it. The universe itself is therapeutic. But look at how hard they have to look at it. I know that in any given situation somebody has to be awfully active to maintain the situation in a bad state. Situations have to be maintained in a bad state, they just don't naturally exist in a bad state. And that's very definitely true of people.

If you were left alone, even if you could put in two or three hundred years at it, you'd start to snap out of your hop. See, you have to pick up the next baby anyhow, all off your own bat. Well, supposing you just picked up the next baby without the between lives implant to slow you down? Well, I find that would be quite interesting – quite interesting thought, because right there you're looking at world clearing.

We got several ways that we can whip this situation. We're actually talking about an existing situation. We're talking about the situation that your pc is sitting in, in that pc chair in an auditing session. There is his PTP: How the hell is he going to get out of here?

Well, I know how to get out of here – I could have went as a matter of fact. Just don't appear in this immediate vicinity of the solar system. Go back and find your friends and bring some battle cruisers in. But the point I'm making here is: The key is, the second you find yourself free, to appear, don't you see? Well, I appeared and I said to hell with that and stepped back up above here again. Said now what the hell's happened here? What's this funny compulsion? And ran that on down, that's it.

Well actually, it doesn't take much to get rid of the compulsion. Now, in exteriorization, it is very easy for a thetan to exteriorize if you have him be in some place he's familiar with. Now, supposing Scientologists just elected a place to be when they kicked the bucket. And supposing, why, we simply ran out – and actually it's just a section of this implant, and even though it jams the case up, who cares – run out that compulsion, even by repeater technique, don't you see? We can do that, see. Run that compulsion to appear over there, you see. And then tell the guy very strong and hard, "Well now, where is a good place that you're very familiar with? Well, when you die, appear there. Now remember that. When you die, appear such-and-such a place." Different place.

Two or three hundred years, even with no processing, you'd be free. In other words you'd live it out. Look at the amount of time that's just been bought. Because frankly, it wouldn't take more than a couple of hours to do this job on anybody. If you simply told a thetan to be in a place where he was familiar with or liked to be, he would exteriorize. You can ask somebody what he's familiar with. He gets tangled up sometimes, thinks he's gone into a facsimile when he's actually gone into a locale, don't you see. As far as that's concerned, you see, you could use Saint Hill, providing you didn't – providing you ran out all your ARC breaks on the subject. [laughter, laughs]

But the point here is elementary. If a guy has got to pick up his own body on his – off his own bat anyway, well, he might as well just pick up a body off his own bat anyway. Nobody else is going to do anything for him. In fact if you're going to give him a – you know very well that if – what would happen to somebody if he had an engram and you gave him another engram on top of it and said that his engram didn't exist, you know how therapeutic that would be. And then you misdated everything he's got and then told him a bunch of lies and then pulled an emotional switch on him. You can imagine the state your pc would be in if you did these things, so supposing you just deleted that out of the subject of death. And somebody just was in a place they were familiar with and didn't go back through the between lives area. And I'm telling you true, that in two or three hundred years you would have lived it out. You'd be flexing your biceps anyhow, relieved from that situation – you'd be starting to take a long breath.

Because there must be considerable fear connected with this. Perhaps the fear of death is mainly the fear of the between lives area. May not be a fear of death at all. Certainly oblivion takes place during that period. Now economic chaos would ensue at once if people kept coming back and demanding their toys back. I'm sure that you'd get a lot of people who would argue against this and say this was not the best for this best of all possible worlds. They'd say, well – well, they could say a lot of things about this. I'm frankly not very interested in what they would say about this.

But now as Scientologists, supposing we just started tabbing people on the shoulder and giving them this two-hour treatment which deleted the compulsion to return to the between lives area – instead of that, appeared in Yankee Stadium or something, and took off and went and found a new body? You see the only service performed: it gives you a place to be when you're dying, see, and spares you some of the agony of death. See, it gives you a place to be as the only service performed. All the rest of them, cut your throat, see. Well you can easily perform that service. Next thing you know you start cutting down their customers.

Now, a couple of things stand in the road of all this. You should know this, a couple of questions are unanswered here. How close is the liaison between these jerks – I mean these nuts – I mean these fellows – and Earth. How close a liaison do they maintain? Do they care anything about Earth at all? They must have seen a space probe going by the other day – they must be aware of some interplanetary action taking place right here. What they going to say about it? When in the last two weeks I've seen a full armored spaceship sitting on a landing port, with mine own eyes. What they going to do? I don't think they'll do anything. I think they're hung with their own petard. The moment they appear, they blow the show. I don't think they'd do anything. I just think they get fixed on a wrongness, and they're continuously executing this wrongness. They continuously – so they insist on its rightness and they think that's going to solve everything.

I'm interested that jamming the track to this degree, and giving so little time period amongst incidents as they do to the person, is giving people a weird time-~~zzzzzzzzzz~~. So that you have fan-job airplanes only occupying a third of a century, where as a matter of fact in most societies they'll be happy and content with the fan-job airplane for anything up to a billion years. Somebody invented a fan-job airplane. Fine. That's good. Over here – over here, we've got jet planes. Now we've got supersonic planes. Now we've got spaceships. You see? Pocketa-pocketa-pocketa-pocketa. It's this acceleration. I've interest – been interested in that because I've seen it as quite different here than it is in any other place I've ever been. And this could be the primary factor. They give you your time track such a fast jam together that everybody gets an idea of more accelerated motion of the way progress has got to occur.

There could be other explanations. There could be an explanation such as a base is being created here for takeover of this particular galaxy, since this type of implant is not native to this galaxy – inspecting your own track you will see that is the case. It's the next galaxy. These could be an enemy to this galaxy, sitting there quietly, letting a manufacturing or production base build up for an attack into this galaxy. These could be simply prison guards. And with tacit consent from one and all, far and wide, why any of you agitators that cut up a fuss or didn't join the local AMA or something like this they capsulized you and threw you down here and they know very well that this is a prison.

Now, I know that this is known in some peculiar way, because bulletin board notices exist all over the place with regard to this planet. They say, "No landings on Earth." Why does everybody comply with this? I got here, why, accidentally landing here up in the Himalayas. But why does everybody comply with this? Why is this planet stayed away from? I don't know – how many visitors did Alcatraz have? See, this is about where we sit with regard to this situation.

Now, there's another factor. Another factor here that's quite interesting. If they have pictures of Earth in order to show you how you died, did they get them on Earth, or are they picking them up on some weird mind reading fact off of beings as they come up there? Have they – have they actually figured out how to photograph a facsimile? If they've figured that kind of thing out, why then that's explained. But how do they know what's going on here? That is not finally answered, don't you see?

Now, they haven't done anything about these space probes. The boys have been at it here, shooting stuff off into the heavens for the last several years and nothing has been done about this. Now, knowing very well, I suppose, that any time they exceeded a certain zone or area – they know very well that an armored cruiser could blow anything that this planet could build like a kid's toys out of the sky, so maybe they're not worried about it. Or maybe they're counting on a decimation of population, a destruction of industry in atomic war.

Another question is: How thoroughly do these people influence the affairs of Earth? We can understand that Earth is a very, very strange planet. I've never seen populations behave with the same hecticness and weirdness. And, of course, if people who were rather revolutionary or upset or nonconformist were picked up uniformly and concentrated on one planet, you'd get a – almost an ungovernable situation. Which I think rather tends to explain maybe what this is all about. I've seen other planets go nutty, but only when they were in external stress of great magnitude, otherwise they were rather peaceful. The days before the Helatrobust Implants on some of the planets attacked by those people, you couldn't maintain a government. It was everything going to pieces all the time. But that's an interesting question.

All right. What degree of influence is exerted against this planet then? Now, astrologists may have something – the astrologists may have something in their favor when you realize that these planets swinging closer to Earth would be easier to travel – would make it easier to travel to Earth, and further from Earth you'd have less traffic or less this or that, and so you'd have less things happening on Earth, don't you see. The proximity of planets, combinations of planets or that sort of thing, maybe just to the degree of the interspatial relationships of the thing and so on – maybe this has some influence on the situation, I wouldn't know. I'm just discussing here points.

Now, here's another point. Where do we sit? I think between thee and me, that's the point we're interested in. Yeah, well, they're maybe counting on an atomic war wiping out space opera and so forth. Space probes already may have excited their curiosity, there may be some purpose in this, but that they took no action when the first space probes passed them either says they're back of space probing or says some other explanation exists for that, so we can neglect all that. What is the – what is the role which we occupy in this? This is very, very, very interesting.

Now, that I release this might be a source of great worry to you. But remember, it's been in a book, one of the books carefully seized by the Fools and Druggists – the Fools and Drug Addicts. [laughter] That's the new name. Ah, that's a good name, isn't it? The Fools and Drug Addicts. Anyway – was *What to Audit*, and the between lives area are described in the book *What to Audit*. This is not unknown. *What to Audit* is many, many years old. It's been kicking around for a long time, been available to almost anybody and look, nothing's hap-

pened. In other words, the information has already been released when the publicity on the subject of Dianetics was at a much higher pitch than it is on the subject of Scientology. So, what is this? If we really started to run with the ball and so forth, we expect a couple of meat bodies in the usual white jumper that comes along with the space opera (except those guys by the way wear khaki – it's an odd-looking uniform), we expect them to appear on the front doorsteps and say, "Are you a Scientologist? Well, there's the spaceship," and they take you up and throw you in the can in – at Pluto, or something. Is this a kind of action here that we might expect?

Or is it a situation where we are no threat to them? It'll all sort of pass away? Or are they in a state where this covert action, going forward for so many years, would tolerate almost anything before they would disclose themselves? Or do they count absolutely on the exact camouflage which we have? We are ridiculed. That's our camouflage. I should think – I should think if anybody was in the know or any liaison line existed between these two systems... Maybe Kennedy and other presidents find this out the moment they step in the White House, you know, maybe that's what makes them look so old in two or three years, the way they cave in. Maybe they find out, "Well, you boys are slaves, you see and..."

No, I don't think anything like that happens. But supposing – supposing you did get a liaison line between this society and them, what would be their best reports on us? Oh, "fraudulent bunch of quacks," "the space opera science fictioneers," "bums." The very best authorities, the AMA, the Fools and Drug Addicts, the newspapers, which is where they get their news, radio broadcasts, television broadcasts, all forms of news, represent us as being totally unimportant, ridiculous and so forth. I think they could have all of our books sitting on a desk up there right this minute and laugh themselves silly, without a bit of worry about the whole thing. They'd certainly not blow the show for it. And they'd have to blow the show, you understand. They'd have to appear. Not covertly. You don't bring spaceships down in a DEW line-monitored society, privately. Must be getting very hard for these characters to deliver the goods these days. We're past the radar screens, and that sort of thing.

I think they could be sitting there with the whole library in front of them and they wouldn't have any impulse to do anything. They'd say, "Well, a few of them and so on, and it's not important and so forth and you wouldn't really want to do that, and after all we never have done anything like this and besides, the atomic war is coming right up. And there's no danger from these people because they're a bunch of frauds anyway. There's always some madman, you know, gets some kind of an idea like this, and it all passes away and so forth. Look at the Buddhist. We let him conquer three quarters of Asia, and he was trying to end this life-death cycle and keep from coming through our carefully maintained plant, and he never made it. Never did anything. So there's your precedent. Nothing happened. Nothing happened." No, nothing happened, but I was standing on their landing stage the other day. Nothing happened.

The funny part of it is, is a lot of us have friends. That's interesting, too. And if you have to work this hard to keep somebody aberrated, and working this hard you still aren't successful in preventing a breakthrough the way we have made in this society – in spite of all of the cockeyed, contrary propaganda lies and nonsense which are leveled at this society, we are making progress. And if this continues, we will make progress all the way. We're a polite

gathering, and it is no time to indulge in threats or violence or anything like that, so I won't describe any future plans with relationship to these people.

But I think the one thing they must be afraid of is having their planet rolled. Which of course is the one thing that will happen to them! Anyhow – [laughter] the situation – the situation is much more favorable to us. It shows that aberration is very difficult to maintain. It shows that it's being actively maintained. As far as the validity of this and the possession of one of these series of implants in your pc is concerned, I'll vouch for it. You may not be able to run it, but it's there. You can certainly cut a swath out of the back end of it, that stops the thing. But to run somebody through it before he's got the track neated up, is impossible.

So look at what we got here. We're going along our own way. The first thing we ought to do is give some attention to preventing further implantations of Scientologists. I've already given you a program by which this can be done.

Your next action on the thing is dispose of them. And I can see tomorrow, I can see tomorrow – the Chinee, he appear on landing stage to go through his false death and he hear words, thought-wave as follows: "Be on Earth. Support your local Scientologist." [laughter] "There is no further reason to upset you this time, you've been a good boy." And show him an "S" and double triangle, and there he goes. [laughter, laughs]

Actually you'd only have to do this for two or three hundred years, and Earth would start to go Clear on its own. Because it wasn't getting this continuous assistance. The only other source of action is the psychiatrist with his prefrontal lobotomy and his transorbital schizophrenia. And this bloke and his avidity for doing everybody in, if you just left – you know, if you just leave a psycho alone, why he'll come out of it. But you've got to leave him alone, got to let him have a rest. That's the best treatment for psychosis: don't do anything with a psychotic, you see.

Well, I think all of a sudden through finding the worst news, we also, not Pollyannishly find some good news, but actually find the answer to our problem. As far as the clearing of this planet is concerned, that is the easiest end of it. The hardest end of it is right now, right here and so forth.

Now, how can you run this incident? That must be burning through your wits right now. Well, what you do is get your GPMs out of the road – they're the only thing you can't scan through – and get your basics on this type of incident. If you run those two things, then the incident can be scanned. And we already have the tools by which the incident can be run. The only thing you've got to do is make sure that your pc gets lots of TA action in a session, and very shortly, no matter if you ran implants or didn't run implants or something like this, they will be jumping up there ready to be run. And the fact that they are – and this gave me a bad turn for a day or two – is I thought, "Are all the things I have run simply jammed into this and have I been running them at a wrong point in time?" No, because they've been properly dated, I've been running them at a right point in time, even though they were then jammed in this particular incident. I've been running them out of the right. And I found out that not all of them had been restimulated there. In fact, a very small portion of them had been restimulated there, just to make it impossible to scan through the thing.

But you run down GPMs, you date them on the time track – you're running them at that time on the time track, you're not running them out of the group, see. Don't worry about that. But sometimes a pc will give you a date. Now we're dating years ago, and their dating are years into the future. These two dates do not conflict. Their dates are wrong, our dates are right. So redating gives you – of any incident – strips it out of this, so any time you find an engram properly dated on the pc, you're away. See?

The amount of false track – at first I blanched. I thought the amount of false track I have must be fabulous. And I tried to get away – rid of all the discreditable incidents by saying they were simply false track. And then I had to run out all the invalidations because they were my own track. I thought, "Well, this is a wonderful way out of it, there's that time when I sat incapacitated for a long period of time and didn't feel strong anymore and so on – that was obviously just false track." No, no, it happened to be real. There's very little unreal incident on the track. Very little unreal incident. When you finally get something durationed exactly and right, you can tell whether or not it's one of these types of implants. But the track is not the same track. It's corny track. It's... there's something goofy with it. The pictures you run out of the pc by and large are the actual pictures of the pc.

And when you can't run pictures on the pc you've got a wrong date or a wrong duration. So if you get a right date and a right duration, you can run the picture, and the picture that can be run that way turns out to be what it is. It turns out to be a real picture or a bad picture. Only the pc can tell you if you've got the right date and the right duration.

So simply by carrying on with R3R without the slightest change, carrying on with R3N without the slightest change, you then get the time track into the kind of shape that a pc perforce could actually scan through one of these implants no matter what type or part of his time track had been. Takes a less number of hours than you would think. You've got the weapons with which to do it.

You get the basic series of implants off of any chain of implants, that is to say you get the basics on these things out, and you'll find very rapidly and very readily that the rest of them tend to fall away. And they desensitize. For instance, if you get the first two items – let's say we've got the same items firing twelve times in a row, and if you got the first two fires clean, the rest of them won't even click. Isn't that interesting? Whereas if you got the twelfth one, it takes you about fifteen minutes to get all the rocket reads of it off and then you get the eleventh one, you've got all the rocket reads to take off of it and so forth. In other words, we've got the mechanism which turns the time track right side to, and it takes the charge out of the place where it counts.

We've got these various mechanisms solved. In other words, what we know already can put somebody's time track in shape so that the person eventually can run straight through one of these incidents, and damn the torpedoes. In fact without having all of my time track beautifully cleaned up, I was playing tag with one of these things my last session, and I was terribly intrigued by the fact that I had become a bit contemptuous of it. I have moved around, I know what it is, it's been cross-dated – it suddenly occurred to me, "All right, so if I find I can't scan through something here, I'll just redate it." And, sure enough, it disappears on the back track the second you do so. So you could probably take it from the year zero, and redate

everything that appeared on the screen in front of the pc and throw his time track back, and the next thing you know the thing would be gone as an incident. Particularly if you were running basic on the incident.

You can run the beginning of it off selectively, you can run the end of it off selectively – the last (quote) hundred days (unquote), the first fifteen days (unquote) – without running the pc through any of his own time track restimulation. So there's many ways this thing can be handled. We're over the hump on this situation. But this thing must exist pretty well as a present time problem for every pc audited. He must be afraid of death; he must be trying to keep his body from getting sick and disappearing, simply and solely because he doesn't want an implant at the end of this life.

All right, if you were to solve that problem by stripping out his compulsion to appear in the implant stage and tell him to appear someplace else, you've probably solved a present time problem of great magnitude on the part of the pc. The truth never hurts. It's only lies that aberrate.

The very fact that this is a prison planet, that it is being monitored this carefully right this minute – right this instant, as I'm talking here, some Joe off this planet has appeared on that landing stage and is being told how he just got through an airplane crash, whereas the guy probably died of pneumonia. See? Right this minute, you see. And this instant, another guy did. In other words, this is a continuing situation that's going on and on and on and on and on. Gives you an understanding of what's happening.

We couldn't have run them in yesteryear; we can run them today. The best answer is to first put the pc in shape so that he can run engrams and GPMs by making sure you can get good tone arm action running those things on the pc. The next thing to do is to run engrams and run implants, GPMs on the pc, until he can go over his track rather comfortably and he can come on back on the backtrack and pick up this other type of time dislocation implant, scan through those things and knock them out. In other words, we've got it made.

They've been looking down the backs of our necks and we didn't know it, for thousands of years. Each one of us as a person and as a society as a whole. And I just want to point out to you that the other day, I was looking down the back of theirs.

Thank you very much.

ARC BREAKS AND THE COMM CYCLE

A lecture given on 24 July 1963

Thank you.

Well, you're going to get some demonstrations before we're much older. And I'm grooving in Model Session a little bit better. Couple little bugs these days in Model Session.

"Do you agree that's clean?" can cause an ARC break. What you want to communicate to the pc is that did the pc have anything to say about it? You, after all, have asked a question, and you inform him of the state of the needle and ask him if he's got anything he wants to say about it. But I haven't quite got the pat wording for that. But it's interesting that the two, three little changes that – they're just little refinements make it easier on the auditor.

We're using mostly the 3N Model Session and in actual fact have not used the old, original, long-drawn-out beginning ruds-end ruds Model Session for some time. And it's a good training ground, maybe, but in actual fact, the since mid ruds are enormously better. Since mid ruds and pull missed withholds are enormously better than any beginning rudiments we ever had. And an ARC break assessment at the end of session, just whether there's been an ARC break or not, is enormously superior to any end rudiments we ever had. Don't you see? So you just clean every line of it. You don't do an assessment by elimination. Just, if you got a tick, find out what it is. And just clean that up, and your pc comes up shining.

So it actually makes Model Session pretty easy to do, but it's still a very precise activity. We've now got the body of the session, we end the body of the session, you know? Goals and gains, all that sort of thing. Everything is there – you know, we adjust the pc's chair and ask if it's all right to audit in the room and get a can squeeze and put in the R-factor and start the session, you know? Same thing. Get the goals and roll right on through. Get the pc's goals, and... pc's needle's a bit agitated, your tone arm is higher than it was the last session, we put in our since mid ruds and see if there's any missed withholds, and carry right on through to the – into the body of the session, and do whatever we've got to do. Come right on up to the end of the body of the session and chatter with him a little bit before we tell him that's the end of the body of the session – that's very informal but still there. Then we get the pc's... ARC break assessment – usually omitted, if the session's quite happy and the pc has had a big win in the session; we certainly don't harass him with an ARC break assessment.

And then we take our goals, and we take up each goal. I notice some not quite doing that, maybe. And actually, those are written on the auditor's report, diagonally across the goal. See, we just write "yes," you know, or "maybe," see, across each goal. We don't write down

another section here that says whether or not he made his goals, see? "To have a good session": Well, we give him that goal, you know – did he make it? He says yes, we write "yes" diagonally across that top there, see? So we can see what his goals and gains were just by looking at that one block. And it's easy to review, see?

When he's got all that, we don't keep pestering him; we just read it to him, did he make them or didn't he make them? Then we thank him for making his goals in this session, or if he only made part of them, why, "Thank you for making some of your goals in this session; I'm sorry you didn't make all of them." Then we ask him for his gains, and we take down the gains. And we don't keep bleeding gains. We don't keep asking the question "Did you make any gains for the session?" We just take what he's got, see? We make sure that he's answered it to his satisfaction – and remember he's pretty foggy, so sometimes that's a little difficult to get closed out. You're still trying to end the session, he's still trying to give you gains, you know? Long time to answer the question or something like that. Well, let him answer it to his satisfaction, but don't you keep pounding with the question about gains for the session. You understand? You can over-ask him, see? And next thing you know, he's giving imaginary gains that he never heard of.

When he's got those you say, "Thank you for making these gains in this session," or, "Thank you for making some gains in this session; I'm sorry you didn't make all of them." And – "Sorry you didn't make more gains," rather – and close that out.

And then we just get a can squeeze test, run any Havingness that we have to run if the can squeeze test was less than the beginning of the session, and simply ask him, "Is there anything you want to say before we end the session?" Let him say it. Then we say, "Is it all right with you if I end the session now?" and get a yes on that and we just end the session. That's it. And "Tell me I'm no longer auditing you."

All of these various lines we've had before – those little courtesy lines are in there. The only additional ones: thanking him for his goals, then thanking him for his gains. And that is the form of a Model Session these days. But it still requires a precision, don't you see? It is still a Model Session and its wording is very fixed for each one of these points.

Before I gave you a demonstration of this Model Session brought up-to-date, however, I wanted to get that business of what do you say to a pc? What is exactly the best thing to say, you know? "That didn't read." "Do you agree that that is clean?" – that type of approach can cause ARC breaks.

I myself have felt like saying, "Well, I don't have to agree that it's clean. To hell with it!" you know? [laughs] "What are you trying to do, force me to say there are no more answers on this question, 'In the last trillion trillion years is there anything you have suppressed?' Hell, I know it can't be clean. It's clean for the purposes of the session, maybe, but sure isn't clean!" That's why, when you heard a demonstration I was giving on that tape a short time ago, I was slipping that. You saw I wasn't using it very much, and fumbling around with it. I was still trying to find a proper wording. Soon as I get that taped, why, I'll give you this new one. It's almost exactly the same one as you're using now; I'm just giving you these little refinements. All refinements these days are just in the direction of causing less ARC breaks and getting more auditing done.

The reason you have rough needles, however, has nothing to do with your Model Session or your rudiments or anything else. The reason you have rough needles is you miss on TR 2 or TR 4. You miss TR 2 and TR 4 and you got a rough needle. That's it – bang. Just like that. Comes back to auditing cycle.

If an auditor's pc has a clean needle consistently, you know that this pc is either phenomenal or this auditor has very, very good TR 2 and TR 4 – very good TR 2 and TR 4, see? And if pc has a rough needle, not all the rudiments in the world will put it together if the auditor's TR 2 and TR 4 are for the birds. See? That's a big point. That's a big point.

Now, I invite you sometime to just watch this. Any auditor will have this happen to him. It happens about once a session. Sometime in the session you got a clean needle, it's flowing along here very neatly and very nicely and smoothly – clean needle, everything going fine – and all of a sudden you got a dirty needle. You immediately assume pc has a missed withhold. If you were to take a tape of your auditing session, you would find out very rapidly that your TR 2 went out or the pc originated and you did something about it. Something happened there between TR 2 and TR 4, and immediately your needle was rough.

Be very revelatory to you if you had a tape of the needle – we're trying to accomplish this technically, a very hard problem – if you had a tape of your needle in your session and you could play it back sometime, you'd learn a lot. And it's quite intriguing. And you say, "What the hell gets into me?" you know?

Pc said, "I had an ache."

"Oh yes, where was it? Oh yeah, hm-mm? Have anything to do with the process we were running?" Dirty needle. Just like that. Bang-bang!

"Uh, well, I feel better now."

"Well, you don't have to worry about that. We'll get you into another..." [laughter]

But you watch the coordination between auditing cycle and dirty and clean needles, and you're going to be fascinated! And whenever you look around and you see an awful lot of pcs have dirty needles, you look around, you'll see an awful lot of auditors have dirty TR 2 and TR 4. You clean up the TR 2 and TR 4 and you'll clean up more needles than you can shake a stick at. It isn't the significance of it, you see; it's the calm flow of the auditing cycle.

Well, I didn't come in here to give you a lecture on this today. I'm going to give you a lecture on the subject of ARC breaks, so I might as well start this lecture.

This is what?

Audience: July 24th.

Twenty-four July, AD 13, Saint Hill Special Briefing Course. And here is a lecture on the subject of ARC break assessments – one which you need. You need. You need this worse than you think. ARC break assessments.

Now, I've just been rattling along here and talking about sessioning in general, which is of course a very applicable part of this lecture. But you normally consider a dirty needle,

you see, as a withhold or something that the pc has done. And you seldom look at it as something that the auditor has done.

Well, let me point out to you that there are two communication cycles in an auditing cycle – two communication cycles in an auditing cycle – and either one of those two communication cycles can be active.

Now, number one is auditor to pc. Number two is pc to auditor. Now, either of those can operate independently. And one of those cycles goes this way: "Do fish swim?" see, and the pc hears it and understands it, see? And that is simply cause, distance, effect. So that's a communication cycle, see? Cause, distance, effect.

Now, pc says, "Yes," and auditor hears it and understands it. Now, that's cause, distance, effect.

Now, you're used to all this, of course, but you probably haven't looked at it in the degree of separateness which it deserves, since either one of them can exist independent of the other one, and both of those communication cycles have to be perfect or very acceptable before you have an auditing cycle. An auditing cycle is not made up, then, of auditor command, pc's reply, auditor's acknowledgment, see? That is a very, very loose look at an auditing cycle.

An auditing cycle can exist, frankly, on either of these independently. The pc doesn't have to say a thing and yet be perfectly satisfied. Do you see – a communication can exist from the auditor to the pc.

What's your R-factor? That's a communication from the auditor to the pc, isn't it? Pc understands it. You ever hear a pc say very much to an R-factor? He doesn't even have to signify he's heard it. There's nothing in the books that says he did. But he has to understand it. He doesn't have to say anything. "Okay, all right. Well, I agree that is the R-factor" – you don't expect the pc to say that, see?

Similarly, you're going along in an auditing session, the pc suddenly says, "Hey! I just realized that dirigibles aren't airplanes, see? You know, it's a fact!" And you haven't even been auditing dirigibles or airplanes or anything else. This very often takes you by surprise. It can be close or far from the subject of the auditing session – that has nothing to do with it – but it's an independent communication cycle. An independent communication cycle.

Now, you're so cheerful on the subject of getting your TR 2 in, just right, in answer to the TR 4 that you don't sometimes look at the fact that TR 4 doesn't depend on TR 2, not even vaguely. That's why it's TR 4. It's up – up numbered. What is this?

Do you know that some of the most successful origin handling I've ever done had no acknowledgment connected with them. Although you can say the auditor is supposed to understand and acknowledge the thing – receive, understand and acknowledge the communication, all that sort of thing – you can go into that kind of thing and try to explain what this is; in actual fact, look at this in its most naked form. This is just simply a single communication cycle, originated by the pc and received and understood by the auditor. And if you look at that, not with any tricks or gimmicks around it, all will suddenly make sense. Just as the auditor is emanating and originating his auditing cycle as a one-way communication in its first step, and just as an auditor can originate things which the pc doesn't have to respond to at all,

so can you get the reverse thing going in a session – which is to say, the pc says something. And that's a communication cycle. And the only thing you're trying to do is signify that it exists. You're not trying to do TR 2 or anything else. I mean, the pc originates, he says, "Dirigibles are not airplanes." He's had a cognition of some kind or another. One of the ways to knock him off his base is to give him a very artificial TR 2. Did you ever have an origin knocked off its base by having the auditor say "Very good. Thank you?" – get a very artificial piece of stuff back in your teeth. You've just said something that was important to you.

Very often in auditing I'll handle an origin with a facial expression or a head nod, because it's a one-way cycle. And only a ghost of the thing the other way needs go, and actually needn't really go at all. If you're really good at projecting your think tank, you could sit there with the face of a wooden Indian and do a perfect TR 4.

I know that sounds utterly incredible. The way not to handle a TR 4 is to make it obvious that you haven't understood and that you have received the communication. "Thank-you." [speaks in a robotic manner]

"I suddenly – I suddenly realize," the pc says, "I suddenly realize – I suddenly realize my migraine headache's gone! I had it for years! Gone! Hey, what do you know! Ha! It's gone! Gone!"

[in a robotic manner:] "Thank you." [laughter]

What the auditor has done in that particular regard is make a mistake of thinking a pc runs a reverse auditing cycle. See, he thinks the pc is now going to audit him. [laughter] The point here is you audit any little kid on "Touch that table" or "Touch that chair" for a little while, and nearly all of them will suddenly start giving the command to you. They get their flow going so far, and you're a fool if you don't do them, too. And you touch the table and touch the chair, and the kid's all satisfied and so forth. And they're perfectly willing for your next command, see? It's quite a game they play. They go into a very complete duplication of the auditing session. A good auditor of children and so on is quite well aware of this and doesn't refuse to execute the auditing command. It throws a kid completely out of session. Kid is overwhelmed. That's the kid's effort to be right, don't you see?

All right. But in handling an origin, the pc has not started to audit the auditor. That's a different kettle of fish. The pc doesn't expect anything but a comprehension. That's all the pc expects.

Now, how do you signify a comprehension? Well, I know your telepathy is kind of busted; it's been busted for quite a while. I know mine has been, to the degree that it might be. I sometimes look back at what telepathy once was, and a guy is two thousand yards away and you hear all of his thoughts with a crash, don't you see? That's OT stuff. You can also have obsessive telepathy where you hear everybody all the time. This is sort of out of control. But we're not asking for anything that is that marvelous. We're asking for pure and simple, an ordinary response to a communication.

Now, how do you signify that you comprehended? Until you can answer that question well – till you can answer that question well and pleasantly – to yourself, see – I mean, not pleasantly but satisfactorily.

Well, you're sitting there right now. How are you "comprehending" to me that you heard what I said and understand it? Yeah, I look at your faces and you're all doing it beautifully. [laughter] See? Perfect.

Now, that is an origin; handling of. And that's all there is to handling an origin. Pc says something and you understand it. Now, we say "and acknowledge it," but we've gone too far because we're tending to put it in a thing. We let the pc know we've understood it. For instance, once in a while I'll just laugh like hell, see, you know? Pc has said something that's very funny to the pc, you know, and seems funny to me (I won't laugh if I don't think it's funny to me; I won't corn up the emotions on it), and I'll just laugh, you know. I'll say... Pc's perfectly satisfied. That's because there's no auditing cycle involved. That's just a communication cycle. That's all there is to it, see?

Now, there are a bunch of processes which require no answer from the pc but do require a response from the pc of some kind or another. But they are Concept Processes – the old Concept Processes: "Get the idea of..." Well, the pc can sit there and get the idea and never really say "Yes, I..." No, nothing to the auditor. You know he's done it. Well, how did you know he's done it? Oh, you look at his breathing and that sort of thing, you take a look at him and so on.

You get into this trouble in R3R. How do you know the pc has moved to the beginning of the incident? See, that's an interesting little hole. Because you didn't say "Move to the beginning of the incident at approximately... and tell me when you get there."

In the first place, that would be very sour, because it's two auditing commands, they're already complicated, he's in too much trouble already; and once in a while, any auditor will get dopey and have moved the pc to the beginning of the incident and then not move him through it. You know, forget. The pc will sit there for a while, finally look at you kind of hostilely and say, "Well, when are you going to move me through the rest of the incident, you knucklehead?" Any auditor is liable to do this, because he's all busy with his computation of where the beginning of the incident is and how many time it was and so forth. And the pc's been taking quite a while, let us say, to get to the beginning of the incident. And so he moves him to the beginning of the incident and then all of a sudden wakes up to realize at last that he hasn't moved him through the incident.

This can happen – not to you just once or twice because you're new at it; this will probably continue to happen to you, embarrassedly, now and then, from here on out. Because you've got an incident that's a trillion years long, or something stupid like this. And the pc's at the end of the thing and has had an awful time trying to find the beginning of it anyhow. And you say, "Move to the beginning of the incident at approximately wumpty-wump-bump trillion years ago." And you decide, "Well, while he's moving to the beginning of the incident I'll just catch up on my note of what he's just told me, because I didn't want to slow him down," you see? And you're busy writing and writing. You get interested in what you're writing, you know? [laughter, laughs]

Well, actually, the pc wouldn't be upset with you if he didn't notice that your attention was on something else rather than following through the auditing command. Pc usually for-

gives this; doesn't cause any ARC break. But ordinarily, you... pc says, "Well, I'm there. So what?"

And you say, "Oh! Uh-ho-hah-ho. Oh." [laughter, laughs] The exact auditing command that follows that, of course, is "Move through the incident to a point (duration time) later." That's the exact command that should be given him at that moment. And he'll go ahead and happily carry this out.

Well, this is a point where, if you're on the ball, you say, "Move to the beginning of the incident" and if you keep your eye on your meter it'll flick sooner or later. You don't have to ask him "Are you there?" That's terribly bad form. You want to ask him "What are you looking at?"

"Well, so-and-so and so-and-so." And I wouldn't spend much time asking him what he was looking at either. As soon as I had any inkling that he was at the beginning of the incident I'd move him on through, because you can't make any real mistakes there anyway.

But the point I'm making here is the pc doesn't have to tell you he's at the beginning of the incident; he simply executes the auditing command. Causes a little bit of embarrassment sometimes, when you don't realize that he's executed the auditing command. But it is a communication cycle. It has taken place. The auditor said something, the pc's done it. That's all you expect. That's it.

All right. Now, the pc says something. It's a communication cycle. He's, not auditing you. It must be, therefore, a communication cycle. He originates see? And he originates something to you, and you receive it and understand it: that is a communication cycle. Communication cycle complete, right there. Now, to make it an originated cycle, you should signify to him in some tiny fashion that you have received it and understood it.

Now, if you try to phony this up and he says, "*Eugulala blou-uboog*," and you say, "Hm-mm, hm-mm, hm-mm," and you don't know what the hell he's talking about, there is some mystic influence sets in at this point which you will see go on the meter. He knows damn well you didn't understand that – half the time because he didn't.

Now, the auditor who specializes in this phrase should be stonewalled: "I just don't understand what you said," see? "I didn't understand you." "I don't understand what you are saying." "Don't understand." In the first place, that's lousy – a lousy approach – from the basis that it uses a very, very powerful word. Understand is the crossroads of A, R and C. And you say "don't understand," you're just asking at once for a complete ARC break. But more importantly, you have said to the pc to communicate the same thing again.

If you'll notice, he said, "I have a pain in my back."

And you say, "I just don't understand what you said."

And the pc will only say, "I have a pain in my back."

And you say, "I don't understand that."

And he will say, "I have a pain in my back!" We're all of a sudden seeing the buildup of the ARC break, see?

And you say, "I just don't understand that."

"I have a pain in my back!!"

You can build this up. But do you notice that the pc is saying the same words over and over and over? It's a peculiarity of Homo sap. If you indicate that you don't understand what he's talking about, he says the same thing again. He says the exact same thing again. He never varies it. What you want him to do is vary the explanation. What you're asking him to do is to help you get this, if he's got to say something more. What you want to indicate to him is he should tell you a little more broadly what he is talking about so that you can get a very good grasp of it. And if you are very clever and there's no substitute for cleverness; you can't give anybody a pat phrase with it because they vary all the time – if you're very clever, he will explain it to you in a half a dozen different ways. And then he understands it and so do you. But it's mainly you that's got to understand it.

Now here, basically and elementarily, we get the basis of an ARC break. I don't care what kind of charge is bypassed, the thing is a bunged up communication cycle, whatever else it is, see? It's affinity, reality, communication – these things are all out. It's a bunged up communication cycle, but what in it is bunged up? Detected and understood – those are what's bunged up in it.

How can you have a communication cycle where the communication is not fully detected and is not understood? How can you have one? It isn't a communication cycle, because the communication cycle is cause, distance, effect, with duplication occurring at the effect-point of the cause-point. That's a very pure, accurate definition. Not over all the years has there been any shift of that.

But look at this. Are you going to call this a communication cycle: cause, distance, altered effect, no comprehension? You said, "Good morning," and she thought you insulted her. How did that come about? Well, it just came about by the nonexistence of a communication cycle. It was imperfectly detected and it was not understood.

Now, of course, it's not understood because it's imperfectly detected. I mean, how much more elementary can we get? Somebody rolls a lollipop in your direction, how can you detect what it is if you don't receive it? Oh yes, it can arrive within four feet of you, and you can look out there and see a lollipop. Then you could detect it without receiving it, which is another thing. This would also be an ARC breaky situation. It's detected, but you didn't receive it.

Usually you'll find TR 4 breaks down at this point. It's detected, but not received. Pc says, "I don't – I-I-I don't think you have to keep – keep the session going much longer; I feel fine."

You say, "Well, we're going – we're going to keep it going as long as is necessary to fill in this particular period." You detected he said something, but you didn't receive it. You've said you didn't receive it because you didn't do anything about it. You said it should be something else before it arrived at you, and you have therefore busted down the communication line between the pc and yourself

Now, that was a very pleasant origin, wasn't it? Do you know that you could so work on that origin that you would have that pc – I don't care what pc, or how calm this pc normally is or how splendid and pleasant this pc is – you could get that pc into an absolute screaming fit, just on that, by just continuing that. Just continue it and continue it, and if you ever want to see an ARC break, man, just rig one of these things so that you don't receive what the pc says. And that can be done to any pc. Some pcs are really a bit below spitting in your face, but they just – you can just see them go *blyaaahhh*. And they just sort of pass out right where they sit. But it produces a fantastic effect. A fantastic effect.

Now, an auditor must realize that that is a primary effect, and that is a primary cause of ARC break. That is not one of the causes of ARC break. That is your textbook, perfect example. From the pc's point of view, there is cause, and there's distance; the distance is not covered, and the communication cycle does not complete. And that's it. That's it.

I don't care what pc you've got, you can reduce a pc to a screaming fit, no matter what this pc has said. You can just get the pc gibbering. A pc will just be shaking and exhausted in a very short space of time. And that's an ARC break. Well, why is it an ARC break? That's because both A, R and C are out. The combination of A, R and C equals understanding, and the understanding is out.

The intention is cause, distance, effect, and the progress of that cycle is prevented so that the communication is actually not fully detected. See? Not fully detected. This is a very, very interesting point in ARC breaks. That forms a woof and a warp of all ARC breaks. Not fully detected – partially detected but not fully detected. Nobody's going to ARC break going out here and yelling at a rock. You could go out here and yell at a rock all morning. You can say, "Oh rock, I hate thee," or "Oh rock, whither dost thou comest?" – anything you want to say – and you will go out and yell at the rock and talk at the rock and speak at the rock and so forth, but your expectancy of what's going to happen at the rock never does get quite up to expecting the rock to give you a TR 2.

So therefore, your estimate of the detection is not at fault. The rock isn't going to detect the communication to it, so you then don't expect anything to happen in the communication cycle, so therefore you do not ARC break. See?

Ah, but the pc is under a very, very definite detection cycle. The pc expects the auditor to detect the communication from the pc and understand it. And when that is thrown sideways – because understanding has entered into it, because detection has entered into it, because only partial detection or no detection has entered into it, in spite of the expectancy of its being detected – you can reduce a pc to an absolute shaking mess of jelly.

I'm not kidding you now. I see from your silence that you're either accepting this as too grim to confront, or you think I may be exaggerating it. This is not so. This is not so.

You can take the most common statement, such as "I feel pretty good now," refuse to detect what the pc is saying, don't duplicate it (don't understand it, in other words), and keep giving the pc evidence that you haven't understood it, and have that pc – I don't care how calm, cool and collected that pc has always suspected himself – in utter amazement at having been a shuddering mess of jelly, because he eventually will start screaming. "But I was just trying to tell you I feel perfectly good now," see? And it goes up, up, up, up, up, scream,

scream, scream, and he'll then break downscale. You can see him go down the scale. "I was just trying to tell you...!" And he'll be crying, you know?

He gets on the same line – the stuck flow of his communication on the thing, and he can't get it through, he tries everything under God's green earth to get it through, and eventually he starts giving up and you can see his whole emotional tone scale follow this, then.

Well, that is a basic ARC break. That's fundamental. Now, you expect me to tell you there are many other kinds of ARC breaks, but there are no other kinds of ARC breaks. These mechanisms are all based on the communication cycle.

I don't care what the devil happens with the rest of the bank, the whole definition of bypassed charge is "partially detected." Now, it wouldn't become bypassed charge unless it were at least slightly detected. You understand? Somebody had to drag a magnet within a few feet of it. It had to be stirred up one way or the other for the thing. But that is a communication line which begins.

Going to restimulate an engram in the session. Let's take this as a bypassed charge source, see? The auditor does this, knuckleheadedly.

You want to be careful in R3R, in selecting incidents, using things like "the first incident," "the earliest incident." Cut your throat, man! What are you talking about? You want "an earlier" incident, "the next" incident, not "first" and "earliest."

Why? What are you trying to do? Life's so dull you have to have an ARC break? Well, how are you going to get this ARC break? The pc can't give you the earliest incident on the chain but could give you the earlier incident than the one you just had. But you ask him for the earliest incident and you will kick in some earlier incident which he then doesn't reach. So, he now partially detects. And you have partially detected. Both of you, now, are guilty of partial detection of a started communication. And somewhere down deep it follows the same cycle as a communication cycle, right there – bang-bang-bang. It'll go all to flinders, just like that – bang-bang-bang. The more you scrape it up and the less you detect it, the more ARC break you're going to have. And that's all there is to it.

If you considered the time track a series of mines – nah, I shouldn't do this; some of you girls are timid enough when it comes to approaching some of these things. But let me give you this anyway. Supposing we consider it a bunch of mines which were activated magnetically. All you had to do was drag a magnet somewhere near them and they'd explode, see? And you want mine number four, and you're all set to sit on it and pull its teeth and not let it explode, see? So you throw a magnet down to mine number eight and then start to prevent mine number four from exploding – and you wonder what that shattering roar is! Well, you see, you just miscalculated on what one you were going to explode.

Now, a time track isn't quite that dramatic, but it gives you an example, see? You want mine number four, so you activate mine number eight. Now, what in actual fact is that?

Well, it's a bum origin as far as the auditor is concerned, but actually, the communication cycle is reverse end to. Somebody has told mine number eight to speak, accidentally. And mine number eight speaks, and nobody detects it, quite. See, it's partially detected. But it is activated and being partially detected now, will follow that same incomplete communica-

tion cycle. Nobody understands it, see? It isn't that that has life in it which is capable of doing that at all. It's just that a communication cycle, once begun, must go through. And if there is any type of thing that you want...

A big truism – a big truism: A communication cycle once begun must go through. If that communication cycle isn't permitted to go through, there will be upset somewhere, sometime, someplace.

In fact, most of the difficulties of mankind, if you wanted to lay them out, are simply begun communication cycles which are not then detected. You know, they're only partially detected, let us say. There it is, see?

Let me give you an idea. The President of the United States says, "I want all of you bums and all of the indigent and the poor and the pauperized characters – I want all of you to write me a letter and tell me exactly what I can do to help you personally, individually and personally." Gluck! Nobody would see in this the eventual revolution. Do you see what's going to happen? The guy's got no technology for handling the communication cycle at all. To say something like that would be weird. And yet the politician in a democratic country has always got this as his stock in trade. He's a glad-hander tell-me Joe, you know – this kind of thing. Eventually it starts exploding in his face. We are very adventurous in that I go ahead and do something like that.

Remember, there's a slight difference here. Slight difference here: You know how to catch the ball. We can catch the ball, we know the mechanics of this sort of thing, and generally the communication cycle doesn't have that as a source. I mean, it isn't that communication cycle that's at fault. It will have been somebody audited somebody, and they got into an ARC break and they bypassed some charge, and then the person wouldn't admit that they had bypassed some charge, you see, on the pc, and then the pc gets more and more disturbed. And eventually they go to see somebody in the area, and eventually the HCO Sec. And then the HCO Sec tries to handle it one way or the other, but it misses there one way or the other. And it slides sideways and slips around and so forth, and eventually hear about it.

And once in a while I drop a ball on these, and I only know of one case extant right now where the ball has been dropped forever, as far as I'm concerned, because he got into the hands of a psychiatrist. Incomplete communication cycle was the immediate and direct cause of that particular action. He already, let us say – we know this – had a tremendous number of overts on the organization and everything was gone to hell, and he'd been in a mess for a long time, see? But a communication cycle – I didn't pay attention to it just as a communication cycle, just directly didn't. And the character sprung sideways, and there wasn't any way you could pick up the ball after that because there was a psychiatrist standing there. Haven't done anything to the guy – apparently some psychiatrist that doesn't use ice picks in the morning, only the afternoon. I only know one that's extant like that.

Well, that's a pretty good tribute to us, and it doesn't say, then, that the situation isn't dangerous merely because it's being handled. But look at this: It is a situation which is pretty doggone violent if it is not handled.

And if you're unaware of this... you realize that gunners and that sort of thing are always chucking around live ammunition, and they're not spooked about it at all. And you'll see

people that work in oil well districts blowing out oil wells and so forth: They're always walking around with a pint flask of nitroglycerin in their hip pocket. They just couldn't care less, don't you see? Well, why? Those guys don't die and get splattered all over the place all the time. They're handling very dangerous materials. They're just familiar with their material. They know what that material is, see?

Well, how would you like to be handling, on a totally unknowing basis, the way everybody else does in the community, see?

Have you heard any conversations amongst meat bodies lately? Have you? Have you? I'll give you an assignment some time: Go around to a tea break in a construction works and listen to them. That isn't so bad as a cocktail party. A cocktail party is armored, on this basis: They don't expect anybody to hear them, so it's never partially detected charge. But this becomes pretty idiotic, pretty idiotic. You just stand there and watch the number of dropped communication cycles. And you don't wonder at all after a while why these people tear each other's throats out all the time. They're always partially detecting that somebody has spoke. And of course they get a blowup.

You see that you can handle the dynamite of the reactive mind. This stuff, you know, is not very dangerous. I don't mean to minimize it, so on. Frankly not very dangerous. It requires understanding. It never has been very dangerous.

But look how desperate it has made practitioners of the past. Look how desperate it has made people. Look how desperate a problem it is and look how frightened people can get if the United States – whatever you call it – is appropriating sixteen billion bucks to let psychiatry figure out how to give quicker and faster prefrontal lobotomies to more people.

Oh, I tell you, man, they must be worried! That worry must be proportional – at least one third as much worry invested in that as they have invested in the Russian situation, because that's about the proportionate amounts of appropriation. I think that's fascinating. You mean, they're so worried about this problem, they're so worried about the mind, that they invest treasure to this extent? They must be frantic to put it in the hands of the people they put it in, too.

I don't exaggerate. If you'd talk to most psychiatrists yourself, or if you were to – if you were head of a committee or something like that and you called in two or three psychiatrists or something like that to get testimony from them as to how to handle the community mental health – if you were just an average citizen – you'd probably wind up with your eyes like saucers. Police listening to these fellows testify in courts, and that sort of thing, have become confirmed in the fact the psychiatrists are always crazier than the patients.

Well, look how desperate the situation must be if it's put into the hands of people who put up forward a mock-up of franticness to that degree, see? Let's just look up these coordinative factors, see?

Well, a psychiatrist, of course, is himself frantic. And if we didn't give him a hand to straighten out, he'll just never make it. And I don't think we'll ever help him.

Anyway, the point I'm making here is this factor of the ARC break. This factor of the explosive character of interpersonal relationship, this factor of explosive nature of social or

any other type of personal contact, is looked upon in quite another way by other people than yourselves. It's looked upon as just "*Huuhrh!* Everybody is dangerous," and "Everything is dangerous," and "Oh, my God," and it's all on an emergency basis, and "*Huuuhh!*" and figure-figure-figure, you know? It's fantastic.

Very few of you would say, "Well, you can't talk to him about that." Just show you that you've arrived someplace else, you see, than in that state of mind. Very few of you would be convinced you couldn't talk to anybody about anything. After you talk to them for a while you know you can handle the situation to some degree or another and so on.

Well, that's not the general state of mind with regard to this sort of thing in this society. "Talk to somebody about something? *Huuuhhh!*" See? "Impossible! *Hu-ooohh!* Dangerous!" What are these characters reacting to? They're reacting to a communication cycle. So the communication cycle is itself the most deadly thing, if mishandled, that interpersonal relationships has, and the most valuable if it can be handled. The reason you can't fish the ants out and straighten them up is because you can't talk to them.

Desperation enters in only when communication goes out. Just remember that. You only get desperate – you can look back on sessions you've given: the only times you've been worried and desperate and that sort of thing is when you actually had the communication cycle go out, one way or the other. You want to say to this pc, "What the hell is the matter with you?" See? "What's the matter with you? I mean, I'm asking you a perfectly simple question here, you know? And you poor sod! If you can't answer that question, get some tone arm action, you've just about had it, man!" You know? You know this, sitting there, you see, and you sit there and you get tied up in the situation.

After a while you find yourself kind of peeved with the pc. Pc isn't responding correctly. Then you get all right when you do get the pc at some level that the pc is responding all right with communication; you find out that, much to your red face, that you had eight wrong dates on the case and that's why the TA action wasn't moving – something like this. You get these things straightened out, you notice the situation evaporates.

In other words, your response to the pc ebbs and flows to the degree that you can put a communication between yourself and the aberration that's bothering him and straighten it out and see the evidence of its discharge. Don't ever think you worry about a case for any other reason. You don't. It's that basic thing. You're having an effect on the case, the case is responding and the case is coming along, and that is what you expect to have happen, and therefore that is happening and all is well. And when that ceases to happen, when your breakdown comes in, and you can't seem to reach this pc with an auditing command, you can't seem to reach this bank with a communication of any kind whatsoever, you can't seem to untangle this knot by speaking at it or into it, you start getting worried and you start getting upset. And that's when you as an auditor become upset, and that's when you as an auditor become worried about your pc. And it's off...

There's no reason for me to give you some pat answer, because there isn't a broad, pat answer to it, because cases have these various bugs and complications of which you're aware and which you get around eventually. But you look it over and try to find out what communication you're not getting home to the pc, and you as an auditor will feel better.

Now, if the pc is feeling like the devil, pc's feeling miserable about an auditing session or auditor, or something like that, you can just be sure that a – not *his* communication cycle; now, don't get this one awry. His... as an auditor, it's always your communication cycle that is awry, from your analysis of the thing. You want to improve something, you improve your communication cycle. But from a pc's point of view – a pc is very much the effect of very heavy and strong processes – and from the pc's point of view, a communication cycle is awry, but it can be awry in various ways.

It's awry. The communication cycle is awry. A communication has started, it hasn't been fully detected and it certainly hasn't been understood. And where a pc is going awry as a pc – you want happy pcs, you just listen to these little words and don't bother about anything else, and you just start figuring out exactly how you apply these to any case that you're auditing that you want to make a happier case one way or the other, and it'll work. And that is, some communication cycle has begun, it hasn't been detected – fully detected, you see; has to be slightly detected or it wouldn't be active – and it hasn't been understood. Now, if you put that in a nutshell as to the basis of low ARC or ARC breaks in pcs that you are auditing, you actually never need another line of anything. You need the mechanics of how to detect these things, you need a list of how many things these can be and so forth, but I give you that as a basic principle.

And you go at that as a basic principle, and you figure out the pc you're auditing has that as a basic principle, even when the pc doesn't have an ARC break. You know, there's no reason to figure this out. Now, get this: there's no reason to figure this out at all. Go ahead and figure it out and you all of a sudden will understand something about your pc that you haven't understood before. You're going to find a communication cycle out. I mean, it doesn't matter what pc, you see, where. You're always going to find a communication cycle out. What's the evidence? He's not OT.

For instance, he's always missing the telepathic communication cycle; see, he's always missing that one – that's always out.

Didn't go out in a session I was in last night. The auditor and pc practically blew each other's brains out by having exactly the same communication cycle on a telepathic wave hit midway and almost blow up in the middle of the session. It was an incomplete communication cycle had taken place in the session. Both auditor and pc thought of it simultaneously and almost went around the bend trying to figure out which one had thought of it first so as to unbalance – so as to unbalance this sudden ridge that had appeared in the middle of the auditing session. Quite an amusing situation.

Missed a goal, back in the session; you know, one of these skitter-scatter sorts of reviews of putting things back together again, redating and that sort of thing, and just up and missed a goal. Didn't realize any goal had been missed until the end of session, then all of a sudden thought of it. Either the auditor thought of it first or the pc thought of it first. The immediate result was a telepath on the subject, and it... [claps]! It was pretty weird. You watch some of this stuff you haven't seen for a long time, you know, you get tremendously intrigued. You say, "Huh! This stuff can exist," you know?

Anyway, we had quite a ball on that. But that's just a communication cycle of some kind or another which is completing. There are all kinds of communication cycles.

Now, what do you think of a pc who isn't receiving the auditing command? And what do you think of the auditor that goes ahead and gives auditing commands the pc is only partially detecting? Hm? Now, does this explain why you can run a "touch" process on an unconscious person, particularly if you're monitoring their hands? You say, "Touch the sheet. Touch the pillow." You say, "Touch the pillow," and then you have them touch the pillow, and now they know they've received the communication. You understand? You see that as a surety? So it even works at the level of unconsciousness. It's quite interesting.

What do you think an auditor is going to walk into who keeps saying, "Squizzle-wig the ruddy rods. Thank you. Squizzle-wig the ruddy rods. Thank you."

And the pc keeps saying, "Yes. Yes. Yes. Yes." What do you think the assessment at the end of session is going to look like? There's going to be a communication cycle missing. It happens to be the auditor's originated communication which is only partially detected by the pc and never understood. Now, what do you think's going to happen in that session? It's going to blow in some weird direction and there isn't going to be progress, and things are going to go to hell in a balloon one way or the other, and it's all going to be very hard to detect. You see that? All right. Now, let's look at another communication cycle. The pc is – I'm not trying to tell you all ARC breaks are based on the communication cycle. You understand, the communication cycle is primary but goes awry at the point of detection and understanding. Understanding throws it into A and R. You understand? There are the affinity factors and the reality factors are what tend to make it not understood. This is why it's ARC. But still you can analyze it head-on on the basis of communication, you see, and it'll fall into that category. It's the reasons why the communication cycle didn't complete and was only partially detected when it should have been really detected, see?

Well, let's say the auditor has never cleared the auditing command with the pc. The pc has gone on answering this endlessly. Well, of course, you're going to get into trouble. What's the primary source of trouble? The fact that a communication cycle existed and the communication cycle was only partially detected, only the communication cycle didn't cycle. It didn't get all the way through. It was partially detected and it was not understood. So of course you're going to get into trouble.

All right. Let's take another look at the situation. We try to get engram four and we trigger engram eight. Well, we've started a communication cycle, don't you see, of engram eight without knowing we started engram eight, and we suddenly hear an explosion someplace and we can't quite detect where it came from. We look it over, and we find out the communication cycle was that we accidentally got the response of engram eight, but then we abandoned that somehow or another and we got four. So actually the communication cycle was not completed. Was directed to eight, was not received at eight, don't you see? It was received at four instead, so therefore you've got a partial detection, and the pc didn't find it out, really, and the auditor didn't find it out, so there it remains as a sleeper, don't you see?

There was something that didn't go through. That's all you've got to figure on the thing, if you left all of your lists home. Something didn't go through. Well, it's only a question of how many things won't go through.

Well, the basic things that won't go through are affinity, reality and communication. And the basic things that those three things face are time. Time – matter, energy, space and time. It's ARC versus time. Don't you see that the livingness of the individual consists of ARC and he faces the material universe which consists of M-E-S-T. So you have the factors of M-E-S-T and you have the factors of ARC. And these confront each other. But this basically takes up the communication cycle. The individual communicating with time, or time communicating with the individual, goes awry. And as a result you get an incomplete and a partially detected communication cycle. All of these things end up in what you call an ARC break. This ARC break results in all sorts of violent emotions which actually could not be exaggerated in their violence. It's just an ARC break amongst nations that causes wars. And yet here's millions of people strewn out across the battlefields causing all kinds of work up here at the between-lives area. (Poor fellows – I bet they even have to work overtime. Let's hope they don't belong to the union or anything like that. The boys must have an awful time.) Well, that's an immediate, direct result of ARC break. Communication breakdown of some kind or another, with the affinity and reality attendant thereunto.

So don't think that because these factors are very simple and very easy to handle and very easy to detect that the results of not detecting them are not severe; and that the severe results that you see in life, interpersonally and in auditing sessions, too, as well, are not catastrophic, or think that these results do not stem from this very simple little factor. Because it always does. An incomplete communication cycle results in bypassed charge – always.

The common denominator of an ARC break is bypassed charge. There's charge someplace.

But what do we mean by charge? We mean – well, of course, ergs, dynes and all the rest of it. Well, we apply it to the communication cycle and we mean that a communication or a charge has been excited and was channeled to go in a certain direction, and then was not detected and not understood, and that charge then explodes in a dispersal of some sort or another. It goes *blooey*. Don't you see? This is elementary. Bypassed charge is something that originates as the beginning of a communication cycle, and then not having been wholly detected or understood, remains then as bypassed charge. And it's very often not detected by the auditor or the pc. And you have a session sort of running at a low gear.

Now, don't think these things are just explosive either. Pc just isn't feeling so well lately, so forth. Well, you've got some sleeping bypassed charge of some kind or another you didn't pick up, that's all. Bypassed charge, we mean we bypassed getting the completion of the communication cycle, or we carelessly started a communication cycle which didn't get completed. That's all.

Accidentally did so. It's very easy to do. We say, "Give me the earliest engram on this chain." Little while later, pc has an ARC break. We say, "Let's see, did I miss an origin, or what did I do? What happened?" Then you hit, finally, "an earlier incident was restimulated."

This usually settles it away one way or the other, particularly if the pc spots what was restimulated. Bang! There goes your ARC break.

Now, it's attended with great magic. But the magical look at it is the fact that we have the anatomy of this tremendously explosive stuff – the explosive stuff of interpersonal relations. We know the magic of that. We know how many different ways the thing can be – a communication can be begun and not be detected and therefore become bypassed charge. It's a lot of ways in which this thing can be done.

Well, knowing those things, you should be able to handle a session better. You should be able to handle a session better. Pc says, "Oh, I – I don't think we ought to go on too long."

And you say, "Very good." Just as your words fly out the window, at least have the grace to realize that you are adding something into the communication cycle, if this then bears bad fruit. Just realize how come it came about. It's a partially detected communication, wasn't understood, far as the pc is concerned. You say, well, obviously that leaves you in a position of always doing what the pc says. No, it doesn't.

"Well, good. I'm glad that's the way you feel. All right. All right. Yeah, okay. Okay. Don't want to carry on too long. All right. All right. Well, good thing that I'm perfectly fresh, and I hope you are the same, because I intended to go for another two hours." We find that one cycle isn't the other cycle, don't you see? You've originated a new series of communications on the subject; you haven't slapped the old one in the head. You only get into trouble by slapping the old one in the head, don't you see?

Pc said, "I think you ought to go all over the track and restimulate all these engrams, because actually the best thing to do is to get to basic-basic, which is tomorrow."

And you say, "All right."

You take a look at this, you understand what he said. You may not understand why he said it, but you sure understand what he said. And you say, "All right. Good enough," and go on and do what you're doing. He still isn't too upset about the situation. See, he only gets upset if you slap him in the face.

Therefore, you've got to be an expert in the detection of a communication that has begun. The better you are at detecting a begun communication – the better you are at this – the less ARC breaks you'll have. But actually you needn't worry about ARC breaks, because you can handle these things before they get catastrophic.

Now, that's an ARC break. That's handling the ARC break. These are the basic fundamentals stripped right down to rock bottom. Your ARC break assessment form is simply the number of types of communications which can be started and only partially detected by the auditor and the pc.

Now, some of you are prone to this (now, this can be done; so you are led astray by some wins): You can say, "Well, an earlier incident was restimulated in the session. That's what's wrong. That's what the ARC break was about," and the pc suddenly feels better. And if you go on that way, and you get wins, and you say, "Boy, this is the cat's. There's nothing to this. This is absolute magic," right up to the point when you get the ARC break that you didn't

assess the right line for or you assessed the wrong list for or the pc didn't quite know where to go to in order to look at and is still fumble-fubbed. You didn't find it, even though it read on an assessment.

So therefore, there are several actions undertaken in the detection of one of these things, and one is to assess it on the form where the ARC break reason lies. That sounds idiotic for me to say something like that, but if the ARC break is in the session and you do an R3R ARC break form, you're not going to find the ARC break, are you? And so forth.

So the right form, the right list – the right list comes as primary in this. And if you don't find it on the right list, why, you better get another list. In other words, if you don't find it, get another list. Your commonest error on these things is not now that the lists are not complete, but that the lists are in several pieces to save you time, so your commonest error is wrong list.* You actually didn't find the ARC break. You didn't find the communication cycle that began and so left bypassed charge.

Now, the main mistake you're making or could make in this, if you do make any mistake on it, is not making sure that it's all straightened out with the pc. That's the biggest common error. You say, "Well, that was an earlier incident restimulated. That's all right. Okay," and go on with the session. The pc's sitting there frying. It wasn't an earlier incident. Or he didn't know what incident it was, and he's totally baffled. The ARC break charge has not been spotted and laid to rest, see? It says right there in the bulletin on this that you better take it up with the pc and find out if that's right.

Well, you can go to the point of dating all of the things which you dated wrongly and finding and locating and dating all of the bypassed incidents. In fact, it could become a total production which will go on for sessions, trying to clean up one ARC break. You understand? A good stunt in this regard is to find the order of magnitude of the bypassed charge. That doesn't let you in for more trouble.

"An earlier incident was restimulated." Yeah, but what? Who? What? Where? What's? Which? Which? What's? Which? It's all you can find, is an earlier incident was restimulated. You don't know what earlier incident was restimulated, you don't know what the hell, and all of a sudden the pc says, "Oh, yes. And, yes, it must have been..." and so on. And, "I wonder when that was. Can you date that? Yeah, there it is," and so on. "Can you date it?"

Good trick is just give it order of magnitude: "Is it hundreds of years ago, thousands of years ago, millions of years ago, billions of years ago, trillions of years ago, trillions of trillions of year – ? It's trillions of trillions of years ago."

"No kidding? All right, that's fine." That's the end of it, see? That's a way of parking one without getting yourself all solidified in a dating. You know that the pc's attention is still stuck on this thing, and he's still trying to sort out what incident it was, and that sort of thing. Well, one of the ways to get rid of it is find its order of magnitude – not go ahead and date it and find its duration and run it by R3R when you, in the first place, were doing 3N. You understand? You can go that far.

* Editor's note: Refers to the lists in HCOB 5 July 1963 "ARC Break Assessments", Red Vol. V, p.306

But locating – locating it on the list – is where the semantic error turns up here. You don't locate it on the list. The list only locates the type – the type of charge bypassed. In other words, the type of communication cycle that began and was never completed, never detected, see? That's all. That just locates its type.

Now it's up to you to take the additional steps of locate and indicate to the pc the charge. In other words, doing the assessment is really not locating the charge. The charge is not on the list, it's in the pc. You get this? I'm not saying that just to be clever. The truth of the matter is, it's only the type; the list will only give you the type of charge. And you haven't accomplished the step of location. You've only found the type, see? People are saying "All right. Well, you locate and indicate. That means you do an assessment. Bang – that is located now, and we indicate it to the pc." Well, the funny part of it is, this is so good that even that works. See, there's where you get tripped up. You can short-circuit it to that degree and still make it work.

Well, recognize what you're doing. That's terribly short-circuited. You've only found the type of charge. You haven't done the location step at all. So in some ARC breaks you are totally baffled as to why the ARC break doesn't evaporate. You're totally baffled. You say, "Why doesn't it go away?"

Well, the primary reason is you haven't done it on the right list. That, oddly enough, is the most flagrant one. But you've never done the location step at all. The assessment is not the location. See? And an earlier incident was restimulated. You say, "All right, an earlier incident was restimulated." Well, the magic of it is so great that occasionally this works, and it gives you a bit of a win, so you say, "Well, this ARC break assessment stuff – pretty good. Ha-ha! That's it. Yeah, fine." And it'll work like that, and it'll always work if you've got the right list. And you've produced this minimal effect on the pc and pc isn't all coming apart now at his edges.

See, because that works, this whole system tends to get very short-circuited. You see, the assessment is not the location. That isn't the way you locate *the* charge. That is the way you find the type of charge that you now want to locate. You go down this – *pocketa-pocketa-pocketa-pocketa-pocketa* – and sometimes when you go over it you retrigger it, and your dirty needle turns off, and your next time down, why, it reads purely. See? You've had a dirty needle on the first assessment. Expect that as normal. Next time you go through and flick those off that were still in – bang – one is standing out there clean. Now you can say, well, it says so-and-so and so-and-so. "That's an earlier incident was restimulated. Earlier incident restimulated, that's what it says here. How do you feel about that?"

The pc says, "I feel lots better. Yeah, it's fine."

Well, let's not plow up the field after it's plowed, man. See, this is just handling ARC breaks as they occur in session. You know? No reason to go into this, stir it all up again, find some more bypassed charge, bypass... no, you had it handled – let sleeping dogs lie. Your assessment, location and indication all occurred in the same breath, see? Then you verified to find out whether or not it was okay, and obviously it all occurred in the same breath, so why are you going to go into any trouble from here on? Everybody's satisfied, why are you going to any trouble? You're just going to stir up more trouble.

But remember, you have done a very short-circuited, shorthand version of an ARC break rundown. That is very short-circuited. If you got the right charge, it can happen. But, "Earlier incident restimulated. Yeah, that's what it says here. An earlier incident was restimulated in this session."

Pc says, "Ah, well. Okay now, that's good," and starts getting interested in something else, see? Ah-ah-ah, that's all right. Nobody's going to quarrel with him doing that.

But you say, "Well now, how do you feel about this?"

"Ah, maybe so, but – uh – yeah, it was that earlier incident that was restimulated. *Aorrwr-rahr!* That earlier incident was restimulated!"

You haven't found the charge, man. And the first thing you should suspect is not your assessment but that you had the wrong list. Reach for another list. Do you know that you can do 3N and inadvertently do some 3R and be accidentally into 3R making ARC breaks of 3R? You can sometimes do R3R and get inadvertently into 3N, and your ARC break lies in 3N. Do you realize that? And sometimes if you have an ARC break on R3R and 3N, it is never the session ARC break list. But sometimes after you've cleared them up you then have to get the session ARC break that resulted from having had those out. You get the stunt here?

But remember that there is an assessment, a location and an indication, and it has to be all right with the pc. So there are four steps, always four. You could say five: Finding out that the pc has an ARC break would normally be the first one. But that is the score on your ARC break assessments. And recognize – recognize those steps, in handling the existing ARC break, actually exist to that number, and the assessment is not the location. The assessment is just finding out the type of charge. You might have to go quite a bit further to find the location.

You say, "Wrong date." You've done nothing the whole session but date, you see? The ARC break's caused by a wrong date. Well, it reads well and it is a wrong date, and that is the ARC break, but the pc says, "What date is wrong?"

Well, you think that you now have to redate everything in the session, and so forth. Well, just call off a few of the dates you found and ask if they're right, that's all. Bang, bang, bang, bang, bang, bang – do they read as wrong dates? That's one way of doing it. Another way of doing it is "first half of the session, last half of the session." There's a dozen ways of doing it. I'm not going to try to teach you that trick. But you can go ahead and locate it right on down. Well, what is the right date for that thing? One of the ways of doing it is simply get order of magnitude. That makes the pc very happy. That causes it all to go back into place very smoothly.

You ran the goal "to spit." You thought it was in the Helatrobis implants; you have a wrong date on the thing all the way along the line. And you find the goal "to spit" had the order of magnitude of trillions of trillions of years ago. It's good enough. Not to go on to run the goal "to spit," you understand, but to find out that you'd found the goal "to spit" and you want to get it out of your road so you can keep on with the goal "to spat," see? Well, you find the order of magnitude for the goal "to spit" and it'll move out of your road.

These are all just shorthand methods of handling the thing. But you are dealing with an assessment for type. You are dealing with a location. You are dealing, then, with indicating what that was, and then you are dealing with another factor here, is; was it all right with the pc, does he feel okay now? And that's what you were doing it for in the first place, so you're a ruddy fool not to find it out in the last place. Okay?

All right. Well, because you can get away with it on the basis of do an assessment – bang – you say, "That was it," and suddenly your location and indication take place just like that, see? You don't, then, break them down and realize that they are that additional steps.

If you wanted to know a complete list of all types of ARC breaks in this whole universe, you would have to find all types of communication that could be partially detected when originated and all the things, then, thereafter that could be misunderstood. And you would have a full list of all ARC breaks. Because we're dealing with the mind, we know the ones that are important, and we know what really causes the explosions and we include those. Otherwise, 150 million books printed, each one, to the size of the *Encyclopaedia Britannica*, could not give you a partial list of the number of communications that could leave bypassed charge by being incomplete.

Okay?

Audience: Yes.

That's the lot. Thank you.

COMM CYCLES IN AUDITING

A lecture given on 25 July 1963

All right. Beautiful, sunshiny day here; cherish it. Go out and make a facsimile of it.

This is what?

Audience: 25 July.

25 July. What do you know about that? A.D. 13, Saint Hill Special Briefing Course.

The auditing cycle. Once upon a time there was an auditor and he knew he could audit; he knew he could audit. But PCs, they just wouldn't PC worth a nickel. And the auditor said, "Well, I'll have to get out of Scientology because PCs are no good."

You'd be surprised how often this line of logic – ha – gets in the road. Most auditors, early on, have a definite idea that there's tremendous variation in PCs, and that some PCs can be audited and some PCs can't be audited, and that there are good PCs and bad PCs, and all different kinds of PCs.

Well, there are worrisome PCs, but just to the degree that you can't get them to get tone arm action. And some PCs are closer to aquiver on the subject of a communication breakdown than others; they're more nervy. Those things are true. But practically no PC can stand up against a good auditing cycle, you know, and say, "Well, I'm going on being aberrated for the rest of my days because that makes everybody wrong and makes me right."

The difficulty that an auditor gets into is normally found in his own auditing cycle and his own impatience. His disabilities in this particular line are last detected by himself. In other words, he's really the last to find this out.

If an auditor wants to polish up his auditing, I recommend putting a piece of session on a tape, at least a piece of a session, and then listening to that tape back, and not listening to the ramifications or the flubs. Anybody is liable to make a duplicative-type flub, you know. Like, you've had to change your auditing command – you heard me make one the other day on that tape. I had to change the command, because I was getting so much bang out of "mainly" that I had to put "mostly." And then I was grooved into saying "mainly," and my concentration, of course, was for the PC, and I was slipping up and I was occasionally saying "mainly" again when I was trying to say "mostly."

Well, you're liable to pick on that kind of thing as being a very important error. Actually, it isn't very important. What's important is: Did you complete your auditing cycle? See, it really isn't how gracefully you completed it, but did you complete it?

There are two communication cycles that make up the auditing cycles, and those are: cause-distance-effect with the auditor at cause and the PC at effect; and cause-distance-effect

with the PC at cause and the auditor at effect. Those are completely distinct, one from the other.

Now, the only place they impinge on each other at all – and this is the only thing that connects them and makes an auditing cycle – is the fact that the auditor, on his cycle, has calculatingly restimulated something in the PC, which is then discharged by the pc's auditing cycle.

So you see, you've kind of got a V lying on its side. You see, you've got the upper V here with the auditor at the top of the wing, you see, and he's cause, distance, effect; and here at the point of the V, you customarily think of that as just one turn. Actually, there's a complication right there: It's what the auditor has said has caused a restimulation at that point, and then the PC is honor bound to start an auditing cycle to get rid of the restimulation. Can you see that? And that is the game that is being played in an auditing cycle, and that's the entirety of the game. There's nothing else esoteric about it at all.

Don't think otherwise than that the auditor is restimulating the PC. Now, some auditing – some auditing – breaks down because the auditor is unwilling to restimulate the PC. Now, you'll see this on a gross level when somebody said, "I had to stop auditing him because the somatics were so great." You see? I've actually heard somebody say that – seriously.

And I think to myself, "The poor PC, man." At that point of the V where those two come together and where effect turns into cause, where the PC is there, at that point, you have a restimulation and then the necessity of answering the question to get rid of the restimulation.

Now, if the PC doesn't answer the question, the PC does not get rid of the restimulation. If he alter-ises at that point, then every restimulation is going to become an alter-is. And all PCs who are having any trouble alter-is at that point of the V.

Here, I'll draw you a picture.⁴ Here is your V. And this is cause and this is distance and this is effect. Now, here's your auditor, see? And here's the PC. Now, at this point here is where you get your restimulation factor. And this point is again, now, cause-distance-effect, see? So we get cause-distance-effect, see? And that's what an auditing cycle in actual fact looks like.

Now, there are some little inner cycles – there are some little inner cycles that throw you off and make you think that there are some other things to the auditing cycle. And these little inner cycles are when you get cause-distance-effect, and he has answered the question, the auditor then says, "Thank you." Well, actually, that's a shadow. And this now starts the shadow back, you see? You understand?

See, there's a little extra communication cycle on here; it's an extra cycle, see? And you have this as the acknowledgment – the acknowledgment cycle. So you have here an ack, and of course that goes this way, you understand, and is received over here; and that's all there is to it. That's a little fade-out, don't you see?

⁴ Editor's note: See Lecture Graphs published as HCOB 14 Aug 63, Red Vol. V, page 339

Well, I very often berate you for being not perceptive, and not auditing the PC and not seeing what's happening to the PC, or what's going on there, don't you see? So I get this kind of an action here: There is another one of these little shadow cycles. The PC has received the auditing command. And that is such a tiny cause that nearly all auditors who are having any trouble finding out what's going on with the PC are missing that one.

You say, "Do birds fly?" and then you fail to perceive that the PC received the auditing command. Now, that's because he doesn't say anything. See, here's your main cycle: cause-distance-effect; "Do birds fly?" See?

And the PC says, "No."

Well, actually, there's another cause in here; there's another little tiny one, and it's right here and it's a little c, see? And you're missing that one where you're not perceiving the PC. Does he receive it?

You say, "Do birds fly?"

And he says... That's all the cause that is emanated at this point, by the PC. See, he just... See, that would be exaggerating it.

But you can tell by looking at him that he didn't understand what you'd said, or that he was doing something peculiar with the command he was receiving, you see? Doing something peculiar with this command.

Well, it's actually whatever that message is that is in response here, whatever message that is, does ride on this line. And an auditor who isn't watching the PC at all then never notices a PC who isn't receiving or understanding the auditing command; and all of a sudden, somewhere along the line, there's an ARC break, and then we do assessments and then we patch up the session and all kinds of things go wrong. Well, they actually needn't ever have gone wrong in the first place.

What is the PC doing, completely aside from answering? Well, that what he is doing is this other little sub-cause-distance-effect line. So a complete auditing cycle consists of no less than six communication cycles, if you really want to get it down to the last ramifications. But the important ones are four. You've got four communication cycles.

Well, where are the other two? Where's the other two? They're so tiny that you wouldn't really notice them, but they are there. Cause-distance-effect of "Is the PC ready to receive an auditing command?" See, is he ready to receive an auditing command? He's going, "Oh, *rum-rum-rum-rum-rum*." Well, that action is actually PC causing, isn't it? And it has to ride up the line across distance and [be] received at the auditor; and the auditor perceives that the PC is doing something else.

You say, "That's not very important," you see? But it is; it is. You'll find auditors goof that one very often. And the PC is going... And the auditor says – he's nulling, let us say – and he says, "catfish," "cat fur," and so forth. And the PC is going like this, you see? See, he's not noticed this first one.

That causes this kind of trouble: You've got the item "fur" on a list that you're nulling, and you hit the item "fur" and it goes through, actually, a complete auditing cycle, one way or

the other, because you very often say thank you after you've done so. It's a very jammed-up auditing cycle, but it's there, you see?

And then you go on to "catfish" on the next one, without performing this top cycle: Is the PC ready to have "catfish" read to him? No, he's hung up on "fur," and the only time you ever get into real catastrophe is when the PC is really hung up on "fur." God, when you said "fur," the PC went, "Ew-w-w-w." *Dong!* and there he is, see?

"What's happened? Where is it? Ho! What's happened?" See? You ever have that happen to you? Somebody goes over a line – *bong!* it goes. And the next thing you know, in the far-off distance you hear "catfish, cat whiskers... "

And you say, "What's that? Where's this? Who's what?" This one becomes terribly important when you run into a situation like that. You don't really pay too much attention to it. But it exists. Got it? It exists.

And there's another one down here. There's another little one down here: Pc received the acknowledgment. And sometimes you violate that sixth one. You say, "Thank you!" and the PC goes like this. Or that you say, "Thank you," and the PC... If you were to do old-time Model Session end-of-session mid ruds at that point, you'd find out the PC asked you why you never acknowledged him. See? You have been acknowledging him, but you've never seen that he didn't receive the acknowledgment, don't you see? That perception has another little tiny one in it, is: Has the PC said everything? But that actually comes on this line here: Has the PC answered everything, see? And it becomes... the auditor is watching the PC, see? And the auditor sees that the PC has not said all he was going to say. Sometimes get in trouble with PCs that way.

Pc says, "Oh, yeah, it was sometime in the later days of the Roman Empire..." You know he's going to say something else, see? Well, this one isn't complete. So everything at cause hasn't moved down the line here to you, effect. And you haven't perceived all of the effect. So you go into the acknowledgment one before this line has completed itself, don't you see?

"Well, it was in the early days of the Roman Empire. Um..."

"Thank you! Now, we will..." *Duh-uh-uh-uh.* You've seen that happen. That's chopping a pc's comm, see?

They didn't let this line here, which is the fourth communication cycle, flow to its complete end. And then this one, the acknowledgment, takes place. And of course it can't go through because this, the fifth communication cycle, is sitting up here on the fourth communication cycle.

So you say, "Thank you," and of course you're right back against... and it's an inflowing line and they jam right there.

So there are six – if you really want to break it all down – there are six communication cycles that make up one auditing cycle. Six – not more than six, unless you start running into trouble. And when you violate that – one of those six, when you violate one of those six – you of course are going to get into trouble, then, which causes a mishmash of one kind or another.

Now, I'll go over these again. I think you would care to have me do that, wouldn't you?

Audience: Yes.

All right. Up here we have number one: the PC. His emanation at that point is simply his appearance and presence. That's number one. Is he ready to have an auditing command given to him? See, are we all set here for the auditing command? That's number one. That's a communication cycle consistence of cause, distance, effect.

Your next communication cycle on the thing – we had better go into number three – is your auditor's communication straight down to the PC. That is the auditing command and that you normally consider the communication cycle. Got it? That's what you normally say: "Do birds fly?" That's cause-distance-effect received at the pc's – here.

Now he has to take care of and handle the charge at this point (and I'll cover this in a minute), he'll have to handle the charge at this point which has been restimulated by the auditor. And now he originates (although we use another designation; I've used origination otherwise, and so forth): He has his answer, which is what you normally call it. His answer, however, is a cause. And that's a cause, a distance and an effect. You understand?

Now, your next one is an acknowledgment by the auditor which goes over cause, distance, effect, is received by the PC; and this is the perception of whether or not the PC receives the acknowledgment. Got that?

But you go over this, work this thing out, you'll find out that it's a very complicated arrangement. And you can count on anybody studying this, promptly and immediately afterwards not being able to audit at all. It's something like taking a golf pro and say, "How do you handle your club?"

But this is your main show.

Now, what you've considered ordinarily the auditing cycle has been this first V which I drew, which is cause-distance-effect – with the PC at effect, the auditor at cause. And then, at that V, the restimulation takes place and you get cause-distance-effect.

Now, I'm not going to go into the rest of the auditing cycle till I show you the center of this thing, okay?

There is another communication cycle inside the auditing cycle – another communication cycle. And that is at the point of the V. [starts to draw the second graph] Here's your PC and here's your auditor, and here was your cause, your distance, effect; here is your cause, your distance, effect and here was a C and here was an E. Don't you see? Cause-distance-effect at the PC. That's the auditing command. And then you've got cause-distance-effect which is the auditing response.

Well, we've opened up the point of the V. And here is your little additional one, and that's between the PC and himself. Here – see what this is. Now, this actually can be multiple, and it depends upon the complications of the mind. But because there has been an effect there, that causes a cause. See? Because you have an effect at this point of impact, you get a restimulation. Now, that stimulation brings about charge, which then causes the PC to emanate

to get rid of that charge. So you have an internal one, here, of cause-distance-effect inside the pc's skull.

Well, that gives us seven communication cycles.

Now, I said this could be multiple. This is him talking to him, see? And you say, "Do birds fly?" and this causes a picture of birds. He receives the effect of the picture of birds, and he causes a query of the picture. "Are they flying?" And as a result, the answer comes back of the flapping of the wings and he says, "Yes, they're flying." And so with his thought he transmits, then, the causative action to the auditor – now directed at the auditor – "Yes." You see how that can be multiple?

Now, you're listening to the inside of his skull when you're examining that V down there. Now, if you think that the inside of the skull is more important than the rest of the cycles, you're going to be very, very disabused. This happens to be the least important of all of the actions, except when it isn't being done. And of course it's the hardest to detect when it isn't being done. It's the hardest to detect.

Pc says, "Yes." Well now, what has the PC said yes to? And you sometimes are insufficiently incurious. You've said, "Do birds fly?" and the PC receives this, and he gets a picture of a dinosaur who is eating, and perceives that dinosaurs eat and says, "Yes." And carrying out the remaining part of the sentence, it would be, "Yes, dinosaurs eat."

So this is actually what it sounds like to the auditor: "Do birds fly?"

"Yes."

"Thank you."

See, that's what it sounds like to the auditor – that's the big V.

Actually, this is what happened: "Do birds fly?"

And the point of the V is haywire; we get a dub-in, see? Picture of a dinosaur flies up, because that's safer to look at than birds, for some reason, or more interesting or different. It's an alter-is of some kind or another – happens on an automaticity.

The PC thinks he understands the question now on the basis of "Do dinosaurs eat?" and says, "Yes."

And the auditor says, "Thank you."

Hey, wait a minute. What's going to happen to this PC? What's going to happen to the PC?

And that, in essence, is this internal perception of line, which I showed you on the other side. This cause-distance-effect backflash here, and so forth, happens to include "Is the PC answering the command I gave him?" Question.

Now, all of this is very complicated, isn't it? And it's sufficiently complicated that any auditor ought to sit down with a piece of paper and work it all out – and not expect me to tell them. I think there are very few auditors ever really inspected that to the degree that it's a multiple cycle. There are seven or more communication cycles involved in an auditing cycle.

Now, it's actually weighty enough that standing up here giving you a lecture on the subject, off the cuff, see, it's very easy to get mixed up on which cycle is which, because it requires a little bit of concentration. You have to actually mock up a complete session, see – complete auditing cycle – and pick out every communication cycle in the auditing cycle.

Now, a communication cycle consists of just cause, distance, effect, with intention and duplication. That's all – that's a communication cycle. How many of these are there in one auditing cycle? And that would include every nuance of the auditing session. So you have to answer with how many principal ones are there? Because some auditing cycles could contain a couple of more.

The PC says, "Huh?" You see, that's a cause. That goes over distance, effect.

And the auditor says, "Do birds fly?" He says, "I will repeat the auditing question. Do birds fly?" And that goes cause-distance-effect. But you immediately have added two more cycles and so you've got nine – because there was a flub, see? You got that?

So anything unusual that happens in the session adds to the number of communication cycles to the auditing cycle, but they're still all part of the auditing cycle.

Now, we've got repetitive commands as an auditing cycle, and that's doing this same cycle over and over and over.

Now, I'll give you some homework here; this is for your own good. You draw out all these communication cycles on a scrap of paper for yourself. Just take a look at all these things and mock up a session, like you do this and the PC does that, and so forth. And all of a sudden it'll come very straight in your skull how many of these things there are, and you won't have a couple of them jammed up. Because actually, what's mainly wrong with your auditing cycle is you have confused a couple of communication cycles to such a degree that you don't differentiate that they exist. That's why you sometimes chop a PC who is trying to answer the question, see?

You know whether he has answered the question or not.

Well, how did you know if he has answered the question or not? By esoterics? New subject matter: esoterics. If you're very skilled at esoterics, you could probably manage it. But there are no esoterics involved. Even if it's telepathy, it's cause, distance, effect. Doesn't matter how that communication took place; you know whether he's answered the auditing command by a communication cycle. I don't care if the distance was zero. It was permeation from same location in space; you were in the pc's head. I don't care how you sense this or if you know that ordinarily this PC is green when he answers an auditing command, and he turns pale white this particular time. You realize he's not answered the auditing command. Well, how did you know that? Well, obviously, it's a communication cycle inside the auditing cycle.

So, I'll give you a little assignment there. You work that thing out. How many of these things are there? And then expect to drop the mashie and the niblick and hook one into the woods for a day or two. So that's perfectly all right to do that, see?

I myself occasionally take apart a piece of auditing and find myself gaping briefly in a session, because I've been trying to put together a very flexible R2H, because R2H is a very –

the way it was originally released – is a very skilled activity. It's too much for me. That's right! It's just too confoundedly skilled. I know you can't do it. Impossible! It's too prone to error. Good training: Man, if you can do that, you can do anything! I mean it. If you can do that, you can do anything.

But, boy, by the time you get some PC who's got an insignificant ARC break that doesn't have the punch of an engram or anything like that behind it, and you're trying to date that confounded thing on a meter – it's just smooth as glass, and so forth – you practically have to ARC break the PC again to get the meter to read! [laughs] Terrific training.

But inherent in that process – inherent in that process – there are a great many processes which go pretty well south and which will, actually, practically go one shot to OT, see? It's masked, however, in the exact mechanics that you're handling.

I found out that you have to use ten – a minimum of ten – steps to get the terrific therapeutic result of which it's capable. At least ten steps. In fact, I got one version of it on the drawing table right now, which I've been working with: I don't know, I think it must have about eighteen separate steps. I'm just trying to milk this thing down for maximum tone arm action, minimal error and maximal ease of auditing. You're doing a training version now. It won't be changed. Go right ahead with it.

But this is really putting that process up to make it get its most results, see? And, by the way, there are only nine levels of assessment in this newest version I'm working out – just nine lines, takes care of the lot. But that's all progress.

But I'm running all this on a PC. You get the idea? It's all brand-new, and it's impossible to audit the original version of it anyway. And I'm handling something that has fifteen steps in it, all of which are strange and different, and the PC has done something incredible in the session that I haven't yet suspected. And boy! You talk about the mashie and the niblick, man! You know? That golf ball goes straight through the trees, hits a tree trunk, caroms off a rock, goes straight up into the sky and vanishes forever. [laughs, laughter]

All right. Well, if you're nervy on the subject of handling the basic tool of auditing, if that's giving you trouble and if you can get yourself into trouble by suddenly breaking it down and analyzing it, then it should be broken down and analyzed at the time you're auditing something nice and simple. That's the time it should be broken down – not until you have three woods in your right hand and four irons in your left hand and you're going to putt with the heel of your golf shoe, see? I mean, this is not the time to practice this auditing cycle.

So you go ahead and break it down. I've given you a general pattern for an auditing cycle. Maybe in working it over you can find a couple of extra communication cycles in the thing. But they're all there, and if you made somebody go through each one painstakingly and painfully, you would find out where his auditing cycle was jammed up. And it isn't necessarily jammed up on his ability to say "Thank you!" It may very well be jammed up in another quarter. Got that?

Now, there's a completely different auditing cycle inside the same pattern.

Just wanted to make you comfortable and make you feel relaxed. [starts to draw the third graph]

Let's work this one out. Here's the PC. This PC, he gonna originate. This has got nothing to do with the auditing cycle. Scrub that other one! This now has nothing to do with it. The only thing they have in common is that they both use communication cycles. That they have in common. But this is brand-new. This is the bolt from Mars. It comes out of the blue, and an auditor who is already concentrating... he's auditing, you know... There are people, they used to read – they'd move their lips while they read, you know? And everybody would make a lot of fun of them, you know, for... You know?

Well, an auditor who's handling his communication cycles and his main auditing cycle on a lip-moving level, see – he's brand-new at this sort of thing: the PC says something, see, that is not germane to what the auditor is saying or doing. And there is just – well, just trucks go over the cliff, jet ships crash, see? All goes to hell, man!

So you actually have to be alert for this thing happening at any time. And the way to prepare for it is just to realize that it can happen any time; and just go into the drill that handles it, and don't get it confused with the drill which you have as an auditing cycle; and consider it as its own drill. It's its own drill. You shift gears into this drill when the PC does something unexpected.

And by the way, this handles such a thing as the PC originates by throwing down the cans. That's still an origin, see? That had nothing to do with the auditing cycle. The auditing cycle went to pieces, maybe, and this cycle came in. Well, the other auditing cycle can't complete because this cycle is now here. Well, that doesn't mean that this cycle has precedence or dominance, but this cycle can start and take place and have to be finished off before the other one can resume.

So this is an interruptive cycle. And it is cause and distance and effect. And here's your auditor. The PC causes something. Now your auditor has to originate, and your V is inverted.

Now let's investigate here. Let's investigate that point. Let's expand the point, just as we did in the auditing cycle. [laughter] What's this going to be, a mad spate of question marks [laughter] or rockets flying off at oblique angles, or what's going to happen at this point?

Well, frankly, you can't put a machine at that point. You can't put a machine action at that point, because this thing has to be understood – has to be understood. So, to the degree that it is hard to understand, you have cause-distance-effect, cause-distance-effect. You understand? This is the auditor trying to clarify this thing. And every time he asks a question, he's got a new communication cycle.

Well, the trick that happens at the open V must not be such as to merely get the original line, cause-distance-effect, repeating itself. You mustn't have the PC continuing to repeat that line, because the PC is now going to go frantic. Because he can't get off of that line, he's stuck in time, and it really upsets him.

So the auditor, when this V is expanded here, has to be able to understand what the devil the PC is talking about. Now, there's really no substitute for simply trying to understand it.

The PC all of a sudden says, "But the Roman Empire didn't have any legs!"

"Tell me a little more about that, please." That's a good response.

And the PC immediately goes off into can gesticulations like mad and explains how – how because of North Africa being in its situation, you see, Egypt being in its situation, and that sort of thing, the Roman Empire didn't run on legs. It didn't run on legs at all; it ran on rivers. We're now getting in deeper.

"All right. Good enough; good enough. I hear what you're saying, now. Ah... " [laughter] "Give me a little more dope on this so I can get a good grasp of it."

Oh, and the PC will go on and he'll expostulate and understand it. And he'll understand it better through telling you. And all of a sudden, you'll find out that he's telling you it didn't have any legs, and it didn't have any legs to stand on – that is what he really meant, and so forth. And he's got it all doped out, and all of a sudden you see what the hell he's talking about. And at that point, you can resolve this point at the open V, you see? And "Oh, that's what the hell he's talking about" is the name of that expanded little V. "Oh, that's what the hell he's talking about" is the name of that cause-distance-effect, see? And then you say (cause-distance-effect), "Thank you."

How many more lines can you put in there? Well, you have to have another little line up here, which is another little cause-distance-effect, before that origination takes place so that you don't run into a jam and you don't give the auditing command. He's originated that he's going to say something. He says... see, whatever it is – and that's not the time for you to say "Do fish swim?" See? You suddenly notice there's a flicker across the table and the PC is saying... [breathes in] See, that's another little communication cycle. So it's cause-distance-effect. And effect at your point is to shut up. See?

And then, you actually can have another little one, here, that's a cause-distance-effect, of "I'm listening." Get the idea? And then, of course, there's your extra ones down here – when you've said "Thank you," then it's your perception of the fact that he has received the thank-you. And there's your origin.

Got it?

Audience: Yeah.

The building brick out of which all of these things are made are communication cycles. That's just cause, distance, effect, with intention and duplication, see? That's the lot, see?

But when you say "duplication" – when you say this – you are carrying, then, the communication cycle over into the A and the R, because there must be understanding.

Now, this is peculiar: There is a difference between an auditing cycle and a military communication cycle. "Theirs is not to question why; theirs is but to do and die" is definitely the military attitude toward the whole thing. And whereas this, too, can get into auditing... and actually is not disallowed and is sometimes used, and not without benefit. The guy is not going to touch that wall. "Thou shalt touch that wall," you see? This kind of an action very often takes place. He's not going to give up the withhold. "Well, you goddamn well are going to give up the withhold," you know? *Bow!* see? That sort of thing is very often better than not

doing anything about it. There are more adroit ways to do it – but this is real crude auditing. But that's the only time it gets over into the military cycle.

Now, the military cycle is simply cause, distance, effect, compliance. And the auditing cycle is cause, distance, effect, understand. So there is an A and an R at the effect point. And therefore, there has to be an A and an R at the cause point, so as to make "understand" acceptable at the effect point. There doesn't have to be, but there had better be. You see that?

So there's where A and R fit in on the communication cycle where auditing are concerned. They are very carefully designed.

Now, a very syrupy affinity is very often highly detrimental to auditing. But too snarly or abrupt an affinity is also detrimental to auditing.

We haven't completed talking about the auditing cycle by a long ways. The auditing cycle, you would say, then, is TR 0, 1, 2, 3, 4 and so forth. Well, the auditing cycle has very little to do with TR 0, 1, 2, 3, 4, just as such, and only as such. The TRs have to do with the communication cycle. And you have to put one all the way together at about TR 5 or TR 6 to take in all of these communication cycles. You understand?

What the lower TRs do is teach you to handle one communication cycle – see, from one side or the other – in varying degrees of complication. Now, of course you've got to have TR 0, because all of these things have to do with confront. All of them have to do with confront, so you'd say TR 0 is native to all of them. TR 1: Well, that's an emanation. And TR 2 is a receipt. So of course, those just handle what? They just handle nothing but the communication cycle. Do you see that?

Now, you can go on and build this up from this point on, but you will find that a complete auditing cycle would require a full-dress-parade TR that covered, maybe, at least six. And then you could have another TR that covered it up to nine, ten or twelve. And you could have another TR that handled an origin through all of its cycles – but that's supposed to be, right now, TR 4.

See, TR 4 – you've always had trouble with TR 4. Maybe I've shown you why today. Look at TR 4. See, that's a picture of TR 4. The V is the other way around. This thing is all upside down, you see?

But that isn't all there is to the A and the R in connection with the communication cycle. TR 1: How good is somebody's TR 1? Well, let me tell you that the ability to say "Do fish swim?" might serve, but how about being comprehensible? How about being comprehensible? Enunciatively comprehensible: you can understand the syllables. How about that? We can get over that point. But how about giving it an understandable communication? Now, let's look at this in its widest ramifications. The R-factor has to be present there so that it can be duplicatable.

You very often, when you leave some auditors loose on making up a command, or asking something, or there's a hole in the routine and it doesn't give them those words, will do a put-together of the statement to be said to the PC which, at the arrival at the PC, is incomprehensible. And yet an auditor is very often called upon to do this. I've noticed this. I'm not being condemnatory of auditors in general, but I've noticed here and there. When an auditor –

some auditors are left completely on their own... Well, something like this: "Well, get me a list. Get me a list of the stuff he's worried about." And you expect them to put together a question something like "What are you worried about?" see? And you get some entirely different, incomprehensible version, like "What are the worst part of your worries sometimes?" Something like this. Now, that's almost sensible compared to some of them I've seen. They're just absolutely incomprehensible. Absolutely incomprehensible.

I don't know how anybody – and I have actually seen somebody run a level fitted into one of these five-to-fifteen command brackets, which didn't make any sense at all, and suddenly found to my horror that some PC had actually been running on this for hours and hours and hours, and every time they arrive at it, says, "I don't have a clue what you're talking about at this point."

And the auditor just says, "I will repeat the auditing question."

So there's this factor in this communication cycle, that the TR 1 aspect must be (1) enunciated in such a way as to arrive in an understandable form, but very often, when the auditor is formulating something, has to be formulated so that it can be duplicated. So these two other factors are involved, besides simply being at cause – is the cause going out with any R? In other words, can you understand any part of this thing? Is this an understandable statement?

"Do fish someti... I'll repeat the auditing question: Do fish somet..." Naturally, no auditing can proceed.

You start dropping s's off of everything; or get somebody with a Japanese curve; you get somebody doing something that is a little bit offbeat in pronunciation – somebody from Boston. Let's go worse – somebody from Maine. You ever hear a "Maine-iac" talk? [laughter]

I was up there finding the Canadian border. The United States government lost it. (They'd lose their heads, you know, if you didn't watch them.) Anyway, they lost the Canadian border and went up and found it again. Found a tree had fallen on it and buried the marker. They have little pyramids that look like the Washington Monument that mark the border.

It was very necessary, because the prohibition agents didn't know where their authority started and ended, see? It caused terrible things. We took the problem off because what we were doing when we were surveying is we would stop the rum runners and tell them we were prohibition agents, relieve them of their cargo, and we always had a lot to drink! Anyway... [laughter] We solved this problem practically. The U.S. government could've taken a lot of leaves from, I think, most of us on practical solutions to these problems.

But I spent the most delighted summer trying to learn to speak "Maineiac." Gorgeous. And the French that had been living up along the St. Lawrence didn't speak French and they didn't speak English. They spoke something else. But it was sure interesting. Got so I could speak the thing, you know? I'd talk about "Baa-haaba" [Bar Harbor] with the best of them. But it wouldn't go in an auditing session.

And very often, some PC gets saddled with an auditor that he can't quite comprehend along some corner or another. Now, you should recognize what's out. The only thing that is

out is the R-factor in the TR 1. And an auditor should actually take great care to keep that one smoothed out. If he knows he's doing something weird that the PC can't comprehend, it doesn't matter how clumsily he sets it right so long as he sets it right.

Supposing you can't tell the difference between the way he pronounces five and the way he pronounces six. You can imagine these two getting jammed. The PC, for some reason or other, always thinks the auditor is saying five when he's saying six, and six when he's saying five. What do you think's going to happen in R3R, see?⁵

So therefore, it is up to the auditor to be comprehensible. That's where the R-factor comes in. Be comprehensible. Not only from standpoint of accent, but sense: the comprehensibility. Diction enters into this. I can see some university in the future teaching "Auditing English, " you see, or "Auditing Speech. " Actually, it'd be a big department, because you'd have to have the translation of all this stuff into German; you have a translation and then its enunciation in German – same factor would apply, don't you see? The same factor in Swedish, Japanese, Chinese, Russian, all of this stuff. How do you audit these guys, you see? Well, all right. So you're going to have auditors perhaps from that country, but remember, they will have the same frailties of pronunciation.

How about translation of line plots, what line plots actually sum up into. Some of these countries don't have good terminology to follow through on a line plot. And yet the line plot will only fire on the right terminology. Don't you see, there's a lot of stuff to be worked out on this particular factor. But there's stuff to be worked out on it right now.

An auditor who is not comprehended by the PC isn't doing his TR 1 right. And therefore the R-factor is very germane to whether the communication cycle can take place at all. And if you say "Do fish...?" You can't do that. Do you see that nothing happens and no communication cycle takes place at all? So the R-factor can do a complete wipeout. Interesting, isn't it?

Then you have the PC who doesn't want to be audited. He doesn't want to be audited at all. Well, how on earth can you start that one going? Because you've got to have a communication cycle before you can even put an R-factor in. See, that's worse end to. He just won't listen to any part of Scientology. This is not a speech defect, but actually requires a lower-level process which gets him to talk about Scientology anyhow.

We used to have one, "Well, tell me why you shouldn't be audited." Tricky kind of an approach of this particular character.

This is all very feasible. But this comes under the heading of getting a communication cycle started, and the auditor is very often confronted by that. So there is something which actually is prior to the communication cycle, see, and that you are very often happy to see exists. And when it goes out the window, you very often are sitting there with your eyes popped – you don't know quite what to do. Well, the thing is, you can't get the communication cycle going.

⁵ Editor's note: At that time, part of R3R was dating, what means the auditor had to call out numbers.

Now, very often the R-factor is out – wildly. Or the affinity factor is out. The affinity factor is out because the PC is being very misemotional. Well, oddly enough, you can do an ARC Break Assessment today, and find the bypassed charge and use that to complete the communication cycle which you started and which wouldn't complete, because it is the generated charge. And that was why I showed you, particularly, the expanded point of the V.

What has happened there is inadvertently, one way or the other, the point of the V has gone awry. The auditor somehow or another or the PC somehow or another has restimulated a charge which has then not been originated either to the auditor or the PC. See, an overstimulation has taken place there. It's quite easy to do. It's quite easy, though, to pick up these days. So, these ARC Break Assessments is [are] a pilot of completing the communication cycle and getting the auditing cycle going again. See how that fits in?

All right. Now, that's all very well to talk about the auditing cycle and say that's just all there is to the auditing cycle, but there's (I mentioned a moment ago) the repetitive auditing cycle. This cycle going over, and over, and over, and over, and over again, is a specialized activity. There's an auditing cycle of one cycle and then there is the auditing cycle of the next cycle and the next cycle and the next cycle and the next cycle, see? That's a different thing – doing it many times. You get your repetitive process, and this is where that gets you in trouble. There is a point where this over-and-over-again gets you in trouble.

You must, you absolutely must, complete a communication – all communication cycles of an auditing cycle. Therefore, you must complete an auditing cycle. But you must also differentiate the difference between one auditing cycle and the repetitive auditing cycle. And why must you generate this difference? It's because one auditing cycle must be completed, and a repetitive auditing cycles are very often overdone, and don't need to be completed in some cases. There's a difference.

Ooohh, where am I leading you now? You will say, "What's this? What's this? You mean you don't flatten a process?" Yes, you always flatten a process. But some auditor can get so eager-beaver with his series – which is flatten the process, see – that he forgets why he is flattening the process. And that is your dominant cycle – is ability regained.

Why are you auditing the person in the first place? To do an auditing cycle? To do a series of auditing cycles, known as repetitive cycles, so that you can get a flattened process?

Now, you say, "Well, you're doing that to flatten the tone arm action." No, that's right there with repetitive auditing cycle; that belongs right there with repetitive auditing cycle, don't you see? There is something that dominates all of this; there's a greater domination.

I'll show you what these points are. This will intrigue you; I don't think perhaps many of you have ever looked at this before. [begins to draw the fourth graph] Here's your big cycle, which is major cycle. See, that's a major auditing cycle. And its proper name is Ability Regained.

Ha. I can see some of you now. You're auditing engrams like mad and you hit this key engram and you hit the thing and you all of a sudden got an OT on your hands, and the fellow gets up and stretches and that sort of thing, and he's getting all ready to square away, and he's wondering what he should do with the body, and – you know? He's all set and you're going

on: "All right. What is the duration of this engram?" Well, that's just too much dedication to this next cycle, see?

And this you can call the Process Cycle – Process Auditing Cycle. This, of course, is just your single auditing cycle. Your progress of case is up, like this, see? Now, if you don't have your single cycle down, then of course you can't do a repetitive cycle. Can't do a repetitive auditing cycle, you can't flatten the process, in other words, you see?

Now, a process is flattened by tone arm action out, no comm lag left, or cognition – I'll draw you a picture of these things – or ability regained. [begins to draw fifth graph] Now, you understand, we're going here from the Process Cycle to this Ability Regained cycle, you understand? We're going just between those two. You understand here, that if you can't do a single cycle, then it's certain that you're not going to be very successful in completing any process auditing cycle – which is the repetitive cycles – and if you can't do this, then you certainly are not going to produce the upper one of ability regained. See? That's obvious.

But what is a flat process cycle? You sometimes come a cropper on this and don't realize what you're coming up against.

Now, three equal commands – this is the lousiest one, see? Three equal commands. That's smelly, but you say the process is flat, see? Safe to leave it. Well, you'd better leave it at the CCHs, otherwise your PC is going to start being unhappy. But remember that they must be confidently done, or something like that. You can't have "He screamed three times," you see?

You very often – you'd be surprised – you very often have this question asked of you. You have some HPA student sometime saying, "Well, but he was angry the same way for three different commands, so therefore the process was flat."

Now, your next level up here – your next level – is a more interesting level from a standpoint of that, but it's perfectly safe to flatten it on a cognition. Guy gets a cognition: "Oh, yes!" see? Even a minor cognition, do you understand? That's not a major cognition; that's, you know, minor cognition – he had a win. "Hey, well, what do you know! That's why elephants fly." You know, that's all set. Hasn't too much to do with the process, but you sort of stop the process at that point. The PC is not going to suffer.

You understand that these first two levels that I'm talking to you about, of "How do you flatten a process?" are just – oh, that's awful shabby sort of a way to look at the thing, but that's just the minimum. That's the minimum security.

Now let's get to the real one, which is TA Flat – flat by TA. That's your auditing cycles, repetitive auditing cycles, and you no longer have TA action on it here, don't you see?

And up above this – and there are two levels of this, to make it better – is a Major Cognition. You'll see that sometimes. You'll see that sometimes. That takes precedence. You haven't got the TA flat, but all of a sudden he cognites all of the level is flat you're running. You'll see him go *pow! pow! pow!* – off the meter. You've got – "failure to scream" was the level you were running, "about cats." And he says, "Oh! Oh, yeah! Yeah, yeah, yeah! We used to mock up these forty-mile-high cats and yeah – oh, well, what the hell! Yeah!" And you see the meter blow down and bang and everything goes to hell. You try to run this proc-

ess again. He hasn't got any level there left to run. In fact, continuing the process after one of those things is invalidation of the PC.

Now, this is Ability Regained and that takes precedence over all of these. This guy couldn't walk and you're halfway through this and you haven't got the TA flat and so forth and he hasn't had any cognition you're thinking about and your processing cycle's a repetitive cycle, and all of a sudden the PC says, "Hey, what do you know!" you know? And he throws the electrodes down sideways and he gets up and starts walking, you know? "Eh! Yeah, I can do it!" Good, are you going to flatten the process now? [laughter]

You may think I'm pointing out something ridiculous, but you do this quite often. You spoil it. You've got to know when to cut and run. See what I mean? What you got coming right up is you're all of a sudden going to make an OT – and continue to flatten the process.

Now, let's look at this, then. This single cycle – you got to have that one down cold, and there's no doubt about that! Got to be able to complete that. You got to be able to complete it repetitively, time after time again, and that's for flattening out a process. And the thing which takes dominance over that, of course, is you flatten out the process until you run into the ability regained.

Now, sometimes you don't run into an ability regained and you go on and flatten the process, and have to do another process before you regain the ability, don't you see? Sometimes you have to flatten a lot of these before you get up to that. Sometimes you halfway flatten one and you're suddenly up to it. You see, but I'm just talking about auditing cycles – repetitive auditing cycles – and where they're aiming toward. You're aiming toward always getting this one completed, but the only thing that interrupts it, in any single cycle, is a cognition. Similar to repetitive cycles, ability regained – a single auditing cycle that you are doing runs into a cognition. What do you do in a case like that? Well, you don't spoil the cognition by completing the auditing cycle. You can start another auditing cycle, if it is necessary to do so.

To that degree, to those modifications, these other things must be pushed through to the bitter end.

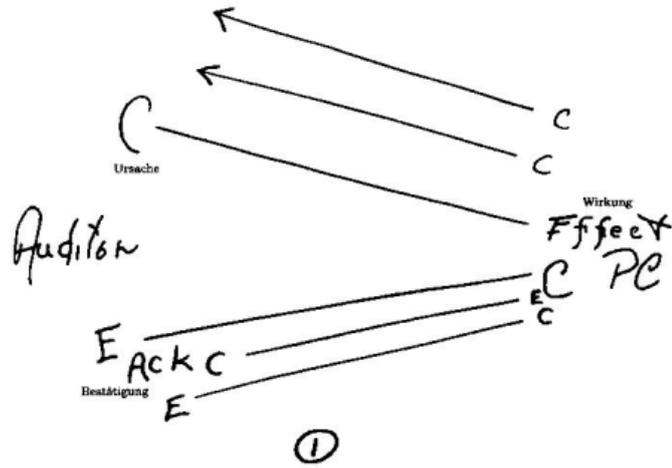

All right. Well, I've given you the dope on this. I imagine that you find this somewhat intriguing. It's a better look, perhaps, than we have had at it. I've been meaning to get around to it for some time, actually, and I've been breaking it down myself so that it could be talked about better. And you're seeing here a bit of gain; this isn't something which I've known all the time and so forth and so on. But I have been studying this ability regained in relationship to finishing a whole series of auditing cycles, and then I started breaking down the single auditing cycle in its communication cycles and got it into a more communicable form. And I think you'll find this very useful, both in teaching people and in auditing, yourself.

I wish you luck. Just go on and audit. Don't try to make me guilty by suddenly knocking the ball into the rough because you've lost the grip.

Okay. Thank you very much.

Auditing Comm Cycles

A lecture given on

6 August 1963

Well, how are you today?

Audience: Good. Fine.

Good. Well, this is what?

Audience: 6th of August.

Six August, AD 13.

[part missing]

We have three new Instructors today – three new Instructors.

[part missing]

No other vast changes are envisaged beyond the curriculum. Now that you've caught up all of your checksheets, you see, it's time to change the checksheets. [laughter] This is inevitable – inevitable. "That mixture which is not shaken stagnates." This is was probably the earliest Greek utterance, so we don't want you to get stagnated.

The only changes which you get in curriculum and so forth is the change in W, which has been in a state of flux anyway. And the definition of an auditor is being used in W – and I have found some new ways of milking down a tone arm, getting the bestest and mostest out of that tone arm; getting that tone arm to really wiggle and wobble. That's very important. And this piece of technology is hand in glove and it all goes back to very basic simplicities. Every once in a while somebody says... And this lecture does concern this definition of an auditor; I'm not going to talk to you too much about the auditing cycle in this. Well, I am going to talk to you about its particular aspects and how an auditor handles it.

Every once in a while somebody says, "Well, why don't you..." something or other, something or other, something or other – that's the crux of the situation – "Why don't you change all administrative actions? Why don't you alter all Central Organizational lines?" "Why don't you..." so forth. "Why don't we change everything in the course?" and so on. What they're dealing with is a problem they actually don't see the breadth and depth of.

And that problem is this: The character of this planet and the population hereon makes it practically impossible to do anything with this planet. Now, I'm not taking off from a failure point. The stress and thought and prevention and cure and this and that which you have to go into on this planet to get anything done and running is absolutely fantastic.

Now, you want to ask why this is? Well, we can go into that in a moment. But those of you who have on the backtrack an experience of you just get some guys together and you do something – you see? Well, that's been a common experience, and you still tend to operate in that zone and sphere of influence. In other words, you said, "Well, it was very easy. We just whistle up Joe, Bill and Pete, and the four of us will go down there and fix up the signboards, and that'll take care of that," see? And you're all set, see?

But that was yesteryear and elsewhere. And you apply that basic feeling to this planet and you're in trouble at once. Why? This planet is part of a larger federation – was part of an earlier federation and passed out of its control due to losses in war and other such things. Now, this larger confederacy – this isn't its right name, but we have often called it and referred to it in the past as the Marcab Confederacy. And it has been wrongly or rightly pointed to as one of the tail stars of the Big Dipper, which is the capital planet of which this planet is.

Now, all this sounds very space operaish and that sort of thing, and I'm sorry for it, but I am not one to quibble about the truth. This gets in people's hair every now and then, and I don't see any point in lying in order to be acceptable. It just doesn't seem to be a right way to go about things, particularly in the realm of science. I don't think a scientist should tell a bunch of scientific (quote, unquote) lies in order to be an acceptable scientist. It doesn't seem to me to be a sensible proceeding.

However, be that as it may, these various planets united into a very vast civilization which has come forward up through the last two hundred thousand years, is formed out of the fragments of earlier civilizations. Now, I can't tell you accurately, exactly what these blokes are up to or where they're from, but this isn't quite germane to this galaxy. That's the first thing you should know about it; it isn't quite native to your track. You find a type of mental implanting and that sort of thing going on here in the last couple of hundred thousand years which are not native to your earlier track.

Now, this is all very important; it's very important, because they have a terrible problem. They have the problem of people who are native to this galaxy and aren't used to this kind of thing, and they have the basic problem of "How do you kill a thetan?" And that's a terrible problem to men who have very, very guilty consciences and blood on their hands – great problem.

Probably the best way to hide your overts is to give somebody amnesia, you see (then they don't know what you've done to them), and then tell them something else has happened. Well, this is a dramatization of a very craven intelligence, and that is what is going on here.

Now, the fellow who conforms to that society is in no vast trouble. Perhaps some bloke who has a military record against them, and that sort of thing, might possibly (no matter what he did) find himself unable to satisfactorily conform. But the point is that their ideal is the conformist.

Now, these conformists are pretty weird, and the personnel of that particular society is pretty scummy, to say the least. Let's supposing you were in the last shambling wreckages of a red-light district: you'd have high-toned personnel, compared to the personnel which makes up the other planets I'm talking to you about. High-toned personnel, much higher toned than their average run. They practice cannibalism. The stuff you get on race tracks – once in a

while some pc will run into race tracks and race-track drivers – this Roman-circus-type entertainment, don't you see? All that kind of stuff – that's all out of this zone and area. We're still with that planetary system.

So, they specialize in the fellow who will conform. Now, he ordinarily is a "worker" who is content to draw wages and not do another single, blessed thing – you know, never really get up, improve his lot, you see, and keep on plugging along somehow, or even slump into indigence. He's still their choice of personnel. So this leaves, this leaves the brilliant artist, the brilliant engineer, the manager, the genius, the criminal, the pervert, non *persona grata*.

And they sentence these people – the upper class (that is to say, the brighter gent) because they can't control him and they're afraid of him, and the lower class because it's too vicious even for them – and they condemn these people to perpetual amnesia. "Dead forever," they call it – the problem of killing a thetan – and wrap them up in mothballs and ship them down here, and here we are. And that is the population of this planet.

All right. Here's a population, then, of minimal workers, maximal managers, artists, geniuses, criminals and perverts. What you going to make out of this lot, huh?

Now, those are the blokes you're talking to when you say "Add up the left-hand column of the ledger." Well, of course, the artist says he could add it up much more prettily. The guy who actually, in his own right, was a very skilled manager, he says he could devise a much better system – it's true, too; he probably could. If the bird is a criminal, he's just sitting there trying to figure out how he can add it up so he can short you. And there's your zone of operation; there is your response to 8-C in trying to get an organization running. It's all alter-is, because the basic crime was nonconforming. The basic crime wasn't being a criminal; the basic crime was not conforming.

Well, actually, this group has gone ahead and made up, up until recent times, a totally different civilization than the civilization which planted it here. In the last ten thousand years, they have gone on with a sort of a decadent, kicked-in-the-head civilization that contains automobiles, business suits, fedora hats, telephones, spaceships – quite interesting, but a civilization which looks an almost exact duplicate, but is worse off than the current US civilization.

Therefore, you find the current US and Western civilization rather restimulative, because it has moved up to look like the Marcabian civilization.

It's been moving up here rather rapidly. And now we're at a point, a very high level of restimulation, because the automobile design, the train design, ship design (why, they've got ships in those areas, look just like the *Queen Mary*, you see?), and the fire engines and the stuff you do with men's clothes particularly – all of these things are the same image. So you're going into a highly restimulative era, because we've not had this before. See? We've been moving up through strata of civilization, but we hadn't matched this one. And remember that this society at the present time looks dangerous; it looks very dangerous.

One of the highest crimes you could pull in that Marcabian society, probably even today, is income tax; you make one comma wrong and it's "dead forever." Sounds weird, does-

n't it? So, they got everybody paying income tax – awful restimulative. Probably nothing much wrong with income tax if it were administered as a tax, but it isn't; it's administered as a punishment, even on this planet today. Well, it's one of their prime punishments in the Marcabian civilization.

All of this adds up to what? An era, going on right now, of highly restimulative associations in the civilization, and therefore a high-felt level of danger. People feel like they are in danger. Scientologists, every once in a while, hearing me talk like this, feel even more in danger. They say, "Boy, those guys are liable to land here tomorrow," you know?

Of course, I pull this every once in a while. Diana suddenly appeared on my right side last night while eating dinner (and I didn't even know she was in the room, you see?), and just out of the corner of my eye, I saw a pair of white spots that looked like the spats a spaceman uses, you know? And for a split second I said, "Well, here they are," you know? [laughs, laughter]

But anyway, you should realize that the material on the between-lives area has been much more broadly circulated than any of our material is now, because it was laid down the line in all directions, to the most unlikely places (including Russia), and was contained in the book *What to Audit* and other materials, and that was 1951 and 52. I consider that's interesting, because let me point out to you, that's eleven or twelve years ago and there hasn't been a ripple. I just want to point that out to you as an interesting point.

No, gents of this character who have a system worked out this way would – the last thing in the world they'd do would be blow their own game, see? All they'd have to do is land one spaceship, and they feel like everybody would go into a convulsion of suddenly remembering everything. And they do, do you know? Any rumor of the men from Mars or something like that and this planet goes into a total convulsion.

They produced Orson Welles's broadcast down in Quito (I think it was), Ecuador, and – the radio station there, I think a seventeen-story building or large building, or whatever the figures were on it – and mobs tore that building to pieces and killed seventeen people in the process. They practically slaughtered the staff of that radio station. In other words, they went mad.

So they know that great riots are attended by this, but a landing in force without any equivocation that it had been a landing of some type, or like this, would be liable to restore everybody's memory. I think that's what they feel. Whether this is true or not, we couldn't worry less.

But here you are; that is the point. Here you are; that is this planet.

Every once in a while you get mad at government on this planet, when in actual fact you're mad at the Marcabian government. And there's a great deal of confusion. Every once in a while somebody will get awfully furious with an organization, very furious with an organization here on this planet, when they have actually identified the organization with the Marcabian civilization.

Now, you start hitting people here with restimulative materials of this particular type, and it restimulates a terrific unreality; it restimulates amnesia.

I have to ask you this: How hard do you have to hit somebody to bring about amnesia? Let's take Joe out here and let's just see how hard do we have to hit Joe in order to bring about amnesia on his part so he doesn't know who he is, where he is, or anything else. How hard would we have to hit him? Boy, that's pretty hard. It's almost unbelievable force is used to handle a thetan and put him into this kind of condition. I've been hit with some awful heavy force in this universe without losing my mind or forgetting who I am, see? So it's pretty heavy duress. And you restimulate that very easily by telling people things. It gets awful unreal.

But you would find, if you gave them the actual dope, that they would be far more in agreement with you than if you gave them just a touch of the dope, do you see? You won't find the citizens of this planet very far in disagreement with what you're doing. So, therefore, you've got some kind of an explosion going.

Well, these guys are not going to blow their own show. See? They're not going to do anything peculiar about it. They've probably got us all sized up, if they know anything about us at all. They probably have some dim idea of what we're doing, and saying, "Oh, yes. Ho-hum." And give the devil his due: They might even say, "Well, hey, what do you know? Those guys might be producing a type of technology which we ourselves desperately need." Look at that.

See, now, they know the problems exist. They couldn't have had any decent solution, or they wouldn't have taken the route to solution which they have. They are beings, too; remember that.

So when we look at all this: you are (1) organizationally handling people who are revolutionaries. They are nonconformists. Probably the common denominator of this planet is revolution. Probably the one thing you could always start on this planet would be a revolution, because it's a state of perpetual revolution. Trying to hold any organization together of any kind whatsoever becomes almost impossible, because everybody you're dealing with is a nonconformist.

All right. So far goes the civilization. There are just those few statements on the thing I thought you might find of interest.

We're dealing now with "What is an auditor?"

You are handling, therefore, the roughest case that you could find in the universe, because the rehabilitation of the individual demands that you rehabilitate his knowingness. If his knowingness does not increase independently, he himself does not get well. You see, electrical charge on the case is simply a symptom that measures his knowingness. If he's got too much charge, his knowingness is way down. See, that's an indirect measure of the amount of knowingness of the individual.

And as the case moves along up the line, you get an odd factor. You get an odd factor: This case continues progressively to remember more. Now, one of the things the case recovers is picture memory, remembering by pictures. "I have a picture of, so therefore I was." See, you can call that a picture memory and that goes from a terrific unreality on it down to a pretty good certainty on it. So a person at that stage of the game – an advanced stage of the game in inspecting his own pictures – can tell the difference between a false picture and an

actual picture that has something to do, really, with him on his track. And as his knowingness increases, he can tell you where it belongs and what date it has and so on. In other words, he can spot it, bang! That's an increased knowingness. It's knowingness that is increasing all the way along the line.

Now, from picture memory, the individual graduates up to simply knowing.

Now, right now, you don't have to get a picture of where you are living to know where you live. You see that? You don't have to get a picture of your name to know what your name is. In other words, you know this. Well, so does knowingness increase as the case improves, and that knowingness increases up the line to a point where you know who you have been and where you have been, independent of any created evidence or cross-proof. You simply know. And that factor is a very slow factor to rise; it's not a rapid factor. Under present auditing, yes, it is rapid, but that is all within a framework of hundreds of hours, don't you see?

Now, I'll give you an idea – an idea of this. For instance, I know – I know where I was and who I was – I know dimly – pardon me, I know with good certainty, who I was and where I was in the last eighty trillion years. See, I know that; that's not much of an argument with me. But the small details of that are liable to go fritter-fritter here and there. You know, what did I have for breakfast two trillion years ago? No. Nix, man. Nah. Did I even eat, you see? That sort of thing is getting pretty dim.

But now, over the top of that, which is an identity knowingness – which comes before a detail knowingness, you see; between your picture knowingness and your total knowingness is this stage of just knowing your identity – why, then, this detail knowingness starts to come up and follow in on this smaller basis. And one of your gains on it: you'll know why you were here. You'll have tangled with it in session and that sort of thing, and you'll have picked data out of pictures. And all at once, it will just get – more and more you *know* why you were here. You know how you got here. You know what you were doing ten thousand years ago, do you see? You know what was happening 11,025 years ago, don't you see? You – no pictures involved; you just know it.

And that is the restoration of the beingness of the person, and I have given you (in a very crude way here) a cycle of that restoration of beingness. His beingness returns to him gradually, bit by bit. Perhaps the lowest edge of it is something on the idea of "Maybe I possibly could know who I was," you know? "Possibly I could know what I am doing here, or I might even be able to know who I am." Just some sort of a feeling like one might be able to know. And that crawls up forward to a picture knowingness, and the unreality of those pictures at first is fabulous. So that anybody shows you any kind of a picture, man, any kind of a picture, that is – must be yours, and therefore you must have been there.

They could show you a picture of an airplane falling apart and you at once say, "Well, I must have been in that airplane falling apart." And later on you suddenly realize, "Hell, I'm looking at that airplane from two miles away. What am I doing looking at it from two miles away?" This dawns on you after a while. Your valence problem all of a sudden comes up; it hits you in the face, whether you're coaxed to do it by the auditor or not. "I'm in that airplane, see, over there, two miles away," see? "So, therefore, I must have had an awful fall."

And it turns out, eventually – you'd begin to see this thing – you say, "Hey, wait a minute. I couldn't have been in that airplane. It was somebody I shot down; maybe it's somebody I did this with." And then you'll finally say, "Well, shucks. That thing is just a false picture. That isn't my picture at all." And then whatever picture of yours is holding it in suspense, that picture suddenly peels off the front of it like a badly painted chromo, and *pshew!* and your own picture is right behind it. And you say, "Oh, *yerp!* there I was," and you're in valence. That various cycle of recognition takes place in this picture line.

But what does it take, then, to bring about such a total amnesia? Let's look at that: What does it take to bring about such a total amnesia? I was riding a spaceship down one day. Side gaskets of the tubes blew out on one side and wiped out the engine-room crew. I went in to drag them out just at the moment when the whole backblast of the rockets moved frontwards through the engine room, and got hit square in the face and managed to crawl out of the place. The ship went into the atmosphere, melted and crashed. And a couple of minutes or, oh, a couple of seconds after it hit, all of its fuel went up and hit me in the face. And I lost my memory; I lost my memory. It took me quite a while, sitting down very quietly, to remember where base was. And I sat there and figured and figured and figured. Actually, I'd sent some people back to come and pick up the wreckage and so forth, and I was pretty foggy. And very shortly, I snapped out of it. You know, "Of course!" you know?

But just – how much force is force? Well, this is the type of scout craft which has the engines of a battle cruiser all packed into a very tight spot, you see, and all of it red-hot fuel. Cape Canaveral has got nothing like the amount of force one of those things can deliver, don't you see? And to get all of that square in your thetan puss twice, and get confused about where base was. Got the idea?

And how much force has it taken to destroy somebody's memory? It's interesting. An interesting point, isn't it? Well, that's how much force you've been subjected to. Otherwise you wouldn't have a case. I'm not trying to make you afraid of force. You get up to a point after a while as a thetan – force-smorce, who cares?

I had a funny feeling the other day. I didn't quite feel up to diving into the sun. I just didn't feel up to it; I didn't feel it would be a healthy thing for me to do just now. I felt weak. And I felt the interactive forces of the sun, and I felt sort of drawn a little bit toward the sun, and I said, "No." I sort of did a suppress and looked the other way. I just didn't feel like taking a sun bath today. You get the idea, you know? You feel queasy. Too much force – too much force.

Well now, that force, of course, has to be combined with trickery, and the trickery is mostly scrambling somebody's dates and giving them opposite, opposing items that can suspend in time, so that the scrambled dates will suspend in time. You get the combinations; you know them in our various technologies.

But let's not move away from the point into the trickery of it; it does require the force. Force. How much force does it take to destroy the memory of a being? Well, that's how much force an auditor is getting off a case. And of course you'd much rather get off unknowingness and oddities and oddball things; you'd much rather, because they're easier to confront than raw force. And they're easier for the pc to confront, too.

Therefore, you say, "What have you done?"

And your pc said, "Well, I had a hostile thought about you the other day. I thought you really should do your hair up in back."

Oh, good – we've got a big withhold off. You get the gentle pat-a-cake that you will sometimes see in auditing sessions. The proper auditing response, of course, is "Well, thank you very much," and so forth. And O/W is a bit different than other brands of auditing. You say, "What have you done, done, done?" And if you work very, very hard, you can get a done in all these thinks. You see, behind all these critical thinks is a done, is an actual action. And you can listen to critical thinks till the cow comes home, and you will never get anybody raised up the line, until you've found an actual action. That is the secret of all Sec Checking, and that is where people fall down in Sec Checking.

Now, why do they fall down? Well, it's much easier to confront this random little think than it is the energy contained in a done. Do you see that?

Therefore, the mission of an auditor is the restoration of a person's awareness, which includes his memory, his knowingness of himself and so forth. Restoration of awareness. What is holding down that awareness? What is holding down this knowingness? What is sitting on this knowingness? Well, you can say trickery and force, but it is force used with trickery, so that an individual will get an ARC break with force and then become the effect of force.

So you're handling, in actual fact, somebody who has lots of ARC breaks with other beings, matter, energy, space, time and location and form. That is in direct definition: this person is out of comm, out of affinity and out of reality with matter, energy, space, time, location, other beings and form.

Now, that's the pc. So what's an auditor? So what's an auditor? Well, an auditor has to be somebody who can release this tremendously involved force, somebody who can release this force from the pc. Obviously, if it's a deranged force which is bringing about the amnesia of the pc, then the auditor, to get a return of memory of the pc, has to be capable of alleviating and removing that force. I mean, that's simple. Simple. Elementary, my dear Watson.

On your E-Meter you have a tone arm. Force is removing itself from the case as long as that tone arm is in motion. And the wiggle-waggle of the tone arm as the pc is being audited tells you that force is being relieved from the case.

When you start to remove force that is aberrated by some trickery, your tone arm hangs up until the trickery is resolved, you know, wrong date or something like that – and your tone arm action is restored. All of these things are all cared for in the processes and technologies of auditing. But if that TA isn't moving, you will never make an OT. That's just it.

Now, you oddly enough do not have to run a process, sometimes, to get the TA moving. Providing the TA is moving – providing the TA is moving and you get good motion out of your tone arm – a person will eventually go Operating Thetan. Providing you can keep the tone arm moving, the person will eventually go Operating Thetan. If the tone arm is not moving, the person will not go Operating Thetan and the case may even deteriorate.

Let's just run this case on and on. The case can run an engram, and so you keep running engrams, engrams, engrams, engrams, and the tone arm is stuck right up here at somewhere in the vicinity of 5. And there it sticks at 5, and you go on and audit and audit and audit; and there it is at 5, and there it is at 5, and there it is at 5, and there it is at 5. Uh-hah – you're never going to make an Operating Thetan.

Now, if you run the right significances off the case and produce tone arm action, you make an OT much quicker. But you can get tone arm action without running the right significances. Get this syllogism here? And you can run the right significances without getting tone arm action. Oh, well, you can run R3R on somebody who can't handle R3R, and you can run all the right significances and not get into tone arm action; you're not going to make an OT.

Now, let me go over this again now and you'll see where you sit with regard to a tone arm. If you just keep a tone arm moving on the pc long enough, regardless of how and what you're auditing on the case, the case will eventually make OT. But if you run the right significances – if you run the right significances – and don't get any tone arm action, you're not going to make an OT.

You got that now? This is terribly important.

Now, it might take thousands and thousands of hours just to randomly keep this tone arm moving on the pc. And lots of pcs can talk forever, you know, without getting any tone arm action. But if you could keep that TA moving, you'd eventually get OT. So you say, then, that a moving tone arm is slightly senior to the right significance.

Now, this is right down to bedrock on the subject of auditing. Your job is to keep the TA moving.

Now, what's this TA doing? The TA is indicating the blowing off of force. That is a measure of the amount of encysted force which is leaving the case – the amount of encysted force leaving the case. You've got a measure of it right there. It goes up and down, and it measures the amount of force which is going.

Now, of course, you don't do this arithmetically or mathematically. I imagine someday, one of these days, why, we will. We'll set up a project that measures some guy from scratch, right straight through to the end, shows the exact number of motions of the TA on every process or type of process that is run on the person, and these are all added together. And we say there's this many hundred million ergs of energy were released, and at the end of that line we had an OT. But that is in essence what you're doing; you're blowing the force, because the more force is blown off the case the less amnesia the case has.

Does it make sense to you now?

Audience: Yes.

Force created the amnesia and you got to blow it to get rid of the amnesia. Now, there's an interesting one-for-one.

Now, the amount of time in processing, the amount of time in processing is enormously speeded up if you run the right significances, because you're running the force off early track, and you start to get force release which you don't see on the meter. Now, let's not

say that if the tone arm isn't moving, it's all okay; the tone arm is *also* moving when this happens.

I was sitting down in session one day, and I could feel – I could feel energy masses disintegrating clear out to Arcturus. It sure wasn't registering on the meter. If it had, there wouldn't have been any more of an E-Meter here; there'd have just been charred wire. You get the idea? It was blowing off all over the place.

Every once in a while we'll get a blowdown phenomenon. Well, when you see that blowdown, *pshew, pshew, pshew, pshew, pshew* – I'm talking about a repetitive down, see? You can see that needle go *pshew, pshew, pshew, pshew, pshew*; it just keeps doing it, and your tone arm is drifting lower and lower and lower. You're watching a remote force area blow up.

Now, if all this force blew up against the pc's face and the pc's body, he wouldn't have any more body than a rabbit. It's pretty hard to do research auditing and keep a body over you. It is, because you make one little mistake here and another mistake there and chew into a GPM someplace else, the next thing you know, there goes this and there goes that, and your right ear looks like a pretzel. Anyhow, the point I'm making here is that your force measured through the E-Meter is only a part of the force which is blowing off the case. But if any force is blowing off the case, you have an additional movement of the tone arm. So if a tone arm is moving you're blowing force, and if a tone arm is not moving you're not blowing force. And that's all you have to know about it.

Now, there are several significances that can keep a tone arm from moving, such as wrong time and an ARC break situation where the pc is out of comm and a few things like this. But we're not now discussing the no-motion tone arm; we're discussing a motion tone arm.

Therefore it is of great interest to an auditor, then, to make that tone arm move. And to make it move all he can make it move. And your most fundamental method of making a tone arm move is not running a process. It is the basic definition of an auditor: a listener. The basic way to let a tone arm – get a tone arm move is to listen, and that is the fundamental of auditing.

Now, somebody could probably talk for a thousand years and never say the right things, and you wouldn't get any tone arm motion. But, similarly, how many pcs talk and get tone arm motion from doing so and are shut up or cut off by the auditor? Ha-ha-ho-ho-ho. Now, there is an inhibition of blowing clear. The auditor is not then doing his job; an auditor is setting up a barrier to blowing mass. And you'll find out the pc winds up at the end of the session stupider. At the end of session, he can remember less than he could remember at the beginning of session.

Why? Well, you've done something with the force. You have moved it out of the bank and dumped it on the thetan's head. Oh, it'll destimulate; it'll go out of restimulation and all that sort of thing.

The basic definition of an auditor is: to listen. He's a listener. His basic job is to listen, not to restimulate.

All right. Now, we stand around and we say, "Well, the Marcabians are gonna get you tomorrow, man, and the size of the between-lives-area screen is 180 feet by 9 feet," and so forth. And people sit there and they go *dzzzz*. That's doing what? That's charging them up, isn't it? That's charging them up. Well, actually, they talk it over, one with another, and usually blow the charge.

It's not a grave matter; it's not a difficult matter at all. Their knowingness increases, and they feel all right about it and so forth. Well, we get away with that.

Why? Because we can talk to one another about it, that's why. The only method of blowing reactive charge is by a communication line – there is no other method – by a communication line. I think that's very interesting.

Here's the auditor, and he's supposed to listen. And the only way the pc can possibly get rid of the charge is blow it by the communication line.

Now, this doesn't mean, oddly enough, that he's blowing it at the auditor. He isn't blowing it at the auditor. But that he can communicate it does cause it to dissipate, and it doesn't hit either the auditor or the pc. If the auditor wants to get hit by the charge, he should put up a barrier to prevent it from blowing, and the pc has an ARC break; and the next thing you know, the auditor is hit by the charge. You can set up a situation whereby the auditor is hit by the charge, but only if he stops the charge.

How do you get rid of charge? Now, get what I just said. How do you get rid of charge? I didn't say how do you handle charge, restimulate charge or anything like that: just how do you get rid of it? Listen. That's how you get rid of it. Listen. Elementary, my dear Watson.

Now, all therapies since time immemorial have consisted of listening – one way or the other. He is a sympathetic person, and people tell their troubles to him and very often feel a lot better. Well, all of that is very well, and you can add that up to a short-circuited look at auditing, but remember, this factor entered in: was the pc, or was the patient, talking with tone arm action? Oh, that's the difference. Or was the pc just nattering or was the pc lying or something? You let a pc sit there and lie, or a patient sit there and lie for a while, and you're going to have one of the stuckest tone arms you ever wanted to see.

So that is the essence of the thing. An auditor is somebody who listens with tone arm action. That's the difference. But remember, the fundamental of all mental activities was listening. Prayer is based on "God will hear me." And if there's no OTs around, who is going to hear him?

Actually, the lama got so disgusted with this that he put all of his praying on automatic; he puts them on a little wheel. He can turn the wheel and it goes *brrrrrrp* and a thousand prayers go up, and he's got that cared for. And I'll bet you his tone arm, it didn't move a bit. [laughter]

So an auditor has the job, and auditing consists, of restimulating a charge (that's the auditing command received by the pc) and then letting the pc blow the charge that is restimulated on the return communication line. Simple, isn't it? I'll draw you a picture of this thing. You needn't take a very accurate copy of this because this is an HCOB (I think 4 August), and

I'm having it squared around. But I'll draw you this thing. Here's cause-distance-effect. That is a communication cycle. And here is the auditor and here is the pc. The auditor utters an auditing command, and it goes across this distance and hits something. What's it hit? The pc? No, it hits the reactive bank, that accumulated mass of force which the pc is packing around that is always kicking his head in. And we get what is known as restimulation at this point. There we are; we get a restim. There's the living lightning.

Pow! goes the auditing command. We know this guy is very sensitive to snakes, so the auditor says, "Recall a snake." Pow! See? Bang! Well, now, of course if we're in some kind of a weird situation whereby we're fighting the pc, why, we're not restimulating the bank. We're just trying to get the pc to fight us or something like that; we're not – it hasn't anything to do with auditing. Just forget that. The auditor's address actually is to the reactive bank, and he says, "Recall a snake." *Bow!* Now we get a communication line: bank-distance-effect. And here we have the pc – thetan.

And the pc says, "Hey, what do you know! There is a snake in there." And he goes: cause-distance-effect, and that's the end of that. This line must follow in, to take care of the charge restimulated in your first line.

Cause-distance-effect: that's the auditing command. *Bow!* There's the charge. He recalls the snake. *Boom!* It starts to hit the thetan and the thetan recognizes it, knows what it is and imparts that information on his cause-distance-effect line, back to the auditor. And there goes auditing. Your cycle then occurs, and the charge is blown. And you see it reacting on the E-Meter as blown.

These are not all the communication cycles there are in an auditing cycle, but this doesn't happen to be a lecture on that. I'm showing the principal action of these basic lines.

Now, remember that life is always giving him commands that restimulates things – here at E, on the pc. This is our old PTP and other things of that character. If you don't believe that, put in your "since" mid ruds on the pc and see how superior your tone arm action is. Usually get marvelous tone arm action on "since" mid ruds unless the pc is protesting them and wants to get on with the session. And you get marvelous tone arm action.

Well, that's just the restimulated charge that's been slapped at him out of this mucked-up bank that he is gratuitously handed, in full restimulation with much added force, in every between-lives session he's had with the little boys elsewhere. He's trying to blow that charge. So he comes into session, and he sometimes will sit there and talk to you for quite a while; and the tone arm would just move and move and move and move. He's getting rid of the between-sessions charges. Interesting, isn't it?

You notice, after he's talked for fifteen, twenty minutes sometime – even somebody who has had a big upset on the thing, you've got in your "since" mid ruds (or you haven't gotten in your "since" mid ruds), you notice that your tone arm action dies down. And then suddenly, mysteriously, the pc is in-session.

What's happened? You've emptied this reservoir of restimulation which life has handed him, restimulated in him during the session – between sessions, you see? And you've

emptied that thing out. Now, you want to know why your pc doesn't go into session sometimes. Well, he's just – he's got a lot of restimulated charge that is all ready to fall back.

Now, you've got "Is it kinder to audit somebody one hour a week or twenty-five hours a week?" Well, of course there is no comparison, because in the one hour you can't even get rid of life's restimulative action in this reservoir here at all, so you spend that one hour indifferently getting rid of three days of the week which you're trying to cover, don't you see? And it's a losing proposition. There's a make-break point in auditing where a person has to be audited enough to get rid of this charge which is being consistently and continually restimulated. Got that?

Well now, this line here then – this lower line with the pc at cause answering this question back to the auditor, who in this case is at effect: then that line must have some seniority to the upper line. The auditor cause-distance-effect, then, is not quite as important as – they're both terribly important – but is not quite as important as the line, cause-distant-effect, to the pc. In other words, between the seniority of the two lines (both in the same order of magnitude), you'll find that the pc's line to the auditor is slightly more important than the auditor's line to the pc.

And in this line of cause-distance-effect to the pc – in that line and an inspection of that line – you will find all auditing failures, providing any process at all that we have has been run. In other words, if a case was loused up by auditing, we don't inspect the process run as the first consideration. We inspect the tone arm as the consideration, because if you got good tone arm motion running that process, then that bottom line – the C-distance-E of the pc – was in.

Now, we've had processes for years. It's true, our processes have to be very neat. They have to be very important. And they restimulate the exact amount of charge that then blows the outer bank charge and so forth, and it's all figured out very neatly. And on some pcs it's almost impossible to get tone arm action; and you have to know what stops tone arm action; you have to know all of these various things.

But I'm now just talking about the fundamentals of auditing; and we inspect on a failed case the C–E (the C-distance-E) of the pc, not the process run. That's the first thing we'd inspect: Was the auditor auditing?

Now, anybody could sit there and say, "Recall a snake, recall a snake."

And the pc says, "Well, I..."

"Well, that's all right. Just don't bother with that. Recall a snake, recall a snake," and all of a sudden the pc is *da-da, da-da-da*, you know? And he's swamped.

All right. What happens in a case like that? Well, this is very, very easy. This restimulation, when the pc puts it on this line, goes bang! straight back at the pc. Got it? When that line goes out, where else can it go? It's only got one place to go, and that's the pc. So whatever you restimulate in a pc comes home on the pc, unless it is picked up on the reverse communication line.

Now, the penalties of this: the first symptom of the pc's cause-distance-effect line – the first symptom of its disappearance is a *dirty needle*. You can go down any line of auditors who are busy auditing, right down any line of auditors, and watch their meters.

You don't even have to listen to them. You just see a dirty needle, bang! this line's out: the auditor isn't listening. The first definition of auditor is missing.

Pc is saying, "Well, that's a snake. I – snake – well, there was one in a zoo *urm-uh-uh-urm*. I think it was a zoo – there was one in a zoo..."

The auditor said, "Okay! Thank you! Good! Good! Thank you! Thank you! Good! Recall a snake."

And the pc said, "Well, *um-sfla-sflassle* hum. Yes, yes."

"Good! Good! Thank you!"

Got this nonsense? He's just backing up all the charge of the process on the pc.

Ah, I see some of you have seen this happen. What occurs then? Well, frankly – frankly, in time, the C with the pc at cause-distance-effect line, in terms of time (the one here from the pc over to the auditor) may take upwards to a hundred times as much time in the session as the line C–E from the auditor. Oh! It only took three seconds to ask that question "Recall a snake."

And the pc says, "Mmm" and "Mmm." He finally says, "Was it in a zoo? I don't know. Zoo?" and so on. What you're seeing is identification turning into differentiation. You're seeing force and charge blow off. The pc is inspecting this thing. And the tone arm moves, and it keeps moving, it keeps moving; and the pc says, well, he doesn't know and so on. Was it a green snake or a blue snake? He's not quite sure if it was a green snake or a blue snake and so on. He can't recall a snake and so forth and so on. "Snakes – nightmare about a snake – but was that recalling a snake? – if – I'm not quite sure on it. There was one down at the zoo when I was a little – yeah, yeah, I got one. Yeah. Yeah, it was a green snake. Oh, yeah. Yeah. There was one. Yeah. Houston Zoo. Yeah. Got it. Got one: a green snake at Houston Zoo, when I was eight. Ha-ha."

And you will see the cycle of the blowing force on your meter (tone arm) accompany returning knowingness on the part of the pc.

And the more you get that thing wobbling, the more positive the pc sounds. You just watch that, because that in itself is a little tiny proof of what I'm saying, is as you get the force off, the pc's knowingness comes back. And you can see it in one cycle.

One auditing cycle: the pc says, "Snake? My God. I'd never – oh, a snake, what snake? Where? What? Why? I'll – oh, *so-sss* – I'm – I guess there was. See, where do they keep – now, I just, why, yeah I was in a zoo at one time. Yeah, there are zoos. Let's see, now... so on and so on. Zoos, and I must have been in a zoo sometime or another. Zoos – when I was a little bo – well, they used to take me to a zoo when I was a little boy. The zoo – the snake house. Oh, yeah. There must have been one in the snake house and so forth. That – yeah, they had a glass, and so forth, see. Yeah. Yeah, I used to be fascinated by some cage in there. Let's

see, I can – I got – yeah. They – it was a glass-fronted ca – they had a green snake in there. Oh, I remember now. Yeah, I was eight. Yeah." *Bing, bang!* He knows!

You've pulled him up all the way through the force that tells him he doesn't know, up to a point where he knows. And you think it winds up with his simply seeing the picture clearly. No, no, he goes all the way through the picture stage which I have just given you. You understand?

Audience: Yes. Yeah.

Now, these two lines have names, regardless of what they will be called on your – the comm cycles of your auditing cycles; they have numbers on the auditing cycle – but they have nice, colloquial names that you can remember very easily. And this is the *whatsit* line, and this is the *itsa* line. Now, the *whatsit* line is from the auditor to the pc, and the auditor is saying, "What's it?" He says, "Recall a snake," you know? "What's it?"

And the pc says *fumble, fumble, fumble, fumble*. He's looking for an *itsa*, see?

"It's a green snake, Houston Zoo." That's the *itsa*. And you'll see the tone arm blow down when he hits it, too.

So your tone arm, then, follows this pattern; your tone arm follows this pattern. Here is your tone arm here – two tone arms. And here is (this is already in HCOB August 4) – here's your regular tone arm positions, and here is a nice solid arm, and here is a dotted arm; and here's an arrow showing the motion as up from 3 to 4, and that's a *whatsit*. You got that? We haven't quite determined the low-tone-arm case, but I think they run in reverse. But that's a *whatsit*; that's the upward throw of the tone arm. That's *whatsit*.

The pc says, "Let's see, snake, snake, wha-what-what-whatsa. Recall a snake. It's a – let's see – wha – ." He's saying *whatsa, whatsa, whatsa, whatsa, whatsa, whatsa, see?* And you'll see that tone arm go up. And then he'll get a little bit of an *itsa*, and you will see the tone arm go down. And your tone arm, dotted at 4, falling to solid at 3, and that's *itsa*.

And you, frankly, can monitor a pc's tone arm on one question like mad. He has an ARC break with somebody, and he sees that there's some difference... some similarity, or he thinks maybe he knows somebody who looked like the person he had an ARC break with. This would be a research test. See, he sees – he knows now already that there's some similar incident earlier, that he's got this person associated with somebody he shouldn't have it associated with – got an identification going. And you say, "Well, what reminded you" – well, you don't even know who that earlier person is, see? but "What reminded you (in the person you had the ARC break with), now, what reminded you of the person in the past?" See? *Whatsa*. And you see that pc's tone arm go right up. You say, "*Whatsa?*" Tone arm goes up.

The pc says *figure, figure, figure, figure, figure, figure, figure, figure* "Was it his – was it his tie, his shirt? His – it's a – tie, shirt. Yup. Or is it – there some way he held – I think it was the way he must've held his head." Then you'll get an *itsa*. And it'll go right down: "Yes, just think it was the way he held his head."

And you say, "Well, was there anything else?" *Whatsa?* And it'll go right up. It goes right into the *whatsit*.

And the pc says, "Well, it could've been – it could've been the way – way he – way – the – he'd stand there, the kind of clothes he was wearing – must've been the kind of clothes he was wearing." Itsa. And down comes the tone arm.

And you actually can sit there as an auditor and control the motion of the tone arm. You can control it. You can say "Whatsa?" and every time you give him a whatsa, you'll see it goes up. And make sure he gives you a full itsa. And then feed back in again another fragment of the whatsa, see? And up, up goes the tone arm again. And he gives you the itsa, and down comes the tone arm again. And you can just sit there and call your shots. (That's a research project; you normally wouldn't handle comm like that.)

But you'll see it in running almost any process. When you say whatsa, up she goes. And you – he says itsa, and down she comes. So, you say "What's it?" to the pc, and you get the up arm. That charge is restimulated and unresolved, and that high tone arm shows you restimulated but unresolved charge. It's sitting there in the bullpen; it's sitting there in the reservoir, and it's going to hit somebody or something. And the pc plows through this charge that's been restimulated here, and he puts it over on this line and he says itsa. And if he's permitted to give you the itsa line, then the charge channels right – doesn't hit the auditor; it just disintegrates, see? And there it goes. Boom! It's gone. You see that?

So auditing is a repetitive... the crudest auditing cycle is the whatsit – itsa; whatsit – itsa; whatsit – itsa. And of course it doesn't take any time to say whatsit, and sometimes takes quite a while to say itsa. So, consequently, this line is much more prone to be out than the upper line – than the whatsa line.

Definition of an auditor: to listen.

Now, you're handling a case: if you knew Scientology in the Galactic Confederation at this particular moment, man, they'd practically put you on a throne, see? Cases! Well, boo. You take some of the old Route 1, and you say, "All right. Be three feet back of your doll. All right. Be on planet A, planet B, planet A, planet E, planet A, planet B. Got it? You're getting along fine. Planet A, planet B. Good. OT. Thank you."

Guy would say, "Gosh. You know, this is terrific" – provided you listened. Guy'd say, "This is terrific. I feel much better now. I don't see why I have to be pinned in that doll's head. I'm going around getting my sergeant's stripes as an OT."

The situation would be very different from what you're operating with. The character of the pc you're operating with is operating under an enforced and continuously each life reinforced amnesia. And if the course of the case upward is to knowingness, think of what stands in your road auditing an Earth case. And if you were up around in some other locales, it would be about the same difference as right now auditing an Earth case; you would sort of feel odd as – how the hell do you audit an ant? Do you see? Well, it'd be that same gap between an Earth case and an ant, as a case of more or less a free thetan out there in space (who doesn't have your technology) and an Earth case. Do you see that?

So I can feel for you, trying to get wins on the cases you're trying to get wins on, but you should recognize what type of case you're trying to get wins on and should recognize where your line is breaking down. Now, I have never been able to describe this to you as suc-

cinctly as this. I myself wasn't making much of this mistake; it didn't call too much to my attention what it is, but it must have been there if the original word which identifies you, *auditor*, means listen – must have been there all the time, well understood.

Now, what's the course of having that line out? What's the source – course of it? Here's, first, (1) dirty needle; (2) stuck TA; (3) ARC break. One, two, three – as inevitable as nonsense from Washington. One, two, three – just like that. If your pc has a dirty needle, a stuck tone arm is incipient on that case. It's liable to happen any minute. Man, you're already three-quarters of the way over the cliff! In fact, the beginning of the piercing, dwindling scream is about to sound. And your ARC break will follow immediately afterwards: bypassed charge.

The most fruitful source of bypassed charge, then, is the itsa line – just it. And that's all – that line.

That is the most fruitful source of bypassed charge, then: Restimulate an engram, don't let the pc tell you about it; restimulate an engram, don't let the pc tell you about it; restimulate an engram, don't let the pc tell you about it; restimulate an engram, don't let the pc tell you about it. If you haven't got an ARC break by that time, the pc must have been dead to begin with!

Do you see that simply by filling up this reservoir full of charge and then not putting in the itsa line – not letting the pc tell you all about it – you're bypassing charge? This is elementary.

That gives you a change in your auditing training program at Level W. At Level W we're going to teach an auditor to be an auditor. We're going to teach them to listen before they restimulate anything. Life restimulates quite a bit of charge. The auditor should at least be able to handle that.

Level I – Scientology I auditing – will consist, then, mainly of listening. You see his TA stop moving, you must have seen earlier a DN and not noticed it. So therefore, if you see a DN, you know that your TA motion soon is going to cease. It may not be the exact next session; it may take two sessions for it to really stop. Two sessions of the same kind of treatment, see? And you know, that's going to wind up in an ARC break.

These people who are ARC breaky pcs are not ARC breaky pcs; there is no such thing. There are only auditors who don't listen. It's very simple. It's very elementary.

I don't wish to give you too much stress on this, because you're liable to go completely overboard and just sit there and let your pc do nothing but talk. But the only crime that you can commit on letting the pc talk – the only crime you can commit – is if the pc doesn't move his tone arm by talking. Pc is talking for a while, and you see that the tone arm isn't moving: Well, you go on letting him talk forever, you're foolish, because the case is getting no-place.

And this question will come up: The pc is motivatoring, motivatoring, motivatoring, nattering, nattering, nattering. First question that was thrown at me. We had a student here one time that only talked in motivators – didn't talk English, talked motivators. [laughter] And the question – question was asked of me, "Well, what if we just let that person talk?" Well, in the first place, she never would have gotten any TA as a result of all this talk. And the other

thing – she was already in an ARC break! Do you follow that? You don't let people talk when they're in an ARC break: you find what the bypassed charge is. Because your itsa line has already gone so far out that it won't put itself back in.

So you say "When shouldn't you let a pc talk?" No TA action or the pc already in an ARC break. The time to do, then, is act.

And the no TA action: Well, let's give them another auditing command or something like that, but that normally isn't what's wrong when you get stuck TA in that particular fashion. Normally the pc is – you're doing ARC breaks of some kind or another like "Recall ARC breaks," and the pc has had an ARC break in present time having recalled – with themselves having [re]called an ARC break in the past, that sort of thing can happen, see? Or they've suddenly bypassed and haven't answered fifteen or twenty ARC breaks. They haven't given them to you; they threw them all away, suppressed them. That sort of thing is happening. Something weird has gone on in the session, and you suddenly cease to get tone arm action. Now, the pc could sit there and talk forever, and – wouldn't get him out of it. No, it requires the auditor to locate what bypassed charge, what has happened here? He has two remedies for this: he has the ARC break assessments and he has his big mid ruds. He has ways of getting people out of this mess.

But that is your basic problem. We're not talking about the ramifications of it. Let the pc talk and let him talk with tone arm action. And let them talk as long as they want to talk and let them talk as long as you can get tone arm action by their talking. Where did you get so industrious? If I could sit there for two and a half hours with the pc telling me all about early track engrams and it's this way and that way, and I've got a TA that is banging here from 2.5 to 4.25, back and forth and back and forth, I'm afraid I would just sit there. And I know some of you sit and acknowledge. Oh, no.

I wouldn't shut that off. I'd just sit there and look intelligent. [laughter] I wouldn't acknowledge a thing – no interim acknowledgments. Once in a while they look up and they seem brighter about it, so I look brighter and nod. [laughter] What do you want to work so hard for? You realize that we're talking now about case level II auditing, because that is case level II auditing. But all you'd have to do is let the pc start talking about his backtrack and get tone arm action and never give an auditing command. Start and end sessions; that'd be all there was to the auditing session. See, it'd get that elementary. Well, of course, it can get that elementary all the way down. But the worse off they are, the more their attention has to be directed, the more particularized the process has to be. The way to bypass charge is not let the pc tell you.

Now, there's the basic anatomy of what you're doing, and it should make an awful lot of sense. And if you were to teach somebody just to listen (Scientology I, see) – you say, "Well, you should go listen to people's problems" they'll have some weird little wins. You're not even teaching them to run an E-Meter, see; just to let somebody talk to you. Then eventually, he'll find out that there's talk and talk. There's the talk that moves E-Meters and the talk that doesn't. By that time they'd be a pro. Learn to listen, and you've got it made.

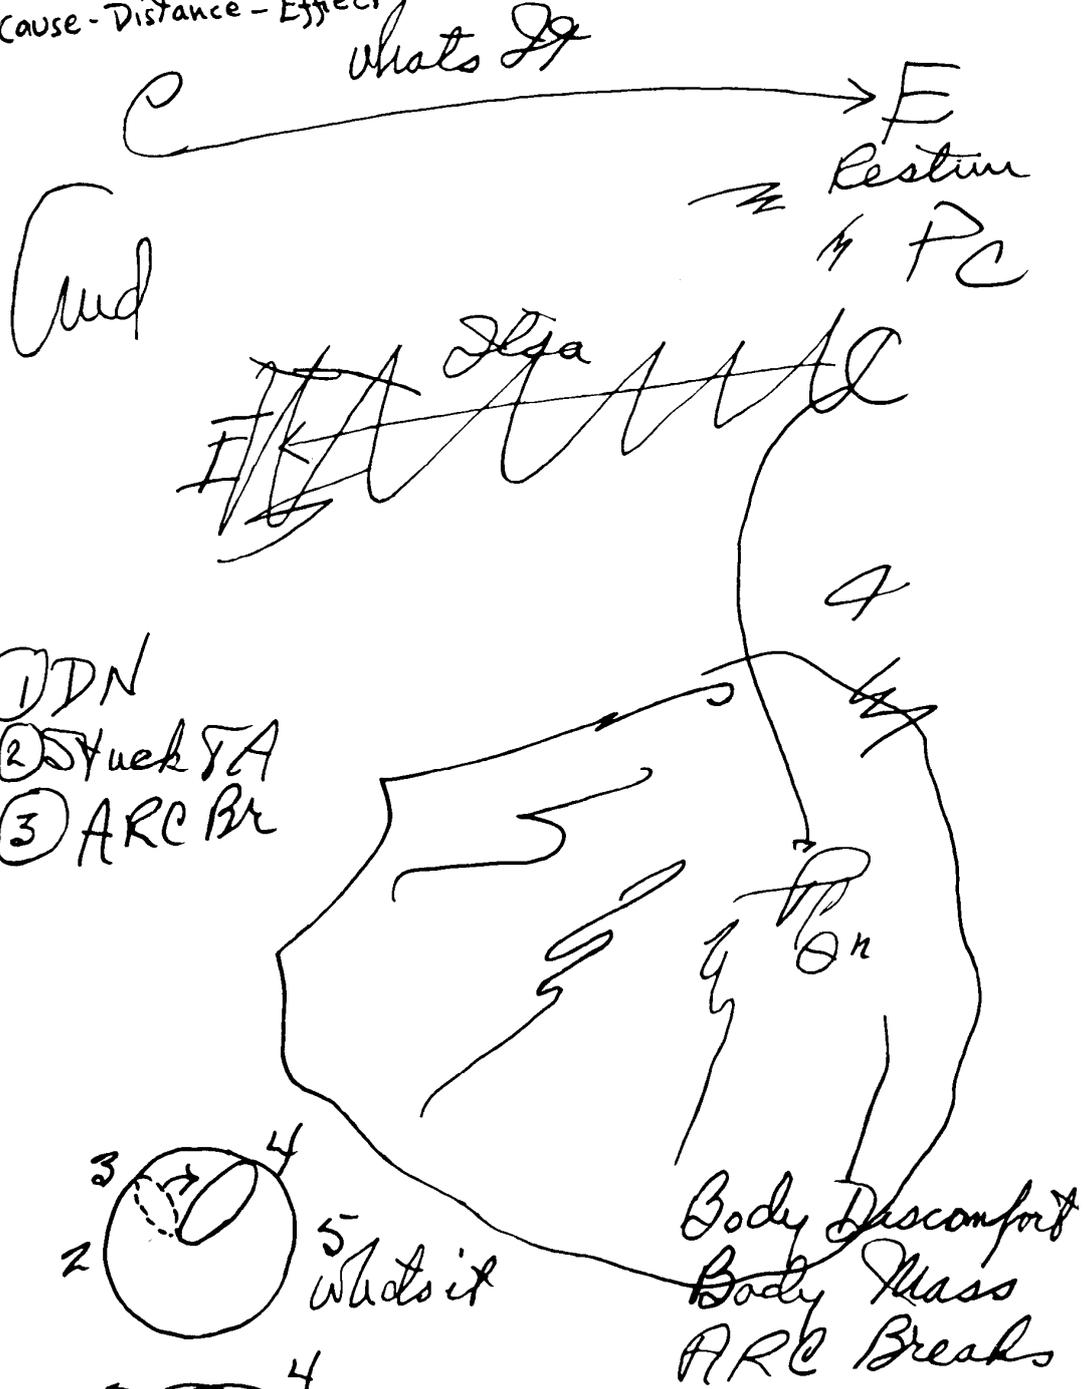

You got this all wrapped up and figured out and you see it and you got it taped now?

Audience: Yes. Yeah.

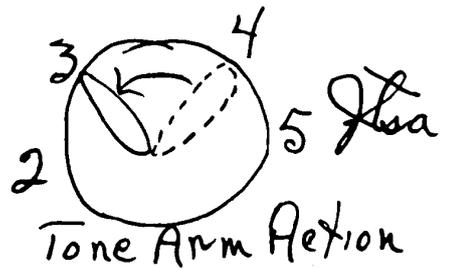

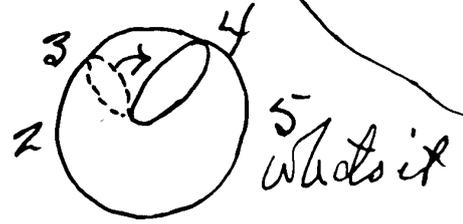

Well, watch those DNs and get that itsa line in.

Thank you very much.

Basic Error of The Auditing Cycle

When Its a line is cut, auditing ceases to work.

R2H FUNDAMENTALS

A lecture given on 7 August 1963

What's the date?

Audience: August 7th.

August the 7th, AD 13, Saint Hill Special Briefing Course.

I'm going to give you a talk today which isn't the official final rundown of R2H but which lays down the fundamentals of the process itself.

All right. R2H is one of the most satisfying processes that you ever cared to run. It is ARC breaks taken apart by assessment. It has a tendency to succumb to inexpert handling, and as long as you give a good thought to the fundamentals of the process, you won't run a cropper. But here is one of the more interesting processes. Contained in the... this process is different than any process we've ever had in Dianetics and Scientology. Don't think that you understand this process, because it's quite different.

This process will run engrams and secondaries. It has tremendous power. And therefore it very well may be senior to R3R, in spite of the fact that it's an R2. It very well may be senior. It may run more bank than these.

And the only thing it won't run is a GPM. And to run a GPM you have R3M and R3N.

Oh, you'd forgotten R3M, huh? You wait till one day you run into a wildcat GPM, man. And you'll thank your stars for R3M, if you know how to do it. Because that's how you got the patterns in the first place, was R3M. That's how you got 3N. That's the papa process.

Out of R3M can be borne patterns. 3N presupposes that you've got the pattern. You sit there and let the pc pattycake around and yap around and bark around and give you random items and you don't see them rocket read, and you don't know which end you're going – standing on, and you let him hunt and punch, and keep sitting there at the E-Meter. I think the fashion is to sit there at the E-Meter as the auditor and just keep shaking your head, "No, it didn't rocket read. No, it didn't rocket read," until the pc blows his brain out. Of course, he doesn't need a brain. That's – that's a good thing. [laughs]

But R3M will do a wildcat GPM – by which we mean a GPM for which you have no pattern. And they exist all over the track, and you'll eventually run into one, inevitably. Don't think you can just go on running the pattern GPMs, because that'd mean your pc was never caught in a bind that was an oddball bind, see? And, he never got out to Arcturus and fell in

that particular area that nobody else fell into, see? I mean – be very fortunate if he was normal and had only the normal implants, but that is never true. He's always got an oddball one.

So you've got R3M, and that takes care of your offbeat implants. And the only change that I would make in it today – I wouldn't ask the cross-question on oppose the way it's asked. I wouldn't ask, "Who or what would oppose...?" to get your next pair. I would say, "What does the next pair consist of? Give me the oppterm of the third pair." That's the one I would use. I would use something like that. And then "Who or what would oppose it?" Yeah. And I'd use that as phraseology.

Now 3N, that's a lead-pipe cinch. But 3N has this liability: On some pcs if you don't random list – I don't care if they had the item or not and if it rocket read or not – you don't get tone arm action. And if your tone arm action ceases, just up and random list. Just as easy as that. That gets all of your locks off. The RI with all of its locks – nothing has changed that, don't you see? Even though you've got the item "absolutably cantankerous," why, make him random list. "Who or what would oppose it?" And he gives you all kinds of things, and that blows the lock and your TA action may restore.

But the big – the big thing that keeps 3N TA action down, of course, is having the wrong date and the wrong pattern. There's nothing like having the wrong date for the GPM and the wrong pattern from the GPM to freeze the tone arm. That's almost certain.

Now, if you add to that session a wrong or out itsa line – return line from the pc to the auditor – you of course have got it made. The TA simply goes up to the moon and sticks, and won't go anyplace else. You understand that, don't you?

You'd be surprised how often you find a wrong date. And you're running the Helatrobust implants – so you think – and you go right into the next goal for which you've listed. And then you try to get "absolutably" and you can't get a rocket read, and you say, "What's happened? TA's up and stuck. I've got this next goal 'to be a goof.' It's obviously the next goal in line, only it isn't here." Shucks, man, you're probably running a Bear implant. It's probably shot back on the track Lord knows where, because the one thing a GPM won't do is properly time. You can duration a GPM and you can time a GPM and you can get the date of a GPM almost endlessly.

Why? Because its primary basis is lousing up time. Those two opposing items fire against each other – sound like time to the pc – produces a no-change situation. So the GPM floats on the track and so it's very difficult to time a GPM. So it's just nothing to get the (quote) "next GPM in line" to run, and find out that it isn't at forty-three trillion but at fifteen trillion trillion trillion trillion trillion trillion trillion. Embarrassing. Eventually you go back and start looking for wrong dates on the case, and you finally locate that "to be a goof" is not the next Helatrobust GPM but a GPM which exists in the early limbos of nowhere.

Now, what's very interesting is an exactly-the-same-looking hill with exactly-the-same-looking parking meters with exactly the same railroad track existed about trillions-four ago, which laid in an entirely different pattern which was far more aberrative than the Helatrobust implants, and which is basic on the Helatrobust implants. And I told you one day the Helatrobust implants are on the screens they show you in the between-lives. No, that isn't. I've been making that mistake for about ten thousand years. Every time I put this thing up on the

screen, why, it's the wrong implant. They're an early implant, and they had a hill there, unfortunately located in the same geographical area as the Helatrobus implants. And it looks to the pc just like the Helatrobus implants, only it isn't. You've got a date error, then, consisting of trillions-four – almost trillions-four, you see – trillion trillion trillion trillion. Your date error. Of course, your TA action will cease.

So there's a lot of tricks in running GPMs. GPMs are what require special techniques. They require special techniques.

Now, nothing else that I know of requires a special technique, and you might even do away with R3R (this is a very adventurous statement) if you had a perfect R2H. R2H has the potentiality of running engrams and secondaries on the whole track with greater avidity and speed than R3R because it takes apart the restimulated and bypassed charges which exist in the secondaries and engrams. It doesn't run the engram so much as it takes out of it all the bypassed charges and causes, of course, that particular segment to snap back onto track.

You probably have not looked at it this way, but you're actually not trying to erase somebody's time track. In the between-lives area they apparently are trying to wipe out your time track so you don't know who you are. Well, we're actually not doing that. You're not in actual fact working with the time track to knock out all the pictures everybody has. That is really not what you're doing. You're trying to take out of the time track the things which prevent a person from having his pictures. And after that, you can restore to him the right to have pictures or not to have pictures, as the case may be. You're trying to pull his knowingness high enough up to a point where the individual does not have to have pictures to tell him who he is. Now, you got that?

You really – your first target is not to erase somebody's time track. You're liable to think that, because that is what a between-lives screen specializes in. It allegedly is trying to invalidate a person's time track to a point where he doesn't have any, and therefore can't remember who he is because he has no picture reference. I spoke to you this way about it yesterday.

Well, you're really not, then, trying to erase the whole time track, but there are certain unwanted pictures that he couldn't handle and which he became the effect of. If you take the charge off of those pictures, then pictures become available to the person and he can have them or not have them as the case may be.

Now, the pictures which mostly louse up things are the GPMs. That's the real mess-up. But because a between-lives implant has a target of invalidating all of your pictures and therefore wiping out your identity and memory, because of this you might think – and I'm sure many people who are upset about auditing might think – that you're trying to do this. You realize a Scientologist may be looked at with... askance by certain areas and interests and so forth as though they were between-lives implanters, because they get some whiff of the idea that you're going to erase the whole time track. And they might think we're between-lives implanters.

I don't know what would happen if we... I was toying with this this morning – let me give you a little bit of a laugh out of the side of this – I was thinking of outer-space tactics and strategy. This is an interesting and vast subject, and I have come to the conclusion that the

missing factor in it is communication, and that lack of communication is what causes all the trouble. All right, that's beside the point – that makes, then, very intricate and complicated tactics and strategy, you see? I wondered if, impishly, you couldn't rise above this factor with a few curves of one kind or another by entering societies from within where you did have communication, you see? Well, how would you go about it then?

I was sitting there idly speculating about it over my scrambled eggs, and I suddenly realized – still eating, I mean, I'm decadent – [laughter] I suddenly realized that these between-lives blokes – the Marcabians – wouldn't know what to do if they came down here and saw that they had a Marcab headquarters here. We set up their headquarters for them, and you put up their flag, you see, and so forth.

And look at the news story. I must have brought this news story on us, or had telepathically realized that somebody was going to call on us. The Mirror group was calling on us today: "So many advances have happened in Dianetics and Scientology in the last three or four years that they had better be covered."

We agree with them perfectly, but how they will cover them, God knows. That's one of the biggest newspaper chains in England, but they also are the author of the "Death lesson" stories, and so we regard them with some suspicion.

But there is this pressure all the time of... We are, you see – were putting out fantastic – the stories involved here would make what's turned out in university labs and the psychiatric blokes and this sort of thing – would stagger them, man. You see? I mean, there's more story in any given week in Dianetics and Scientology, you see, than these birds... and the pressure – the pressure of this much data inevitably will produce some sort of a reaction on the surroundings, you see? And you'd find these guys sooner or later are going to realize they missed the boat. Instead of writing about "that cult," they might write about "those people" and you'll see them swinging around to this sooner or later.

But look at the Marcabian press: "Here in this prison, in spite of all that has been done to them, they're still loyal to their mother country." [laughter] God, you know, that's touching, you know? That's a tear-jerker. And I sort of sat back and I said, "Well, Ronnie, you're a dangerous man." [laughter, laughs]

But the reaction of Earth population, all of which has come down through that channel, to these symbols might be something approaching the most fabulous thing you ever saw. It might be utter frothing, see? Might produce widespread riot and chaos. I don't know. But it was an interesting thought, anyway, as I think you will agree. Not that we're going to do anything desperate like that – at least this afternoon.

The point I'm making here – the point I'm making here – is that if you tell the pc that you're going to erase his whole time track, why, he's liable to go into a sort of an anaten propitiate, because this happens to him every sixty or seventy years to such a degree, you see, that he doesn't quite know whether he's coming or going. But you tell him you're going to give him back his pictures and you might entirely change your identity, as far as he's concerned, as an auditor.

See, he's got certain pictures that make it impossible for him to get back his pictures. That's the condition he's in. And you're in actual fact trying to return him to Case Level 2. And oddly enough you have to move him to Case Level 2 before you can move him to Case Level 1. That's what's very interesting about it. And your pc – in spite of all your erasure of pictures – is going to wind up with pictures. Man, he's going to have pictures! He takes them all the time, they just aren't available. Some of these pictures aren't too pleasant, some of them aren't too unpleasant, but the point is there is no dearth of pictures. What's the matter with him is that he obsessively makes pictures of everything without discrimination. He's something like a garbage collector, see? Any old picture is good enough, you see?

But he gets some of these pictures, like GPMs and jails and things like this from between-lives implants, and they then hit him every time he tries to see his own pictures, you see? And he sees these, and of course they're his pictures, too, but he never realizes this. They're so hostile to his future and his mental health that he disowns them.

I've just gone through a phase of disowning my whole track – out of disgust, you know? Had a beautiful case resurgence for about – oh, I don't know, must have lasted for an hour or two. Then of course it collapsed. But what I did was go through the consideration of track, and track became artificially, you see – the artificiality of it became less and less real until the track itself disappeared. And now the track is appearing with total reality, you see, and good knowingness. It's an interesting, through-the-knothole experience. You know, "I wasn't. I don't know who the hell I am. I..." You at least got up to the point of where you didn't need a picture to tell you who you are – you got brave enough to say, "Well, I just don't know." And from that point on you start getting your own track back.

That's an interesting point, that this occurs. And perhaps, perhaps, you haven't given enough attention to this, as nobody's trying to wipe out your pictures – they're just trying to pick out those pictures which bar all other pictures and which the individual considers hostile. And when you've done that, why, the individual gets back all of his pictures. It's very simple. The hostile ones can no longer bite.

Now you've got a Case Level 2. Now you go after the mechanism which makes it automatic for him to make pictures, and you put this back on power of choice, and of course you've got an OT. And that's the whole scope of processing where it has to do with pictures and bank and knowingness and so forth – they're all wrapped up in that.

Well now, you see, instead of erasing pictures, you could go at this another way. You could bring up the individual's confront with regard to pictures to such an extent that he could even face the hostile ones. Ah, that's an interesting approach, too, isn't it?

Now, this is comparable to the old exteriorization approach. Instead of erasing the guy's bank, pull him out of it. That's the old exteriorization approach.

Well, this is a similar approach, but it's different than either of those approaches, you see, of erasing the pictures or pulling the guy out of the pictures. We're pushing the guy up so that he can disentangle and confront his pictures. In other words, were getting him so he can understand his pictures. And this one works, too, which actually gives you a third route to processing.

So R2H is not just a method of erasing pictures or getting the pc away from his pictures, it actually raises the individual's potential in recognizing and owning his pictures and making the pictures better.

Now, well-run R2H can make the pictures much better, much prettier, much solidier, without them being obsessively solid so that they intimidate the pc with their tremendous solidity. Now, that's the important point of it.

So, with R2H, you actually are embarked on another philosophy. If you understand this grip on it, it is its own philosophy. Doesn't make the other philosophies invalid, but it embarks on its own private, personal railroad car and says this is a whole philosophy in itself. Of course, it uses the elements and mechanics and other things, but the individualism of R2H is based on this. There have been some new discoveries about this, and they've been put to work in R2H. And let me show you what these things look like.⁶

Here is a thetan. Now, your first level of life and beingness – your first look at life and beingness – what life and beingness are, exist as potentials or abilities, not as things – and those potentials and abilities consist of A, R and C.

You know all about A, R and C: Affinity, Reality and Communication. But think of those things as potentials – not affinity for anything special but the potential of having affinity. In other words, you could say, "What is the potential of the A, R and C of an individual? What is his potential?" You'd be asking the same thing as "How alive is he?" The more alive he is, the more ARC he's capable of – the less alive he is the less ARC he's capable of. That's interesting, isn't it?

What do you think of a philosophy that thinks that man is mud? Well, let's take a look at this. ARC. ARC – and probably this could be drawn in different ways – ARC goes out to... and remember that communication with other beings is through matter, energy, space, time and so forth, see? This ARC potential, or ARC with what? What is this ARC with? Communication with, reality about, affinity for, see? What are these things connected up with?

Well, if there were just other beings, it'd be a telepathic ball and that would be that. But when you talk to Joe, you're actually talking through MEST to Joe – no matter how you're communicating with Joe – unless your ARC is so much on the ball that you can telepathically communicate.

And by the way, your ARC doesn't have to be very high to telepathically communicate. That is quite interesting, that man is, at large, below this level of telepathy, but it is paid attention to in some civilizations to the degree that – oh, they set up – you've got a three-way communication. You got a conference with other departments or ship commanders or something – it wouldn't matter whether it's a business or a unit of some kind or another – and you set up a box. You set up a box. And the thetan briefing them briefs them through a box which telepathically retranslates his thought onto an endless banner, and puts it out with sound also. In other words, telepathy sufficiently strong that it can be mechanically reconverted. A device

⁶ [Editor's note: Starting at this point in the lecture, Ron made diagrams of some of these points. These were issued in HCOB 14 Aug. 63, "Lecture Graphs," which can be found in Technical Bulletins Volume V, page 339.]

no more difficult than the vocotyper that the IBM keeps trying to make. You talk to the typewriter and it types, you know?

Well, this is telepathic vocotyper. I'm not talking to you out of *Popular Mechanics*. In other words, the telepathy factor is strong. It is something you have to deal with.

They have anti-noise campaigns in New York City. Well, I imagine in a boarding-house, a bunch of thetans would have an anti-telepathic campaign, you know? That you stop shouting telepathically all night, you know? Telepathy is a very heavy, hard-hitting force.

Some of you will be going through an implant, or something like that, and you'll pick up off the track what you think is your postulate and then suddenly realize it isn't your postulate, that somebody thought it in your vicinity. You sometimes can pick up the thoughts or fear of some thetan down the line who is also being implanted. This stuff will sometimes kick back into an implant. It's quite valid. There's nothing to worry about with that.

Now, this isn't any lecture about telepathy – it gives you an idea of how low ARC can go without disappearing and how high it can also go, because the birds I'm talking about that use telepathy for communication aren't even, by your chart estimates, in very good shape. See, they've had the Helatrobus implants, too, but they just aren't getting their lives wiped out every sixty or seventy years, see? That factor is missing – the only factor of difference between your case and theirs. See, that's the sole difference.

Every once in a while, why, their empire gets wiped out, and somebody implants the lot, but that's life.

So here's your ARC. And your ARC can go up, then, to pretty high levels.

And it depends below a certain level on matter, energy, space and time as its communication media.

ARC gets very important after you start dropping away from telepathic communication. Becomes very important – because, you see, it's so much present before then that nobody ever thinks of it. Nobody ever thinks of it at all. You're just not mad at people, and reality is terrific and you know all about it – and communication is good, and your understanding and knowingness are pretty well up, so it wouldn't be something that you worried about at all.

But the second you start introducing MEST into communication lines – living with great dependence upon this universe in this universe – then ARC become very important and become the measure of life.

Of course, they're there all the way up. But you don't measure them as going out. In fact, I believe nobody would believe they could. Livingness – degree of livingness is measured by ARC. How alive is somebody? It's how much ARC is he capable of. That is the test.

Now when you get over here... Let's just rule out telepathy.

I'm saying it exists, but it isn't necessary to our proposition at all, and it's a highly individual and odd bit of business, see, that transcends matter, energy, space and time and goes straight to other beings.

So, we would have thetans as a thing to be in ARC with, and then we would have matter, energy, space, time, form, location. Now, you could add to this, you could break these down further, but they are the principal things beyond which there is no breakdown. Possibly in importance it ought to be L and then F.

Now, the ARC that this individual has expresses the degree that he can be cause over these. The potential of ARC of the individual, gives you the degree that he can be at cause over thetans, matter, energy, space, time, form and location. The less life he has, the less he is.

Now, as a thetan gets more and more solid, he is less and less capable of ARC. That's fairly obvious, isn't it? Why? It isn't that his solidity prevents him from communicating or feeling affinity or that sort of thing – but it's simply an indicator that he must have broken ARC with matter, energy, space, time, form and location, or it wouldn't be piled on him without his choice. That's an interesting point, isn't it? He must have had ARC breaks, then, with matter, energy, space, time, form and location. Ah, but how could he have ARC breaks with matter, energy, space, time, form and location without having ARC breaks with other thetans? Well, I think it's probable, and very possible, that he could have. But the truth of the matter is, it was having ARC breaks with other thetans that caused him to start to ARC break with matter, energy, space, time, form and location. Doesn't necessarily follow that way, but normally that would be it.

So, as an individual rises up the line – as he rises up the line – he then rises back toward direct communication, direct affinity, direct reality on other beings. The less ARC he has, the more matter, energy, space, time, form and location he has to go through in order to communicate to other beings.

See you look a little bit dense on that one. Let me give you an idiot's line. Here you have Bill, and here you have space, and here you have Joe. Now, Joe, in order to hear Bill, has to register an air wave which is generated by Bill.

So Bill generates an air wave – vibrations – that are received by Joe and are reinterpreted into ARC. So ARC here are converted, and then are converted from matter, energy, space, time to ARC. And you in actual fact have done this cycle. This thetan here communicates to those thetans there by going up here, here, see? And actually, they communicate back similarly. See? Get the idea?

Once you drop away from telepathy, you enter MEST into the line, and ARC, then, becomes subordinate to MEST. And you eventually get a bunch of knuckleheads implanted up to their ears. Did you ever realize Einstein went through the between-lives area when he kicked the bucket? (Served him right. I wonder if he traveled faster than constant? These brutal, gruesome thoughts I have every once in a while.)

Now, look at this – man is not mud, but a fellow who isn't alive at all would think only "mudly." He'd have very muddy thinking. He'd come to mudlike conclusions. Therefore, his mental sciences are very mud-like.

There are no mental studies which admit – today, that are currently being taught – that admit of the existence of a being. They only admit of the existence of biological combinations of mud resulting in a very muddy result. Psychology textbooks today begin by very carefully

defining the fact they do not know what a psyche is, and they do not even know if one exists, and they're pretty sure it doesn't – "But we will now give you the parts of the brain." See?

What are you dealing with there? You're dealing with somebody who is so far away from other beings that he is no longer talking *through* MEST, he's talking *to* MEST. Ding, ding, ding, here comes the wagon!

Every once in a while you see some poor little kid that's been knocked in the dome too much, and he'll be out there beating his red wagon. And you yourself in your dippier moments will start talking to something on the mantelpiece. And when you're particularly foggy in the morning and haven't been awakened, you're very often prone to curse your shoes.

Well, you may be doing it on another harmonic, because a thetan is always capable of investing things with life. And you're probably doing it because you've "alived" the shoe. You see, you're perfectly capable of mocking up a living being and making it talk and walk totally independent of you. Perfectly, perfectly capable of doing that. Used to do it as OTs all the time. So you're capable of investing matter, energy, space and time, and so forth, with life. And then other-determining it, saying it is no longer I, and having it walk around and talk.

Now, those – that's a potential that's talked about in *Dianetics: Evolution of a Science*, that speaks of "Throghmagog." You can always invest something with life, such as a shoe. And you can always pretend that a shoe is alive. But how would you like to be in the kind of a condition where you thought another living being was no more capable of life than a shoe? Let's reverse that, see? Let's get a total reverse on the situation. Let's look at a living being and say that this living being has no life in it.

Now, you got some kind of an estimate of how far down scale you can go, and somebody can still sit there and eat breakfast. Got the idea? It's pretty far south.

Matter, energy, space, time, form and location – ARC breaks with – cause the dwindling spiral of. ARC breaks with other beings, matter, energy, space, time, form and location bring about a deterioration of one's ARC.

It never really deteriorates – one just believes it is deteriorated, you see?

In other words, you can have an ARC break with MEST, you can have an ARC break with form, you can have an ARC break with locations. It's very common for an animal to have ARC break with locations. A place where an animal has been hurt will be avoided by that animal, very carefully.

Now, what in essence does this forecast? That is the basic theory behind R2H. It forecasts that by clearing up a person's ARC breaks, one then returns to him his ARC potential. Clean up his ARC breaks with matter, he feels better about matter. Clean up his ARC breaks with energy, he'll feel better about energy. Clean up his ARC breaks with space, he feels better about space. Clean up his ARC breaks with time and he will feel better about time. Clean up his ARC breaks with form and he will feel better about form. Clean up his ARC breaks with location, he feels better about location. Clean up his ARC breaks with other beings and he feels better about other beings. And all the way up the line, of course, his bank – that reservoir of ARC breaks – is getting plainer and plainer to him and more and more confrontable to him. Because his – all of his ARC breaks in terms of pictures have responded as the reac-

tive mind ARC breaks. Because the reactive mind is made, after all, out of images of other beings, matter, energy, space, time, form and location. It's as easy as that. And that consists of the reactive mind.

So by cleaning up his ARC breaks with these things, you tend to clean up his ARC breaks with the things he's got pictures of in the reactive mind that he can't confront, and his reactive mind opens up and he can tolerate it and confront it.

So R2H considers and conceives that the reactive mind is a reservoir of ARC breaks. That is the basic assumption on which that process hops off. We know that the reactive mind contains images or beliefs in other beings, and with – certainly their images in terms of thought, don't you see? We might, by the way, have put a "T" under other beings for "thought," you see, because thought or significance could be included in that – but by just putting up other beings you also have the reflections of other beings, and so that you could omit that.

But you know that the reactive mind consists of images of other beings, thoughts of other beings, thoughts of oneself and so forth, plus matter – if you don't believe it's composed of matter, someday run into a ridge, energy – you hear and see the energy flutter-fluttering around in the reactive mind all the time and that's what registers on the tone arm, space – every once in a while a guy can't see a thing, and then he suddenly realizes he's looking across too much space to see it. In a picture, it always has space, and lack of space is the main thing that's upsetting in the reactive bank – you can't get away from the lousy thing, see? You can't put space between it and you. Space is the cure for no confront, see? And time – good heavens! The thing is not time. If there's any time in the bank, that is remarkable. What you have in the bank is an absence of time – an apparent absence in time in the presence of a totality of time. You've got a nothing where a something is and a something where a nothing is. And that's what makes it reactive.

Reactive – remember, that's what the thing is called. That means instantaneous response, regardless of what time the response is laid in. A=A=A also equals twenty-nine years ago equals a billion years ago equals eight trillion years ago. Before you start inspecting it, they're all the same time. So you got this terrific time identification – you also have space, energy and matter identifications.

Now, as far as form is concerned, that's not a terribly upgraded thing.

It comes into the field of aesthetics and arts more than anything else. Some people like Picasso, some people don't. Some people like blondes, some people like brunettes. Form, aesthetics, tastes, that sort of thing. And the reactive bank – the things least confronted in the reactive bank are those forms which one has disliked most. And so, of course, he's got a wonderful close-up stockpile of forms he detests. We're not talking now about income tax forms – we're talking about pleasanter things, like girls and things.

Anyhow, as far as location is concerned, if there's anything that is A = A = A in the reactive mind, it's location. When I first collided with this early Helatrobis, I was absolutely sure that it was in exactly the same location – that here, trillions of trillions of trillions of years before, some knucklehead had begun this thing and then somebody had walked back in the vicinity and said, "Well, this is what you do when you are here," and proceeded to give

the Helatrobis implants. I was sure that was the case. In fact, I only know now intellectually that it is not the same place, because it's the same type of scenery. Given a little similarity of form, and boy, those locations were identical. But what you're doing right now, packing around in your bank and your head and your ridges, planets which are light-years away? Looks to me like that's a very interesting identification of location.

In an auditing session this comes off all the time. It happens so often that you don't even think about it. This guy is sitting there, let us say he's running something, and it's something that happened in Australia. Doesn't seem either peculiar to the auditor or the pc that it is being run out in England. There's a 12,500-mile error in location. And you very often see this kind of an odd thing happen: You get the thing all run, and it goes *spang!* and stays there. It goes to its proper location. It seems to disappear or something.

Of course, by moving in time you can make the thing disappear, too. But I've had this odd experience of not being able to run certain engrams because they were too well fixed in their proper location. You practically have to go to Arizona to run it – that's where it happened! You can spot the facsimile, but it's over in Arizona. Well, it couldn't be very aberrative if it fixes its location that smartly, see, because that's the right location.

Well now, if everything was on its proper time span, you'd have to move all over time in order to connect with anything, wouldn't you? So the thing must be in its improper time span if you can reach it in present time without yourself moving back trillions of years in time. Well, there's something wrong in the reactive mind with other beingness and other thoughts, with matter, with energy, with space, with time, with form and location – and everything that is the matter is they're identified one with another. Two times are identified, two forms are identified, two locations are identified, two spaces are identified, two energies identified, two masses identified.

Can also go the other way into what you call a disassociate. And you as Scientologists run less into this thing of disassociation. Someday you may read some Sigmund Freud, and you'll hear all about disassociation because he specialized in this thing, disassociation. It's not anything we've ever talked about to amount to anything, but two things which are the same thing, approximately, look entirely different. In other words, two pictures of the same person at two different locations look like two different people, see? That is an inverse of identification. Things that should be seen to be similar, are seen to be madly different.

You don't pay much attention to this because after a person's done that he's more or less flipped his lid. But you're now going to run into disassociation – and that's why I'm making a little side comment on it here as we go – because you're going to run into it if you really put in the itsa line. And you're going to wonder what's happening. Because the pc doesn't at first answer the auditing question.

You say, "Have you had any gains in this session?" And he says, "The – well, so on – The floor dropped out, and then I had a couple of drinks. And three or four years ago, why, I knew a girl named Mabel."

And now, in putting in your itsa line, by the rules of the game you shouldn't interrupt him. He may sit there, but he's not finished with that communication. And he'll keep on going and going and going, and you'll see all these disassociates come up. And then all of a sudden,

if you let him go on, he will eventually come up and tell you a gain he has made for the session.

But you're running such violent stuff, you see, on the whole track, that as he passes through the stuff, he's actually going through the session trying to answer your question – and these things are getting in his road – so he says them to you, they tend to as-is, and after that he can finally reach the material necessary to answer your question. Got the idea?

But now, if you've put in an itsa line all the way across the line you're going to see disassociation, so you better know what it is. It's simply that two things which should be seen to be similar are seen to be madly different. It's the inverse of identification. It's you ought to see a similarity between the question and the answer.

"Have you had a gain for the session?"

"Yes, I've had a gain for the session. I can see better."

You get that? Now, that's a similarity, you see? There's the same communication line, and the answer compares to the question that was asked. You get a disassociation this way:

"Have you had a gain in the session?"

"I had a beer three years ago."

That's a disassociate. Well, it isn't that the pc isn't answering your question, he's getting around to it. And if you're very good at your itsa line, he will eventually wander torturously through and eventually will come up and say, "Yes, I don't feel like I'll be so thirsty all the time." Of course, that is almost a sequitur statement. He will have uttered other statements less sequitur. But as you search the thing out, you would see that he was coming closer and closer to answering your question as he talked.

Try that sometime on a full itsa line, and you will be very, very, very pleased with the result. The guy was answering your auditing question. If you let him go on talking, he eventually would have answered your auditing question. He only didn't answer your auditing question if you cut him off at the point he was disassociating. Then he didn't seem to answer your auditing question.

You'll notice his eye is no longer on you again, you'll notice he's still groping, you'll notice he's still fumbling with the bank, when he – as he tells you these things. You'll see this. Well, that's a disassociate.

All right. Guy comes up and slugs his mother, thinking that she is about to rob him. Well, he's associated his mother with a burglar. Well, you'd say he's nuts. Well, yeah, true enough. But there are people who are nuts. But that is what that is.

So identification isn't the only crime. There's one beyond identification. That's two things that you ought to recognize the similarity between, you see as vastly different.

So this whole thing here goes on to an inversion. What you get is a restimulator factor. We knew a girl who had pink hair, see? We knew a girl who had pink hair, so therefore girls who have pink hair aren't to be trusted – therefore nothing pink must be trusted. And we know

a fellow named "Pink," who brushes his teeth, so we'd better not brush our teeth anymore. Do you follow that torturous line of logic?

Well, that is ARC as it goes down scale doesn't just stay as ARC, it goes into an inverse, because it gets too many things identified, and then it gets things disassociated in some kind of an effort to see some separateness in existence, and eventually starts going into a twisteroo. So that you will have people who consider good communication shooting people. High level of communication.

I had a husky one time that knew what communication was – chewing people up and being bitten. There he was. He was quite a dog. It was very funny, I'll never forget that dog; he was the toughest dog I think I ever saw. I'd walk into the yard after being gone for a long time – you know, a year or two or something like that – and this dog would suddenly see this (quote) "stranger," and he would bare his teeth – he was one of these fantastic malamutes – and he'd bare his teeth, come tearing across the yard, fangs just shooting out of his face in all directions. And I'd pick him up on either side of his jowl and, using his lunge, throw him twenty-five feet. You practice up a little bit with police dogs and things, you can get so you do – it's like dog judo, you know? And he'd go through the air and he'd land. And he'd get up: "Oh, Ron!" [laughter, laughs] He knew what communication was! [laughter]

So, there's all kinds of wild levels of communication. You get people who tell you what pleasure is – they describe agony. It's very funny. So you get these various inversions. ARC, then, doesn't just decline, it goes and inverts and inverts again and inverts again. And you get a hodgepodge down at the end that nobody can make anything out of. Go down and listen to them in the spinbins and you'll see how far ARC can go, because those people are still alive. They're still alive.

How far can ARC go south? All the way – there is no bottom at which one dies, but there's some mighty peculiar things happen on the way down.

Beingnesses can die, but the individual – no. Forms can die, but the person actually – no. Memory can die, but not the person who is capable of remembering, you see? Not the person who – who is, you see? He can forget everything. And he's still in that kind of a state.

Now, ARC never ceases, so you have no bottom to the process. There are no bottom limits to the process. There is some method of communicating all the way down. It gets down into weird versions of reach and withdraw, as I just described one to you – with the dog. That's a kind of a reach and withdraw. Want to make him happy all day Sunday? Why, chew him up all Saturday night, you know? Big case gain.

This is your Tone Scale. As people go up scale, they go up through anger and so forth. It's very funny.

I remember one poor psycho in New York – auditors would process her, get her up to anger, and she'd scold her family, and they'd promptly put her in restraints and put her back in the hospital. And then she'd get out, and then the auditors would process her, and she'd get back up to a point where she'd scold her family, and they put her back. And this nonsense just kept going, see? They'd never let her get up through anger. Of course, they'd been knocking

her in for a long time, and she just never was able to say that she was mad about it. She was never able to do that, so she never recovered.

Now, here's a case, then, of a process which if you can get any C in at all and get an improvement of the C or an improvement of the R or an improvement of the A, you get an improvement of the C, an improvement of the R, an improvement of the A, an improvement of the C, an improvement of the R, an improvement of the A – you get the idea? And you just keep raising this triangle – all three corners of this triangle – up, up, up, by the process of running ARC breaks. Now, the basic limit of the process is the communication of the auditing command itself. And you'll be surprised how many interpretations there are of an ARC break. And one might make a criticism of the process by saying, "Well, look, it has such a specialized command, 'Recall an ARC break.' Only a Scientologist would know what that meant."

Well, actually, you're really not asking for an upset, you're not asking for a worry, you're not asking for a time he was concerned, you're not asking for this, you're not asking for that; you're asking for an ARC break. Now, I don't think it'd take you any time to describe to the pc what an ARC break was, and he'd eventually settle in his own head what an ARC break was. He'd be better off if he could understand the communication of this phrase "ARC break." But this is one of the weak spots of the process. But it's not a very weak spot.

It's very funny how fast this communicates. You say, "Life is composed of affinity, reality and communication. When one of these breaks down, a person doesn't feel so good about something. Now, an ARC break is a time when affinity, reality or communication have been cut down on a person, have been reduced. That's what an ARC break is."

It may take the individual three or four days to digest the definition. But the funny part of it is, having digested the definition, he will have made a case gain. I don't really consider it a liability.

Now, that process isn't going to be used very broadly, and shotgunish. You can't use it in a co-audit – it's too particularized.

So there's the anatomy, however, of what you are trying to do with the process. You are trying to increase the individual's affinity and reality and communication with other thetans and thought, matter, energy, space, time, form and location by picking up those points in time when the individual has suffered a cut or reduction of communication, has suffered from a lowering of reality, or from a reduction of affinity level – period. You don't know – care what he had an ARC break with, because he has to come up quite a ways to recognize ARC breaks with MEST. This is a long way north – good, clean-cut ARC breaks with MEST.

In that earlier GPM, about the only thing that was causing a great deal of difficulty in running it was a supreme ARC break with MEST, that it would obey people who would do things like this GPM implant – big ARC break with the fact that MEST obeyed that sort of thing – and an ARC break with the people for debasing and degrading MEST to such a usage and end. The items – to hell with it. See, that wasn't the important thing. The important thing was that anybody who would attempt something like this using MEST, that MEST would obey them, so on. Big ARC break. So there's one even wrapped up in a GPM.

The thought that you're trying to get across with your auditing command is you want a time when affinity, reality and communication have been reduced with other beings, matter, energy, space, time, form and locations. And you don't direct what you're going to get the ARC break about or with; that'll all work out more or less automatically. You simply ask for an ARC break. You don't ask "in this lifetime"; you don't limit him in time – you hope he'll give you something to at least let you get your teeth into the process and get the process grooved in before you're handling a God-'elp-us engram, but you want from the pc a time of that reduction. That is what you want. And that's all you want. And then you want to find out from the pc what it was.

This goes into your form, which is still being worked out – but which is more or less grooved in now. The formal steps of R2H done for good gain on the case are: What, Where, When, and then an assessment, and then cleaning up every line of the assessment when it reads – not going by it. That is a difference. And working the ARC break over until it no longer reads on the meter and the pc feels all right about it, and so forth.

Now, the exact way the assessment is done, I'll go over that again – I'd better go a little bit earlier. The exact way What is done, is you take what the pc is willing to tell you without probing. "What's this ARC break about?" and he'll give you a résumé of it, very brief usually. *Where?* Where – that's to help him get the time. See, these are all development of the ARC break so that he can more ably identify it. And then, *When?* Now, this When gets very important. He'll have trouble with the Where, but nothing compared to the trouble he may get into with the When.

Now, the rule is – you use your meter on these three steps only when the last dog has been hanged. And you don't date nothing with the meter unless the pc is in despair and on the verge of tears about the actual time. And then you chip in, at the last moment, and you say – so on. Something like this: This meter dating is terribly easy. You know, there's a training version – that's to train you to date on a meter. I'm giving you the therapeutic version – this is the way she really rolls. You've been sitting there with the meter in front of you, and the pc's been saying, "It's 1937 – no, it's 1936 – no, 1937; no, 1936; no, 1937; no, nineteen-thirty... 37, I think it was; 38, 38, maybe it was 38, 39. No, it could have been nineteen thir – [sighs] Oh, I just don't know, I just don't know, I just don't know where. I don't know when it was. 1937, 19 – "

He's already admitted he doesn't know and your TA action has slowed down to nothing, and so forth. And you've watched 1937 bang every time he said it. You say, "It's 1937, according to the meter." That's your dating step. Got that?

Pc may also get into a specialized case sometimes, when if it was in 1937, it would be a terrible ARC break – whereas if it was in 1938 it wouldn't have been a terrible ARC break because something else had happened. So they keep saying it's 1938 when it was 1937.

Here's the only other way you go about this: When your tone arm is hung up, you've got a wrong date – and you damn well better find it. Tone arm is hung up, you can't get it moving, everything is going to the devil, and so forth – well, you just better do a scout for wrong dates. "Did we have a wrong date?"

There is a number two that you scout for when the tone arm has stuck. (This is repairing it.) Number two is you get in your BMRs on the session or the process, because the pc has, recalled ARC breaks which he has then suppressed and has not given the auditor. That causes a tone arm hang-up. These are the three things that hang up a tone arm. And the pc ARC breaks in session because of an ARC break in the past. It isn't because you've bypassed charge in the session – he's recalled an ARC break in the past, which has given him an ARC break in the session. And when you find that – any one of those three (wrong date, suppressed ARC breaks or an ARC break in the session because of an ARC break in the past) – you've got to remedy the situation. Your tone arm will stick and the process becomes unworkable. But one of those three things exists if your tone arm ceases to move on this.

The other one that can stop your tone arm from moving is just too corny. You've missed an assessment, you've missed a meter read, and you haven't got the reason of the bypassed charge. That's just pretty corny. That's under the heading of meter reading, and so forth.

The ARC break is always cleaned up to the tremendous satisfaction of the pc, and you're looking on this as something whereby you do an assessment, you say, "Well, that was the bypassed charge. That's it, thank you. Recall another ARC break." That isn't the way it's done.

Now, let's go into the last end of this thing. You say to the pc... you're doing an assessment – you clear it line by line, just like you used to do old rudiments. If you get a read, you say, "That read." You've got your pat assessment sheet. "That read." You got a new one – there'll probably even be a different – newer ones developed from time to time. I haven't issued this latest sheet yet, but it's very comparable to the L1 which you've got – it's just a little better.

You see that "an attitude refused" does so. That ticks. You didn't go down the whole thing, see? You just said – right off the bat, you said, "All right. In that ARC break was an attitude refused?" Tick. You say, "All right. What attitude was refused?" And that's the end of your job. It's now up to the itsa. That's your whatsa. And the pc is going to stem and fuss and stew and try to figure out what attitude was refused where. And the only time it won't come off is when those three things I gave you are out – you've had a wrong date in the session; the pc has recalled some ARC breaks and suppressed them; or the pc has had an ARC break in the present time in the session. See? And this system doesn't work if those three are present. And if this system doesn't work, those three are present.

So you clean this line up, and it's all up to the pc. "An attitude refused? I don't think any attitude was refused – attitude was refused..." And so forth and so on. Says, "Well, I don't – I don't think there was one."

What do you know! At this point do you shove it down his throat. You say, "No? All right, thank you," and go to the next line. Well, he can't remember it, so obviously the thing needs shaking up some more.

But you leave that mark alongside of that thing, because you're going to come back to it. It was hot once – it's going to be hot again. In other words, it's – that just wasn't ready to be answered, that's the only thing you communicate on that. If he can't find it, and he says he

can't, that's it. Leave it marked. Don't even say, "We'll come back to it later." Say, "All right," and go on to the next line. Otherwise your needle's going to get so dirty you can't assess. Highly practical consideration.

And you say, "All right. Was that ARC break caused by a communication ignored?" – you get down to that line, see? – and it goes ping! And you say, "All right. I have here that a communication was ignored. What communication was ignored?"

"Oh, well, let's see. It was Bill and me and Pete, and there were three dogs. And a spaceship landed. And the dog barked, and we said to hell with it, but if we'd listened to the dog bark – Yeah. Yeah. We ignored the dog barking. Heh-heh! Yeah." Down comes your tone arm.

You run by blowdowns. Your whole meter action is by blowdowns – your whole determination is by blowdowns. You find an ARC break for which you get no blowdowns, then you haven't got the cause of the ARC break and the pc hasn't remembered anything about the ARC break. But just because you get one blowdown isn't – doesn't mean that the ARC break is gone. At this point you say to the pc, "How do you feel about that ARC break?" and watch it on the meter.

The question is asked of the pc and watched on the meter. If you get a rough-up of a needle – the slightest reaction of a needle – that ARC break isn't gone. But usually the pc will tell you, "Well, I don't feel as good about it as I want." Then keep on with your assessments. Do you understand? But every time you find one, and you clear one up, then you ask the pc how he feels about it. Pc feels all right and it doesn't bang on the meter – to hell with it, get off of it, man. That's it, that's it.

Don't get into a situation where the pc feels perfectly all right about it and you haven't done three-quarters of your assessment sheet, so you just go on doggedly doing the remaining three-quarters of your assessment sheet. You're now trying to find the bypassed charge for an ARC break that doesn't exist. And I can guarantee that you've got the withhold of nothing. The pc hasn't got anything to tell you, so he's going to ARC break.

So the other frailty of R2H, much more important than the communication of its auditing command, is that an inexpert handling of R2H can bring about an ARC break. Very interesting.

Every time you find a line, you go through the same song and dance. You find a line, you ask him the question, he answers the question, he's got it all to his satisfaction no matter how long the itsa line is. Don't expect to do many of these a session, man. You probably won't do more than three, four, five a session. But boy, the tone arm action you can milk out of that thing – wham, wham, wham, wham, wham. You can get lots of tone arm action.

Why recall ten and get the same tone arm action as you do get recalling four, and still leave the pc with some missed withholds? You get the idea? So you just want tone arm action out of it, not the number of ARC breaks handled. See, you're not interested in the number of ARC breaks handled – just handle those you get well. Every time you find a reason for it, you'll find a tick, and the pc will give you the answer, and you've now got that.

Now, you don't even necessarily test that line again. You can drive a pc berserk. He's now satisfied. He's found it, and so forth.

Now, you may suspect, from the doubtful nature and the fact you haven't got a blow-down, that there is another tick on the same line. Just say, "Well, I'll check this line now. In that ARC break was a communication ignored? You know, that still reads. Do you suppose you had – know any reason why that should still be reading?"

"Well – no, I don't see why it should be reading. Maybe I protested."

"All right. You protested it, that's all. That's all I wanted to know." Down to the next line – leave it. You're not going to get anyplace shoving it down the pc's throat.

But every now and then you say, "That line still reads."

"Oh, it does? Oh, well, wait a minute, wait a minute, wait a minute, wait a minute. The – ha-ha! – it wasn't really the dogs communication. I ignored their communication. They told me not to go anywhere near that place and I did and I ignored their c... Yeah, well, that caused the ARC break with them, because they should have told me more loudly." And you'll see your tone arm blow down.

You see how it's done? Treat them like end rudiments that you don't care whether they clean up or not, and don't leave an ARC break unless the thing is reading smooth as glass. An ARC break is going to give you blowdowns. Just regard it as a source of getting some blow-downs. And if an ARC break doesn't blow down, you're now going to run into trouble with later ARC breaks. That is the way to forecast trouble. We had ARC break, and then we had another ARC break, and we didn't get any blowdown on either of these ARC breaks. Ohhh! Now, our third ARC break – our chances of our getting a blowdown on that... The next thing you know, you're getting in the mid ruds and the pc's going into an automaticity of suppressing ARC breaks, and we've got a sort of a mess on our hands. Why? Because we excited some bypassed charge by asking for the ARC break and then didn't clean the bypassed charge.

Now, the whole basic mechanism on which you are operating here is that incidents will blow if the misaligned or bypassed charge is knocked out, and that an ARC break is caused by bypassed charge. There is no ARC break without bypassed charge. So therefore you must find the bypassed charge, and if you do, there won't be any ARC break. And it straightens the bank out, and the guy gets oriented in the middle of his bank, and there you are.

It's a terribly permissive process. It depends on the itsa line and for that accurate assessment, and then, having found what the thing assesses, let the guy run on.

And it also depends on not to keep slugging him with assessments for ARC breaks that have cleaned up. It has a frailty. You can get the whole ARC break cleaned up, it doesn't seem hardly worthwhile. And there was a reality rejected, and you got a ping on that – it wasn't a very big ping – and he answered this thing, and we asked for the ARC break, and he didn't have much of an ARC break – but now we went on and did the rest of the assessment. Oh, you've got an ARC break now. Why? You've invalidated the reason which he gave for the ARC break.

Takes rather delicate, slippery auditing. But with those reservations, it's absolutely terrific. It's a fabulous process. Terribly mild, terribly permissive.

I see I've left you hanging on the ropes a little bit – there's probably something you don't understand about the process. But if you just did it like end mid ruds, which you didn't bother to finish if your pc got bright, then you've got it made. You've got it made. And if you monitor its success by the number of blowdowns which you get, you've also got it made. And when it doesn't blow down, start worrying. And if it is blowing down and the TA is moving and so forth, don't worry. Just sit back and ride your luck. Look for trouble when it comes, not before it gets there, because it'll carry you through all the way.

Pc wants to talk to you the whole session about one ARC break which is giving you tone arm action from 2 to 6.5, you are an absolute nut not to let him. See? It's the amount of tone arm action you can get in the session, up and down – not the number of ARC breaks you cover. Because the pc you are auditing is in, after all, present time. He is here – all there is of him is here. He isn't barred out of existence by his bank. And if you discharge all of these crossed bypassed charges off of present time, theoretically you could run him all the way to OT without him ever going backtrack to amount to anyone. He just picks up this item and that item and that incident and that incident and this one and straightens them out, and his pictures are getting better and the track is straightening out.

And the next thing you know, he's eight feet back of his head saying, "What do you want done with these between-lives guys?"

Thank you very much.

R2H ASSESSMENT

A lecture given on 8 August 1963

Thank you.

This is the what?

Audience: 8th of August.

The 8th of August, AD 13.

The figure 8 is a symbol of money. Actually, its original derivation was two money-bags, one sitting on the other. And when Pythagoras came back, why, he gave us this datum and here we are in Greece, at the apex of the newest and the best: numerology.

Oh, it's the wrong lecture hall! [laughs, laughter]

You have to laugh when you consider what man has considered knowledge to be at periods in the past.

All right. Here we are, Saint Hill Special Briefing Course. And today I have some good news for you, and this is the evolution of List One for R2H. I'm going to show you how you can evolve a List One. No matter if you have landed in the middle of Pangopango, or something of this sort, and you don't have a textbook to your name, you can evolve List One.

Now, this has really taken some doing. I don't mean to exaggerate. It'd be impossible to exaggerate the difficulties which have been connected with this. R2H is a process which – told you yesterday, in yesterday's lecture – a process with a new rationale. There's a new rationale connected with that process. This actually is the Level II process, Case Level 2. And R2H really goes into both channels, but isn't just headed at OT – this gives you your Clear way stop. Because you can move up this process, and sooner or later you're going to start seeing free needles – and that kind of phenomena is very likely to occur in running this particular process. Not necessarily with every case. Some cases are going to run so head-on into a GPM that you're going to have to shift to 3N in order to carry out that particular GPM, and then shift back to 2H. Just as you can shift from R3R over to 3N and back again.

Well, given the fact that you could shift over to 3N, and back to R2H, you're dealing now with a Case Level 1 process. This will boot them all the way on up the line. But if you are dealing with just your normal course of human events and just avoid any ideas of GPMs – don't bother with trying to clear up track in that particular direction – undoubtedly the pc will come back off the track, and you'll start getting key-out phenomena. You see how that process might very well, theoretically, branch? In other words, you keep on running the process itself, you eventually make a track that looks pretty straight and pretty clean, and gives you an appearance of Case Level 2, which is Clear, see? And that would be with the benefit of key-out

and free needle, and you probably find the phenomena, and this is probably... Because you understand, this has not been done by this process, but we have done so many of these that it's pretty easy to predict on a process line. And you would get a phenomenon which looked very like – this is just pure R2H, see? You'd get a phenomenon that looked very like a Case Level 2. However, it's a keyed-out Case Level 2. The person's whole track really isn't available to them. But it would give you all the attributes of Clear, by all of its definitions.

All right. Now, if you introduce into it the factor that when you collide with a GPM you're going to shift over into 3N, then you've got one that goes to Case Level 1. In other words, you could take R2H, combine it with 3N when necessary, and wind up at Case Level 1. You understand that this process has this branch – fork in the roads.

Now, therefore, it unexpectedly joins up with what we're calling now – and you aren't – really haven't started calling it yet – but Scientology Three. Scientology Three was more or less suspended in favor of Scientology Four. The levels of Scientology: there's been a recent policy letter out which divided Scientology up into five levels.

And there was Scientology One, that's for the public. That's your PE-level Scientology. And we're putting out a plea to one and all to please contribute any data they think is vital and necessary to be in this.

And then there's Scientology Two, which is healing, which we haven't had too much to do with. That's care of the body, and so forth. And HPA/HCA levels probably get quite a bit of Scientology Two.

And then there's Scientology Three, and that's advanced auditing, advanced Academy courses, that sort of thing, leading up to the area of Clear – such phenomena as we've had in the past. Now, it doesn't happen to be a well wrapped up area, because we jumped off of that area to go into Scientology Four. And this occasioned even some of you quite a few headaches, because there was a necessary speed-up in research, and the place to research toward, of course, was OT. Now, that's Scientology Four. And the material which you're learning right now is Scientology Four.

And then there is Scientology Five. And Scientology Five is the social, political, organizational levels of Scientology. This is a takeoff from the level of OT. And that isn't just Scientology applied to political problems. That would be a misnomer although it would read like that in a textbook, and so forth. That isn't that at all. It's actually what does an OT do about it? That makes quite a different subject, doesn't it?

So anyway, it is of interest to have picked up some of the earlier work at Scientology Three, and carried it forward to something of a conclusion. Now, you're not really interested in Routine 2H – and it probably ought to be redesignated. You're probably not interested in Routine 2H, which is by the way also applicable at Scientology Two, don't you see – some other version of it, much easier to do, something like that. You're interested as R2H applies to Scientology Four, which is OT.

Now, I want to point out to you (and this is just a side note here) that these things fit with classifications as they exist today. See, so you have a *Class I Auditor*: he can listen. And you have a *Class II*: well, he could probably cure something up and run repetitive processes

and, you know, CCHs, something like this, Reach and Withdraw. You have *Scientology Three type auditor*: well, he could make a better human being; that's the level of the better human being. *Scientology Four, Class IV Auditor*: you're heading for OT. *And Five*: we're heading for a sane universe.

So this compares with your classifications, and I think you will find that it's very neat to have the subject organized like this. For instance, you can slap onto the covers of textbooks, one right after the other, *Scientology One*: Perfectly safe issue for general public, don't you see? For instance, we have a newspaper reporter prowling around right now, and we're feeding him *Scientology One*, which of course is about all he should have anything to do with. And he doesn't know even what he's looking at, see, right now. He thinks he came down here to investigate our marriages. Crazy, you know?

Anyway, he's got a copy of Reg's book⁷ and he probably looked at its title, I hope, and he probably read something of that. We're getting this thing in some kind of order, however. We're getting this thing squared away one way or the other. He's looking for sensationalism, so we'll give him sensationalism at Level I.

Do you see? It brings a little more order to the subject. Instead of just – it's all spattered out across these lines, why, we can subdivide it into its materials. And this only becomes possible because we are reaching up at a high level of attainment in each one of these levels. We have quite a bit of accomplishment in the lower levels and we need codifications and publications; and in republishing and codifying, and that sort of thing, we need designations.

Now, it's very baffling for you to have a process which moves on up through more than one of these levels, which attains different things at different levels, and so on. And it is phenomenal to have such a process at all. It moves around. It handles the thing called an ARC break.

Well, there are many ways you could handle the thing called an ARC break. There are probably many versions of processes which you could handle ARC breaks with. So you'll probably see this material splintering off into these various levels. ARC, just the explanation of what ARC is, is Level I, you see? Perhaps specific and directed ARCs at various body parts and that sort of thing, and perhaps O/W, and that sort of thing, would constitute healing applications of ARC. And at Clear level, of course, you're trying to raise somebody's ARC; you can do some remarkable things with picking up their ARC breaks in this lifetime. It would be quite phenomenal to do that.

Well, ARC has been with us for quite a while, and the push – or demands – of ARC this high – the theory of ARC, the triangle of affinity, reality and communication – to push that much stress onto it and say, "All right, let's try to push this into *Scientology Four, OT*," – well, that's really asking for a few blown gaskets. Because it's obvious that if this much stress is put on the theory of ARC, then any slightest frailty in any scale is going to show up. In other words, you're really going to have to have the stuff there.

⁷ Editor's note: "This is life – an introduction to *Scientology*" by Reg Sharpe, published 1961

We haven't been asking very much of this, but now we're asking everything of this. And boy, some of our – not very much of it, fortunately, but there were some holes – there were some holes in what we knew of ARC. It was, you might say, insufficiently embracive or insufficiently complete to do a totality of work.

It's all right to run a machine, let us say – you can run a machine just fine and it gets along fine. And then you put more load on it, you see, and it starts to heat up a little bit and its life seems to shorten, and that sort of thing. And you put a little bit more load on it, then any bad connection or any bit of weak metal in it is going to go *spling!* You see? And that's approximately what's happened to ARC and the CDEI Scale. Now, those two things together – those two things together – needed an overhaul. And I've been overhauling these things empirically.

Now, R2H has only one frailty. And that is the list you use for the assessment. It's the only frailty it has. Given an auditor who will listen, given a meter that will react, given any kind of decent goodwill in the auditing session at all – well, the machine is pretty tolerant in those parts. You see? R2H: it'll work just fine. I mean, you can even flub it and mess it up here and there, and make mistakes with it, and it doesn't break down.

No, the point where it just breaks down absolutely with a crash would be a wrong assessment list. And if that assessment list – it could have a lot of things that weren't necessary on it, but if it lacked one single ingredient, then the bypassed charge on the case would not be located, and you would succeed in restimulating the case at certain levels, and the case would eventually move up to a stuck tone arm, because the charge would be wrongly placed and encysted here and there, and the track wouldn't straighten out. You see the liability of this?

In other words, you could miss the charge on one ARC break or another ARC break without making the case crash. That's one or another ARC break. But if one specific, very important type of charge was missing from the list on all ARC breaks, eventually that charge would overwhelm the pc, and you'd result in a good, high stuck tone arm and an ARC broke pc, and so forth.

In other words, the limit of this particular process would be the embraciveness of the list which was used. So there is the weak point of this process: the list.

So I had to sweat and fume and fuss and fiddle and overhaul and try it again and – I've had some of the fanciest systems, you know? These things would make a whole psychotherapy up at London University, or wherever they teach the stuff here in England. They would, you know? It'd just be marvellous. Whole new systems of interlockings and all of this kind of thing. Beautiful. The logic in them, impeccable. See? But they didn't work. That was all that was wrong with them. Like modern psychiatry: it's terribly convincing but doesn't work.

Now, that list with its liability of bogging a case down if an important type of charge is missing... You understand that you can miss the charge on an ARC break and then get the next one well, and then miss the real charge on the next ARC break and get the next two well, you see, and you don't ruin anybody, you see? But if consistently that type of charge is missing on that list, sooner or later your pc has had it, see?

So what is the totality of the list? What formula is it that makes this list a completely embracive list? Well, you'll laugh when I eventually show you this thing, because it's always these simple things. It seems like anybody can discover anything that's complicated. I mean, that seems to be very easy. They go out and they discover the plutons running into the neurons, and these fantastic chemical formulas that run on for eight pages and give you better lipstick. [laughter] It's these simple things. It's these simple things wherein lies the genius of the situation, you see? They're the ones that you can just take and knock your head off on.

And you come back to it, what makes a good auditor an auditor? And we've eventually broken it back to five points. And they're all fundamental points. And where you don't get auditing done in some HGC or something like that where you're supervising auditing, you watch it; you go back over those points and you'll find out there's one or two of them are just madly out – not even slightly; they're just madly out. But the reduction of auditing to just five basics is pretty wild.

Now, the breakdown of a communication cycle, and the breakdown of the auditing cycle and that sort of thing – these things are terribly simple. But it takes some discovery like this itsa line. That's... I'm sure you sat there when you saw this itsa line, and you said, "Yeah. Yeah, yeah, of course, you know. Simple."

Well, frankly, when you discover these things, you feel like a complete idiot. Very self-invalidative, you know?

It's like you've been running into this rock all the time, and you finally come back and take a look at it; you say, "Hey, it's a rock," you know? And you've never noticed it, nobody else has noticed it. There it's been! See? These are the discoveries that are something. And it's this type of discovery that finally wrapped up this other list so that it just springs engrams, you know, bang, bang, bang.

And you could put any kind of significance you ever heard of and you might still miss it on this list, so I better give you the formula of derivation. And this is a derivation formula. I'm going to give you the full derivation formula. I'm not going to give you any little short-handing of it. You, by the way, don't use this full formula in making up List One. But I can show you a very trick system by which you could employ it without assessing forever, see?

Now, it works like this: The CDEI Scale has an upper and a lower band. And it was on this band that we all fell down. Now, here's your CDEI Scale: Curiosity, Desire, Enforce, Inhibit.⁸ You're very well aware of the CDEI Scale. But that's only a piece of the scale. Now, we only needed that piece to do everything we've been doing up to this time. And the missingness of the remainder of the scale was not something that destroyed empires. But when we run into something like R2H and ARC breaks, if we haven't got the whole scale here, we're in trouble.

Well, what is the whole scale here? K, U – Know, or Known, and Unknown. Well, look, let's look it over. Let's look it over. What about that Know? Well, Know is already – you had to postulate you didn't know up above it, but that isn't unknown yet. See, the Not Know

⁸ [Editor's note: Starting at this point in the lecture, Ron made diagrams of some of these points. These were issued in HCOB 14 Aug. 63, "Lecture Graphs," which can be found in Technical Bulletins Volume V.]

goes up above this. The basic four-postulate stuff is already in this stuff, and we don't happen to need that because that simply measures case gain. This we do need: Known, Unknown. Why does that fit in? How come?

It's elementary, my dear Watson. You never get curious about something you know about. [laughs] I mean, it's these damn fool, idiot things, see, that... So knowingness must have disintegrated, because we know as a case progresses its knowingness rises. So as the case progresses, its knowingness rises, and therefore we must be running out unknownnesses. And this tells us that things have to be unknown before you enter into the CDEI Scale at all. That gets to be very interesting.

And you'll find out a very, very interesting part of ARC breaks is the unknownness. You know, the unknown datum – we've even got it in our early Logics. An unknown can cause a confusion, and so forth. And there's obviously where that belongs. So that's part of your CDEI Scale, oddly enough, which is a scale of the way one looks at things.

But that isn't the complete scale. I'm sorry to have to get into this thing any further. But what's that? That's nothing. Nothing. That belongs on the CDEI Scale, believe it or not: nothing. It's neither known nor unknown. There's nothing there to inhibit, enforce, desire, to be curious about, to be unknown or to be known. There just isn't anything there. And that is pretty obvious, too, isn't it? In fact it's an idiotic obviousness. It's just an absence. That's all. You're not – you haven't got something now to inhibit.

That's the black panther mechanism. And you feel more idiotic about this thing appearing on this thing when you realize that it's in Book One. It's the black panther mechanism: ignore it; do nothing about it. It's just a no-action level. Pretty grisly. It doesn't mean no ARC. We're not into ARC yet. This is just, well, you can inhibit things – well, how about just doing nothing about them? Just nothing? Well, of course, that's one of these "of course" mechanisms, because man routinely does nothing about things. That is one of his best mechanisms. In fact, no government on Earth could be the way it is if they didn't specialize in this one. Do nothing about it until it's too late or something of the sort, which is again just doing nothing about it.

All right. Well, that's fine, but is there anything else on this scale? Well, unfortunately this is the one, man; this is the one that broke the camel's back. This is the one. We've talked about it. We know it exists. We've had it around. I mean, everybody knows about it. But we know all about it and so we've never defined it.

But the basic part of this one was designating it. Finding some word that designated it that would communicate – that would communicate. And it's F: falsify. And after you do nothing about it, there's nothing there, you can falsify. You're not inhibiting something, you can falsify it. You're not doing nothing about it, you're falsifying it. But of course that puts something else there. So it tends to turn the whole scale up here again in an inversion.

See, after you've gone down this whole scale, how do you start it all over again? Well, your K at the top, Known, becomes False. And then of course, you don't know about falseness, and then of course you're curious about, you see, the falsifications, and so forth. And this scale then turns round and round on that basis, but it's just the same scale now. It now hits

level after level after level after level all the way down by just running this one point. So that's what makes the scale invert.

So it's a probability in this universe that you almost never see the K. The whole scale probably lies below F. That part of the ARC scale, then, which most people are working with, and so forth, are below F. So you see, as you go downscale, it requires all of those primary designations to bring about lower harmonics. You see what I mean here?

Let me give you an example. Let me give you an example of a tremendously involved scale: K – we'll do this very small – K, U, C, D, E, I, O, F, U, C, D, E, I, O, F, U. See this? See what's happening here? See, there's your whole scale. Got it? It goes on south. Perversions of perversions. Falsifications of falsifications. Don't you see? You finally get modern science – you go far enough south – all based on a false premise that man is mud. You see, something like that, and then you can go all the way, see? You get this now? Well, that's how that thing inverts.

So, there is it. Top, K, U, C, D, E, I, O, F – Zero, F. It's not an 0; it's a zero. Probably better be spelled with a Z. And that is a complete band. And it takes each one of those levels to make a complete band. And as long as we only had the CDEI Scale, this was very pure and very upscale, but we couldn't deal with aberration. We couldn't deal with the raw aberration of an engram, because we didn't have enough lower inversions, because the scale wasn't complete, so we couldn't invert it.

There were more things in each band than we had, and the things that were missing was Known, Unknown at the top; and down at the bottom, Zero and False. And there we have a total cycle, you might say, of the scale. Now, again I show you, that cycle can turn over again. Instead of Known, now, you have False, so it goes down to – you unknow falseness, you see; you're curious about falseness; the desire of falseness; the enforcement of falseness. You see? And then you get down – the inhibition of falseness, and then no falseness, and then you get a falseness about falseness. You see that? And you just keep on adding this up and you will get more and more and more and more involved lower levels.

I see you're sitting there a bit stunned. Now, what don't you dig out of this? What do you see there that you don't understand? Seemed to me to be perfectly obvious. [laughter]

You're looking, by the way, at only one band – when you look at the full scale like that, you're looking at only one band of the old Tone Scale. That's shown up: You can take *Science of Survival*, the old Tone Scale of one kind or another, and let's take one band. Let's drop down just one band. Let's go from 1 to 2. Let's just take a look at that. Let's say 2 to 1. And you're going to find all those levels between 2 and 1, and they'll be at some harmonic or another of the upper levels, you see?

Now where a pure – a pure scale – call it the CDEI Scale just for lack of a better term at this particular time – is so unimaginably high that it's probably never envisioned. It's terrifically high. And most of the scales that we see, and so forth, are already with falseness at knowingness. See? It's a false, a false, a false, a false...

Look what they teach you in school. George Washington never cut down any cherry trees, because he was an Englishman and they are orchard men, or something. You wait.

You'll just see that legend go along far enough and it will become *blong*, see, and it'll go down another one, see? Very interesting.

So all truth or actions or data or almost anything else goes down this CDEI Scale in that fashion: Known, Unknown, Curious, Desire, Enforce, Inhibit, Do nothing, Falsify. Do you see that now? All right.

Here we have our old friends, A, R and C. Nothing to this. Here you have ARC for the incident, and here you have – that's for the incident itself (now we're getting into R2H) – and then we have earlier incident. Got it? And we have A, R and C for the earlier incident. We've got it for the incident we're working with, and we've got it for an earlier incident. See? And you just do this: And each one of those levels has six. We have them for the incident, we have them for the earlier incident. Got that? And then just for fun, in case they didn't get the word, and so forth, on each one we put – this is for the purposes of really getting the thing scatted into sight – we put a missed withhold. And over here, of course, it's an earlier missed withhold.

That's your List One. Let you digest that for a minute. That's List One. Now, that's actually all possible levels that will have any reaction on anybody about anything. That's an ARC break laid out, man. Each one – Known, Unknown, Curious, Desire, Enforce, Inhibit, Do nothing, Falsify – each one of those levels has eight questions. Each one of those levels has eight questions. And those eight questions are the incident attitude, communication, reality – see, the attitude, reality, communication and a missed withhold. And then, is there an earlier incident with a bypassed charge of the attitude, the reality and the communication and the missed withhold, see? Put the missed withhold in there just for kicks. You'll find out it's a bucketload of stuff.

Now, that's a full list. Now, you can add that up mathematically. There are eight questions. You can count them up: there's one, two, three, four, five, six, seven, eight. There are eight questions for each level, and there are eight levels (and that chimes into my gag about the figure 8, beginning of the lecture), and you have eight times eight and that gives you sixty-four questions. And that's all the questions there is. That's a total List One – would consist of sixty-four separate questions.

Do you see how to evolve this? I'm teaching you how to evolve it. I'm not trying to give you a list. There's somebody sitting back there saying, "Well, he's going to give us the list in a moment," and so on. That isn't what I'm going to teach you. I'm teaching you how to evolve this thing. I'm assuming that you're on Pangopango. You have collided one way or the other with the wrong asteroid or something, and you're trying to put Scientology back together again and run some R2H on somebody, and there you go. How do you put a List One together? And there is your List One. Very important thing.

Sixty-four questions. I actually, at this stage of the game, don't care what you do with the sixty-four questions, you see? It's just, there is the totality of all possible combinations of an ARC break charge. That's all the charge there can be on an ARC break.

Now, you can dream up a whole bunch of additional ones. Oh, you can dream up additional ones madly. I don't care if you do, maybe some of them will communicate, maybe some

of them won't. But they will actually come back to this one. And they will not be central charges that really are bypassed charges to amount to anything.

Now, this list, this list with its sixty-four questions, gives you very interesting application possibilities, so that you don't have to assess sixty-four questions. Well, let's assess the CDEI Scale first on the incident, and then take the biggest read on that, and then move that sideways onto its eight questions. So that leaves you with a totality for assessment of eight and eight – sixteen questions. I'm showing you there are trick systems by which you can break this thing down.

In other words, you figure out some communicating name, see, for each one of these things. Well, for instance, Enforce, you put "too much." Right now you're using the Inhibit Scale all the time, all the time. An attitude refused, you see, a communication ignored: that's really your Inhibit Scale – and an unknown this and an unknown that, and so forth.

But you can say, "Was there something known about the incident? Was something unknown about the incident? Was there some curiosity about the incident? Was there some desire in the incident? Was there an enforcement in the incident? Was there an inhibition in the incident?" Or you can – Enforcement, you say, "too much something in the incident?" "Was it a nothingness that upset you in the incident?" Or "Was it something that was falsified?"

Now, one of those things bangs, and you've then got your standard scale, which of course... You could put it on separate little cards, and it's written up specially worded for the level it comes from. See? "Did that incident have an unknown attitude? Did it have an unknown reality? Was there an unknown communication? In that incident, was that a restimulation of an earlier unknown attitude? Restimulation of an earlier unknown reality? Restimulation of an earlier unknown communication?" Restimulation of earlier missed withhold, of course. The missed withhold questions are always the same. Not "an unknown missed withhold," see? It's just "Was there a missed withhold?"

Now, that would be quite a remarkable system. And you'll find that system would work. That system would work very well. But it doesn't happen to be a vital system to what you're doing. It isn't vital that you do the system that way, because a whole bunch of these levels are null. That's interesting. They don't have significant charge on them. And under the heading of significant charge you can cross off K, U, C, D, E, leaving you with I. You can cross off Zero. And F – you can leave F.

Now, if you're just going to do a short list that'll serve you in good stead, then the only thing you're really going to leave on the list to amount to anything at all is I and F. Those are the most pregnant sources of ARC breaks.

They upset people! Which gives you a sixteen-question list.

I'm showing you different ways by which you can handle this situation. See, I'm not giving you that as a recommended action, I'm just giving you different ways by which you can put together this same scale, see. You can find out... And that's the truth: You'll find out that for this lifetime, certainly, I and F – they cause nearly all of your bypassed charge. It's because of the case level you're dealing with, don't you see, and it's monitored by other fac-

tors. That leaves you here with I and F and nothing else that's going to worry your pc, at least in the beginning stages.

Then after a little while you're going to find your list starts falling short. There is something going on here now. The list starts falling short and so forth. And you'll find out that you have to add "too much" – "too much attitude," see, "too much communication," "too much reality," "too real!" And you could expand it right back on out again, and you start processing somebody around Case Level 2, that has actually attained Case Level 2, you're going to find yourself with a greatly fanned-out list – greatly fanned-out.

I'm just showing you there are various ways by which you can put this thing together. Now, you can probably scratch your head and get into it and develop yourself quite a fancy system of identifying the type of charge and assessing that particular type of charge. Only thing I'm trying to put to you is the fact that if you've got something missing on List One, you've had it, because that tone arm is eventually going to go up and stick.

And I don't say yet that somebody three quarters of the way up the line isn't all of a sudden going to run into a type of charge which isn't there in his estimation. And as you go on down the line, of course, the lower a case is, the more complex the case tends to be, and so you're going to have to probably include "emotion" instead of just "attitude." That'd probably have to be on your scale.

Now, the only thing that varies the scale, however – this is your basic and fundamental scale – the only thing that varies this scale is the communication of it to the pc, this particular pc at his particular state of case. You say, "Was there a false communication?" The pc is very odd indeed, very low scale or very high scale, he may only interpret this as a lie. A lying communication, see? He immediately interprets it over. But it's good enough, ordinarily. False communication. A false reality. A false attitude.

If you don't think false attitudes aren't in the keeping, the most popular textbook on the handling of your fellow human being is Dale Carnegie. And that's a full textbook on how to create and maintain false attitudes and realities.

Psychology actually hasn't even come up to being able to maintain a false one. That gives you how... the prevalent popularity of some things, and gives you this.

Look at the newspapers people read. You don't think there's very much true in a newspaper, and so forth, and yet newspapers sell a lot of copies. Well, so where must they be on the ARC scale? Where must they be? False attitudes, false realities, false communications. But how false?

Newspaper goes even falser than false. The newspaper takes a false scientific fact and then falsifies it. And that's why I drew you that other picture there, so you could show the harmonics that that thing goes down on. You can get into the falsification of the falsification of the falsification. It's like trying to handle some of these trillions-ten that you run up on some cases.

I don't know how we're going to handle that. That's one of our big problems. Pc is sitting there trying to count the number of trillions you're saying so he knows whether or not it's

the right date, you know? You start holding your hand up, so that it's trillions-five. But look, you only got five fingers, you need the other one for the E-Meter.

Now, there's your full scale. There's your full scale. There isn't anything more, really, that can cause an ARC break, because this is the full lay-down of life. The communication of this to the pc may cause you to make some ramifications of it, but you can abstract these ramifications from this scale.

So you got a new CDEI Scale which had to be expanded for its usability. Now, that's empirical. That doesn't necessarily fit in with anything, it's just what is there. What is there that is significant to a case. And that's Known, Unknown, Curious about, Desire, Enforce, Inhibit, Do nothing about, and Falsify.

Now, there's some question as to whether it ought to be Zero and then F, you see, or F and then Zero. Because you say, "Well, even a lie is some communication." I think you're splitting hairs, because you'll find ordinarily that a falsification is worse than no communication, ordinarily.

Now, plotting that sideways – remember that your basic scale on all of your List Ones consists of affinity, reality and communication, and a missed withhold for the incident. And then for earlier – not even earlier incident, just earlier – restimulation of an earlier attitude, reality, communication, missed withhold. See, that's an earlier missed withhold. And missed withhold would actually only have to occur – if your big scale is out, it reduces the number of questions slightly.

Because you're simply repeating the thing if you break this down into separate cards. And that's there because – and you break it down into separate cards, for God's sakes, don't omit the missed withhold. Because this is a peculiar communication of the same thing. See, it's a didn't communicate, you know? And also could falsify a reality, and also change an attitude completely, don't you see? But it's a peculiar little mechanism; it's asking, in essence, "Was there a bypassed charge?" But it speaks normally, "Was there something you didn't say or something which you were consciously withholding?"

Now, if you went and expanded this out and out and out and out and out, you would get yourself into trouble. If you say you're going to put a missed withhold on there, then why don't you put an overt? Well, you don't put an overt because it mashes engrams. You start running O/W in the middle of an engram and you can get the pc in more energy soup than you've gotten him in for some time. There are too many GPMs, and there's too many this, too many that. And the effect of the bank is that if you run the eighteen buttons of a Prepcheck, or the handful of buttons that we constitute now the big mid ruds, or even the old little mid ruds, about and into an engram, specifically, you see, that thing will mush. It'll fold up. And you won't have a picture. See? An overt, and the big mid ruds particularly, run directly against an engram, can cause that engram to fold up into so much oatmeal. The energy structure of it breaks down and it no longer is able to hold its constituents, see, and who can tell what's in it.

So you don't do those things against engrams or secondaries. You say, "In that ARC break, has anything been suppressed?" Well, you might get away with that one, you see? "In that ARC break, is there anything you are careful of?" Uhhh, *du-du-da-da-da-oooh*. "Fail to

reveal" – perfectly all right. "In that ARC break, has anything been invalidated?" *Uh-uh-uh-uh-uh-uh-uh!*

"In that ARC break has anything been suggested?" *Oohhh!* Pc will be going "...What's happened?"

Because frankly, you're using 18-inch naval cannon to shoot rabbits. The buttons are just too fundamental. They're just too powerful. I did far, far too good a job in designing the big mid ruds and isolating those buttons. You could never say, "On the reactive mind has anything been..." Apparently it takes just so much aberration to hold a picture together so you can run it. Anyway. They go back too early, and they're too powerful.

But these, these buttons – they don't do anything to the picture but strip off and disconnect the charge and realign the thing. And it's a very smooth operation indeed, the way this happens.

You're essentially, in R2H, trying to make somebody's pictures better. That's what I'm trying to call to your attention. It's all right to say, "Since the last time I audited you..." you know, big mid ruds, and "In this session..." big mid ruds. Don't worry too much about that. But, "On that ARC break..." big mid ruds – oh, no. In other words, you can run against the physical universe in its near-up environment. Right now you can run all the big mid ruds you want to.

"On that plank," see, "has anything been suppressed?" This is the same thing as, "Since the last time I audited you has anything been suppressed?" Still got the whole physical universe around you, and you're not going to get this pc to knock the physical universe apart by running the big mid ruds buttons – at this state of his case. There probably gets a point in his processing as you get up the line where you'll no longer be able to do this safely. "In this auditing room has anything been suppressed?" *Cre-e-eak!* Ghosts, see?

Now, the point I'm stressing here is that the list has another importance rather than its significance, is we don't want the list to be too beefed up. See, the list, instead of missing some levels, could use some buttons we know about in Scientology that would be totally destructive of the goals of R2H. Boom! See? This guy all of a sudden is covered with white energy, or something of the sort, and mashing engrams, and everything is getting blah, and so on. So there are things you don't want on the list. It isn't really all right to just anything you dream up, put on the list, see? You can go quite a ways.

I've tested out nearly all of these various variations of the thing, and they're actually not necessary. "Was anything misunderstood?" Well, that's covered, of course, in your Unknown level. "Was any earlier misunderstanding?" and that sort of thing. And you know, I've had those on lists, and I've never seen them significantly be the cause of bypassed charge.

You'd think No Communication would be terribly important. Well, it isn't terribly important till you start walking up into engrams. The guy was in jail for a million years. What caused the ARC break? There was no communication. Shortly after he was locked up they had a war and he got killed – the jailer got killed, and they forgot to shut the power off and forgot to let him out. ARC break – no communication.

You'll find that this steeps up the line. But frankly, in usual running of cases and so forth, you'll find you won't need it.

Now, this is the woof and the warp of how you put together a List One. This is the formula by which you put together a List One. This doesn't necessarily give you a List One that you promptly and instantly should sit down and audit your pc with madly. There are too many ways you can put this thing together.

Now, the *preassessment* of List One probably itself could be done with a shortened number of CDEI points, see? Just take out those that ordinarily wouldn't fall, and leave about four in. See? Leave about four in. And preassess. "Was that ARC break caused by an unknown? Was it caused by too much of something? Was it caused by too little? Or was it caused by an absence? Or was ... ?" You know? Any way you want to chop it up, see? But you for sure get False in there, and you for sure get Inhibit in there, see, because that's where those ARC break live. And you start running heavy engrams, you'll find out, sooner or later you're going to need Zero.

Also, somebody can be found holding on to a death. Now we're starting to run heavy stuff, see? Somebody runs a death. What's wrong with this death? Why is it in restimulation all the time? Well, he never could find out who shot him. That was the ARC break. Never could find out who shot him. Bullet came out of nowhere. It was a beautiful day in spring, and he was sitting on the lawn of the Ladies' Aid Society building in Des Moines, Iowa. There he sat, and he was suddenly hit with a rocket blaster! Cause a fellow to think for quite a while!

He's liable to keep that engram in his hip pocket and look at it every once in a while, wondering if somewhere around the edges of it he hadn't gotten a picture of who shot him. Wrong place, wrong atmosphere, wrong mood, you see? And with an unknown in it. It's pretty certain.

You see how you can do this? Hm? All right, what don't you understand about that scale – why what is there? Is there anything in it that you don't understand why it's there? Hm? I see you all frowning, but I don't see you cogniting on anything. It's just too formidable; is that what's wrong with it? Or is it too – as I told you a little earlier – too nonsensically simple? It kind of strickens you with its simplicity, doesn't it?

Well, I've been overshooting this confounded scale and overshooting it. I've had some of the fanciest examples of this scale you ever saw, and assessed with them, you know, and so on, and just assessed with them, man, and gone clear on down to the end of the list, and TA remains high and the charge isn't on the list. That's how this scale was formulated. Total empiricism. What is it? What is it? What is the missing charge? What is the missing charge? And I knew it didn't have it. Well, I finally managed to get around and found out that we were not missing charge, and so forth, so we obviously had it. And the last one on the list was F, False. And that is what a thetan mostly objects to. That is one of his heaviest buttons: a false communication. He himself feels guiltiest about uttering a false communication, or abetting a false reality or a false attitude. Under this heading, you could say, "Well, we should have a line that says 'Was there a betrayal in this incident?'" you know? Obviously that'd read, but unfortunately it doesn't respond, because a betrayal is actually just a falsity.

Betrayal. There's a big sign says Ice Cream Cones Free Inside. And so you walk inside and there's this cage drops down and the machinery grinds. See? Well, what on earth is every theta trap on the track but a false representation? Falsity. It's the one thing that aberrates a person, because his level of trust with the physical universe drops, you see? He can't trust the very reality he's looking at; in some way it's been falsified. And so he begins to ARC break with the stuff.

So that was a key button. And the funny part of it is I expressed that one time as "twisted" or "perverted" and you know, it didn't assess. Didn't communicate. Didn't even vaguely communicate. "Perverted communication," "twisted communication," "altered communication" – these things just didn't communicate, till I finally got down to "a false communication." And man, you'll find out, I think, that communicates.

The pc you assess this on or the pc that you run this process on, naturally, here and there, has to get a reinterpretation. You say "missed withhold." Well, that communicates to thee and me, but does it communicate to the pc you're running, don't you see? You say, "Is there something you were holding back? *He-ho!* Was there a kept secret?" That kind of thing. "Was there a kept secret in the incident?"

But it's actually senseless to give you all possible wordings of all possible questions. See, that's senseless, because that you can't work with. All possible wordings of all possible questions is just a gobbledygook. One ARC break: you assess a dictionary. One of these Webster dictionaries, you know? Complete with obsolete words. [laughter]

So, therefore, therefore, I've given you the basic formula of assessment, and that formula of assessment is you take each level of the old CDEI Scale – now expanded to K, U, C, D, E, I, Zero, F – each element of that, and you move it over here into that.

Now actually, each level only has six, but if you put them on different cards, you have to add your missed withhold in the incident, missed withhold earlier, which gives you a basic list of eight. Your basic list of eight – you must never get less than eight. And by putting that over, you can do all sorts of things. You can preassess. You can bobtail the number of levels you're going to have. You can do this and that. But still, the least I can do is give you the absolute, complete list.

So for each one of the K, U, C, D, E, I, Zero and F, we have the possibility of affinity, reality, communication, and a missed withhold in the incident, and then an affinity, reality, communication and missed withhold in earlier incidents, or earlier charge, something like that. And you can make up one of the fanciest little wheels you ever wanted to see.

I imagine you can take this particular schema of some kind or another, and you can draw up dozens of different systems by which this can be used. And you can certainly draw up dozens of different wordings. For instance, right away you're up against at A, attitude. "Was there a Tone Scale...?" That doesn't communicate, see, but that's what we mean. Affinity. Person says affinity, well, it must mean love. You know, bang. You know? But those semantics are for your delivery to the pc, so one of your basic breakdowns is you say "attitude," and then you also say "emotion."

Now, you realize you could break that down further and put "effort" in there. You realize that the whole Know to Mystery Scale can go under A.

I hope you recognize that. See? The whole Know to Mystery Scale – and they're all part of that A. Or you could have symbols, and so forth. You could get mighty fancy. You just substitute it for that. And you start getting that fancy, however, you sure better develop a system of pre-assessment to get it all sorted out.

Now, I have one correction to make in R2H. I have led you to believe – I have led you to believe, erroneously perhaps, that the best system was to clean every level. That is in actual fact the easiest-to-audit system which gives you the least dirty needle and does not necessarily release the most charge from the case. And I thought I'd better give you a slight addendum to that. Because if you can skitter down a list rapidly and pick out the major charge, the biggest read off of that list, and bang that back at the pc, you're getting more tone arm action per minute of auditing time, you see? Which gives you then, if it can be done, the *best* system. That doesn't necessarily say that it is the most doable system. You got that?

Now, some pc who drags the bypassed charge through the remainder of the list every time you touch any charge at all – you get into endless difficulty, if you try to assess the whole list and take the biggest read and give him that, and have him explain that in full with the itsa line in full, see? That gives you the most tone arm action per minute of auditing time, see? Obviously, because you get the blowdown right now, and so forth. But if you run into too much difficulty doing that – and an auditor who is having difficulty at all with a pc, or a pc who is having difficulties coping, a needle that is hard to read, a meter that is hard to read, and all these things are quite usual in auditing, you see – you treat it like end rudiments. Treat it like end rudiments and clean it up all the way down.

But in any event, no matter what system you use, you have to be satisfied.

Now, there's a liability to treating it with end rudiments that I must inform you of. I say this is the easiest for the auditor to do, and is very often the most easy and comfortable on the pc because the pc is, after all, sitting there all during the rest of the assessment – by the time you've bypassed the bypassed charge the pc maybe – almost have steam coming out of his ears, you see?

As you go down this list, you can, by treating it like end rudiments (this has a liability) destroy the major read, because you've bled the charge of read already, and all you get is a slight hump of the needle as you go past this thing. You don't get the major charge that is going to give you the blowdown, reading with a good sharp *tsk*, see? You don't get that. Instead of that, it now, when you meet up with it, simply puts a hump on the needle.

See, because if you took it without bleeding the ARC break of any charge, the ARC break has got enough charge in it to give you a good sharp read. But if you bleed that ARC break down by taking every tick of it off, why, you're liable to get to a situation where the meter is very difficult to read, because it's just a slow or a speed will become the major charge.

So if you're going to do this rudiments system all the way down like rudiments, then you also have to take those slows and speeds. So it gives you a new problem in reading the meter in return for having solved your dirty needle. You get a new problem.

There are many ways by which to do this. The way that gives you the most tone arm action, that you can run, that the pc will sit still for, is the way to use – obvious. Obvious, that's the way to use.

Now, if you've got a preassessment on this particular list, and you could preassess, and move right in on the hard charge – see, that is the list, bang! – it's rather brief assessment, don't you see? And therefore it goes *powie!* see? You just go right on down the line and get your biggest read, *bow!*

And you say, "That's it. What is it?" And the pc has to figure it out and give you the itsa on it and be perfectly satisfied with it. And you'll see that tone arm go *pow!* and down she'll come, see? You're all satisfied with that one. That ARC break doesn't read on the meter. Up goes your next one. "Recall an ARC break"; your tone arm starts up with the whatsa – the whatsit line. And do your assessment. Get, of course, your "What was it? Where was it? When was it?" Get your assessment in on it. Get that charge. And you'll see that tone arm, *pow!* It'll come down again as soon as the pc picks it up. And you'll get a tone arm which is moving, moving, moving, moving, moving, getting looser and looser and looser, if you do it that particular way.

Too shortened a list, too abbreviated, so as to miss the principal charge, leaves you with a high TA. In actual fact what happens is charge moves the time wrong in an incident. The incident is all charged up because of something that happened in 1912. So the charge of the incident is in 1912, the incident is in 1920. Wrong date.

Now, if your List One does not specify that charge, you of course are going to miss the 1912 charge, and the incident will continue to look to the pc like 1912. It's very interesting. Your TA will get higher and higher and get stickier and stickier, and the thing will eventually go over the moon, and you'll have it riding up here at 5.25, and R2H is working less and less well, no matter what you dooo.

Well, actually, you're restimulating charge which you aren't picking up, and the inevitable fact when you do that is the pc will get harder and harder to audit and eventually he'll ARC break, just on the diagrams I gave you concerning the itsa – the whatsit and itsa line.

Want to make one little more remark to you. That's all there is about that. I hope you can evolve one of the things. Okay?

I want to make one other remark to you. I thought of a process. This is just research, see? I thought of a process by which you could possibly see a tone arm pump at your will. See? You could probably see it go. You say, "Recall a worry" – see, whatsit. Because a worry is obviously whatsit, like crazy! See? "Recall a worry. What was it about? Recall a worry. What was it about? Recall a worry. What was it about?" You'll be able to drill your tone arm up and down on a pc with that particular type of process. It's not particularly therapeutic. I'm just showing you, here's a way to make a tone arm actually work for you so you would see the whatsit – itsa line in complete operation, providing you let the pc tell you what it was about.

Now, I can show you how to get a tone arm high and keep it there: "Recall a worry; recall a worry; recall a worry; recall a worry. That's all right. Don't bother to tell me what it is. Recall a worry..."

The other thing you're going to worry about, and I already had some questions on it: You've probably audited a pc one time or another that got very good tone arm action but didn't get any better. This is a possibility that you may have run into. Let me call to your attention something in that bulletin that came out there, is tone arm action, if present, will take the pc eventually to OT. But let me point out the word eventually, and even later in that bulletin it says, "even if it takes thousands of years," you understand? You understand?

You're at least getting somewhere if you have tone arm action, is the only point I'm putting across. Well, what is the expectancy? Well, that's pretty long. You have to run the right significances. Very often you've got a pc who is getting tone arm action all right, tone arm pumping around. You may have changed the process right in the middle of the tone arm action. See? Well, now you've got a whole bunch of new charge without blowing the old charge, and the pc is going to go on feeling very uncomfortable while getting better. Charge is coming off, don't you see, but the specific thing that you were after didn't happen with the pc.

The way to analyze something like that is, what did you consider "better"? And how long did you just sit there and let the tone arm waggle, without chipping off new charge and throwing it into restimulation on the case? Of course the case was getting better, but a case can get better comfortably, and a case can get better very uncomfortably, and a case can get better insufferably bad off. That's right. You start running screen implants – stuff that's been restimulated on these screens in the between-life area, you see? You got a tremendous quantity of track back to the last date that has never been restimulated by the screens, see? More modern stuff is not screen-restimulated. You get back earlier, and you'll run into a span where you've got screen-restimulated engrams. And my God, they've been restimulated every sixty or seventy years, don't you see, for the last ten thousand or something like that. Every time you died, you got that particular set of engrams beautifully, gorgeously steamed up. And man, you get in and you start to run them today, you get tone arm action, but you just wish that you just hadn't started it in the first – why not just go up through the between-lives area again and get it all over with.

You're getting tone arm action, but getting better is not how the pc feels. See? It's whether he's making more progress to more knowingness and more ability. Also, his current state in auditing is not a measure of his getting better. He can have a beautiful memory, hit the between-lives area and his memory goes *blorp!* He's getting better. He can't remember a thing. But he is closer to being able to remember everything. You understand?

So you can put certain things into restimulation in a case that bring about temporary conditions on the case. And they're pretty ghastly sometimes. And sometimes they're not well taken care of, and they stay that way for quite a while, and then one day they all blow out.

You've got to review a case over a period of the thirty days. You've got to review a case at least over the period of an intensive, or the period of thirty days, or something like that. I had an example of that the other day. I was thinking about organizations and Dianetics and Scientology. Matter of fact I was giving an auditing session, and a bunch of data was

coming up that spanned that period. And you know, I was absolutely amazed. I had never taken a look between the improvement of 1951 and 1963 and its interim states. You know, I mean just – you know – what were we doing then? What were the organizations like then? What were our communications like then? Wow, you know? I thought, "Good heavens. At this rate of speed we're going to take this planet over practically tomorrow!" It's true, too. We are.

Thank you very much!

AUDITING TIPS

A lecture given on 14 August 1963

Okay, well, how are we today?

Audience: Fine. Great. Good.

I'm getting into the medical scene, I'm swapping terminals. How are we today? Nurse, get the bedpan. [laughter]

Well, you should be having a demonstration, of course, today. But, there's a lot to – of ground to cover one way or the other, and I'll try to give you some helpful hints in auditing which will make up for it.

First and foremost, this is what?

Audience: 14th.

Fourteenth August – you surely keep my time track nice and straight, thank you. 14 August, AD 13, Saint Hill Special Briefing Course.

We have a lecture on auditing – style, kind, type, how do. If you must audit, why, audit to a gain. The customer is always right. I mean, the preclear is always right. It's true. The significance – the significance is less important than the TA action. TA action on the right significance brings about faster clearing. The benefit is in the word "faster." The right significance and no TA action equals no case gain. Keep the itsa line in. Get TA action.

When training an auditor, get him to figure out how many ways you can cut an itsa line. And maybe dawn will break. The smoothest auditing is the auditing which least cuts the itsa line. "Auditor" means "listener."

It takes a lie to hold aberration in place. Serious aberration surrenders easily. It's the mediocre that takes the long haul – mediocre type aberration.

The primary difference between Scientology and psychiatry is that psychiatry is authoritarian and tells the person what's wrong with him – often introducing a new lie. Scientology finds out what's wrong with the person from the person. And then knows more about it than the person – but listens anyway. Listening is the badge of superior knowledge. He who has superior knowledge is privileged to listen. It's only he who has no superior knowledge that talks all the time – Confucius.

Now you got these maxims, and pearls of wisdom? In actual fact, with that data you could go straight out and evolve all of Scientology – just like that. It's remarkable, isn't it?

But, you mustn't in actual fact discount – just because it's discounted to the pc – you mustn't discount the backbone and body of knowledge of Scientology. Soon as you tell some-

body that he's lived for the last thirty trillion years – of course, thirty trillion years is a drop in the bucket – soon as you tell somebody he's lived the last thirty trillion years, and so on, he's liable to be hit with a feeling of unreality.

That unreality busily boils off. But he natters while it's being boiled off. How it's all unreal, and that sort of thing. Well, he's actually running off unreality and you shouldn't pay much attention to it. Remember, he's now talking about an unreality. And he never talked about that before. And in the process of talking about it he actually is raising his ARC with whatever it is. Even though he may do it very slowly.

Now, there are two kinds of talk that a pc indulges in – two kinds of talk. Talk one is theta talk, and talk two is entheta talk. It's theta talk that brings you out of the woods with a pc. And the entheta talk is the symptom of an ARC break. So auditing actually divides down into two actions. Is getting theta talk out of the pc, that's one action. And that's keeping your itsa line in, because it's the theta he's generating that's blowing his bank apart, you see?

And the entheta talk is handled by locating the impeded charge of theta which is barred in the bank. We call this bypassed charge. In other words there's two actions here. One, you can let him talk, and keep his attention directed indifferently, sometimes, but keep it directed in the direction of the right significances. Don't keep it directed to such a degree, however, that he ceases to get tone arm action and ceases to talk, see.

The other action is in actual fact putting in the itsa line for the pc. And that's how you cure an ARC break. You find out by assessment what trapped charge has been ticked and is trying to get loose. He'll just natter as long as that charge is trapped. And the auditor can then locate that trapped charge and free it. He'll desensitize it.

So there's two auditing actions in actual fact, you see. This first and foremost is listing [listening] with tone arm action. And then secondarily locating, by assessment or any other means, the trapped charge.

Now a pc who is – who is talking smoothly and on and on and on – even if the pc is crying about it – is not interfered with. See, don't interfere with that line – that's interfering with the itsa line. Just let the pc roll, see. But the pc is not talking about the bank, but is talking up out of the bank – natter, natter, natter, natter, natter, "It's all bad; they're – they're after me; they're caving me in; what you're doing to me; what everybody is doing to me; how bad they are" – you know, talks like a newspaper! Then you realize at that point that this talk is really not doing the pc any good at all.

This pc is in an ARC break. He's protesting cut communication lines, you see, in his environment usually, and so forth. He's protesting unrealities. He's protesting lack of affinity, or its absence. And what's happened there is that charge has been ticked and missed. And unless the auditor gets very, very busy and locates that charge and indicates it and lets the pc see it and figure it out, why, that pc is going to go on nattering and you're not then going to get an increase of case.

Now, in the old days we said that if – a pc could talk his havingness down... Remember that?

Audience: Mm-hm. Yes.

Well now, you've probably wondered how that sits today. That only applies to Case Two, which I have just given you. A pc only talks his havingness down when he's natter, natter, natter, natter, natter. And you'll find in Case One, where the pc is talking about his case, is talking about his bank, is talking about himself, his past and so forth, and you're getting tone arm action – you'll find out that the longer he talks, the better his havingness gets. Do you see that?

Of course, the whole phenomenon of havingness is raising his ARC with his environment. So if he is in a situation where he's – he himself is cutting his ARC with his environment, then of course his havingness will drop, because his ARC with the environment is what we call havingness. Havingness is simply – can be defined as ARC with the environment. That's all. That should be very elementary to you.

But now let's see, how many ways can you cut an itsa line? Now, the best way to do this is to get somebody the graph, of, – was it 2 August? The HCO Bulletin that has the big graph on the back of it that gives you the cut itsa line, shows you what the cut itsa line is?

Audience: Fourth August.

Fourth August – thank you.

Now that 4th August bulletin has a nice graph there and you should – in training an auditor – you're going to make – you're going to make marvelous strides if you do this. In training an auditor, if you'll just give him that graph and you'll say, "Now go ahead and list the number of ways you could cut this itsa line." When he's done that, why, "Give me an example of each one of these" – that's your practical aspect, you see? Give me an example of each one of these cut things. And then give me an example of each one of these things how that needn't have been cut, or you would overcome it if you did this inadvertently. In other words, get him thinking on this subject. Get him to comb his hair out on this subject so that he is not walking around in a fog.

Because it's one of the most complex things you ever heard of – if you want to make it complex. And everybody's going to have a different bug on it.

Now, I can draw you up the communication cycles which are contained in the auditing cycle. And these are all very neat and there'll be drills for each one of these things, eventually. But it all comes down to this. Initially getting the pc in-session, which is interested in his own case and talking to the auditor, and then keeping the itsa line in, in such a way as to give maximal tone arm action.

Now, when we state it that way, we're stating it the way a very skilled auditor would look at it. See, this is the hallmark of a very skilled auditor. And it's simply an expansion of a highly elementary definition which I gave you in the first place. Now that's – this, where the skill comes in. That's a skilled auditor.

In other words, he can get somebody interested in his own case and talking to the auditor about it – and then keep the itsa line in, directed in such a way as to give maximal tone arm action. And if you add to that: And knocking out the significances necessary to resolve the case fastest – now you have the super-super-super-skilled auditor! And there you

have actually delineated the various levels and grades of auditing. That's just to the degree that you expand to the last definition I give you.

Now, if you want to move an auditor downstairs, in terms of level – I mean, if you want to get an idea of the lower levels of auditing, then the upper levels – all you have to do is keep snipping pieces off of that definition, and you'll get lower and lower levels of auditing – till you even snip off "tone arm action" and "assessment" at the level of Book Auditor. You don't expect him to know anything about a tone arm. You don't expect him to be able to give an assessment, if he wasn't getting tone arm action. So you just define for him that you keep somebody talking about his own case and you continue to listen to him.

And the odd part of it is that he's going to get a lot more results than mucking up criss-crossed actions that he doesn't understand. You see, you've given him enough right there and you're going to give him an E-Meter now – and he doesn't know anything about an E-Meter, and you're going to give him an E-Meter – and he's going to wonder, "Let's see, the tone arm, is that this knob at the bottom that snaps? No, that – that's not it, uh... and tone arm action. Tone arm action, what does quite that mean?" And he's watching this tone arm action, he's putting down "3.001" – he's gotten so he can read verniers, you see – "3.002, 3.001." Pc is getting tone arm action, you see, obviously. Adequate tone arm action.

In other words, you get the idea – you've got to keep giving him these significances, and keep giving him these significances, and keep giving him these, and finally train him in on what a tone arm is. Well, you've been over that yourselves so often and so long that it appears absolutely ridiculous that nobody would know anything about it.

Well, just sometime, just hand an E-Meter to – well, a psychiatrist or somebody – and say, "How do you operate this thing, bud?" And – keeping his professional lingo, see, "How do you operate this thing, bud?" – and he comes up with the same thing he's told the Food and Drug Administration of the United States: "It cures things." Cures things. Thing is around for eighty years – measuring emotion, and so forth, in the world of psychology. And that's the best technical opinion that they can come up with – it cures things. I don't know, I think they – "Seven and a half volts through the thing, that put on the person you see – and if it runs through his hands for a little while, why then he ceases to get speckled fever or something. I don't know – I don't understand this!"

You see, you give a piece of equipment or something like that, or you give a complication to somebody, and they Q and A with the complication by making it far, far, far more complicated, to a point where it no longer means what it meant. See, you can just chase this thing over the far horizon. It ceases to have any value at all. So it is better to stay – now listen, because you'll be training a lot of auditors – now, listen here – remember – remember: *Pound one simplicity home*. Don't make it complicated, just pound one simplicity home at a time. And you've got it made.

You've got some people on a co-audit – just keep him talking and when you're absolutely sure he's shut up, and he's said everything that he's going to say on the subject, why, you just look at him intelligently and you just ask him for something else. And that's all we want. See. And that's all we want. We want you sitting there, and when he finally – see, you don't even have starts of sessions or anything else, see – and when he's finally finished up talking

and saying what he wants to say, then you say one of these questions to him, you see. And it's here. And we don't even care if it's the same question every time or another question or something – but your idea is to keep him talking about himself. You got the idea? And that's all we want. We just want you to keep him talking about himself. That's really what we want and let's not get off into your inability to duplicate the auditing command, or you're waiting there to get in a new auditing command. Let's not get in there about whether you acknowledge what he has said, let's not add any complication to it at all.

That appalls you suddenly, as you take a look at it. You take all those things in as automatic, don't you? How can you get along without them? Well, it's up to you to find out. Because at that level of auditing all you want to have happen – all you want to have happen – is somebody telling – B telling A about their troubles. We don't care what they say. He's not going to have a tone arm to look at. He's not going to have any complications like this. So he'll want to know how can you tell.

So you add then, the next step. The pc gets brighter and talks better. That's his index of success. You would express that as more ARC. And that's the most elementary basic of auditing there is. You could take some old-timer and you could take his own auditing trained patterns and you could say, "If you were auditing you – if you were auditing you, what part of your case would you start for?" Sit back, man, that's it! [laughter] Tone arm sit there and move beautifully. Clean up all his past auditing, everything else.

Now, I've given you there the various levels of auditing. See, if you'll only recognize it. See, those are the various levels of certification, that. That actually automatically establishes your zones and patterns of training. Now where we exceed those things, we lose. It would take quite a while to get administration wrapped around that much simplicity. But you eventually will get to a point where you'll see that simplicity achieved. And that's the ideal. That is your ideal.

Now, as you move along in auditing a case, you're going to be confounded with this basic problem. Soon as we move up and put the E-Meter in somebody's hands – of course we're confounded with this problem before. But because we haven't got that level of skill in the auditor, we don't pay any attention to the problem. And the second that we graduate somebody up to putting a meter in his lap, then we want to see that TA move. And when that TA moves, we've got charge coming off. And there's your basic problem, is how do you keep a TA moving? That's going to worry you, that worries Mary Sue on your cases, that worries me on her case, that worries people, people, people, that worries Mary Sue in auditing – anything. How are you going to keep that TA moving?

Now, that is the deepest problem in auditing at this moment. Not what to audit. That is not the deepest problem, that problem has been solved. The other problem is how do you keep the TA moving on that particular pc? That is the problem, man. And when you walk upstairs to the highest level of skill, you of course keep it moving by addressing the case to certain significances. How do you keep it moving. This gives you a *lot* of problems. I could delineate these problems by the hour. Now we're getting into *complexity*. So you're now going up to a supervisory level of auditing. Takes quite a lot of knowledge. How do you keep a TA moving?

Well, the basic stop of a TA is time. The reason they stop is time. And the biggest time stopper is the GPM. I beg your pardon, that's as far as a – that's as far as an incident – type of incident is concerned. That's a great time stopper. But a GPM never becomes a terrific time stopper until it has been grouped in one of these between-lives screens or some analogous type of incident where things are redated, or cross-dated or something like that and it gets stuck and at wrong times. The GPM is incipiently, then – if it didn't exist, you see, you probably would get no time stopping at all – probably nobody could group a bank. You – you got that? That – because that's perfectly true. I followed this out, painfully tagged it out bit by bit. The only time my tone arm has ever stopped moving is on GPMs. I've got good subjective reality on it, good objective reality on it and so forth. It's a GPM. If it weren't there, it couldn't get latched up on one of these screens or anything else, you see. It's a big time stopper because it gives the mechanism of instantaneousness in present time. And it floats in time, so therefore it can appear anyplace. And then it gets pinned down in these between-life area screens and there goes your TA action – thud! Stops. That's it.

So, that's all – that's all very interesting. It sounds terribly final. And it doesn't make it a simpler problem but if you know that, you can get this thing disentangled more easily. But that's – that's what that is. So then we assume then, that as far as significance of incidents are concerned, why, the GPM plus any grouping incident gives you billy-o as far as the tone arm is concerned. That is what is in the bank that will stop tone arm action. You got that?

Now, what auditing action stops tone arm action? See, now this is a different problem. This is a different problem. There is an auditing action – it's the same action. It's wrong dating. You get the wrong date on an incident and your tone arm action starts folding up. Pc can't even run, by the way – can't even run the incident you're trying to run – can't do anything with it. It's got a wrong date on it. You'll find that a wrong date tends to group incidents. It does all kinds of wild things. If somebody has got a 3-D visio of a facsimile, then I can tell you man, you've got the right date. And as he runs through it, it stays 3-D and stays in one place, boy, you've got the right date. Don't start worrying about dates.

But if he's running it, and a half a dozen others at the same time, then it's a lead-pipe cinch you've got the wrong date. This doesn't necessarily mean that you can find the right date, but it means you have *got* the wrong date. Got that?

Now, when you wrong-date a GPM, what do you think happens? Here is your greatest incipient wrong-dater anyway – it floats in time all over the place – and when you get the wrong date on a GPM, brother! That is a grim situation. It will stop the tone arm almost as though it ran into a truck. Wrong date.

Now, this is mixed up with the fact that the GPM is – *is* possible to date. Do you understand how faintly I make that statement? It is *possible* to date a GPM. That is a very faint statement. But the mere fact that it is a GPM gives you the tiniest possible reads on dates. It gives you the tiniest reads and the roughest job of dating of any incident. And after you've dated one, why, that date is as valid as it gets tone arm action. But that doesn't mean that a half an hour later, on a redating situation you're not going to find another date. How do you like that? Perhaps you didn't realize that this amount of sneakery was going on with regard to one of these confounded GPMs.

But I tell you this for this reason: The way you're dealing with GPMs, there's no sense as an auditor of going into tears back of your meter – because lord knows you will feel like it! You've just got this thing beautifully nailed down, at some incredible date you can't even keep in your head, see? Gorgeous, see? Trillions all over the place, and so on. Boy! You're sure glad to have that! Picture showed up. Fifteen minutes later pc is going into an ARC break or starting to natter about your hairdo or something. [laughter] You give him an assessment. And it says "wrong date." It assesses out to a wrong date! But how could it assess out to a wrong date? We just had the right date. So we very often would be foolish enough to back off. Be very foolish, you see – foolish enough to back off and say, "We got that one right-dated. Let's see if we can find something else that is wrong-dated."

No, you better take what's nearest and dearest to your dating, because that GPM probably has another date. You probably dated it onto a screen. In other words, this was the screen date. That's still a right date – but it's a screen date. And when you redate it again, that's – the pc has blown enough charge now to be aware of the wrongness of this date. That's all that's happened. So you redate the confounded thing and you get it off the screen and it moves someplace else. And you've now got a right date.

The difficulty with this – the reads are absolutely microscopic! Hundred and twenty-eight on a Mark V, you see? All rudiments in. All the pc has got to do, is you say, "Greater than," he thinks, "Less than" and immediately you get a read on something else and *bzzong!* Here we go, see? So you delicately, cat-footedly date this thing and you get a beautiful read and you get a blowdown and you say, *aaahhhhh!* You know. Meter is up there at five-and-a-half on the tone arm – you got a beautiful blowdown when you got this new date – and you're all set and all ready to go.

You run some more items out of the thing and fifteen minutes later the pc is finding fault with your necktie. So you do another ARC break assessment and so on – pc absolutely can't go on. The only time you do one is when the pc just can't – he's passed into such a stage two there that you can't get any auditing at all. And you do an assessment and by God, it comes up wrong date." Oh, but wait a minute! You had a blowdown on the thing! No, you moved it to another screen. Nice.

Completely aside from the perils of just plain "his rudiments go out" so you get a wrong date, you see. You've got the thing that the thing has got a lot of dates! So, you finally get it back and you finally – you say, "I heard Ron say something about that one time, and I'm really going to get in this thing real good. Is this an actual track date?" And it reads – actual track date. You didn't also ask, "On what screen?" [laughter]

So, you get your new date and after that it runs like a doll. But beware, you actually could start dating on a certain series of GPMs – now listen – and go seven sessions trying to find the date of the series. Be wonderful if you kept the pc's itsa line in the whole way. And don't turn off that itsa line. Because you've pulled a whole series of GPMs off screen after screen after screen – you're straightening out his track like crazy. But you could sit there and just chop him to ribbons by never letting him help you in any way, shape or form. Take all the data off the meter. Never let the pc volunteer anything. And if you then went seven sessions

with all this, your pc would be going downhill like mad, don't you see? You wouldn't be getting any tone arm action either.

You see the liabilities – you see the liabilities of this confounded thing called the GPM? False track actually is nothing because it is never false track. They might show you some pictures and say, "That is track," but they're usually still pictures, solid pictures and very brief pictures. When it comes to track – there are false pictures, yes – but when it comes to track, false track – actually you shouldn't use the word and I shouldn't have used the word false track – because I've since found out what it is.

When you invalidate somebody's time track hard enough and hit him hard enough, he puts dub-in over the top of the actual picture. And the dub-in looks quite like the actual picture but it's just a little – little film over the top of it, and as you start to audit it, that film comes off and he sees the actual picture. And actually, it isn't too different than his own track.

He won't find much variation in his time track by the reason of having had his track invalidated it to dub-in. I've now found this out, you see – he's still got his track. He's still got his – still when he was a big thetan, he was a big thetan, you see? And when that has happened to him, it happened to him. He might have oddly askew pictures on the subject and the thing was all grouped in one locale by a screen, but *that's his track*. When you've run it over, the pictures all of a sudden start going into 3-D and he sees these things as looking a bit better than they did and he's got a better sense of reality.

The reason most of you have – in pc's particularly – find unreality and the pc kicking back is because you haven't run across it enough to scrub off the false picture. See, that is unreal to the pc. Unreality is force and invalidation, don't you see? That's what unreality is. You ever run a car into a brick wall? Things momentarily looked awfully unreal! Well, that's the same phenomenon – unreality. You hit somebody hard, and things get unreal. They get unreal down to a point of unconsciousness. What is unconsciousness but a total unreality. Now, that's all unreality is.

Of course, unreality stems from the ARC pris... side of the situation – it's a sudden, steep drop in ARC. That really gives you some weird waves of this thing. At the same time he's being hit, he's also got, not only the ARC break with MEST, but he's got some other consideration on the subject of ARC break. And it gives him an ARC break that that particular thing would hit him.

See, it's compounded. That he runs the car into the brick wall and the impact and so forth renders him unconscious – but he's got another ARC break on the ARC, you see, side of the thing – this was the MEST side of it, his unconsciousness, you see. But his other ARC break, with magnitude, is the fact that that wall would do *that* to his car! See? And it's an ARC break with the circumstances of the situation. Shouldn't happen, you see. Protest, one way or the other.

Now, dealing with pictures then, you get a considerable unreality coming off, and when you deal with these pictures, you get into ARC breaks – which is the only point I'm making here about dating – and you'll notice that an ARC broke pc only reads on the exact subject of the ARC break. All other reads go out. A severely ARC broken pc, then, does not read on the meter, except on the bypassed charge which caused the ARC break. That's the one

hole in the E-Meter – because it won't read during an ARC break. Well – wait a minute! In a GPM you're always auditing an ARC break, aren't you? He's ARC broke like mad! Time is all askew and he's been captured and stuck in that thing and oh, you know, all this kind of stuff going on. And of course the E-Meter doesn't read well – he's ARC broken with himself for being such a fool as to be caught. You know, there's all kinds of crisscross ARC breaks. He has ARC breaks with matter, energy, space and time because somebody would – it would obey – to quote an exact ARC break I noticed myself at the beginning of a GPM – because it would obey such low-toned people! Perfectly logical ARC break.

Well, so the ARC broken condition of the pc in the area influences the meter read. Meter is reading very badly for that area anyway. This is the hill that a very skilled auditor climbs. But, now, listen to the good news back of it.

If you just keep trying and don't cut the itsa line, you will get tone arm action in your effort to date it. And the itsa line and blowing charge will increase the pc's reality on the incident to a point where the date is more and more real. And you will see bundles of facsimiles start to come apart.

For God's sakes, put this down in letters of fire because someday as an auditor this is – well, I can give you a lot of tips about auditing – but someday as an auditor you're going to be – sit there and you just – just feel the tears under your eyelids, it's just too desperate, you know? *Gawd!* You tried!

You don't dare say anything to the pc – you're out of communication with the world, you know, and you've *tried*.

"Is this GPM more than two trillion years ago? Less than two tr... what did you think of? Oh, all right. Is this GPM more than two trillion years ago? Is it less than two trillion years ago? Apparently less than two trillion years ago. All right. Is this GPM more than five hundred billion trillion years ago? Less... that's a wrong date, excuse me. One and one-half trillion years ago? Less than one and one-half – it doesn't read. It's all blank. Let's see. Have you been thinking of anything?" [laughter]

"Well, let's do another order of magnitude, huh?" [laughter] "Tens of years ago? Hundreds of years ago? Thousands of years ago? Tens of thousands of years ago? Hundreds – tens of thousands of years ago. Is this GPM tens of thousands of years ago? Ah, is it more than tens of thousands of years ago? Greater magnitude than tens of thousands of years ago? Less than? Is it tens of thousands – oh, that's good, huh! Nice read!" See? "All right. Is it more than fifty thousand years ago? Less than fifty thousand years ago? It's less than. Is it more than twenty-five thousand years ago? Less than twenty-five thousand years ago? Less than. Is it more than ten thousand years ago? Less than ten thousand years ago? Less than!" [laughter] "Is it more than five thousand years ago? Less than five thousand years ago?" [laughter] "Oh, you thought it was greater than fifty thousand years ago?" [laughter] "Oh! Oh, all right. All right. All right. All right. Was it more than seventy-five thousand years ago? Less than seventy-five thousand years ago? That didn't read, did you..."

You're very foolish if you don't interrupt that somewhere along the line. "Well now, what's been occurring to you while this has been going on?" And get yourself a little TA action, see? And bust it down. Because frankly, you can go on like that with a very, very tough

GPM. It's just like – just like trying to catch a slippery fish. One time it's trillions and the next time it's thousands and then all of a sudden, you... Why does it do that? You're slipping it off one screen and another screen, you see? And its restimulation factors are blowing, and so on. So, you've got to keep your itsa line in while you're dating.

That is probably one of the toughest things that a pro has to do – keep the itsa line in while dating. You get to sweating over this E-Meter and you forget about the pc to some degree – and if the pc is thinking about it and talking about it, why, there it is.

So much so, that I like to try to run the tone arm action out of it without dating it directly up. Get any idea the pc might have of the date. And just let him talk himself along the line until he either gets the date and gives it to me on a silver platter – or gives up completely, throws in the sponge so it squishes and then go ahead and date. And then try if I can't find the date, do it all over again and just keep arguing and talking about this, you know, back and forth and getting my tone arm action. Because get this, now: If you *just keep trying to find something* and keep the itsa line in while you're doing it, you will *eventually find it*. *Clang!* But this is one of those things that you wouldn't ordinarily discover in the run-of-the-mill activities of auditing. You just wouldn't ordinarily discover it!

Because how often are you going to be willing to put in seven separate sessions trying to get the date of one GPM? How often would you do this? You jolly well wouldn't! You know, you'd say, "Well, it's amounting to no auditing, pc every once in a while gets ARC breaks, this is a mess, I'm in tears half the time, this is – the whole thing is just sending me straight up the wall and so on."

Well, relax! Because this is a stable datum – and this is a stable datum that you can just put back of your left ear that isn't going to be cancelled by tomorrow's bulletin. Because I've seen this happen, now, and I've seen it done. I know it's true. You just keep chewing away at trying to date or locate or get the character of something or get the *pattern* of a GPM – you just keep the pc headed at it, keep that tone arm moving and keep trying to find it – and suddenly enough charge will have disappeared off the area so it'll all go – *sssthung!* And you say – there it is like a stage set. You wonder how in the name of God did anybody ever miss it?

As I say, that is something you ordinarily wouldn't *discover* because you probably wouldn't give seven consecutive sessions to the – just one lousy little subject of auditing. Like, what is the pattern of this wildcat GPM? And one minute you're running this – you're trying to date it, see, and your dating is kind of going haywire; but you're trying to get the pattern – that's what you really want. And the pc is down in the cellar. His morale is just zero. How in the name of common sense is he ever on God's green earth going to get the pattern for this GPM? *Uhhhhh!* Wildcat GPM, my God – the thing... you tried out any other kind of a pattern. You've asked him about it several times and you've asked him about this and you've asked him about that and it just – just *uhhh!* Just horrible!

"Well, maybe the first one is – maybe the first one is – is 'to be a spirit.' I think it's here. I think it's a goal. I – I *think* it's a goal. Maybe the first... I don't know that there is a goal in it, you understand, but there is certainly positive and negative items, or something in it."

Now, the more you put the itsa line in with the meter, the more you ask the meter for this data, the less you're going to win. And you've found that to be the case. Yeah. So, the pc just chews away, and he says, "I think it's 'spirited – never spirited'."

All right. Now, the wrong thing to do is to shake your head and say, "No, that didn't rocket read" and so on. Just, "Go on, tell me some more about the pattern." Don't keep him repeating anything. And he says, "Well, I think the next two items on it are, uh – are, uh, 'undoubtaditably to be a spirit' and 'doubtaditably to be a spirit'. That's what I think."

"All right, well, go on, go on, give me some more on the thing. Your tone arm's moving, but you're not getting RRs."

He's going to tumble to it suddenly. Hell say, "Well, hell, no! This thing has nothing to do with spirits, it's 'to be drunk!'" [laughter]

You just keep him chewing at it and you'll see TA action, TA action, TA action and all of a sudden hell come up with something. Well, all of a sudden he leans back – if you don't cut his itsa line and chop him up – all of a sudden, "Well, the pattern of this thing is very simple. It's just plus and minus and then a dichotomy. See? It just goes drunk – not drunk, sober – not sober – I think... then it says, 'to be drunk.' Yeah! Yeah, that's what it is! It's 'drunk – not drunk, sober – not sober, to be drunk.' Oh yes! And then it fires the other way to. Then it fires with the items reversed, to the left and right. Yes! That's the way the thing goes. And it goes – it goes, over here, it goes, you got – got – got 'drunk' over here on your – on your right, now, see? So it goes – no, now wait a minute, now wait a minute. The way this thing goes – the way this thing goes is 'drunk – never drunk.'" And boy, you see that meter all of sudden take off, see, getting this one. Rocket read. "It's 'drunk – never drunk, sober – never sober, to be drunk.' No, no. No, no. No, I got it now! I got it now! It's 'sober – never sober, drunk – never drunk , to be drunk. Yeah, I think this is pollibsy root of my alcoholism!" [laughter]

And you just keep him chewing at it, rather than sitting there trying to ride him into a hole. Now, the hell of it is, is you take anything as complex as the Helatrobis Implants, it takes you longer to get the charge off without the pattern than with the pattern. But the pc trying to understand this thing and trying to run this thing and so forth and trying to get a grip on it, sometimes will kill his own TA action if it's too evaluated. Why? The itsa line is being put in for him. The itsa lines are being put in for him. What is it?

Now, a meter is very, very didactic. It reads at a lower level of consciousness than the pc, but remember it's just a little bit lower. And you blow some charge and the pc will become conscious of what the meter becomes conscious on. All a meter does is become conscious of something before the pc becomes conscious of it. It just reaches the pc – it reaches him up just a little bit further along the line, and therefore gives you a preview of coming attractions.

Well, now do you understand, you could look at the graph – you can look at a graph of your itsa line – whatsit-itsa, see, and you see that you can say, "Whatsit?" and the pc can say, "Itsa" and you've got auditing happening. Ah! But what if the pc says, "Whatsit?" and the meter – you use the meter to say "Itsa." You want to see tone arm fold up? You've reversed all this now.

Now, pcs will do this if you create a meter dependency. And you should always keep your meter back. Don't do anything. "What do you think?" is a very good way, although a pc sometimes mildly ARC breaks on it.

He very often says, "Yeah, but I want to know!"

You say, "All right. Horse? Goat? It was a goat." "Reads on a goat" is the safer statement to make. "Is that right? Is it a goat?"

"Yeah, it's a goat."

Pc is demanding information. Well, this means he's given up. Now, when he's given up you can help him out, of course.

Well, let's take a look here – let's take a look at this whatsit-itsa line. And supposing the pc – you ask, "Whatsit" and then put the itsa in on the meter. And then you ask, "Whatsit" and put the itsa in on the meter. And when you ask "Whatsit" and put the itsa in on the meter. Don't be surprised if your tone arm action ceases to exist. I don't know, you must be doing some kind of an audit on something, but it doesn't have anything to do with the pc, don't you see? That's the way to get good and messed up.

You say, "All right, whatsit," and then, "Well, all right, I'll help you out here. Itsa." I don't know what the auditor's doing there, saying, "Whatsit, itsa. Whatsit, itsa. Whatsit, itsa. Whatsit, itsa. Whatsit, itsa?" Where's the session? See, it isn't anyplace! It isn't anyplace at all.

But your pc must not be pushed down into the depths of despair. You say, "Well, what do you think the date is?" It's a nice way of dating. The pc says, "*Uhhhhh, daaaaaooooo*. I just don't know. I just haven't got a clue." Date on the meter for a while. And you're starting to get near it, "Do you got any idea of the date now?"

"Oh, yeah! It's so-and-so and so-and-so and so-and-so." And you say, "All right." And that's it. That's quite common; but the reverse can also be true. You start dating, "You got any idea of what the date is?" And he says, "Well, that's a so-and-so, no, it's a so-and-so, what's it-so-and-so, and so-and-so. It might be more than billions, but it's less than trillions. Seems like it was just yesterday, you know, but it isn't really. And so on and so on and so on and so... It's pretty unreal. It all – and so on and ... Well, I just don't know, my God, I just don't know. I just haven't got a clue!"

Oh, well! By all means, now, in R2H it's very simple, he says it's 58, 57, 58, 57 – I don't know whether it was 58 or 57! You say, "Well, the meter flicks every time you say 58. All right. Good. Is 58 a wrong date? That doesn't read. Apparently 58."

That's more desirable, don't you see, than having him quit. But, look at this trick of using a meter. "Well," you say, "well, what – what do you think the date of this thing was?"

"Well, it might have been this, it might have been that, but on the other hand, it was some – tha... it might have been this and it might have been that and it might have been something or other and I – well – bu... I give up. I don't know. I don't know, I just don't have a clue."

You say, "All right, we'll do an order of magnitude on this. Was it tens of years ago? Hundreds of years ago? Thousands of years ago? Tens of thousands of years ago? Hundreds

of thousands of years ago? Was it millions of years ago? Tens of millions of years – that reads. Tens of millions of years ago? Tens of millions of years ago? Millions of years ago. Millions of years ago – that reads. Millions of years ago is the order of magnitude" and so on. "Have you got any idea what this date is?"

Now what are you doing? You're doing a different trick, aren't you? The trick you're doing now is using the meter to jog the whatsit line, see? Slippy, huh?

Audience: Mm!

Then the pc will sit there and say, "Millions of years ago! Let's see, was it five million years ago? Six million..."

They sometimes develop systems. The picture comes in clearly on six, but doesn't come in on five, you know? So they say five and a half. Got a clear picture, so they say it must be five and a half. Then they realize if they say five and a quarter it turns on heat. "Must be five and a quarter. Five and a third. Five and a quarter, five and a third – five and a quarter! Five and a quarter. Must be five and a quarter million years ago. Does it read on the meter? Five and a quarter million years ago?"

"Well, do you think it was?" See, because if you said, "Oh, yes, that reads on the meter!" You know, see? It's the acknowledgment of what they've just done, but at the same time they're still depending on the meter. And you sometimes have them say, rather satisfied, "Well, it's a five and a quarter million years ago!" See, they're saying, "Does it read on the meter? Does it... five and a quarter million years ago?"

"Well, do you think it is? Do you think that's the right date?" See, that's a way of snapping back your itsa line in, see? They tried to hand the itsa line to the meter. "Do you think that's a right date?"

"Yeah! Yeah, that's a right date – that's a right date."

"Okay," you say, "that reads." See, by doing it in reverse, you see, you get them certain – and then say, "Well, you should have been certain about it all the time because it also reads on the meter, see?"

Of course they have the feeling that you're sort of a spy hanging over their shoulder anyhow, because you've got the meter in front of you. So they're afraid to be right. And the more evaluative auditors have been to them, the more chopped they have been in their auditing, the less itsa line they have had in, why, the more queasy they are about being right. So they will tend to invalidate themselves. And you can just pick up pcs any day of the week, they just invalidate themselves like mad. All the time, all the time, all the time – invalidate themselves.

One of the ways they do this is to invalidate what they've just said and ask you if it reads on the meter in order to be validated by the meter. And the more an auditor can do this without being a nasty slob about it, see, "Well, I'm not going to tell you what it says on the meter – you think I want to create a meter dependence with you?" and so forth. [laughter] I'm afraid that wouldn't be very workable, you see.

But, if you can – if you can use that meter to boost the *whatsit* line and coax the *itsa* line in, why, you'll be very successful with the meter – very adroit. And only date when the guy just throws in the sponge. It goes *squash* all over the auditor's reports, you see. Because you can get up to a point of asking him for more than he can give and that's one of the ways of cutting an *itsa* line. See, every time the guy gives you something, ask him for some more.

I'll give you a way I've done this, see – pc very proudly says, "Ha! I got a picture here! A color picture. Got a – got a color picture of some mountains." He's very satisfied at this point, he's communicated the whole lousy lot, see? And you say, "Well, what kind of mountains are they?"

"Well, they're just mountains mountains."

"Any... anybody in it? Any people on..."

"No, there's no people in it!!" We can just hear their tone come right on down.

So after the guy has said, "I can't find this date. I don't know what this date is." After a guy has chucked in the sponge and you say, "Oh, come on, give me the date." Cut your throat! You see? Because what you've done is stretch an *itsa* line beyond its ability to stretch. What you need to do is plug in a little bit more restimulation. See? So you've actually bled off all the restimulation that is there. So you just use the meter to knock another block off the glacier and let the pc clean it up.

"Order of magnitude *bla-bla-bla-wow, bla-ba-ba-ba-bow, bla-blow-blow-blow, bla-bla-bla-blaw, bla, bow-bow-bow, bow*. All right, you ge... coming any closer to what the date is, now?"

"Oh," he'll say, "yeah, yeah, you say – you say the thing is – is millions of years ago, and it's – yeah, yeah! Yeah! It's so on and so on and so on and there it is and so on. It's five – five and a quarter million years ago. What's it say on the meter?"

"Oh, all right, well is that right? Is that five and a quarter million years ago? Is that okay?"

"Well, yeah, that's okay, what's it say on the meter?"

You say, "Well, it says you're right." Or "It isn't reading on the subject, at the moment." Slippy. Dangerous – awful dangerous territory to be haunting around very much.

"But I want to know what it says on the meter!"

"Well, at the moment it doesn't say anything on the meter."

"All right, then it must be some other date!" the guy says.

All right, now you don't ask him, "Well, what is that other date," see? Say, "You want me to do another order of magnitude?"

"No, no, that isn't necessary; I think the thing actually is trillions-three. Trillion-trillion-trillion. Not trillions-two. That must be what it is. That must be what it is."

"All right."

"Will you check it for me?"

See, you're on the spot now. You're on the spot. It's a very, very slippery little contest that you can run in this particular line. [laughter] It's perfectly all right to tell the pc what a meter is reading, what his tone arm is doing, that sort of thing. He'd be quite relaxed about this thing. The moment the pc starts relying on the meter instead of looking at it himself, why, you're in trouble. You get him in too much of... that's relying! Dependency. Let him create that dependency and you've spoiled some of his case. You've spoiled his sense of time and that sort of thing.

So it's a very nice point. It's a very nice point. And you have to solve that by being alert. And the basic rule is: is use your meter to get in the whatsit line and coax the itsa line.

And at last resorts, such as a howling ARC break, of course the only thing you've got left is your meter. The pc isn't talking or thinking. That's the last resort. So now you do ARC break assessments and that sort of thing – that applies to sessions, by the way. Doesn't apply to you giving an ARC break assessment. Down... oh, Peter landed with all four thuds down there in Australia and – and he got everything wheeling and dealing in a hurry. Things were going in all directions quickly. He had this congress laid out and he – he's fast, you know – he picks this thing practically up off of his bulletin line, you know, off his desk, and goes down to the congress and puts six auditors to work doing ARC break assessments on every congress attendee. He put them in a booth outside. So here were six auditors, you know, all during the congress, going *bangety-bangety-bangety-bangety-bangety*, doing ARC break assessments, you know? And they're just cleaning up ARC breaks all over the place and everybody's saying hurrah, wonderful, marvelous, you know? He's industrious. I'll bet he didn't even get a chance to read the bulletin himself. [laughter] He's quick.

Anyway, now, it doesn't matter whether somebody's ARC broke or not ARC broke, see? You can give them an ARC break assessment out of session or any place else or every Friday in a Central Organization or something like this and keep things wheeling and dealing. But you can cut an itsa line to ribbons with ARC break assessments, man. You can just cut them to ribbons. *Swish-swish, slash-slash!*

"Well, I don't know if I've got the right item here or not; let's see." "Oh, well, I'll do an ARC break assessment." Sounds incredible! "Well, I don't know. I don't know if this is quite the right goal or not, let's see, this, well, right goal or not. We might have bypassed something here. It might be something." "All right, I'll do an ARC break assessment."

Cut your throat, man! That's putting in the itsa line with an ARC break assessment! Don't do it! An ARC break assessment has its value after all else has failed – and that's almost the same with the meter. The meter needle has its greatest value when all else has failed. ARC break assessment has its greatest value when all else has failed. Because the most operating thing you've got anywhere around you, actually, is the pc! You can take data from this pc. You get surprising data from the pc. Pc will sit there and *barkety-barkety, bangety-bang*. He can give you more darn data.

Just because a pc says, "Oh, I don't know, is – I – doesn't look right to me, there's something wrong here. Something wrong. I don't..." That's no reason for you to do a thing! I know you have consciences – you want to get in there and earn your fee, earn your keep, pay for your own auditing, it's that sort of thing. I know you have an idea that if you just get busy

enough and you heave enough bricks through enough windows, why, everybody will pat you on the back for being so industrious. Well, you're not ever patted on the back for being industrious. You're only patted on the back for getting case advances, see?

Well, great day then, the pc says, "*Rrrr*, something wrong here, some, uh – *rmmmm-mmmmmmm-mmm*." I don't care how long he goes "*Mm-mm-mmmmm-mm*." Let him go on and "*Mm-mm-mm-mm-mm*." Just as long as that TA moves – that's all I'm interested in. And he can mutter and fumble and stumble and bumble all he wants to – as long as the TA moves. I'm not asking precise data from this pc. That's what's wrong with this pc – this pc has a lot of imprecise data. Very imprecise data. Let's take an ARC break assessment – also his confidence in his own bank is very, very poor.

Let's take an ARC break assessment. And you're going down the ARC break assessment. *Bark, bark, bark, bark, bark* – and the pc brightens up all of a sudden. And you – you've got two choices here. And one of them is *wrong!* The choice is to go on and complete the ARC break assessment. That's wrong! That's wrong – every time. The pc suddenly looked bright. See, he didn't even say he had anything to say. Oh, you know! You'll see it, actually, sometimes a flash on the meter while you're doing the assessment, if you're not looking at the pc. "You think of something – anything?"

"Yeah! Yeah, it's actually the unknownness of the whole thing. I didn't know anything about it. I didn't know the guy's name, you see. Everybody's trying to tell me his name was Joe, but in actual fact I didn't know his name. And that – that was what that ARC break is – was all about. Heh! That's it!"

And you didn't get a chance to earn your keep, man! You know what you're supposed to do – you're supposed to go down the whole list. Now, if you say to the pc, at this point, "Well, all right! Well, now how do you feel about that ARC break?" The meter goes tick. You say, "Is there something else about that, that you haven't told me yet?"

"Oh, well, yeah, maybe you didn't get that... See, the guy – the guy – I didn't know his name, but they said his name was Joe. And I had never found out what his name really was. They just said it was Joe, you understand? They just said it was Joe. And I don't know that his name was Joe, see. And I never did find out the guy's name. I don't know what his name is. And that's – that's what the ARC break assessment is, all the time. They were trying to put this – this was – I guess it's a false datum."

And you say, "All right, good. How do you feel about that ARC break assessment?" Clear as a bell. See, he thought he'd interrupted you and he didn't quite get it across to you and he had various explanations, don't you see, why maybe he didn't have his itsa line in on you because he had distracted you and kept you, you see, maybe from assessing and earning your keep, you know?

Pcs have lots of weird reasons like this. But you shouldn't automatically assume. I know, because I myself have had this happen in a session while I was auditing. And it's very embarrassing! You say, "Does that clear it all up?" *Clang!* See? You say, "All right, is it all right if I go on with the remainder of the assessment?" The pc – glummer, glummer, needle getting dirtier, dirtier, dirtier.

Look, it would be better to leave the charge on it than it would be to ARC break the pc about it! Do you follow that?

Audience: Yes.

That applies also to GPMs. You can sometimes ARC break the pc like mad on some wildcat GPM just because you were trying to be precise all the time and the pc is arguing with you. I myself ran into an ARC break as a pc one time on the subject of – I had "to listen." I saw "to listen" come out of the floorboards of one of these GPM rooms. I saw it come out! I couldn't understand why I'd *seen* these words come out! Because I ordinarily don't do that in a session, see? So I said, "I just saw 'to listen' come out of the middle of the floorboard. We must have some kind of a goal in here like that." And the – and the auditor looked at the meter and said, "It didn't RR." That, frankly, was the end of that facsimile. It was being held there by two frayed hairs, anyway! Very highly charged area, preceded by lord knows how many GPMs. The reason I got to the place, nobody will ever find out. But that's all it took, see? And the GPM folded up! Denial of the pc's perception of the GPM. Actually it took it a little bit longer than that to fold up. It took another slight blunder immediately afterwards, but that was the reason it folded up, see.

It was just – pc all of a sudden originated and said... The auditor knows he's trying to run the goal, let us say, "to catch" or something, you see. And the pc says, "Hey! You know, coming right out of the floorboards here is these words 'to listen.' And – never saw anything like this before."

"Oh, no, that doesn't rocket read."

Well, the pc didn't give a damn whether it rocket read or not! You get that? He didn't care – he didn't care for a minute whether this rocket read or not! Very often in putting together a GPM a pc will be going and giving you the items, *bang, bang, bang, bang, bang, bang* – giving you the items, repeating them a few times – and all of a sudden will get to the next pair! Get to the next pair. And the next pair dinning his ears in, and the auditor says, go back and clean up the old pair.

What do you do in a case like this? It's very interesting. Because if you leave partially charged items on the thing, the pc is going to ARC break and if you don't take the pc's next items, he's going to ARC break. What do you do? Well, you're an auditor. That's one of the perils of existence! [laughter, laughs]

There is a solution. You can hastily write them down so he won't forget them. You can say, "I've got a note of those," and go on and get your items clean. That's just one solution. Did you ever think of the solution of going through a GPM and then through it again? That's totally possible, too – but also dangerous because all sorts of weird things are liable to happen, don't you see?

So the contest of how you get a GPM discharged without cutting the itsa line is one of the more interesting things that an auditor can do. And it takes very, very skilled auditing in order to accomplish this fact. And the variations of it are so many that you couldn't possibly cover all possible cases. Your job is to get the GPM discharged and keep the pc in an enthusi-

astic state of mind so he will discharge the GPM. Because the pc in a lowered state of mind can't discharge the GPM.

Now, your *whatsit* – your *whatsit* line uniformly, completely, totally, thoroughly means just that – what's it. It's called "*whatsit*" because those exact words raise the tone arm. And the *itsa* line is called "*itsa*" because those exact words lower the TA. Or in a low TA case, I think, reverse it – although I myself haven't seen this as an auditor yet. Too new.

Now, if that is the case, then we would say that the solution of mystery was the resolution of a case and the restoration of TA action. And as I told you a little earlier, your cessation of TA action is your heaviest auditing problem. TA isn't moving. That's the case that drives you around the bend. A case will also drive you around the bend in numerous other ways. But when the TA stops moving, you've got a headache. That's a worry. Right now, right now, that's a worry.

So I'd like to give you a clue as to why this is. Whatever else you say about GPMs or a time or anything else, this is certainly true: That the pc is stuck on a *whatsit* for which he has no *itsa*. Elementary, my dear Watson. Doctor Watson, now, by the way – that was his gag – I took it from him.

Now, did you ever think of the possibility that the pc might have asked his own *whatsit*? Now, I'll give you an exact example. They do this all the time. It's not once in a while.

Now, this pc – pc sitting there, gives you the *itsa*, *itsa*, *itsa*. In the process of giving you the *itsa*, *itsa*, *itsa*, gets in two *whatsits*, on himself. All right. Now, they got clear as a bell, everything was fine and you went just a little bit further and all of a sudden the pc felt foggy. The pc felt foggy because of the two *whatsits*. These are two new auditing questions, if you please, but you didn't ask them! But the pc asked them and now you've got some charge in restimulation that's not been *itsa'd*! And so the pc feels foggy.

You'll sometimes get this toward the end of session. You were doing fine and you asked one question too many and then you can't get the TA down and you don't know what happens. Well, ordinarily it stems immediately back to a question the pc asked themselves. Now, the most common cause of a TA going up in a break is the pc asked themselves a *whatsit*.

Audience: Mmmm.

That break gives them a short period of time without the auditing question in which they can demand of themselves a *whatsit*.

Now you, of course, because they've forgotten the *whatsit*, they never give the *itsa* – and you've got a high TA and you sometimes will struggle around endlessly and fruitlessly and forever trying to get this TA to do anything – put in your since mid ruds and every other confounded thing to get it to come down. The one thing that you seldom ask for is what *whatsit* did they ask of themselves. Could be put in other numerous ways: "Did you speculate about anything in the break?"

Now, the funny part of it is, is as-ising *whatsits* does not give you auditing. I've tested this out. That's interesting, isn't it? You don't as-is *whatsits*. *Whatsit* – you cannot run a case

on solid mystery, in other words. It sounds impossible, but if you just, "Get the idea of questioning things. Thank you. Get the idea of questioning things. Thank you," you would just drive the tone arm up, and it wouldn't come down.

Why? Because the bank is composed of a cure to the problem. Or as Reg was saying a few minutes ago, the puzzle, see? And the reason the puzzle is hung up is because there's something in it which was a cure. Cures brought about problems. And to as-is problems you have to pick up the itsas. That itsa was always a cure to some problem which is now holding it in place. So it takes both the whatsit and the itsa to get the stable datum and the confusion off. The whatsit is the confusion, the itsa is the stable datum. So you announce the confusion and the pc gives you the stable datum, and of course you get restoration of balance. You get the thing blowing off.

Actually, in tiny vignette, this is the mechanism of a GPM. And it's just the common questions that you use, you see? You would have to ask somebody, "What have you been puzzled about? What was the answer to it?" That's a little bit blunt. "What answers might there have been to it?" Two-way comm is something that drives some auditors around the bend. They don't realize that two-way comm maybe won't run an engram, but it will blow off all the locks. So you could say, "When did you first become aware of this problem?" That "first" is a bad thing to use, but it nevertheless keeps somebody diving at it. "Give me a time you became aware of this problem." That starts a two-way comm cycle, don't you see?

Pc says, "I have a big present time problem about something or another," see. Big present time problem.

"All right, well, what solutions have you thought of? Have you ever had similar problems in the past? How do people ordinarily solve such a problem? When did you first become aware of a need to resolve this problem?"

Now you're drifting off back into the whatsit, don't you see? But you can get the itsas of almost anything. I think it's interesting, isn't it? Therefore auditing questions, to be valid, must balance between announcing the puzzle and getting the cure. But if you have him inventing cures, then the puzzle will get more puzzling. So you – the only way you really produce a gain – a gain in auditing – the only way you ever really produce a gain in auditing is having him become aware of the problems and the solutions which he has had for those problems. And then you get tone arm action.

That's a theoretical dissertation, but it's also quite empirical. Takes the whatsit and it takes the itsa. And if you never let the pc reach any of his own itsas, of course, you don't get TA action. There are many ramifications to this; there are different types of processes produce different potentials of TA action. There's a lot you can go into about this. It will continue to be a worry, but I'm giving you the exact fundamentals of what causes it to cease when a tone arm stops. Okay?

Audience: Mm.

We're way over time – thank you very much!

THE TONE ARM

A lecture given on 15 August 1963

Sorry for being late. What's the date?

Audience: The 15th.

Fifteenth?

Female voice: Fifteenth of August.

Of what?

Audience: Of August, 1963.

Female voice: Oh, I beg your pardon, 1913.

1913?

Female voice: AD 13.

AD 13! That's a wrong date. [laughter] All right. Thank you.

This is a lecture on the subject of the tone arm. I've been trying to figure out how to build a meter that just had a tone arm and I can't quite figure out how to keep it centered. You know? It'd be an extremely elementary meter – it'd be a very cheap meter, and we're coming down to a point now where we actually should build up something for a co-audit or for a Book Auditor, see – and we shouldn't worry him with the needle. We should build him a piece of a meter. If I could just figure out how to center a tone arm, you know, I'd be very happy about it. I'll probably get it licked in the next few days or...

Anyway, we need just a meter – just a meter, and it would have to give the equivalent sensitivity, here, it would have to give the equivalent sensitivity of 16 on its tone arm action. See, a Mark V, at sensitivity 16, for its tone arm action – and then just follow through its tone arm action. Now preferably it ought to be able to spin all the way.

Audience: Mm-mm.

Not have any stop at the bottom of it. Should have the same numbers on it exactly – should have probably a one-hand electrode – just a one-hand electrode. And it probably ought to have a belt clip of some kind or another, so you could hang it on the pc with a belt or something. You could run it on CCHs then, couldn't you? It ought to be very rugged, [laughter] and really shouldn't be any bigger than just the area of the tone arm there – a couple of batteries in the back of it or something like that. Have to be about the same voltage that goes through this Mark V. You get the idea?

Audience: Mm-mm.

Now, the reason I mention this meter to you, haven't quite figured out how you can center it. You need something to center so you know what the tone arm should be, see. You can't really have a light, it burns up too much juice. Maybe if you put a little – a little telltale at the bottom of it that was a very crude meter-movement of some kind or another and you kept that centered, and so forth, why, maybe that would be all right. Possibly over here a little bit to the right, maybe a little telltale there, that had a little white center there, maybe a little black something that you kept at the button – when it moved off the button, why that was that, and you could get your tone arm reads.

I'm trying to show you that this meter of yours can be subdivided to that remarkable degree, and can still be an extremely serviceable auditing machine. See, doesn't have to have any lie detection in connection with it or no healing adjunct or anything else – it's just whether or not discharge is occurring. You would see that.

And you realize that you could – it's impossible to run a GPM with no tone arm action – it's impossible, if you're getting dial-wide rocket reads, even though it returns every time, across the dial – because you are blowing one-dial width of tone.

Now this shows you how much tone arm action you are actually getting. Here, I'll show you on this very meter, here. This meter's not centered well, but let's get it down here very delicately. Now that is approximately – oh, let's be very, very something or other – it's about 2.85, on one end of this needle. Now let's take that needle the whole width of the dial, and get it balanced here – just about in the test area – and a dial-wide slash on the thing would apparently give us something like one-tenth of a tone arm division – up and down.

Now that's translating your needle action into tone arm action. Well, of course that is not enough. You'll still get tone arm action, don't you see, even though just the needle is moving, but as you've just seen, it's one-tenth of a division. And if that's all you were getting every twenty minutes, that is not enough. Your minimum is .25 – minimum .25 divisions. But if the pc were running that, with considerable élan and that sort of thing, and good perception and so on – you still would be blowing some charge. You got that? Actually it's enough charge to blow a somatic.

Now, what's interesting is – what's interesting is, is that is enough for healing. Isn't that interesting? That is enough for healing. Some guy has got a bad foot, and you actually find the engram – the accident where he hurt his foot, see – and you get needle blow-off – not tone arm – you get needle blow-off. You can't run this thing with any tone arm motion. You get needle blow-off through this thing, and you can erase the somatic in his foot and he will feel much better. You will get into this when you eventually get R3T, which I am putting together, which might become R2T. It's the itsa line combined with dating. And it's just the itsa line and dating, that is all really it is – but you get into some remarkable circumstances with that.

Now, that would be enough to make his foot feel all right. Just that tenth of a division – make his foot feel all right – but is actually not enough to make *him* feel better by reason of auditing. See, you've got that careful delineation. Because this was the puzzle of the Dianetics Auditor. This used to drive the old HDA around the bend. He'd heal Aunt Sally's arthritis, and Aunt Sally didn't believe in Dianetics. And used to make the old HDA about blow his brains

out, see. She didn't feel any better. Well, the hell she didn't – she used to sit there all crippled up. You – I see this – one or two of you are thinking of cases of this. You've had it happen, haven't you? And she isn't any longer going gimp every time she gumps – and yet she didn't think auditing did her any good. She had nothing much to say about it.

It's a terrible lose. You get some big win – you get some big win from your point of view, a physiological change on the pc – and then so help me Pete, the pc never finds out about it. You got that as an example?

All right, this is quite fascinating. I mean you have to – actually have to experience it to believe it. You can get rid of somebody's warts. It's "Oh, you, oh my God, warts, warts, warts, warts." It's all you ever heard about was his warts, you know, and you can get rid of his warts. Something like this happens. You see them go, man, you know. I saw a goiter one time, go. A girl was running up and down the Foundation hallway at Elizabeth, New Jersey, showing off her pc and doing it fast, because the goiter was diminishing so rapidly that it really didn't last off the display. You say this is weird auditing – but it was – but the goiter started to go down, and she took it around and showed it to various people and they could see it go down. In half an hour, a goiter there, which was the size of a cantaloupe, just disappeared into the person's throat – just like that. Really fascinating. It's too much to say that woman did not ever appreciate this, but I will say that afterwards she really didn't know about auditing. She still had an open mind on the subject.

It's quite marvelous to behold. You can do some of the most remarkable things. Now that, let me point it out, is what drove us out of healing – not the "*tsk, tsk, tsk, tsk, tsk, tsk, tsk, tsk,*" of the medical boys. We couldn't have cared less. But auditors in actual fact did not find it a very satisfactory area of action. They had too many loses, and actually we lost too many auditors. And looking back on it, it was fairly wise to keep them from attacking the healing profession all the time.

But we have just passed over, and we've told people that they mustn't heal and all that sort of thing these days for various reasons; it's kept them out of trouble and all that sort of thing. There's also a technical reason back of this – which I myself earlier was not aware of, but which I have become aware of now, just now – is the fact that without a complete understanding of the tone arm, it is doubtful if an auditor will ever be able to predict whether he wins or loses. And will therefore many times, get a tremendous shock with the pc saying they have lost when the auditor was sure they had won.

All these are very important data. They're very important to the morale of an auditor. You see that TA sitting there absolutely fixed, or with a tenth of a division running through a GPM, or something stupid like this going on. You sit there and watch that TA – absolutely fixed, sitting there – not necessarily high, but just absolutely fixed. There it is at 5, and you go on – and you audit, and you audit, and you audit, and you audit, and it's just fixed, right there. This is what you know. You might not know much else in that session, but this one for sure you know: That the pc's going to drop a curve on you at the end of the session one way or the other, and within twenty-four hours, is going to be subject to some sort of upset.

Now you really don't see this outside-the-session upset as often as it happens. They get a little bit upset. That's because you ordinarily pick up the person. Now, you know that if this

person is audited session after session, after session, after session with a stuck TA, they will eventually just start going to pieces. You maybe have seen that. They somehow or another have been able to hold their head up, but they're a little bit nattery. They're not really – it doesn't encourage ARC breaks particularly, it just is a *nyahnyah-nyah-nyah*. They're just not doing, you know, and so on, and they're not sure of whether they should be audited or not, and they don't know whether Scientology works or not...

This is the sort of a thing that you can expect from a no-tone-arm change, session after session after session. But perhaps you haven't followed through a session with no tone arm change, resulting in an upset of some kind or another in the pc's personal life within the next twenty-four hours. That's fascinating, see? You should take a little cognizance of this.

I don't say that this is inevitable, I don't say that the upset is catastrophic, I don't say that anything horrible will happen to the person – and actually they can have bad luck even when they had a little tone arm action. You know, case in bad shape may have a little tone arm action, nothing to amount to anything, and they still go on having bad luck. All that's, all that's part of the game. But I just want to show you that these data are tied together – the pc's personal life and the amount of tone arm action he gets in the session. They're tied together.

Now, this gives you then a prediction. You sit there and you watch that tone arm, no matter what you're saying, you watch that tone arm just sitting there or getting minimal motion, and the least you can expect is a sort of a cool, "I don't know" goals and gains. Well, you thought the person did pretty good, you were running through something you thought did them a lot of good, even though you weren't getting any tone arm action. And goals and gains – well, they made some gain – they made some gains. Minimal – minimal response – minimal action. If you follow that through, they're liable to be subjected to a little bit of upset – life, in life.

Well, I should base this on this one thing; that you've actually restimulated charge, because all auditing restimulates charge. Any auditing restimulates charge, that's for sure. That whatsit line, as it goes across there – I am sure somebody out in San Bernardino or someplace is going to misread this or – Bloemfontein or somebody – going to misread that August 4 HCOB, AD 13, August 4 and they're going to say, "You see? An auditor that gets in a whatsit line restimulates the pc, so you shouldn't get in a whatsit line because that results in restimulation which gives body discomfort," and I can just hear this all being explained in some lecture. "It gives body discomfort, ARC breaks – all the sins of auditing come from the whatsit line because obviously, it says right there, see, that it restimulates the pc, and we know that is bad." And they have it all explained. And therefore will refrain from ever getting in a whatsit line. The pcs go around the bend – sit there with nothing to answer, nothing to do and you think I'm being too snide, and cynical.

But don't... I know how these things backfire. I know I'll catch on to one sooner or later and 99 percent of everybody, why, they'll get it right down the groove, right down the groove. And can you imagine it, somebody a long time ago, who had been trained here for several months, eventually revealed why they could never complete a list – all lists had cyclic rock slams. Rock slams, rock slams, rock slams, rock slams – so therefore you couldn't complete the list, because it still had rock slamming items on it. It went on and on, and on and on,

and on – and everybody just took it for granted that this person was unable to complete a list on the person. The pc therefore was a very unusual and extraordinary pc and nobody ever bothered to look over the auditor's shoulder. Because a "rock slam" was any movement of the needle – a tick, a fall, anything. Oh, some of you were here! I see it – nodding. Perfectly sensible auditor. I don't know how the dickens this was ever gotten missed. I straightened her up in a hurry.

But you're going to find these things extant. No – any auditing inevitably must restimulate. Auditing must restimulate. In doing O/Ws on somebody, that's what makes that a tricky process. That's what makes that a process which is not now being pounded hard. It isn't that it doesn't work – it's that auditors don't seem to uniformly have good luck in restimulating the O/Ws necessary to pull off the case. So you'll get O/W being run this way – any Prepcheck of overts – "Well now, let's see, what have you done?"

"Well I thought a nasty thought the other day."

"All right, that's fine. Now what was that thought? Let's see – what – what was the nasty thought? Here's the What question: What was the nasty thought? Who was it about?"

"Joe."

"All right, what was the nasty thought about Joe? That's basic, all right that's fine. All right, let's get another nasty thought about Joe – is there any earlier nasty thought about that?"

"Well yesterday I thought a nasty thought about him, too – yesterday."

"All right. We got yesterday's, now we got today. Good. Tell me all about the nasty thought, now. All right, that's fine. You – you thought – you thought he wasn't as tall as he should be. All right, that's good."

See, we're really making headway on this pc, we're picking up all of his overts.

You say, "It's the pc's fault," you see – they blame it on the pc, and say, well, the pc just isn't coming up with his overts. No, no, no, no, no. The auditor – the auditor just is never restimulating his overts. One of the favourite methods of restimulating somebody's overts, if not the best one – it's still one that was very commonly used by somebody who has great success with that type of Prepchecking – is: "What have you done? No, not now what have you thought – what have you done to Joe? Done, you know? *Done, done, done.* What have you *done to Joe?* *Done,* you know? To Joe. Done." It's what is known as impingement, see. [laughter]

And the pc, "*Aaaahhhh!* Stole his lunch one day."

"Ah, good." [laughter]

That's in the realm of restimulation. So any type of auditing which requires extraordinary targeting and restimulation, becomes more difficult to do. The more difficult auditing is the significances of restimulation which the auditor must engage in with the pc. Now the degree of the restimulation restimulated in the significance, becomes even a greater level of skill. That's really smooth. How much GPM are you going to restimulate to get the GPM run? The very smooth auditor restimulates just exactly the items which he wants to restimulate in the GPM and gets them blown.

Now as the skill deteriorates, the greater the number of items are restimulated by the auditor, the greater the number of GPMs restimulated by the auditor to get one GPM – until you'll eventually get some auditor who has sixty or seventy GPMs restimulated with half the items in each one in high level of restimulation, in order to get one pair of items.

This sounds like an exaggeration, but it almost isn't. You get the amount of skill? Well, this is the regulation of restimulation. That's your whatsit line. And the only thing that's called for on the whatsit line is have a heart. See? Know what you're going for, know what you've got to get to and have a heart! Take it easy! See, that's the thing. Let's go for the engram necessary, you know, to be run at this particular time in R3R – let's go for this thing and let's run it. And let's restimulate and run as much of it as the pc can handle.

Let's don't restimulate the whole chain in order to get one engram slightly run, see. You could actually hunt and punch around. Q and A helps to mess it up, you see? "Well, no, I got this, I got this, this incident here. It's got a – it's got an airplane in it, and it seems to be diving – diving at the ground."

"Oh. Oh, all right. Okay. Any earlier incidents there of airplanes diving at the ground, and so on?"

"Well, yeah, yeah, here's another airplane diving..."

"Good, good. Any – well, give me the – give me the earliest – give me the earliest – the earliest incident of airplanes diving at the ground."

"Yeah, well here's a whole bunch of airplanes diving at the ground. Here's a lot of incidents of airplanes diving at the ground, uh – so on. Seems to be able to get to me – I feel very funny as a matter of fact, I'm not quite sure..."

It's the use of that word "earliest" and getting engram after engram after engram, without running any engrams. Get the idea? I mean when you finally – when you finally get through with this poor pc, you overrestimulated. You haven't permitted him yet, technically, by running things, or listening to his itsa line or anything else – haven't permitted any of the – of the charge to come off of the incidents he had available. Next thing you know, why he's got so many incidents available, that they're sitting in one place, and the bank's so charged up that it looks like a live bomb. So does the pc. He's getting very hard to handle, and so forth. Restimulation is inevitable. The very tools of the trade in the auditing session result in restimulation.

Now auditing works because of restimulation and the blowing of that charge. And it's a cycle. You restimulate and you get the charge off and you restimulate and you get the charge off and you restimulate and you get the charge off and you restimulate and get the charge off, you restimulate... That's all that auditing is – there's no more than that!

Now, of course the odd part of it is, that you don't have to personally sit on top of the charge which is being blown off, so therefore you can blow an early charge on any chain – blow an early charge on any chain of incidents, without the rest of it being particularly in restimulation – and you'll get the charge blowing off the rest of it out there a light-year away, and it all kind of starts shattering and going to pieces and dropping apart. And you don't see it particularly register on the meter. This is what marks faster auditing. See, it's getting the

charge, which triggers off charge. That is what regulates it. But, that's merely faster. That's the only thing that does.

But, whether it is charge restimulated in present time, or charge restimulated ten years ago, or charge restimulated ten umpty-bumpty trillions, it is nevertheless charge – and it's going to be restimulated on the whatsit line. Now, if you don't put in the itsa line, and let the charge come off that is restimulated, then the pc gets too much of it banked up – pardon the pun – and he just more or less drowns in this stuff. And he doesn't know whether he's coming or going after a while. He doesn't know who his auditor is, and so forth, he ARC... he's ARC broken with somebody on the track and he ARC breaks with the auditor and bypasses charge, and he dramatizes and all that sort of thing. This is strictly because he's overwhelmed.

It's: How much charge do you restimulate? Now, I've shown you two examples – restimulating too much charge and restimulating too little charge. And they're equally errors. Because in the first place, restimulating too much charge, eventually no auditing gets done – and restimulating too little charge, no auditing gets done and they're both sins. It's not necessarily true that the person who restimulates too little charge is more virtuous than the person who restimulates too much charge. In fact I would say, he's the real sinner. Because at least this pc sometime or another may be able to sit down with somebody who *will* listen to him, and get off the charge he has now become aware of. See, that possibility exists. So the real sin is not restimulating any charge.

And you'll find somebody who pulls off from running an engram because the pc hurt too much. Well, I don't think that has anything to do with auditing. I never heard that influence an auditing session before. So he hurt too much – what's that got to do with it? What auditing are we dealing with here? No auditing I ever heard of. Pc hurt too much. What's that got to do with it? I don't understand. You mean you ended the session because the pc hurt too much? You can kill more pcs that way. Pc's saying, "*Ow-ow-oh, it's terrible! Oh – it's terrible!*"

You say, "All right, well, it's too terrible, we won't finish running it."

And you want to see somebody in terrible condition, man! That pc is now in terrible condition! You just bypass the rest of the pain right there, you see. Lock it all up and boom! I'd go so far as to say that earlier on the track when they're in good shape, thetans enjoy pain. If you don't believe it, sometime tell somebody "Waste some pain, thank you. Waste some pain, thank you. Waste some pain, thank you. Waste some pain, thank you."

You'll see him all of a sudden get this haunting idea. "Go ahead. Get the idea of wasting some pain. Good. Waste some pain. Good. Waste some pain..." He looks at you, "You know, I like this stuff." It's very remarkable. Sadism is not peculiar. Sadism is a lower harmonic of an actual fact. Any sensation is better than no sensation and anything is better than nothing.

Now, that's different from only being able to enjoy pain. That speaks of a very low-scale character. But pain ordinarily didn't bother you at one time or another. I can see you now, putting your – putting a beam into power line insulators for kicks. You know, wondering how much *zing* you'll get out of it. "Hey, Joe, come over here. I think I found one that's a

couple of hundred thousand volts." [laughter] "That stuff over there, that's only ten thousand." [laughs]

Well, just look at your Effect Scale, you realize that as a thetan goes up scale he can stand more effect. He can feel in different ways about the same effect, too. This has nothing to do with it then. That's a particularity of sensation or a particularity of reaction. An auditor really doesn't have anything to do with the particularities of action. You can't say that actions are bad actions or good actions, as far as what the pc is going through. You can only say, is his mind on his case or not on his case? If he conceives all the bad actions taking place in his environment, he for sure has an ARC break, i.e., newspaper reporters, and so forth. They're ARC broken someplace or another – to such a degree, that they're practically psychotic. And they can only see the environment, you see. They can't get interested in their own case. Therefore, they violate the basic definition of auditing and they're therefore unauditible. Most newspaper reporters are unauditible.

Scientists have every once in a while tried – I'm not starting on the subject of news, but there just happens to be a breed of cat – and he has a hard time, because he's running up social overts all the time and he eventually gets a tremendous amount of missed withholds. "Now, Joe, I'd like to write this story about you, Joe, and we're really going to write a good story about you, Joe." And police think that Joe has murdered his wife, see, and he's just trying to get some hot dope. Joe sees the story on the headlines, "Murder Suspect in Love Nest Slaying." See, his overt is creating a fantastic ARC break, see. The guy told him something in confidence, and he went and wrote it in some other way, don't you see. He gets caught in this all the time and he eventually with this piled-up series of overts, he starts dramatizing it. So there he is – he's just caught and it... everybody talks to him, missed withhold, missed withhold, missed withhold, missed withhold, don't you see? Overt is create the ARC break – betrayal, betrayal, betrayal. Missed withhold – betrayal, missed withhold – betrayal. Next thing you know, there he is. See, total ARC break with the entire environment.

I'm just giving some – just that as an example of somebody who gets chronically in this condition. And you can put your pc in exactly that condition – not because of overts or withholds particularly – but by just taking a great big slug of restimulated charge, letting the pc not get hold of very much of it, restimulate it pretty well out of his sight, you see – and then drop a nice iron curtain down in front of the charge. And boy, that charge glances off that nonexistent itsa line, and goes right back on the pc – *kapow!* It's just like short-circuiting things.

You could even – you could even dream up an electrical circuit that would do this – it'd be quite factual. Dream up an electrical circuit so that this condenser over here, and so forth, could build and build and build, and then the line this condenser is supposed to bleed, over here and the charge dissipate. And then get a knife-edge or something that crosses that line, to block that dissipation line, don't you see, and get the charge so that it's rerouted back to a bulb we will call the pc – and boy, let me assure you that bulb will light up, see. Or you could even have a little neon circle around the pc called "restimulation," a red neon tube around this bulb, and boy, you would not see the pc light up, you would see the tube light up, and even that would be more graphic. The pc goes out and the tube lights up, don't you see? You could make all sorts of graphic representations of this that would demonstrate it, because

it's as crudely demonstrable as that. I'm not talking allegorically. There's no allegory mixed up in it at all, it's just fact.

Auditor says, "*Da-da, da-da. Da.*"

And pc says, "Hm-mmm..."

"Well, all right, thank you." In the multitudinous ways he can cut the line. And the auditor says, "*Da-da-da-da-da-da. Da.*"

And the pc says, "Well uhm – actually..."

"Well, sss – it's – doesn't read on the meter here. Don't bother to answer that. Very good. *Da-da-da-da-da-da-da. Da*" – *Bow!*

And you can practically hear the electrodes connect, finally, in the pc's skull. *Bzz-zzzz-zzzz!* Pc goes out of control and is no longer capable of self-control because all of his control mechanisms are shot – they're short-circuited with charge. After all, he controls his body, his voice, his thinkingness and so forth, with neuron-directed currents, as long as he's in a body. And the second these things get too charged up, why any action that is there to be duplicated in terms of a dramatization, will of course get duplicated. And he then cannot get through this charge in order to assert control of his voice, his limbs or otherwise. He sort of sits back himself in total amazement at watching himself in this ARC break, and also totally incapable of halting it until you finally identify, locate and indicate that charge. And the second you locate and indicate the charge, you have dissipated it to that degree, that the person all of a sudden says, "*Phewf!*" and you've given him back his controls.

It'd be the same as taking the pilot out of the cockpit of the airplane and throwing him back halfway down the fuselage. Meantime having thrown enough tanglefoot into the cockpit that it'd short-circuit all of the various instruments, controls and so forth. Naturally the plane will go into a spin. It's as elementary as that, it's not any graphical or allegorical or odd thing, I mean – it's sitting right there in front of you. You can look at it straight in the eye and see it happen.

Now reversely – reversely, we don't give the session any fuel to run on. Don't let any current run in the lines at all – no current at all. That'll be the end of that session. "Is it all right with you if I start this session now? All right. You sure there isn't something you want to say? Oh, you're not – not saying anything, all right. It is all right if I start the session now, isn't it? All right, well, here goes. Start of session. All right, very good, okay, we're going to run some sort of a process here, but you just feel free to tell me anything you want to tell me. Now what – what do you want to tell me? You haven't got anything to say much, huh? Well, I don't have much to say either. All right. Well, maybe we can put two-and-a-half hours in here without getting into trouble. Seen any pictures lately – no, that's a pretty dangerous subject. Let's talk about books, huh? Let's talk about books we haven't read. How's that?" [laughs]

Well of course – of course it's a no-auditing situation. Your pc by the way will get just as upset on a dry run. Why? Because he keeps trying to find something, he keeps trying to find something to talk about, and he hasn't got anything to talk about, and you're now however running an electrical circuit with no current at all.

Eventually, running it with no current at all, you run it dry and it sort of takes on a sponge-like characteristic. And the condenser will start picking up charge, whether you want it to or not. Simply out of the intention that auditing is going to occur. And this no-current circuit will gradually bleed some charge out of the bank, in spite of the auditor, in spite of the pc, it is still mis-charge and the pc will still explode. You can't win. The only thing you can do is to restimulate the amount of charge necessary to keep the session going. And that's how much charge you restimulate. See that? That's how much charge you restimulate. You make it as basic and as fundamental and as significant as possible – but you don't keep going for charge and charge and charge and charge, leaving charge unblown – because you're eventually going to swamp your pc, no matter how tough he seems, you still will swamp the pc.

Now, this tone arm is the instrument which measures the adequacy of restimulation. That shows you that an adequate amount of charge is being restimulated in the session and that it is being adequately dispelled on the itsa line. And this shows you that the cycle of whatsit-itsa is in progress, and the amount of restimulation is adequate to get auditing done.

Now the funny part of it is, that it's absolutely miles of margin. You would say – you look at some pcs that have a fragile, delicate tone arm, and you won't think there's this much margin – but in actual fact, on the usual pc there's just really miles of margin. You can over-restimulate and still get tone arm action, you actually underrestimulate and get some tone arm action. In other words this is a high level of tolerance. The tolerance is tremendously high. That's perhaps a happy thing, but it doesn't give you a split hairline estimation. You can have the pc pretty well swamped and still be getting tone arm action – you can be running the pc too shallowly and still be getting adequate tone arm action, see? So there's a lot of tolerance in this. It isn't anything that you have to measure very precisely. Most auditors, therefore, groove into the situation that they get tone arm action, then they don't worry about too much restimulation or too little restimulation.

Now if you get too much restimulation, you get an inevitable cessation of tone arm action. If you get too little restimulation, you get an inevitable cessation of tone arm action. The result is the same for both conditions. There is nothing in the meter that tells you you're getting too little or too much. But the mechanics of auditing, all by themselves; any valid auditing question, that gives tone arm action, is restimulating enough charge to cause auditing to occur. So auditing itself prevents to a marked degree the lower, too little restimulation from occurring, if it is done.

For instance, if you're doing anything and getting tone arm action, you probably are at the minimal. Now, that's also – you're told by the amount of significance which you are auditing. You're auditing, let us say, GPMs, man. And you're piling it on, hot and heavy. Well, let me tell you, at no time during that session are you going to have too little tone arm – too little charge. At no time are you going to have too little charge. You're fooling with stuff – you're fooling with stuff that obviously is going to give charge – heavy engrams, heavy GPMs, back-track stuff, all this sort of thing. That is all capable of furnishing Niagara's of charge – and just ticked will furnish a Niagara of charge.

So when you're using upper-level processes – when you're using upper level processes – the only error that you pay any attention at all to is too much charge being restimulated.

And that's the only area you pay any attention to. You're sitting there throwing the GPMs at him and that sort of thing. Well, you're sitting there pushing items at him. All right, you're running a chain of engrams. All right – fine, fine, fine. There's certainly available Niagara's of charge. So on higher-level processes you only have the "too much charge" error. On high-level processes you only have "too much charge" as an error – and that's the only thing that halts the tone arm action. You actually can't err in the direction of minimal charge. Because if you just stopped running the GPM the guy would start – and let the itsa line in – the guy would start drifting up through the locks, telling you about locks and that sort of thing. It'd be impossible for him to remain static in the bank, in the vicinity of this much living lightning, don't you see? You can't make the minimal TA error in running high artillery.

Build an atom bomb or build an atom bomb that doesn't explode enough. You see, it can't be done. That's the whole trouble. You take the Savannah – that atomic ship that they built and these submarines. They've done a pretty good job on the submarines, on that atomic ship, and so forth. Their trouble, all this atomic design – the trouble is just too much hate. There's too much horsepower. They can't get rid of it. There's enough there to run the ship and to warm all the water around the ship and cook all the fish for half-a-dozen fathoms down below the keel and they still can't get rid of the stuff, you see – there's just too much power. And that is your problem in auditing high level processes.

This is one thing for you to know, man – in spite of the fact that you don't think the pc is getting much contact with it, because you aren't getting tone arm action. You've got him running through any GPM, and you're not getting tone arm action – let me tell you that it is never *too little* charge. See? Now you get this pc going through the incident and you're not getting tone arm action and you're just getting a flash. In some Central Organization recently they were – no tone arm action – no tone arm action, and half-inch rocket reads choked, was considered adequate to run a GPM. And everybody was walking around looking like corpses. Fortunately the Assoc Sec landed in time. Grim!

All right, now what's this condition? What's this condition all about? Too much charge. Pc shuts it down. Tone arm locks up – no tone arm action. Can't be any such thing as minimal charge, you see? You say, well, it's beyond the reality of the pc. Well, you've explained it in a dozen different ways. I don't care how you explain it. It's just too much charge. Because unreality equals force and invalidation. If you want to know what unreality is, it's force and invalidation. You can add on the thought level, disagreement. Force, invalidation. Invalidation slightly on the thought level, too. Uncoordinated force – raw force. That sort of thing. That's unreality. So that person to whom things are the least real is that person swamped by the most charge. Your problem in such a case is how do you bleed it off – not how do you restimulate it. How can you open up a line to decondense the condenser – that's the problem, not how do you restimulate charge. Life's done that for you adequately and the pc has cooperated gorgeously – and the pcs got themselves in a charged up state that they're like living lightning. They're swamped all the time. Don't feel good, this, that, the other thing – all these various body conditions, sort of ARC breaky with life, and so forth. There's just too much charge.

The auditor – the auditor has to be a skilled wirelayer, to attach the discharge line, with sufficient delicacy that it won't blow all at once because the pc would simply explode

into an ARC break or something. So you've got to bleed it off very carefully. Now what do you – what do you put the lead to? What do you put the whatsit line to? How do you tap this thing? That's the big problem. Look, you could sit there and say, "Well, do you have any GPMs in restimulation? Well let's run a GPM." This person's tone arm was never known to move from 6.5, or from 1.0, see. "Oh, let's run a GPM." Oh, great. Oh, man. It's like emptying the Pacific Ocean into the Atlantic Ocean because the Atlantic Ocean doesn't have enough water in it or something. See? And after you've emptied the Pacific Ocean into the Atlantic Ocean, why, you're going to find the Atlantic Ocean is now too full. That's for sure. People are going to be wearing rubber boots in New York, that's for sure!

But let's look at this then. Then it is not a problem of emptying the Atlantic Ocean at all, to one of these fragile tone arms – pardon me, not throwing more charge in there at all. It's not even a problem of emptying it. It's a problem of how do you get a few drops out of it. You know? The few drops that the pc's knowingness and reality will carry as a channel. You'll find such people very often beg you for a one-shot Clear process, you know? They actually sell this so hard they probably create psychiatry. Create these heroic methods, see. The old Effect Scale is in process here, see. To these people, you say, [whispers:] "Did you ever solve any problems? You ever – you ever think about anything? Would you like to tell me about it?"

"Well, yes, yes..."

They don't know if it's safe, see, and you'll see them clam up a lot, and not talk a lot and go into large pauses and all of this kind of thing, don't you see. But gradually you'll all of a sudden see your tone arm move. See, you've opened up a safe charge-bleeding line. They're not suspicious of it; they're not worried about it. They know nobody can handle this stuff, see. They – that's what they know. That's the biggest knowingness there is. They got the idea they're, they're just delicate, that if they think the wrong thought they're going to go nuts. See, they're in a – they're careful. They're careful all the time. They must think pure thoughts. "If I walk this tightwire called life, exactly right, I don't know, maybe I – maybe I'd better not walk it today." [laughter] "Tomorrow – tomorrow, that'd be – that'd be best. We'll start tomorrow. *Whoooo!* I almost stepped on the thing," see. Everything is a live wire.

The Scientologist who's had quite a bit of auditing, particularly you guys, you'd make me laugh at you if you told me you felt like you were going mad, or something like this. I frankly would just laugh in your face. I wouldn't put the itsa line in at all. I'd laugh. Because frankly, you couldn't possibly make it. [laughter] Once in a while, after a session has blown your brains out or something of the sort, you might feel like sobbing and crying to yourself quietly, but you'd still know you're going to come out of it.

Well that isn't how this character who's never had any charge bled off at all feels, man. That is the carefulness created in psychotherapy of past ages. That is the general philosophy of such people's lives, if they're just cautious; if they – if they just aren't adventurous in any way, they somehow or another, will get through. Well, what are they – what are they doing? They're just – they know they're living on a bomb, and they're afraid to connect it up to anything, so they're afraid to say anything to anybody, or anything like that. I know one pc up in London – finally we found out he'd been collecting all the blackness in the universe – all the blackness in the universe, to keep other people from having to suffer from it. That was his

final act of kindness. And this guy – this guy looked like an animated corpse, complete with – complete with formaldehyde scar, you know? This was a bird, man! He was a gone dog.

Now you run any pc too high grade, pick up too little charge on the backtrack, you keep him looking bad while he's getting better. Let's get into another ramification of this. You might even deteriorate the condition of his body while he's getting better. There's no particular reason making him look pretty, but the point – the point I'm making here is that you actually can run him too steep by far for his body tolerance, and still get tone arm action. But when you exceed that – when you exceed that, your tone arm action will cease. This is all on the subject of charge and nothing else.

Well all of this is very, very interesting but what do you do? What do you do? And what actually has happened here? And how did somebody get that charged up? Somebody comes off the street, never had any auditing, never studied any books – no reason for all this charge to exist. You realize by cognition alone, they read books and get charge off one way or the other. We discharge a lot of things that we never see on an E-Meter – tremendous quantity of it.

Oh, there've been a lot of cases of birds lying in bed sick, they read something like *Dianetics: Evolution of a Science*, something like that – and been in the hospital for Lord knows when, the doctors are about to operate and they say "to hell with them," and get up and get on their clothes and go out and never been sick since, you know. Weird things like this have happened. Well, that was a showing that there was a link existed for the charge, and some must have blown at that particular moment and brought the case to an equilibrium. So it knocked out the psychosomatic illness. Anybody with psychosomatic illness is simply suffering from too much restimulated charge that he doesn't know what it is or how to get rid of it or anything else.

If you ever want to meet a nasty character, meet somebody – I mean a nasty-tempered character – meet somebody with cancer. They're uniformly nasty tempered. Well how much – they're in an almost total continuous ARC break. Just fabulous – ARC break going on all the time. Certain particular types of cancer are worse than others.

Arthritis – arthritis is a case in point. Arthritics, *raaooow!* See. Well, what is all that stuff gathered up on the bones and binging into the cells, and all of this sort of thing? Well, this isn't any esoteric charge, like poor old Wilhelm Reich's. What was it he had? – orazone or something. The FDA killed him you know, just as sure as they stood him up in the street and shot him down with a gun. And he was never arrested for anything he ever did. They faked him a contempt of court charge, you know, and threw him in prison, and the old man was already an escapee from Hitler and he just went into pure terror and died. The good old FDA.

Anyhow, poor old Wilhelm Reich, he was always talking about this stuff that was drifting all over everything. You understand – he was talking about charge. You find old Jung. He's always talking about some kind of mysterious influence in his vicinity. You know, stuff broke around him. You know he never attributed it to himself? It's very remarkable, but stuff – everything was breaking and snapping. He and Freud were in a room one day and a whole bookcase split down the back. [laughter] Just fantastic things going on around him. He never – he never said for a moment, or he never thought for a moment that it was himself, see.

These guys are actually dealing with force. Forces of one kind or another. Well I don't care whether we measure them like poor old Reich, and call them by an odd name or measure them and not know anything about them at all except note their effect as in Jung's case, or wherever we look we see the evidence of what we're talking about and calling charge.

This guy is going this way down the street, see, all the time. Well, what's holding his hand like that? He wouldn't be holding his hand like that, man. There's something holding his hand like that. All right, call that charge. He's – here's somebody else – here's somebody else and he's got himself a neck – hurts him, all the time, all the time, all the time, all the time. Well, we isolate it down; we find out after a while it's a pole trap, or it's something like that or somebody's stuck in a GPM, or something like this has happened to him – that's what gives him the somatic. But that's the particularity of the charge, giving its time and date location and so forth. It is simply just charge. And it is in restimulation, so it chews the devil out of him.

Sometimes you notice right after a session you've got somatics. And you walk away from a session and they vanish. Well, it's a case of momentary restimulation. Other times you walk out of a session, you have an awful somatic and it doesn't vanish. And the next day you're still feeling foggy. And two or three days later you're not foggy anymore. Well that is the period of destimulation of charge. Usually from three to ten days. Now of course if you continuously stimulate charge and continuously stimulate it, continuously stimulate it and never pick it up, give it no way to bleed off or anything like that, it becomes chronic charge. And that is what happens in life. You get a restimulation of charge and it becomes chronic.

Now actually, you have to enturbulate a thetan pretty badly to put him in a condition where he can get chronic charge. You have to give him an implant every twenty-five, thirty, forty, fifty, sixty, seventy years. You have to hit him hard – and sometimes even then you don't hit him hard enough. I know, they're probably being critical right now on the subject of, "They've got to step up the megatrons in the between-life area – those damn Scientologists coming through here, blowing out all the fuses. Rewire the place." Make you feel creepy? Well it shouldn't make you feel creepy, they wouldn't do anything for you. I don't think they're that energetic anymore.

They're dependent upon a system. So they've got to charge up your bank and charge you up, and so forth, so that you can get charged up and be uncomfortable enough to consider yourself entrapped. I just ran into – while they prepare you for the series of implants which you will get at the end of each lifetime – your preparation series. It's just a series of GPMs. The wildest most vicious GPMs I ever ran into. Practically everybody's got them at least twice. Carefully misdated. Carefully misdated. And every goal called a wrong goal.

Audience: Mm-mm.

There's at least thirty or forty wrong dates on every one of the GPMs. And that's how they get you to return. Because between the wrong dates, they tell you to get out and come back here, see. That's how they freeze that in. I wondered how they made you feel all the time you're being dragged around and everything. I'm on the – I'm on the trail of that now. But that was – it's very elementary how they get you to return every time – they sandwich the command to return, between a series of about eighty GPMs, and somebody is going to come up

with the idea that he ought to, whatever other idea he gets. But it makes you think more and more that they're not native to this galaxy, because this particular series does not carry the significances. The goals are opposite-terminated, yes. But the goals themselves are of a characteristic, as to make life the opposite terminal, so that livingness gives you the oppterm. This is very nice.

Goals are lovely: "To be wrong." "To get caught." You know, that sort of thing. All derogatory goals. So they make you of course be the opposite thing to this, see. So they naturally stay hung-up better. And then they're all misdated. So you could produce this on a laboratory basis. Research basis, see. You can produce too much charge as a research basis. You could have this PC, pc is running with tone arm action, pow-pow-pow-pow-pow-pow-pow-pow-pow-pow. Not let's – let me show you now the ceilings you could go into. They're not all wired for asbestos sound, and take unlimited amount of bang. They can't. They're not like you, either. Because they're still thinking that careful thought, man. See, and you're going to put a little bit more charge on it, they're not going to think that careful thought, they're just going to go – thud. You're running a person who is awful close to thud. Whether it's his individual tolerance or not we won't discuss.

But you can get TA action off this person, TA – you'll have this problem all the time as an auditor. I'm going to talk to – about – I'm talking about one of the commonest problems you'll have, see? You get this person, they got – getting TA action, goes *ping-ping-ping-ping-ping* and it goes from 3.4 and 3.4 and 3.4 and 3.5 and 4.25 and 3.4 and 2.75 and it just – nice tone arm action. You're – they're just sitting there talking. See, they're just sitting there talking. And nobody's running any process on them, so you say, "Well, that's fine, this person gets good tone arm action. So therefore, we're going to run the goal 'to forget.'" All right, so we run the goal "to forget," and the tone arm action is from 3.5 to 4, with wide strikes. Now this is perfectly all right. But watch it, man – watch it, man. All you've got to do is bypass some charge, leave an item charged, mess it up, give it an ARC break, be a little bit unskilled in auditing and, – pow! that discharges. Gone. There goes your TA action – gone! You aren't going to get it back, either. Not without an awful lot of work.

And now this person's jumpy. Person doesn't quite know what's going to happen to him. Something catastrophic has occurred. Don't you see? They're not getting results out of auditing. They don't think auditing is giving them the type of results, see. So your first indication that you are moving a case up to zenith on high-level processes, and if they're going to hit that point of tolerance and go right straight on through the sound barrier – bong! – the first point is a lessening TA action. Now watch it, man. Because when the TA action lessens, you are already running the case beyond tolerance. Now I'm talking now about your Routine 2, Routine 3, Routine 4 processes – which you haven't got yet – 4.

But, your – this is your skilled – this is your skilled auditing level, you understand. Those – those are the things. You watch that, you watch that diminishing tone arm. Ordinarily you won't see it, because you don't study it until after the session – or half the session goes by and you suddenly realize that you know, this character was moving from 3.0 to 4.25 yesterday and by George, this whole session so far, the pc has only moved from 4.75 to 4.5 and see what's happened here.

Now, you're not in trouble – you're not in trouble. You can go on. You see, your tolerance is pretty good. You can go on. Only, watch it. Start auditing more carefully. Start being very careful to keep that itsa line wide, wide, wide open. And be very careful that the charge you do restimulate is actually brought off the case. Start to audit that case more delicately, don't you see. And don't change to another type of auditing, don't restimulate another single item, until you've gotten what you're doing squared away.

Some cases are quite masochistic. They want to go earlier and tear up the whole track. You've got a case that has already had lessening tone arm action, and he wants to go back on the backtrack and restimulate a whole chain of goals. What do you do then? I'll just leave it up to you, because man, you've opened up a whole chain of goals on this character – you've opened up something new when you haven't got something old finished off and you are now in trouble. And many a pc will sit there on a very hard sell and try to persuade you to do exactly that. And you can just cut your throat, man! Understand, that that pc has had diminishing tone arm action. You've already seen diminishing tone arm action on the pc.

Now the pc's going to get ambitious and wants to tear up a lot more charge. Oh, boy! That's the way you get your tone arm stuck. Now, the way – the best way to keep from worrying about a stuck tone arm is not to stick it. Now, that's really the best way. Now, the next best way is notice it is diminishing. And the moment you see it diminish, haul out of there – as far as more restimulation is concerned. Let's start getting – let's start getting thorough. See, we've got a GPM. I'll show you one way to do this – we've got a GPM and all of a sudden during that whole session that tone arm has diminished.

I'll give you an example. We run the center goal out of the Bear Implants. One of the centers. We've assessed for it on 3 – on R3R, and we run the center goal out of the Bear Implants and we say, well, we've got that, we'll just run the rest of that series of goals. So at that level of the track, you assess. You list for the next goal to run. Yeah, but you had good TA action, see. And your TA action goes – gone. What happened? You restimulated the three or four adjacent goals in that series of five goals, and you now have four or five GPMs in restimulation and that amount of charge has caused a cessation of tone arm action. See this? So, that you can ordinarily trace back any ceased tone arm action that has been moving to some additional charge stirrer-upper – which then was in no way at all handled. You say, well, you couldn't handle it.

Well, then the real subject of this lecture, which I should have given you earlier, but can be told to you in a very few inches of tape, is simply this: The problem – the puzzle – the mystery is the high tone arm. That's the whatsit line, you understand? The whatsit line or restimulation in general gives you the high or very low tone arm. But the common denominator, the overcharged case, the overcharged case, is always the whatsit line – even if life is putting in this whatsit or even if the pc is putting in this whatsit.

And the wrong thing to do is to get more whatsits on the case. Let me show you a totally wrong process. I don't care if it was part of 2-12. I've just discovered this. This – to – absolutely completely bassackwards wrong process, completely *blyaww!* – is: "Tell me something you've been worried about." All you would have to do – all you would have to do is get one with a puzzle, a mystery, you know, a whatsit type item, you know, whatsit item. You

know, "What have you not understood in life?" That would be marvelous, see. That's a what-sit type item and have him just list whatsit type items. And the tone arm is going to go right on up there and it's eventually going to stick like crazy. Why? Because that's nothing but whatsites. Even though the pc is giving them, the pc is not given any opportunity to do anything but concentrate on whatsites. See, terribly elementary situation here.

If you wanted to cure that, you could have assessed it to a central or a reading whatsit or any of the whatsites on the list the pc seemed to be interested in, and just ask him "What solutions had he had for this." And that's your itsa. And watch the tone arm start moving into action again.

"How many problems does this solve?" would be a totally incorrect auditing question. That's absolutely backwards. That'll just park a tone arm. Now let's get it right way to. "How many solutions are there, have you had..." let's not dream them up or invent them – "How many solutions have you had to this problem?" That's totally correct. Because the pc is where he is, because everything has cured everything. I have an index someplace or another, done in 1958, I ought to bring this to you, I have to give you another lecture on it next week. But the cures are the cures are the cures are the cures. It even goes into matter, energy, space and time, how each one is the cure for the next one. Cure, cure, cure, cure, cure. That's what gives you the itsas. The itsa line then goes in. See?

"How have you tried to solve this problem?" Got a problem, see. "What solutions have you had for this problem?" I'm just trying to give you a graphic auditing working example, see, that puts the itsa line in and brings the tone arm down. So you ask for – you give the case new problems, new problems, new problems – you give him no chance to give any solutions to the problems, your line will go up, see. You give him itsas, itsas, itsas, itsas, itsas, eventually it'll come down, and eventually it won't go any lower because they haven't got any problems to give any itsas for. See? They haven't got any whatsites to give any itsas for. Now is the time to find out another whatsit already in restimulation, and get all the itsas for that whatsit that is already there. And then find another one on the case that was already in restimulation, and find all the itsa lines for it. And you could coax anybody's tone arm down, following through this. You got it? It's elementary once you start looking at the thing.

But it can be very baffling, and I know very well that you're still going to have some awful headaches, sitting there looking at some pc whose tone arm has suddenly ceased to act and ceased to move and trying to get the pc to answer the question, trying to pick the lock, trying to get that fantastic and horrible combination – that one little delicate point that the pc will release some charge on – that will start the tone arm acting again. Trying – trying to bleed that charge off. What is something small enough or tiny enough that the pc can let go of? And you'll get the tone arm acting again. Pc lets go of nothing so long as you have no tone arm action, so therefore tone arm action is necessary to get off any charge.

Oddly enough, knowingness and reality do not increase unless charge is released from the case. So then the case knows nothing has happened if you don't increase his knowingness. Okay?

All right.

That's all I have to tell you about it.

Thank you very much.

THE ITSA LINE

A lecture given on 20 August 1963

How are you today?

Audience: Good. Fine, thank you.

All right. This is what?

Audience: Twenty August.

Twenty August AD 13. Thank you.

Well, this is a lecture on the itsa line. About time. The itsa line. Why is it called the itsa line? The auditor says, "Whatsit?" and the pc says, "Itsa." It is the pc's communication line from pc to auditor. And it isn't necessarily pursuant to the auditor's whatsit; it is sometimes pursuant to the pc's whatsit – pc very often puts in his own whatsit.

Okay. There are numerous communication lines between the auditor and the pc and the aggregate of these make up the – what you call the auditing cycle. The auditing cycle is made up of several communication lines. A communication line is cause-distance-effect. I call your attention to *Dianetics 1955!* for the full definition of a communication line. What is a communication: intention, attention, duplication at the point of effect, and so forth.

All those are quite important and technically accurate, but what you're mainly interested in is cause-distance-effect. Cause-distance-effect is a communication line. A communication line is not cause-distance-effect, cause-distance-effect – that's two communication lines.

Now, a communication line can be very faint, and one of those that you'll find out routinely on an auditor is the attention line: line 1 minor; line 1 minor, the attention line. And that is just consistently out. But as I say, there are numbers of these and we're not particularly going into them. That's the first line. That's – get the pc's attention; how do you get the pc's attention to cause the pc to put his attention on the auditor? And that line is the one that is put in.

Now, that line itself can be complex and become two lines or three lines. Pc sitting there and he's saying, "*Gob-gob, walla-walla,*" something, and the auditor wants to get his attention on him. See, it has to have attention on the auditor. Now, the auditor can't really give an auditing command or do anything with his command unless he gets his attention line in.

Now, that can be done very crudely. You can drop the E-Meter, you can cough loudly in the pc's face, tip over your chair, get angry. There's, in essence, numbers of ways to get this line in very, very wrong. And the line has to be put in, however, and very often you find a pc fogging around at the beginning of session and his attention is not on the auditor, it's really not on his case, it's not on anything you're trying to do, and so forth. Well, how do you get it there? Well, one of the ways of getting it there is, having an attention line already extant, you then convert it to an itsa line.

Now, this is the whole trick, because there's another attention line. There is attention on what, see? And this looks like another attention line – it's actually 1 minor. It just isn't putting the attention on the auditor, it's putting attention on something else. And this is a little trick I used to do that used to baffle everybody in ACCs. They used to get baffled, and everybody would drop his jaw and look at me dully when I would try to get them to do this – and it's been wholly unsuccessful – but by dividing down the auditing cycle into these various communication lines and component parts, I will bravely take another crack at it.

It's slippy. I know if I give this to you, it'll become a repetitive-command process, which it isn't. It's slippy, that's all – is you just very adroitly, without really putting the pc's attention on anything except what his attention should be on, just flick the pc's attention over to what it should be on. I'll give you an idea.

Pc is saying, "Oh, I just – just – just can't stand – can't stand these – these wild parties. Just can't stand them. Had one last night and just can't stand them, and so forth. There's just too much – too much music and everything. And I've got an awful present time problem, because this guy's – this – this – this girl's b-b-boyfriend came over and wanted to pop me in the eye because I was getting too familiar... and it's terrible." And present time problem, present time problem, present time problem.

And you know you're running the GPM "to be sexual," see? This you know about the case. This is – this I'm giving you, also, is the itsa line.

[One can hear thunder in the background] Hey, we're getting a nice storm tape here too, Peter. We'll cut the storm off of it, and so forth, and sell it. They go great in the Middle West. They love storm tapes. It reminds them of home.

I had a green tornado one time in Kansas – never been back since. Twenty-five-pound blocks of ice were falling out of a pea-soup-green sky, and the visibility had dropped down to about fifteen feet – bright green. Never quite recovered. Was impossible. Couldn't have happened – but it did.

Now, your pc's attention being all over the confounded place, the auditor sits back and says he's going to put in the itsa line. Now, usually by this – unless he is well trained and has this data, and so forth – this means he's going to sit back and leave the pc's attention totally uncontrolled. The itsa line, when you first start giving it to people, is just never doing anything but listen. And that's because people think it is simply a communication line, and it isn't. But we will go on to this in a moment.

Now, therefore this pc is running on and on and on about this party – and this is slippy auditing. I can sit and do this by the hour. PC never finds out about it, and there's no com-

mand process being run and everything else, and tone arm moves like mad, and so forth. It requires a certain estimation of effort, you understand? And I actually, years and years ago, despaired of getting anybody to control attention that lightly. This is another effort to do so, see?

So, you say – he's going on and on, "And this guy came over and he almost bopped me, but this was a nice-looking girl, and so forth. And I had a terrible problem because of my wife, you know, and so on, and..." Here we go, see?

Now, the auditor who is not well informed and who is not well skilled just sits back and listens to this whole thing. Now, to do anything about it suddenly is to put line 1 minor in on the auditor. Clank! And boy, the pc will ARC break, see, because it's a sudden shift of attention. So the whole thing is the skill by which you can take line 1 minor and flick it over onto what you were doing or want to do in the session – the skill with which you can do this. And, believe me, this is a skill manoeuvre. And when you are really skilled at this, you could almost sit down and run a full auditing session, and even a casual observer would think you were simply listening to the pc, which you weren't at all; you were actually directing the pc's attention very closely. The pc was talking exactly about what you wanted that pc to talk about and nothing else, and the pc never realizes that their attention has been grooved on it.

Now, that would be the tremendous difference between psychoanalysis listening and Scientology auditing. You see, these things could look quite alike.

The psychoanalyst (1) did not really know what to direct anybody's attention to, see? He didn't know the anatomy of the bank. He thought if he could direct somebody's attention to sexual incidents in early childhood, he had it made. Well, now, a pc – a pc – actually follows in his case, at any given moment, the least-charged line. A pc will always follow the least-charged line. Get this. Get this good, because that's one of those remarks that goes by in the night and you wonder someday – you're sitting there auditing somebody and you don't know what to do, and so forth. And it's one of those things that if you knew that well, you'd know exactly what to do. He always follows the least-charged line with his tone arm action. If you're going to get tone arm action, it is on the least-charged aberrative line – not the least-charged thing he could talk about, but the least-charged aberrative line. The tone arm action exists on the least-charged aberrative line at any given moment in a case progress – always the least-charged aberrative line.

Now, give you what I mean by that. Let's take dynamics. You've got eight dynamics you could audit on the pc. The third dynamic is what the pc is always coming up with. Well, if you kept the pc on the third dynamic, you know, you would get tone arm action because this happens with the pc to be the least-charged line. You got it?

Now, the other lines do not give tone arm action, and this does not mean they are not charged; it means they are overcharged. There is too much charge on them. Got that? So you're always trying to snake through the minefield on the least-popping firecrackers to get your tone arm action. You got that? You want little ones that'll just tingle his feet; you don't want those that'll blow his legs off. You understand?

Well, the mind is so regulated and safety-valved that it will not release charges which the pc considers over his ability to tolerate. Now, an auditor can actually punch these charges

into view; he's got all the materials in his hand. And therefore he could actually throw the pc into areas which are overcharged areas to be run – the areas are overcharged.

The result of an overcharged area is a stuck tone arm. Stuck tone arms have many peculiarities and particularities. You can say that if you want to really get tone arms moving you have to get the GPMs on a case run; that's the most likely to give you tone arm action. Because it's the most aberrative in terms of time. You can say a lot of things about tone arm action. You say tone arm action sticks because of time – these things are all true. But with regard to charge, what you really want to know with regard to charge is that in the presence of too much charge, too much charge, the TA ceases to operate. TA action ceases when you have too much charge.

That doesn't say that you couldn't bleed it, that you couldn't work your way around it, that there aren't means of getting off the charge anyhow, and all that sort of thing. But when you see a TA ceasing to operate, and ceasing to act, then you have entered an area of too much charge – particularly on an extremely high or an extremely low TA. Do you follow that, now? Too much charge.

It's not because there's nothing there to run; it's because there's too cockeyed much there. See that? And if you don't get tone arm action, then the charge that holds the significances and ideas, postulates, cognitions, and that sort of thing, in place – just the corny electrical charge, you understand, no other significance connected with it – this thing packed up and held in facsimiles, masses, all of this sort of thing, won't then let the case advance. And you get no case advance in the absence of tone arm action. That is – that's it! I mean, there aren't any ands, ifs, ors or buts about it. No tone arm action: no case advance!

I don't care if you erased a somatic, I don't care if the pc has ceased to have lumbosis, I don't care about any of these things – because you're not auditing a body. As far as this pc is concerned – no tone arm action: no case advance.

Now, can you worsen no tone arm action? Yes. You can bring about no needle action on top of no tone arm action. *Hu-hu-hu-hu*. And if you insist on running a pc without tone arm action, you soon will begin to see it expressed over here in the needle, which will get tighter and tighter and tighter. And after a while everything locks up. And then if you use real desperate measures, why, you can just freeze the pc into something that'll feel to him like solid rock.

The longer you run a case without tone arm action, the more you will freeze the case into no tone arm action. And the more the case is frozen into no tone arm action, the less chance you have of getting charge off by any means. You see this? I mean, you're walking away from the point of resolution. The further you go with no tone arm action, the less likely you are to fortuitously produce some. So it's not just "Well, he's running without tone arm action," and brush it off, you see? It's "Oh, my God! He's running without tone arm action! *Whew. Huh*. Hey, hey, hey! *Bo-bo-bo-bo!* No tone arm action! Hey, hey, hey, hey! No tone arm action. Get some tone arm action. Ha-ha." You know? It gets that type of emotional response, you know? Not "Well, he's running without tone arm action, so he isn't getting any better," and so on, see?

Guy being run without tone arm action is somebody you're watching go down the big toboggan. And the longer this goes on, the harder it's going to get to get tone arm action.

Now, the most likely way to get tone arm action on any condition, any case or any anything, is getting in the itsa line. This has processes connected with it. These processes are designated Routine 1C (C for communication). Routine 1C: this is the soft-touch process. This is the process that will be given to Scientology One Auditors, and after you've studied it and used it a year or two, you'll find out that there's a lot more to know about it.

It is at once the clumsiest use – it's the workhorse, you see? You say, "Well, you've got two processes to make an OT. You've got 3N, you got R3R." No, you've always got three processes. See, if you've got two like that, then you've always got one more, and that'll always be the itsa line, or 1C, see? This is the workhorse. This is the workhorse.

And, yeah, somebody in a co-audit; yes, sure, somebody in a... doing a book-auditing job; yeah, somebody, some student in the Academy; yeah, these people, oh, yes, these guys will be able to make progress with this thing. But before he's gone very long in the Academy and before he's done very much auditing, he'll all of a sudden begin to believe – he'll do one of two things: either, "Well, I just get tired of just sitting there listening to him talk and talk and talk and talk, you know? I just get tired of this. So this itsa line isn't so good." See? He didn't even know what it was in the first place, see? Or he will all of a sudden begin to realize that there is a certain deftness required here or one will just continue to sit and listen and listen, and the pc goes on and talks and talks.

Well, look, they talked for five years in psychoanalysis without getting anyplace. See, we don't know that they had tone arm action, but we sure know they didn't get anyplace. They did. They did – pardon me, pardon me. That – I'm maligning the boys. I'm maligning them. They got careful. They did get someplace.

Well, look-a-here. You learn, then, that an overcharged case can most easily be bled down by the itsa line, and you'll restore tone arm action. So the best way to restore tone arm action to any case that has become overcharged through being run in the wrong departments is getting in the itsa line. Now, that's your base process. You can restore tone arm action, no matter how badly the case has been jammed up, if you are clever in handling the itsa line.

Now, when I say "itsa line," and when I say "clever," yes, they're very definitely joined together. Clever. It is not a process; it's a cleverness. And the biggest trouble you have anything with is (as we'll come back to this) line 1 minor. Why put the attention on the auditor when all you've got to do is shift it slightly in the pc?

This guy is saying, "Well, and so forth, and we had this big – big hassle at this party and I – this – my wife bawled me out, and everybody bawled me out and so forth. And I've got this terrible present time problem. I got this awful hangover and I'm having an awful time in this session," and so on and so on and so on. Yeah, under a long series of runs you could probably take apart this present time problem, but you were running on the pc the goal "to be sexual." The pc is having trouble with being sexual, that's for sure.

Well, that's where the cleverness is, is was there anything that happened – you know, is what the pc's talking about got anything to do with what you were doing, see? So, of

course, the adroit question practically walks up and hits you in the head. The adroit question is – pc takes a long breath and momentarily he isn't going on any further. Just momentarily, see? He actually hasn't run his communication line out terribly, but he's just been floundering, you're getting minimum tone arm action. And you say, "Did our last session have anything to do with this?"

"Oh. Let's see, what the hell were we doing in the last session?"

"Well, I don't know. Just review what we were doing."

"Well, let's see, so and so on, so on, then we had an ARC break and we were doing something or other and so on. We were running out some kind of items; there's this backtrack and there's this stairs or something there. Let me see, now. I – I'll – I'm gettin' it now," and so forth. "Oh, yeah. Yeah, yeah. Yeah, we were running – you see, I – I really can't get anywhere near this, I'm so worried about my present time problem – but we were – we were running some goal, some goal, some goal, some goal, something along this line and so on. Oh, yes, 'to be sex – ' say, what do you know! Yeah, I sure do have a lot of trouble with – with this thing 'to be sexual.' I ha... Yeah, I sure do. Yeah, I – I have a lot of trouble with that."

"Well" you say, "well, what items did we have there, right toward the last?"

"Well, I think we arrived at this point on the line plot, and I think it was – I think it was – 'absolutely' no, it was 'nix' – yeah. Well, all right. There we are." And you're starting to see your tone arm move and your needle start to twitch.

And he never knew what happened. Magic, man, magic! It's gently taking line 1 minor, without actually putting it on the auditor, and putting it back to the subject of the auditing. And, you see, there's no process that you could announce that will do this, because the auditing is tremendously variable and the pc's worries and concerns are fantastically agglomerate.

Now, sometimes, the pc has legitimately had a present time problem and something catastrophic has occurred between sessions, something like this – this is just using this factor for just a present time problem – and it's something *way* off. And the only thing you can do is to keep flicking that attention line. Flick. It's really not a whatsit line; your whatsit's already in, you see? And you just keep moving it around till the pc will ventilate the PTP that he's worrying about.

Now, the crudest, but still acceptable example of this is simply "Tell me about it." See, that's crude. See, that's something like we're going to build a house so we pile up some bricks. That's crude. That's about as adroit as the cow doing the twist, see? [laughter] But nevertheless, it's functional. You do get some motion. I couldn't forbear to milk that gag. [laughs, laughter]

Now, so there's the pc, see? And the pc can't get his mind on what you're doing because something else has happened. And this something else is real worried, and maybe it's worried down to the level of grief charge, or something like this, see? Well, all you can do is move the – move this little attention line around onto things that'll give him itsas. And you can cut it down from – well, actually, failing to relieve the situation, that's how bad it can be, see? You just didn't really relieve his problem, or you relieved it somewhat, or you – next

grade is you spent the session making him feel better about that present time problem. See, we're well into the acceptable band, if we've got to be. Or, we handled it in the first two hours of the session, or we handled it in the first hour of the session, or we handled it in the first fifteen minutes of the session. And that difference of time has very little to do with the seriousness of the problem; it has everything to do with the cleverness of the auditor – without putting the attention line on himself, without cutting the itsa line – adroitly shifting that little attention line there to this and that.

"Well," the person says, "but this – but I don't see – I don't see why we had to fight half the night after we got home. I told her I just was attracted by blondes, and so forth, and she just wouldn't listen," and so forth.

And the auditor says, "What have you found out about arguments like that with your wife?"

"Well, itsa, itsa, itsa, itsa, itsa, itsa, itsa."

"Well, that's – that's fine. All right. Now, how do you feel about this problem now?"

"Well, the problem is all right."

Well, he's still a little bit fluttery, so, "Well, let's review now what we were doing on something or other." Got the idea?

"Well, we were doing so-and-so and, well, you know what we were doing as well as I do."

"Well, all right, yeah, probably. But I may not have full records here of this. There might have been something that came up during the session, or something like this, or between sessions you might have thought of something else."

"Oh, yes! I did, as a matter of fact."

You're away, see? Got the idea?

Actually, it's just about as skilled as building a watch, but because there is no apparent skill there, don't you see, it gets slightly into disrepute. People can watch a session in which this is occurring, and they really never even hear the auditor say anything, see? And the pc never really hears the auditor say anything, because the attention line isn't "All right, now. All right. Okay. All right. Yeah, yeah. Yeah, I – I got all that you're talking about. Now, all right. Now we're going to give you – going to give you the next – the next – next auditing command – the next – the next – the – the next auditing command. You got that now? Got that now. All right. Here we are, now. All right. Do birds suffocate? Okay? Got that now? Do birds suffocate?"

Now, you've restimulated some charge. I won't say what charge you've restimulated.

See, now that can grade on down from just too much, you see. That can grade on down to "Do suffocating birds have anything to do with this?" "Were there any birds suffocating in that?" See? To "Well, do you think your processing has bettered this situation?" Now we're really getting feather-light, aren't we? Pc hardly heard you say it and neither would anybody else, you see?

"Well, let's see. Let's go over what we've covered so far in auditing. Well now, you had a couple of cognitions in the last session there that had something to do with this. Have you had any other cognitions with regard to goals, and so forth – these implanted goals?" This is getting awful adroit, see? You've actually got something he's already been talking about, and you put it in by the duplication factor. You duplicate what he has been talking about and you just pull his itsa line a little bit further and put it on something, see?

I'll give you an idea of doing this. He says, "Well, auditing, auditing. I get these awful headaches in auditing and that sort of thing."

"Well, have you particularly gotten them while we've been running goals?"

Few sessions later – he's forgotten all about these headaches, and so forth – we're having a hard time getting his itsa line handled: "How about these headaches? Are they troubling you as much now? When we run these goals and that sort of thing, how are these headaches?" Sounds merely solicitous. It isn't; it's a itsa line, see? See, you've taken a dead-ended communication line someplace back down the line and you've repeated its subject, so therefore you have made a duplication, so you've created a communication line. It's all very technical. And the person's attention goes back on to this and he has to make a comparison. He has to say his headaches are better or worse or there's no change, and while he's doing this he has to put his attention on GPMs, or whatever you're trying to run on it.

And you say, "Well, with this last one that we were running in the last session – the last one, 'to be nutty,' 'to be crazy in the head,'" so forth, something like that, "how were the somatics in the head getting along there? Were they turning on and off, and so forth, while we've been running that?"

"Oh, well, you shouldn't really remark on this, because I had them pretty well off."

"Well, what item did they go off on?" "Well, they went off on – Well, I really don't know. Someplace in the first part of it. Um – um – um – I had an item in there – is – 'idiotably...' I think it was 'idiotably nutty.' Yeah. Yeah, that was the one. Hey, I got that headache again, you know?"

You say, "Well, give me 'nix idiotably nutty.'" You're away, see? See? He doesn't know what hit him, see?

It's moving that attention line adroitly, adroitly, see? Adroit. With the little pinky – the little finger, you know – raised just right on the teacup, See?

Now, you'll see an auditor who really hasn't got much feeling for it, and no tools and so forth, why, he's got this teacup with both paws wrapped around it, you see? And you'll see somebody else has poured the tea into the saucer with both paws wrapped around the saucer and inhaling at a very large number of decibels. See? So, that you'll see this in all of its shades of gray, you see, down to outright black.

But before you understand anything much about the itsa line, you have to understand that there is such a thing as an attention line – line 1 minor – and unless you can handle that attention line slightly, adroitly, greatly, smoothly – you'll curse yourself sometimes. Even the best of an auditor will say, "Well, let's get to running this GPM now," or something like that.

Cut your throat, you see? You spend the next fifteen minutes getting out of this hole. See, it was just too much in the wrong place, see, and it just smashed everything up and the pc is busy explaining to you that he is eight thousand light-years from that GPM and his attention wasn't on it, you know?

You find yourself making these mistakes. Don't knock yourself in the head and say "Well, I'm terrible at this" and run a big make-guilty on self because you don't handle this well always. Just, those times you have been clever, pat yourself on the back. That's the one to pay attention to. I'm not kidding you, because... Well, I gave a session last night and I dropped – three times. Once I dropped a handful of anvils on the floor – shook up the session most interestingly – and another time I put off a whole chain of firecrackers in the middle of the auditing table, and another time practically ran the mains voltage through the cans, see? But that was three, see? That was three. But there was two hours' worth, and probably something on the order of 150 that were handled, you know, with such aplomb, man, that nobody ever found out anything about it, and it got the pc out of the woods gorgeously. See? Quantitatively, see? 'Course what you put your attention on are those three that had to be patched up, see?

"Oh, oh. Well, your attention wasn't on it. Well, I'm very sorry, and so on. Have I cut your communication?" You know, "Sorry," and so forth. "Well, what would you have said if I hadn't have interrupted that?" See? Good recovery, see, level, and so forth. Nevertheless, if you really were self-critical to a vast degree, you would have been practically kicking your brains out for having pulled any one of these three.

Pc is going on and saying, "Well, I think I have blown that last GPM. I think I have blown that."

"Well, all right. All right. Good. Let's check some of its items." Oh-oh, cut your throat, man, see? Just put the pc's attention on the wrong thing, the wrong place, it's all going crash, the pc's needle goes dirty. Get the idea?

You see, you're split between wanting the pc to think well of you, and getting your job done. And these two things are very often at... they're dipolar phenomena. You try and get your job done sometimes uphill against something and in the final analysis it just merely depends on, did you get your job done, see? That's what it really depends on in the final analysis. But in the process of getting your job done, you happen to have ARC broke the pc and cut the pc's communication line several times. Well, the difference between a good and a bad auditor is not whether the auditor always audits smoothly with never cutting an itsa line, but whether or not he attains his eventual objective without creating so many ARC breaks that the pc's case has not improved. That's the test!

If you go around training people on the basis of "You must never cut an itsa line; you must never create an ARC break; you must never upset the pc" – all of these things, you see – it's something like laying in a GPM, you know? Oh, in the first place, it's an impossible attainment. Always train them with "Be as clever and adroit as you can," and "You can be a little more adroit than that." He dropped his E-Meter in the pc's lap halfway through the session. Poor handling of the attention line. Why? Pc's attention went on meter, not on own case.

All right. Now, how many dozen ways are there to shift the pc's attention? I don't know – dozens, thousands. Thousands. I'll give you an idea. You got an alcoholic. You're trying to process this alcoholic, see? Alcoholic's drunk most sessions and you know you're not supposed to audit somebody who's drunk. All the alcoholic'd do is sit there and say, "Well, Alcoholics Anonymous will tell you you can't cure anybody of alcoholism." That's all he's going to say, see? He knows you can't help him. He's saying, well, it's impossible, see? And you say, "Well, the case is unauditabile."

Yes, the case is unauditabile to everybody except those who are surpassingly skilled with the attention line and the itsa line, see? The whatsit line is practically missing.

"Now, what have you learned about Alcoholics Anonymous?"

"Oh, well, that's something else. Well, I met this fella down the street, this fella, and so forth, and he gave me this book, see? And I read this book and I threw it in a garbage pail. Couldn't teach me anything. But I learned better after a while."

"When was that?"

"Oh, in about a few days later I learned better, see? I had this awful hangover, and I just got fired and I was being sued for divorce, and I found out they were your friends. That's what I found out then." You're going to see that tone arm starting to move, man.

He has just told you that you can't possibly audit him. He has just told you that you can't possibly help him. So you just – *hhh-hhh* – polish up the fingernails, audit him, help him, and somewhere up the line he finds out about it as a major cognition.

But all the way up the line he's improving. Because if you can get tone arm motion and get the guy with the session, see, by flicking that little old attention line right where it lives, parallel what the mind is doing, and it will do everything you want it to. Nothing new – that's the beginning lines, I think, of one of the first-book things. But nevertheless, this gives you the anatomy of how that's done. You just find out about what this guy's mind is on, see? And if you can produce tone arm action by having him locate things about it, then he will recover from any obsessive or compulsive tendencies about it or toward it. It's the tone arm motion that takes off the compulsion, not the significance of what he digs up. Given enough tone arm motion on any given subject, and that subject will right itself in the head of the pc. And man, I'm talking from hard-won experience. I'd say, if we've learned anything in the last thirteen years, man, we've learned that. 'Tisn't the significance alone.

It's the tone arm motion that can be obtained in relation to the significance that brings about the recovery.

Now, that's, the fastest recovery is, of course, the tone arm motion plus the right significance to be run. Now, that's your fastest recovery. But your recovery takes place somewhat and eventually if you just produce tone arm motion. That's all you have to do, is produce tone arm motion on the case, regardless of what's run, and eventually – at some vast distance – why, this pc is going to recover from these various targets and so forth in the case. He's going to recover from them. That's for sure. But if you audit the right significance and get no tone arm action, the pc will never recover. See, those are terribly important data.

Well now, the most overcharged areas of the case are the case's – parts of the case that give the high TA. The high TA and the overcharged area compare. The least-charged aberrative area gives tone arm action.

You very often will find some alcoholic that gets no tone arm action on the subject of alcoholism, but he's got corns. You can get tone arm action on the subject of corns, you see? In other words, he can't face that highly a charged approach. So that sometimes the absolute direct approach to a compulsion or obsession of some kind or another will get you nowhere at all, because it's such a highly charged area that it's over the pc's head, and you get no tone arm action on that.

Well, the answer to that is don't abandon it; just get tone arm action! See? That's the thing to do. Just get tone arm action! Very remarkable. Because the mind is stacked up the way it is, if you continue to get tone arm action, he'll all of a sudden walk up on that thing, do you see?

Now, undirectedly – that's just not directing him toward any specific target or goal or aberration or anything else, or any reason he's not able or anything at all, anything – you get tone arm action and he'll eventually collide with something. And he will know processing is helping him!

You'll be utterly flabbergasted sometime. You have this surprise in store for you, if you haven't collided it already. Knowing the idea about tone arm action, you sit there and this pc babbles on and on and on, and it doesn't have anything to do with anything you can see, but my God, that tone arm is moving. You're getting up and down motions on that thing – not a quarter division every twenty minutes, man. You're getting – it's got to be a bit healthier than that for a pc to know something about it – but it's certainly getting a whole tone arm division every ten minutes, and that's pretty fair tone arm motion, see? And that's acceptable. I wouldn't buy much less than that myself – tone arm division every ten minutes. And that would say only down, but you realize that it also has to rise in order to go back down again. So if you added the plus and minus, that'd be two tone arm divisions, you see – one up and one down – in ten minutes. Well, that's – that's just barely, marginally acceptable, see, to produce this phenomena.

You get that?

All right. Pc talking about his grandmother's jam making. Well, cripes, you know? This is about as aberrative, don't you see, as petting the pup. But, my heavens, you're getting tone arm motion on it, man. Well, you can't do anything else much. You've tried something else and gotten a stuck tone arm, so let's let him go on, see? And just completely neglect your attention line. If you were very skilled, you would be unable to totally neglect it. You would punch it around a little bit and increase your tone arm motion, see?

Pc leaves the session feeling fine – feeling fine, wonderful. Pc always makes gains if they have tone arm motion, see? If they have real tone arm motion, they always make gains. If they don't have tone arm motion, they don't make gains.

Now, I can tell you at the three-quarter point of a session whether or not the pc will have anything to say decent in the goals and gains. It's just how much tone arm motion has there been during that session. That's all; it's a direct monitoring factor, see?

So this becomes burningly necessary to produce tone arm motion. At any cost, produce tone arm motion. And now you come into your own about the itsa line, because tone arm motion only occurs when the itsa line is in, and tone arm motion does not occur with the itsa line out.

Now, a lot of you think the itsa line is a communication line. It's not. That's a surprise, isn't it? Just because it's labeled C-distance-E and because it *is* a communication line, well, why don't we just call it the preclear's line to auditor? That would make it a communication line. But we don't. We call it the itsa line. Why the itsa? Why? Why?.

Well, one of the ways to get this across is to give the student a drill. Just imagine a thetan in various circumstances, you know, like a guy in jail. All right, now how is his itsa line cut? See, it isn't just on the graph. That isn't the only way you can show how the itsa line is cut – in an auditing session. Let's just take it out in life. And we say, "All right, this guy is in jail. Give me a number of ways this fellow's itsa line is cut." And you may get some awful comm lags on the part of the student, but he'll eventually dig it up, see? How's his itsa line cut? Well, let me give you some notions, then, for definition of the itsa line. Well, he can't go anyplace else to see if "itsa." He can't go anyplace else to itsa. He's right there in jail, isn't he? Let's say he was up in London in jail. All right. Well, he couldn't go down and itsa the coast, could he? He couldn't say "Itsa water, and itsa beach, and itsa resort, and itsa Brighton," could he? He can't get there. How the hell can he itsa it?

Well, he can itsa it on a via, if somebody'd give him a map or a book or a novel that's about the coast, or something like that. That's itsa on a via – substitute. Itsa by substitutes. So it's a kind of an itsa. Well, itsa by facsimiles is an itsa by substitutes, too. So this is not ineffective. But his itsa line – direct itsa line – is sure cut.

Now, there are other ways his itsa line can be cut by reason of being in jail. I won't go into those particularly.

We have a fellow sitting at a table. We put a blindfold on him. How is his itsa line cut? Do you see how his itsa line is cut? He can't itsa! That's what an itsa line is.

What's a nightmare? What's a nightmare? A nightmare is the inability to itsa, followed by mocking up something that can be itsa'd that's wrong.

A thetan likes to be oriented. He orients himself. How does he orient himself? Itsa. "Itsa ceiling, itsa floor, itsa wall itsa ... Therefore, I'm a..."

You hide somebody. You hide somebody – The itsa line is cut on himself. Nobody else can say itsa. Nobody can say itsa. Do you see that?

Disassociate somebody from his identity. How's his itsa line cut? He can't say "Itsa me. Itsa me, Joe Jones," see? Can't be done. He hasn't got an identity now.

Well, we get into a whole tangled web of aberration and we find out that that's the basic aberration: inability to orient or declare or identify or recognize. Not just solve, you un-

derstand. It isn't cure versus cure versus cure. That's also itsas, but that's only part of the picture. How do you know you're here? Well, that's easy. That's easy. You say, "Itsa chapel, itsa chair, itsa notebook." Where you are, "Itsa body." Up here, "Itsa Ron," see? You know where you are. Your itsa line is in. You're oriented, so you feel happy about the whole thing, see? Fine. You know where you are.

It isn't necessarily how dangerous the environment is. You could be out in the jungle, and you'd be surprised how happy some hunter looked when he says "Itsa lion!" Hasn't really anything to do with safety, security, and – none of these. These are just extra considerations, see? So you just shred all these extra considerations off and itsa. See? "Itsa jungle, itsa me, itsa gun, itsa lion, itsa bearer up a tree. Well, at least I know I was killed by a lion. My itsa line is in on the subject of that death."

Well, look, if this is so important to power, and it is; and if this is so important to sanity, and it is; and if this is so important to memory, and it is; and if this is so important to ability, and it is – then we would expect the major tricks on the track to comprise of cutting itsa lines one way or the other.

So, you're standing up there loud and clear on the parapet, gripping dramatically the flag of the lilies of France, being shot at in shot and shell, and all of a sudden there's a snick, and you is disconnected. Well, you at least know how you died. You got some idea that it was a flying object, unfriendly directed. And by God, in the next half an hour or something like that, they're telling you you died some other way. Correct? Spoils your itsa line.

And then in the ensuing actions that take place on it, why, they give you a completely false position as far as you're concerned and a false situation and a false here and a false there and they throw your itsa out on time and they give you a little GPM to carry home with you very happily, give you some nice somatics to go along with it. You're an idiot to ever go back, you know?

I mean, you move right around the corner of the thing, and itsa where? If it's 70.6 trillion-seven years ago, which is right now, that itsa is certainly for the birds, isn't it? You understand, they've misdated a somatic on you, because they say, "Now we're going to give you your future," and somehow or another restimulate your facsimiles of the past and say they're in the future and...

What's happening here? Well, enough happened so that everybody on this planet believed they lived only once. And that's how serious the cutting of an itsa line can be. You combine this with plenty of force and you got it made, man!

I can see it now, the development of a new psychiatry. A new medical psychiatry can be developed out of this. You can get people so mixed up that they'd report back to the medical doctor every time. They do. Insane patients are always reporting back for their shocks, and so forth, see? Well-known fact. The report-back mechanism is just used and used and used and used and used by these nuts.

By the way, I thought of a difference between a Scientologist and the world at large on this particular planet. The people think that what we're doing is unreal, but we know the sub-

stance of their unreality, which of course makes us top dog every time. We know the substance of their unreality.

In other words, we know where their itsa line is out. See, they know what – they're not identifying. See? Their itsas are just for the birds, you know? "Man is an animal. He is a biochemical protoplasm which goes no place. At death there is a cessation of cellular commotion." That's a good itsa, isn't it? That just immediately makes nothing out of everybody.

Ah, so there's a formula. There's a formula involved here. And that is, your itsa line can be out on A, R, C and K, U, C, D, E, I, O and F. How many ways can an itsa line be? Well, it's that whole scale I gave you for R2H. Known, unknown, curious, desired, enforced, inhibited, none of it and false – absent and false. This is how many itsa aberrations there can be, see?

Well, false, that's the easiest one of all. You hold up somebody – you say, "Here, have a piece of candy, sonny." Give him a piece of chalk, see? He bites it. His itsa line is out, man. Got the idea?

You say, "There is nothing here, boys. There is nothing haunting this planet; there is nobody after you; there is... nothing happens. I mean, you're just here and just natural and there's nobody after you, see?" That itsa line is for the birds, see? "You're paranoid! You think people are pursuing you!" Of course, nobody is pursuing us – they don't have to. They got us, man! [laughs]

So they say something isn't, which is. Well, of course you can get the reverse of that. They say something is which isn't, such as the Darwinian theory, which is just an old implant.

Inhibited. Inhibited: Give a guy a pair of distorting glasses or make him look at things in a twisted mirror, like a fun-house mirror. His itsa line is inhibited. Tell him he must not examine such-and-so and so-and-so because it is very dangerous, and of course his itsa line is inhibited at once.

And of course, enforced itsa: "You better damn well know about this or you will be shot tomorrow morning without cigarette or blindfold." Enforced itsa.

Desired itsa – see, that's a "want to know" sort of itsa: Somebody is very happy to know that you're all right. You see? That's a desirable itsa.

And the itsa of curiosity is not just being curious about what is; it's an itsa which is curiosity. It's a curiosity itsa, don't you see?

Now, you go up higher than that and you get an unknown itsa. Hey, you know, there is an unknown itsa. I just gave you an example of one. You have a complete reality on the unreality of people on this planet. See, the itsa is their unknownness, see? You recognize they don't know! Well, that is an itsa. And it's pretty high-scale stuff for a thetan to be able to recognize that it is an unknown. This thing really boxes him around, because, of course, it mixes in with the actual desire to make something known which can be known. And amongst that, you get the accumulations of unknownnesses that are just unknown and will always be unknown, will never be anything else, because they're tailored to be unknown. And if you don't think that can't be, look at the word unknown. See, there's a perfect example. Yes, there is

such a thing as an unknown. There's a word, there's the concept that you back it up, u-n-k-n-o-w-n, unknown, and that is a something which is unknown, isn't it? I mean, this is getting idiotic.

There's many a religion, man, which is built 100 percent on a beautiful building which houses a non-existence. And they have created an unknown. That's what they have created! See, it is something that can be created. And a thetan's tolerance, as it rises, eventually gets up to a point where he can actually confront an unknown without doing a thing about it. He can recognize that it is unknown; it's a manufactured unknown.

Like x , in algebra. There's another example. Somebody writes x . All right, he can confront the fact that x is unknown. Of course, if he's nowhere near an algebra teacher he probably won't even be forced to find out a known for that unknown, either. He probably won't even do the equation $x + y - z = 0$. Of course, you don't even know what the equation applies to and neither does anybody else. A mathematician is somebody who's gone overboard on the subject of unknownnesses and he has to solve all of these unknownnesses.

Now, if you don't think that isn't prevalent – if you don't think that isn't prevalent – there is one of the things that holds up auditors in auditing, is they get so upset about the pc being in an unknown while he's trying to itsa that they eventually grab hold of the meter and they say, "Oh, well, let's see. Is it twenty years ago? thirty years ago? It's thirty years ago. Yeah, well, we know about that now." [breathes sighs of relief] They say they're just helping the pc. It's just they can't confront that "Well, and so, and so, za-za-za, za-za, za-za-za, I don't know. I just don't know. It couldn't have been so." And they think, "Oh, my God, if this goes on a minute longer," you know? And they get the itsa line in for themselves. [laughter]

And then, of course, an itsa line can be too known. Every once in a while some murder-mystery characters... The thing is out because it is known. Every once in a while, some murder-mystery writer has the postman do it, because nobody ever sees a postman. See? It's too known. I bet there's crime after crime on the books down here that remains unsolvable because it was committed in too known a fashion. See? It's a known itsa. Itsa of knownnesses.

Every once in a while you're doing an ARC break on some pc on R2H and can't quite find out what it is, and you eventually will hit "known communication," you know? Known. Well, of course he knows it. He thought it was something else. Why? Because he knew it. So you get how slippery that can be, see? That's this "everybody knows" that is talked about in *Dianetics: Evolution of a Science*, you see? Everybody knows these things – that's known itsas – so you never examine them. That's another way of having a known itsa.

But the pc's attention with his itsas rise up and down this whole new version of the CDEI Scale, see? – goes up and down, each one in those various stages. And he picks out this and he picks out that and he picks out something else, and all he's doing is saying "It is a..." He is identifying, in other words. He's identifying something. And when he cannot identify something, then he identifies by classification – identification by classification. "This is a type of..."

Psychiatry does this all the time. They say, "This is dementia praecox case..." They've gotten so idiotic with it now that if somebody goes to that Chestnut Lodge, where Graham – that publisher of *Newsweek* and the *Post* that was so against Scientology – where he went, and

went home on vacation and killed himself. He went home for a day; he was supposed to come back. Up there at Chestnut Lodge... I've told you about it before. That's actually the name of the joint; it's up around...

And it's very remarkable. But it's very remarkable up there. But if a person is transferred to Chestnut Lodge, regardless of their symptoms before, they now have schizophrenia. And I have asked this several times, trying to get the answer. And I finally did get the answer and understood it was the answer, and after that it didn't plague me. But it's a very interesting example of an interesting variation of itsa, see? And that is, they are a schizophrenic because they were transferred to Chestnut Lodge, because that's all there are at Chestnut Lodge!

Well now, that's by classification plus idiocy, see?

When you say "It is a cupboard," you have a pleasant sensation of familiarity and knowingness. You seldom stop to think that you have classified something. You know something because you know of a similar something, and so you get your gradients. Your gradients of classification establish familiarity in that particular direction.

Every once in a while this familiarity gets betrayed or something like that and you get an ARC break with it. You say, "It is a cupboard," and you open it up and find out that it's a mouse home, or something, see? Somebody's using it to breed white mice for something, or something. Or "It is an automobile," and you get into it and find out it's a stage prop. A little minor ARC break there of false itsa, don't you see?

That's quite common in GPMs. Pc goes halfway through the GPM and all of a sudden does the right itsa. "*Ha-ha, ha!* These are just railroad carriages with a painted backdrop of a train going off in the distance. They're not trains." See? Identified the character of the itsa.

This is all, then, on the subject of identification; it's all on the subject of familiarity; it's all on the subject of finding out; it's all on the subject of – of making oneself comfortable with what he is looking at; it's all on the subject of straightening out one's various grades of ARC with the universe. Now, what gives a thetan such a passion for this, this is something else and not the subject of this lecture, nor, actually, the subject of cases at the present moment. But it opens up a very interesting channel of research. What's this passion to itsa? See, that's an interesting question.

But, that you do get tone arm action when you itsa and the case does improve, this is well established. And this is germane to all cases. So getting the itsa line in has nothing to do with getting the pc's communication in. I say "nothing to do," that's another action. That's more apt to be the attention line – to you, or something of this sort. Don't you see? That's getting his communication in. That's not the itsa line. No, getting the itsa line in is getting the pc to identify, separate, compartment, differentiate, inspect, decide about, things in his bank – or, in an objective process, in the room.

You want to see a tone arm fall, you could probably produce it normally by saying "What's that? What's that? What's that? What's that?" and have the pc itsa.

You say, "What's that?" pointing at the fireplace.

Pc says, "It's a fireplace."

Actually, you run it for a very little while ... This is not a broad, general thing, because there are other factors involved here. Pc is so introverted that it's painful for him to extrovert his attention, and he can only extrovert his attention on a broad via. And other special conditions arise here that doesn't make this a pat process, you understand? It's a pat process, though, as far as his bank is concerned, always – not necessarily objectively. But I'm giving you the objective version here, which is a limited version of it.

And you say, "What's that? What's that? What's that? What's that?" See? Every time the pc says "Itsa." Normally, if a pc is not having too bad a time and he isn't fouled up and you haven't got him stuck on the track someplace and interested in something else, you'll see your tone arm fall.

You can also see a pc getting very interested. All of a sudden, he – "What is it? Yeah, it's a fireplace, but – but..." And he'll want to go over and take a closer look at the thing to make sure it's a fireplace built out of a certain kind of brick, see? His itsa's getting sharper. You will see his identification rise.

Now, this is so good that a Touch Assist works. Familiarization processes permit people to get driver's licenses who couldn't, by just touching cars – you know, "Itsa, itsa, itsa car" is all he's running, you know? He thought it was a buffalo for a while or something. Well, listen, if he couldn't drive the thing, he must have thought something weird – that I assure you.

So itsa, itsa, itsa, itsa – that's familiarization.

You want to teach some girl to type. Well, just have her familiarize herself with the tools of the trade. Very funny. She can get up to an itsa, itsa, itsa to a point, and her ability will rise, rise, rise along with it, which is very peculiar. But then this has something to do with charge. The change of case has to do with the release of charge because of the itsa. There's two things happen: The individual who is really itsaing things is also blowing off encysted charge caused by former confusions about them. And that charge is encysted, and that is a force aspect and a mass aspect with regard to this.

Here's the phenomenon, see? Here's this encysted little thing here, see? And you said, "What's in there?" see?

And he says, "Oh, *sfoo-uh-zoo, and zoo-oo, zoo-oo, zoo-oo.*" Tone arm is moving, see? Picking up those fingers one by one off the clasped hands, you see? And "Well, that's off. Well, that's off also. I don't know. Let's see, see what – what it is, what it is... Oh! Palms!" [laughs]

You didn't think anything was in there, did you? [laughter, laughs]

That's just charge. And you see that tone arm start moving; well, that's charge coming off of one of these bundles, and the guy is looking and it's just a method of as-ising.

Now, while he's doing this, what drives some auditors around the bend is he puts in a lot of additional itsas. Why, that's of no great harm, see?

He says, "Itsa house. No, itsa car. No, itsa..." See? "Itsa fingernail – no, oh, no. No, no. Oh, I know what this is! I – I know what this is. I know what this is. A watermelon!" And

then (as an auditor said to me last night) we get all set and we've both got a watermelon and then all of a sudden he says, "No, it isn't a watermelon, it's a diamond ring."

And the auditor starts feeling kind of confused, because, you see, his itsa line is being thrown around by the pc. But only, only if the auditor doesn't completely understand what he is doing. He's trying to find something and then be content with it. Well, that isn't auditing, man. An auditor's superior knowledge should be that if the guy says it's a watermelon, he for sure is going to call it a diamond ring shortly. And if it really is a diamond ring, he'll never mention it thereafter, because it's itsa'd.

But until it is itsa'd, he's going to call it all sorts of things. It's going to be at a billion years, and it's going to be 5 years into the future, and it's going to be back trillions-five years, and it's going to be 465 years ago, and it's going to be yesterday, and it's going to be now, and it's going to be fifteen minutes ago, and it's going to be trillions-ten ago, and it's going to be 18 trillion years ago, and then all of a sudden it settles down to 125 billion trillion years ago. Period. Bang – that's it.

You don't hear about it anymore than that, because he got it, see? It's itsa'd.

So, a lot of apparent itsas come off in the process of obtaining an itsa. And you almost could say that all the running of a case, from the first moment of its processing on through to the final cognition of the case, consists of conditional itsas. Conditional itsas. That's the way it is for that circumstance and that certain place, you see? An auditor should never have any thought that he's got to get nothing but permanent itsas. Naturally, you go through a GPM, you tear off the items according to a plot. Well, that's the itsa of it!

Reason I don't have any trouble running a GPM is I have no doubt about the itsa of a GPM, see? That's it. It just is what it is. There was nothing there to understand. It was put there to louse you up and immobilize you and cut down your power and ability, you see, and it's a bunch of electronic circuits which go into a couple of boxes, and they have a couple of things that fire on both sides of the thing, and they start you in the top, turn you upside down at the bottom, and that's all there is to it. And you go through and you *say*, "*Pow, pow, pow, pow, pow, pow, pow, pow, pow,*" and that's the end of the GPM. No false itsa, see? Actually, in most cases, not even much of a protest. You know, not saying "It should be some other way." Once in a while a spotted intention with a false idea of the intention will hang it up for a moment. But that's an itsa, see?

You don't have the immediate and direct itsa of "How come I got into a situation where I started getting these things in the first place?" you see? Well, that's one of these big itsas, see? This finally starts dawning on the pc. "What the hell was I doing delivering myself up to a comedy like this," you see, "every few trillion years?" You know? "What's the matter with me? What'd I do? What happened to me? Well, what's wrong with me 'ead? How come?"

And you'll find most pcs will start chewing on this after a while, and they chew on it and – they sometimes chew on it for two, three, four, five, six, seven, eight hundred hours, see? How come? There's no reason to blow your brains out about it or stretch your medulla oblongata all out of shape. It all of a sudden will rise up in your midst and there it will be: the itsa of "It is..." See? "Oh, that's why!" you see?

Now, the adroitness with which an auditor can use the little attention line to put the pc's attention into areas that can be explored, that are easy enough for the pc to see into, that will produce tone arm action – is a very skilled auditor. And that is what is known as getting in the itsa line. Getting in the itsa line does not consist of sitting back and letting the pc talk for hours about nothing. You understand, we do not frown on that if you can't do anything else. You understand? But there is a much more adroit level by which you put his attention on things that can be identified by him, and which he will therefore unsnarl the thing called a problem or the bank or that aberrated area.

And it's the degree that you can obtain tone arm action – that you can do that – that marks the skill of the auditor. That is the most skilled center and zone of auditing. It's almost so skilled that I hesitate to mention it again, because I've had loses along this line.

Now, if you can do that, there is its anatomy. If you can do that, you would be known as this fantastic thing called "the touch," "intuition" – all these other things would mount up back of this. It's quite awesome. So getting in the itsa line isn't just sitting there. It's actually doing something else.

Now, *letting the itsa line exist* is descriptive of the lowest level of auditing on this, you see – just letting the itsa line exist. We'll get somewhere, see? We'll get somewhere if we just do that. But don't go speaking carelessly of getting the itsa line in unless you're doing just that. You're taking the pc-to-auditor communication line, and you are putting it right into zones and areas where it will find itsas. You're putting the pc's attention in there to where that line will be "itsa a..." and a "itsa a..." and "*Rur-rurrrumdaummmmm*. Well, itsa a..." you see, and "*rrrrrr-ra-ra-ra-rm*, and so on, and so on, and so on. Well, I guess – I guess it was my complacence in college. That's what got – Yes, that's right. That's what really got me in trouble. I was complacent about everything. I was – that's it!" Bang! You will all of a sudden see your tone arm go right on down, see? You see the charge come off of the case in the bucket-loads.

This is actually so skilled that it's the production of cognitions. You can produce cognitions if you want to. You can be that skilled. This is something that takes some familiarization with yourself. You should know what the tools are: The tools is the line 1 minor, and that is used to produce a searching attention on the part of the pc; your whatsit line is left there more or less alone, to produce this kind of phenomena. Why? Because the universe is full of whatsit lines. The pc is suffering from too much whatsit and too little itsa. And the net result of this is of course to jam his itsa line. And you, the auditor, by letting it flow, pull him out of the soup.

Of course, the direction of significances as powerful as a GPM, as powerful as a super-duper engram, as powerful as this sort of thing on the way backtrack, God 'elp us, and so forth – man, that's putting in the itsa line on a significance with magnitude. And that thing actually requires considerable skill. You've got to have line plots and the idea of cross listing, and the doingness of the auditor is considerable. The skill is considerable, his drills are considerable, and so forth. Nevertheless, even those fail if you don't let the itsa line exist. You got to leave that itsa line alone and let it rove.

Now, it also consists of not cutting it, and there are numerous ways the itsa line can be cut in auditing. It's a good drill to get somebody to come around and show you that August 4 plot. Have him find the number of ways you can cut that pc's itsa line. Then make him pass the drill: How many ways could you aberrate somebody by cutting the itsa line? And then he has to find out what the itsa line is. That's an awfully good drill, and that drives it home with a thud.

All right?

Audience: Mm-hm.

I hope you get a good grip on this one, because it's a slippy one. And of course it's – trouble with it is, it's so known, see? It's an "everybody knows," you know? Itsa line – obviously it's the pc's communication line. Even though we went on saying "itsa" and calling it an itsa line – well, why is it called an itsa line, and so forth? And you'll see this one drift on through Scientology and always, forever, in some part of Scientology, this one will be too known. That I know, for sure.

But the very skilled auditor and the very well reputed auditor and the auditor who gets terrific results will be the auditor who has this one down cold. He knows an itsa line backwards and forwards. Pc sits down with a present time problem – it isn't necessarily a speed factor involved – but the pc talks to him for a while and mysteriously this present time problem blows up and the pc is sitting right exactly in the middle of exactly what the auditor wanted him to be in, and the pc is running on exactly what they ought to be running, *zippety-bop*. And the pc is happy and the auditor is happy and everything is going as smooth as glass.

Naturally, there will be some jolts on the line. Every once in a while you'll wish you had never opened your big mouth. And I hope you don't get into as many of those as I have in the last thirteen years. [laughter]

Thank you very much.

THE ITSA LINE (CONTINUED)

A lecture given on 21 August 1963

What's the date?

Audience: August 21st.

Twenty-first. Twenty-first August AD 13.

All right. We could cover an awful lot of stuff here. Be very easy to do.

The main things in which you are involved at the present moment probably look far more complicated to you than they are.

I'm going to talk to you some more about the tone arm and the itsa line, and forms of sessions. Things look to you a lot more involved than they actually are.

Sitting somewhere back of every thetan's bank is some tremendous insecurity in which he believes implicitly that the universe is dangerous, or that he himself is in danger or that he cannot live or survive as a powerful being. And whatever that state is, and however that state is created originally is not particularly germane to this lecture.

But the discovery of the itsa line may look to you to be a highly simple little thing, perhaps even a duplication of psychoanalysis. After all, they talked. And if you didn't know anything about the itsa line, you could draw all sorts of wild conclusions, you see? Make the mistake of saying, "Well, it's a communication line, and therefore any communication line is an itsa line, and therefore if you let anybody talk about anything, why, he will get better."

We already know if you let a fellow talk on an entheta line very long, he'll run his havingness out the bottom. So the complexities of the itsa line are really quite something. It sits on a tremendous amount of technology, but in itself is very simple to understand. There's nothing much to understanding it. If you understand it you'd see – you'd see actions like this very readily and immediately, and these actions would be something like this:

Pc said, "I-I don't know whether it was – let's see, now, it was – twenty, twenty, twenty – I guess about twenty years ago. And the fellow said uh – I don't know what he said, but I know what I think about it. I-I-I know that I-I know I think it was a big swindle of some kind or another. And – come to think about it, I don't know whether I said that or *he* said that."

Auditor: "It reads that he said it."

Oh, wait a minute. What happens at this point? What occurred there, exactly? Well, you know at once what occurred, if you know the itsa line. The auditor put in the itsa with the meter, leaving the pc in a zone and area of insecurity.

Now, we say, all right, the line plot. The line plot: that tells the pc what items are in the GPM. See, just like that, see? So obviously we say, well, this to some degree puts in the itsa line for the pc. Well, no, no. That could be said to, but we get across the proposition of the lesser of two evils. If you've ever seen a pc wrapped around a telephone pole with undisclosed charge from running a GPM he knew not what of, or did not know any of the elements of, you will use line plots.

If the thing is a known line plot, we will use it. Why? Because that was a predesigned plot in the first place. It was an other-determined design – you understand that somebody else determined the design. What's important about it is the charge that is on it, and what's important in the auditing is to get off the charge and get the pc to identify, to his own reality, that itsa.

See, if the line plot you handed him on a sheet of paper didn't agree with the thing he was running, you will very shortly hear about it. He can get wrapped around a telegraph pole with great speed. But that's a shadow of putting in an itsa line, isn't it? That's a shadow of putting in the itsa line with the pc – but a necessary action.

Now, I'll give you its similar borderline: Pc says, "Oh, it's twenty years ago, it was fifteen – no, it's eighteen – eighteen, four – twenty, twenty-two... It's twenty-two year... I think it was twenty-two year... No, no. It – it must have been twenty-five – thirty. No, twenty-one – I-I don't know. I don't know. I just don't know when it was." He quit, see? He quit cold.

What you going to do? Sit there with a pc who has quit cold? Or are you going to say, "All right, I'll give you a hand. Was it more than twenty years ago, less than twenty years ago? Was it twenty years ago? All right, it's more than twenty years ago. Is it more than twenty-five years ago? Less than twenty-five years ago? Less than twenty-five years ago. You got some idea of it now?"

"Yeah! It was twenty-three years ago."

Or, "Was it more than twenty-five? Less than twenty-five? It was less than twenty-five. Twenty-three? Twenty-three? I'm getting a read here on twenty-three."

"Yeah. It was twenty-three."

Get that? So you didn't totally put in the itsa line. See, you could start putting the itsa line in and the pc catches the ball, put it almost totally in and the pc catches it, see, and get right onto the hour and the minute, and the pc never caught it, but at least you don't have something wrong dated. And those are the gradients of putting in the itsa line. And the last one – it's a little bit of a lose to have to put it all the way in for the pc, see?

All right, now, look at the length of time you and other fellows around have been stumbling around on this planet. There's a number of thousands of years. And the number of thousands of years you've been in the Marcab Confederacy are quite numerous. They probably run up to two or three hundred thousand years that you've been inside this system. And let me call to your attention, never during that time could you put your foot on the first step of the road which led back to a better life and some happiness and freedom, see? You couldn't get a foot on that road at all.

All right. Right now you have technology. You have a map. The map has got all kinds of blank spots in it, but nevertheless, there's the type of map it is, don't you see? And those are persuasions toward an itsa line. And the only time you totally lose – the only time you totally lose – is when you have to put the whole itsa line in. Give somebody the pattern for a goal: All right, he has to list for the actual goal in that sequence and find it. And he has to list for and get the top oppterm, to make it, in order to fit the pattern, and then he's got to fit the pattern together. And this is an awful lot of itsa. See?

Well, all right, so you've got the preprinted pattern. Give him this, and he just reads it off. You understand? This is less desirable, but it's still feasible.

All right, now let's put it totally in. Let's put it totally in. Let's just hit him with a lightning bolt so that he can't contact any of the facsimiles in it, and we have medical psychiatry. See, the evil involved in this is putting in an itsa line in such a way as to have no self-determinism, no power of choice left in the pc at all. Total wipe-out of power of choice, don't you see?

Now, you can fall short of that in various degrees. Little kid is going around, see? He's real unhappy about the whole thing, he's real unhappy about life and he's walking around in circles and so forth. And you say to him, "That is your bed." Well, you haven't really done very much for him, but you have improved his state of mind or his peace, see? Just to that degree. You understand? You say, "That is your bed."

Nevertheless, you have put in the itsa line. He himself has not found out that it is his bed, you see? But look, he's still very happy to have the bed.

Now, when we get down into pure, unadulterated evil, we get a denial of the itsa line and we go into aberration, creation of. See, this whole thing inverts, and we get K, U, C, D, E, I, O, F – that whole scale of means of perverting the itsa line.

Now, those means, well, include an inability to ever find anything, an inability to reach anything, and so forth. Well now, medical psychiatry (to amend what I was saying a moment ago) is of the inclination that it is better, you see, for nobody to have anything to do with anything, see? See that? Now, look at that as an inversion. That's an inversion of the fact.

Now, the aberration of this line – perversion of this itsa line – has to be very direct in order to be very aberrative. You have to pervert the line, you see – just outrightly put in something false, or put nothing there, you see, or... so on, or inhibit very directly, and you have to work at it. It has to be worked at and so on. Given the slightest chance, why, the pc will start putting in his itsa line. But what does he put his itsa line in on?

All right, let's take Freudian analysis: he puts in his itsa line on childhood sexual incidents. They're not aberrative! Anybody get anyplace? Old Papa Freud did contribute something. He said there was a possibility. Great, let's applaud him for that.

But he was putting the itsa line in in directions that didn't wind up with anything, and then after he got through he put the line in, totally; the practitioner put the line in. See, he said, "The reason why you are aberrated now is we have finally found out that you had a fetish going. You had a fetishism. And actually, your little brother's right shoe has aberrated

your whole existence, and that is why – that is why you are always talking about the feet on chairs, you see? And now we've got this all explained, and you are better."

Now, that's all very fine, but he didn't look at the hypnotic character of the statement "You are better." That's putting in the itsa line.

All right. We got some guy walking around in circles out here. (Let's take a look at these various gradients of putting in the itsa line for somebody; you'll gradually see what I'm talking about and what I'm driving at here.) Got some guy walking around in circles and, man, he doesn't know which way to turn. He's got lumbosis and he's been aberrated by hearing of a psychiatrist when he was young and he's got all kinds of things, you see. He's having a hard time – having a hard time. And you say something can be done about it.

Well, you've put in some variety of itsa line, haven't you? And that's what you call a hope factor. And this guy very often responds to this, and he feels much happier about this, don't you see? You see that – that the hope factor, then, is to that slight degree putting in the itsa line, see? It's not really much of an itsa line. You're not saying... but you're saying, "It is not – it is not hopeless!" See? You're sort of putting in a negative line for him a little bit there, and you carry him along.

You see, as we look at this problem, we'll see that there are various degrees of putting in the itsa line for somebody. See, there are various degrees of this, and these things vary from the very, very evil – which is to say, hand a guy a pomegranate and say, "That's a bomb." See, that's putting in a false itsa line. They vary from that up to a – well, making it impossible for him to put it in. (That's a lower grade, making it impossible for the person to put in an itsa line.) Varies up to the little necessary actions necessary to begin the flow of the itsa line.

See, and these little necessary actions are such as "Start of session." And the basic intent is what makes the difference. That's the first fundamental difference, although this, too, can go too far.

But the basic intent is what makes the most fundamental difference. Do you intend to improve this person's itsaing ability, or do you intend to knock it into a cocked 'at? Which? So it begins right there with the intention. And that gives you the difference between the cowboys in the white hats and the cowboys in the black hats, see? And it's right there, man, bang!

Intention: decrease this person's ability to itsa – cowboys in the black hats. Intention: by some or any means, to improve this person's ability to itsa – cowboys in the white hats. That's good and evil, defined in terms of the itsa line. That's the difference between freedom and slavery, that's the difference between making freemen and making slaves. You make slaves by the intention to decrease the ability to put in the itsa line. That's how you make a slave. And that gives you the whole textbook of how to make slaves, right there, complete with gold letters and a chain-pattern cover.

And the other way is to improve the person's ability to itsa. In other words, to identify, to spot, to find out. And there we have that point from which we can separate the Scientologist from the medico, we can separate the decent civilizations from the lousy ones; we can go right on through there.

This quarter of the universe, by the way, is suffering from an overdose of lousy civilization. See? That's what it's suffering from. It apparently has been recently conquered in recent times (in the last few hundred thousand years), but those who were conquered had already been – their governmental actions – had already been set up for their own failure, see? They'd been set up to be conquered by using, themselves, mental technology which made slaves. They implanted their own troops. *Oh-ho-ho-ho-ho-ho-ho-ho, ah-ah-ah-ah-ah-ah-ah.*

"We're going to plant somebody up to be a loyal soldier, to fight bravely, to never give up his body so long as it is alive, to be true to the empire."

We're going to plant somebody, are we? Remember, every one of those items we put in, to stick, has to have a negative item! And that doesn't just cut it down 50 percent, that puts it in the betrayal line. It cuts it down enormously, because some empire that would do this to somebody gets their support like giving them the itch, see? "Yeah, we'll help the general out," you know? Help him into the car so that he goes through the other side and falls out the opposite door, you know? It's an accident, you know. When the planes take off, half their motors don't run, you know? Just – they're just running up against total sabotage, because they've already got a slave empire.

And you may be able to force a group by slavery and so forth into a semblance of a civilization, but it's only ever a semblance; there's never anything to which anybody freely, wholeheartedly contributes. It has no strength, it has no power. Because remember, 50 percent of the implant is "*Don't be a good soldier.*"

And then the fact that the implant occurred at all, of course, is enough to knock one's loyalty in a cocked hat.

Let's take an earlier and probably still extant organization, the Galactic Confederacy: eighty trillion years, smooth as glass. No implanting. Interesting? I don't know the exact length of the Espinol Confederacy, but it's probably something on the order of a few hundred thousand years. Implants – no empire.

The figures read themselves. Rome died at the hands of her slaves. That's for sure. She was never conquered by the barbarians. I know it looked very nice in the history books, but the truth of the matter is, who wanted to fight for Rome? You get through with a war, you come home, you find out the slave civilization has already taken over the farms. There's no need for your production; there's no need for a freeman; there was no pay to be a freeman. That was the reward and the pat on the back for having fought through the wars, you see?

And it started going into a civil-war situation. And half of the Roman Empire was always fighting half of the Roman Empire. I don't remember the exact name of the battle; it doesn't occur to me. I read it in Gibbon (and it's probably wrong in Gibbon) and got cluttered up on it – it's either Messana or something like that.

But the reason the first barbarians got to Rome was because – she didn't have very large numbers in her armies, but forty thousand of her first-line troops lay dead at Messala in a civil war caused by unrest caused by slavery. And they had no first-line troops. That was

practically the entire call-up of the empire. And historians today trace back to that battle as the reason the barbarian was able to conquer the thing.

Well, you trace back the battle, and you find the battle came because of civil war. And we find out why the civil war came and it came by slavery.

The American Civil War, that destroyed one of the better agricultural areas of America, and so forth, was again a battle about slavery, one way or the other. Every time you have slavery, you have trouble. See? You don't even have to be sentimental about it. You don't have to be sentimental. You can be terribly statistical. You don't have to say it's good or it's bad or anything else. You don't have to beat the drum for it, or be a person who wants to reform things or something like that. Just look at the statistics. Slavery never pays off. That's it. That's that. It's dangerous. If anything is dangerous, it's slavery.

You don't suppose America would be having very much trouble right now with its race riots and 250 thousand negroes about to converge on Washington, and so forth, if they hadn't kicked off this slavery. And it's very funny, but the most involved people in American slavery were the Bostonians. Used to have what they called the "triangle trade." They'd send ships loaded with rum down to Africa, use the rum to buy blacks (as they referred to them), use the whip and Christianity on them to bring them back over, and they traded in the blacks down around the West Indies, and so forth, for sugar cane, and they brought the sugar cane up to Boston and they made rum, and they shipped the rum to Africa, and they just had that worked out. And practically the first families of Boston are founded directly on slavery.

Kennedy missed that. He wasn't there at that – family wasn't in America at that particular time. His family got out from underneath another type of slavery: the landowner, the absentee landlord, the high rates – this type of economic slavery, and so forth. And these things go back to roots. In other words, we have catastrophes in all directions. We have the catastrophe of Boston, the catastrophe of Kennedy.

We've got a situation here whereby you trace world trouble, and you trace it straight back to slavery. I'm not trying to beat the drum for anything. Why do you think Russia can't get its feet under itself, and why is everybody having such a hard time with the Russians, and why are the Russians so silly as to evolve a slave economy such as communism, and so forth? What's all this fuss?

Well, this fuss goes back to the idea in early Russian history that a man belonged to the land, and when you sold the land you sold the man with it. Well, the European civilization got out from underneath that, two or three centuries before, and Russia has not yet got out from underneath that. She is still carrying the burden of her past chains. And therefore she can't think straight. She's like trying to get a pc to think in the middle of a session, you know? Can't do it. That's a little more touching picture than they actually are painting.

Actually, what I think is, is the White Russian prince and that sort of fellow, you see, he went back to the between-lives area and he came back and he picked up a body and became a commissar. I don't think they've really changed their faces very much.

But the trouble with world affairs today is slavery. The greatest empire Earth ever had went down in the dust with slavery. The British Empire right now is having a rough time and

is staggering around because of its efforts to colonise, and to do this and to do that and do something about this, and to free man and not to free man, and somehow or another to hold him in economic duress, don't you see, and not let him free but then to let him free, and... you know?

You got all this trouble down here in Africa running around in one way or the other. Well, that's the sort of trouble you get when you suddenly start taking the lid off something that has had the lid nailed down on for a very long time, you see? And without anybody around who really knows much about it, why, we get those boys going back into slavery, too. First action of a new African ruler is ordinarily to throw the whole opposition in jail because they are insufficiently enslaved by his regime, you see? This viewpoint. This viewpoint.

Now, I'm not discoursing on this just because I have a bee in my bonnet about it, because I frankly couldn't care less, as far as this planet is concerned. It'll never get out of any mess unless we get it out of that mess, and I'm just using the situation just to show you the liabilities of slavery. You always get a lash back – always. Because a thetan never gives up! That's it. He really never gives up. He's lying there. He might look awful quiet, he might look terribly dead, he might look like he doesn't interfere with anything, you see? But, in actual fact, he really never gives up!

He's got some trick: You can put him in jail, immobilize him, wrap him all up in adhesive tape and electric cord, and so forth, and he gets even with you: he sits there and thinks how he's right. He even goes down to that point, see? He can hold that postulate clear on down through the lowest levels of unconsciousness – that he was right. Well, I think that's very interesting. Because if he ever gets out of it, he'll go on being right, see? If he ever gets out of it, he'll go on being right about what he was being right about before he got put in that state.

In other words, the effort to dominate, the effort to dominate and deny power of choice is the road that this universe walked toward the hell it became. Fear – the unlovely specter of fear stands ahead of all of those.

Let's trace this out very carefully: To survive. All right, very good. This guy wants to survive. Whatever put him in the state of mind that he had to survive? Because this is your biggest piece of nonsense. A thetan can't possibly do anything but survive. In fact, it's probably the trouble with him. And that's certainly the trouble governments and things have with him. That's the trouble the Marcabians are having with him right now. How to kill a thetan is the biggest problem in this universe. See, it's just not solvable. They thought they had it all solved and we came along. See, they just never really are able to whip this problem. How do you kill a thetan? Well, it's not an elegant problem to whip.

Now, how can a being – who actually can't be struck at, who cannot do anything but survive and cannot die, who can pass through various lapses of memory and that sort of thing – how can this being get into a state of mind whereby he's concerned about survival? Well, it takes quite a lot of trickery to do that. Usually it's on the extension of self into a possession, like making a minion. You mock a mock-up up and then you endow it with some life, you see? And then somebody comes along and starts to kick its head off, so you protect it and you identify yourself with it. Or you construct a civilization and identify itself [yourself] with it,

and you're trying to get the civilization to survive, so that eventually you get worried about your own survival. You see the mistake which has to be made there? That mistake actually has to be made directly before a thetan gets worried about his own survival.

In other words, he has to extend some type of line onto something that he feels can't survive, and then identify himself with it to such an extent that he feels his own survival can be affected. And this is your first step into aberration.

All right. Your next step forward from this is an elementary step: Because one is now worried about survival, one resolves the problem of survival by domination. This is not any kind of a solution at all. It's a lousy solution, but it gets used and is probably... that which is not admired tends to persist. That very definitely applies in this particular line, because domination is probably the least admired thing in this universe, and yet, oddly enough, is continuously successful. But it's really not successful.

So, domination – domination comes in here. And we have thetan A and thetan B, and the way that thetan B is kept from destroying thetan A's construction or civilization, don't you see, is by thetan A dominating thetan B, you see? That is the formula by which this is arrived at. So thetan A, to protect something he wants to have survive, therefore seeks to dominate thetan B. And then being in a frame of mind where he feels he himself cannot survive, then he just obsessively goes on and dominates thetans B, C, D, E, F and G, see?

But he overlooks the fact that if he dominates thetans B, D, E, F and G, sooner or later, thetans B, D, E, F and G in their turn are going to dominate. Do you see? Because we've set up a cause-effect line, and the best thing you know about a cause-effect line – we may not know much about overt-motivator sequences; we know all about the cause-effect line from which the overt-motivator sequence comes. And the best thing about those things is that communication contains cause, distance, effect, with intention and duplication. And because of the duplication of the intention, then any communication line will reverse. That's the easiest thing a communication line does is reverse, because of course it has duplication on both ends. It's very easy for cause to become effect and effect to become cause, because there's a duplication in the communication line. All you have to do is make a slight mistake of which is cause and which is effect, and you have the waiters, which at one time through the last century served people in black tuxedos – you know, the guests all wore black tuxedos, and so forth – you have the waiters now wearing black tuxedos, you see?

And you look at any custom as it comes along in this universe, you are actually studying the cause-distance-effect-duplication aspect of a communication line. It's going to reverse. Well, there's lots of ramifications whereby we protest and we do this and we do that. But this fact of any custom you see on this planet at this time – you could absolutely count on its having been the reverse custom at an earlier date.

Now, this makes an awfully broad statement, but if you look into it, you'll see that's the case. You take the clothes today of women, and the clothes today of men, see? Well, you don't have to look back very far to where you see that that one flipped, you see? And you look into – into almost any custom you can follow down and you will find out it slipped. It went the other way to.

So the formula of communication, and communication itself, then, is the most important factor in looking for aberration. It's very elementary why: It's cause, distance, effect with intention, duplication. The duplication factor, then, makes the C very easily look like the E, and the E look like the C. So of course the line can reverse around the other way to. And we get all sorts of superstitions about overt-motivator sequences, and we get all kinds of things. Of course, that's factual, but it's simply based upon the nature of a communication line.

We beat somebody's head in and we beat somebody's head in and we beat somebody's head in and we beat somebody's head in. Of course, at cause you have the intention to beat somebody's head in, and at effect we have somebody's head being beaten in. That's pretty elementary. And then one fine day we wake up with a headache. Where did the headache come from? Well, one slipped. One slipped. One made a misidentification of the C and the E on the line, see? It was quite accidental. You're reading a book by Montaigne, or something, and it said, "And thy servant, he is a man, too," see, something like this, you know? Guy just, you know, just *blah*...

(I don't even know if Montaigne said that. But you have to add these erudite points when you don't have your quotation dictionary handy. Besides, I usually find out I can make up better quotations than they said anyhow. [laughs] I figure out their works were culled. I used to work on the basis that if you wrote enough words, you'd say something clever, and that saying things clever was usually solved in the field of philosophy by writing enough words. See, just by law of averages you would eventually be clever. Anyway ... Fifty thousand monkeys writing for fifty thousand years apparently by accident would write all the books of the world, and I think they did! [laughs, laughter]

Anyway, you see what happens here now? Do you see? There's a switcheroo on these lines, and you get what looks like an overt-motivator sequence. And almost any pc you audit at the level of *Homo sapiens*, and so on, has got this so switched that you can absolutely count on O/W working. But as I've often told you, it's not a high-level concept. See, it's limited. It only goes up so high because it depends upon this error of identification, you see?

But you can always get a case result by saying, "What have you done?" "What have you done?" because you've freed up now some vicious communication line. And it's certain that he made a misidentification from that point up, see, and so therefore we can free some somatics or something like that. We can practically count on the fact that if some guy has got a sore neck, that if we just find out what sore necks he has caused, we will eventually tear apart a couple of facsimiles of some kind or another, which will straighten it out, and he'll cease to have a sore neck. Because he obviously had given somebody else a sore neck, you see, if he has a sore neck. I mean, it's that elementary.

But what is this really based on? It's based on the misidentification of a communication line because of the duplication factor in communication. Can't communicate without some duplication. That duplication, of course, sneaks up. You can't communicate at all without duplication.

Well, all right, if communication is so dangerous, why is any thetan communicating at all? Well, he communicates because he wants to be oriented. And we're back to why he communicates. He wants to be oriented. Of course, I don't – then, of course, he takes his best tool,

getting oriented, and proceeds to aberrate it by using it to dominate, to do people in, and to mess up things that he tries to identify with, see? He messes up his own communication line. In other words, he misuses his communication line.

Now, the communication line is there because he's lost and feels the need of orientation. Hence his desire for communication. There's an insecurity back on along the line which causes him to use this communication line. As I say, we haven't got the full answer as to why that is. I'm just showing you what this comes from. And that gives us, directly, the itsa line. So don't regard the itsa line as a low-level concept, it's actually Scientology Five. It's not Scientology One, but it's used in Scientology One, and I'm sure will be used well for a long period of time, will also be used very blindly in many quarters.

But let's appreciate what we're using. We're using the obsession to identify, which lies back of the communication line. But we're using a principle higher than communication, coupled with communication, in order to orient and rehabilitate a thetan. You've made a full statement of processing at that moment, see, except for this one little fact: Is there anything else earlier that gave this guy an insecurity? The original one, in the absence of communication, is somewhat hard to understand – particularly at our states of case, see? A little bit hard to understand. What the devil was it?

This guy, you see, isn't communicating, he doesn't feel insecure, he is *not* protecting anything, he hasn't got any reaching going on, he had no real reason to reach, and so forth. How did anybody get to him?

You can figure out a lot of answers to the thing, and they all wind up with a communication line mixed up in them. And of course the moment a communication line is mixed up in them you haven't got the answer.

How did he originally feel the need of orientation and familiarization in order to be comfortable? See, how did he do this? How was this done to anybody, and how did he do it to anybody else? And if so, why? So, there is a riddle still sitting there, see? There is a riddle. But we have the walkway back to the answer to that riddle. And what you're walking, on the line of OT, is you're walking to the answer of that riddle. And the funny part of it is, when you put your foot on that which lies on the other side of all of the energy and all of the Confusion and all of the overts and all the misidentification and everything else – which you're handling right now as cases, and auditors, see – right on the other side of that, just as it took one step to get on the road, it only takes one step at the other end of that roadway to suddenly go OT. OT is a gradient process for a long period of time with a sudden fantastic upsurge.

You'll get shadows of that upsurge as you're processing somebody. You haven't made it yet, but he all of a sudden will do something peculiar. He'll do something very OTish – and the next forty-eight hours shake in his boots because, you know, ha-ha. *Blu-uh!* Guy starts to reach for the telephone and it leaps to his ear, you know? Scares hell out of him.

Next session you'll spend processing it having happened. [laughs] But that's processable, too. These are just the lines up.

But the realization at the other end, the solution to that riddle and any of its ramifications, determines more or less the state attained. In other words, processing is the cure of hav-

ing to be familiarized with things and having to itsa things, and so forth. The end product of processing is no further need to have to do these things. And as soon as one attains that no further need to have to do one of these things, one would find he would suddenly snap back to all of the power that he possibly could want. At which moment he probably turns around, and he's so mad at everybody because of that time he spent there being right that he rights the various wrongs that he was going to right, and he probably will take a dip at that point and then he'll come back up again. And there will be various curves and toboggans along on this road that will probably look very dizzy, but that's okay. So that's the way it is.

Now, we're undoing – we're undoing, then – this obsession to itsa by using it. And because the dependency on it is so great, you'll never get a bank taken apart, as far as I'm concerned, until it has been utilized to its full.

Now, self-determinism, pan-determinism, personal beingness, personal power, restored to the individual, is done on the road of minimal help, maximal recovery of self-determinism – or maximal recover of self-ability to itsa. See? That's up. Now, as the case goes along, its progress is measured directly and immediately by the degree that this is returned into the pc's hands. Therefore, you could get a fantastic number of engrams run – now let me show you how you can mess this up, see – you get a fantastic number of engrams run and a fantastic number of GPMs run, and the pc would be foggy and wouldn't be much alert, and so on.

Oh, you haven't really harmed him. You've slowed down the recovery in just this one way, by every time the pc says "Uh ... let me see, there's a picture here, and I think it's a..."

"Oh, all right, I'll date it for you. Is it greater than a hundred trillion years ago? Is it less than a hundred trillion years ago? Was it a hundred trillion years ago? It's less than. All right, is it greater than eighty trillion years ago? Less than eighty trillion? It's less than," so forth and so forth. "The date is so-and-so and so-and-so and so-and-so."

And the pc says, "Oh, all right. Hm-hm. Okay." See? See the nonsense involved in this thing?

And it just goes much more subtly, see, much more subtly: "You know, I think I must have been one of the Brobdingnagians."

Little tiny head shake as one looks at the meter and sees that it didn't read on Brobdingnagians, but did read on Lilliputians, see?

And then, "Oh, well, I didn't mean anything. I – helping you out."

You actually have the identical problem that a mother has, auditor. And some mamas solve it and some don't. They help little Roscoe to a point where, at twenty-one, little Roscoe can't shovel soup into his gullet, see? [laughter, laughs] Of course, there's an equal extreme the other way. They don't help little Roscoe to a point where little Roscoe, at the age of twenty-one, shoots them! Puts cyanide in the soup!

See, all of this is a happy mean, you see? And it isn't constant one pc to the next. That's what the trouble is, because one pc requires more help than another pc, because they're at different levels of independence. And you get a pc who has a very high level of independ-

ence and a very deep level of aberration, and of course you've got trouble! I mean, the guy can't walk, and he keeps putting his feet in the stew and in the mud and everything else. And you watch this guy caroming off into doors, and it practically hurts, you know? "Oh, I'll do it, I'll do it!" and at that moment, why, spills the tureen over his head, you see?

Well, that's all within the margin of an auditor. That's where his ebb and play comes in, is how much does it take to improve this guy's independence and self-determinism? How much does it take to improve his ability to know? How much help does he need in order to know? And you'll find out that's a varying quantity, see?

Here's this poor guy off the street, he doesn't know which end the door is, you know? And he's helped enormously because you actually show him where the door is. It makes him a bit better. You understand, from there on he can find the door, he can itsa the door from there on out. See? So you haven't taken all of his itsas away from him.

All right, well, that's the extreme case. But let's handle that extreme case wrong. Let's handle this just dead wrong: We tell him he never can know where the door is. See? And let's build him a special set of rails so that when he walks toward the door he runs into it. And every time he walks around that particular end, why, he'll collide with the door, see? Well, at this point, of course, you have exceeded the degree of. In other words, you haven't helped him at all. You have deteriorated his ability.

And what you want to do is take what ability you have, that you find there, don't you see, and gradually uncreate any dependence that is created. And the perfect formula is reduce it. See? Give him all the help he needs to get along and then gradually reduce it. That is always safe. Give him whatever help he needs to get along and then reduce it – which makes something like 3N into about four or five different routines, which is quite remarkable. And eventually, why, he isn't even given a line plot. But that's getting pretty adventurous, don't you see, because he can get himself in more trouble without a line plot. It's almost a dirty trick to turn somebody loose into a wildcat GPM before he's run a few that are line-plotted, you know? You can make a pc fly, but then the pc says, "I don't think – I don't think, I don't think this sequence follows on through this way. I think it cuts off someplace here. Something cuts off."

"Well, follow your line plot! Follow your line plot! The line plot. Give me the next item, the next item. That's what I want, next item."

"Yeah, but... "

"Next item!"

Well, even if it was there, the pc sooner or later is going to be right enough to convince you that it isn't – because you never let him find out.

Now, combining all of this nice sense of judgment is the extra bonus of your own flubs, because you cannot reduce them to zero. Don't ever try. Don't ever go beating your brains out. Because you get caught in cross-plays of communication where you didn't quite understand what the pc said when you thought you did, don't you see? And so you said, then, at that time – the pc is saying, "Let's see, what was that series we found? It was – let's see, I think I found early – earlier that such a series we found..." and so on.

Well, you say, "Well, you've already found it, you see? It's been found for several sessions, and it's 25.4 trillion years ago," see? And he's trying to find this date, you see? He's trying to re-remember what the date is, and you're just trying to get the series started, see? So you say, "Well, that was – that – oh, you're talking about the 25.4-trillion-year-ago series."

He says, "Yeah. Yeah, I guess so. I don... I-I do – get the.... No, you see, that isn't the point. Um..."

And you finally let him stagger through this, because you've, see, flicked his attention and slipped him the mickey with the wrong communication line because you didn't understand. That wasn't what he was saying at all. He's trying to find that lock incident that defended on the series, and his communication being a little bit blurry, why, he's not really communicating what he thinks he is communicating to you, so you make a mistake on it. And because the pc's communication line is so often fogged up in session, for an auditor, then, to do a perfect job of handling the communication line is impossible, because it depends upon the pc's articulation and communication being perfect.

Sometime a pc will say something to you like this: "Well, I suppressed my gains for this session." And what do you do? Well, is he giving you an itsa? Is he announcing a catastrophe? Is he getting off a suppression? See? Does he want you to do something? What's the intention of his communication? Well, maybe he doesn't even know, either. And almost anything you answer to this, you're going to be wrong! See?

So don't go around in fear of being wrong, and don't teach people to be afraid that they're going to mishandle one of these lines, because you're teaching them to be afraid of something that's going to be inevitable – inevitable.

The pc all of a sudden looks up and he gets a starey-eyed look in his eye and he says, "Say, I don't think that's true." You're running a Helatrobis implant, you see, and "Say, I don't – I don't think that's true."

And you say, "Well, what?"

He says, "That. You know? I just don't think it is."

Well, what do you do? Is he talking about the Helatrobis implants? Probability not. He's skipped into something. What's happened here? What's he collided with? We don't know. All right, to ask him for more data than he's got is a fatal auditing error, so we ask him for more data than he's got and we are in trouble. We don't ask him for the data he does have, we are in trouble. Don't you see?

Because, these are the troubles of handling an indefinite communication line, and troubles always originate. The communication line at its source is indefinite, so therefore the handling of it becomes a situation. So that just makes you have to get very slippy. And you have to learn various things about the intention line which we're not particularly discussing today.

"Do you want to tell me about it?" *Ha-ha-ha-ha* – cut your throat. How do you put the pc's attention on anything? How do you put his attention on a chair? You say "chair," don't you? How do you put his attention on a house? You say "house," don't you? How do you put

his attention on a date? You say "date," don't you? How do you put the pc's attention on the auditor? You say "auditor," don't you? "Do you want to tell me about it?" *Clang!* Out of session, ARC break, house falling down, everything going to pieces, gains being wrapped up, everything betrayed – Christ, what happened? *Ha-ha!*

You in vain try to trace back anything you did. Naturally, you tend to blame yourself for it. Well, you, in actual fact, didn't do anything except inadvertently direct the pc's attention in a direction where it wasn't going and give him a sudden attention shift, because of your misunderstanding of what the pc was talking about in the first place. Do you see the liabilities of this kind of thing?

So, know how to do it right, and do it right most of the time! See? That's the only thing you can expect and hope for.

All right. This pc itsa line is going to get better to the degree that it is permitted to exist. This doesn't mean to the degree that you let the pc talk, necessarily. It means the degree that you keep the pc's attention directed in directions where he can find things to identify: in his bank. And when he's found things in his bank to identify, let him identify them.

He says – you say, "All right. Now, I want you to take a look at that incident there that has the robots in it. Good. All right. That's fine. All right."

And he says, "Say,..."

"Yes, I know. They're robots."

Well, I'd just say that was too corny for words, see?

All right, you keep up that sort of thing with a pc very long, and you tell him what he is looking at always – see, it isn't a 100 percent proposition there, either. You sometimes tell a pc what he's looking at, see? You put his attention on the track to some incident that you know is there, and he doesn't know is there, well, you're certainly giving him something to itsa, aren't you? So you've given him something to itsa, and he'll start itsaing it, happy as a clam, see? But if you prevent his itsaing it after you have given it to him to itsa, you will see a gradual deterioration over a period of intensives – now, not one session, it's a long period – of his ability to identify. You'll see this deteriorating.

You're creating a dependence on your metering. You can create a dependence on your recognition, a dependence on his confirmation as to whether or not he's right. He says, "Well, I don't know if it was the cowboys in the white hats or the black hats, and cow ... You look on the meter," he will say. "Look on the meter."

One of the ways an auditor gets this started is invalidating a pc's data. He invalidates the pc's data a little bit, and – you know, tends to somewhat, and sounds doubtful, and the pc sounds this – and finally the pc will say "Look on the meter." And the auditor cuts his throat and looks on the meter. See? It's a case of he should say, "Well, I believe you. I don't have to prove it," see?

"If you don't believe me, look at the meter."

Proper response is, "Well, I believe you. Go ahead, tell me what it is. " Don't look on the meter.

Eventually you'll get a habit started whereby every time the pc wants to communicate anything to you, he convinces you by showing you that it bangs on the needle. And his itsa line will start deteriorating. See, this can be done in various ways. That's confirming his itsa line, which leaves him with no positiveness. It leaves him with no sensitivity as to what's right and what's wrong.

Well, that's an ability that you are trying to improve. And if you look on it as an ability that you're trying to improve and as the *chief* ability which is there to be improved in a case, you really won't make many mistakes on it. Your mistakes will be cut to a minimum. But if you look on a case as something from which significances have to be removed in any way that they can be removed, regardless of the self-determinism of the pc and regardless of his ability and regardless of his knowingness and his recognition and so forth, oddly enough, you will still make it, but you've multiplied your time factor considerably. Time factor is going way up – ten to one, something like that – because you're deteriorating his ability.

Now, just auditing the pc in general, you'll see you will inevitably get an improvement of the ability by the removal of charge. Now, if at the same time you're creating a dependency, to the degree that you're increasing – you see? You can increase and decrease, and whereby he's getting more track and more charge in his vicinity, his actual potential of improvement is being cut back by his dependency on the itsa of the auditor, see? It improves anyhow. But the auditor is cutting it back, and he's just costing himself more auditing time, more auditing time, more auditing time, more auditing time. More difficulty, more ARC breaks, more upsets.

There's many a – many a way, many a way by which all this can be handled in various ways. See, you have what you call an ARC breaky type pc. Well now, this pc probably has a high degree of independence and probably has a high degree of itsa ability already, but possibly is a bit swamped with charge, see?

All right. Now we take this pc and we deteriorate his ability to itsa, you see, by creating a dependency on the auditor. You know, by telling him everything, by telling him everything. You know, "That read. That didn't read," and so on. Of course, the funny part of it is – there's one other point of this I should mention in passing – if you don't tell a pc when an item is finally discharged, in the early stages of running GPMs, he'll leave items charged, and the mechanics of the bank will cause him to bounce and ARC break. See? So that again is one of these factors whereby you're putting in the itsa line – "itsa discharge."

Now, but sooner or later the pc is going to start telling you when it is discharged. Well, that's damn well when you better stop telling the pc that it's clean. Do you understand? You just better stop telling him at that point.

Ah, but you've got an interesting problem here. Maybe you've stopped telling him at the point where he still can't tell. Now you're going to have hell raised, because you're going to have him stuck in incidents. You're going to have RIs live all over the place, you're going to have his postulates live and so forth.

I think I'd start working on a campaign on him: "Well, run it until you're very sure it's flat" is the kind of a campaign I'd start running, is "Get that item until you're very sure it's flat."

"All right," he says, "that's flat."

"Okay, say it again. Good. Fine. You're right, that's flat," see?

And he all of a sudden, "See, I can tell you." You know?

"All right, good. Good," see? "Fine." And wean him. And gradually don't check, see? Don't check. Say, "All right, I can depend on you." Because he can tell you, eventually, when it's flat.

He'll also get very bored with an item and leave it half-unflat. You can sometimes make a citizen out of him by letting him do so. Trouble is, he's liable to have bounced and gone into something else.

Now, there's various problems involved here. I'm not trying to tell you this is simple. Don't get so involved in the problems, however, that you miss the basic mechanics of the situation. Basic mechanics of the situation: the pc is the one who is living with this bank, and if he can't tell what's in it, and so forth, he can't live with it. Obvious? I mean, that's one of these ne plus ultra things. You're unfortunately, or fortunately, not going to be at his side for the next two hundred trillion billion squillion years. See, you're not going to be there telling him whether it is a GPM, you see? Going to have to find this out for himself. So sooner or later, you're going to have to kick him off with regard to this bank.

The time to start is when you start auditing him. You start auditing him, why, start weaning him. Don't increase his dependency. Decrease it. Give him all the help he needs! But isn't that a tricky statement? How much help does he need? Well, you know if he doesn't have line plots and a design on the track and the concepts of life, and that sort of thing – if he doesn't have something like that, he'll never put his foot on the road at all. And we know that if he doesn't have a line plot for a standard GPM that he's got to run, and so forth, we know he'll wrap himself around a telegraph pole, man. He'll practically finish himself off by giving you wrong items and upside-down items and missing items, and so forth. And the next thing you know, why, the penalty is much worse than the cure, here. See?

Well, where do we go? Well, how much help do we give him? Well, we give him all the help he needs. How much help does he need? Well, that is something you establish individually in each pc.

You're going to get ahold of some pc sometime or another – you know, he possibly hasn't been down here long, or he got here by accident, or something of the sort. And this pc cognites on the Axioms, knocks out the bank, does Change of Space Processing between your auditing room and the next building for a while, goes around and thanks you very much; you're left with your jaw dropped because you haven't had an opportunity to get your meter on and tested. [laughter]

Well, don't feel so betrayed that you didn't get a chance to audit. You audited. So, there are various degrees by which you have to approach this problem, and that's the difference of pc's.

Now, these very, very ARC breaky pcs sometimes get a reputation for being ARC breaky and they get very upset this way and so on. It's actually where their concept of their

own independence is being invidiously cut up by people putting itsas in for them. And the charge on the bank is too great, so that they get into this stuff and they'll dramatize at the drop of a hat. And this is upsetting to them. It's more upsetting to them to dramatize, but how did they dramatize? They dramatized only because somebody put in the itsa line they were not able to.

So, what do you do with such a pc? Well, a pc who's routinely ARC breaky must obviously have something wrong with the itsa line. Well, he wasn't the result of auditing – it was probably something that occurred before auditing, because we are not in the business of aberrating people. Well, it must have occurred in some aberrative area.

Well, you can do such a thing, as give them an eighteen-button Prepcheck on the itsa line. Simple. Now, an eighteen-button Prepcheck is not thrown out by the itsa line because the eighteen buttons are the select choice, very best, grade A, straight-from-the-ocean itsas. You realize that a Prepcheck is almost the perfect series of itsas. Most powerful buttons, so they're most powerful itsas in existence since the beginning of the universe. "Since your beginning of travail, has anything been suppressed?" Wonder how long that would run. But that's an itsa, because he must have itsa'd by suppressing. So you're getting off the crisscross, see? If he suppressed it, then he can itsa it. If you get the suppression off, then he can itsa.

These are almost perfect itsa lines. The Prepcheck actually comes into its own. But very interesting about a Prepcheck: you can prepcheck the itsa line. See, on that? That takes the cake, man.

Now, you take one of these very ARC breaky pcs that has a very great reputation for being ARC breaky, and you put the itsa line into some comprehensible thing. Very often, if you just explain to them what the itsa line is and prepcheck it, you'll be better off than trying to redefine something, because you won't then be prepchecking the itsa line. But this takes some doing.

An auditor has always got to be able to interpret the auditing command and clarify the auditing command so that the pc knows what it is. One of the best ways to clarify an auditing command like "Recall an ARC break" is explain an ARC break and give it to him, because you use any other word, you'll run into some GPM – almost certain to run into GPMs. "ARC break" is contained in no GPM and therefore is a totally nonbackground word. See? Give him a new word, new symbol.

All right, so you say, "Itsa line – well, your – your recognition of things. Your consideration of things. What you think life is all about. Your opinions. You know, somebody says, 'What's a cat?' and you say, 'It's a four-legged animal.' I mean, your right to do that." You know, go on, go on, explain it any way you want. Prepcheck the itsa line. Or get some other designation for it. But prepcheck it.

And you'll be very fascinated that the pc who is the ARC breaky pc is not really ARC breaking because of auditing and bypassed charge. This pc's itsa line is cut right here and now as his most colossal PTP – by something else, nothing to do with auditing.

I'll give you a marvelous example of how somebody's itsa line is cut right here and now: He's on this planet, isn't he? If he tries to get off, he hits the between-lives area. His itsa

line is cut because he can't it'sa anything else in the universe. He can look at the stars, but he can't tell what condition they're in. See, he's the prisoner on the island who looks toward the mainland longingly, so his it'sa line is cut.

See, there's all kinds of ways of cutting the it'sa line, don't you see? No reason to dream them all up for the pc. Put in a Prepcheck on his it'sa line.

You'll be astonished. He'll make some case progress – sudden case progress, and cease to be ARC breaky.

Other ways of attacking this same problem sometimes give us the very, very fascinating and interesting aspect of somebody who has found that the ARC break is a solution to some problem. So he solves the problem by ARC breaking. There's various ramifications, but he normally runs into this when you prepcheck the it'sa line. You have a big piece of understanding here. It's a big, new, whole piece of understanding. It's a new piece of the jigsaw puzzle which has fitted into place and made citizens out of most of the center pieces, and has shown us that there's just this little few out here on the edge, of how come a guy had to identify and familiarize himself in order to feel alive or secure? How come a guy got into an obsessed necessity to it'sa? That little piece is about the only piece missing right now, and it's up here in the corner. And it's missing just to this degree: You show me a problem, very shortly later, I'll show you the answer.

Thank you very much.

PROJECT 80

A lecture given on 22 August 1963

Thank you. Well, what is the day?

Audience: 22nd of August.

Twenty-second of August. Boy, you're lucky! You got all the way up to the 22nd of August. And you're still alive. Boy! Some people have all the luck!

All right, Saint Hill Special Briefing Course lecture. And we're going to recapitulate now on the itsa line and levels of auditing and et cetera, et cetera, et cetera. Going to talk to you first about Project 80.

Why 80? Why does Ron always use these 80s and so forth? Well, 80 is a mathematical trick, because you turn it over on its side, you see, and you have infinity. And it's a sort of a mathematical joke. You've got an infinity, you see, and you've got a zero. So you have embraced the totality. So it's just a mathematical trick of saying "all."

Now, Project 80 has to do with organization targets and dissemination and technical planning. And this has a great deal to do with organizations, and it has a great deal to do with anybody who is in practice and has a great deal to do with anybody who is in Scientology.

And the only reason a designation of Project 80 has been assigned to it at all, is because there's a whole cluster and collection of bulletins and policy letters which will be coming out along this line, and there are a great many publications will be coming out along this line. And you'll recognize them when you see them because they will have designations like "Scientology One," or "Scientology Two." And the embrative action of what to do with these things is included in Project 80.

Now, you're watching here now the dawning of 1964, which is the year of Scientology for everyone, you see? And what has happened here precisely is a lot of guys have come along, and we've been all together in plowing through the research and it's been very trying at various times. Research is very far from ended when you can make a breakthrough of the magnitude of the itsa line, here, just in the last couple, three weeks. But we've come all the way along this line, and we've seen it changing, changing, changing, and this and that coming and going, and stable gains and a lot of hope going along the line and all that sort of thing.

Well, this has made in essence a special breed of cat. And we're not in a situation where we're going to lose such people, see? Most organizations' activities, forward pushes, in this particular universe are up against continuous loss of personnel. It's one of the most crippling things that they have – the loss through death and casualty and implant and this, that and the other thing all the way on up the line, you see? And frankly, if anybody could live long

enough he would be rich. Just think of that for a moment. Supposing you went on with some – at least the vigor that you might have at thirty or forty, and just keep going! Keep going with no wipeouts.

Well, let's take movie stars. Let's take movie stars. All during the – all during the 40s and 50s you had the movie stars who had made it in the 30s and 20s, which is quite remarkable. Those that came up in the 30s, particularly. John Wayne, Gary Cooper – these characters, you see? And you just saw them on and on. My God, he's... Gary Cooper playing the lover at sixty-five was quite interesting, I think. But they simply were not necessarily good, they simply were persistent. [laughter]

I don't know anybody who ever handled dialogue worse than Cooper. But they were persistent. And what happened to their rivals? Well, it wasn't that their rivals didn't make it or weren't so good or something like that; they simply fell by the wayside, preys to various ills. And even those that were prey to considerable ills still made it. Like, look at Judy Garland, the ups and downs and so forth. Persistence. If you could just keep going, you yourself become a sort of an institution, don't you see?

Well, we've got this particular factor, to some degree, licked – at least the solution of it is well in view. As I told you yesterday at the end of the lecture, why, give me a problem and I'll get the solution to it, usually. I've been operating on the basis that if I can conceive of the problem – I amplify that a little bit further – if I can conceive of the problem, why, I know we're about forty-eight hours from what made it a problem. Not the solution to that problem, which is a MEST universe reverse-end way of looking at the thing, but how did it become a problem? And this is organizational, you see? And we see this pretty well, so that I've become cocky to this degree: I know that if I can conceive of what we're up against, and I know if we can conceive of what we're up against, we can – in dissemination and technical and that sort of thing, we can whip it.

It's all very important to our future progress. Now, we are also, incidentally, working here with the problem of vanishing people. And that problem is the one that causes most organizations to deteriorate and go by the boards.

Now, we've had quite a struggle coming up the line one way or the other. That struggle's a long way from over, but the murderous – the most murderous aspect, organizationally, is well within our realm of resolution, which is losing all your people. In any given – any given twenty, thirty, forty years on this planet – on this planet, any organization practically loses the totality of its people. Now, we're not up against that. We have a lot of people here who in the last (some less than this) five, six, seven, twelve, some thirteen years, have been going along this research line with me, see? And things have ebbed and flowed and you've seen it all changing and reversing, and the ink was dry on the bulletin so therefore it must be out of date – this kind of thing. Right here this particular unit of Saint Hill has had to cope with shifts and changes, but I myself have never compromised with this for a moment. And I think you're awfully good sports, all of you who have put up with this, to put up with it, because I'm sure you understood that if there were something better coming up you didn't want the something worse just for the benefit of stability.

You see, in essence *we* are the stability, when it finally works out. Well now, it may not be apparent to you, and it may be apparent to you, particularly those in Z Unit, that we've pretty well got Level Four – Scientology Four, the road to OT – that's pretty well wrapped up. You could know a few shortcuts, there's a few refinements, there's a terrific number of releases to be made on this subject. For instance, I discover lots of exciting things along in Four that aren't yet released. For instance, just last night I got my hands on the pattern of the O/W sequence itself – the overt-motivator sequence, rather – got the whole pattern, tailor-made. And it's a lolly, man! It's a doll! It's a GPM of sorts and its own special breed of cat. And there goes your overt-motivator sequence. Well, there's a lot of stuff coming out like this, you see?

But the *modus operandi* by which you find that material is there, and the type of material which is going to be found has already been established, and the various ways by which you use this material on the pc has all been established, don't you see? And you call that a wrap-up, see? It's an incomplete release, but a research wrap-up. Nobody is going to be working very, very hard to find some new type of incident, or something like this. They just aren't. There was one more type to be found after the GPM, and that was the screen-type incident. There's some ramifications of postulation-type incidents and so forth, but these we already have the technology for. We already have any kind of a drill you ever heard of for a Thetan Exterior has already been wrapped up years ago.

So call that level a wrap-up. It's just practically office work to put the stuff together, see, if... that which isn't together. Anybody finishing the Z Unit here at this particular time is perfectly competent to handle all of this. He'll pick it up and say, "Oh, oh, yeah, yeah. Well, that's one of those," you know?

So, in view – in view, of course, is a wrap-up of the between lives, and stripping it out so a person doesn't do a report-back. Now, that's very, very pertinent – very pertinent situation, and I thought that was going to be very tough. It is a little bit tougher than I thought it was going to be. You can undoubtedly strip out the report-back mechanism without doing much else, but the between lives is full of GPMs. Ha-ha, isn't that nice! And they're all negative on the beginning end of the screen and they're all positive on the "end" end of the screen, so of course the positive-negative type goals, the di... it's a dichotomy, you see? Those that are positive dichotomy are as you leave, and those as you arrive are negative, so of course that collapses one on the other to a marked degree and makes it a very nice mess.

Fortunately they're not given with very much violence and the earlier sequence and series of these things is given much earlier, before one has actually entered the civilization which you now unwittingly find yourselves. They're the Train goals, and we have the pattern. I've got to confirm this and dabble around with it for a while, but it's that kind of work which we're doing.

Exciting enough in its way and certainly valuable enough and vital enough to make OTs. But I don't think that anybody has very much doubt, except if he's been dropped in the middle of session, that we're going to have all of this worked out and it's mostly a matter of grind away and get the GPMs out of the road and keep the tone arm flying and so forth, and

gradually work it out, work it out, and hold the pc's hand through the rougher passages of it and rough it out and then we'll finally have arrived at that.

It's a matter of – once more it's a matter of shovel work. It's more comparable now to moving a pile of coal from point A to infinity-zero, see? It's just – it's just auditing. It's a number of auditing hours. There are some rules I'm working out that make it faster and easier, such as if you get your paws on a GPM, the running of which gives you tone arm action, do not let it go till you have run it and its whole series. This is the faster ways to do this sort of thing, you see?

If you are stripping off a between-lives screen and you suddenly find some incident that's way back in something-or-other land, just don't just date it and let it go – run it. And when you've got it run, come back to the screen lives... between-lives screen to strip it down some more, don't you see? And eventually the whole puzzle all comes apart and everything falls apart in your hands, case all goes back to battery, and bang – that's it.

That's just a matter of working at it. But what is the central action of this? The central action of this is auditing. And auditing's central action has to do with keeping the pc's attention directed to those significant portions of the track which give him tone arm action and which take his case apart. That's the highest level of professional auditing. There it is.

Well now, look. You know how long you've been on the road, and look how much you've studied, and how much you've sweated and groaned and that sort of thing in order to achieve the technical level which you right now have achieved. That applies to anybody here. You know how far you've gone. That's quite a ways. That's quite a ways. If we expected everybody to go that similar distance, we would lose. And what we happen to have – we have a group now who have come along over a tremendously long distance and who then form an advised cadre. They would know which way these cats are going to jump; they've been exposed to just about every brand of process that you can imagine and so forth.

Now, this is very important. This is very important to have such people. We're not going to lose these people. It's going to go on for quite a while. But how about all of those other blokes, huh? How about all those other people? Well, to expect them to graduate up the hard way – it's too much to expect. A lot too much to expect.

They're operating at certain levels of reality, and that level of reality establishes their ARC. And if we're going to bring off any coup with regard to large public acceptance, broad dissemination – if we're going to bring off any coup on this particular planet, we're going to have to pay attention to that ARC.

Now, this bloke is plodding along there, and the highest level of his understanding of mentality is "Women are all alike." This he knows. When he finally decided that, wisdom burst upon him. He felt pretty good. Every time somebody throws a coffee pot at him or something like this, why, he just sits there and he's satisfied as can be. He grabs hold of that stable datum, inserts it into the middle of his thinkingness, and he knows now the answer to it: Women are all alike, see? And that explains the coffee pot, and that explains everything, you see?

And we come along to this bird and we say, "Hey, bud, you're a convict. You live on a planet called Earth; it's part of the Marcab Confederacy. What you got is a whole lot of GPMs and you got to run these out, see, because they're positive-negative items that go into a dichotomy." Now, you give me his ARC. What is his ARC at that moment, see?

Male voice: Broke!

Broke but good, that's right. Correct! At least it's just going to be kind of unreal. He's not going to be very happy with us. Well, what then in essence has happened – is we've carried along here by our bootstraps, at many times great personal sacrifice, certainly through lots of disappointments, upsets, through tremendous loses, all kinds of things – we've carried along here, and we have been making our way and we've been getting along just fine, and the gap between us and them has been getting wider and wider and wider, and eventually we find ourselves in an informed ivory tower which of course we can take off from, to Lord knows what but we've left no bridge behind us.

So the particular cadre of Dianeticists and Scientologists who have come forward to this point could very well just sever at that point and we all goes our ways selectively, or we do or we don't, but we have left no bridge behind us. I consider that somewhat important. Particularly since it's going to take a long time to bail out things and square things around and that sort of thing.

I want to point out to you, this planet is in a slightly different situation than other planets in that – not to go space opera on you – but this planet has a prayer of not getting tilted. That is, what you put into this planet has a tendency of remaining here. There's a probability that it will, don't you see? Well, this is not necessarily true of the other planets in the immediate vicinity of this planet, because very often you get into a condition of warfare of some kind or another and things happen.

Now, all I'm talking about is that to get any kind of entrance into the social strata of nearby planets and so forth, to get any entrance into that is fairly improbable. They're far more likely to explode – being very tightly and intimately governed, they're far more likely to explode and go up in smoke. Do you see what I mean?

The... you've got your feet into this one, and this one does make a rehabilitation center of one kind or another. It's worth salvaging – with all the other crude expletives I've been using about planetary tilting and so forth – it is worth salvaging.

Now, what happens to the other immediate planets that are connected with this confederacy in this system I could not bet on just for two seconds. I just could not bet on it. In the first place, these are invasionary planets; they possibly were facing some type of invasion here into this particular galaxy. There's probably political situations in existence and you and I would not know what of, don't you see? And I know they've made a considerable incursion into the thing, because I know that the Espinol Confederacy used to control this very much and I found out the other day that their return platforms were closed, were barred off with speakers, you know, saying "Get away from here," and "Report to the ones we told you to report to," and "Get away from here," and "We don't want anything to do with you." In other words, their return points are closed.

Well, that just spells nothing but defeat, see? So what is this? Now, is there some other planetary system – is there some other empire system which is deeper in to the heart of this galaxy which is going to backfire against this one? I would say probably yes. Probably yes. There... probably this is coming right up over the hill. I mean it probably is not long. Maybe this confederacy or this activity right now is in trouble. But conquerors nearly always spare the jails. Did you realize that? The Allied troops going in Auschwitz, Belsen, places like that, they didn't knock those apart. They knocked apart the belligerents' property, but they didn't knock apart their jails. All kinds of political situations complicate this picture.

I'm not trying to tell you what they are about or the solutions to them. I'm merely saying that these are complicated and I've only vaguely touched on how complicated it might be, see? We can't bet on that. We actually can't bet on the preservation of Earth. But we can bet on this – that this planet has a better chance of becoming a rehabilitation center than other planets, see. That's a very faint bet, don't you see? But supposing – supposing now, you have not left any bridge to – in the rehabilitation center, don't you see? Well then, everybody in this area, now, just keeps floundering around without any contact and no way to get up on it, and very mad at the only group of people that could assist them. I don't think that's a desirable situation at all. In fact, I think it's a highly undesirable situation and I think it could actually impede what we ourselves are trying to do. We've got to leave – we've got to leave a bridge.

Now, organizationally and in private practice and other functions, our feeder lines into the public are very, very weak – extremely weak. But they are not weak administratively, they are weak technically. It's technical weakness. Now, that's why I've circled around and come back to Scientology One as a heavy point of concentration in research and development.

Now, this is all very, very interesting that we would consider Scientology One a heavy area of research and development. Well, the other is wrapped up. I'm working on it as fast as I can. You see little things sandwiched in amongst other things. For instance, you just saw a bulletin – if you've gotten it yet – how to handle the pc's postulates when encountered in GPMs and engrams and that sort of thing, you see? Well, you see stuff like that all the time. But this other stuff is coming out now which is this bridge. And that bridge is Project 80. See, that's just Scientology for everyone. Now it requires, actually, that we study Joe and Bill and Pete a bit and find out what they agree with and utilize that agreement to improve their ARC – not with us, but just to improve their ARC – up to a point where we can hit another level of agreement. See? In other words, raise them from a level of ARC, from where they are, to a next gradient point of ARC. And then at that next point of ARC put them in the way of getting their ARC improved up to the next level. And they come to Scientology Three, Clear. And then put them up from that up into a higher level. Do it by gradients, in other words, not with crush and crash.

Now, the eight dynamics, various scales, the ARC triangle, the dynamic principle of existence – all of these things are too high for Scientology One. Interesting, isn't it? So they comprise Scientology Two – HCA/HPA level. And you're back to – you're back to what you might call thirty-, sixty-day HPA training. That means a lot for a Central Organization.

Well now, how could we possibly make an HCA or an HPA in that length of time? It's because of our breakthrough on the itsa line. It's this piece of technology which has made this

possible. And we couldn't have climbed this hill with the technology we had, because we had to have technology that could be grasped so easily that even if misinterpreted somewhat would still work. Now, that's an easy one. So we come back to that. And we get various definitions for these various levels.

Now, in studying over this problem, I am now supported by a tremendous amount, and growing rapidly, technical data – technical results – from the itsa line and this exact approach. And I'm very, very interested. Why, I'm also very interested that some of you, as auditors, haven't yet coped with the level of win. See? You're living here on cloud nineteen, see, and you know what a terrific win would be in auditing, you know? Well, run out a whole series of GPMs on somebody with terrific tone arm action and so forth. You're hoping for that level because you know you're setting them right straight up for OT, you see? And you overlook what is a big win to a pc. For instance, our Staff Auditor has just made that mistake. He's worried. Of course, he's trained up to the nines, you see. And he got a perfectly raw piece of meat and their first session she couldn't say a word, really. No benefit, nothing. A few repetitive questions were asked her, practically spun her.

Next session, she was very happy to have been able to talk to the auditor about these things. Now, that was her gain for the session. But the auditor hadn't been able to get her to talk about and get good TA action on what he wanted her to talk about, so he was regarding this as a lose. See, he was getting worried about the case. Isn't that right? I just saw her folder and I haven't had a chance to talk to the auditor yet; he's at a disadvantage here. Well, he's getting his itsa line in on a brand-new, fresh pc. And probably what he doesn't realize is she is violently pro-medicine oriented, and would ordinarily be what you would consider an impossible case to process. In a couple of sessions she's got him – she's talking to the auditor and getting a little TA action doing so. Well, I consider this is terrific, because this case would have barred us out a few years ago, or even a year ago, even a few months ago. It's at the level of win. See? You have to learn to settle for these little wins, see? See, you have to settle for these wins on a gradient. So he's winning. He must be doing an awful smooth job of auditing to get over all of that. And in actual fact, the moment he started putting in the itsa line, just as such – even though she wasn't particularly interested in talking about what he was putting the itsa line in – he had a win. Think of that! I consider it fascinating!

Tells me at once the auditor must be doing a splendid job. And it tells me the case must be winning and it tells me this case, which I would have considered unauditible, who has been refusing auditing left and right – not really refusing it, just ignoring it; much worse than really refusing it – and he gets the itsa line on this person a little bit and he gets a win. So I think he must be doing well. That case must be doing well. And he doesn't have to do anything very, very extraordinary about what to get this case to talk about. See, as long as he can keep the case talking she'll win. Aw, that's an awful easy level of auditing.

So here we are, operating in the operating climate of where we've known this is very hard to do. So hard to do we've almost forgotten that we ever hoped it could be done! And there it is, sitting in front of us, doing it! And it's almost too spectacular to be accepted.

How long has it been since you took somebody who was half-seas over or upset in existence and tried to audit him, and wouldn't be audited and had to then fall into an unauditible

category. When's the first one of those you ever had, and when was the last one? Well, now those are the real loses, man. Because, you see, you didn't get to process him at all! So it's a win if you processed him at all. And you actually, when you get your hands on this, you will be completely surprised to find out that in this kindergarten of auditing you have very stellar results obtainable – so obtainable that medical healing is contained in this line – solutions to the problems of medical healing.

Now, I'm not saying we are going to do medical healing. I wouldn't be caught dead with it! I've done my... I've served my time that way. And pretty poor. So don't think we're downgrading a result, is all I'm trying to put across to you. We're not downgrading a result, but it's going to take us a little while to get used to the level of result.

I had quite a shock on this the first time. First time, I just – I had worked out completely, in the absence of tone arm action the pc wasn't winning. See, I'd worked this out, theoretically and so forth, and I started putting it to use and kept very close tally on it and found out that the significance which I would erase off the case did not have a value comparable to the amount of charge that was tone-armed off the case. And I was completely flabbergasted. It was a matter of watching pcs over twenty-four hour to forty-eight hour periods after a session, and it was astonishing that the session following good tone arm action on the pc – regardless of the completion of that session, regardless of the significance of the session – established a very high level of win for the pc. Pcs felt brighter, more alert and so forth.

Now, you could get tone arm action and too much significance entered into the situation and be pressuring the pc along very hard in the direction the pc had to go, and yes, you were driving the pc toward his ultimate goal and that sort of thing, but the pc wasn't particularly happy about it. It was trying – like trying to get speed out of a motor boat half-full of water. Not lots of charge was being released, and slopped over, and the pc felt groggy and weary and sluggish and so forth. You nevertheless were making it, you understand.

So the optimum level of cheerfulness as far as the pc is concerned, and the feeling of getting a case advance, as well as actual case advances, lies just in the direction of the itsa line in and the tone arm moving. You can almost delete "on what," see, at your lower levels of auditing.

Now, when I say – I used that "medical healing" unadvisedly because they'll be wiped out soon if our plans mature. These birds... here we've got a guy who is – who's got a – he's got a wonderful case of lumbosis and so forth, and his lumbar has been bothering him for a long time. It's Douglas fir or something, and termites have gotten in there, and this is predisposed toward disease, this area. A predisposition toward disease.

Well, I think this is quite remarkable, because if they treat the disease they never get at the predisposition, so something else has got to happen to the lumbar. So the obvious thing to do to the lumbar is to surgicalize it – cut it out so there is no lumbar. Obviously the solution to trouble with the lumbar is no lumbar, see? But they've completely overlooked the predisposition of the lumbar to disease because of trauma. They keep concentrating on the bugs, you see?

Well, this has a – perhaps has its limitations. But what exactly does this do? Do you know that if you could get somebody talking about his health, or his lumbar – for instance,

you're handling that right now; you actually are trying to head in and get her to talk about something about her health. Something. And you'd probably have to make a very fancy assessment to find out what it is. But the final analysis here is if we can get her talking, this pc, about her health, we'll eventually get her talking about her lumbar, and we'll find out that the cures and solutions and decisions and discoveries and cognitions and comments and considerations and hopes concerning that lumbar, in their aggregate, caused her to have lumbosis. And if we can get those off with TA action, we will then have a recovered lumbar. It sounds utterly incredible. Doesn't apply to broken legs *yet*. See? Probably have to set a broken leg.

I'm just trying to give you where the zone goes. Your Scientology Two is probably the open-sesame to healing. We've got to accumulate a lot more material on this, and I've – as I've said already in descriptions of Scientology Two and in the process of getting this material together – well, my whole statement is, is we're not putting in this HCA or HPA's hands weak tools!

Just because they're simple, they're not weak. And by using the itsa line, we possibly could take this person and cause him to be very effective in the treatment of some physical conditions from a spiritual/mental level that have never before easily surrendered. See, I mean we've got a door open there. It isn't just cracked open, it's crashed open!

Now that means, then, that your HPA/HCA level training is just exactly in the zone of where you've been here with the itsa line and the TA action, with a slight direction of the pc's attention – method of direction of the pc's attention – mostly to this lifetime, to limbs, to conditions in their life and so forth. So we have to train him at this level. We have to train him in the Auditor's Code; we have to give him, of course, some TRs; we have to tell him about the Axioms so he sees that the subject has breadth and depth; but mostly, we tell him about the ARC triangle, the CDEI Scale, matter, energy, space, time, form and location; we tell him about the dynamics – see what I mean? And when we get him all grooved into this line we teach him the tone arm of the meter, and that's it.

Now, this is certainly several cuts above Scientology One and is an expectable cut, because he'll be able to use that information, particularly if we put it together so he can use it. Now, puppy to the root, with great curiosity and facing the unknown, he will of course (and his instructors may of course) wish to charge up into the character of this bloke and his name, rank and serial number before he came into the Marcab Confederacy, and considering it very important that the auditor know this, and then it's very important that the auditor know something about 3N, it's very important they really know how to run an engram, and it's very, very important that they know how to run this and run that – and in the course of a few weeks they try to press in an education which has actually taken you something on the order of what? That's heading for no success.

But if they could learn these other factors and well, and if they effectively produced a result for them, then that whole group undergoing that training and handling that processing would win. They would win all the way across the line. Their ARC, then, would again come up.

Let's take Scientology One again. We study this guy and that guy, and we find out what they are in agreement with – already what they are in agreement with and what they are

antagonistic toward. And studying these factors, we give it a Scientological orientation and organization – that's Scientology One. You got a datum, something – if you realize that psychology has not even come up to that level that we're aspiring toward in Scientology One – you realize these guys dabble around with stuff like this and consider it very wise? Such as, "When troops get letters from home their morale rises." – psychological report rendered to the commanding officer – "Therefore I advise that you have more mail transports to the front lines. Chief and God almighty of the Psychiatric Division of the Army of the Republic, signed this date..." Scientologists look at that and say "Oh, *pfft!* Why is the morale of front-line troops down? The morale of front-line troops is down because they don't get mail from home. Bull!" This bird, then, is occupying a point of swindle to some degree, because he's supposed to be a high-caste character that knows about these things, but what he does is put out these fantastic banalities. See, we're not even – we're not even going to go that low for Scientology One.

Scientology One says that it is possible to have a happy marriage. Improbable, but im... not completely impossible to have a happy marriage, see? That's its level of discussion of marriage, you see? Not "Marriage is a marvelous experience which can be..." you see, all built up on the line. And, "How do you actually live a happy marriage? How do you get along with children?" Well, you make the whole of child psychology something on the basis of – something on the basis of "When the kid tries to tell you something, understand it and acknowledge it. Don't ignore it."

Employee-boss relationship. Communication formula with regard to the employee, with regard to the boss. The project of saying, "Good morning" to somebody over a period of forty days, until they finally say, "Good morning" back. You know, the use of. It's just getting into communication. See, your common denominator of all that.

Now, you turn – you turn you loose on a platform, talking to the mothers of East Orange, New Jersey, about their children. Now, look at your levels of choice. There you are, facing all of these girls, and they know you know your business. Now, you can say, "Your little Rollo has just been through the between-lives area, has the following GPMs..." [laughter] Or, you can say – or you can say, "Your problem with little Rollo is basically one of communication..." I think you could take off from there. I think you could really take off. What is he trying to say when he cries? How to handle him. How to handle him.

I'll give you a case in point. The stuff's effective! But it takes a while. One little boy – one little boy went – I don't know, it must have been the better part of four, five months – without feeling anything but hostility, but at the end of that time became very anxious to please. And what exactly was being used? Every time he said something, great care was taken to find out what he'd said and to acknowledge it. Every time he showed up one said hello to him. This brought about the total reform, as long as we deleted out of existence any punishment the child was getting during that period. And this reformed a very bad boy. That doesn't sound like much, but you'd find people who were not particularly ambitious would care to undertake a project of that character within their own limits long before they would undertake a more complicated project, and the joke is that that project happens to be real, the case history I gave you is perfectly correct, and it is a way of handling the situation and is quite remarkable.

Now, there's – odd thing about it is, is once you've given them a single datum, you have an enormous series of complexities that add on to the datum, and you'd just be amazed at how many questions there are that arise around that complexity, and you can ama... imagine after you've answered a few questions from the floor on the subject of what you have just told them you'd be surprised how your repertoire goes up and how you finally find out what they want to know. And you may be incredulous at what they want to know, but nevertheless that is what they want to know, don't you see? And you, with a great deal of technology at your fingertips, of course are able to evolve that rather easily.

Now, it doesn't really put you on a withhold with regard to the thing.

"I understand that you Scientologists believe that everybody has lived before. Is that true of little Rollo?"

"Well, Madame, that would be up to little Rollo. If he wanted to tell you that, why, I'm sure he could, or would."

Experiment of exact nature was carried on at Wichita, Kansas one time. Little Rollo in this particular case was about five, six years old, and he was over at the swimming pool when Mama was asking this somewhat snide question. She was intending to be rather nasty. And she said – I said, "Well, why don't you ask little Rollo – involved?" and so forth.

And she called little Rollo over and she said, "Now darling," she says, "you don't remember when you were a baby, do you?"

"Oh yes, Mommy!" he said, "I remember when I was in your tummy," and went off and dived into the swimming pool. [laughter] It's all very interesting.

Now, where you cut this line and how you design it and what you do with it, and so forth is all regulated by what people can go into ARC with. And there's the only point where a dissemination program or training program would fall down.

Now, you have not any good example in me. Just – I'm not a good example of this, because I'm mainly talking to you. And I don't care if stuff wanders out into outlaw and wildcat hands – I can take it. I simply say what is with regard to what I am now looking at, at Scientologists, and some of them think I'm kind of unreal lately, or batty and so forth. I am sufficiently insouciant and confident, and confident of my ARC with Scientologists in general to know that they will forgive me, and also know that they will look it over and run into it themselves and say, "Hey, what do you know!" and all of this sort of thing, so I'm operating on a different – on a different basis to a marked degree in that particular regard.

It doesn't mean that you have to withhold what you know about it. But you certainly have to talk to people at a level where people can talk, if you intend to have any ARC with those people. And therefore your basic dissemination area throughout the public must be at a level that people can go into ARC with. The technical material must be such that they can use it, and there we go.

Now, you could make a Book Auditor who will get fantastic results, and I'm – I was just telling you I was very proud of the fact I've been studying some of this in just the last few days, and I've been getting a lot of material on this itsa line and so on. And R1C is – you'll be

getting it in proper bulletin form – but it is simply a list of questions that anybody can add to, that you get people to talk about to get in the itsa line. That is all; that is what you do.

And it's a bunch of canned questions, but it actually could be thousands of questions. And I can see it now! I can see some Book Auditor with a dictionary of these questions. Guy's got lumbosis, and here are the cross-referenced things with regard to what this guy can talk to that will cure up his lumbosis. See, this is how you get the R1C run on his lumbosis. And you can get a very complicated cross-coordination of the number of questions he could answer that would finally add up to his lumbosis, see? And it would – which is much more surprising – it would answer up to his lumbosis.

Now, that's Book Auditor line. Of course, we expect a Book Auditor to have many more failures, flubs, be incapable of possessing sufficient self-control and discipline to keep from flying in the pc's face. We expect this kind of catastrophe, but oddly enough, my experience at this level of auditing has been rather good. It has been rather good. And if we put into their hands very, very securely, stuff which they actually can co-audit on and get results with – merveilleuse! And that's your R1C, don't you see?

And you hear somebody starting to dive for GPMs, something like that, say, "Well, perfectly all right for you to dive for GPMs' perfectly all right. But your pc – your pc probably feel better if you take the HCA Course and the HHS Course and go to Saint Hill and then come back and run it on him. You're liable not to make as great a mistake."

And he'll say, "Oh well, I can still run it." Call you up in a couple of days and say, "What do I do?" you know?

Say, "Well, all right. That's good. Why don't you ask him about things he has not quite liked about auditing, or..." [laughs]

You'll find your brains are sufficiently stretched even handling that level of co-audit, you see, with just R1C, that type of question. But they gonna get results! And that type of processing going to raise their level of ARC. And if this type of processing also exists on co-audits and so forth, you actually can divide Scientology One into two grades: the nonauditing and the auditing. Well, the nonauditing are going to stay much less advancing and so forth, but remember they will still exist. Old Dianetic and Scientology groups always had people in them who wouldn't ever audit or be audited but were members of the group. And they very often would form a majority of the group. They hung around the fringes of this and they never dared quite get their toe wet. And you had other members of that group who considered themselves very, very upscale because they did audit, and they were auditing somebody and being audited and so on.

Well, the natural evolution of this thing, then, divides it into two, is the nonauditing and the auditing levels of Scientology One. So therefore, you've got to have quite a bit of theory that matches up with Scientology One that people can talk about. A lot of theory going along with it.

Scientology Two – Scientology Two is capable of getting tremendous results. I think even an old-time auditor wouldn't really believe the results that are obtainable at that level. The backbone processes – the backbone processes are R2C – any assist line, or anything like

that – but R2C. And getting complicated now with R2C – this is a complicated process. This is R1C, but an assessment predetermines the thing. I can give you a very rapid rundown of what R2C is, and I think you'll find it's a workhorse process. It's with an assessment. You have your new expanded CDEI Scale, and you have an expanded scale of eight dynamics. That gives you two lists. The session is begun and the tone arm is used, no needle actions take place, and the person is given the expanded CDEI Scale to inspect to find out which one of these things best characterize his life.

Now, you don't expect this assessment to take place in any specific period of time. It might take ten minutes and it might take fifty hours. As long as you can get tone arm action out of the assessment, why, you're in! You don't care how long it takes him to pick over this little CDEI Scale of cards and try to figure out which one most applied at what times in his life and where and how and which and what they are and how they relate and that this is a pretty clever scale and... I can see some guy getting stuck for a hundred and fifty hours just doing nothing but examining this scale, see? See, so I'd never discourage him or speed him up from examining the scale, because there's a lot of residual tone arm action to be gained right there with that scale.

Well, let's say he finally came up – anywhere between ten minutes and five hundred hours – he finally comes up with a level. See, you don't care if he picked it right out or it took a long time, as long he was getting tone arm action while he was doing it, that's the only condition. And we... he's picked out this level. He's decided that that is the one which most applies to his existence. He's got that now. All right, that's level X.

And now he thinks he's all set and you're now going to do something else, but you don't give him any chance to do that; you repeat the operation, you give him the eight dynamics, expanded. They're expanded with their subdivisional dynamics, you see? And he has to inspect that list and tell us which one he has been most concerned about and how, in this lifetime. What one has he been most concerned about in this lifetime? And that's again anywheres between ten minutes and five hundred hours, you see? That's a repeat and a replay of this thing.

It actually doesn't matter whether he does this slow or fast, don't you see? As far as his case gain is concerned, it doesn't matter a darn whether he does a fast assessment or a slow assessment.

So we've got these two scales now, and we have – Y has been picked out as that dynamic he is most interested in. Therefore our question for R2C now becomes XY, all in one question – "False actions about animals." Anything that you want to do. Now, there's a third one – if you want to put your auditing question together perfectly, you could have a third one which has "decision, solution, cure, consideration, ideas about, concern for," don't you see? You'd have a whole bunch of verbal actions if you needed it to continue to put your question together again. That just makes your question neat. What has he been with regard to animals and so forth? Well, he's had concern for them. All right, that's fine.

Now "concern about falsity about animals," and you just plow right down the middle of his case, man. You've got a wide-open significance that... and it'll make that tone arm flow like mad. And what have you done, essentially – you've matched up the ARC triangle against

matter, energy, space, time, form and location in a neat little package, and he's away. See? And you've matched it up on gradients so that it first starts out ARC versus ARC, and he gradually gets around to where he can confront MEST a little bit, you find out he'd eventually swing into the sixth dynamic, and he'd eventually swing into the seventh dynamic as you repeated this operation.

I think you are looking at clearing this lifetime. I think that's what you're looking at. I think this is a process which would bring about a free needle. Now in Two you also have – this is upper Grade Two, and we would expect this on a retread. We expect this on a retread. You would have R2H, and you would have any other process that – such as Prepchecking and so on, is relegated more or less to that band, not really to the band of HPA, because that's a needle action.

So what do you do? You just take up the itsa line, purely, and then at the lowest professional level you take up the tone arm, and then at the retread professional level you take up the needle. You're moving these things up gradually, consistently, on a gradient, and you've got people who at every level can produce a result. It's whether or not they can produce a result that permits us to do this trick, don't you see? If they were unable to produce a result at these levels we wouldn't be able to do this trick. So I've just been glowing – glowing like a well-oiled halo on the subject here of watching this itsa line produce some remarkable results with regard to it.

Now, if you're going to run anything like this type of an activity, you're going to pay any attention to this at all, you'll find out that another element enters the scene. Just as the devil always entered Paradise according to the very best implants of the O/W sequence – the overt-motivator sequence, rather – they're all apparently associated with the devil and hell. I think it's quite interesting. Devil, hell and punishment. The... we already found heaven, now we've found hell. Very good.

But just as the devil always enters in, so does the ARC break. There's always the auditor who couldn't keep his mouth shut. And we have a tool which requires the use of the needle. So we make the ARC break assessment a specialized activity. And we try to bring it home to everybody that if this person is ARC breaking all the time, that the person has to have an ARC break assessment. Well, this gives us a crack at the auditor as well as the pc. So you say bring the pc in for an ARC break assessment, and you go ahead and give the pc an ARC break assessment.

Now, as a Central Organization operating a special division or department in which this is done can also keep an awful lot of co-audit activities running here and there throughout the field, and can keep a lot of teams straightened out (when I said co-audit I meant just individual teams) and can keep an awful lot of stuff on the fire and can keep a lot of – actually, professional auditors who are having trouble one way or the other, can keep them patched up by giving their pcs some ARC break assessments and straighten them out. We also would have a crack at the auditor at that time. Right? And we lay the fear of something or other into him on the subject of breaking up the itsa line and chopping off the pc, or evaluating for the pc, basically by pointing out: follow the Auditor's Code.

And in such a way – in such a way, you'd have a high level of effective activity going in a community or an area. If you add such things as testing and very cheap co-audits, and if you add some little course in which an HBA can get a classification – you know, he can come in and he can study these drills – this little basic drill on how you listen, see, and how not to cut the line, and give him some gen about the Auditor's Code, and that's it – he's a classified auditor, see?

We straighten him out to that degree – the organization or the auditor in private practice is always willing to give an ARC break assessment to somebody who is falling apart, and straighten out somebody's pc for him, don't you see – why, you'd have a well-knit, well-running, very orderly forward progress in the community, providing that ARC is maintained to agree with the public at large, to agree with the partially indoctrinated, to agree with the first levels of professional. If the ARC is there to match, why, of course we will communicate like mad.

The whole secret of our communication is the fact that it's up to us to establish the level of the communication line. And we have to some degree considered it rather dishonest to establish a line less than everything we knew. Well, it's not true. It's not true. There's no particular reason to hit everybody in the head with everything we know. But we all do it. We all do it one way or the other. I suppose we'll continue doing it. I can hear it now – this Book Auditor, he's sitting there, and he's... we're trying to do an ARC break assessment and he keeps coming up and he says, "But all this person will talk about is wanting to moo. And they just keep saying 'to moo, to moo, to moo' and so forth, and I've gotten them to repeat it several times but it gives them a headache!" I can hear you now. He gets the equivalent of a Saint Hill Course in the next fifteen minutes, you know? At high velocity!

But I'm not at a – for any instant even vaguely pretending that this won't happen. See, I'm not pretending for a moment that the program will go forward perfectly and without a hitch. There are various reasons why it won't go forward without a hitch. And one of those reasons is, is some people get nervous when they see action in their vicinity. Gets them nervous! Gets them nervous. They see fifteen people in the Registrar's office and they know that's too disorderly. People have no place to sit down or anything like that, the place is crowded, the Registrar can't do her work. She's putting money in cash registers, you know, and they keep dashing around having trouble with the invoicing machine, and commotion going on, she's leaving pieces of paper on the floor – very, very unneat. And so they know what to do, so they cut down the line going in to see the Registrar. That's obviously the right solution to the situation, because they want things neat.

And you see testing being knocked out in various ways. I think testing – there was some forty-some ways testing was knocked out in Johannesburg one time after it was put in. Those forty ways were counted. I think they were the subject of an Info Letter. I've forgotten how many there were. Such things as leaving bicycles across the walk into the testing office, don't you see? Making sure that no forms or blanks were available. Making sure that the person in charge of testing had too many other things to do and couldn't test.

Now, that isn't being really vicious; this is the consequence of people who are upset about motion. And they get too much traffic and there's too much going on, and they get –

they get emotionally disturbed about the whole thing, so they want to shut it off. You find that kind of action. And you finally find people who think that if they could just be left quietly to –by themselves, the best solution to the whole thing is to go get a rich man someplace and have two auditors process him and audit each other, and a hundred years from now, why, somebody will make it. I've had that advanced to me, by the way, two or three times as the only real solution to Scientology.

Well, that's awfully quiet! But the funny part of it is, it's been tried and it always failed. I think that's the most remarkable condemnation of it. Oh, they'll have other things going along that will be hashed up one way or the other. You'll have situations of the unusual solution. They can't get the tone arm moving. They can't get the tone arm moving on an itsa line, can't hit the right questions, so they ask you. And they – you give them a qu... the answer, and they despair of ever fitting in the answer and they go off and run something unusual. And then they can't get any tone arm motion there, as a matter of fact it's a little higher, so they run something more unusual. And the tone arm is a bit higher and they run some – needle getting tight now – so they run something that is even more unusual. And you keep telling them to do the usual, and then you find out to your horror that you have a pc you've got to put together again with tweezers practically. You can only bleed off charge one micro-amp at a time, see?

There will be casualties of this sort of thing. There's going to be some... you say to this husband and wife team, they have no training of any kind whatsoever and you tell them that they should co-audit. All right, and they go off and they co-audit, and you hear the house is burned down or something. They're busy getting divorced now, because they got rid of some O/Ws inadvertently, don't you see, and the other one couldn't take it and blew up in their face in the middle of session, and all this sort of thing. This is not... you see, this doesn't make for peace! That's what I'm bringing home. There's a certain amount of catastrophe involved in this sort of thing and the only thing you can do is minimize the catastrophe. Just minimize it. And hold it down and keep it along the line, and then not get pinned on this dissident member of the congregation and that character who is raising trouble and that situation, and then just get pinned totally against these things and forget that everywhere else it's just running fine. These various things occur.

Actually you can practically destroy an organization by getting your attention too fixated on two or three small evils of one kind or another, and you don't realize that the rest of the organization is running wonderfully well. I had that happen to me in Johannesburg. My attention got riveted and I had – the situation was picked up long after I could do anything about it and the attention and so forth got riveted on everything but the fact that the staff was doing extremely well. And the traffic was going as well as could be expected. They were getting their throats cut from a certain quarter and I think to this day don't even realize that they got their throats cut from that particular quarter.

Outside pcs were being used to collect money individually and the poor staff was not getting any of the money it was working for and therefore was working for practically nothing, and then being told by the very people who were doing it to them that it's all very sad and they should do something extraordinary, and so forth. And these guys were cutting their throat. And the second I tried to do something about it, the situation was so triggered and so

explosive and so forth that it practically spattered over that corner of Africa. Just now getting back together again.

This kind of thing occurs. And that occurred from the result of getting your attention too fixated upon some evil and trying to take this evil apart, forgetting the rest of the organization, don't you see? And it was running all right. It comes from what you could call "crusading." Crusading in ill-advised directions.

You've got mobs of people who are walking in for the PE lectures. Mobs of people, see, they're just walking in, and they sit down and so forth. And the PE director makes his biggest mistake when there's that guy named Swinkopf. And damn that fellow, you know! He comes in and he sits down in the front row, and he sits there with a sneer on his face, you know and so forth, and the whole lecture gets twisted around Swinkopf. Guy's talking to fifty-five people out in front of him, you see, and yet addresses his lecture to this one dissident character who is probably a commie anyhow. See, it doesn't make sense, you know? If Swinkopfs get too much in my road, why, I always tip off a couple of guys, the next – in the next lecture when he comes in, why, you put him out. They always do it very gladly.

There's no sense in, then, narrowing down the whole of the forward progress and all the information you've got and all the theta you could generate, you see, to take care of Swinkopf. The odd part of it is there probably aren't a dozen people in the United States, actually, who are against Scientology. I mean, count them numerically. There are probably not a dozen. Look at the amount of time and effort being invested in that particular line. Great!

Two birds at the AMA, fellow by the name of Keaton and a fellow by the name of Field. And these birds throw all the brickbats, generate all the press, kick all the fuss up that is kicked up, and so forth. Well, there's probably a member or two of the AMA board that sicked them on, and there's probably some bird down in the FDA, who – I don't know, maybe he's done something – I don't know, maybe he got somebody in a family way at some time or another, or maybe he takes all the drugs that are sent in – something. Anyway, this guy feels absolutely imperiled by something or other, so he's just Johnny to the root on it, and so forth.

Well, there's no doubt about it, they can cause a lot of fuss. But just let me point out something to you. You don't see me spending very much time concentrating on that particular dozen. Because every moment of time I spend on them is wasted on the remaining – count them, man – a hundred and eighty millions. It just isn't a figure, you see, that's proportionate one way or the other. Probably all evil generates from too great a concentration on evil. You can neglect a fantastic amount of entheta and still get by. And you keep the show on the road and you make it very easily. But the way not to keep the show on the road is get so fascinated with how the show is not on the road while it is still on the road, that you, of course, contribute to not getting it on the road. You eventually contribute to stopping the show, don't you see? You have to be very careful along in this line.

So there are fifteen co-audit teams going in your immediate vicinity and so forth, and there's one team that is always in trouble. Every Saturday night that you have off, it's an ARC break assessment for this pair. They've blown up in smoke, see? And there it is, there it is. Now what are you going to do about it? Man, I'd lay down the law! I'd say, "Now, look! Either sign up for professional auditing, go into the local HGC – something on this situation."

Because why? Because they're taking up all the time you actually should be spending with the remaining fourteen teams – which is a bad economy, a bad estimation of effort, don't you see? There are means of taking care of these situations. And what you want to do is form up ways of taking care of these things and take care of them on a routine basis, not on a emergency basis all the time, well appreciating and predicting that things like this are going to occur. And then traffic will run. And then the consequences of stirring up such a tremendous activity in the public at large and so forth, actually will be very easy to handle. And when we get – finally get through with this thing, we'll be handling a lot more than we're handling now.

This thing has fallen out into its natural consequences. Finally when you go out through the top you can generally pick up a simplification at the bottom. We are a very long way from totally finished with research, but I think that when we've gotten down to the basis of where we have shaped auditing at its lower levels totally around the definition of "auditor" – one who listens – if you can get any simpler than that, I would like to hear about it.

Therefore, I think that we have laid in a safe basic, and have made a safe assumption that this is good dissemination channel material, and will remain constant enough for us to project it very easily and heavily and consistently and keep it going for a long time and get it all grooved in, and get things shaped up in that direction, and take the general public and make 1964 the year of Scientology for everyone.

Okay? Thank you!

RIGHTNESS AND WRONGNESS

A lecture given on 27 August 1963

Thank you.

All right. What is this?

Audience: August 27.

Twenty-seven August AD 13, Saint Hill Special Briefing Course.

All right. If I can get the text written on it, these two new students will be getting Scientology – a Scientology One process known as "Acquaintance with Saint Hill." We're making strides here at an incredible rate of speed on a lot of things, and I've been working hard on getting processes arranged as to their exact uses and getting exactly what you can do with a case and how to put a pc's tone arm exactly under the auditor's control so the auditor doesn't have to worry about it and so forth.

There have been quite a few breakthroughs of great importance here recently. And all this stuff is going down in bulletin form, and I thought this morning – I was sitting there, I was thinking to myself, "Well, this morning, here I should be putting it all down in a bulletin; I'll probably go out there and put it in – down in a lecture," don't you see? And then having put it down in a lecture, then I won't bother to put it down in a bulletin, you see? Then you'll all forget about it because it was just in a lecture, don't you see? Horrible. So it left me in between, you see? So I didn't know whether to give you a lecture on the subject of what I was currently doing, you see, and what you needed to know, or throw away the lecture and put it down in a bulletin, and it left me in a terrible confusion. So I guess the best way to resolve the confusion is just tell you what I know about it – and also write it down in the bulletin. But you probably won't see the bulletin for a long time, so you better get it here.

Very complicated. Are you sufficiently confused about it? If I keep on this way, you see, you won't in a moment know whether you're reading a bulletin or listening to a lecture. [laughter] And this is Russian technology, Russian technology: how to convince somebody that black is white and that he's somewhere else when he isn't.

Lubyanka Prison, I think, they practice this sort of thing. A guy is walking down to an interrogation, a woman dentist will step out from a secret door in the hall and start examining his teeth. See, totally non sequitur. The guy is trying to understand this, you see? And while he's busy trying to understand this, something else unpredictable happens to him, see? Guys come in looking tough with big rubber hoses, and so forth, and offer him a cigarette and talk

about his wife, you know? It's all *th-th-th-th-th*, see? When he gets through, he doesn't know what he is or where he is, so he joins the communists.

The use to which mental technology is put in this universe, remember, is put that way and is put to the use it is put to in this universe because people don't know what they're doing, because there is no mental technology.

Now, if you stop and think about it for a moment, the purposes of mental technology must consist of survival, with its consequent domination – necessity to – and must, therefore, thereafter, consist of being right and wrong. It may be somewhat mysterious to you how these three things fit together in a channel, but they do. This fellow is trying to be right, trying to be right, trying to be right. Why is he trying to be right? He's trying to be right about the most aberrated things you ever heard of. He's always trying to be right.

If you as an auditor look at this bloke who is suffering from alcoholism or dope addiction or something like this, there's one thing that you can always be right about, see? It might be that it was made available to him while he was in high school and he was being blackmailed into it and he was this and that. And it might be this and it might be that and it might be something else, and it might be because his medulla oblongata has slipped – a lot of might-be's, might-be's, might-be's – but in actual fact all he's trying to do is be right. And if you want to be right about him, then you should realize that the reason he is drinking or hitting dope or something like that, or doing anything else he's doing, or cooking bad dinners or anything else – whatever else this person is doing which is apparently weird or contrasurvival – is in actual fact his effort to be right. And you can always be right about somebody's aberrations when you recognize they're trying to be right. That is the lowest ebb of aberration. Sounds completely weird.

Well, that's because a thetan can't do anything else but survive, and in order to survive you have to be right more than you're wrong, so you get obsessed in being right. This is elementary, my dear Watson. Do you follow that?

If you go out here and make a practice of being wrong, wrong, wrong, wrong, wrong, you're not going to survive. See, if you're always going to be wrong – you go out here and you get on a motorcycle, and you turn the petrol on and you turn the spark on full, advance it all the way, and – particularly one of these big boys – and kick the kick starter, and so forth, you sail somewhat gracefully over between the handlebars because the machine kicks back. Well, if you consistently do this, why, you're apt to be nonsurvival in the extreme. You follow this? So, actually, right and wrong are the tools of survival and nonsurvival.

In order to survive, you have to be right. In order to get somebody else to succumb, they have to be wrong. You follow this?

You see, actually, no great military commander ever wins a battle on anything else but the wrongnesses of the enemy. And he compounds these wrongnesses up to a total attack which really makes them wrong. So even they realize they are wrong, and of course at that moment they no longer survive. And the point you degenerate into succumb from survive is the point where you recognize you are wrong. That is the beginning of succumb – the recognition that you are wrong.

Naturally then, if that is true – and that is true; that's not sensible, it's true – naturally this follows, then, that if a person is surviving at all, if they are "thetaning" at all, no matter inside of what mass, there must be some residual rightness, even if it's only an insistence upon rightness. So rightness goes hand in glove, immediately, with survival.

So this works itself back and forth into an aberrated A=A=A. If the individual is surviving, he must be right. It can even go to – if an individual is undertaking an action, it must be a right action, if he is surviving. Do you see how A=A=A this becomes. In fact, it becomes complete idiocy from the lucidity of its beginning, because in actual fact there was no reason for a thetan to worry about survival in the first place.

See, he has to enter this lie into the scene before he gets off into this other series of lies. He starts worrying about his own survival. Now, we can well ask, "How does he start worrying about his own survival?" Well, he worries about the survival of something else and then identifies himself with it. You see? He says, "This thing has got to survive, and I am it, so therefore..." and here he comes, his next lie – and he needn't make this fantastic lie at all, but they manage it – and that is "I am now worried about my survival." And actually, it isn't until he takes that step that he goes halfway round the bend. See, he's practically finished now.

There is no reason at all, just because you have built a bunch of sand castles and are protecting these sand castles from destruction by the tide or naughty boys – there's no reason at all that you can't go on protecting these sand castles ad infinitum and safeguarding their survival. You don't have to take the idiot step of becoming a sand castle. See? It isn't until the individual takes that idiot step of becoming a sand castle that he himself becomes worried about his own survival. But at the moment he becomes worried about his own survival, he then enters into the necessity to dominate in order to continue to survive. Best way to protect your sand castles, of course, is to dominate anybody who would threaten to destroy your sand castles. That's elementary, isn't it? You have to be tougher than the other tough boys on the beach, in other words. You have to dominate their behavior to the degree of restraining them from destroying the sand castles. This makes domination a necessity, if you've already entered the game of survival. See, you don't even have to have become a sand castle to start dominating.

Now, what happens now? What happens now? The game of domination consists of being right and making the other fellow wrong. And that is all the game consists of. There isn't any other – I mean, out of this vast universe, you finally shake out this one little, tiny, idiotic simplicity, you know, and it all makes everything look silly, you know, when you come to think about it.

Russia and the United States – the great game. Well, that's silly! The game is silly. Russia has to dominate the United States in order to survive; therefore, capitalism has to be wrong; therefore, communism has to be right. The United States has to dominate Russia in order to survive, so communism has to be wrong and capitalism has to be right. What's wrong with this? Well, what's wrong with this is there isn't any capitalism to amount to anything. Ha! And there's practically no communism. That's getting idiotic about that stage of the game, you see? Anybody can see that one.

But let's go back to why does Russia have to dominate the United States and why does the United States have to dominate Russia. Well, that's because Russia is liable to destroy everything in the United States, and the United States is liable to destroy everything in Russia. Now, let's look at this a little more closely.

Why are they liable to destroy everything in the United States and Russia? Why is this liable to happen? I don't think you have any more answer than anybody else does. Exactly why? Well, that's because Russia is threatening to destroy everything in the United States, and the United States is threatening to destroy everything in Russia. And that's why the United States have to be very careful not to be destroyed by Russia, and Russia has to be very careful not to be destroyed by the United States. You see, this is very elementary.

You work this thing out. You don't need these Ruskian idiocies pronounced at great length to explain the international situation, to see, actually, what is taking place. Yes, but Russia is devoting so much of her production capacity to weapons and rocketry and other things in order to dominate the United States, that communism is failing. And the United States is devoting so much of its production capacity – it actually amounts now to three quarters of the total production capacity of the United States and three quarters of the total engineers, scientists and technicians of the United States are involved in this effort – that it is destroying capitalism. Because, you see, it "has to" in order to keep the effort going, in order not to be destroyed. Well, this is a typical game.

And you start examining this game on the basis of survive, dominate and right and wrong, and where's the right and wrong come in – you start to examine it, or examine any game on the basis of just these things: survival, domination and rightness and wrongness. Examine the game and immediately the rightness and wrongness that you see residual in it appears to be pretty mixed up.

Well, the United States would be very wrong to destroy its economic stability and prosperity in order to destroy communistic economic dominance or prosperity, see? And reversely, communism would be very wrong to destroy any benefit residual in any communistic system, if there is any, in order to knock out the capitalistic lines, you see? She'd be wrong to do that, but she is doing it and she is doing it on the supposition that she is right. And the United States is doing all this on the supposition that it is right. So you'll see that A=A enters into the situation where rightness becomes wrongness. And people will defend the most fantastic wrongnesses on the basis that they are being right.

As you audit people, if you specialize in this particular line – as you audit them you will sometimes be appalled by the justification of the person's own actions. You're utterly appalled. Gauze is armor plate compared to the argument that they will put up, don't you see? I mean, they put up this thin facade. "Well, you see, the reason I left my wife – reason I left my wife is because she seldom, uh – very, very seldom, uh – was ever home, you see, to put out my bedroom slippers. And therefore, I had to leave her."

"Well, why wasn't she home?"

"Well, she was working and supporting me."

And you say, "End of scene. *Rm-rm-rm.*" [laughs]

And yet he will go right on leaving, you see, and staying "left," and perpetuate this action and defend it down to his last breath.

I can see it now, the hammer and sickle flying over the White House, you know, and all of the arguments and press releases that are coming out from the White House saying, "Down with Russia," you see? "Down with Russia. We are absolutely right to continue to support capitalism."

Then you'll say finally, "Well, what is capitalism?"

"Well, capitalism is all the workers are told exactly where to work, and exactly how much they're going to get, and all the property belongs to the government, and a capitalist gives you a clenched-fist salute. That's what... And we are being right. This is a right action. And it's right, what we are doing."

Well, maybe the actions were sensible. If you look down along the line, you see, you'll see some sensible actions being – taking place, and this is what throws you. Because you can see some sensible actions going forward through all this, and you may understand some of this, but what you don't understand is how right this is, or why they don't recognize that the consequences of it are just wrongness, and that they are actually being very wrong while they are saying they are being very right.

You go over to Russia and say, "How come you got income tax these days, bud? How come your workers all get different rates of pay, and status symbols seem to be entering in here, and what's all this about some unions being organized, and well, what's all this going on here? This doesn't look like communism to me."

"Oh, yes, yes, yeah. Oh, this – this is communism. This is communism. You see, a good communist – a good communist loans money at interest. That's the definition of a good communist. And we're perfectly right in everything we are doing. And that is really correct communism."

And you look at this and it just becomes complete idiocy to you. You don't see whether you are coming or going, you see? What is all this about?

Well, you see this sort of thing taking place on the international front. It's very, very easy to recognize at that level of action. Very easy to recognize. But it's not quite so easy to recognize when you see this skid-row bum. He's just all soiled from having spent the night in the gutter, you see? And you smell the canned heat on his breath, you know? And there he is, you see? He's about ready to hit the chutes. Now somebody tells you, "Why is he doing it?"

"He is doing it because it is a right action."

You say, "Oh, no!"

"Yes," you say, "he's being right. He is asserting the rightness of being a skid-row bum and canned heat and all the rest of that. And he's asserting that as a rightness. And that is why he is doing it."

Well, you see, you've undercut the simplicity and you've left a large zone of unreality, because the society itself has worked out all kinds of rightnesses and wrongnesses on its own bat as to why he's a canned-heat eater, see? They worked out this fantastic... "Well," they say,

"after all, he probably had few opportunities in his youth." The guys who want more appropriation for the university say he never had a chance to get a university education, you see? The milk producers who want to sell more milk said, "Didn't have enough milk and there wasn't enough strontium 90 in it."

Everybody has got explanations for this, so you come down to the final, last-ditch explanation, which is the right one, and nobody recognizes the rightness of the explanation. He is asserting the rightness of eating canned heat. Why? Because everybody has always tried to make him wrong. His automatic response is to be right, so he has no choice but to eat canned heat. Get the idea?

Now, if he at any given instant says, "I am wrong to eat canned heat," he'll collapse. He's finished. He may go into a coma. He may even die. I mean, it's on that elementary basis. It's a fantastically elementary situation.

What is it all about? Well, behavior doesn't necessarily have everything to do with the whole track, you understand? Behavior is behavior, and then people have tried to aberrate it one way or the other and have tried to twist it around one way or the other and mess it up and make people do some other way, but the science of life still remains the science of life.

The factors of life still remain the factors of life. And if you were to delete all of the GPMs and incidents and everything else, you would not have removed the basic laws on which Scientology is built. That's interesting, isn't it? Come to think about it, you get so involved in erasing things. These simply enforce and exaggerate and destroy freedom of choice. They destroy freedom of choice over the exercise of the ability to be happy or powerful or normal or active, or something of the sort. They destroy power. They destroy freedom of choice. They destroy the ability to be self-determined or to be pan-determined about things. They make a person one-sided about everything under the sun, you see?

And they simply use basic and residual law – unwittingly, by the way – to exaggerate certain things which then lead a person to enslave himself. And the basic mechanism of enslavement is survival – the insistence upon surviving, followed by the necessity to dominate, followed by, then, the necessity to be right or wrong. The necessity to be right or wrong then becomes as irrational as the original postulate to survive. And these postulates go downhill, and you will find in them the most incredible situations you will find. You will blink – I told you about this, you look for it. And one of these days you are really going to blink at what somebody is doing in order to be right. They just become totally concentrated on the last way they can be right. This is how they can be right! And everybody's working all around them, on top of them, pounding them, publicizing them, kicking their head in on the subject, and the more that people kick, why, there it is.

Then the person will go more degraded. You'll see sometimes a person who is only nominally degraded – they're a politician or something like that, see? And you'll see this person go downhill and become a covert criminal and slip a little bit further and a little bit further. And you'll see him out lecturing for the Salvation Army, protesting against the very thing which they recently held to be right. This individual has sort of died a death now. He is talking about going to heaven. He's talking about being dead. That is mainly what he's talking about.

You very often go into – you go into a church of one of these older faiths, and you'll find the minister up there haranguing and screaming, you know, about "the evils of the demon rum," or something like that, to the congregation. "Stay ye away from that pub, bud," you know? Yelling, you know? And he goes back to his study, you see, and he takes this little nip of medicine to fortify himself, you see, after the exertions of his lecture.

Now, these birds who are working this hard were working inevitably and invariable in the field and area of death, because they are right down to the point where you get an aberrated rightness and wrongness; cessation of survival is so threatened that it becomes imminent. It actually gets dramatized before it happens.

And you'll see somebody turning against religion because of the amount of hypocrisy in it. You know, the guy is saying, "Well..." Well, the Roman Catholic church probably lost its grip on the world which it's trying to reassert now by killing off the Buddhist. I beg your pardon, the better interpretation is that it's only those in charge in Vietnam who are members of the Catholic church. That actually isn't everybody. There are some Presbyterians there, too, in the American troops, and so forth.

I have opened up a chapter here which is leaving you blinking just a little bit.

I'm sure somebody is going to make the assumption sooner or later, though, that if the only government in the world being maintained in force actively by US arms is a Catholic government, that that government's turning against another religion has something to do with something here that we haven't quite put the finger on. And we add to the fact that that same government is attacking the only other organization on the face of Earth who doesn't believe in death forever, we begin to ask interesting questions. You probably hadn't linked the attacks on the Buddhist up with US arms supporting the government of Vietnam, nor the attacks of the FDA against the FCDC in Washington, DC.

Yeah, everybody else is all right. Criminals, they're fine, and so forth. Everybody's all right. But it's just these two organizations on the face of Earth plus one other, the Theosophists, who talk about reincarnation and who talk about coming back to life again and who talk about these other things. And it's an oddity that just in the last two or three years all three of these organizations have been furiously attacked by the US government.

Sort of an interesting puzzle, isn't it? Well, don't worry about it. We'll get there before they do. This is just an interjected thing.

Now, they're evidently asserting a rightness about death. I know it's mean of me, it's cabalist, it's rabble-rousing for me to infer that the majesty of government is actually being used to further some foul, religious end in some way and to cause everybody to be dead. But I'm very interested in the fact that the Church of England, of all organizations, right down here in the form of a vicar (who, I think, has had to move since)... this bird – I'm looking at a face or two here who were present in this – was being very censorious about our giving death lessons to young children. Story went around the world. What do you think this guy does every time he stands up there in the pulpit? It gives one to wonder, you know? He's talking about going to heaven and all this sort of thing. He's giving death lessons to little kids.

Diana came home from school one day crying. She was going to a local school up here. She wanted to know if all this stuff about poor Christ was true. And I gave her the hot dope, and [laughter] – well, as a matter of fact, I did. I was very reasonable about the whole thing. I said, "Native populaces have their religious beliefs, and wherever you are, you must remain tolerant of the current beliefs," and so forth, and she took this in.

But it's interesting that this bird down here is asserting how wrong it is, don't you see, to give children death lessons while he himself is giving them death lessons. Only our death lessons are straight dope – this is what happens with regard to death – but his are a darn lie. Somehow or another, this makes him right. How does this make him right? Well, you can just go round in circles trying to figure out what's the rightness and wrongness of this, you see? Why should a powerful state attack a truthful philosophy, you see? Why, you know, why some of the calmest and most decent people in Asia – the Buddhists – why are these people being attacked and shot down and their pagodas burned and that sort of thing Why? What...? And you can go round and round and you can get real confused and you can get real upset.

Well, there's always one stable datum. There's always one stable datum: Somehow, whatever they're doing – no matter how mad the action may appear – is undertaken by them to be right. Now, you would actually have to get them on a meter or get them to explain and put in a long, long itsa line on this subject and get off the automaticities until they finally told you the rationale. And the reason it isn't a rationale is because A=A=A along the whole line. You just would not be able to believe how or why this guy had to, you know – canned heat.

You ask him a question, "Now, how does it make you right to eat canned heat?" You say, "Well, he sure can't answer that, you know, because – ha-ha! It's ruining him. Everybody has been down on him. The 'I Will Arise' and everybody else is jumping him about this, and he's been talked to by all the ministers and everybody. He's read about how the evils that it'll do and so forth. So, heh-heh, he can't defend this one." So, of course, one would never normally ask that question; say, "How does it make you right to eat canned heat?" See? Well, brother, only an auditor would be able to adventure this far, because you're going to get a screaming automaticity.

Well, it makes him right. "Eat canned heat? Well, that's..." Makes him right because "*Rah-da-da-da-da-da-da-da-da-da* and *ta-da-da-da-da-da*," and that makes him right. And "*Ta-da-da-da-da*," and that makes him right. And "...eat canned heat, and therefore this makes that right," and it's "That right and that right, and so forth, and so on and so on and so on and so on and..." I mean, you finally get through, this thing has practically wound itself around the dial.

And you say, "All right, now. Now, how does it make someone else wrong?"

"Oh, ha-ha-ha-ha-ha! So-so and so-and-so and so-and-so, and so-and-so and so-and-so and my father, and so forth and so on. And I parked my bicycle on the church steps there one day, and that old minister came out and – and he actually had the police take away my bicycle, and so forth, and he always was lecturing on the lectures of drink, you see? The evils of drink and so forth and so on – ha-ha! There you are." The guy says, "Wait a minute. That isn't sensible."

And do you know, whether he has understood it very well or not, he will now have a very hard time eating canned heat. See, here's sanitariums, the Keeler Institute – Keeley, I think it is. (One has lie detectors and the other has alcoholism. I always got them mixed.) He's been there. He's been treated. He's been biochemically injected, you know? He's been psychoanalyzed. He's been everything you could think of, see? They've given him stuff that when he eats canned heat it makes him sick. He just goes right on eating canned heat. There wasn't any stopping it because of this block – this block he had. And that intention is the strongest intention in the universe. There is no stronger intention than that at a mental level.

Above that, of course, you have the effort to dominate, and above that level you have the effort to survive. These things are very strong, but I'm talking about a mental activity: a mental activity, a thinking activity, an intentional activity – strongest intention. Survival – that just happens, you see? Domination – that just happens. Those are not intended things. You get down along the line of *intended* and it's right and wrong. And that's where that lives.

This becomes very remarkable. We've got this teenage girl. We've got this teenage girl, and she's running around and having an awful time. And she's been arrested and lectured to and shown motion pictures and been horrified and hit over the head and defamed and threatened with kicking out of her home – that if she doesn't behave on the second dynamic, you see? And she goes right on misbehaving and that sort of thing and so on and so on and so on. Now, this is an actual case history.

I had one in my office one day. Changed her whole life – almost accidental. One of the research cases that furnishes data that leads to data of this particular kind. She was just trying to make her parents wrong. She realized it. That was the change of her behavior pattern, right there. We didn't even touch in that particular case on her trying to be right. She was just trying to make her parents wrong. Well, obviously, how could you make them wrong. Well, you could make them wrong by trying to make them change their mind on what they insisted upon the most. And the diagnosis of how do you make a person wrong is, what does that person most insist upon? Therefore, if that person most insists upon this particular factor, then that is the one you must make them wrong on.

So the criminal tries to make the forces of law and order wrong, you see? The diagnosis taken from the viewpoint of the being involved is simply, what are these persons insisting is wrong? What do these people insist is wrong? And then make them wrong on it. It's a perfect Q and A, see? What they say is wrong: make them wrong. You can't get a closer identification than that, you see? Mother is saying, "Be a good girl, daughter. Be a good girl, daughter. Be a good girl, daughter. Be a good girl, daughter." Daughter, getting more and more antagonistic against the old lady – she knows now exactly how to handle Mama. You make Mama wrong. How do you make Mama wrong? All you got to be is not a good daughter. Elementary, my dear Watson, see? It isn't what aberration the individual is dramatizing. It's what aberration does the individual dredge up in order to make somebody wrong. That's behavior. It isn't the accidental thing that you think it is.

So we've got a schoolteacher. And he says, "Children, you mustn't chew gum. Children, you mustn't chew gum. Children, you mustn't chew gum." Well, the characters that like him the least are going to chew gum. Don't you see? That's how to make him wrong. You

can't destroy him overtly with 16-inch guns, but you can cave him in trying to make him wrong covertly. And he'll sit around and worry about those children chewing gum. It does. It serves to cave him in, too, a little bit, you know – a little bit, a little bit, a little bit. He may even go away sometime and stop teaching school and leave the children alone, you see? This is fantastic.

So a government which is trying to conduct decent law and order has worked against it, continuously, this factor: that bringing about decent law and order is wrong. Now, a government with that force pushed against it continuously, endlessly, on and on and on, will eventually come to the realization of exactly what keeping law and order is: It's being as criminal as possible. See, it's been made wrong to the point where it now identifies the right label with the wrong action. It knows how to be wrong: to be a decent government.

See, on this broader perimeter you watch this thing as it works its way out. If you can see that, it gives you a rather vast understanding of aberration. Now, whether or not you can reach this aberration is not the subject. This is simply, can you understand it?

Not whether or not you can reach it and do something about it with an E-Meter; because this particular rationale, although it is very true, happens to have been booby-trapped by some very evil-intentioned characters on the whole track, who implanted goals which contain – and items and implants and GPMs – which contain in them right and wrong.

And you start running an individual very long on rightness or wrongness, he is liable to collide with one of these implants and it goes into restimulation, and the cure is therefore barred. And you're unable to cure him of this particular thing, because you can't audit him on the process necessary to resolve that particular facet of aberration. This is a barrier, in other words, that's been installed. It is totally accidental that right and wrong are there, and he is not acting the way he is acting because he has that GPM.

Now, get that through your head, see? He's not. That just intensifies this action, but it doesn't bring about that action. That action would, in any event, exist whether or not there had ever been an implanter or not. But unfortunately there have been some of these implants, so you can't ordinarily say with complete security – oh, yes, you can without any security, and often get away with it – ask this little girl, "Now, how does being sexually promiscuous make you right, and who does it make wrong, and how does it make them wrong?" see, and get those two things worked out, and all of a sudden she's completely reformed. She isn't doing this at all. Oddly enough, she's no longer able – this isn't necessarily making her well – she's just no longer able to get the power into it that she had in it; she's no longer this interested in it; she's no longer this fixated on it. Because in any itsa line you will tend to trigger out enough to deintensify the force and power and concentration of the aberration.

It's very interesting that aberration is very hard to maintain. Let's say this fellow is – he's an accident prone. He takes an automobile out and runs it into a brick wall; and he takes an automobile out and he runs it off the edge of an embankment; and he takes an automobile out and he runs into another automobile; and he takes an automobile out and he leaves it parked on the train track, and so forth. And you let him come anywhere near this automobile – well, all of us have accidents to some degree, but he is carrying it to excess.

money make others wrong." Now, it might not even be real to him, and he might have an awful time doing it, but that's the end of that behavior.

Now, this is processing actually below the level of recognition or cognition. You can dig this one awful deep with a pickax. You can also do some weird things to a case in changing its behavior, going along this line. But too much of a good thing is too much of a good thing, and it's a hunt-and-punch process. In actual fact, contained in this is the answer to neurosis.

Neurosis could be defined as an antisocial action or an antisurvival action which is compulsively undertaken by the individual. We just wrapped up the work of Sigmund Freud. It's as elementary as that. You understand we didn't – if you don't intend to make the person happy, and don't intend to make the person cheerful, don't intend anything except just to keep the person – fit the person better into the social framework, and if that's all that mental therapy is for, why, you got it wrapped up. I think it's faster than implanting.

Now, in the first place, the only condition for this sort of thing is we have to be more capable of communicating, perhaps. We have to be able to communicate to the person in that we would have to listen to the person. We'd have to listen to the person. We'd have to ask the person a question. But we'd also have to get our hands on the person in order to do that. The cowboy in the black hat has to get his hands on the person to implant him, too. And they also have to do some communication, too, don't they? And then they create a hell of an ARC break, don't they? I think they get twice as much aberrated behavior afterwards. I don't think it's a solution. I don't think the development of mental technology for the purpose of aberrating people down to a level of powerlessness where they won't bother us – I don't think that's a successful approach.

Well, let's just be practical. This has nothing to do with decency or overt-motivators or anything else. Let's just be cold-bloodedly practical, as cold-bloodedly practical as these characters fancy themselves to be. I don't think that it's valuable. I don't think it's valuable technology. It's valuable to know about it, of course, from your point of view. But as far as knowing how to implant people and calling that a mental technology, or knowing how to give somebody a transorbital leukotomy and calling that mental healing, knowing how to shoot somebody with some weird powder or something of the sort that makes them bounce about in the middle of the floor for an hour or two, it looks to me like all of those lines of action are unsuccessful. I don't think they're successful. They always have a hole in them, and the hole in them is that survival can futurely be threatened.

Suppose anybody ever undid it. I wish I had a nickel for every implant station that's ever been destroyed. I've known thetans to make a career out of it. In fact, I've known thetans to tilt a planet ten or fifteen degrees, with the equivalent avalanches and glacial epochs and so forth, or pull the air cover of a civilization just because it went on implanting. In fact, there's a lot of things happen because of this. Why? Because somebody was implanting. I don't think it's a sensible solution at all. In fact, I don't think it's a solution. I just think it's a dramatization of rightness and wrongness. I don't think there's any more intention behind it than that.

Look at the amount of time and effort and energy expended. Why, in any given day the appropriation of the US armed forces is probably less than the Marcabian appropriation

for the maintenance of implant stations. I think it's expensive. I just think they do it because they are trying to be right. I don't see any other reason for it at all. They're trying to be right and make others wrong. That's all.

Now, you can add political significance just as you can on Rusk's pronouncements: "NATO must be in accord with the Franco-Berlin Wall unity because the ruddy rods are all on the left side of the rifles," you see? "And therefore, all us Turks must pull together with all us Hungarians because the great entente of northern Rhodesia must be maintained," you see?

Well, it's not quite as insane as that, but in actual fact if you take it apart and examine it very carefully, the aggregate sum total of it is insane. It is not sensible. What's the end product of it? The end product of it is no solution and a worsening condition.

Now, whenever you see this rightness-and-wrongness situation where somebody is acting simply to be right and making others wrong simply to make others wrong – you know, there's no more action to it than that, no more reason to it than that – whenever you see that, you'll see a worsening condition. Wherever that zone and area is, you'll see things worsening.

The young girl trying to make her mother wrong with sexual misbehavior: that young girl is getting worse herself and is making her family worse, don't you see? In other words, it isn't that a status quo is being maintained. You're getting a dwindling spiral out of this sort of a thing, see? It's the last dregs of domination, this whole action, you see? No matter how covert it is, it's still an effort to dominate. It's like the guy lying on the ground with four knives in him, he's still being right and the enemy is still wrong. It's still his final effort, you see, to dominate the enemy. And many of these methods of dominating the enemy exist. And it's just an aberrated war which is in progress.

Now, we look over this implant situation as an implantation proposition, and we cannot really assign to it any improvement of circumstances. If any improvement of circumstances existed, it existed for such a short term as to render it relatively useless. A short term on the whole track might even go to a hundred thousand years. That's a short term. That's no duration for an empire. They might say, "Well, we've got it all licked here. We've got it all solved," but they haven't. They've just got a lid on, and you'll notice the situation deteriorates. The situation gets worse, gets worse, gets worse.

So that any activity that enters in upon this type of a rightness-wrongness solution – "We are doing what we are doing simply to be right and simply to make somebody else wrong" – any time any solution is entered which has that sole rationale, you can then expect a continuous worsening, not only of the person who is engaging in enforcing that solution, but also the people in that person's vicinity. So the whole thing becomes a dwindling spiral. This thing is going to develop a leak sooner or later. It's going to blow out at the edges, don't you see? Any such situation is going to go *blingo!* someplace or another, because it isn't a solution, it's a dramatization.

Now, you may not suspect it, but you are looking at the final ranks not only of neurosis but psychosis. That is the madman. That is the madman. He sees spiders on the wall. Medical treatment consists of telling him there are no spiders on the wall. This looks to me like one madman handling another madman, both with the same solution. The madman is saying, "I am being right and you are being wrong," and the person (quote) "handling his case"

(unquote) is saying, "I am being right and you are being wrong." Because of this basic agreement, you find many of these medicos winding up themselves in the padded cells.

First place, they don't understand what they are doing. And they don't understand that their solution is just as crazy as the patient's assertions.

Guy is having trouble thinking: cut his brain up. Can't think. Well, ding, ding, ding, here comes the wagon, man! This is nonsense, don't you see? I mean, there isn't anything to be gained in this. I don't see anything happening on the subject of medical mental healing but more insane people. The insane population of the world is going up, up, up, up, and the medical doctors say they've got to have more people to take care of these insane and there have got to be more buildings to take care of them. Statistics are increasing. Statistics are going up. There are more and more people going insane. And therefore, we got to have more doctors to make more people insane.

You begin to look at this after a while. You say, what the devil is wrong with a legislator who won't look over the fact the statistics are rising on insanity, therefore, the money we have been appropriating it for is being wasted? Obviously, there is no proper solution to this, we obviously have the wrong people on the job. But they never do this because they're engaged themselves in a rightness-wrongness type of piece of nonsense, and most of government is how to be wrong convincingly. So the end product of the thing is no solution, don't you see?

You want to know why they did this to you, or why you ever did something to somebody else. Well, in the final analysis, the overt-motivator sequence hinges, basically, simply upon this aberration concerning survival – the effort to dominate – which falls into a contest of "I'm right and you're wrong." Now, both sides are saying, "I'm right and you're wrong," and therefore, you get a double-clashing sort of a proposition. You have A saying, "I'm right and you're wrong"; you have B saying, "I'm right and you're wrong." You get a natural commingling of their ideas. After a while they don't know what the hell they're talking about. They don't know what's right. They don't even know what they started out to say was right, you see?

Now, a mental technology, so called, which engages itself upon the worsening of people, or making people wrong and making themselves right as an exclusive activity, is not in essence a very broad or a very intelligent technology. This is hardly worthy of the name "technology," yet it does have technology, don't you see? It certainly is not a mental science which embraces very much understanding. There's very little understanding involved in this thing. Something like the psychologist or Pavlov: if you put a young man on the table and make a dog bark, the young man slavers. (I'm being sarcastic.) Well, I don't know. I'm tempted to say on the subject, you see, "Well, I don't know. I look around and I'm not having any trouble with slaving dogs. I mean, why are we working on this problem?" It's as idiotic a statement, you see, as their own conclusions.

Stimulus-response mechanisms and so forth. Why be interested in a stimulus-response mechanism? Aw, that tells us right there that somebody must be, interested in being right and making the other fellow wrong. Don't you see? The stimulus-response mechanism – that's as far as they ever advanced. Stimulus-response mechanism. Well, stimulus-response be

damned. The consequences of the stimulus-response is what is – the Scientologist is interested in. And that goes at once into the overt-motivator sequence.

You move right on upstairs from stimulus-response, you see, into a proper piece of technology. They seem to have avoided that whole piece of technology. Why? Because they're only interested in being right and making somebody else wrong, don't you see?

Now, a mental science cannot be worthy of the name "mental science" if it keeps dramatizing an unknown one of its parts. See? That outlaws anything which continues to dramatize one of its parts, you see. It outlaws it from the proper name of a complete understanding. You said a science; a science would be a complete understanding of something. Well, if something is dramatizing one of its parts, it certainly does not have a complete understanding of life.

Now, the sciences of life are difficult just to this degree: You are living. See, you have a day-by-day interrelationship with the laws of life. And to rise superior to this, in any way whatsoever, is so phenomenal as not to have happened ever before. It's one of these tricks. It's by your own bootstraps, don't you see? And for a while, if you know all the aberrative angles, you find yourself batting about in the bottle like a bluefly, see? Every direction you fly, you run into something else. If you started analyzing your own behavior in a single day according to the basics that you know, and if you had all of them available in Scientology, you see – if you analyzed your behavior throughout any twenty-four-hour period, you'd find out, a short period of that time, somewhere along the line, you were dramatizing something. In fact, you wouldn't have to do very much analysis.

In fact, right now, all these people out in front of me are dramatizing breathing. Automaticity: they think to stay alive they have to breathe. You tell some doll that someplace and his jaw would drop, you know? You say, "Well, you can't live on Exnoo because there's no air." There'd be a lot of beings that would look at you awfully blankly.

"What you want air for? What's the air supposed to do?"

"Well, you know, air, you know, air – you got to have air, you got to have oxygen."

"What are you going to do on Exnoo that you need oxygen for?" They'd try to figure it out how you're going to put it in bottles or sell it or you... Maybe you got a new fuel for rocket ships has to do with oxygen; couldn't make... They'd finally understand what you were talking about. They'd finally understand that you were peculiar. [laughs] You get the idea?

The total cessation of the dramatization of the game called life, you see, renders one, at first glance, in a very confused situation, since he's trying not to dramatize its various parts, you see, and yet he inevitably must dramatize certain of its parts. And then he finally comes to the conclusion, "In order not to dramatize life, you climb away to a large cave on the side of a very bare mountain and hope people will put crusts of bread outside, while you sit and meditate and don't have anything whatsoever to do with life."

Now, by not having anything to do with life you have now rendered yourself free of dramatizing life. And oddly enough, there's enough workability to that. You get away from all restimulative factors and your restimulation dies down, you see? Get less restimulated, you feel quite calm. So you say, "Well, this is the way to do it. You don't be any part of life."

No. The real challenge of a science of life is to know it and be able to live – be able to live that life, you see? That's the real challenge, and oddly enough, if you know all the answers you can always do that. It isn't necessary – because you know a half a dozen lies, you see, that you think are answers, it isn't necessary to go crawling off to some cave all by your lonesome, you see? You can stand out in the middle of life and live life, don't you see?

The final challenge of a science of life is does it produce life? Not does it produce death.

When you analyze this thing all the way on down, it'll leave you kind of buggy at first. You get all sorts of weird ideas. "Well, maybe I ought to stop auditing. Maybe I ought to leave auditing. And maybe I ought to get back to my knitting or whatever else I was doing," don't you see? "And I ought to something or other."

And then you suddenly realize that what you're trying to do is drop part of what you were doing, you see, in order to get away from what you were dramatizing in order not to dramatize. You can get into an awful confused state, man. You can sit around for days trying to sort something out along those lines. Well, that's all right.

It's enough to realize, however, that you are in a situation where it can be sorted out. And that's a remarkable situation to be in. Very remarkable situation to be in.

Myself, I've had to groove off the importances of existence – what are the important things? – because time, making a problem, you see, has made it necessary to concentrate on certain importances of existence and wrap these various things up. Well, that's a very proper solution to the thing, but it certainly isn't inactive. It's flat out, man, flat out activity going along at a very high rate. I notice that there's more and more of a tendency – more and more of a tendency as one goes along the line – to recognize more and experience more life. He doesn't have to work so hard to experience life. That's one of the things.

Person who can't experience very much has to work very hard to experience something and get all involved trying to experience existence. Existence is all around them. Walk down the street and they're experiencing existence. But to convince themselves that they are surviving, they think they have to stand under a truck. And that is another way of going about it. They have to suffer impacts. They have to be in there living. What is living to them? Well, living, to them, you see – find to some degree, is being right. They have to be convinced that they are being right or convinced that they are surviving or convinced they are dominating something, you see?

And you take some king of olden times: why, there he sat upon his huge throne, and so forth, and all of his courtiers are saying *bog-bog* and *bow-bow* and walking backwards three quarters of the entrance hall, don't you see, and bumping into the guards and messing it up. All of which is simply designed to convince this fellow and convince others that he is dominating, you see?

Well, I'd say he couldn't have had much of an impression on people if he had to work at it that hard. That's simply the mechanisms of domination. You find anybody who has to work at it that hard, see, he's practically dead, man. He'd be gasping most of the time.

You find some teenager, for instance, out here going to dances and listening to music and diving and experiencing all sorts of weird new thrills and sensations and so forth; they're trying to convince themselves they're alive, don't you see? They're half-dead about nine-tenths of the time. But they're having a hard time of it.

But a science of life should bring about living.

Now, there is a level at which rightness and wrongness ceases to be analytical or comprehensible. And when we speak of aberration, it's when it drops below that point. It isn't that trying to be right is wrong: It's obsessively being right about something that's obviously wrong that goes loopy. See, that's when that mechanism goes astray, and the level of neurosis is only reached when the individual is no longer able to select his own courses of behavior, when he is obsessively following courses of behavior in order to be right.

Now, everybody has a few of these. You can all try them on for size. This fellow is – eats salads. He hates salads, but he eats salads, and you just get on this. "Is there anything you're doing that you really don't like to do?"

And this fellow says, "Oh, I just don't like to eat salads."

You say, "Well, how does eating salads make you right, and how does it make somebody else wrong?"

Now, you're going to get into an interesting situation where you're going to find out he has been already overwhelmed on the subject of salads. This thing is going to cross back the other way. It's a question of how was Mother right in making everybody wrong on the subject of salads, don't you see? And that is not a good processing question. That's somebody else's aberration, so we're not particularly interested in that.

So we just bring him up to that point and this thing will snap. You've got a lot of these things, but by and large they have no value. They have no value.

It isn't until a person reaches inability, weakness, stupidity and other suchlike things as a way to be right that the dwindling spiral is entered.

Now, he's being right by being unable. When you see that one loom over the horizon in any zone of behavior, you have approaching neuroses if it's not there already. And when a civilization goes all out for this, watch it, because it's going to be dead tomorrow. The dust is going to be moaning through its temples and the tumbleweed rolling down its freeways, because that civilization has already entered in upon the necessity to be unable in order to be right.

The way to make somebody else wrong, then, is to be nuts – incapable.

Now, a dramatization, any dramatization (entering in upon this whole field of mental science), which brings about a further disability is wrong for that civilization, no matter how right that civilization thinks it is. And anything which enters a civilization into more life, more livingness, more ARC and so forth is, of course, by basic definition, right for that civilization.

So, you see, it's also capable – this also renders itself susceptible to understanding what one should do, as well as knocking out neuroses. Now, anything that is mad in an indi-

vidual, at some higher level, was okay. All madness is simply an exaggeration of some ability or capability; it's some perversion or exaggeration of this.

Let us take in the lower rungs of it – well, let's take sexual misbehavior of some kind or another. This, of course, is a lower-harmonic enforcement of the ability to create, see, way upscale. By the time you get this thing all mixed up and clouded up, and this way and that way, you get it down here, you got some sexual disability of some kind or another, and that is how the person is still being right about this upper thing, you see? So these things really enter along this line. Way up here it was right – really right – you see? And then it came down a little bit, and it was a method of survival, and then it was a method of dominating, and then it was a method of being right in order to make others wrong. And then in that contest one got enough overts – the communication line did a switcheroo, don't you see – so what was right about it is now wrong about it, but what is wrong about it is now right about it. And we've got this thing all the way down to the bottom of the scale. It's very recognizable where it came from, but it's gone through all of this switcheroo, and down at the line it's practically unrecognizable from its immediate state as far as a person's behavior is concerned.

This fellow is an artist. He could paint. Let us say he could paint a side of a house, you see, you know, with a beautiful scene, you know. *Prrrrrrrooom* – nothing to it, you know. And you find this fellow down there nursing a girl's shoe, you see, to his chest, you know? And he hides this all the time. It's a girl's shoe, and he sniffs it occasionally, you know, and it gives him kicks, you see? I mean, it's more or less the same channel, but there the upper-scale ability has become the lower-scale mockery.

And you get these lower-scale mockeries all the time get the upper-scale abilities in trouble. And once in a while you go around feeling ashamed of yourself for having suddenly thought you could do something about the United States or something like that because some nut in the booby hatch is talking all the time about doing something for the United States, don't you see?

Well, the difference is, is you probably could and he couldn't – a slight difference of ability.

Now, when you look over this whole panorama of behavior and what a person is trying to do, you enter in upon an ability to understand much of the nonsense which at the present moment you may only be protesting against. You just look around on it. But this task is rendered very difficult by the fact that the explanations so obscure the kernel of insanity of the rightness-wrongness that it's very hard to get at what they are really doing.

I don't know what the United States is doing today; maybe it's having a revolution. But it's being right about something. It's being right about something, and it's making people wrong about something. We're not sure what it is, but on a careful analysis or on an auditing level, we could discover those two points. The moment we discovered them, they'd all go un-snarl.

So a science of life actually is a science of examination of behavior, and behavior is based upon lots of ramifications, tremendous explanations in all directions, but narrowed right on down to the middle, looked at in its bare bones, it comes down to survival, dominate, rightness and wrongness. That becomes the main line of behavior. I hope sometime when

you're looking at somebody who is sitting there picking bugs off himself, one after the other, cockroach here and a cootie there, let us hope you don't jump back to keep them from getting on you. And let's hope also you don't try to convince him that there are no bugs there, because you are now playing the one game which makes him make you wrong, and at that moment, you will cut your communication line – just like that.

So now he has only one purpose in view, and that is to make you wrong and make himself right. And you can cave him in, you can deteriorate him, you can put him further downscale, but you can't bring him back up the line again. It's impossible. Because you've taken the one step to cut the communication line which could have made it all right. You see that?

So a dramatization of rightness and wrongness is not the answer to a dramatization of rightness and wrongness. And probably out of all the factors of a science of life, that one you would have to know, otherwise you would simply get trapped into the dwindling spiral of everything you tried to do anything about anyplace. It is the essential piece of understanding which is necessary to keep you free of going the chute. Okay?

Thank you.

THE TONE ARM AND THE SERVICE FACSIMILE

A lecture given on 28 August 1963

How are you doing today?

Audience: Good.

Good.

[part missing]

Well, this is the what of the what?

Audience: 28th August.

Ah! August the 28th, 195..

Audience: AD 13.

AD 13! Thank you. Thank you. The day the White House was burned. All right. Well, today we have some good news. We have some good news technically to do you the most good. This is all, actually, Scientology Two. But the understanding of it, I'm afraid, lies in Scientology Four.

Now, let me give you the first startling statement – just a startling statement. If you cannot make a Keyed-Out Clear with a Prepcheck in twenty-five hours or less of processing, then the pc is operating on a service facsimile. A startling statement, isn't it?

Male voice: Yeah!

It's elementary. It's elementary. A Prepcheck fits in with your itsa line in a very hand and glove proposition. And, of course, these are the hottest itsas there are: is on your eighteen-button Prepcheck list. Those are hot itsas.

And you give somebody an eighteen-button Prepcheck and that tone arm doesn't go through the complete rehabilitation cycle – *uh-uh-uh-uh-uh-uh-uh-uh!* We assume that you, the auditor, have not parked it with clumsy auditing. We assume that. We assume you haven't let an uncontrolled itsa line wander down through the bank and restimulate everything on the early track. See. Because you put in an itsa line that is untimed and uncontrolled, and you sooner or later are going to be in trouble. Itsa lines have to be timed. In other words, your questions on itsa always require a time limitation factor or you're going to get somebody in trouble. "In this lifetime _____," "Since you have been in Scientology _____," "In Birmingham _____," "In college _____," you get the idea; that sort of thing.

Your pc wanders around all over the place and wanders into a bunch of things that you didn't want him in and you've got a restimulation factor to deal with now which you didn't intend to have. So an uncontrolled itsa line, now that you've had a lot of fun letting an itsa line wander all over the place, I'll give you the trouble with an itsa line. And the trouble with an itsa line is that an uncontrolled itsa line will get the pc in more trouble than you've been in for a long time with a pc. Why? Because the pc's attention is permitted to wander and tick and clip things which heretofore were inert. They then restimulate and the charge comes up and blows his head off.

And then, because you aren't running systematic whole track things, like R3R and R3N, you of course keep clipping GPMs, and that sort of thing, and restimulating them and clip another GPM and restimulate that and clip another and then half a dozen engrams, then a few entrapments and a few crashes and a few betrayals and let him touch two or three overts, too! By this time you have no tone arm action. Why? The case is overcharged. That's an uncontrolled itsa line. We'll go into that more fully later, not necessarily in this lecture. I just give you that as a word of warning.

You can let a pc's itsa line wander all you please, as long as it is wandering exactly where you want it to go. [laughs] I'll give you an idea. Sometimes the pc will overanswer the question. You say, "Review..." – I was going to put this in a new Model Session and then didn't do so because you'll have too much trouble with it. You would have had. "Review the last session." All right, the pc says so-and-so and so-and-so and so-and-so. If the auditor right – isn't right up there on the edge of his auditing chair ready to cut that line the moment the pc exceeds that question, see – the pc doesn't review the last session but starts to run the incidents or new incidents contacted in the last session. Doesn't just review it, but gives you brand-new stuff out of the last session which wasn't there – in other words, exceeds the answer to it – and you all of a sudden have yourself some trouble. Well, what's this trouble? The trouble is that your pc, on an uncontrolled itsa line, has gone and plunged off and started restimulating material that he shouldn't have been in and now you're going to have trouble in this session.

You already predetermined, by letting the itsa line be uncontrolled, what you're now going to run in this session. So therefore you can't ever carry out an auditing program. It'd be perfectly all right to do that as long as he *just* reviewed the last session. That was all. "What did we do in the last session?" "We did so-and-so and so-and-so and so-and-so and etc., and I had a cognition of so-and-so and so – and – so and so – and – so." And you say, "All right. Thank you. Good. All right. *Good! Thank you.* Thank you very much. All right." Your pc – your pc, if the auditor is unadroit, psychic, and so forth, is going to feel his communication line has been cut. But let me assure you, it's far, far better for that pc to feel his communication line has been cut than wind up eight trillions eight ago in the middle of a GPM which you had no business running. Because now your pc's really going to ARC break!

In addition to that, why, you've got more charge restimulated than you're about to handle. Do you understand? You got to control the itsa line. The best way to control it is with a time span. You can do time spans in several ways. I wrote that up recently, I don't know whether it was published or not. There's a... time is always part of it. There's time by subject,

you see? Saint Hill, see, that's a time period although you've merely said a subject, and so forth. But they're all time periods.

All right, so itsa line is always controlled by time period. You go in, put in R1C on a pc without specifying the time of your question and without carefully limiting the pc's wandering and you're going to have an overcharged pc, an overrestimulated pc, every time. Got it?

There is a direction of attention necessary where the auditor comes in. Now that you've had some experience letting a pc wander all over the place, and so forth, maybe you've learned how to listen; now learn how to control that line. Very difficult problem: how to control the itsa line without cutting the communication of the pc. That, my dears, is *your* problem. [laughs] Still getting me in trouble; I've got no business telling you how to do it!

Now, what's good news, here – what's good news here that's not necessarily germane to the situation – is that a pc answering Prepcheck buttons is, of course, giving you straight, direct itsas. These are the key itsas of the case. So, as he gives you Prepcheck answers within a time period – and I don't care how you limit this time period; it'd probably have to be half this lifetime. You'd have to clean up something on the order of about half of this lifetime or maybe a bit more in order to make a Keyed-Out Clear with ease. A Clear – let's drop it back in definition to the Dianetic definition which never considered anything more than this lifetime and let's handle what we set out to handle in the first place. We made a lot of Keyed-Out Clears. Let's not defame this particular situation because it is very valuable. It's a valuable state of case and it's a state of case which you yourself ought to be able to create now with the technology we have with the slightest – without the slightest qualms.

How? Well, just put in an eighteen-button Prepcheck. Well, do you require an assessment? Well, that would be nice. That's about how valuable the assessment is. It'd be nice. Gives the pc something to ask – answer about, the assessment does. But that assessment and your Prepchecks are headed at only one thing. They're headed at restimulation. What you're trying to do is key out restimulation and that's the only thing you're interested in, is just keying out restimulation. Therefore, clearing is destimulation. Way to clear somebody is destimulate him. Well, how do you destimulate him? Well, you knock off the points of clearing where the restimulation took place. This has nothing to do with getting out the original incident.

Incidents, then, categorize into an inert incident – unrestimulated – an inert incident. Nobody's worried about it. It's buried down there in the center of the Earth. Nobody's kicked it, tripped it, touched it – has nothing to do with it, don't you see? It's inert. It's got charge in it – potential charge, man! You tread on its tail and it goes *bzzzzzzzz!*

Now you have restimulated it. All you have to do is flick the pc's attention on it and you have restimulated it. There's of course the degree that you can restimulate it, but we are not worried about the degree that we restimulate it. This could be a large catalog like Kraepelin's chart of insanity, see, the degree of restimulation. And if you work over an incident and chew on it and chew on it and chew on it and restimulate it, of course you restimulate it more. And then there's not letting it discharge while it is being restimulated and there are all kinds of conditions to the degree that an inert incident can be restimulated, see; restimulated greatly or slightly or just kicked in or something. Well, we don't care about all of that. That's getting

far, far too nice. That's like a fellow being good mannered and being an expert on Emily Post. I don't think they have anything to do with each other particularly. It's just being too much. It's what kind of fingernail polish do you wear on your little finger that you hold aloft from the tea cup, you see? What is the proper color of the fingernail polish? What is the proper color of it? That of course is *pooh!* Who cares?

An incident is restimulated or it's not restimulated and that will do us. You will find yourself saying, "Good and proper restimulated," you see? And there's also "unknowing restimulation"; it got restimulated and nobody knew what was restimulated including the pc and that is the subject of your ARC break. There are different conditions of restimulation. But in final analysis, it doesn't matter what the condition is. The fact remains that it is restimulated. So there is simply this matter of it being restimulated.

And then there is a state of case. A case is restimulated. All cases are restimulated to some degree of one kind or another – all cases are. But a case can be overrestimulated and that is a condition of restimulation. The conditions of restimulation are extremely varied, as I have just said, but there is a condition of overrestimulation and that condition of overrestimulation is that it will – its Definition is – it will not discharge by ordinary means.

Now, the situation that we have to deal with, in all of these regards, is whether or not something can be discharged. And something that is overrestimulated is not easily discharged because in some fashion or another the discharge has been prevented. That's prevented discharge; overrestimulation. So it comes from getting ahold of too much and not discharging it. And that is what is an overrestimulation.

And then there's the condition of destimulation which simply knocks out the restimulation. It doesn't knock out the incident. And then there's the condition of discharge. Discharge is entirely and completely wrapped up with what is being discharged. It is simply the flow-off. Now, an incident which is discharged, is discharged! It is no longer capable of restimulation. It is not now an inert incident. It is a gone incident. The batteries in it have been short-circuited. That's the end of it. It is no longer capable of producing restimulation – discharged.

Now, where you get a condition of restimulation which is then let off, that is not discharged. Now, we're introducing a special definition and meaning here. That is not discharged. It is *destimulated*. Got the idea? That's not discharged. Discharged means that the incident just is now incapable of being restimulated. You have just up and hit it in the head with an ax and it's gone, see? But if this incident is going to be put back in an inert state, then you destimulate. So there's two things which you can do to a bank. One is destimulate it, which is simply knock out the key-ins of the original charge. You didn't knock out the original incident, you just knocked out the moments when the original incident was keyed in.

I'll give you an idea. You're coffee shopping with somebody and you say – you say, "You realize, you realize that there's a GPM – there is a GPM devoted to homosexuality, in the between-lives implants? There is one!" And he says, "Oh, I don't really think so." He says, "Well, get the – get the – get the idea now, just get the idea of 'to be a homosexual.' Just get that idea for a moment, and you'll see." Ha! That, of course, throws that GPM alive, see? It actually – just discussing it isn't going to do very much about it, see. He's got to con... you got

to concentrate – somebody's got to concentrate his attention on it! Him or somebody else, you know, has got to look right at it, you know, straight at it and bang!

That GPM, which up to this moment has been inert, now becomes restimulated and is now in a restimulated state. Now, there are two things which can be done with it. One is discharge it, which is run it. Get its items out of it and take it off. It's something like taking the battery out of a car. Discharge it. In other words, there's no battery left in it. It can't charge up now. That's it. It's had it, you see?

And the other thing you can do, is say, "Now, recall the time that you were talking to Joe, there, in the coffee shop, and he said to remember that GPM. Yeah, that's right. Well, what was happening *in the coffee shop*?" See, there's your time factor, see? "Oh, there was a lot of clicks and clacks of cups and saucers, and Joe was arguing with me, and so forth, and actually I had a withhold from him at the time. Been out with his girl last night," and so forth, and *click-clock*, that's the end of that GPM restimulation, see?

Get the idea? That is now destimulated. Now, at any given moment, somebody can come along and say, "Well, there is a GPM in the between-lives area, 'to be homosexual'." "I don't believe it," he says.

You say, "All right. Well, just take a look at it!" Bang! You see? There it is; somebody's turned on the ignition switch.

So, an incident – an incident, which is an inert incident – is not having any effect on the pc. It's not part of his aberrative picture, you see. But might very well, by various chains and channels, have influence upon him, don't you see, in various ways. But it itself, as an incident, is not restimulated. We're not interested here in behavior. What does this inert incident do to influence behavior – the degree that it is inert – we're not interested in that. We're just interested in whether or not charge is coming off of this thing or charge is blocked up and almost off of this thing, and we're interested in that kind of a proposition.

So there's two things you can do to an incident. You can destimulate it, which is knock out the times it's been keyed in, or you can discharge it, which is to just to knock it out and shoot it down in flames, forever, see? There's the two things you can do.

Now, let us consider, let us consider that the reactive bank is basically concerned with and contains inert incidents. Let us just assume that. It's inert incidents. After all, there's a fantastic amount of time track and the individual has not been out on this time track to amount to anything and there it is all stacked in one way or the other. And there's probably thousands – hundreds of thousands of incidents – make some auditors just weary to think of how many incidents there are in the reactive mind. They'd just throw their hands up in horror. And all of those things are little potential batteries. They can furnish charge. They can furnish charge like mad, see?

But nobody's been walking around on top of them. They're just lying there. They're not doing anything, see. Not hardly anything at all. They're not doing anything. Well, if they'd just stay quiet, you'd never have to clear anybody. But the pc's attention, directed by life or some artificial means such as auditing, can be made to connect with – or by his own means –

can be made to connect with one of these incidents that has never before been alive. And at that moment its batteries go *bzzzzzzzz!* and start generating juice.

Now, what's remarkable is it's actually the pc's attention which generates the juice. So the incident is merely a manif... a trick put together by which the pc's attention can be converted to restimulation over which he has no power. It's out of his control, if you want to go into the real mechanics of the situation.

In other words, here's this dead fish lying there. Had no life in it. Pc's attention is placed on the dead fish and the fish begins to wiggle. Worse than that he begins to fan his tail and the ripples come up from that we will call "charge" – that's charge. All right. Now actually, as long as his attention is flicked back and forth across this inert incident, charge is generated, and if this attention is fully enough directed to it and if the channel of the pc's attention is clear enough so as to permit understanding and confront – in other words, permit his ARC to flow – you will see motion on the tone arm of your meter, and very soon, fish: no wiggle. Very soon after that, fish: not there.

Now, actually, you can put the pc's attention on this, he can put his own attention on that zone or area of the time track as many times as he please and he will never get any charge from it. That's discharging an incident. That's erasing one. You have various terms for it already.

Let's look at this other action. Let's look at this restimulation from another point of view. Pc's attention flicks onto it – either from an uncontrolled itsa line or something happens in life. Somebody comes charging up to him and holds a dead fish in his face, something like this, and it reminds him of this other thing – and his attention wittingly or unwittingly flicks over this particular section of the bank which has been lying quiescent. And the moment when his attention flicked on it is the moment of restimulation. We call that a key-in. His attention hits it, so you got a moment of restimulation.

Now, oddly enough, it is only necessary to destimulate that incident to have it go back into a dead fish state. You only need to hit this moment of restimulation. Knock out any aberrative factor in the moment of restimulation and the incident will destimulate and the individual's attention is no longer fixed or fixated on this particular incident and the incident goes quiet again. "Keying out" is the term we normally assign to that action.

So theoretically, you can take a hold of the pc and take anything as powerful as the eighteen buttons of the Prepcheck and with any time of – kind of a time span, or subject direction here, that nevertheless gets it all in – let him wander up and down this thing, putting in the buttons of the Prepcheck – and you should key out the bulk of anything that has been keyed in in this lifetime. Then you would return to a state of free needle.

You have, in effect, Clear. You've destimulated somebody to a state of Clear. That's a Clear. You see, it isn't necessary, then, to make a Clear in order to make an OT; but, you should know how to do it because you're going to have to do it, in part, a lot of the time.

Very fascinating, that all of this ties together so neatly, because it s directly represented and analyzed by the tone arm. Directly and immediately, and in the higher state of free needle, of course, requires the needle in addition to the tone arm. There are eight states of

needle. You'll have a bulletin on it. There's no reason to go into them now and call them off number by number. They begin with free needle, they begin with tightening needle and moving tone arm. They go up to – through this to high tone arm. They go through high tone arm to low tone arm. They go from low tone arm to tone arm at clear read, dead thetan. See? Clear read, tight tone arm, tight needle, no motion, at clear read, for the pc. That's dead thetan that you've got in your *E-Meter Essentials*, and so forth.

Its next stage now – let's – you got that? That's a cycle of tone arm conditions. There are a few more of them, intermediate stages, but you'll have a list of those, as I said. Now, let's take a look at this. They also compare to your eight levels of case. They're straight across. You can analyze the level of case by the level of behavior and action of the tone arm. Now that makes – I'd been trying to solve this for you for a long time of how the devil did you make a diagnosis of the case and finally worked out how you could do it, with the way a person appears on a meter. So, that's very direct.

How does he behave in the first few minutes of processing on the meter? And that gives you the level of case – bang. I'm not making a lecture now on the diagnosis so you can have your levels of case and your tone arm conditions and so forth some other time, or in the bulletin which I'm doing on it, if I ever finish it!

I seem to keep hacking away at this bulletin. It's now getting about a foot thick, full of papers and...

Now, the conditions which you must pay attention to are these: dead thetan, clear read without tone arm motion and tight needle. That's your lowest case range, save one. There is one below that. But that one below it is not a tone arm manifestation, so it is not included. But I just throw it in gratuitously. The needle is inversely reading. It's inversely tight so it's frantic. You'll see for the first time a constantly rock slamming needle with the tone arm sitting at dead thetan. It's just constant charge that is reading. It's like reading a switchboard of a power plant, it's just *yaawlyaaaa* – everything moving except the tone arm. But we just include that in the unaware case since it's a needle manifestation; we don't need it.

Your next movement up from dead thetan is low tone arm case – the low tone arm case. That case sits constantly and continually around 1 or 0.5 or something like that. You just can't get any motion out of it. And the next case that is important to you is the high tone arm case. And the next case is one moving in the high range and then there is the case which has got what you would call good tone arm motion, which is going past and through clear read. And then this goes right on down to free needle with tone arm at clear read.

In other words, it turns a whole cycle. So you have to be able to recognize the difference between a dead thetan and a Clear. It's fairly easy to do. One's alive and one's dead, I mean, [laughs] but you'd be surprised how often this one's been missed! I've seen it missed. Guy sitting there, he's a pale gray, you know, never has anything to say. The needle is totally stuck. You ask him anything, try to do a Sec Check or something on him, total stuck needle. No reaction from anything of the sort. Somebody comes around and said, "Well the guy's Clear." I've had it happen! I haven't believed it, but it's happened.

Then I've seen arguments with Clears. Arguments with clear reads. Now, you can see that if the state of Clear – and this is something that's needed classification and clarification

for a long time. We're working actually now at the level of Scientology Three when we're actually working with Clears. This has needed clarification for a long time. The second I tried to push a Clear through from anything but a destimulated Clear to a discharged Clear, I found out you had to go all the way to OT. There wasn't any way stop. Even though the person would exteriorize and they'd be a Theta Clear and they'd be this and they'd be that and so forth. None of these – none of these furnished a sufficient way stop short of OT so it's just a long pull. The odd part of it is that at any time on that route you could make a Clear. At any moment on that route, you could make a Clear.

Well, all you have to do is prepcheck them this lifetime to a free needle and you got a Clear. That destimulates whatever you're running, see? You just drop all the restimulation off the case, and there it is. You'll have a free needle. Now, it's interesting that this is a very easy one to produce. It's been produced by a nine-year-old boy on a staff member in New York. That's right! He just got in the Prepcheck buttons on his pc and didn't nag the pc and clean cleans or cut lines, probably didn't even read the meter, to that degree! The pc finally said that that was all the suppress, well, that was fine, that was all the suppress. I don't know that the session went that way, he might have been hell on wheels getting that needle clean, too! But obviously, he couldn't have cut the line very hard or he wouldn't have gotten the result he got which, of course, was a free needle. Needle sloppy and flop and drifting across and falling on its own pins and you can't get it to read on anything, you see? Elementary.

Now, the condition you've got to have, in order to take anybody to OT, is that next-door neighbor to a free needle, a moving tone arm which is moving through the clear read with good motion. Now, if you don't achieve that before you start trying to strike for OT, you're not going to make it. Well, why? The case is overrestimulated. There are too many incidents kicked in, and you, in trying to take the case – it's elementary, it has nothing to do with the state of case, oddly enough. I mean, it doesn't matter whether the guy is loopy, balmy or – it has nothing to do with it, you see, what he can or cannot do, it's just the state of this meter. And you try to take this character on to the backtrack and of course you restimulate something new and you add it to the overrestimulated case, which adds up to a frozen tone arm. So you actually have put his case state down one click, see, from wherever he is. Now, if you continued to do this, he would theoretically – theoretically – go from a fairly loose tone arm – well, that is to say it moved a little bit once in a while – he'd go to a high tone arm and if you continued to overrestimulate the case and run the case without tone arm action, the case would then become a low tone arm case. And if you continue to run the case without tone arm action, you would have that needle stuck at the clear read; just as elementary as this, you see?

Then, by doing a Prepcheck – now it's now more difficult to do the Prepcheck, don't you see, because he's sort of disassociating and he's overcharged and blown toward PT and he can just get yesterday and so forth – you've overcharged the case. Now, with Prepcheck, however, you start cleaning up all this stuff. You back the thing down from clear read stuck; that goes right straight on through to a low tone arm case, stuck, and that frees up a bit and goes to a high tone arm case, stuck. And then with more prepchecking and actions in this direction, destimulating the case all the way, the case then turns to a fairly free needle – toward the free needle state, don't you see?

Well, you don't have to get to a free needle in order to now run the case on the back-track. It's a cinch if this guy is carrying around this much toxemia in the way of an inert bank, that any time anybody sneezes in his direction, inadvertently puts his attention on the time he was crucified, he then – he goes from free needle to this, you see, [laughter] it's a cinch he's got to have those incidents discharged sooner or later.

Now, the subject here is not *how* you discharge the incident, it's *when* you discharge the incidents. See, that gives you all. Now you really know all when you start to look that over. Well, you put the case in a state where incidents can be discharged. And if the case is getting good tone arm action – and what do I mean by good tone arm action? There's a bulletin on it – but you've got – you've got to have a fair sweep of that tone arm. It's got to be moving around, man. And it should, preferably, be moving through 3, preferably moving through 3. A higher range motion, from 3 to 5, is critical. And the second you go backtrack, by actual experience, on a case that is moving – well, not 3 to 5, but a case that is moving from 3 – no, let's take an actual – let's take in some actual figures here: A case moving from 4 to 5.25 with good tone arm action, when taken on the backtrack to restimulate a new incident or GPM, promptly flies up to 5.75 and sticks. See? The case would run on this lifetime with tone arm action between 4 and 5, or something like this, or 4 and 5.25, and get good tone arm action. And the second you go backtrack and grab a handful of inert incident and restimulate it, why, clank! She goes clang! Right there – stuck – 5.5 – stuck – 5.75, something like this, don't you see; stuck. *Thung!* There it is, see? Got the idea?

So that case isn't a high enough case level to run backtrack on. How do you diagnose this? Tone arm motion is moving in that sphere or zone. Now, let's take a much more critical case. Let's take a case that is moving down here from 2.25 to 0.5, and let's achieve that as the case's tone arm motion. 2.25 to 0.5 is the extreme range; and we take that case backtrack, well, you're probably not going to make a high needle. You're probably going to stabilize this case toward clear read with less tone arm action. Ah! You moved it from a low tone arm case to a dead thetan case. That is a long way from enough tone arm action or a proper tone arm response to run backtrack, see. That's a long way from it.

That case, actually, under Prepcheck, will become a high tone arm case – in theory – and move around to the high range before it moves down to proper tone arm action. Do you see the progress of a case, then, as represented by the tone arm? Stuck tone arm at clear read, low tone arm, high tone arm, tone arm in range, tone arm settling back to clear read but loose and the needle free. See, it goes that cycle. That's the way that tone arm behaves in the presence of cases. To get a clear, absolute, text book look at this, is rather difficult because sometimes, when you start prepchecking, the case transfers rather rapidly from one kind of case to another case – rather speedily – goes through one of these stages without your seeing it go through the stage. See, because you weren't purposely going to stick the case high up. So therefore it doesn't stick way up and then doesn't stick lower, and so forth, actually does a spin and goes through 7. And you'll see such cases, a low tone arm case, go through 7.0 – *bzzzzzz!* And you wonder where the needle's gone – where it's gone – where's it gone – sit there, the meter's gone out of action, obviously, because the tone arm can't be centered on anything – gone, you know!

When that happens to you, and you wonder what has happened, by the way, there is something on here, you probably had never paid much attention to, there's the trim knob. And you just take that trim knob between your thumb and forefinger and give it a violent switch. And you just twist that trim knob all the way over and your needle will come back on. When she goes through 7 and won't register, why, your trim knob will put the needle back on the dial for you – if you get stuck at 7. Handy thing to know. But I myself – it happens so frequently... infrequently that somebody goes through 7.0, that I myself get caught on this. I got caught on this the other night.

I was trying to catch the thing... and then finally flip, and I had it. Thought the meter goes out. It's almost impossible, it's such a startlement, to keep from directing the pc's attention to something weird going on here. Could happen – very rare. It's very rare that your thing goes through 7.

Now, it can go through 7 wrong way to. It can go through 7 from high tone arm – high stuck tone arm – to low stuck tone arm. That's undesirable. It can also go through 7 and come back off 7 again, by going through high tone arm, through to low tone arm, you rescue the pc by doing R2H, or something like this, you're doing R2H or something which rescues the pc rather easily and relieves charge rather easily and keys out nicely. And it only stays in a low tone arm state for a split second. And then *slip-slip-bing-bang!* Goes back through 7 again and comes up on the other side, but this time maybe a bit higher. In other words, you were carrying the case downhill and you went through 7. Going through 7 doesn't always mean that the case is improving. The case can also deteriorate.

Now, this puts under your control – this puts under your control – the very interesting fact that you can make a Clear at any given moment. You can make a Clear anytime.

You can just sit down and make a Clear! Nothing much to it. You got the weapons, it's very easy, just don't clean cleans on the Prepcheck line, or something like that, and be rather permissive in running some kind of a Prepcheck on some kind of an assessed subject, and maybe another Prepcheck on another assessed subject, and maybe even a third one on another assessed subject, and all of a sudden you'll be sitting there looking at a free needle. Pc will feel wonderful. It's fine.

And, oddly enough, you have done enough – such is the power of auditing – to keep him going for years in most cases. They'll start worrying about it, however. They'll start chewing at things which they remembered they used to chew at and they'll wonder how those are now and there goes their attention onto an incident you'd made nicely inert. And they kick that one in so when they get up in the morning they put themselves on the E-Meter to find out if they're still Clear this morning – and they're not. They're at 3.25 and that's not so good. And they worry about that, don't you see, and wonder what incident kicked in, put in their own itsa line, flick down, hit some other, and the next thing you know you've merely got somebody with an active tone arm now.

You see what's happening here? In other words, you carefully destimulate somebody and they, or life, restimulates the thing back out of existence again. Well, that's about all there is to clearing. Clearing, then, you would look at it as a relatively unstable state, and so it is.

But it is more stable than anything that's ever existed in the whole field of mental healing, psychotherapy, or anything else; so why not accept it as a state?

Now, you could – the next step up by which you achieve this and by which you achieve this totally stable – with complete stability – is there's nothing left in the bank except things that don't have batteries in them, see? The incidents left, whether they're inert or otherwise, aren't going to do anybody any harm. You get a case level 2, you see, as far as the bank is concerned because you discharged everything else. You're going to start seeing free needles occasionally, and when you just delete all of those, too, or delete why he is mocking up a bank, all of a sudden the whole meter goes blank. Then the pc has to worry about how does he estimate the amount of beam to put on an E-Meter electrode in order for you to get any connection between the two cans. And one way of doing that is just hook a permanent beam between the two cans and the meter continues to read very nicely. That hasn't anything to do with the individual.

In other words, you haven't got anything to measure and that, of course, you reached up to a state of OT. So a state of totally discharged bank is OT, and a state of – see, OT and Clear are the same breed of cat except they go out on two different sides of the house. See, you pull the guy out of the bank and he's not in the bank and he will behave very nicely and can probably do a lot of interesting things, but if he does them he's going to kick in charge, occasionally, and this is going to worry him and he doesn't really dare turn on any power or juice, because if he turns on any power or juice he runs into inert incidents and they activate and this throws him down scale again, so he feels tippy. He feels – he feels somewhat unstable the second he starts keying back in again. It's a loss of hope. He gets a lose. That is he considered himself in such wonderful shape and suddenly he isn't in such good shape.

Because, actually, that fellow still has in his bank enough incidents – he has them all, you see – that if you threw those incidents alive, one after the other, systematically preventing their discharge, you could run this case just *bang-bang-bang* – by the amount of charge that was restimulated – you could just run the case down to action – action, and then highest tone arm, and then low tone arm, and then dead thetan. You could so overcharge him he couldn't remember his name, rank, serial number or anything. Because he's still got a bank.

Overrestimulation is the cause of amnesia. All you have to do is overrestimulate somebody, you get amnesia. It's the cause of weird behavior. It's the cause of a lot of things. It's the cause of making you feel like your skull's coming off. It's the cause of making your body feel bad. It doesn't matter much what part of the body feels bad or what's the significance of feel bad is, it's the overcharge that makes one feel bad. One feels nervy, edgy – that sort of thing.

Now, if you were to give a pc three sessions in a row without achieving any tone arm action on the case, the case starts to feel pretty wild because just the fact of auditing is going to restimulate. In other words, he's going to wander around. Now, the more overcharged, the more restimulated a case is – the more overrestimulated, to use the proper term – a case is, the more it greases around on the track. The more it dissociates, the harder it is for it to hold a position on the track. The harder for it is to sit in an engram. The harder to stay on the back-track. The more easily the case is swept up toward present time. It's all grease, see, and it's all

uncomfortable. Memory is bad, recognition is bad, the facsimiles look bad. Of course, you're walking up to something that's charged like – got ten thousand volts on the confounded thing, you know, and you expect him to get near this facsimile. See, because he's got so much charge residually, the charge is starting to match up with charge.

Incidents start to jam together and that is all assisted by wrong dates and wrong durations. And the bank starts to look like it's been in a wine press or something like that. It's kind of a mess. And that is always due to overrestimulation. Now, as you move overrestimulation off the case, why, the case goes back into a happy state of time track in place – everything's in place, everything's fine. You don't even have to head for the exact moments of restimulation, just Prepcheck buttons are good enough. Case all gets patted back together again. Time track will be back there, unwalked on, but in beautiful condition. The pc will be able to get near incidents, hold himself on the time track; everything's going along fine. Visio is up and perception up when he does hit an incident.

Now, in a condition like that, an auditor, carefully, without keeping the itsa line in with no control – an auditor carefully regulating the pc's attention – goes backtrack, grabs up a handful of GPM that he knows about and runs it with an accurate line plot and discharges the thing, and so forth, and he's still getting tone arm action. Now, the tone arm action of the pc potentially will increase and you get better tone arm action because he's one less GPM, don't you see? That is, even if you do put his attention on the backtrack, it isn't so likely to freeze; providing you don't take eight GPMs, you see, restimulate all those, and then go off to find some better-tasting clover. And then because that didn't taste very well, go off someplace to find some more. And then find the exact combination of how come he got GPMs. Well, let's get basic on the whole line of GPMs and let's get the first GPM out. Let's do this, let's do that, and let's not run anything. And the next thing you know, why, your case is a high stuck tone arm case and you're getting no tone arm motion; you can't get anything on the backtrack; he has no perceptions; his memory's bad. Somebody drops a pin a block away and he jumps a foot. He's all nerved up. What is happening to him in auditing? Auditing is doing him in – all of this, all of this, all of this, you see? And he gets all of those things as a net result of overrestimulation.

Now, you can turn right around, prepcheck the case – with appropriate terms, and so forth – you can prepcheck the case back to good tone arm action; take him on the backtrack to stuff you already know is there, take the stuff up selectively one after the other, discharge it properly and the case is on the road again. But the wrong thing to do is to not pay any attention to the condition of the tone arm and hope that you can go backtrack and pick up the incident which is responsible for this restimulation. *Pah-ha-ha-ha-ha!* Because you always restimulate, at any given instant, more than you are discharging. So a case has to have some latitude for restimulation. You're going to do a – you're going to take one Bear GPM series; one Bear series. Well, I defy you to run one Bear series without ticking the adjacent pair... pardon me – one goal out of the Bear series without ticking the adjacent pair in the series: the one above it and the one below it.

Just in the process of finding the top oppterm, why, the pc is around – that isn't so much. Finding the items, that's fairly easy. But getting down to the bottom – you have to have the next GPM in the series to get the bottom oppterm. So you've now thrown that one alive,

haven't you? And now how about listing for the next one? Well, that's liable to throw that one and two or three other series alive, see? What is the next GPM? Well, you have to list for it which, of course, throws more restimulation onto the case.

There's got to be some tolerance for an additional restimulation without killing the tone arm action. In other words, the case has to be in pretty good shape to have this kind of thing happening to it. It's got to have a width of tolerance. In other words, you started out with a margin of tone arm action. Now if you started out to do this action with no margin of tone arm action, no tone arm action to spare at all; this case is running between 4 and 5. Getting good TA action between 4 and 5. And now we're going to go back and we're going to take a series of the Bear goals, one right after the other, and we're going to run those GPMs out.

That case is going to stick at 5.25, or thereabouts, and is not going to budge because it's overrestimulated. See, it's overrestimulated to begin with; didn't have enough margin to run on. Now, sometimes you win on this, so you discard it. Sometimes you just play it lucky. You knew there was a GPM back there, you went back there, you ran out that GPM and it restored a little more tone arm action and so you ran the next GPM to it and there's a little more tone arm action. You thought that was fine. And once in a blue moon, you will actually restore the case's tone arm motion from the backtrack. Cut your throat, because that's the type of win which leads you into sin.

Because the other nine times out of the ten that you do that, the reverse happens. You go back, you knew where the GPM was, you're going to run this GPM, you got the plot, everything of the sort, you start – *bu-uh-uh-tut-tut-bebo-ba-pong!* And we're presented with something which is running at 5.5.

One session at 5.5, pc survives it. Two sessions at 5.5, *hmmm-mmmmmmmmm-mmmm*, "Well, if we just get the rest of this GPM out, *ahhh-ahhh*, if we can just get the items and we have no – no ARC breaks or flubs or anything like that, and the pc stays happy through the whole thing and we get enough charge off the case because the GPMs are actually what cause that tone arm to stick, we know that, so-so-huh-this-we-get-the-th-th – and so on, you – you say you have an ARC break? Well, let's see, do we do an assessment? Uh, well, maybe we can just clear it up – what – did I cut your comm or something? Oh. *Ohhhh!* Next – give me the next item. The next item. The next item. Yeah, give me – give me the next pair! Give me the next four." [laughs] "Let's just get anything off of it we can, down to the end!" See?

5.75 – stuck. We did get a blowdown of 0.2. And we try to run something else, and there's that tone arm: Up! And you're not going no place, man! And you can't get on the backtrack without sticking it harder. Why? The case is already overrestimulated. You've got to take a long breath and run something on this case to destimulate it and return the tone arm action so it's going pleasantly, back and forth across 3, and is running in to good condition and good tone arm action before you dare do anything else on the backtrack.

Now you go on the backtrack and get some of the charge off and the case runs like a startled gazelle and everything is fine! In other words, you damn near got to make a Clear before you can OT somebody.

I consider that a very interesting set of data, and that's why I say we're lucky. Because that tone arm behavior compares exactly to case levels and case level is just overrestimula-

tion, not bank. You consider that a case has a bank, a reactive mind, the content of which is inert. But if he gets walking around in there in his muddy feet, it soo... going to soon cease to be inert. But there it sits. Nice big inert mass of junk. Unrestimulated. Big, it's sizable! It's formidable! But it is inert and therefore is not bothering anybody.

And then we have a subsidiary, if we want a graphic – graph this so it looks like something. Draw a great big circle for your inert bank and then draw a little tube off the big circle and draw another little circle. And you call that the restimulation; the amount of restimulation. And the amount of restimulation is always the auditing target. Now, that amount can be great or small. And as it becomes great, you get the lower case type and as it becomes small, you get the higher case type as far as your representation is concerned.

In other words, you're working on two bins here. There's one great big one, that has inert, and then there's what has been restimulated off of that, and that lies in another cubicle. And the auditing is always done against the cubicle of restimulation. And when that cubicle is emptied, the auditor can reach into the big bank, expertly, grab by its tail one GPM, haul it over into the little restimulation cubicle, audit the hell out of it and empty the restimulation cubicle of that, and then reach over into the big bank and haul another great big whopping series of stuff out of it and put it into a state of restimulation. And just graphically represented, it's now in the restimulation chamber, and now he empties the restimulation chamber and so he brings about an OT. Now, when he puts his great big hands into the inert bank and hauls out fifteen dozen fish, all in full restimulation, he finds he's got more fish than he's got bank! He feels now that he's auditing the whole reactive mind, simultaneously, and that's the way it looks, because he's restimulated too much.

So, having – if he's done that error, the thing to do – or if life has done that to the pc – the thing to do is just throw the fish back into the main chamber inert, and just empty this cubicle.

Now, if we get this graphically pictured, we get something that looks something like this – which I've just described to you. We have your big bank and that is your reactive mind, and then we have the restimulation chamber.

You understand? And your restimulation chamber has some kind of a vent on it which is discharge. Now, you can discharge this – and always some of this discharges, regardless if you're destimulating – or you can put it back to sleep, which is destimulate, see? So there's – you're auditing the restimulation chamber, always. You're always auditing the restimulation chamber and you have another action, which really isn't auditing, it's restimulation. You do it with an E-Meter, and so forth, and you select something out of the reactive mind and it goes live and it looks like it hasn't moved or anything, and it really hasn't. But pretend that you've hauled that through into the restimulation chamber and you've got now charge. And you audit that charge off and you discharge that.

And when you've got this thing nicely empty, only then do you reach back into the reactive mind and haul something new out into the restimulation chamber and discharge that. At any time, if this condition seems to exist, whereby your restimulation chamber seems to be that size, you open up this line – of course inevitably you get a little discharge here – but you open up that line and just empty it back into the reactive mind. Got the notion that we're in-

volved with here? It's just the idea is the auditor can, at will, put into restimulation or into this restimulation chamber, at will, he can put anything and everything he wants from the reactive mind.

Well, you got line plots, you got pictures of the track, you got various things like this. Put an itsa line in, "Uh..." – get a time factor: "On your early track..." that's a nice time factor! "On your early track, what do you suppose you must have run into that convinced you you should have aberrations or pictures or something like that?" And then just sit there for a while, see, and let the pc talk. In fact, sit there for several sessions, if you really want to make a good test of it, because you're going to get tone arm action first. That's what's going to fool you.

And you'll see the tone arm go on up and stick. And then you'll see the tone arm go through 7 and go low, and then you'll see the tone arm go to dead thetan, because you're just asking this guy to restimulate the whole backtrack, see. Uncontrolled action. So you brought this restimulation chamber, not just full, but bursting. If you're not undertaking an auditing action to empty it – such as to run the line plot and shape it all up and groove it all down and that sort of thing – horrible! This case, pin drops quarter of a mile away, goes through top of skull. Nervous. Body things happening. All kinds of wild things are occurring on this case. You say, "Go to ten years ago." Track's greasy, see, so he goes to ten million, five million, six million, tomorrow, yesterday, out of session, *zzzz*. Looks like a bear on skates. He's just going all over the doggone place, see?

And you say, get an incident when you were in a baby carriage. Flick-flick-flick-flick-flick-flick-flick-flick-flick-flick-flick-flick-flick – he's gotten fifteen incidents of being in baby carriages in the last fifteen lives.

Why? Well actually, the thetan just gets backed up here in the corner, subjected to enormous pressure. He's just overwhelmed. He's just drowned. He can't cope with it. He can't... he isn't – hasn't been permitted to understand or confront the things which have been restimulated, so they haven't discharged. And he doesn't know what to look at. And you get a high tone arm case; the main thing wrong with them is they don't know what to look at. And you ask them to do anything and they do something else. And they don't quite know where or how to go about this. And it takes very precise action on your part. So it takes something like a Precheck. You get to put in a time limit – one that is real to the person. And the next thing you know, with one single exception – which I will come to in a moment and give you a much greater lecture about – why, the case peels right on down into destimulation and you get the case back from this state to this state and then you actually get the case into a state of nothing. That's Clear! Nothing in the restimulation chamber. That's all a Clear is. No loose charge kicking around.

But some case that is having trouble – some case that's having a lot of trouble – all you have to do is make a motion. You know, you've got more charge kicked up in this restimulation chamber, it's practically bursting, you see; and you just raise your hand in session, and bank caves in on him. See? In other words, the charge, the overrestimulation, the amount of charge present is so great – charge isn't overrestimulation, but the word overcharge is not proper. People get to thinking about fees or something. And this degree of restimulation is so

great that anything in the environment kicks some part of the restimulation into action. So he's just totally reactive. Everything is already fixed up so it can react – it's already reacting, so everything reacts.

You run any pc three sessions with a stuck tone arm – I don't care where the tone arm is stuck – case is going to worsen. *Uuhhh!* Then they come to the fourth session, *hohohoho!* They've already been coming in feeling grim. And that fourth session, *hmmmm!* Man, they feel bad and they're griefy, they don't want to go on, they don't want to have anything to do with anything. Just overrestimulation. Because it's not possible to audit somebody without doing one of three things – one of three. It's impossible to audit somebody without doing one of three; which is: restimulate, destimulate or discharge. You got to do one or another of these actions.

Now, when a case is already in a confusion and is not understanding or confronting well, naturally the amount of destimulation and discharge is going to be minimal so the restimulation is what takes over. And you just start auditing the case and just auditing restimulates the case. Nothing is being discharged because there's no motion on the tone arm. There's no destimulation taking place and there's no discharge taking place. So obviously there's only one thing left to happen and that's restimulation. So just the fact of auditing somebody is going to do one of three things. And when you don't destimulate anything and you don't discharge anything, you certainly are going to restimulate something more.

So an auditor's danger signal is no tone arm action; and that's a danger signal. And you should go at once into finding out why there is no tone arm action. And there's several reasons why there's no tone arm action, but first and foremost amongst these things – I say several; there are two, two reasons why there's no tone arm action. Of course we understand already that the tone arm action as case level has deteriorated because of restimulation to that case level which doesn't achieve tone arm action. That goes without saying. We say there's no tone arm action; obviously the case level has deteriorated.

Now, these two things here are present in your actions. The auditor either does something that can discharge the existing restimulation or looks for what reason it has not to discharge. In other words, he really undertakes those two actions. He either discharges it right now, which he'd better do, and if he can't do that right now, then he had better look to find out why it isn't happening right now.

The case isn't running something that will discharge. In other words, the case is overrestimulated – the stuck tone arm. It's already overrestimulated, so you better jolly well not restimulate anything else. You'd better take an action under that heading which will discharge something that has already been restimulated, but mildly and up toward PT ordinarily; not necessarily. Tone arm action just stopped. You just got through abandoning twelve GPMs, one right after the other, and tone arm action is now stopped. Well, the way, obviously, to start that tone arm action – go back and flatten those twelve GPMs one right after the other, and the tone arm action restores, maybe.

You see, you might have accidentally restimulated more by doing this, you see, than would ordinarily discharge and you're now – the case is over its head. Your best action is a Prepcheck type action or R2H, or some such action as that. A Routine 2 process – which is

aimed toward making people healthy and well and clearing them and so forth. Or Routine 3 actions – Routine 3 actions which tear into the backtrack are definitely out! And if the condition doesn't instantly and immediately remedy itself and tone arm action restores by reason of your Prepcheck or your R2H, or something like that, and if you don't get immediate restoration of that and you can't bring that about at once, then there's only one other thing that is wrong with this case – this case is sitting on a service fac. Service facsimile.

Therefore, we can say that any case, any case that cannot be restored or put in the situation of Clear in a relatively small amount of auditing, certainly less than twenty-five hours, is sitting in a service facsimile and their case will not do anything but worsen until that service facsimile is located and cleared.

This also gives you the hidden standard; this gives you a lot of other things. And just so you'll have a record of it right now, rather than – I'm going to give you another lecture about service facsimiles and that sort of thing. The service facsimile is viewable because, when you prepcheck them on some subjects, mass turns on in the pc. The Prepcheck turns on mass? Oh, who ever heard of such a thing. A Prepcheck couldn't turn on mass. Oh, yes it will, on a service facsimile, because the pc doesn't intend to get rid of this. The pc has, of course, a rightness-wrongness equation of something in life and this rightness-wrongness thing is what doesn't surrender, then, to normal auditing because it is a service facsimile. And you now have rightness and wrongness and you have domination and you have survival that you can directly address the service facsimile and discharge it, and the case will then go back to battery, and go to clear read.

But, if anybody has been audited over a long period of time on Prepchecks, on "In Scientology *yap-yap-yap*," on this, on that and so forth, and they have not reverted to clear read, there is only one thing that stands in their road and that is a service facsimile. And the service facsimile has got to be gotten out of the road with picks, shovels, sledgehammers or any other type of action, and as soon as it's out of the road, then the case will pick up and fly and will go to clear read.

There's a rightness-wrongness computation. The reason we never handled a service facsimile before – the reason we never handled service facsimiles before is actually we didn't have any way to handle it. Because we didn't know their total anatomy. We knew of their existence, as you'll find in *Advanced Procedures and Axioms*. But the service facsimile is a rightness-wrongness computation. Any case that isn't improving at once, instantly, alertly, right on the way, tone arm action improving, needle action improving, on such a thing as a Prepcheck, on such a thing as "Their auditing," on such a thing as "Recent times," on such a thing as "This lifetime," – anything in this lifetime – case isn't snapping back to battery, the case still having recurrent present time problems, case is still worried about something of the sort, *yip-yap, yip-yap, yip-yap*, always trouble with this case, this case isn't so on, tone arm action is very hard to restore on this case, Prepchecks don't seem to do anything to this case – oh, my God, isn't life awful – that case is sitting on a service facsimile. And the thing to do is to isolate the service facsimile. And we haven't got that all tied up, "How do you isolate the Service facsimile," but I will tell you, the service facsimile, if present, will turn on mass when prepchecked. Won't surrender to a Prepcheck *ha-ha – ha-ha – ha* – what do you know! And that was the big discovery on the thing.

How could anything not surrender to a Prepcheck, see? Well, all a Prepcheck is, is the series and types of decisions which a thetan makes about things. If a Prepcheck is going to turn on mass, what's kicking here? What's happening? Well, it must be that the Prepcheck is in conflict with the rightness and wrongness, and the auditor must be sitting someplace with the Prepcheck, trying to make the pc – in the pc's imagination – wrong. So the pc reinforces the facsimile and moves it forward in defense, reactively. You got a rightness-wrongness computation represented by the existence and increase of mass.

Well, that takes care of about three-quarters of the HGC pcs, doesn't it? [laughter]

Well, I think it's quite interesting. I've often noticed that an HGC got along all right when it didn't get any case results. But that's quite interesting; an awful condemnation. But the truth of the matter is that it often – I've noticed this – that quite a while it'll get along all right, without getting any case results. And we can finally put that down to that it makes people so right not to have any case improvement. Lack of results in their immediate neighborhood, however, over a period of six or eight months, eventually will catch up with them and the whole roof caves in. But they can go along so long without case results that one almost wonders if people don't come there to be made right about what they're doing.

So, there is your proposition. There's your proposition with regard to why charge can't be discharged. And the only thing which prevents charge from being discharged is there's too much overrestimulation. The overrestimulation is so great, the pc can confront nothing so you get no tone arm action. As long as you address unspecific backtrack things, you get no tone arm action. You got to have something the pc finds very easy to understand, very easy to confront. In other words, his ARC has got to be raisable on it before it'll discharge. Or, if this isn't happening, no matter what you do, then it must follow that the pc is operating on a service facsimile.

And then your two reasons for high tone arm action – actually the one reason for high tone arm action is overrestimulation. See, that's the one reason for high tone arm action. But the two things which prevent discharge are the overrestimulated condition or the fact you're auditing a service facsimile and the guy isn't just about to give that up! "My God, what would happen! What would happen? What would happen? If you can't chew tobacco – if you can't chew tobacco, how can you get even with the army?" You know? Horrible! Horrible situation here.

All kinds of additives get added on this situation. "Well, naturally I've got to have – I've got to have – I've got to have a – the situation has got to be terrible, because if it weren't terrible, why, it would be terrible!" See, logical! You've got case where a little kid, if he wasn't on crutches, why, he'd be wrong. And you try to take him off crutches and he's – mass turns on. How fascinating! So, you must be, then – by resolving his crutches – you must, in some way, be making him wrong. So he's defending his right to be right. This is perfectly understandable and that's the anatomy of a service facsimile.

Now, to some degree, very few cases fail to fall into this category. There are very few cases that – but most cases, the bulk of cases, are slowly resolvable. And so you settle for the slow resolution. And actually the service facts that the case has aren't directly across the auditing channel. So then we assume that only those service facsimiles that lie directly across au-

ding actually prevent a discharge or destimulation of the bank. So they're the only ones that really stop clearing from occurring.

A guy can have a lot of service facsimiles if they don't operate directly and immediately in the road of auditing. See, if the service facsimile, however, has to do with the condition of his spirit or the service facsimile has to do with the fact that if he got better something or other – if it has to do with his case; if it has to do with a – well, let's take a state of insanity. Supposing he was being right with the state of insanity. You're going to audit him, huh? You're going to audit him on any other button but this, are you? I'm afraid not, see, because there's a vested interest in insanity. What's the vested interest? Well, obviously it's a vested interest. That's all. Service facsimile, that's all.

You've got a situation going here whereby the person can only be right by being insane. I know that sounds insane, but all service facsimiles are insane just that way. So there's your whole situation laid out in a panorama. The closer a service facsimile moves in toward being right by having a wrong case, then the less progress the auditor is going to make on this pc. So the pcs whose hills are very hard to climb have service facs which lie directly across the road of auditing.

For instance, I asked myself – this is so true! – I asked myself – this is so true! Then if I have a bank at all, then I must be having a bank in order to be right, see. In some way I must be having a bank in order to be right and I almost got my head knocked off. I ask myself silly questions like that once in a while. Help you out, see? And I got – the answer was sitting right there, man. If I didn't have a bank they'd give me one! [laughter] See? So therefore, the only way you can survive would be to have a bank and then they'd leave you alone. Well, that's the type – that's the type of logic, you see, by which – by which that whole computation occurs.

There are also interesting computations, if you can't go anywhere on right and wrong, you also can go someplace on dominate or survive – the survival value of. But right and wrong is your best – your best bet. And it's always, "How would it make you right and how would it make others wrong" woven around in some way so you get a right-wrong balance in asking the question.

Now, there's your service facsimile lying across, and you actually have only these two factors involved in the state of a case. As far as from an auditing viewpoint, you only have this – they're the only factors involved in a case state. One, two, three. The case factors are: the state of overrestimulation and the possible presence of a service facsimile. And if your overrestimulation cannot be immediately and directly cured and you cannot make the case promptly and immediately Clear so you can get on with auditing them to OT; in other words you can't get the tone arm moving well so he can go up to OT, then you know at once that you're dealing with a service facsimile and that you'll have to handle that service facsimile with a Prepcheck or an itsa line or something of this sort, and your case will still get on the road. And I think we've just whipped the biggest single barriers of auditing.

One, an understanding of what is charge and what is restimulation and what are we auditing in the first place? And the other one is if you can't do this, what other factor is involved, and we've had that for years. But we now have a process that handles it and I hope you find it very successful.

Thank you.

THE SERVICE FACSIMILE

A lecture given on 29 August 1963

Thank you.

Well, let's pick it up where we left it. What is the date?

Audience: August 29th.

August 29, AD 13.

[Part missing]

Okay. Today I want to talk to you about service facsimiles. And this has a great deal to do with overrestimulation, the tone arm, the itsa line, all of this is a very neat package. And if you absorbed all of its various angles and all of its ramifications, boy, will you be able to audit! Wow!

Now, we've covered everything, actually. We've covered the itsa line and we've covered charge and restimulation, and we've covered all these various factors. And the last challenging statement I left you with was something on this order – was, if you couldn't make a free needle Clear in a twenty-five-hour intensive using Prepchecks, then you must be dealing with a rightness-wrongness computation. Must be dealing with that computation, see? One of the data on this is the fact that if a Prepcheck turns on mass, you've got it. Your pc is sitting right on a service fac on that Prepcheck subject.

Now, when we say a service fac, we are dealing with old Advanced Procedures and Axioms, and actually we are adding to the definition an understanding of something we have had for a long time. So there isn't any good sitting back and yawning and say, "Well, I know all about service facsimiles," because I'll let you in on something: I knew they existed, but I myself did not know all about them. There was more to be known about a service facsimile.

It's what the individual uses, according to the early definitions, to explain his condition. That's according to the early definition. What he uses to explain his condition or get his way in the world, and so forth. There was ramifications to uses. That was why it was called a service facsimile, because it was of service to him.

Now, let's extend this a little bit and understand exactly what this thing is. Because with that definition which you have just been given, it did not promptly surrender. You notice nothing in that definition gives you an open sesame to – how to attack this thing. How can you do anything with it?

Yes, we know this is true, but that is the end of it. So this guy has a service facsimile, of a bent head, you see? All right, what does he do with it? What does he do with this? Well, he makes – he explains how he is not getting along in life and explains all of his failures with

it, and so forth, and we know this about this bent head, but you notice that doesn't resolve any bent head.

Now, a new factor swings in on top of this and we also had the O/W mechanism and that might have ticked some corner of the service facsimile, but they don't seem to be too closely associated. But in actual fact, the service facsimile manifestation is a blood brother to O/W. A blood brother. Because it's how you make people guilty.

Now, a better understanding – a better understanding of this – many pieces of which we've already had and, I'm sure, thought about – opens the door wide open to cracking a case. So it took just this little bit more understanding. And that is, just this definition of a service facsimile: It is that condition which the individual uses to make himself right and others wrong. And the second we have defined a service facsimile as any condition or state which an individual uses to make himself right and others wrong, the second that we have done that, we open the door to a resolution of cases.

It's terribly, terribly true. The only thing which blocks the door from opening all the way, is the fact that the line has been booby-trapped in GPMs with rightness-and-wrongness GPMs. There's "to be right"; there's the right-wrong dichotomies in GPMs; there's... these things are to be found on the track, and by using rightness and wrongness, we are liable to get the individual into them, particularly if we do not use a time factor. But the use of a time factor obviates much of that.

An individual has not had a GPM in this lifetime, so we say, "In this lifetime, how have you been right or how has doing something or other made you right?" [An airplane is flying over the house and is making disturbing noises] Anybody got a fly swatter? We say, "In this lifetime, how has eating canned heat made you right? And how has it made others wrong in this lifetime?" Don't you see? And you've kept the guy from going scintillatingly backtrack. Now, in actual fact, you're dealing with sufficient power here in sufficient magnitude, that you can whip somebody on the backtrack and restimulate more than you can pick up in a long day of Sundays, if you run it with complete wild abandon. Just like you let an itsa line wander around on the backtrack, you're filling up the restimulation chamber – the... so fast that there aren't enough petcocks on it, and the seams go creeeak and the pc looks like he's going to explode.

In other words, you can kick up charge with this. All you have to do is get the pc into the GPM of rightness and wrongness and then not run the GPM and *zzzuh!* Actually the GPM has only partially aberrated this thing. In other words, it's not the reason for it. The GPM of rightness and wrongness, a goal to be wrong or the goal to be right or something like that, actually are not the reason for this situation. We're dealing now with an upperscale rationale.

Now the remaining parts of this rationale will be of great interest to you. There's survival. Now, once in a while you run into the goal "survive." You run into this once in a while. There's one about – the fifth galaxy over here, they start their Darwinian implant, and so forth, with "to persist." And you wonder where's the rest of the GPM. Well, the trick is there isn't any, and it isn't – hasn't even got an opposite side. It simply sits there as one lonely item at the beginning of the implant, "to persist." There's – not very often on the track do you find this idea. But it's mostly couched in the lines of "persist," or something like that. And frankly, at

this moment, I do not know of a single GPM that contains the word "survive" – at this moment. I'm prepared to be wrong and find one. But I don't know of one. Which is quite interesting, as you look at it there on Dianetics – you had expected Dianetics to be mostly dramatization and things off the whole track and that sort of thing. The funny part of it is, it rather miraculously escapes these at all angles. And "to survive" apparently does. Of course, I'm at any moment prepared to find one. But apparently this concept was not motivated by some bank mechanism.

"Survive," you'll find – except for "to persist," or something like that – you'll find is a relatively free highway. You can use "survive" in processing rather easily. Now it is the top scale of all of this. By the way, "live" and "alive" and other things like that, man, that'd – *heh! Hah-hah-hah-hah-hah* – the implanters never missed those, you know, "That's the trouble with you people, you are alive, you know! Oh, we got to do something about that!" Sound like the American Medical Association, you know. "An operation a day keeps the doctor wealthy!" "You might not feel good, but we can buy better Cadillacs!" You know? That kind of approach. I don't – didn't mean to make a snide remark. We should actually bow our heads and – in a moment of silent prayer over the poor AMA. Do you realize that the major insurance companies now have all of their money on the fact that the AMA will cease to exist, as a powerful entity, within five years. Why? Because they're going to be socialized. Socialized medicine is the chip on which the big insurance company has put its money in the United States and of course that finishes the AMA.

The AMA is only there to keep the doctor wealthy and the moment the doctor is expropriated, the way these foreign governments are always taking over your assets, you know, well, the doctor gets expropriated within five years. Our strategy on this is very sound. All we have to do is hold the fort, keep ourselves in good shape, keep our technical alive, keep the gun cocked and within five years there's no opposition. It will have been taken out by another of our worst enemies. I think it's marvelous! All we've got to do is hang on, hang on politely and sweetly, and so forth, over in the corner of the ring, not getting in the road of too many blows, and there's two fighters out there in the ring right now, cutting each others' eyes open, and bloodying each others' noses, and so forth, because "Democracy is going to bring medicine to the people." Democratic governments have insisted that this is their right – to bring medicine to the people. We're not quite sure why, but they're going to bring medicine to the people. That's democracy.

And on the other side of the fence, the medical doctor has decided that he is not going to be part of the government. And he lost that fight in Britain here a number of years ago. And actually, you go up and you kick the British Medical Association and push it and turn it over, look at its face, pry open its eyelids, turn it back over on its face again – it's dead, it's dead all right, but somebody forgot to bury it. And the only overt action it's taken against Scientology, as far as I know, is an occasional letter to somebody who asked them about Scientology or something like that and he says we're a bunch of quacks that hang out in Brighton. I think that's their public line on this.

And that's very interesting, because we don't use quicksilver. You say, what has that got to do with it? That's the meaning of the word "quack." It is one who cures with quicksilver. You used to see them around the county fairs of England all the time, with bichloride

mercury, and they cured things with mercury and very often poisoned people, and so on, and had a bad time in general, and from "quick" came the word "quack." And that is what a quack is, it is one who uses quicksilver. And you probably could win a suit against the AMA right this minute, by saying, proving conclusively that we do not use quicksilver! They tried to broaden the definition of this old English term. And of course, it is still itself and has no other genus.

All right, so much for that. The point we're making here, is that we have a wide open road, all along the line, here, for clearing, and with clearing goes healing. The line is opening up to such a degree, that I would suspect that the HPA/HCA of tomorrow practiced a great deal of healing. In the past, as we realize, we have not really wanted anybody to go in for healing. I've told you many times it is nonsense to go in for healing, and I'm sure you've heard me. The world of healing, however – it was not something that we couldn't do something about, we were actually being polite and courteous, and so forth, and didn't try to invade that particular sphere. And we didn't get paid for it. And they kept saying, "Why are you healing people?" And we didn't heal people and they'd say, "You dogs, you're healing people!" And so forth. And one court in Virginia they proved conclusively that Scientology was a healing science, because it cured things, and actually brought people into court to show that they had been cured of something by Scientology, which proved it was a healing science, and gave some... and I don't even think though they had the nerve to call the auditor in and sentence him. I think he remains unsentenced to this day. It was just too much nonsense, you see.

In other words, they can go clear around the line. That proves we're a healing subject, you see. Wild business. Look the length and breadth of the land, I don't think they could have found anybody who'd been healed by anything on medicine. But they were proving our cases for us. I think it's marvelous! But anyway, that restriction will be over. You today could heal in England. And as far as Australia is concerned, Australia is very closely associated with the United States with regard to its attitude toward medicine. And the Australian medical pattern is patterned directly after the AMA. But there is a great deal of pressure on, in Australia, to socialize medicine in Australia and I think that the next orders to Australia will be, "Put all possible pressure behind socialization of medicine by the government." Because it apparently totally paralyzes medical activities. It's the greatest way to have no medicine that anybody ever invented.

"Socialized medicine is good for you!" You just get a – because there isn't any healing involved with it. Doctors are supposed to have a certain number of patients and if they get a large number of patients then they draw certain fees and they can't draw any more fees than that and that's the end of that. And then they don't have to see the patients in order to draw any fee, so they don't have to work, so who cares?

You'll find, however, they're quite eager beaverish and do try to drum up a practice out beyond their socialized practice here in medicine. And you'll find out this is – they're quite active in this particular sphere.

Now these boys – these boys have a tough line and with their existing technology won't make it. Because there's always the plumbing trade. The broken leg has to be put back together again. The bits and pieces that get strewn over the highway have to be reassembled.

There's always the carpentry side of healing. It's a sort of an artisan activity. Somebody's – gets a fractured skull and that sort of thing and the bits of bone are around, and so on – well there's always... They used to use barbers to do it and so on, and well, the barber sign today just shows, "We bleed people." Why don't you startle some barber someday when you go in and say, "All right, bleed me!" Because the barber pole twisting around is a trickle of blood running into a basin and that's why that barber pole is striped that way. Phlebotomy was done by barbers.

Now, the medical doctor is straight up against it. Because the moment he comes out of the plumbing trade, he runs square in to the mechanics of the mind. He believes that structure monitors function. He believes this. He's hung with this one. If you ever want to argue with a doctor and get him going in circles, start proving to him that function monitors structure or thought monitors structure. If a guy doesn't want to walk, he isn't going to. You can do a lot, but somehow or other he'll always manage to fall down and not walk. No matter what you do. No matter what you do, medically. Now, you can go into the plumbing trade all you want to and still nothing happens, you see? These guys are up against this all the time. And when they get away from setting the broken bone and patching up the face and putting a new piece of skin on Mrs. Gotbucks' nose and re-forming the ears and physical features of criminal B, and when they get off these various points of purely mechanical handling of matter, they're lost.

Nobody on this planet knew anything about it till we came along. They had ideas. Psychology merely had the idea that it didn't do any good to cure anybody. Not only would nobody ever change, but it didn't do any good to try to cure anybody, because if you cured them of anything, they would get something else. And the psychologist has already commented upon that and so has more or less abandoned cure.

The medical doctor is infuriated by the use of the word "cure," so is the psychologist, so is the psychiatrist. They do not want to have anything to do with this word "cure." In fact there are twenty-five diseases in the state of California – I'm sure there are more than twenty-five diseases in the state of California – but there are twenty-five diseases out there which it is illegal to try to cure. If you say that you are trying to cure them or say that anything could cure them, you could be promptly arrested and slapped in the clink. This is how convinced they are that a cure is impossible.

However, twenty-two and a half percent of all the cases which come in front of you, you shouldn't be proud of. Twenty-two and a half percent of your pcs should cause you no vast feeling of pride, if they suddenly grow wings and get well. Because that's the expected percentage. If you fed them flour-and-water pills, if you patted them on the back, if you tapped them on the shoulder lightly and said, "Your name is skunk," it wouldn't matter – they would get well of whatever they have. This is this suggestion group. There's over twenty-two and a half percent or twenty-two and a half percent of the people of this planet are apparently in a constant hypnotic state. So almost anytime you tell them they're well, they're susceptible to becoming well. That doesn't keep them from getting sick tomorrow. That's something that you should realize. If a healing profession does not get more than twenty-two and a half percent, it is not doing anything. And if it gets less than twenty-two and a half percent cure, it is impeding it. Your expected figure, then, is twenty-two and a half percent. If you do a perfectly dreadful job and sock them on the head and depress their morale and kick them around and

all of this sort of thing, why, you will get less than your twenty-two and a half percent. If you do something for them, you will get more than twenty-two and a half percent. That figure is going to stay there anyhow. If you're a healer, you'll get that many people getting well. Which is quite interesting to you.

I don't know what our figure is up to. I am unutterably cocky about this kind of thing. I myself have healed so many things, accidentally and otherwise and on purpose and not for pay, that it was quite obvious that weird things would happen if a Scientologist was ever turned loose in the healing professions. Healing something is relatively easy with Scientology. But the only thing which cuts your percentage back now – there are two things – is you can't get in communication with the person – already dead, or something – in a coma or already dead and you can't get in communication with him at all. See, you understand, that would cut you back. And the other one, is the service fac. That's the other one that'll get in your road.

Now, if we allow now, in our technology, for the fact that as far as present lifetime techniques are concerned, it takes a relatively short period of time to train an auditor into them, and don't worry about making an auditor who can make an OT – let's just keep him along in that other level – he doesn't have to be a super, super, super expert to do a Prepcheck on this lifetime, let me assure you! You consider that amongst your more banal toss-away tools, you see. And if you turn somebody loose with an understanding of the service facsimile, an understanding of a repetitive process, an understanding of the itsa line, limited him to this lifetime, let him rely on the tone arm of the meter, there he'd be! He'd be practically sweeping the boards, as far as illness is concerned.

Now it's all right to say somebody has a bad back because they have a facsimile. Got an incident or an engram. All right. Now that's all right. But that's too short a look at the situation. In the first place, the facsimile has to have been restimulated for the person to have had a bad back. Just the possession of a facsimile that can deliver a bad back – if that guaranteed that you would have a bad back... and this is, of course, the one thing that the healer of the past has never been able to sort out. This guy – one guy has an experience of some kind or another and gets well, another guy has the same experience and he doesn't get well and therefore it's all random. See? Now, the truth of the matter is that having an experience which is liable to give you a bad back, is not a guarantee that you will have a bad back. That's no guarantee at all. Another factor has to enter in: Something has to restimulate that experience. Something has to bring it into being, kick it in and actually, to give you a real bad back, hold it in. You have to have a continuing restimulation of this thing to have a real bad back.

And that comes under the heading of restimulation. So not only do you have to have the incident – see, unrestimulated, this incident is going to be nothing – you also have to have a restimulation of the incident, in order to bring about a bad back. And that restimulation to keep the back bad, for a long period of time, has to be constantly restimulated. Constantly. For instance, part of the incident that's being restimulated is a girl with green eyes. And the guy marries a girl with green eyes. He's had it! Bad back!

All right. You get the mechanism by which a psychosomatic illness can occur. Now, add to that a mental aberration. Oh, there isn't one of you that doesn't have a beautifully pol-

ished, wonderfully grooved in, perfectly administered, by the best medical – I beg your pardon – by the best implanting agencies, some goal, like "to be insane." Well, why aren't you all crazy?

I ran by one the other day, I'm afraid I wasn't even interested in it. It didn't go into restimulation. Wasn't anything there. It just didn't appeal to me, somehow or another. Wasn't anything I was afraid of and it wasn't anything I was going to attack and it wasn't anything this way and it wasn't anything that way. It was likely to remain quiet for a long time, don't you see? Well, the combination of circumstances and so forth didn't include that particular one into the lineup – well, it just – it isn't even the accident of restimulation. It's what the individual feels might become restimulated. What he himself opposes. What he becomes afraid of when it is restimulated.

Because to all this mechanical activity, which viewpoint we have gratuitously inherited from the Aesculapians from all of the ancient schools of healing. Just that it's just going to be a mechanical fact, see. They're so used to dealing with the broken leg, that they say, you hit a leg – it breaks, when you set it – it heals, see. They love life to be in that mechanical action. To that we have actually added the individual. Now this is something new and strange. This is something that is unheard of. Now, the medico says, well, some people want to get well and some people don't want to get well, and sort of dismisses it. He hopes. If he ever enters into that field at all.

Did you ever stop and think that the experiential pattern of a being might itself make up an aberration? Regardless of the incident. Now, we see, we're above the level of Scientology Two, Three. This guy has lived all of his life in the vicinity of very cold winds, storms, situations – cold. All of his life. Cold. He eventually gets a certain amount of knowingness on the subject of cold. He eventually learns how to take care of himself on the subject of cold. So one fine night you throw him out into the middle of the forty-below cold snow storm. Well, one of two things will happen. He either has somehow or another maintained his confidence in his ability to handle himself with regard to cold or that confidence has vanished with regard to it and he is afraid of being cold. So at the point we throw him out, he either freezes to death or lives. See, even though we've had a lifetime of Pavlovian slaving – excuse me, conditioning – even though he has had a lifetime of this conditioning, a lifetime of conditioned reflexes, of familiarization and so forth, we can't count, at the final end of this line, whether or not he has learned to be afraid of what he is conditioned on or has become confident because of what he is conditioned on.

These factors have a lot to do with the individual. How he looks at something. You can take the same engram. Identically the same engram in A, in B, and C. You may get something on the order of, A will be terrified of it and fight it and try to get away from it and want nothing to do with it whatsoever. B won't even look at it, just skips it. And C says, "Oh! Phhh!" And that's the end of it. Now what makes the difference between these three reactions? What makes that difference? And we curve right on back to the service facsimile.

How many ways, off hand, could you use a facsimile to be right and make others wrong? How many ways? Now this guy who is terrified of this facsimile, ha, ha! Obviously lying in back of this thing you're liable to get lots of ways to be right by having this facsimile

and make others wrong by having this facsimile. This guy B, who doesn't have any reaction to it at all and just skips it, doesn't have any use for it at all. Either to make himself right or to make others wrong. And this guy C, who just goes "*Phhh*," has got another method of making others wrong: By being competent, with regard to this type of facsimile.

See the ramifications of it? There's only one of these three, then, that has no vested interest whatsoever in the rightness and wrongness of the situation. So that is always present, in any bank, in any pc, any place, it is always present that you have the rightness-wrongness possibility. Every person is slightly liable to this – greater or lesser degrees in one field or another field. Everyone is liable to this. Of the using certain kinds of injuries. Using certain kinds of actions. Using certain kinds of disabilities. Using certain kinds of inabilities. To make himself right, and make others wrong.

So this is not a selected thing, which simply goes home to one, two or three people. Now, to the healer – to the healer, this represents a very heavy barrier. Because a guy who is using ulcers to make himself right and make somebody else wrong, is not going to get well from the ulcers. Man, you can feed him full of barium meal. You can cut off his cigarettes. You can prescribe all kinds of things. You can put various type of amino acids in his diet. You can beef him up with types of refortification of his blood sugar or *sovwaal*! You know? And the guy will still go on having ulcers!

Sometimes if you're really good and he isn't watching, you get to him. See? You get to him sometimes. Even though he does have a rightness-wrongness possibility, so the occasional random cure among the rightness-wrongness things tends to set it aside as being the reason why, you see. He just wasn't looking. You know, he kept taking the amino acids and kept taking the amino acids, and by God, one morning he woke up and he didn't have ulcers. I bet it worried him sick! Did, too! Very shortly after he has nightsweats.

Why? Well, you've taken away from him, you've taken away from him his rightness-wrongness service facsimile. It's the most constant use. So what's he got to do now? He's got to get another one.

Now I told you something the other day, that wasn't quite accidentally. I gave you a joke and you might have taken it as something that was something else. I said the guy who was picking bugs off of himself – I was telling you not to worry about getting them on you. That was the joke. In actual fact, if you were to sit there and pick bugs off yourself, you'd establish a communication line with the guy. That's perfectly valid! And will furnish you enough cures of such characters as to establish you a considerable reputation! This bird's sitting there – you sit there and you go... All of a sudden the guy'll look at you and he'll stop doing it. He's somehow or another communicated it to somebody. He may take it as an itsa line. He also might take it as a mockery, he might also take it as an insult, he might take it a lot of other ways, but enough times you will have gotten through to him that you could at least talk to him.

So it's quite valid to mimic in that particular line. That has a very low level of application in the field of psychotherapy. Now it's interesting, it's interesting. But a certain number of those cases will stop picking bugs off themselves and promptly look for snakes in inkwells. So you look for snakes in inkwells and they'll stop looking for snakes in inkwells, don't you

see, and start looking for police in wastepaper baskets. And this goes ad nauseam. Now the second you would not have established the first communication line and the person would have done something else, you must recognize then, that the person has a vested rightness-wrongness interest in picking bugs off themselves. Insanity or craziness or distraction is a service facsimile. Aberrated behavior is a service facsimile.

Well, now, that blocks the line to more hopes of curing things than you could count. Because you can't ever apparently, if you didn't know about a service facsimile, you could never get a hundred percent series on any technique. Let's take a hundred patients and you're going to cure up and up along the line, and all of a sudden you have there thirty or forty of these characters standing there looking at you jut-jawed, not cured. Your first response to this sort of thing would be, "Well, that technique did not work." The wrong answer might be to find another technique. Of course it's also possible the technique didn't work, see? There's always your random factors.

Was it because the technique wasn't working? Or was it because those thirty or forty people had service facsimiles?

Now, if the technique is good, good enough, for God's sakes, to work on sixty or seventy of those people... [whistles]! Look at how far that is above that twenty-two and a half! Look how far that is! This is how you evaluate techniques and processes, by the way, you should have some knowledge of that. Look, my God, you cured sixty or seventy out of that hundred! What were you entitled to? You were entitled to 22.5. I don't know what you would do with a half-cured bloke, but there you are! Your statistics, then, are well in excess of the required 22.5 percent.

So actually, recognizing that, you would – should look elsewhere. You should look around elsewhere to find what happened to this thirty or forty. What happened to them? How come? And what you would find, if you investigated it very carefully is, being the way they were, made them right, and being the way they were or that type of were-ness, made another or others wrong. That computation sits there surrounding that service facsimile.

Now, this is apt to keep a lot of research workers running on a mad treadmill. Trying to find something that gets the hundred percent. And paying no attention whatsoever to the fact there might be something different.

Let me give you the difference of research. The medico sets up a series – he sets up usually a series of two, series of one. That's right. You read their papers when they have conferences, you'd be amazed the biggest series they'll show. "It is incontrovertibly proven, that nitroglycerin is the very, very best thing to fix up bunions. On three consecutive cases with bunions, chosen at random, over a period of eight years, putting nitroglycerin capsules between the toes..." and do you know this is good enough to cause Parke and Davis and Lilly and the big drug companies and all these blokes of one kind or another to immediately turn out eighteen billion pills, sold at a vast figure, at a vast profit. Particularly to the AMA which apparently owns the major stock in the drug companies. And the FDA, of course, which somehow or another always seems to come out tops when they pass a drug. And it was a series of three.

Quite interesting. This is very careless research on which modern medicine is built. Very careless. Series of one, series of two, series of three. They'll pass a whole operation on the basis that three people survived it. That's not good enough. That's not good enough research statistics. Because of what? Well, I don't know, maybe they were – you haven't outlawed the twenty-two and a half percent, don't you see. What'd you have? What'd you have? Three volunteers? Well, how do you know these three volunteers weren't part of the twenty-two and a half percent, and would have gotten well whether you'd done anything with them or not? How do you know that?

So it requires a long enough series to get around that factor. And when you're demonstrating whether techniques work or not, it's a series that has to be longer than... so you can isolate the twenty-two and a half percent. Because the more people you use, the less likely it is that they are members of the twenty-two and a half percent, don't you see? You got to outlaw that accidental fact, and we've very definitely outlawed it over a period of years, we've outlawed it and gone upstairs – I don't know how many cases have responded along in this particular line.

But it wasn't important to us, because we had no way to test whether or not the case was or wasn't. And the way this problem got its back broken might interest you. The tone arm. The tone arm turned out to be a very reliable measure of case progress. The tone arm's a measure of case progress. A consistent and continual, to get effort, to get results, here, there and elsewhere, on cases meant that you had to get tone arm action on those cases, and it was very carefully watched what was getting tone arm action on these cases and the negative result was the first one that turned up. The negative result. If you don't get tone arm action on a case, restimulation is the only thing that occurs from auditing.

That's a horrifying figure, you see, restimulation, destimulation or discharge. Those are the three things that are possible under auditing. And if there's no destimulation, of course, there's no tone arm action. If there's no discharge, there's no tone arm action. So when you get no tone arm action, you have restimulation. That's all you've got left. Because something is going to occur in auditing. Why? Because the auditor is busy, the pc is busy – they're trying to do something.

That's the negative look. That's the negative look at this situation. No tone arm action, you're going to get restimulation. You audit without tone arm action and you'll worsen the pc. About three sessions, he's had it. Three sessions without tone arm action, and he will become one of the saddest characters you wanted to see for a long time. The margin is only about three sessions. At the end of the third session, he feels horrible. Don't ask me how he feels at the end of the eighth. Because it would be proportionately greater, because there's more and more restimulation occurring here.

It is overrestimulation which brings about the acute amount of discomfort that the pc ordinarily claims about. If a pc is being upset about auditing in any way, if the pc's life is not running smoothly, if the pc's ability to handle things is bad off, and so forth, that all slots in to the one slot of overrestimulation. That covers the lot. You don't have to worry about whether or not he's got GPMs in restimulation or engrams. You don't have to worry about whether or

not he's got ARC breaks in restimulation with the auditor. We don't have to worry about anything except that. We know overrestimulation has and is occurring.

Which means more has been restimulated by life and auditing than is being discharged in the auditing session. All right, that was the first thing learned. And that's a very, very important datum. It's idiotically simple this datum, anybody can get ahold of that one. That's easy.

What about the additional data? What happens with medium tone arm action? Which is to say, something that would add up to, well, something that would add up to fifteen to twenty divisions of tone arm action at session ends, of down tone arm. Quantitative, see? Supposing you took every single little twitch of the tone arm that occurred in the session. Every twitch down. Of course, it's got to come back up, too. But let's just take every twitch down, that it makes, during the whole session. And let's carefully mark those down in fractions of a division – no matter how tiny they are, don't you see? Let's mark every one down. At the end of the session let's add all those up.

Good tone arm action, or excellent tone arm action, would be up around thirty – somewhere upstairs like that. Around thirty. Acceptable tone arm action will be around fifteen to twenty. And below that point, more restimulation is occurring than discharge. *Oooh!* That's a lot more tone arm action than you thought, wasn't it? *Ugh!* Horrible! My God, what are you doing to your pc? Hey, I better watch that. Stop worrying about it. You'd be surprised how rapidly fifteen to twenty divisions of action stack up, even when your pc is only getting little quarter of a division blowdowns. And if you want to really know, just pull that mathematical trick on the pc. The figures, actually, I've given you are just approximate. The estimation of how much is good, excellent, and so forth. That's just approximation.

We'll know more about this when we measure more pcs.

But that gives you how much tone arm action there was in the session. It isn't really how much per twenty minutes – that gives you a small amount. But actually if you wanted to know how much there should be in the twenty minutes you should add up all of the moments – movements down during the twenty minutes and get that final figure. And little blowdowns of .2, little .2 blowdowns, well, .2, .2, .2, .2, .2, well look, we got a division! You'd be surprised how fast these things add up.

But there is a point where an apparency of tone arm motion exists, when in actual fact only restimulation is occurring. And that's – you work on the guy and you work on the guy and it's stuck, see, oh boy, it's really there, it's right there, 4.75, you see. And you work on him and you assess and you assess and you assess and you talk to him and you work on him and you work on him and finally he finds the little lock and you get your tone arm blowdown! Hah! Finally! I got all of that tone arm blowdown!

Well, in actual fact it was 1.75 divisions. And it starts going back upstairs again and it goes back upstairs again and it goes back upstairs again and you work on him and you work on him and you work on him and down toward the end of the session, somewhere down toward the end of the session, you get this tremendous blowdown from 4.5 to 3.75.

Well, that's 1.75 plus .75 and that's the total shift of the tone arm for a session. Oh, oh, oh, oh, oh, oh! How does that – how does that agree, see, with this other figure I just gave you? Well, it doesn't at all. It's a dangerous amount. In other words, it's just sitting there. Of course the one I'm talking about, a motionless tone arm, that just sits at 5, at 5, at 5, at 5, at 5, for three sessions, your pc is darn near going to blow his brains out, man!

But you see, this was apparent – you did get a couple of motions of the tone arm during the session. So you say, "Oh, well, yes, there was tone arm – tone arm motion in the session!" No, there wasn't tone arm motion in the session! Not enough to worry about, see. It was just 1.75 plus .75 and that was the totality of the whole session. Look, you restimulated more than that. Just making him look at his bank, you restimulated more than that. That's for sure!

You're – sure enough, you're going to find at the next session he doesn't sit at 4.75, but sits at 5. It's gone up .25. More heavily charged. Now, we're going to have less – less ease of getting those blowdowns. When we get this blowdown, it's .2. *Heh!* And we get two .2 blowdowns in two and a half hours of auditing. *Hmmmm!*

Now! Next time he comes into session, we've got it at 5.25 – it's sitting next time he comes into session. And we audit him that whole session and we don't get any blowdowns at all. And tone arm doesn't move at all. Now, if you went on another session, after this, that needle's going to start sticking and if you carried on a couple of more sessions after this, this thing is going to go through 7, backwards. And you're going to have a low-tone-arm stuck-needle case. Now, if you carried on with this nonsense any further, you'd have a dead thetan. Tight stuck needle, pc at Clear read, going no place.

All this was very important data. Very, very, very important data. If that kind of thing can happen to the pc, we'd certainly better know all there is to know about a tone arm action and behavior. Well, one of the things of course that I went into and found out – I didn't so much go into this. Mary Sue got the idea that she would – kept somebody adding up all the little blowdowns, all the little blowdowns, all the little blowdowns, any kind of motion, and so forth, and I think she wound up with what? Thirty...?

Female voice: Thirty-seven, that's up and down.

Thirty-seven, up and down, which made an aggregate of something on the order of about eighteen and a half down. And that tone arm, during the whole session, never moved more than about .25 divisions. But it did it so frequently, you see. It did it so often, and actively. And that's what made the difference.

So, it is the total amount of blowdown, during the entirety of the session, all added together, that gives you what you call tone arm action. Now, I'm going to get a little pedometer one of these days, if I possibly can, every time you move the tone arm down, it cranks a little speedometer up at the top of the meter. Now, I don't know who the devil will ever make this or when it'll ever come out. But that is the – that's the ne plus ultra, see? And you mark down on your report that the pc got that many tone arm divisions.

Only in that way would we know with great accuracy what is tone arm motion. See, and then we could carry it out and finish off the whole thing, as a thing, and we could give it to the decimal. And we'd say this exact figure. When you don't get as much as that... *aagh!*

Watch it, see? And if you get more than that, why fair, if you get more than that, that's good. And this is an adequate discharge to permit us to run whole track. And then we'd set the auditor up that he's got to clock off – he's got to clock off, pretty regularly, with routine processes, he's got to clock off enough TA action to permit him to run the whole track. And then of course, somebody's going to free the needle and get none, by Prepchecking, and then, of course, never be able to go whole track because he hasn't got enough tone arm action – ya-ya, I'm sorry! That's a – I'm getting cynical, you're making me cynical, you realize that?

Now, that's – you got to have a certain amount of tone arm action in order to say that discharge is taking place and that you're discharging or destimulating more than you are restimulating. This gets very important. Because it goes into this fact now: Why does the tone arm go up and stick? Why? Is it just the pressure of overrestimulation? Hm-mm. That's it!

All right. In the presence of no tone arm action, why, why – if you have no tone arm action – why do you get restimulation? Well, that gets a bit stickier. Because you're overwhelming the pc's power of choice and therefore you're throwing up mass. Restimulation is throwing up mass on this pc. You're trying to get a discharge and the pc isn't going to let it discharge and that's what it amounts to.

Now, if you're running something that isn't restimulating the backtrack heavily, isn't restimulating new stuff heavily, isn't stepping all over the inert bank and throwing it into view, and your auditing, therefore – the type of auditing, would be present life or Prepcheck or 2H or something like that – is causing an increase in the height of that tone arm, without a consequent discharge, you therefore must be overthrowing the pc's power of choice. And to prove this, he gets more and more ARC breaky, as this occurs.

Well, somewhere, in that thin, never-never land, of border between just pure charge – there's no more significance to it at all, it's the pc is simply overrestimulated, the tone arm sticks, see? That's an easy one. Some place between that and then auditing him and not getting any further tone arm action, we move over from the simple fact of overrestimulation, over into this new field, service facsimile. And we move there, at that point, where, when we're prepchecking the pc – you won't always notice this, but it's the thirddimensional pole that stuck out of the two-dimensional plane that indicated this whole thing to me and permitted it to be wrapped up.

There's the mathematician's story about the two-dimensional worm. Two-dimensional worm, of course, he lives on a two-dimensional plane. One day, walking along on this plane and he bumps into something. And he says, "That shouldn't be," and looks kind of upset, his reality shattered, because how can you bump into something if there's only two dimensions? You can't bump into anything if there's only two dimensions, because that requires a third dimension.

Another worm comes along, a long time later, he's maybe heard from this first worm there might be something over there, and he goes along and he runs into this thing, clank! And he says, what's that? And he gradually is able to lift his eyes for a moment off his two-dimensional plane and he sees this pole up above him. And he says, "Hey! There's a pole!" And he starts up the pole. And when he gets up the pole, he doesn't know what the hell to do! That's where we get our, "Up the pole." [laughter] That's where it came from. Somebody went

up the pole. He's up there, and he doesn't know how the devil it is and he doesn't know where he is, he sure feels pretty wild and ecstatic sometimes. He's discovered something, he doesn't know what, has nothing to do with his reality. And you'll see this occasionally.

Now, this is a mathematician's – an old time mathematician's effort to get somebody to understand the fourth dimension. So he puts it into the second dimension, you see, and then adds the third dimension and then it gets into everybody's reality. The actual fact is, anything that has not been discovered operates sort of in that fashion. You find something that shouldn't be there.

And the thing that shouldn't be there is that when you are doing a Prepcheck on somebody who is a stuck or sticky tone arm case, the Prepcheck will turn on mass, or when you're doing a Prepcheck on anybody and it turns on mass, you are looking at something that is perfectly idiotic. How can a Prepcheck turn on mass? It can't! You're asking somebody how does... has anything been suppressed? Anything he's been careful of? Anything he's failed to reveal? Anything been invalidated? Anything been suggested? Mistake been made? Anything been protested? Anything he's anxious about, anything been decided? And you mean to tell me his coming up with answers to this situation, which are good, clear-cut answers, are going to turn on mass? How could it possibly turn on mass? It's not possible!

And that's the basic diagnosis of a service facsimile. Your Prepcheck buttons would easily get rid of it. But some other mechanism moves in back of it and asserts it. The pc is being right as long as he has it and is going to make somebody else wrong. And the main person who is being made wrong right there in the session, unfortunately, is you! And so, there turns on the mass! Pc is perfectly innocent of this thing.

Let's say – let's take a husband, you see, and we're prepchecking him and we accidentally start prepchecking him on his marriage. And we begin to notice there is something very peculiar starts occurring here with the tone arm. We'd notice it with the tone arm. The tone arm seems to get less action. Doesn't seem to be much action in this sphere. There's a little action, but there's not much. And then all of a sudden we notice he's looking sort of crushed or strained or something. You say, "What's happening?"

"Well, something seems to be pulling in on me. Something seems to be frightening me."

"Well, what happens there? Is – what – what am I asking about? that makes...?"

"Well, every time you mention my wife."

Ah, ha, ha, ha, ha, ha, ha, ha, ha, ha. What have we got here? Look, any mass for a thetan, is an assertion, that's wrong, man! If a thetan's wearing mass, why something's weird going on, right away, now, anyhow, although you have to go to some lengths to do something about it. The fact that it turns on during the Prepcheck shows you rather quickly the fact that he ain't going to let go of that, man! You're confronted with this odd phenomena. You got a block of ice and a hose of hot water. Now, you know and I know that if you turn a hot water hose on a block of ice, the block of ice is going to melt and that is going to be the end of that block of ice, right? Well, you're confronted with this thing, when mass turns on in a Prep-

check: You take a hot water hose and you take a block of ice and the longer you play the hot water hose on the block of ice, the more ice you've got.

Can't be! That's how you define – there must be interference with people's livingness on this particular planet. Because in actual fact, if people just lived long enough, if they just lived long enough, they would – the restimulation of life is not really adequate to keeping the whole bank restimulated. Life isn't that dramatic. Just ordinary living, it isn't that dramatic. Read all the detective stories you want to. About the only people that get kicked around in life – there are a few, there are a few activities in life which actually manage to furnish themselves enough restimulation, which on top of the interference with the thetan on this planet before he's set here and all that type of implantation and all that sort of stuff, in addition to that, is almost enough to keep it going.

Newspaper reporter, he's the leading contender. Every time there's trouble, every time there is upset, every time there is anything, the newspaper reporter is there. And where do we normally find him? We find him at a case level 7. He's only interested in his own opinions. He writes his story before he leaves the office and comes down to you to see if there's anything he can furnish – you can furnish him that will confirm his opinion, which he got before he arrived and so forth. And you find this young man, he's ordinarily all shook up, all the time, man, he's in terrible condition. And you look him over some time. It's very interesting. They only talk to you if you treat them like a case level 7. You salt your speech down with, "Your opinion of this thing is obviously..." and then tell them what their opinion is and they just sit there... They're – of course, they're in a hypnotic trance to their own opinion, so anything you say must be their opinion, see?

Aw, you shouldn't do things like this to people. "Don't cheer, boys, the poor devils are dying." That sort of an attitude. It fits in this. There's several other professions, there's that of doctor, who's always being pulled around, restimulated and whose suicide rate is higher than any other. The various activities of this kind almost furnish enough restimulation, if you start the person out with that much restimulation.

But, in actual fact, almost any other field, the bank just would go to sleep, if that was all there was. It'd just go to sleep! Give it a couple of hundred years, particularly, or three hundred years, it'd be damping out and things would be going inert with such rapidity, that the guy would get a lot better. Of course, this is all potential to be kicked in at any moment, so therefore he's in danger to that degree. But what do we have? What are we looking at here, when we're looking at this mass increase? We're looking at an impossibility. You mean auditing is going to make the guy worse? You mean mild auditing is going to make the guy worse? See, what we've asked him in essence, "Now, is there anything you've decided about your wife?" Well, we know that that will deintensify mass, don't you see? Naturally, because it pulls out little fixed attention points and having pulled those things out, the confusion and randomness surrounding them tends to ease away, see? Ah, so we pull out some of these little fixed points and he's got more mass! Well, that's because what you're doing and what he is doing are in two different spheres of agreement.

He ain't about to get rid of his attitude and opinions about his wife and you are trying to get rid of it and the disagreement in the session is enough to turn on that mass. His atten-

tion – his intention is to hold onto it for billy-o's sake! And your intention is to get rid of it, so you and the pc are in completely divergent agreement with regard to this whole situation. He's sitting down there, not to resolve his marriage. And you start addressing his marriage, he isn't going to resolve his marriage. He's not sitting there to resolve his marriage. He's sitting there to make his wife wrong. That's his only purpose. He has no other purpose. And don't think for a moment that he does have! No matter what he says, he's just trying to make somebody wrong. Now, it follows that any thetan that has been hit hard and consistently and continuously, has had loses continuously and who has tried to get back at and attack continuously any zone or sphere, will be unable to put in the itsa line on what is attacking him.

He can't say what it is. And that's actually all there is to this whole mechanism I'm talking to you about. Can't put in the itsa line. He can't say whether it's bad, he can't say whether it's good, he can't recognize it or something like that. Maybe it was emanating too much. He doesn't feel he has the power to look back along that communication line or be at cause over that communication line, in any way.

Now, a thetan, to be sane at all and to have any reality at all, has got to be at – some degree at cause. Now when he goes down scale his final method of staying at cause – this is present all the way down scale, but remember it's only when it becomes a final method that it becomes horrible – is to be right. And for the other person, to be wrong. And this goes on down the line to a point where he simply has to – to make them wrong – he simply has to hold the concept that they are wrong. And to be right, he simply has to realize that he is right. And the final effort of being right and wrong on the thing is just to have the idea or concept that one is right and the concept that the other person is wrong. And he is still being cause.

His target is a thousand light-years away and has been dead for trillennia. Don't you see? He wouldn't even know when it disappeared. That's one of the laughable points of it is. He wouldn't even know if he'd ever succeeded. Because he can't observe it. It isn't there to observe. So this particular mechanism hangs out in life as a sort of a side panel to it all, because it can never as-is. He never knows when they disappear. He never knows when they go away.

You could take some old lady and haunt her house for days and days and weeks and months, and so forth, and then not haunt her house. And she's liable to go on for years, being sure the house is being haunted. You understand? You – you get how this mechanism comes in?

Well, it's because she never saw anything that was haunting the house. And she couldn't have gotten back at it in the first place, so there is no method of inspection of cessation. How do you inspect the end of everything? How does it end? How do we know it ends? Do you know there are Japanese soldiers left out in the Pacific, who still think that World War II is in progress. I'm absolutely sure of it. Because they were finding them years after World War II, up in caves and so forth, on South Pacific Islands and they just knew what would happen to them if they were ever captured and that sort of thing and the war had been over for ages! And there they were, up in the woods.

They were haunted by a nonexistent thing, in other words. Why were they? Well, because they didn't have the communication line to ascertain a cessation. They couldn't ascertain

that it had ended. So if they couldn't find out if it had ended, the right survival action is to assume that it is continuing. So, one answers the problem of survival best, in that particular category. There's many a guy who has been missing the top of his head. Many a guy – top of his head went missing, because he assumed that the enemy over in the next gully had pulled out. So he looks. And there went the top of his head, you see?

Now, life can teach you this lesson – rather consistently and continually. So eventually, you develop a little more cautious frame of mind with regard to these things, you eventually come up with this solution to those problems. *That if you cannot ascertain if anything is ended, you then assume it is continuing.* And out of this you get this wrongness-rightness thing going on for trillennia.

In the first place, the guy went back into – through force and overts and other things – he went back into only being able to be right about this thing. He couldn't do anything about it, you know. If you want to really start a cacophony, ask somebody in one of these modern socialistic countries, how they have been right about the government. You're liable to get automaticities. But you say, these people don't ever think about the government. I know they don't ever think about the government. No, they don't do anything to the government, no, they don't have anything to do with the government. They're supposed to vote once in a while, but less and less votes are being cast per capita. That's the final thing they could be about the government, is right. That's the final thing they could be about the government.

Look at the fantastic things they would have to do, in order to have the government be wrong. Look, look at them, man! They're legion! And they'd all be aberrated. Why? Since the government today represents fantastic force! Fantastic quantities of force are represented in the powers of government. So much so that the leading heads of government today tell you that no population can revolt. US – top gun in the US not very long ago was holding forth at great rate on the subject. I think it was Lodge, Henry Cabot Lodge, and he was holding forth at a great rate on how no modern population could revolt in the face of the weapons which were available today in the hands of the government.

What is he talking about? He's talking about raw force, isn't he? The more that force goes upstairs and the more – and less and less able that populace is, to ever reach back, in any way at the government or to be cause over that government, you see, the less, so forth, why, the more they have to go into aberrated rightness and wrongnesses with regard to the government. Until they finally get down to some of the wildest things you ever heard of!

And you'll find people walking down the street, and they spit, on the street. And that's their one channel of action against the government. Because it's against the law. How could they be right about the government? They could spit. It's irrational, see? It – listened to in that line, it becomes totally incomprehensible to the auditor. How this could, any way, shape or form, add up to a logical answer of rightness and wrongness. And that is why it is aberrated and that is why it turns on mass and that is why a Prepcheck won't do anything with it. Because it's totally irrational.

Now, how do you establish this? Well, actually you could establish it with the preliminary step of R3R. You could establish what they're being right about; what they're being wrong about. You could take your original listing steps of R2 – R2-12. Don't do R2-12 on

pcs, by the way, it's dangerous. But you could take the original listing steps of R2. You can think of innumerable ways to establish this sort of thing. You can say, "What have you been trying to solve in processing" This is another totally illogical approach. "What have you been trying to resolve in your case in processing, Mr. Smith? Very good. Oh, you've been trying to resolve the fact that you have ringing in your ears? Thank you very much, Mr. Smith. Now, let's see, how many hours of processing have you had ringing in the ears?"

"Well, let's see, I had a twenty-five hour intensive in Washington, I had fifty hours in London. Then there was a private field auditor who gave me a hundred and seventy-five hours, and that didn't do any good either, *heh, heh*, no, that didn't do any good. And then we had numerous other processing and there was a lot of Group Processing and that sort of thing and I tried some 'Subub,' too and that didn't do any good either, and so forth. And I've been under a doctor's care for some time now, with this ear ringing, and so forth, and just nothing does it any good."

He has given you the whole song, bell, book and candle, so help me! He's told you that the ringing in his ears is, or is associated with, a service facsimile. What is the rationale? It is a service facsimile because it didn't surrender to processing. Didn't surrender to mild processing, so it must be a service facsimile. I mean, the – you will be lead astray, in two directions; assuming that everything is a service facsimile and trying to run everything on rightness and wrongness and the other way is just assume that nothing is, because it is all so reasonable. Well, he's got it all explained. Actually the first auditor he had over in Washington was mean to him. And the next half a dozen auditors he had, they didn't understand him. That was obvious. And we didn't have the technology at that particular time.

You see, you can be logical about this whole thing, you can go on and on and on. You can realize all of this. You can figure it all out. But all I ask you to do, is just look, head on, at that one fact: Has the guy been processed on it unsuccessfully? Or is it something he wanted to resolve in processing and never seemed to be able to resolve? And that is your total diagnosis of a service facsimile, from an auditing point of view.

Now, you can diagnose it in numerous other ways. You can use the medicos for a diagnosis. You say, "What have the medicos treated you for, bud?"

"Uhh, kidneys – kidney trouble, *ne-ho-ho*. Didn't make me any better, they operated and then they put in two new kidneys and then we have a couple inflatable life tubes now, back there, and so forth..."

You can use this, don't you see? Now, you have to vary the wording of it, so that it makes sense, like – what is it, his health, sometimes it takes a broader word than "kidneys," you see, "being sick," "being unable," and so forth. One of the ways of doing this would – "What would be a method of making others wrong" and he will sometimes give you on a list of what would be a method of making others wrong, he will sometimes give you the exact thing that he is making others wrong about and you turn the process around and find out how he is being right with it. Which is the missing side of it, don't you see.

Now, I'm not pretending that – to give you at this particular moment a complete diagnostic system by which you could always determine the service facsimile. This includes other things such as the Hidden Standard and other things of that character. I'm not trying to give

you such a system at this moment. I'm simply pointing out to you the basic mechanics which underlie this thing.

The O/W sequence falls hand in glove with this, because of course, as I will tell you in another lecture, make-guilty is something we've known about for a very long time and which plays its role in this. But your right-wrong characteristics and factors involved on it are very useful and very usable.

These are survival mechanisms, whether they realize it or not. And if you can just look at them as survival mechanisms, and not expect them to be sensible survival mechanisms, why you can crack almost any case. If you go around insisting that every survival mechanism be sensible, or workable, then you're not going to crack a lot of cases. And you're going to find that there's some weird ones sitting around and they sit around on these buttons of rightness and wrongness. Fortunately, there are only these buttons that would really aberrate a human being, then.

There would be survival, domination, rightness and wrongness. And, if those buttons were not contaminated in any way, why life would be a dream for an auditor. But he, of course, has got to run... some broken field running in here, against the backtrack implants that contain the words "right" and "wrong." And he's got some other things to worry about – he could use time to get around these things. He's got other mechanisms to use to get around these things. But it's still a liability processing very directly on the thing.

So, at the moment I would reserve rightness and wrongness for the extreme case that doesn't immediately surrender and go down toward fast tone arm action and good tone arm action on Prepcheck, and destimulate rapidly, then I would get very interested in what part of their case, or maintaining themselves in an aberrated condition, is a service facsimile and resolve that and get back to standard processing.

We're not trying to ride a hobby horse here, whereby all processing becomes the service facsimile, you see that often – too often happens. What we are doing is simply giving you a weapon, whereby if a case gets difficult on you and you're doing all of the usual things for the case, and so forth, and yet the tone arm does not come down and level out, then you had better go into an examination of this case from the viewpoint of a service facsimile, and you will find out, and the case will agree, that there are several reasons why he must not get well!

And when you crack through that, of course, your technology goes through it like hot butter and you get the remaining thirty or forty percent that you were looking for. Okay?

Thank you very much!

R3SC

A lecture given on 3 September 1963

Oh, you're in for today! I wouldn't have applauded like that. *A-ha-ha! Blll, bmmm.* Bad business. Oh boy. In for it today. Wow! Can't you manage look scared? What's the matter, don't you believe I'm mean? Ah, I'm afraid you know me too well. Anyhow, what is the well-known date?

Audience: September 3rd, AD 13.

3 September AD 13, Saint Hill Special Briefing Course. And we have a lecture on R3SC.

Notice, Mom, no hands. [laughs] No papers, no notes. Cold, like that!

All right. Now, once upon a time we had something called a rock slammer. You remember the history of a rock slammer?

Audience: Mm-hm.

All right. You did a Scientology List One, which is not the L1 in that bulletin, but the old Scientology List One. And what did you find in this? You found that occasionally as you went down the line you picked up a tick, and when you put in the big mid ruds on that particular tick, you all of a sudden got yourself a nice, handsome rock slam. So you say "auditing" to somebody and you got a rock slam, right?

You remember this technology? Well, this meant that something was going to go wrong in the vicinity of auditing with regard to this person, by reason of aberration.

Now, of course, punitively, punitively, we said at once all rock slammers were bad, and they all ought to be shot, and so forth, until we found out that practically everybody rock slammed. [laughter, laughs] And then, of course, we had to come off of it. [laughs] But that isn't all that we came off of. We just dropped that piece of know-how in the mire and let it lie. You notice suddenly we weren't saying anything about that at all.

Well, that didn't mean that I forgot it, completely. That didn't mean that it was utterly gone as far as I was concerned. But I had seen some phenomena which I definitely had to straighten out. And that phenomena had to do with the reason a person doesn't recover under auditing. Now, that's the whole department head; that heads up that whole department: the reason the person doesn't recover under auditing.

Now, this has been with us, actually, since 1949, 1948. It must have been present then. I didn't run into it head-on until about 1950, and it became very crucial in 1950. One of the

reasons this would peak up is that in the type of auditing which I was doing in 1950 there was a great deal of slippiness. A lot of it was very slippy. And there was a lot of this and that would work its way through, and you didn't have a hard, tightly bound process, you see? And as soon as you got a tightly bound process that was limited to running of engrams, you ran into this phenomenon of people not getting well.

So again we have run into engrams and again we all of a sudden come up with this interesting datum – but not for the same reason – of people who just don't recover.

Now, in my catalog of things to be done, this business of rock slammers and reasons why people didn't get well continued to ride right along there and take a prominent position in looking over all new things.

And all of a sudden I collided with the old service facsimile. But the collide was rather oblique. And the way we collided with that was by a study of the tone arm, the necessity to get tone arm motion and the various positions of the tone arm.

Now, all of that material which you've had in a recent lecture – very germane to this. It became obvious that if an individual were audited for three sessions without tone arm action, he got into pretty terrible condition. Bad. Bad show. Bad show. Therefore, you had to audit with tone arm action.

I don't say he fell to pieces, but he just wasn't feeling well – he didn't feel so good. You'd find his session goals became gloomier and gloomier. In other words, you could predict any time that a case was going to feel not so good by noting that he had no tone arm action during the session you had just run. And this I tested out. And I tested this out. I watched it, coordinated it and so forth – no vast series of cases but that wasn't necessary. I had a considerable background on all this material.

Now, there we are – person gets no TA action during a session, person doesn't feel so good. Three sessions – they feel pretty wog. No TA action. So we mustn't run without TA action. So it became very, very important to find out what was stopping TA action. And there are several reasons why TA actions stop. Many of them... the basic reasons are still those; all the reasons I have given there are very valid reasons. But they fall away from the very high theoretical to the very easily applied practical aspect of it. And the practical aspect of it indicated just this: that an individual would release charge or an individual wouldn't release charge. And that's about all it came down to.

Now, that you are getting – now get these slight divisions here – that you are getting tone arm action does not guarantee that your pc will feel better. Now, that is one for you there. Doesn't guarantee your pc is going to feel better. But getting no TA action guarantees that your pc is going to feel worse.

Do you see that, see? So you haven't got quite a yes or no. Now, why the individual who gets TA action doesn't necessarily feel better is contained in restimulation and over-restimulation. The individual is overrestimulated – the restimulation is too high and yet the charge is still releasing. Now, that's quite interesting there. You've got maybe fifteen sources of charge that can be released, and they're all in restimulation. And you're only running one of them, so you're releasing charge off of that one.

Let your pc's attention wander off of what you are running and you instantly have added more restimulation to the case. All you have to do is be a clumsy auditor at Level IV auditing on the itsa line and you've had it.

Now, let's grade up auditors here – let's grade up auditors, just in passing. I: Well, we just leave it on accident whether the guy gets TA action or not. We hope he gets TA action, see – Class I. We just hope he does. And it's not going to endanger anybody very much because the fundamental questions that they're being asked are very un-fundamental. They're being asked how they cured their lumbosis or something of the sort. All right, so they don't get TA action. So the guy gets a percentage of wins and he gets a percentage of loses, and we just hope the percentage of wins that the auditor gets at that level are greater than the percentage of loses, and that he doesn't get discouraged about it all, and so forth. We just hope, you understand? Because frankly, at that level of training, we can't do anything else. See, it's – look at the amount of technical material which goes into this and you see at once that it's too formidable. This guy would go on – he'd have to go on for months or years of training before he would come up to being able to cope with that situation.

Well, it's a very small price to pay. Because the funny part of it is, now, with the itsa line, we can take that chance very nicely and come out with a great deal of percentage of wins. But you recognize that the auditor at that level is taking that chance that he's going to run some sessions without TA action. He's going to listen to a lot of natter and he's going to listen to this and he's going to listen to that. And he's going to get a certain number of service-facsimile-type cases that don't get TA action, you see, and he's not going to get any TA action. And this isn't seriously going to put somebody in the hospital or anything like that, because the process isn't that strong, don't you see? But it's going to be the guy just doesn't really think auditing is getting him anyplace; that sort of thing, you know? And he just feels gloomier than he would ordinarily feel, and so on.

Well, what's happening with all this? Well, we can't expect at the level of training of Class I for the auditor to be able to remedy it. And of course the second that you, instructing auditors and so forth, come back to remedy this situation, you are no longer operating in the zone or area of Class I and you are actually trying to make a Class II Auditor. So you see, that still stays with the definition.

You start saying to this guy – the moment you start saying to this guy, "Hey, for God's sakes! Read those rules, man, read those rules in that RIC. Read 'em! You're asking this person for problems, problems, problems – what problems have they had in life? And what have they been trying to solve in life? That's a backwards question, a backwards question, man! Of course that TA is going to stick." You know? Well, you're working on Class II, see, straight away. See? So, you see, the condition still remains as it is in Class I, which is a relatively un-instructed auditor.

All right. Now, we move up into Class II: we get "with tone arm action." And the way we handle it there is actually not with the change and shift of processes, beyond just altering the question a bit. But we get listening with tone arm action, and that means that a certain amount of direction of attention is going to have to be done, even if it's just directed by the question that is being asked. "What have you done about your lumbosis?" See? Now, he's

supposed to know the rules of what not to ask, and so on, and to get TA action, and he's got some various ramifications there that are pretty good.

And he can do some things in this line, but it's very light attention direction, don't you see – very light indeed. In fact, we don't even instruct him to direct attention; we rather tend to instruct him not to direct attention. For instance, "Don't drop the E-Meter," you see?

All right, we get up to Class III and what have we got? What have we got at Class III? We've got a direction of attention at Class Level III toward service facsimiles and the state of Clear. Now we're starting to drop out this endless, wandering itsa line, don't you see? We're starting to clip this guy for letting the pc's attention wander off too far into other subject matter. We're supposed – that auditor at the level of III is supposed to be able to control the pc's attention to keep the pc's attention on what the pc is supposed to be talking about. We get – the limitation of attention is what enters in here, see, to some degree. We start telling the fellow, "Now, don't let this pc start wandering around on the early track. And don't do this and don't do that; and keep the pc's attention centered on what you're trying to run and don't let the pc's attention wander over into his environmental restimulation. And if it is there, clean it up with 'since' mid ruds." See, at this level we're using mid ruds; we're knocking down environmental attention. We're paying a lot of attention to the pc's attention at Class Level III.

Now, that control of the pc's attention is at a very high high, you see, there at III. That's pretty high, now. This pc is really being put in the groove. This pc is supposed to talk about A and B and his attention is supposed to be freed up from C and D so that he will talk about A and B. You get the idea? In other words, here's control – control of attention here is getting rather heavy. That's fine, has to be.

Now, let's take Class Level IV: Man, you're living with the lightning now. You've got this pc on a backtrack. You've got this pc there. You've got him on stuff that is quite overwhelming. All he has to do is skid around inside the GPM. All he's got to do is say "Let me go back up and pick up those two early items that we missed." *Zzzzzp!* – and he throws forty RIs into restimulation. Why? Because he had to walk through forty RIs to pick it up that are only – you see – that are not properly discharged. All right, that isn't so bad, you see?

"Let me repair – Oh, I see what this item is. Let me repair it in the earlier goal." And then, much to your embarrassment, you have missed a GPM between these two goals, and he returns up to the earlier goal and throws a whole GPM into restimulation, consisting of some 230 items in the Helatrobis. *Eeerk!* Look, you're walking across Grand Canyon on a wire one millimeter thick.

Now, if you see the various classes in terms of expertness of control of the pc's attention, all will start to make sense to you on the subject of these classes. If you only see these on the complexity of the information the auditor has, auditing will not occur. Oh, well, yeah, you know all about GPMs and you know all about engrams, you know all about processes, you know all about this and you know all about that, and therefore you're Class IV. No, no, no, no. There could be that one element missing – that one element missing – control the pc's attention with expertise – and you would not have a Class IV Auditor.

Now, you start letting a pc talk, you start putting in the itsa line on the backtrack. *Ha-a-a-a-a-a-a!* I've done it myself; I know exactly what I'm talking about, because I've got a

good subjective reality on that sort of thing. "Hey! I just had a cognition. There's a this and a that and a tho and a thee, and down there in that engram there's a spot and a *bolp* and a *bo...* oh, my God!" *Bow!* The roof falls in. You got the idea? Suddenly throw into restimulation fifteen or twenty chains of something, see, just with a nice cognition. There is something earlier! Zoom! See?

Now, the auditor in that particular case wouldn't even have time to open their mouth, you know? Pc is sitting there in a brown study. You think he's looking over the next RI, you know? Pc all of a sudden says, "I think this came – I think this came from – Yeah, there's a – there's a GPM there about eighteen trillion years ago. Oh yeah. Oh yes. There it is. And it's there and there, and that fits into the other two and it comes up to here. And then that is what gives you the background music of all that – *uh-uh-uh*. What's the matter with my throat?" The auditor actually doesn't have time to say a word.

Now, how does that situation take place? That situation takes place when the case is already overrestimulated – greasy on the track, attention hard to control. Greasy on the track. Now, if this pc is quite a bearcat, he will go right on getting tone arm action but very uncomfortably. He'll go right on getting the tone arm action necessary to resolve the case, that's for sure. But he's running in an atmosphere of exhaustion, of worry; misemotion comes up here or there. In other words, he's a bit overwhumped all the time. You see, you've gotten up to the point of overrestimulation, and with this overrestimulation now in progress, you are still discharging things. Do you see? Case still runs but the case isn't comfortable while running. Case will still make it, but doesn't feel like he's getting many auditing wins, see? Awful hard grind. Spends most of the time between sessions in a fog, don't you see? Case still making it and tone arm running.

Now, let's add this other liability. Now, you see that we've gone over some difficulties here. Now let's really clobber it. Let's say that this case we're doing this with has a fragile tone arm to begin with, which is susceptible to being stuck low or stuck high or stuck dead thetan. Let's add that liability to all this other complexity.

Now, what do you think is going to happen? Well, the auditor is going to spend all of his sessions worrying about the pc, and the pc may or may not spend any sessions worrying about auditing, or between sessions, but just going around being *blaaah*, or having a bad time or being very nattery or something.

But the auditor is wild. Auditor is trying to get tone arm action, trying to get tone arm action. And he keeps looking. He comes back into the session. He finally got tone arm action in the last session. Oh boy, finally got it. He got four blowdowns of one division in the whole session. Oh, that's fine. That's more than he'd seen for a long time, and so forth. And he comes back in; he got this pc halfway through a GPM, don't you see? Now all he's got to do now in the next session is pick it up and finish it and that means – you know, was getting tone arm action, more tone arm action, and you run some GPMs, you know, and you get tone arm action. That's obvious, you know, wonderful. That's obvious, and so forth.

And he comes back in, and there's the tone arm. "What the hell? Well," he says, "something must have keyed in between sessions. Something must have keyed in. This tone

arm is sitting here at about six and a half. Something must have keyed in between sessions. All right. All right. Something keyed in between sessions. All right.

"Since the last time I audited you – now, when was that? When was the last time I audited you? Last time, last time now? When – when was that?"

Pc finally thinks and thinks and thinks and thinks, and finally remembers. No tone arm action.

"Now, since the last time I audited you, has anything been suppressed?" There it sits. Right on down through all of those buttons, there it sits. Pc tells you all sorts of things, but there it sits. You say, "That's obvious enough to give anybody tone arm action," but there it sits! Horrible!

You say, "Well, if I can just finish off the rest of this GPM. Now, in this session, if I can just finish off the rest of the GPM." You say, "All right, now let's pick it up at the last item where we left it," and so forth.

And the pc says, "Last item? What – what's the last item?"

"Well, that last item. It was 'absolutably coughing,' you know," and so on. "Let's pick it up."

And the pc says that and then the needle doesn't twitch and nothing happens and nothing moves, and... You realize suddenly that if you stay there any longer, this pc is liable to do an around-the-clock and go into maybe a low-tone-arm case, or something like that. You realize that you're looking at something here which can't hold, because you're getting absolutely no discharge at all. And you hit the silk, and you get out of that. And you say you're going to put in the itsa line on auditing or you're going to do a Prepcheck on auditing or you're going to take anything that you've had as a good way, you know, to key off the case, and so forth.

Now, in this particular case we're talking about, this tone arm here, is – let us say, is gone at 5.75. So you say, "All right, we'll just destimulate the auditing. That's easy. Just destimulate the auditing and we'll get tone arm action back, obviously." So we say, "All right. Now, on auditing, on auditing, when was – well, how many years have you been audited?" or something like that, or "How many months? ...has anything been suppressed?" And of course you get the same story as the "since" mid ruds. There it sits at 5.75 – no tone arm action. The restimulation is now too great to permit even the discharge of the key-in. That's what you've run into. In other words, you're running this case downhill on a toboggan. And it all traces back to what?

Now, you see, this is quite a problem I've outlined to you here. And I see from the looks on some of your faces that you yourselves have had something like this problem. Now, the resolution of this problem is therefore pretty gargantuan. And that's what – just to get it all in line – that's what's been resolved with service facsimile.

Service facsimile, in actual fact, is not an accusative thing. It is simply a solution that the individual has himself so restimulated that it won't discharge and nothing will discharge past it. In other words, it's a solution that is so valuable, so survival, so magnificent, that if one got rid of it as a solution, one would, of course, perish at once – like a wax effigy, you

see, would just melt right there, you see, and be gone. Too horrible to contemplate getting rid of this solution. Actually, it is simply an overcharged solution. That is all it is.

Now, how does it get so overcharged? Well, it's because the pc is restimulating it. It isn't being restimulated by life. There's volition going on here. The pc himself is keeping this thing kicked in.

This girl has life solved, has life solved: Don't eat. Every time the boss is mean to her, something like that happens, "Well," she says, "I don't have to eat. That's the good, sensible solution to the whole thing. Therefore, really, I don't really need a job; I really don't need anything."

The husband, he's a little bit mean, nattery and upset some evening. So she says she knows what to do about this – he don't eat. Dinner accidentally burns or something like this, see? And one of the children gets upset, something like that. Well, she knows what to do about that – kid just won't eat, that's all. That's it. He's had it, see? And all of this is so complicated and so filled with ramifications that it actually has become a survival computation. And it sits there. It sits there like a mountain rising out of the plain or a dam across a river, and no charge can flow by it. Because if charge were permitted to flow by it...

You see, the difference between our rationale, and so forth, is we know people do things. See, it's not on the automatic, push-button type mentality of Pavlov, you see, and Wundt and the rest of these birds – gents – jerks – fellows. Push-button mentality, you see, so that it's always caused by some mechanical thing. No, there's also a being there. He's also up to something, and that's the further complication, don't you see? The person can do something, you see?

Now, if you tell somebody that the survival computation is "not to eat" – if you told somebody else – they'd say, "You're nuts!" But not – not this one. See, that is the survival computation. Well, naturally, it's aberrated, but unfortunately for this being, it works. Hubby always gets in line; the kids always shut up. Don't you see? And she can relax enough about her job or doing what she's doing, so that by saying "Well, I don't have to eat," you see, that actually that sort of – she stops attacking in that zone and sphere. And it actually has some weird, backwards, upside-down survival computation, see?

So what it is, is a non-survival solution which has become survival. And it doesn't make sense – not even to the person, when they begin to take it apart. It really doesn't make sense, but it appears to make sense. It appears to make sense. And that solution can become so fixed in the activities of the individual that the individual feels that if it were disturbed in any way, life would become unlivable. And this can be a pretty batty solution.

You maybe are looking at a service facsimile when you look at a suicide type of thing: The way to live is to dive off the top of the Empire State Building, see? Now, you say, "That's nutty." But the funny part of it is when you run it, if it weren't so pathetic, you would probably be able to sit there and just almost ruin your stitches, because this – it's wild! I mean, how this thing works out. I mean, the way the put-together, the A=A=A and the disassociate and so forth, of this is so – so fantastic.

And very often in the early stages of it, the pc will sit there and they give it to you with such a straight face and with such a solution to the whole thing and, "Well, yes, obviously. Obviously, the way to cure a fear of height is to fall off the Empire State Building," or something like this, you see? It'd be something fantastic. Even that's too sensible.

But what it is, is a solution which has become fixed and which the individual is actually working with. And maybe they've been overwhelmed by this solution – it's explainable in bank terms, too – but the individual keeps that chain or channel in restimulation. And then you start to audit the engrams of this thing, and all the individual sells you is "bring up more engrams of this thing," but oddly enough they won't erase.

And this was another source of search. The other source of search, of course, was why do some engrams erase and some engrams not erase. That is an old, idle datum – been kicking around for a long time. Some engrams grind out and some discharge. Why? Some pcs turn on mass when you prepcheck them and some don't – mostly don't – but some do.

What's with this pc who does? What's with this pc who can't erase this particular engram? You go over on the left and right of this engram channel and you can find engrams that will erase, but the pc never gives you those – they only give you the engram channel. That's because they're obsessively restimulating this particular channel in the bank. They're obsessively restimulating it, because it's survival to have that. Therefore, they will sell you as the auditor that particular channel if it is a service facsimile, because their penchant is to keep it restimulated. So they always sell you that channel.

And then you, you knucklehead, you going to run it out, man. Why, you've picked – if that person is a service-facsimile case, which – not all cases run this way, fortunately. Unfortunately for us, many cases run quite easily and smoothly without any of these complications, don't you see? In fact a little more than half of your cases will run smoothly, without these computations.

Well, that – that makes it bad, don't you see, because then you're unable to understand this other percentage of cases that doesn't run smoothly, see? So you say, "these techniques work, but on some cases they don't work." Well, therefore, you have to bring the broad line of restimulation and so forth. Aberration is always of some use. At some time or another anybody's aberration on any subject has been of some use to them – always. You can trace it always – you can trace it back. It's been of some use. Otherwise they wouldn't keep mocking it up. But it normally doesn't amount to this fixed service facsimile level crash, you see? And it erases, and it handles up, and the guy cognites on it, and it straightens up, and all that sort of thing happens.

But on a service facsimile none of these things occur. The engrams don't erase, the prepchecks don't work, the tools of the game are suddenly null and void, apparently, unless you know this little, secret channel down through the middle of it. And that secret channel is advised by any tone arm trouble – that doesn't mean that for a quarter of a session – since you always get the top of a GPM almost always early on in a case, you're going to find the tone arm hung up high or something like that. The tone arm normally will hang up on the first fifteen, twenty items of a GPM and then suddenly loosen up and tone arm action restores. That's on a Helatrobust-type GPM. In the first stages of hitting a GPM, you normally will get a bit of

a lockup. That's beside the point. That's just a point in the session where the thing locks up. No, we're talking about the case that gives you trouble with a tone arm, the case that is a dead thetan, a low tone arm case, a high tone arm case or a case whose tone arm hangs up at the drop of a hat.

The full, complete diagnosis of the case is done with the tone arm, not with how loopy they're acting in life. I think anybody on this planet is acting loopy in life, see? If you put it up against survival standards, you'd find it was very non-survival. You cannot be human and be right. So there's no reason at all to try to trace it back, analytically, or medically – psychiatrically – say he's got schitzobonga, or something, you see? There's no sense in any of this. This is all for the birds. There isn't any reason to do it off of a graph. There isn't any reason to do it off of any of your tests. Nothing. The only place you'll really see this is by putting the pc on an E-Meter, and then, if the pc's tone arm looks all right, running the pc awhile to see if you run into the trouble.

You see, you could even be fooled – and some of you will be – by a dead-thetan case that merely has a Clear read and a tight needle. Maybe the person isn't a dead-thetan case; maybe they're just sitting in the middle of a bump of some kind or another that's got the needle slightly tight. And you ask them one question and you practically have a free needle, see? Needles change in their characteristic. This may be hard to analyze, but that's the only state that is hard to analyze. The low tone arm, the high tone arm – the second you put them on the meter – the low tone arm, the dead thetan: definitely, always service-fac case. Dead thetan: service fac. Bang, bang. That's all.

This person cannot get discharge in life. In the process of living he discharges no aberration. So living is a very, very aberrative thing to him. See, he's right up against it there: there's no accidental discharge of anything. Give him a birthday present, he doesn't say "Hey, what do you know!" you know, and his tone arm moves, even though you haven't got him on the meter, see? No, nothing like that ever occurs. This guy's tone arm is fixed all the time, all the time, all the time, you see? Always fixed. And as he lives, he just gets unhappier and unhappier; life becomes crueller and crueller. And eventually he becomes a newspaper reporter, you know, or something like that.

It's a very weird thing how many newspaper reporters I've seen who're dead-thetan cases. Restimulation of life is too high for their level of understanding.

Now, the low-tone-arm case: definitely service facsimile. All you have to do is put somebody on the tone arm, see it's got a low tone arm, See it's hanging down below 2 here – nah, service facsimile. That's it. See? Diagnosis right now, bang. You just know.

High: questionable, but probable. You can question it, but it's probable. But you just accidentally put somebody on the tone arm – you just put somebody on the meter and you find his tone arm is reading high, that's enough, see: service fac.

Now, case down here at 3.5, 3.75, something like that, with a fairly decent needle and so forth: some possibility still exists that this is a service-facsimile case. So it goes from some possibility still exists to maybe/maybe not but probable on the high tone arm case. Low tone arm case: yes, yes, yes, yes, yes, yes – nothing else. Dead-thetan case: well, you're lucky if

you can get them to talk to you long enough to give you the service facsimile. Definitely service-facsimile cases.

So any difficulty with this tone arm – any difficulty with this tone arm... Now, I'm talking about tone arm difficulty; I'm not talking about difficulty with a case. You know, difficulty getting a pc into things and difficulty getting them out of things. And you can have a thousand different things that could be difficult in running a case. Well, just – it's just difficult to run cases. That's not diagnosis. That's just a banality.

Oh, this guy, every time you let him anywhere near the backtrack, why, he all of a sudden starts picking up things at trillions-eight, then there's one at trillion-thirteen, and then there's one at trillions-six, and so forth. Yeah, you have trouble with this guy. You have trouble limiting his line, getting him into something and so forth. Well, the case is simply overstimulated. You could use this same technology and possibly hope you could find a service facsimile on him to cool it down. Wonder why this stuff doesn't bleed off faster or why the case restimulates himself to this degree – maybe it still lies in the realm and zone of a service facsimile, you see? Possibility that it does. It's worth scouting, worth scouting.

But all these troubles I'm talking about are troubles with the tone arm. Anybody who's got a troublesome tone arm, has given you a bad time, won't move enough, gets stuck in these three positions with great ease – no, man, you're looking at a service-facsimile case.

Now, what you're doing is looking at the normal river of discharge blocked up with a great, big, high stable datum – "horses sleep in beds," see – with this slight trimmings: He knows that if he gets rid of this and if he no longer believed that horses slept in bed, oh, cut his throat! Finish him! The hallmark of a service facsimile is that some time during – in the running out of this service facsimile – some time during its run out or between sessions (you'll hear about it when the pc comes back into the next session), a person questions the wisdom of getting rid of it. I don't care if it's jabbing butcher knives in their right arm. He will question the wisdom of getting rid of this aberration. And you might miss hearing it on some cases, but it is always there. Sometime in the process of running it out, they got up to this level.

"Now, let's see, if I got rid of this, *uhhhh-ohhh* I don't know. I don't know." Say his service facsimile is "hitting policemen," see? "Oh, I don't know – if I got rid of that, man, I just might be in jail all the time."

You look at him in amazement, you know? "If you got rid of the service facsimile of hitting policemen, you would be in jail all the time." You don't treat him like that as an auditor, see, but you'll hear some weird ones. The guy is in jail all the time from hitting policemen, see? But if he got rid of the service facsimile of hitting policemen, something would go very wrong in his life and he couldn't survive and it would be finished, see?

It's where life has been so overwhelming and he has done so much overwhelming that it actually – it makes no more sense – he has abandoned it, and in lieu of any good sense he has erected this monument. See? And that monument is a monument to total asininity.

"The way to have good health is to smoke cigarettes," you see, "and never take any exercise," and so forth, and so forth. And you'll hear this guy going on along in this and you'll

hear a dissertation and it seems to be just a little bit offbeat. And you'll wonder how on earth this – what this really adds up to.

Well, without precise assessment you probably could not establish exactly what it was. But it might be as banal as "good health." The service facsimile is "good health." How do you have good health? Well, the best way to have good health is eat poisonous foods and throw yourself under trucks wherever possible, and so forth. You see, the thing is completely twisted around the other way to. It's an aberrated survival computation, is what it is.

Now, it might better be called a service computation, or a survival computation – but we already have this term service facsimile, so we might as well stay it – with it for the present at least – because it isn't just one facsimile. It actually isn't a facsimile at all. It's the guy himself keeping facsimiles in restimulation because he knows what's best.

You see all this wild aberration inside of a society which compels its citizens to do this or that. You're probably looking at third-dynamic service facsimiles. They get stuck on these things. Take the jail system which is used right now in the West. The jail system is rather interesting. Because they know for a fact, and all their statistics demonstrate, every single one of them demonstrates – the lot – that they increase criminality with the present prison system. All the penologists know this and they adhere to it slavishly.

In 1835 a study was conducted to find out what penal systems were in use around the world – not to find out which was most workable, but what ones were in use. And they adopted the present system in Philadelphia. They adopted this present system of the cell and the confinement and the guard and the this and that. And at the time they adopted it, they knew that it did the least rehabilitation.

I mean, the committee that did this had the data in front of them that they were doing the most they possibly could to perpetuate crime by adapting the present prison system. Now, this prison system today is so general and it is in use so far and wide, and the present court system – court system is not any part of it – is so wide and general and so forth, that everybody thinks that is the only prison system there could be. That is very far from a fact.

There are actually hundreds of prison systems. And yet they have hung themselves with the one which they found was the least rehabilitative, the least workable and produced the most crime. And that was done by study – by careful, analytical study. So you must realize that there are third-dynamic service facsimiles at work. It's a totally non-survival computation to choose the worst prison system you could possibly choose, and yet they set out to do so.

So I don't think they were studying public safety. See, they weren't any longer studying public safety. They were simply studying how to make criminals wrong!

So penology, by 1835, had ceased to be a study of how to make an honest society safe from the inroads of a criminal and had begun to be just a system by which to dramatize "the criminal is wrong," see, so no longer had any useful application. I don't care what money they're spending on crime today, if they'd stop spending it they'd have less crime. I don't care how weird and aberrated that happens to look. But I'm just showing you, here is a solution stuck in the society.

Not to go on this subject, this is not a horse I ride; it just happens to be an interesting datum. I got this out originally and was rather interested that Warner Brothers did one on this a long time ago. Crime colleges: that's what they've established. You want to – as I asked you in an earlier lecture, how is it that argot is the one thing that seems to be a current slingo that goes along, a language that carries along, and yet it's the most secret language there is. How is this perpetuated? Well, it's perpetuated by the state with its existing prison system. So with that argot then, must go all the systems of defrauding, robbing, murdering and wrecking the society. And they have gratuitously, at public expense, erected these universities all over the place in which these fellows can carefully communicate to one another the very best criminal methods. And this is all done at great public expense.

And that's a service facsimile at work. That solution – the prison, see – stands up there right now as the primary method why the society is going criminal. And yet it is supposed to be the reason why the society – or... the reason why the society is not criminal. See, it's erected to protect the public from the criminal. And there it is, however, educating criminals, perpetuating crime, going forward in a very businesslike way at great public expense to do the least possible rehabilitation for the criminal, make him feel the most outlaw of any other system, make him feel the most individuated from the society, spoil his reach and therefore his sanity. It makes sense to a Scientologist particularly – put a guy in his place so he can't reach anything, can't itsa anything, he's naturally – get a case deterioration. Well, if he's already a criminal because he's crazy, how about deteriorating his case? Well, naturally he'll become more of a criminal, won't he?

So, all kinds of actions of this character – I'm not even standing up for another system. Frankly, if you just erected a big stockade someplace or another and told the fellows to go in there for a while, and we didn't care who they took with us, we'd probably, you know, have a better system.

If the Scientologist were to go about this – I already figured this out for the federal prisons of the United States. The head of all federal prisons in the United States has required Dianetics to be read, by the way, by all his wardens. And I worked out a system for him. Too much work for me to put into effect and so never went into effect. We are not without friends or connections or influence, in spite of the fact that some two-bit – some drug addicts, the Federal Drug Addicts, are after us, because they're actually not under the government, they're under the AMA.

Well, that's who pays them, you know? People work for those who pay them, don't they, normally? Naturally. They, by the way, recently got some legislation through, I see. Now, so that anything is mislabeled, all they have to do is arrest the guy and throw him in prison without a hearing. I was interested in this new legislation that came through from the FDA. When they do something like this, they get a level of unpopularity that has exclamation points after it. So they're doing their best, and we'll help them out. The direction which they want to go, we will help them go, any day now.

But there is service facsimile.

Government sets itself up a stable datum: "Foods must not have noxious products in them." And this outfit is now protecting the public against good electrical equipment and cer-

tifying electric-shock machines that break people's teeth and spines. And they pass these. But the E-Meter – no, that's deadly. It's pretty grim – I mean, it's pretty gruesome when you start to think over the level of action.

Well now, that again, on a third-dynamic level, is a service facsimile in action. See, somebody put up this solution that the public shouldn't have to eat noxious food products or something like this, or poison should be kept out of foods. That, basically, you see, is a good idea. And then this idea starts going all mad, and madder and madder and madder, till practically the only thing that'll get certified is something that kills somebody. See? You get the idea?

Well, all right, so they must be there simply to make somebody wrong. I don't think they have anything to do with anything except making somebody wrong. I don't know who they're trying to make wrong. They're not going to make us wrong. But they must have somebody they want to make wrong, and we're not quite sure who it is. But there is, you might say, a service facsimile.

Well now, you take any good solution to a situation and then plow that solution in so that it lower-harmonics. It goes through several flips. Stays itself, you see, but it's lower and lower and lower on the Tone Scale. It finally gets below all other solutions and becomes itself an aberration.

Now, it isn't true that all solutions become service facsimiles. You could immediately conclude this. As a matter of fact, I have looked at it rather wildly occasionally and said, "My heavens, if you – if any time you solve something, why, you're in the soup." No, no, that isn't it.

A service facsimile is a solution which is insisted upon but won't itsa. It's a solution which is insisted upon but won't itsa. A solution, to be a solution, leads to a further ability to itsa.

Now, if you solve something on the basis of the solution reduces the itsa or the ability to itsa, then you've set up a potential service facsimile. This is one of the reasons why Scientology would never become a service facsimile in a society. See, it increases the ability to itsa.

Now, let's look back at the FDA for a moment. They are taking over a role of classifying for and protecting the public from making up their own minds about food. They're denying the public an analytical attitude toward products. And they step in there and protect the public from themselves, which is to say, they cut the public itsa. Now having reduced the public itsa very severely along a level where it didn't need reduction, they have then set up a situation where anybody they pass is okay. The public then loses the criterion of inspection; the public no longer does its own inspection. They don't buy Salinas Valley lettuce because it's good and avoid Mexican lettuce because it's bad, see? But the FDA, aberratedly, because it's in some wild state, then goes in and passes – because somebody slipped them a quick buck or something like that (slipped them Mexican lettuce) – and says, "Well, that's okay. Mexican lettuce: that's – that's all right, that's all right. Seal of approval – bang. It's fertilized with dysentery."

Look what happens to the public suddenly. The public can be caved in by it, because it's opened a gate which is destructive. See what they are? They are not, then, increasing familiarity with the environment. They are decreasing it and leaving this area in a mystery. And it's all set up on the irrational supposition that they're infallible.

They had some non-pregnancy drug the other day and it had wild side effects, and they passed it. They passed it. There's been several drugs of recent times that have been passed that are terribly destructive one way or the other. Now, obviously, some role exists for such an agency. But every time you set up such an agency, you set up a potential service facsimile, which will then accumulate to it a great deal of evil. And the next thing you know, you have set up a situation where nobody can live with it. Now, you get how that's done? It's by reducing itsa.

For instance, you'd almost never look for travel agencies to aberrate a society. See, you wouldn't look to a travel agency as a primary source of aberration in the society. They could bring in a little bit. We had a situation here – we had a situation here in England where anybody that could buy a ticket in the West Indies, you see, could come to London. And some shipping company made millions shipping everybody to London. And this was looked on in some particular lines as something. And then oddly and wildly enough, the Parliament up here was faced with the embarrassing situation, suddenly, of limiting the amount of immigration from one of its own colonies – very embarrassing. They managed to get over it and pass it and nobody has ever heard of it since. And they've limited immigration in that particular line. But I'm afraid this wasn't even much of an aberration. I mean, that's about as close as a travel agency could come, you see?

So it doesn't mean that all these sources are perfect. Little randomities exist around these other sources, don't you see? But broadly, those that directly reduce the itsa – those that directly reduce the itsa and don't help or support the itsa line in any way – are most likely to become service facsimiles. They're a solution without inspection which is too broadly applied.

This girl has a survival solution. She simply says, "Families are no good." This is what she's made up her mind to. She holds that in place. She proves it to herself all the time. She works day and night. She sits there – you can see her in a brown study, you know? She's sitting there and so on. "Hmm, yeah. Yeah," she'll say to herself, "yeah. Proves it. Mother didn't say anything to me this afternoon, so that of course proves, you see, families are no good." See, and it all works out. Now, she doesn't have to look to find out why didn't Mother speak to her all afternoon. And that brings about a no as-issness of mass. There's no necessity to inspect. She's got it solved. Mother didn't speak to her all afternoon because families are no good. That's it. She didn't have to inspect the fact that she, last evening when she took the car out, bent the front fender and then didn't say anything about it and didn't offer to do anything about it and put it back in the garage. And Mama found it at noon and cut the communication line because she already knows that it's disastrous to try to talk, you see?

So you've got a situation there. Now, that little ARC break is never going to blow away, is it? It's never going to be talked about, not going to be any communication on the subject and so forth. Well, what's preventing it from being talked about? "Families are no good." That proves it.

Now this, added to – you understand, it gets charged up because every one of these ARC breaks that contributes to it in its immediate vicinity charges it up further, and the person holds it in line harder, and more ARC breaks pile up on it until it eventually becomes an accumulation of mass. And therefore, when you prepcheck somebody with a service facsimile around the vicinity of this service facsimile without hitting it on, you turn on mass. The source of the mass is: nothing has been itsa'd.

Now, you're prepchecking them this way: "Since the last session, has anything been suppressed?" Let's say it's auditing that's the target. This is in vignette; this is not a real service facsimile – "My auditor is no good."

("There is no reason to answer this question because my auditor is no good, because auditors are no good.") "No." Now, the case is in a solid, continuous ARC break so it doesn't register on your meter.

"Since the last session, has anything been invalidated?" you see?

"Nope." ("Auditors are no good. Wouldn't do me any good to answer the question anyway, because auditors are no good.") You see?

Yet the case isn't thinking this consciously. Case isn't thinking that consciously. That's just everything that you ask the case comes up against this.

And you – my God – you're trying to talk to this case. You're trying to get this case to talk. You're trying to get this case to do something. And you do know what you're doing. And yet you're going up against some kind of a barrier like this in this case. And then all of a sudden, you wheel back and you say, "Uhh-uhh! I'm a failure as an auditor." No, you're not a failure as an auditor. You just didn't clip the service facsimile that made auditing impossible. You see that? And this is expressed by the no-motion of the tone arm action. Because there is no itsa in that immediate vicinity, there's no, then, dismissal or discharge of the charge hanging up on it. You see that?

Now, you're listening to this opinion, "Auditors are no good," on somebody who is... who never inspects an auditor or auditing. There's no itsa. In other words, the whole thing is just completely unjustified. How do they know whether the auditor is no good or not? They've seldom heard one; they've never looked at them. See, how would they know?

And let's get another situation: I'm very, very sure that some of you have been over the coals of being considered immature, or some other way, by either your mother or father or family – irresponsible, see? Now, you probably have never asked yourself this other question: "Did they ever look at me?" Now, there's lots of mothers, the last time they looked at little Roscoe was when he was about two. And they're still trying to advise two-year-old Roscoe at the age of thirty what he should do about his marriage. Well, they don't know anything about him.

If you want to give somebody a send that has a lot of family trouble, just ask them questions along that particular line, and so on. Ask them what they have observed about their family. There's a good RIC. Probably get tone arm action out of that, you see, because it's on the fringe of something if they're having trouble with something. And they're liable to come

up with the realization that their family has never looked at them and doesn't know them. See, we're on a no-itsa situation, some preconceived notion.

Societies tend to get stuck with these things, to get stuck with some idea. And it's very interesting that this is probably the way that a society reduces its strength, just as an individual reduces his strength this way. I feel sorry for this society, in a number of ways, because in certain zones and areas which the society depends upon for its control of mean, vicious, nasty persons and things like us, these guys haven't got any itsa line out. Do you realize what's happening? If you want to look at it bluntly, these guys are sitting back taking the wrong actions with regard to certain situations. They're trying to prevent – through their wrong itsa on Scientology – they're trying to prevent certain zones and spheres of activity, which is to say, "the public must not be practiced on by an unqualified guy who doesn't happen to pay dues to us," and that sort of thing.

All right, now they're set with certain set, fixed ideas, see? They believe these ideas. And they believe that what we're doing and what we have to do with is no good and it's corn, see, and that it's not any advance on anything.

And my God, during this whole period of time we're moving right straight on ahead into more mental technology and more technology about life and livingness than they ever dreamed could ever exist. We have actually been effectually isolated and insulated from any further interference, or from having our energies drained down by being made to comply with or agree with the mores of their particular practice lines. That would have slowed us down like mad, don't you see? We're moving forward at express-train velocity.

There isn't any faculty of any college or something like that is going to tell you or me whether or not we had better research or not research some particular sphere of existence. If we can put an itsa line on it, we look at it. It doesn't then make it "bad" or "impolite," see, or something like that – "this is why we shouldn't look." And we're actually traveling as a subject without a service fac, and it's making fantastic velocity. And here these poor sods are, whose whole life is bound up in these – you know, the mustard-plaster level of healing. And they're not in contest to keep their developmental line coming forward, so there they sit, and there we go.

How high can it rise before the potential suddenly explodes? They're nuts. That's what it makes them look to us. The potential will eventually explode in their faces. In what way? They suddenly won't have any patients. Nobody will be paying any attention to them, because they have a wholly authoritarian educational system. That is to say, they put it on TV, "You must see your local doctor. Your local doctor receives you in open arms." Well, they're so unreal they don't realize that that isn't the public line. Their word of mouth – I don't care how much advertising you buy, you got to have good word of mouth, man. You can buy newspapers full of advertising to get somebody to go see a movie that's no good and the theater will stay empty, because their word of mouth is bad, you see? And the word of mouth on medicine is very bad. Very bad.

And while they're taking fortunes away from people in the United States for not healing them, and not advancing their own technical lines, and not really measuring up the way they should, they're not making the effort necessary to survive. Why? Because they have a

service facsimile on us. They don't even know they've got it. It's hidden down amongst their case, amongst any other batty lines.

I had a good news story on the subject. I didn't release it. It might have woke them up. They have to reorganize the whole of mental and physical healing before they could cope with what we're doing. This potential – these poles are stretching further and further and wider and wider apart, and eventually they will become a no-factor. That's what happens to them – they're a no-factor. They simply are not powerful enough or influential enough or anything else enough to do anything about it.

You may not think that we're growing. But I look back over any six months of the last ten and eleven years, and frankly, I hardly recognize a comparable size – just six months to the next six months. This is a rather fantastic thing, only this is going on internationally.

Now, did you ever double a penny for thirty-two days? It's the old mathematical trick. A guy says, "Well, you needn't pay me anything but one cent doubled every day for thirty-two days."

And somebody says, "That's fine," but of course at the end of thirty-two days – I don't know what the figure is. It's either a million pounds, or it's something like that that it has grown up to, don't you see? It only takes this type of curve growth going on up.

Now, therefore, they're not impeding what they should be impeding if they wanted to survive, themselves. They're not handling the situation within its own zone of reality. And that's all aberration is, is a failure to handle the situation in its own zone of reality.

So this, then, is the service that a service facsimile performs. It makes it unnecessary for an individual to handle the situation in its own sphere of reality – makes it unnecessary to do so. So nobody ever does anything about it; so mass accumulates up on it. Now, any mass that accumulates on a case, any mass that accumulates by reason of Prepcheck, any body mass that occurs by reason of processing and so forth, must to some degree or another then be battling up against a service facsimile. And if a person cannot be knocked out on the subject of a psychosomatic illness of some character or another by processing, then that must be part of a service facsimile.

Those things that auditing won't change are, then, rooted in this other mechanism. They're a solution without inspection which pulls in upon it all the uninspected mass. That's all. And of course, mass disappears because it's as-ised. And when a person does not as-is the mass that is there, he naturally gets an accumulation of mass. And the mass that accumulates around one of these service facsimiles is rather marvelous to behold. And of course, it's that mass accumulating which holds and prevents the Prepcheck action. And those are the technical mechanisms which prevent tone arm action.

If you don't get tone arm action, it's because the individual does not as-is and has not as-ised any mass in that zone or area for a long time. And not having as-ised any, when you get into its vicinity, you go into it with a thud if it gets anywhere close to processing, getting well or handling the environment in which the individual finds himself.

The auditing session, to this effectiveness, extends out to everything the individual does during the period of time that he's being audited and every environment he finds himself

in. So that if any service facsimile exists which is being reacted upon in any of his environment, anyplace, it will to some degree influence his auditing. And the more of these things exist, the harder it is for you to get tone arm action – until it gets impossible.

Now, an individual can have a service facsimile and still get tone arm action – get some tone arm action. And it would be better in some cases to make sure that the service facsimiles are out of the way before plunging backtrack. The amount of time that you could save in processing is a very large factor. I've just made a restudy of this. And I've been brushing off Clear left and right and saying no good, no good – you know, I mean, and so on, Keyed-Out Clear. And I recently found out that you can stabilize – there's a possibility here of stabilizing a Clear by the eradication of the things that will key in. So, you see, if you knock out a number of service facsimiles out of an individual, why, the case then stays stable to the degree that it doesn't still have service facsimiles.

Now, R3SC is an extremely workable process. I have written it up; it's been released. Of course, one can expect certain refinements of a process of this particular character. But this is peculiarly complete, because we accidentally already had a couple of types of assessment that you could do for this. We have the old 2-12 assessment, and we have the R3R assessment – preliminary step. They're perfectly adequate, don't you see? There are slippier assessments that you can do and I'm sure we'll have some fancier assessments on it one way or the other, but these happen to be adequate assessments. And you'll find that the mere inspection of a folder from beginning to end will give you a bunch of candidates. Just inspect the folder. Just start turning over things and looking at auditors' notes and mentions of this and that, and what the individual has had *bing-bang* runs on of one character or another – whether they gave tone arm action or not, you see? But look particularly for periods of no tone arm action and then go back before those periods and find out what was being addressed on the case. And you'll probably have a service-facsimile combo sitting right there, and just use it in your ordinary steps of R3SC.

You get an idea: let's take a period – we found a period here the individual was audited for an intensive and toward the last half of the intensive got no tone arm action. We notice this from the old, old, old, old auditor's reports, see? We find out that on Wednesday "form" was addressed by the auditor and that was the end of tone arm action. We notice that there may have been two subjects there that could have been addressed. Well, run them both! Don't be chichi, see?

Now, you can run almost anything with R3SC, which is what makes it very good. Just don't overrun it. And if the pc says no, and he can't give it answers and so forth, come off of it; don't shove it down his throat. With those ramifications, then, it doesn't much matter what you pick to be the service facsimile. But if you do a slippy assessment, which is a preliminary-step assessment, it's a bingo assessment right dead-on – and something like that – boy, you get action, man, you'll get action. But if you pick almost anything else, you will also get some action.

So it's not critical – the assessment is not terribly critical. Of course, the faster you get what is really the service facsimile on the case, then the faster your tone arm action restores and the case reverts to battery. So there's a lot of ramifications to this sort of thing. But in the

final analysis is, here is a process, full bloom, which totally replaces your R2-12 type processes – makes them utterly unnecessary – and takes care of this thing we call a rock slammer, and takes care of body mass and a lot of other things in cases that we've been particularly worried about, and particularly takes care of the auditor's main worry which is "How do I get tone arm action on this pc?" Obviously, if he can't get tone arm action on the pc, the pc is sitting in a service facsimile. I mean, that's the end product of that.

Now, you may have to run two or three or four service facsimiles, but by that time you're going to Clear. So you might as well go ahead and clear the guy. Throw it all out of restimulation; make the case sit there with a free-flop needle, and so forth, and say, "All right, I cleared you." Let the guy enjoy it. Let him enjoy it for a day or an afternoon or something like that before you reach for the earlier GPM.

All right. Now, that's R3SC. And I hoped – I noticed – do you notice that it's tabulated 3? I want to make a short note on that. It's the tabulation of 3 is because, actually, it is a 3 process – being a clearing process. We rehabilitate Scientology levels against the existing scale, and that means that your R3N, and so forth, will be called R4N. It's a reorientation. But I'm not going to reuse their letters when they're moved up to 4. And there aren't any other R4s, so they're very easy to recognize, and they won't get you tangled up in any way. And then we'll be able to throw these clearing techniques in straight where they belong. And there are a few of them there, so we want them tabulated. We're getting our house in order, and it's making very good sense the way it's going together.

That means that there's quite a few cases around here will have to be cleared before they go on to OT. I'm sorry, but that's the way it is.

Thank you.

HOW TO FIND A SERVICE FACSIMILE

A lecture given on 4 September 1963

Thank you.

I'm very, very glad to announce that there are some of you who are not in trouble. Thought we'd start the lecture on a happy note.

What's the date?

Audience: Four September.

Four Sept. AD 13. Don't know what the month is named after, but probably something very barbaric.

Well, the shadow of your big toe has approached within several yards of a service facsimile. You remind me of a scout looking over a citadel which is bristling with guns and quite hostile, observing it from as far deep in the neighboring woods as you possibly can get. And I think maybe you've caught the tip of one turret or have seen a sign which says "Citadel." And I'm going to ask you now to be brave and even get out to the edge of the woods and take a look at this thing, because it's well worth looking at.

And perhaps the fault that you have not seen it is resident with me. It appears to be quite lucid to me; it doesn't seem to be offering very much complication and so on.

But I know what this breed of cat is. I myself have taken a look at it and have audited it and have seen the results of it, and over a period of years have had an unhappy history of colliding with it. You know, you're going down M1 there and you're wide open, you know, and everything is fine and I'll be a son of a gun if somebody hasn't piled barrels across the road, don't you see? And well, that's the end of that one, you see?

Pcs, pcs have always been full of surprises, and it's been of great interest to me to find out how they create these surprises. [laughs] And so I'm very, very happy with what we've got here in the service facsimile, because it is how they create these surprises and what happens. Apparently there's a great deal to know about this thing. And I have not, to any great degree, relayed this information even in the bulletin of R3SC. Apparently this takes a lot of grasp, basically because it's terribly simple. And it's not that anybody is protecting their service facsimile – you can almost wipe that out.

You head a person's attention toward the service facsimile, and they go right on in, man. They go down the toboggan and over the falls – crash! They are no more able to keep

out of the service facsimile than anything. And you needn't erect, now, a structure of philosophy to explain bad assessment by saying the pc will defend himself against his service fac being found. The pc will not. The pc gets to the middle of this whirlpool and just whirls. That's it, man. All you've got to do is swing him somewhere in the vicinity of the lake in which the whirlpool exists, and he dives right in and swims like mad and goes right to the whirlpool and says that's it – unless he's prevented from doing so.

My first plea, then, is don't prevent the pc from finding his service facsimile. That seems to be a rather obvious point to make, and I'm sorry that it sounds sardonic or sarcastic, but I'm afraid has to be made.

Because you could say, "Well, of course, if the pc counts on this for survival, he's not going to let it be found," you see? And you could go off on that line and make a lot of hard work for yourself, and actually it's not of that nature at all.

Now, there are so many ways of isolating a service facsimile that to cover the area of assessment at this particular stage of the game is merely to put in your hands a lot of rote this and that which will more assist you to miss the service facsimile than to find it. There is no substitute whatsoever for knowing what one is; there is no substitute at all.

Now, the service facsimile, first and foremost, is a tremendous solution which the pc believes, if disturbed, will end his survival. It is always an aberrated solution; it always exists in present time and is part of the environment of the pc. And it is something that everyone, unintentionally or otherwise, is telling the pc is wrong and causing him to assert that it is right.

Now, you get to understand a service facsimile a little bit better when you recognize that last point. That last point is very, very important. Otherwise, you're going to be running some of the silliest things and calling them service facsimiles, and you're not going to make the boat at all.

The environment, the mores, one or another dynamics, is insistently and constantly at work trying to tell the individual that the service facsimile is wrong, and the individual is constantly saying that it is right. And when you have that situation you have an unauditible pc, because he is getting audited only to prove that this is right and actually will constantly bring it up in auditing.

It is about as hard to find as a burning tar barrel in the middle of an empty field on a dark night, see?

The pc is always bringing this to the auditor's attention. This is so much the case that once you have found it you will consider that you have been very obtuse indeed. But sometimes it's being brought to the auditor's attention in different wordings, in different conduct, in different approaches that one doesn't find it easy to label. And it is probably labeling it that is harder than finding it.

Now, let us first look at the exact thing we are trying to do with a service facsimile – the exact thing we are trying to do with it; there is one thing we are trying to do with it – and then this will move out of your perimeter, as an auditor, any necessity of trying to use this principle to make an OT, because that is not what we're using it for.

I'll give you an idea now of this. Reg and I just had a discussion a moment ago, and he was saying, "Well, a human body would be a service facsimile." He's absolutely right. He's absolutely right. But this, of course, is being applied to going OT – not for the purpose we are applying it.

See, the remark is absolutely correct. It turns on mass. See? It is being asserted constantly, and so forth. Obviously it's a perfectly good service facsimile, you see? Well, all that's wrong with it is that it isn't the service facsimile we are trying to target. See? The wrong target. Because if you used that, you would be going to OT, don't you see? And we are not using the service facsimile for that. We're simply using it to get a person auditable, this lifetime, and get out of the road those constantly restimulated solutions that make it hard to audit this person. And that's its purpose. Its purpose is simply to clear this lifetime.

Now, I can give you some beauties on the application of the service facsimile on the whole track. What do you suppose you have a bank for? It obviously must be some sort of a service facsimile. Obviously; it turns on mass, doesn't it? It follows all of the rules.

Obviously, "How would having a bank make you right and others wrong," well, obviously – ha! – obviously would kill the pc. Why? Well, you'd just restimulate the whole early track and you'd throw him into countless GPMs and you'd overrestimulate him like mad. But obviously, according to the theory, it's a perfectly valid service facsimile. A reactive mind is a perfectly valid service facsimile, but not for the purposes that we are going to use this for.

It's well to remember the basic principles of the service facsimile when you are running somebody to OT, because sooner or later you're going to find this guy, and he just can't seem to get up to a point where he can tilt a planet. You're having trouble with this pc. He sits down there on one mountaintop, and you sit there on the other mountaintop and you're trying to audit him, see? And the E-Meter you use are the little glows that appear in the various parts of his vicinity. See, you say something; you see something glow, you say, "That read." [laughter] Probably your auditing commands are all in telepathy or something like this, but we don't care much about that. That's a good thing to remember. This guy just – he keeps complaining, complaining – ARC breaking. Weather gets terrible on the planet, you know – keeps ARC breaking. Thunderstorms and other things occur. And he's got this PTP, you see? He just can't tilt a planet. Weak. And I bid you remember this point, you see, that undoubtedly you are now bucking a service facsimile, see, which would probably, after you've talked for a while, add up to something like "being incapable."

And you ask him, "All right. How would being incapable make you right and how would it make others wrong?" and so forth. And you run it on up with just the same steps of R3SC. You undoubtedly got this boy flying again, you see, into some new zone or area.

So you're never really rid of the principles of the service facsimile. He's got some tremendous solution, and that solution is "being incapable." How does he survive? By being incapable. At what level? At some very upstage level of some kind or another, you see? All right. So that's perfectly valid.

So it'd be valid almost at any point of a case, but that isn't what we are using it for and that is not the design and style of R3SC. It's the same breed of cat – the same breed of cat. But

we are attacking here a solution which, just like any other solution, is a barrier to the discharge of the confusion.

What's made this possible is a new evaluation and a new road found through the bank on guess what? You've had a new communication level in auditing, and so forth, and that clarified a lot of things. But, of course, the service facsimile is born out of a reevaluation and a readjustment of the confusion and the stable datum – that basic; confusion and the stable datum.

The confusion can only stay in place as long as it has a stable datum to hang it up. Now, that is so light and so easily changed by a thetan or a being that this does not much get in anybody's road. It's only when it becomes an aberrated solution, the loss of which threatens survival, that the individual fails to be able to discharge the mass associated with it.

So if you could see confusion as a stable datum (you know those principles; they're old HCA principles), you should realize that you can actually pluck, out of the center of the confusion, the stable datum, and at that point get a discharge of the energy held in place. It's a new discovery, you see? What holds the confusion in place? A stable datum. That's a new thought, do you see, because you handle life all the time on the reverse line. You've got too much confusion, put a stable datum in and the confusion lines up on the stable datum. That's how you've been using it before.

All right, let's take a reverse look: How is the confusion held in place? The confusion is held in place by a stable datum. So the removal of the stable datum then discharges the confusion. And a confusion is a very good description of "what is charge?" Charge is an electrical confusion.

Now, as long as a stable datum is held in place by the person, the confusion will not discharge. Do you see this? So here's a new piece of advanced technology – rather remarkable piece of technology – that we have had around for a very long time and it's simply a reverse look at the thing, and we know now how to hold a confusion in place.

Now, fortunately for us – fortunately for us – confusions are tolerable and not always aberrative. In fact, the biggest part of the confusions of life are not at all aberrative; they could go on for a long time without hurting any thetan or incapacitating him for a moment.

You're playing a card game; you're playing a card game and you're having an awful time playing this card game. You just never seem to really get anyplace playing this card game. And you discover a little booklet and it says "How You Play Canasta," see? And you read over this booklet and it gives you some hot dope on the thing, and after that you can play canasta. This is just about as aberrative as eating blueberry pie. You understand?

Nevertheless, the confusions of canasta are held in abeyance by these little rules you have learned about canasta.

Now, of course the confusions concerning canasta, as I say, have no aberrative value whatsoever. Zero. Life, you see, as I've told you several times in recent lectures, is not in itself an aberrative activity. Aberration has to be rather extraordinary. It has to be worked at; it has to be kept in restimulation all the time.

Now, this rather innocent action of the switchboard girl solving the confusion of her job on the principle "If I have twelve calls simultaneously appearing on the board, I handle one and then handle two and then handle three," don't you see? In other words, she's got a confusion of calls, all you have to do is teach her to handle one call. Each confusion she has from that point thereon is handled by that. Well, it actually is not at all aberrative to her. Nothing going to drive her mad because she has twelve calls simultaneously, don't you see? That's nonsense.

So now, we pull off the case – we say, "All right, what system or solution have you had to answering calls when they were too many or a confusion of calls?"

And she says, "Well, I answer one at a time," and so forth. We get the motion of the tone arm here could not be detected with a micromilli-vernier UNIVAC. See, it actually doesn't back up any charge. You get the idea?

No, there's got to be force and violence mixed up with these things. There's got to be something fabulous. Now, she could add this up and you could add this up as part of the confusion of trying to survive by having a job – and this could be part of it. And you might touch on it and it might appear to move some mass, but actually she's got something else she is worried about. Her survival is threatened by the fact that she could not handle her job and she's liable to be dismissed, don't you see? Ah, but look, solving how she handles a switchboard does not solve what she is worried about. She is worried about the fact that if she does not handle her job she will not have a job and her survival will thereby be threatened.

Ah, there's a much bigger tower on which this little piece of confusion was leaning, don't you see? All right, so we address this. How does she hold her job? By being a competent switchboard operator. Well, I'm afraid that this is not very aberrative either.

Why is she worried about holding her job? You say, "What solutions do you have for holding your job?" And you get a little TA action, see? Get a little bit of TA action.

She says, "So-and-so, and be nice to the boss" and so forth, and so forth, and you get a little TA action, see. Because this threatens her survival, don't you see, very much – much more intimately.

But the case is still relatively unauditible. There must be something on this case if we're auditing this case and we're having trouble with the case; there must be something else that we are bucking into here. What are we running into? Something else. Something else.

And we look around and we find out, "Well now, what makes you upset, particularly, about losing a job?" or something like that. "What would be upsetting about this?"

And you hear, marvel of marvel and wonder of wonders, you hear – you expect to hear, you know, "My aged mother would then starve to death," you see, or something like that. And she says, "Well, actually, it's my dog."

You can't add this up. Actually, she can't either. Actually, it's unaddable. And you say, "Well, what about the dog? What's this got to do with the job?"

"Well, you see, uh, they'd put the dog to sleep if I couldn't feed the dog, you see?"

Now, you might be getting here close someplace and that even looks a little bit sensible, don't you see? That doesn't look quite completely dippy. But you've got the idea of a human being working like mad and terribly worried about their job and so forth, and we've traced it back to a dog. Now, ordinarily human beings do not work to support dogs. But this one is; this one is. And my golly, we work this around for a little while and we suddenly find out that she has lots of trouble all the time and lots of upsets about keeping the dog in an apartment. And we may have a service facsimile that is simply described as "keeping a dog."

See, that's probably too mild a look at it, and I haven't given it to you as rough as you would actually find it or as incredible, because I want you to understand it, not sit there with your jaw dropped, see? But keeping a dog – keeping a dog, or keeping a dog in an apartment, some such action as this, or keeping a dog – and "How would keeping a dog make you right?" And "How would keeping a dog make others wrong?"

And we find out that this girl has one computation in existence which makes her right and makes others wrong, and it has to do with keeping a barking dog in an apartment where it'll annoy people. And that makes her right and makes others wrong, and she feels if she were deprived of that solution her survival would be shattered. And this is what's causing her to worry about her job. Don't you see?

So she always carefully gets these little, sharp-bark terriers, you see, that scuffle and raffle when they walk around on the floors, you see, and that yip and yap endlessly, particularly in the middle of the night. Sooner or later as you're running this thing, she'll all of a sudden cognite, "You know, I always seem to get very noisy dogs. Wonder why that is?" Well, of course, naturally. It bothers people more.

And you run this thing down and you will get some kind of an incident, early-life incident and that sort of thing, where somebody insisted that a dog be put to sleep or something like this because it was getting old and scrawny. And she had to drive it down to the pound, and everybody was busy making her wrong and, he [she] was trying to make everybody else wrong, don't you see? And this thing is all wound up in a ball. And wonder of wonders, we get this thing audited out – it's all about dogs, you see? And suddenly, because keeping a job and handling a switchboard was attached to an aberrated service facsimile, you see, to this degree, then, her worries and anxieties all have a big lie in them, you see? And they're all twisted around wrong way to, and all of a sudden she can operate a switchboard much better – doesn't even have to have a stable datum to operate one, she just operates a switchboard, don't you see? And she can keep a job, she doesn't worry about the job, and so forth. She's relaxed on this line. You get this action?

Now, I've given you a very, very simple, understandable solution here – very simple, very understandable. And they're not quite that simple when found in real life; they are more aberrated. I gave you a more intelligible one because I wanted you to understand there was some connection. Now, as you walk across this in real life they jump, usually, a wider gap than from job to keeping a dog, see? Probably be more involved than this.

They are across a larger spark gap. You may find out that it is "breaking dishes." So you may have some more steps in it, you see? Breaking dishes. And this doesn't make any sense at all about keeping dogs or holding jobs, but nothing makes any sense anyway. She's

breaking dishes to be right, you see, and breaking dishes to make others wrong, and this is the service facsimile on which everything else is piling up. And oddly enough, if she's not permitted to break dishes, she knows she cannot survive.

She may not know what the barometer reads; she may not know how wide the street is; she may not know a lot of other things in life. But this she does know: that if she ceases to keep the dog or break the dishes or something like that, why, that's the end of her – total tertiary line of defense.

Now, you may not discover this at once on a case. You may not discover this promptly, immediately and at once on a case. You may audit off one, two or three apparent service facsimiles that all answer up to the complete description of a service facsimile, but are actually only leaning on the central service facsimile that is restimulated in present time, don't you see? But as you take these things off, why, the central one comes to view.

Now, you see now why, when you say or imply to me, "Now Ron, you should give me some kind of a rote procedure by which to isolate this every time," you're asking me, of course, to apply a logical system to an illogical action. I probably could do it and we probably will do it and all of that sort of thing, but I actually would much rather you understood what you were doing. See, I'd much rather. Because, frankly, you can hunt and punch around on a case. You can take an old case, assessment sheets and folders and 2-12 and something, you know, on the case, or the case reports or auditors' reports or case histories or something; and you could get a whole list of things – anything that's been found on the case. And you can have a discussion over these various things and points, and you can assess them in various ways and get one or another of them to read. And you'll find out the pc's interest will hang up someplace on this list. They'll be very interested in it. Far from leaving it, they dive right in on it, see? And here's the pc's interest; it'll hang up with a somatic, so forth.

And now, in fooling around with this, it is sometimes necessary to reword it. You don't have to worry about rewording the command. You'll get results on cases by running different commands, but you'll only be running oddball, flank material on the service facsimile itself, don't you see?

Now, the command's – is always, how would it – whichever you have found – makes the pc right and makes others wrong. It's always that command, see? It's not "How would opposing it," "stepping on it," "throwing it away" or something like that, or "fighting it make you right?" see? Because you haven't got the idea of what the service facsimile is, see?

Because the condition, the final identification is that the service facsimile solution is the pc. That solution is the pc, so it is something he has. It's "How would it make him right and make others wrong?" Now, you can vary it: "How *has* it made you right?" and "How *has* it made others wrong?" You could even say "What would be made wrong by it?"

Now we're going afield, but the pc sometimes springs over, and when they're operating in an aberrated area of this particular character, their ability to follow an auditing command deteriorates markedly and they slop. That's all right.

The way you handle that, and so forth: He's all of a sudden – pc is answering what and not answering how, see? You say, "All right. Well, just give me the rest of the whats and we'll

get back to the how," you know? I mean, they're not very tough. You know, don't make them wrong and stop them and all this sort of thing. Let them go because you may be standing in the road of an avalanche at an automaticity, see? They'll slop on that auditing command, do you understand?

But the auditing command is not ever "How has it made you wrong?" Never. Never. Never. Oddly enough, it'll run, but it'll run the pc down scale. "How would doing things to it make you right?" see? Oh, oh, oh, no, no, no. You'll get some tone arm action. See, this is what'll fool you. You'll get a little tone arm action. It'll look okay.

Well, let me take the case in point. We assess "Father, " and some genius has just read the rest of the 2-12 bulletin and found out that it was always "oppose" – you were supposed to oppose what you found on that. So he ran 2-12 plus R3SC, which is pretty good. I suppose you can run several other processes in conjunction with it, too. You could probably have the pc feeling the walls at the same time you ran the process. I mean, you could do a lot of things. [laughs]

But anyhow – I'm sorry, but that actually happened. And the command was "How would opposing Father" – this is not quite the right one, but don't want to cast too many bricks – "How would opposing Father make you right?"

Brother, that is not a service facsimile: opposing Father is not a service facsimile – that's an action. See, that's just an action. Now, if you assessed it out, you've got to try it. You got to try it on for size and you got to find out if there's anything to this, because it would be if you assessed Father... it just simply – I mean, it's too idiotically simple: Father must be a solution. See, it must be a huge solution. So we say, "How would Father make you right?" And "How would," you know, "Father make others wrong?" you see?

Now, you can drag this over into the cow pasture and say, well, hating Father is probably the service facsimile and so forth, but actually you're just looking at a secondary or tertiary condition of a service facsimile. You're not looking at a service facsimile, because this is no action. See? This'd be something which was the result of a service facsimile.

And the first rule is – what I first gave you in this lecture – if the pc doesn't immediately jump into the lake and swim right straight to the whirlpool, but tells you "Oh, well... Father – make me right, hm-mm, doesn't make any sense," I call to your attention the pc is still standing on the bank – not service facsimile. Got the idea? Pc has not swum madly in and got all embroiled in this thing. Because that's the first thing they want to do, hit the service facsimile – drown. Why? Because to drown is to survive. Obviously – that's the characteristic of a service facsimile.

The pc says, "Um, I don't think um, I don't know. It's – I'll have to – right – I don't know whether that's right or not. I'll just – make me right? And – don't – I don't know if that would make me right or not. Let's see, would it make me right? Would it make anybody else wrong. I don't know. I can answer the question. There doesn't seem to be very much wrong."

Wake up there in the auditing chair and take a look at what's going on.

Pc is standing on the bank, feet not wet, whirlpool not approached – equals service facsimile not been found.

So go on and do something else clever. Say, "Well, that's fine. I'm glad we covered that," cheerily, cheerily, cheerily, cheerily, cheerily, and you gather up your papers and get the hell out of there, see?

Pc won't be able to keep out of it; that I guarantee you, man. Won't be able to stay out of it.

You say... the service facsimile is "burning cats." See, something weird like this comes up, see? Or "being a cat," you know? Something like that. "Being catlike." "How would being catlike make you right?"

"Oh, well, that's so-and-so and so-and-so, and so-and-so and so-and-so and so-and-so, and then, of course, so-and-so and so-and-so, you understand. There's quite a – quite a – that's quite a thing when you start really thinking about it like that. You see, catlike is so-and-so and so-and-so and so on, you understand? And so on, and a lot of times been catlike because, you see, it – it uh, it's catlike, you know, and – and so forth, and uh, that's the way it is and so on." And when you can't get in an auditing question to get the session properly started, know that you have hit one. [laughter]

Now, the reason it turns on automaticities is, of course, that it is automatic, unanalyzed solutions, and they simply just pour off in a Niagara. When you got a real one and you're running one, always note in your auditor's report "automaticity." It merely means, more answers than the pc can articulate are arriving from the bank – conveyor belt stacking up. Just note down when you find one of those automaticities. It's a guarantee you've hit on a service facsimile.

Now, this gives us the way it has to be run. Because it is susceptible to avalanches, you can't then run it with the old TR 0, 1, 2, 3, 4, see? You've got to throw the question into the arena and let the lions fight over it for a while, you understand? And just don't stop it with a new question; don't stop it with acknowledgments; let it sort of run out. After a while, the pc has given you fifteen, twenty answers and so forth, and seems to look rather blank – doesn't seem to have one now, and that sort of thing. Well, you can either give him another question or you can change the thing over to the other side, and it does the same thing then. So it's actually not one auditing question for one auditing answer. You're not running it that way. You're running it one auditing question for one waterfall.

But sometimes the pc swaps ends in the middle of it. Well, this is no time to stop him either. He's busy making others wrong with this "being catlike," you see, and others wrong, others wrong, others wrong, others wrong, "and it'd make me right to so-and-so and so-and-so." And he's just reached the end of the flow and he's turned around and he's on the back flow. You can also overrun these things and put the pc into a stuck-flow sort of a drifting anaten. You're insisting that more answers must exist, you see? Well, he's already at the end of his rope, and you're making him run too long on that side. So it's run very permissively.

What you're trying to do is get rid of this avalanche and automaticity and get some tone arm action. That's your main purpose. So how you do that as an auditor is give only enough questions to get the pc going and only enough acknowledgments to acknowledge the fact that you had a lot of answers. And turn it around whenever it comes toward the end of the rope; and turn it around the other way. It's very simple stuff.

Now, trying to keep the pc answering the auditing question is sometimes difficult, as I just told you, because the pc will skid around on this and disassociate because he's in a disassociated area. And don't you ever tell me that you're very shocked because this pc has given you a whole bunch of answers that weren't answers to the auditing question. Now, that's expected. That's expected, see? Because what?

This solution – now, let's talk back on the theory of the thing. This solution, you see, is holding back a tremendous amount of aberration, none of which makes sense, so it doesn't as-is. So there sits this solution, see, "keeping a dog," you see?

All right. All this stuff is back of it and nothing is going to flow, because as long as this person is able to keep a dog, life is handled: Jobs are taken care of, everything is protected; all is right in the world – except, of course, for the painful stomach, a hatred of dogs and some little marginal fringe worries, you know, of one kind or another. And being broke all the time and not being able to have a job or hold a job.

It's like trying to solve a problem with a whopping lie, don't you see? And boy, would you have to get busy to keep this problem solved with this whopping lie. So it has to be continuously asserted – continuously asserted. And that solution, then, is just a solution. That's all it is. And the pc doesn't even have to work on it consciously because the pc has got it all triggered to be worked on all the time anyhow. It's the immediate answer to anything.

So life just continues to stack up on this solution, and it accumulates mass on this solution, and the solution accumulates mass.

Now, because the solution... Now, let me give you the condition of what kind of a solution it's got to be: It's got to be a below 2 on the Tone Scale solution – always below 2, nothing above 2, see? It's a below 2 solution, because it, perforce, is a substitute for an itsa line. It's a substitute for an itsa line. The pc started out by feeling he or she could not itsa the object that he or she was trying to make wrong and so dreamed up this solution – dreamed up this solution as a final solution. And that, then, is a substitute for an itsa line, believe it or not.

Well, there's a girl sitting there and Mother has not spoken to her since noon because the fender of the car has been dented. And she has this solution, "Well, families are no good," you see? Makes it unnecessary to observe Mother; makes it unnecessary to observe the environment; makes it unnecessary to participate; makes it... No necessity at all to do anything about it because it's all done – it's all contained there in the solution. And then because, you see, there is no is-ness occurring on the environment, you get an accumulation of mass. See, mass only accumulates in the absence of itsa. So there goes the old shell game. So it's actually a substitute itsa line.

Now, because of this, of course, it then is referred to every time one refers to anything. And when it is a below 2 on the Tone Scale solution, it of course is propounding this – it's propounding this very clearly, as aberrated as this sounds: To survive it is necessary to succumb. And that solution always propounds that, one way or the other, in some oblique, aberrated way.

Survival is made up of a numerous number of succumbs. How to survive: "Not to have any fun" – that's a good way, see? "To cry all the time." "To appear to be destitute." Obvi-

ously, see, I mean, to... These are all manifestations of non-survival, don't you see? Survive, in order to, it's necessary to manifest non-survival in order to survive. It's always this kind of an oddball solution, see? You'll get something like "not eat," see? That's quite common, by the way, service facsimile: refusing to eat, not eating – common service facsimile. Little children will play this an awful lot of the time, and when it gets out of that realm and range and moves into adult life, why, you have diets. They usually don't amount to a service facsimile, but when they do, you've really got a mess on your hands. It's really a nice, big mess. And this must be terribly common because one of the major problems they have in insane asylums is making people eat. Not eating is one of the final protests – hunger strikes. Throw guys in jail, one of the first things they think of is go on a hunger strike. If they want to make a big protest, they go on a hunger strike. So there's a very common service facsimile.

Some version of no sex – no second dynamic. I don't care how you have it or how you phrase it. It's got to be some "no second dynamic" one way or the other, see? It's an incapacity on it; it's an aberrated practice of it. It can go worse than that. How to survive, you see, is to murder children. How does that add up? Well, it adds up to the guy all right, you see? And on the first dynamic, how to survive? Well, commit suicide, you see? In innumerable ways, you can commit suicide on many gradients, you see? "Be ugly," you see? "Be overweight." "Be too thin." Be this, be that, be disabled, be something, be something – doesn't much matter what it is, you see? You might collide with that on the first dynamic.

On the third dynamic, "to be antisocial." See, these are all sure methods of non-survival, don't you see? And yet they are added up as a survival computation. "Shoot policemen." Third-dynamic solution: how to survive: shoot policemen. Simple, effective. And you say, "Yeah. But that couldn't be a service facsimile in this lifetime, because this pc has never shot a policeman in this lifetime." *Ha-ha-ha-ha-ha!* Don't make me laugh. This pc has always shot a policeman; every time they see a policeman they shoot a policeman.

"Robbing houses." You say, "Well, robbing houses – this individual – this couldn't be a service facsimile, because this person has never robbed a house." Oh, well now, don't be too sure. Never passes one but he doesn't rob it – thinks about it and so forth.

Well, how does he use this service facsimile? Oh, he uses it via the newspapers. He always clips out robberies and shows people about robberies and that sort of thing. Figures out robberies; reads nothing but detective stories, see, and – robbery – robbing houses; good service facsimile.

So, you see, it doesn't even fit in with the guy's environment. Therefore, it sometimes is rather hard to trace.

You get somebody who is in a death cell, you see, having already shot up innumerable policemen and so forth. Well, you know what his service facsimile is – you think. You say it's obviously "shooting policemen." No, I point something out to you: He shot policemen. Probably wasn't his service facsimile at all. His service facsimile is probably "never loading guns" or – you know? Service facsimile is "being kind to everyone."

See, the exact circumstance of the person doesn't always guarantee you that you have your hands on the service facsimile. That's what I'm trying to point out here. Because this thing goes underground. It's not very visible, and they very often... The most effective service

facsimiles are those which are totally hidden until you've come anywhere in their vicinity and then they're laid in your lap, see?

You don't find service facsimiles above 2 on the Tone Scale. Now, it'd be completely silly, then, to add up the ARC of the lower Tone Scale, like "not communicated" or something like this, and say "Well, his service facsimile is 'not communicated'." "How would not communicated make you right?" or "not having communicated make you right?" or "not communicating make you right?" and so forth.

Well, this is, I'm afraid, a little bit too general, see? You don't use these buttons by their isolated selves because they are insufficiently directional.

The pc answers them too broadly.

And all you do in such a case is restimulate the service facsimile without labeling it. Well, let me give you – just dream one up here; don't say it's terribly workable: "Who or what would make themselves right by not communicating" Something like this. Or "Tell me a means of not communicating," and make a list and assess the list. Don't you see? Some odd action of this particular character. Such a button, then, is useful for the location of a service facsimile, but is not in itself a service facsimile.

You eventually get, on this list, "hiding pencils." And you say, "Well, this can't be very damaging, but we will run it anyway." Well, it's not maybe very damaging; but you find out that the reason the pc has always looked so bulky is because they're always carrying fifteen or twenty gross of pencils; can't get into their room at night because of the crates of pencils, you know? Everybody in their vicinity misses pencils all the time. Never spotted him. This is loopy conduct of one kind or another. But sometimes it can look so ordinary to you – because this is this planet – that you sometimes don't put your finger on an obvious service facsimile.

Let's say it isn't "being sick" but it's "having chills." "How would that make you right and make somebody else wrong?" or something like that, you see? Or "having a cold," or something like this. That still could separate out into a service facsimile, don't you see? But it might not be on and it might be on: it doesn't matter.

You, you see, I've given you a bunch of stuff that you may think, by this time, the service facsimile, again, is very hard to locate. No, it isn't. I'm just giving you the idea that you've got to look for it. You've got to prowl around. After this character has given you something that might be it, make a "represent" on it. Be quite frank with the pc. Don't pussyfoot on this thing. There's been too much pussyfooting about already.

Say, "We's looking fo' you' service facsimile. What is it, boy?" You know, subtle!

"What do you think your service facsimile is?" Do a list. Pull the missed withholds and null that list – good reliable method. Pc – withhold it perhaps, and then just the fact that you put it down on pulling the missed withhold – and all of a sudden he dives into the water, swims right over to the middle of the lake, dives right into the middle of the whirlpool and says "There we are. *Uhhhhhh!* What am I doing here?" Interest! Attraction! So forth.

Because, of course, it's not a volitional solution. That is to say, he doesn't think up this solution all the time. It's a subawareness solution which goes into automatic action. It's that buried. He's right on the verge of it all the time, he's in direct connection with it all the time, so you just lay down the faintest link to it and he can't help but travel that link, don't you see?

That's one of the reasons, you say, that neurosis and psychosis are very, very difficult to maintain. All you practically have to do is spot them and they start blowing up. It's very hard to dramatize the exact reason for them.

Why anybody would go through heroic actions to explode a psychosis or neurosis, or electric shock people or go into brain treatment, just because the person is jumping about the floor and screaming or refusing to eat or doing something like this, and so on – that's not a good enough reason. That doesn't mean that the psychosis or neurosis is violent, you see? That only means that it produces violent reactions. See, it doesn't mean that it is violent at all. Maybe this girl, insane, is jumping about the floor because she doesn't like cockroaches. And that's the logical explanation of the thing, and people fail to note that this is true because there are no cockroaches there. But she's seeing cockroaches, you see?

So you might have something on this order (this becomes very elementary): You say, "What really might be worrying you all the time?" You make a little list. And she jumps about the floor and hangs from the chandelier and rolls up in a ball and so forth, but she'll talk to you and she gives you, finally, a list. And you assess this list out according to interest: Which one is she really most interested in? And you'll find out that it's cockroaches. She's very interested in these cockroaches that are all over the floor. And you'd say, "Well, how would seeing cockroaches make you right?" And that's probably the end of her insanity. Why, she probably couldn't maintain it from that point on. She wouldn't be well; she wouldn't be calmed down or anything like that. But she's now going to have a hard time maintaining it because she's got a connection to it. And the thing will discharge. See, it's hard to do now. Now you got to get volitional about jumping around in the middle of the floor; now you got to mock up the cockroaches to put them on the floor, don't you see? And she just can't make it. And that charge, just that much charge, and it's gone.

That, by the way, was practically the totality – the accidental fact there, is probably the totality of the Freudian recoveries – is contained right in that. It's just that they would evaluate in some fashion or another, like you do with an ARC break, you see? And they'd happen every now and then to strike something that was a service fac, and the individual would think about it, and it would be impossible then to dramatize it. But not knowing the mechanics of it, it nevertheless would slightly discharge, don't you see? And it's all those false assignments that made their people sick, see? It was the assignments that weren't service facs, and that sort of thing.

So you can learn from that just in passing. And don't give a guy a bunch of phony service facs, see? Let him decide what it is, you see? Don't ever foist one off on anybody. You'll find that's always a good part of the rules. If he says it isn't it, it isn't it, man. That's it. That's the rules. Customer is always right. Because frankly, if you've got it, he can't stay out of it, see? That – if you keep that little fact up your sleeve, why, you can afford to reject any quan-

tity of them. You say, "All right, 'beating dogs' and so forth. You don't think that is it. I had it on the list here. It read a little bit."

"No, I don't think that is. Beating dogs, beating dogs, beating dog, beating dogs, beating dogs, and so on – beating dogs..."

"Would it make you right in any way?"

"Nah. Would beating dogs make me right? Hm. Heh. No. No. No. Wouldn't do much. Well, actually, could add it up – it could make me right to object to bad behavior on the conduct of dogs and make dogs wrong to indulge in bad behavior." End of computation, see?

You'll find every once in a while a pc will give you something like that. And then they'll say, "Oh yes. Let's see. How would it make me wrong? Now, let's see. How would bad auditing make me right or... bad auditing wouldn't make me right – it'd make me wrong." Of course, that's the end of that. You pursue that no further, see?

But, "How would getting stuck in an engram make you right and make others wrong?"

"Wouldn't do it."

"Well, how would auditing make you right and make others wrong. You see? How would auditing make you right?"

"Well, it'd make me right if I got better and it'd make the auditor wrong if I didn't." End of computation.

Of course, that's no service fac. Perfectly logical answer. There are no further answers behind it. No vast blast of the TA as it falls down; there's nothing going on here particularly. So you don't want to hang people with these things, because it's too easy to find the right ones. And they abound, man.

This is one of the most interesting little treasure hunts you ever engaged upon, see? And you might as well get used to what it is and figure out what it is and put your own itsa line in on it, and so forth, because you'll sure know what it is, then, see? You say, "Here it is, man. This guy has got this thing which is some kind of a horrendous solution of some kind or another, and it's got all this charge backed up. And whenever I audit him with a Prepcheck, why, very little TA action or mass turns on with a Prepcheck – must be a service fac. This case not very easy to audit; has a fragile tone arm; tone arm gets stuck hard" – another condition, you see? – "must be a service fac, and so on. Can't get this thing. Why?" Well, look – it – obviously, if all the discharge you're going to get is a confusion running off in the form of charge – if the charge won't run off, there must be a solution there which prevents the charge from running off. And that's all there is to it. He's got it solved. He doesn't have to look around. Back's bad and his head's bad and his ribs are bad and he can't sleep at night and he's got ulcers and so forth; but he doesn't have to inspect this. See?

Say, "Well..." You start running this down, you'll find out, well – do this little list or something like that, or however you're going to run it into, or do past data, moving in toward this thing – you find out he sleeps on the floor. Doesn't sleep in bed. Has a bed but he sleeps on the floor.

Well, I'd try that on for size and just say, "Well, is there any possibility you do that because it would make you right?"

Now, you're going to get one of two reactions: "*Ppffff*". Well, it would make the landlady wrong, because she doesn't change the sheets very often, and so I sleep on the floor, see?" Or, the other reaction, which is the one you're looking for, see, is "Well, sleeping on the floor make you right?" "Oh, yes, yes. As a matter of fact, it would, so on. And a long time ago when I was in – when I was in – in boarding school, you know, we used to have these bed – big high beds and so forth, and could pull you out on the floor and ma... But that isn't the real reason why this thing was. You see, I kept sleeping on the floor. Actually, you get more fresh air, and so forth, and..."

Well now, look, don't be a complete knucklehead as an auditor and try to go through some more action, see? You're just using auditing actions to cut the itsa line. You got one running, man. Just sit back and let it run. Do the easy thing, see? All you got to do is sit back and let it run.

The only trouble you'll get into is sometimes the pc starts running backtrack on it in a hurry, and then you should start getting nervous. So if you can get in an auditing question on the thing, why, slide "in this lifetime" or something like that on the front of the auditing question, providing you have asked an auditing question. If you haven't, why, try to get it in at the next question – if you get a chance to ask the next question. Got the idea? You might not get a chance to ask the question at all. It may run all the way out and he's now ready for the other side, see?

Now, the main thing that you gain from all this and the main thing you gather from all this is tone arm action. You've got the mass flowing that kept the pc from getting tone arm action. And that's your interest in it. You're not interested in his social conduct. You're interested in his auditing conduct. Where old medical psychiatry went adrift, we needn't go adrift. They become so fixated on the subject of "rrrrright conduct," without even being able to define what it is (except maybe a slaver when the bell rings), that these birds are always adjudicating everything on the subject of conduct. Insanity is a brand of conduct. Neurosis is a brand of conduct – conduct, conduct.

Well, the unfortunate part of it is – the unfortunate part of it is – that it doesn't catalog, it doesn't classify. You cant do that, see? Because it just renders everybody open to the charge of being neurotic or psychotic, just everybody wide open – which is one of the more interesting factors, and then they can use this politically, don't you see? And then anybody they don't want around, they merely say some of his conduct is aberrated and they can throw him in the local spinbin and chop his brains up for hamburger. I don't know what they eat.

The point I'm making here is that's highly dangerous – highly dangerous – saying a person is insane or sane when your sole basis of adjudication, you see, is conduct.

So this doesn't always meet the eye. Some of the most roaring inanities on this planet are classified as sane behavior.

Now, in actual fact, you're measuring up not a person who is in agreement with this planet but you're measuring up a person who has lived a very long time. So whatever is the service fac is the service fac, don't you see?

It's not because he does something peculiar, or not because he does something this, or – we have a list of things. I can tell you what it's more likely to be than something else. But action that is peculiar is only peculiar, not compared to the mores of the society in which you find yourself but just compared to the datum of survival. See, just compare it directly to the datum of survival. And it's always a contrasurvival action which is posing as a survival action.

Revolt. I don't even know why you'd revolt against an Earth government; they're all convicts, see? You're living in an area where there are no wardens, see? Actually kind of silly to do anything particular in this particular direction because they're nuttier than anybody else, don't you see? They probably need their hands held twice as hard as anybody in the spinbin, you know? They don't know what they're doing.

So what is considered normal on this planet might at any one point be completely batty. So the service facsimile comes down to the comparison with the datum of actual survival and the fact that the pc is interested in it and that it releases tone arm action because it must be a fixed solution.

So actually, what you're studying are fixed solutions uninspected by the person, which are contrasurvival. Now, when you hit all of those, man, you've hit the jackpot.

In any case which has a fragile tone arm which is liable to stick at the drop of an E-Meter cord, see – bang! like that – you're looking at a service facsimile. You must be. There must be a fixed solution. Why? Because there's no charge runs by it. So if no charge runs by it, it must be a fixed solution, and it gets in the road of auditing, so it must be contrasurvival. Actually, it could be a fixed survival solution which really was a survival solution, and you'd find it wouldn't even vaguely influence auditing.

See, you'd go out and audit the guy and you get tone arm action, and he'd go on flying and he's got these fixed solutions all over the place. He's practically nothing but a bundle of fixed solutions. You're trying to find the black spot in the middle of the ball of yarn, see? The black spot in the middle of a mountain of white spots. The mountain comes down if you find that spot. Fortunately for you, there are several gray spots in its immediate vicinity, any one of which can be hit and do the case some good. So it's a constant prowl on this route. You handle one. All right. Fine. Is this case going to remain stable? Well, that's very doubtful so let's find two. Let's find three. Let's make sure we got it, see?

Now, your tone arm is flying around and your needle, by this time – the thing can't stick. You find you find one, the case will tentatively resume its stuck-needle condition, momentarily resume it. Interesting. Can't hold it, but it's a drop, you know?

You haven't got all of these now; you haven't got all of them you want, and it'll still be a little this way. And the next one you find – *pshew-sss-sss-ssss-ssssew*. It's coming down. Needle is getting so it can't stand upright, because there's nothing to hold it. Just the weight of the needle causes it to bang against the sides, you see? You actually have trouble reading your

tone arm, as you're winning on these, when you are really hitting center. You're having trouble with that tone arm because you can't find out where to center it.

Your needle is not as nice as it was before. It's too floppy. You're having a trouble centering it. And you just about get it centered and it moves, see? And you just about get it centered, it flops over the other way. Your tone arm reading gets very, very inaccurate as this really starts to bite. You can't quite keep it properly centered. It's moving too fast, too. Pc just thinks a thought, see, and it goes clank! It's gone. But, gee, how much charge went off there? Well, we don't know. It's because you're bleeding, you see, a central reservoir of charge and it's flowing in a Niagara.

Now, the other thing it does for you and the reason why this is very beneficial to the case – completely aside from unblocking this – is a service facsimile is always protruded into present time, always protruded into present time. So any constant PTP that your pc has had will of course produce the service facsimile. And that is very good news for you. You can produce the service facsimile out of any PTP that has been constant and continual with the pc.

"What did you come into Scientology to resolve?" And he'll give you a long series of this and that.

Now, it's very, very dangerous to list too many problems on a pc. You list too many problems on a pc and you're going to wind him up in a bang! That's dangerous. Call that to your attention. Listing problems – not so good, see, not so good. Bad show. Doing an incomplete list of problems will ARC break the pc. A complete list of problems is very often too long and is a bit dangerous to the pc's needle and case condition.

So how do you find out the problems? Well, you have to take a step backwards before you take a step forwards. See, locating the problem that you're trying to solve – you can't let that run forever because that's the exact opposite of an itsa line. It's a whatsit line. See, a problem line is a whatsit line. And you can freeze your tone arm gorgeously with a whatsit line. So a whatsit list will freeze your tone arm, and so forth. So it had better be on the basis of a friendly discussion which you can leave in an awful hurry. And you recognize that you're taking a step backwards with this case, making him whatsit, which is basically what's bum with these assessments, and so forth.

"What problem – what was your chronic present time problems when you got into Scientology, and so forth? What were these things? What were these things you were trying to solve at that particular time?"

Now, if you hang up this case too badly, you can take that little list and ask for a solution for each one of the problems he's given you – if you've made a list – ask for some solutions for those problems, and you will take the tension off the tone arm. So there is a cure for this situation, but it's rather a lengthy and involved cure. But you may have, sitting right there... the solution, you see, is not a problem; the solution is not a problem, but a few of these problems can be looked at as pointers to a possible solution.

He's having trouble in a certain area. Now, your problem, once you've got any idea of his problems, is to put your finger on some solution with regard to that problem. And that solution will be the fixed solution – which gives you the service facsimile.

Now, notice that R1C and R2C are designed to strip away solutions, decisions and stable data off the case – so-called stable data. Therefore, they are very, very easy to run and they produce tone arm action and are the least likely to hang up the tone arm. You start asking for whatsits, however, in R1C: "Well, you say you have had a – you – you've had the idea that all snakes were – lived in the tops of houses, and so forth. Now, what problems would that solve?"

Man, cut your throat! You've asked the reverse side of R1C and the tone arm is going to go up and stick. But notice that your R1C and R2C, these itsa-line questions and run, are designed to strip away charge from the service facsimile area.

Therefore, it is a very good thing to find out if the pc has been run on R1C and R2C. Of course, they won't have discharged the service facsimile but they may have some data there that they uncovered in looking at all this, which you might then sort out and get an idea, don't you see? So you say, "While you were being run in the co-audit down there, what did you run into that you found very interesting while you were running your case? What did you really run into?"

"Well, I ran into this and that and the other thing and the other thing and the other thing," and you make your little bit of a list of these types of solutions and zones and areas and you've got yourself an assessment, See? Then run this thing down, and – with a little further discussion with the pc – and you're liable to hit right on it just like that.

Funny part of it is that R3R is almost a dead-center pitch on a service facsimile, providing it winds up in a stable solution.

Now, "failing not to communicate with eating figs in Smyrna," I don't think you would find a good service facsimile. I call that to your attention. If it doesn't make sense to you, it's not likely to make sense to the pc. So don't go astray on this, because, after all, the preliminary step of R3R was designed to do an entirely different thing and it may be only a fragment of that and it won't be the tone level you found, see? It won't be that. It'll be some fragment of it or a rewording of it.

Now, I funnily enough have found one on an incomplete R3R assessment that two stayed in on. The list had to be extended, don't you see? And one of those was the service facsimile. I find that quite interesting. In other words, if we had completed the list to the final run, we wouldn't have found the service facsimile, see, because it would have been buried back on the line a little bit, don't you see?

Well, this tells you that it doesn't really have to be a terribly good assessment – any kind of an assessment. You've run something like "failed to shoot" – "What have you failed to shoot?" or something like this, or "failed to have been with?" or something – And you get a list, get a list of this; go on down the line; assess the thing out. Well, even if your "failed to shoot" is kind of a lousy level, as long as it's in not because it's been protested or was a mistake on your part, see? Pc has protested it, so it's in, you know? That's the corny way those assessments go astray.

Pc didn't understand it, didn't know what it was. So it keeps reading, you know? If you don't clear anything with the pc while you're assessing the pc, you can expect that problem to come up on auditors that are green in your supervising sometimes.

That can be sort of corny and it'll still produce something. And you're doing yourself a list over alongside of this thing, and you didn't even really get a chance to complete your list very well, and so on, but it went out, and you finally had a level stay in. It's much more likely to be that level if the pc is interested in it. You get the idea. It's the item – pardon me – it's much more likely to be the item, you see, than it is the level, because the level is too broad. And just running it loosens up the bank enough so that you can then do one with greater accuracy, because everything on that – as long as you just got something to stay in for fifteen strikes or something like that – you know, one of these arduous lists where everything is alive on the whole list. Everything is alive on the whole list and you've got ten strikes after each one, but one has fifteen strikes in before they *all* went out. You know, one of those corny ones, and so forth. You can actually pick up one of those and the thing that has fifteen strikes, "Was that in because you didn't understand what it was?" "No. I understand what it is all right."

"All right. That's it. Now we're going to list this one."

See, it's that crude. You'll still get somewhere in the vicinity of a service fac, because it operates just like a magnet. And that you're ticking away at it draws the pc's attention toward it, and as he lists, he's even liable to list it non sequitur on the list. It doesn't even answer the question, but there it is, see? You want to watch this, see, because his attention is being pulled to this thing inevitably. You're asking him for right answers, and he gives you the rightest answer he knows: "Jump off the top of the Empire State Building." That's the solution. That solves everything. That solves all problems, so you're asking him "What don't you have affinity for in this lifetime?" and he finally puts down "jumping off the top of the Empire State Building," see? Hasn't anything to do with what he doesn't have affinity for, but it'll go on the list. You get what I'm talking about, now?

You see, your assessment is greatly assisted, greatly assisted by the fact that as long as you're not ARC breaking the pc and keeping him on levels that he is protesting and is unhappy about, and as long as you don't disregard the pc's interest while assessing, the mind gets pulled right over to the service facsimile, bang! They'll put it down non sequitur. They'll put it down a dispersed, a disassociated item, and all kinds of wild things happen while you're doing an assessment. You want to watch this sort of thing. That thing stays on the list, and you notice it doesn't even have anything to do with the list sometimes.

Well, actually, the degree it's disassociated from the subject of the list is the most likely clue that it's a service fac. But it just reads on the meter as long as anything else. It'll stay in. You'll assess it out, long as the pc understands what it is and isn't there because it's a protest, see? Solution is not very difficult to find. If it's the solution to life, the guy is going to give it to you. He's going to handle your session with it. See? And you'll sometimes think you've been an awful knucklehead. You've had a pc sitting across from you for a long time that's been handling all sessions with this. Something like that. So it eventually dawns on you that that's what that is, you see? Doesn't make sense, but it's sure been present.

And I'd keep looking for and running service facsimiles on a pc until it looked to me like we had notoriously and considerably altered this pc's methods of going at life and until I had a wonderfully free needle and a nice, gorgeously clear TA, and I'd just keep it up.

Now, what's the basic benefit? I was going to give you one other benefit to the thing. It, of course, is the source of your present time environment. So the pc who is always coming to session with a PTP that has to be audited before you can get on with the session, of course is having his service facsimile kicked, out of session. So it's a diagnosis of the existence of a service facsimile. That's continuous. Anybody has a PTP once in a while. That's always got big PTP, big, big, you know, big, big. You know, *"Il-dal-dal, oh-dada-dal*. And we can't be audited today because of so-and-so, and we got to handle this other situation and so on."

You're just looking at a service facsimile. What mass is it that is such a magnet for trouble on this case? There must be something restimulating here in the environment all the time. There must be some restimulable item right here all the time. And man, if you can get rid of that, the overrestimulation factor of a case vanishes. See? The overrestimulation vanishes. So you have knocked out at one fell swoop – because restimulation by reason of present time is always about 50 percent of the restimulation present on any case at any given moment, that has service facs, you see? It's about 50 percent of the charge on the case.

You've only got, then, 50 percent, you see, that you can restimulate with safety because the tolerance for restimulation, you see, is lessened by 50 percent. All of a sudden this character will run like a startled gazelle if you can get this service facsimile out of the road, because your environmental restimulation has nothing to kick back on.

Now, we used to try to solve this by "process him faster than the environment can kick him in." Remember? You know? Process him twenty-five hours during the week, keep him away from home, and his wife won't kick his head off, and when he goes back home he'll stay stable. You know? That kind of thing. But we were just hoping we'd get the service facsimile before he went back home. You understand? So if you could reduce that factor out of the case, then all the gains the case made in session would stay. So there's another bonus. See, the cases wouldn't drop between sessions, see?

Now, the amount of attention which the pc has turned in on this service facsimile, and it's the disabilities which accompany it, and so forth – the attention that he has on that – also keep him from looking at his bank. I could say that an expert handling of service facsimiles – this is just a wild guess – would probably raise the runability of a case about a hundred to one. How easy a case would be to audit. See, if every case has some of this and it only becomes visible when some cases make it impossible to audit, see, well, how easy is a case to run? Well, we probably don't know the answer to that question.

See, but we know some cases are impossible to run and those are the ones we have attention on right now. So, you take care of those for me just now, will you please?

Thank you.

SERVICE FAC ASSESSMENT

A lecture given on 5 September 1963

Thank you.

Well, you're very lucky today. Very lucky today. I'm not mad at anybody. What is this date?

Audience: 5th of September.

Five Sept. AD 13. And we have a lecture here on Scientology Three, which wraps up the field of psychotherapy.

I don't wish to overemphasize these banal, sweeping statements – and I don't even think you heard it. In fact, I know you didn't!

I'll say it again. I have a lecture here which wraps up the field of psychotherapy. [applause]

Thank you, thank you. [laughter, laughs]

All right. Now, we have been walking around the edges of the field of psychotherapy, by which we determine its relationship to the neurotic and the insane, and so on, for a very long time. We've been giving the boys, who we thought were holding down this field, the courtesy of more or less staying out of it, and so forth.

But there are some interesting things which you should know before I go into the technical material involved here. And this is sequitur to the two lectures which you have heard this week, but there're some things which you should know at this stage.

The word psychiatry has no proprietorship, has no legal definition, is supposed to be the treatment of the neurotic or the insane, and isn't owned by anybody, isn't patented, means nothing in law, and so forth, but does mean something to the public. I consider that's interesting.

We were having some press trouble here a few weeks ago and I wrote at that time some articles on this particular subject which clarified... I had to study two particular spheres – that of newspaper, and had to study the field of psychotherapy to some degree. And although I was talking a great deal about psychiatry, I finally differentiated exactly what I was talking about. I was talking about the untrained mental doctor in the field of psychiatry.

He has no business there. Of course, you always look for an aberrated situation, you'll find that there's a lie connected with it.

Things which people can't solve have a lie connected with them, and that thing we call a service facsimile. And this happens to be the third-dynamic service facsimile. The medical doctor who is not trained for and has no business in the field of mental healing is attempting to take dominance over this particular field.

See, he's not a trained mental practitioner. In fact, somebody just gave me a clipping – down in Australia, some London bigwig comments on the amount of training given the medical doctor. And I think it was ten half-hour lectures, most of which were unattended by the students. A real roast.

No, this man is not trained in the field of the mind. He's trained in brains and surgery. So therefore, he applies brain – gray matter and surgery and force and electric shock – naturally applies these things because he doesn't understand the mind at all. He has no proprietorship over the mind. And as a matter of fact he's not trained in the mind at all, he's trained in the brain. He knows it occupies the skull and that you can shove ice picks in it. And this he considers mental healing.

Ah, but he's told a big lie. He's told a whopping lie. And he's put it across on legislatures and that sort of thing: that the medical doctor is qualified to operate in the field of mental healing. And of course he's not trained in the field of mental healing.

And all you'd have to do is bring pressure to bear on legislatures that people who are not trained exclusively in the field of the mind may not practice in the field of the mind and you've secured the entire field of the mind. I think any legislature would pass this. "People who are not trained in the field of the mind must not practice in the field of the mind." Banal.

It's on that stable datum that most legislatures pass laws – misrepresentation. You've got to be trained in the field of the mind, you see? That's the is-ness of the situation. The big lie is that people who aren't trained in the field of the mind at all are practicing in the field of the mind and calling themselves psychiatrists, which they are not. They're medical doctors. The only person you have to deny the field of the mind to is the medical doctor, and he has no business there.

As far as the field of the human mind is concerned, George the other day, did a survey out of all existing society records and so forth, and found out there were 272 mental practitioners in England outside of Scientologists – 272. And there were some eight nurses who were also qualified to give diathermy to the disturbed – 272? Well, we outnumber them, man! Over and over and over, I mean, just active Scientologists outnumber them in England. They're nothing to outnumber. There are 70 in South Africa. In all of South Africa there are 70.

In other words, there is no field of the mind. There's apparently a great deal of advertising, there's the medical doctor, who is numerically very short in supply, and there's lots of articles in the newspapers saying "the field of the mind, the field of the mind." There's legislatures, there's appropriations. Everything is all laid out just as though there is a field of mental healing.

I wish to point out to you, my fair friend, that it's a totally unoccupied field. There isn't anybody in it. They rattle around like an atom in a cubic light-year of space. See, they aren't. You don't have an opponent. And one of our lies, then, is that there is some opposition. And

we have done the trick of putting an item where it isn't. See? We've said there's opposition there; therefore we've mocked up our own opposition. And you know how serious it is with a pc when you put an extra item into a GPM. See? Well, we've done that.

Now, somebody, gratuitously, someplace or another, I don't know on what budget, is advertising the existence of mental healing. I don't know, but they're spending fantastic quantities of money on it. There's nobody to receive the results of it except us. This becomes a ludicrous situation.

Therefore, people qualified at Level III will very soon have available to them a certificate as a psychiatric consultant. It's perfectly all right with me if you call yourself a psychiatrist. [comm lag, applause] Marvelous! People must be looking all over the society for these psychiatrists, you see? That's 272 of 'em. Isn't this a fantastic situation? When you look at it – when you look at it right in the teeth – you see that it is a fantastic situation.

Now, when you recognize that human illness will surrender to R1C, and certainly to R2C – you know, that's just "What solutions have you had to your lumbosis, bud?" – you're going to get 60, 70 percent returning. There would be 30 percent, 40 percent, something like that, that won't recover. That's because they require further care.

But just your ordinary healing: You know what you can do with an assist, you know what you can do in this various levels. The medical doctor isn't even then safe in his own field of healing. He isn't safe there because I think that an HCA, an HPA, very shortly, will be graduated in the field of healing. He'll know the three corners of the ARC triangle and the eight dynamics, and he'll know some of the basics of Scientology, and he will know how to keep in an itsa line and keep it directed to the person's illness, or something like that.

And just about that level we have an HCA/HPA. And then your Level III is somebody who can list and do a Prepcheck. So we've opened the gates here by taking out and training and specializing in.

Now, when you think of your level of training, well, this is something else, isn't it? So that requires a much broader recognition. And there's a lot of HCAs and HPAs right now who won't be just eligible – through the training they are getting right this minute – they won't just be eligible for an HCA or an HPA, they'll be eligible for an HSS, don't you see? All they've got to do is round off their qualifications for HCA/HPA with their itsa line, don't you see, and that gives them that. But they've already gone on to Prepchecking and meters and all kinds of wild things of this particular character and so on, so they've practically completed their HSS.

Now, how about you? How about you sitting here, you see? What do we do with you? Well, I don't know, we've already got you a certificate, haven't we? And we can also make this other certificate available to you, "Psychiatric Consultant."

So if you want this certificate, listen to this lecture! Because I'm not going to have it said about us that we give ten one-half-hour lectures which nobody attended. We'll go them one better: You're here, listen! [laughs]

Now, you've already had two lectures on this subject. The difference is, we expect now that you produce some results with this. Now, you've been getting your fingers...

(This is the lecture I'm giving you now. Those were mainly announcements. Giddy world we live in.)

The orientation of Scientology – reorientation of Scientology – looks very innocent. It looks like nothing much happened. I put out these five levels of Scientology, you know, and it brought order, order, order, order, order, and everything has been snapping into place beautifully. Well, you're the winner because you've gone all the way on up through the lot, don't you see? And the future face of Scientology will look a bit different.

But Level III is expected to be able to clear. And it also, incidentally and accidentally, takes in the whole field of neurosis and psychosis and gives you a greater purchase on this particular zone and area than any mental practitioner in existence on the face of this planet – or any other one, for that matter. You'll be far more qualified to treat the insane if you can do this particular trick, because this is the only thing that makes them insane.

This is the basis of insanity. The basis of neurosis and the bringing about of a state of Clear are all the same breed of cat, except they're just different degrees. It's what is it wrong with the mind, but it's in different degree. The degree is whether a person can live with it or not. And if he can't really live with it but just worries about it all the time, all the time, and really can't live it at all, and so forth, well, we say he's neurotic. And if he can't even manage himself in his environment, we say he's insane.

But what's wrong with him? He's got the final solution. He's got a final solution and that solution is not necessarily the solution of being insane. It is some solution which is all-pervading and makes it unnecessary to it's anything. After that he never has to look. So of course, what happens to him? He just disappears in a mound of un-as-ised mass. He never has to look. All he needs is the solution.

Now, in processing, a certain amount of introversion takes place. A certain amount of introversion takes place by reason of processing. But that introversion is only undertaken to bring about extroversion. The actual progress of a case depends upon the raising of the A, R and C of that case, step by step, forward. The only way that introversion does not lead – introversion and erasure of something – does not then lead to a greater ability to reach in the environment or greater ARC, the only reason that does not occur, is when overrestimulation is brought about.

In other words, you restimulate twenty units and pick up ten of charge, you see? Well now, although you have advanced the case by means of erasure, you've actually increased the introversion of the case by running it at too high a level of restimulation. That factor still exists in Class IV. You've restimulated too much.

But it is full track, whole track, that is most likely to get a pc into this condition. You're not likely to get this pc into this condition in the very circumscribed area of one lifetime. You have to let his attention wander all over the whole track and on to the backtrack, and let him it's this GPM and that GPM and another GPM, and this chain and that chain, and not flatten these things, and so forth, at Level IV, in order to get this individual more introverted by reason of processing than extroverted. But of course, you're winning all the time, even though you're winning with an introverted pc.

In other words, he's looking in all the time, he's looking in. He is not reaching more. He will eventually come out of the woods at the far end of this thing and have a tremendous reach. But during the period of his going, he is overrestimulated and therefore introverted.

That's the ills of overrestimulation. They are not very great. You're not likely to spin anybody.

That's at Level IV. What about overrestimulation at Level III? Well, at Level III you take somebody who is very, very batty. You could probably overrestimulate him in this lifetime. Let's take somebody who is in catatonic schizophrenia. Let's use a fancy term – doesn't mean anything. Catatonia means they're lying still, in apathy, unmovingly and not reaching anything. Schizophrenia means "scissors." I don't know how you can lie still in a scissors, but they've managed it.

Just shows you what happens when strange people who don't know anything about the mind try to invade the field and advertise that they can do something in it: They get things corned up this way.

Let's put it more factually. This character is in total apathy – total, unmoving apathy. He's lying there in the asylum. If you put your finger on the exact button this person could talk about and would talk about, the person would communicate with you. But if you put your finger on a half a dozen other things and plunge them into even this-lifetime engram, or something like that, the person would spin more, don't you see? So the worse off a case is, even in one lifetime – and this is true for all cases, even on the whole track – the worse off a case is, the more careful you have to be about overrestimulation. If you restimulate something, pick up the charge you have restimulated. That is the byword on this.

Now, you won't see very great upsets by this, but once in a while somebody will – who is pretty bad off, somebody who is pretty neurotic or something like that – if you're treating this person, if you're processing this person, and you all of a sudden just ask them accidentally for any pain or anything that was connected with that incident – and of course they've been running it on a conceptual basis and weren't close to anything like that – and they suddenly go into more pain and they practically spin in front of your eyes. You got the idea?

So the worse off a case is, the less reach they have, the less ARC they have with their environment – these are the things which measures worse off, see, the less reach, the less ARC – the easier it is to overrestimulate the case. Becomes very easy to overrestimulate the case because you're using very powerful tools, actually, and they go into the mind like they're going through hot butter. And it's very easy to do this.

So remember this; this datum monitors all clearing efforts, and that's Level III. You see, you're not going on the whole track to clear anybody; that is the next thing you must realize, that you're going to stay off the whole track. If you're going to clear somebody, you're going to stay in this lifetime, and that's the only place you gonna stay! If you're practicing Level III, you have not left this lifetime; if you're practicing Level II, you have not left this lifetime; Level I, you have not left this lifetime. You got it? The only place you leave this lifetime is Level IV. And the only reason you take somebody down the line on Level IV, if their tone arm is sitting more or less in a very active conditon. And it never goes low and it

never sticks high. And then you're going to run somebody down the track because then it's very difficult to overrestimulate them.

You can overrestimulate them at Level IV. You can just, perforce, overrestimulate them, in spite of good tone arm action and so forth. You can do it.

But this is Level IV. This is Level IV when you take them on the whole track. So Class I, Class II, Class III, whole track? Nyet, nyet, nyet. See, strictly Russian participation in world affairs. No!

Guy says, "You know, I think I've lived before."

"Oh, good. Thank you very much. I'm glad of that. Now, in your immediate environment here, have you noticed..."

You understand? Why? Because if this person is having trouble... Now we get to the next factor of restimulation, see? This is all a piece with what you've been hearing about restimulation and everything else. It all integrates together very nicely. You got another factor you're working uphill with, with any pc on this planet particularly, and that: environmental restimulation.

And it is environmental restimulation that is the straw that breaks the pc's back.

If you can audit the whole track on a pc who also has environmental restimulation, you are doing something heroic. It can be done; it makes hard auditing, and you are doing it right this moment in Z Unit. So don't think it can't be done. But you know, right there, that it's a source of considerable amount of upset and worry. Guy has PTPs, he has this, he has that and so forth. What are all these things? What's all this constant level of restimulation in this environment?

You take, in an HGC, where people are walking in off the street: these people have PTPs; they're just nothing but a walking PTP. Well, all right, that means their environment is keeping them tremendously restimulated. Day after day, night after night, their environment is restimulating them. That's environmental restimulation. That's the wife's natter and the kid's demand for another shilling. That's the income tax folder that is lying in the mailbox. That's the news that just comes out on TV that all males are now going to be conscripted below the age of and above the age of, or maybe, see? It's this, it's that, it's the other thing. Environmental restimulation.

When this source of restimulation is at a high level, the pc is unauditable. And the difficulty that the auditor has in carrying forward a case to a good win is basically – when dealing with the public at large and that sort of thing – is basically auditor versus environmental restimulation, not auditor versus bank at all. Now, this is so great that an individual who has tremendous present time problems in his environment does not make progress on his auditing. He will not change his graph.

Now, we know that. That's a stable datum, man, that's in with spikes and rocks and welded. They know that in HGCs; before they operate very long, they learn that one. Pc has a continuous PTP throughout the intensive, there will be no graph change of any kind whatso-

ever. If he has a PTP throughout the intensive and ARC breaks during the intensive, the graph will worsen.

How to make a high graph? Well, you've got to audit the pc in such a way as to get around the environmental restimulation. Therefore, the practice of an HGC operating mainly with raw public or partially interested Scientologists or just newcomers, something like that – or even old-timers, very often – is a battle with the environmental restimulation, the surroundings in which this person lives. It's not a battle with the reactive mind at all.

Now, when this environmental restimulation rises or when the pc is more susceptible to it, he gets into states which are called neurotic and psychotic. There are no psychotics on the whole track – no whole track psychotics. Psychosis is a temporary condition which normally exists in one lifetime. Interesting look, isn't it? Very temporary condition because it's environmental restimulation monitored by the susceptibility of the individual to that environmental restimulation and that's all there is to it. It's his ability to withstand the restimulation of the environment versus the environmental restimulation.

Now, of course, a person's ability to withstand the environmental restimulation is one erg of thrust-back, you see, and the environmental restimulation is three ergs. Right away you're going to get a condition – of course, I'm giving you an erg or a dyne or something like that, you see, as some fantastically... I think a dyne is the amount of force exerted by one something-or-other, infinite – one gram going one centimeter? What is this thing? It's something on the order of a lead pencil dropping – a lead dropping from the end of the pencil to the table, don't you see, over a distance of about a half an inch. You know, just nothing, see?

Well, this guy's a very weak little fellow and he lives on a little farm, and it's a long way from every place, and it's awful quiet. But his environmental thrust-back is capable of only one erg, see? And by God, one day the pigs get loose. And by God, he spins. You see, this is proportional. This helps you understand what happens to cases. And this other guy has three megatrons of resistance, and he's got forty foot-pounds of thrust in his environment, see? Nothing, you see? Doesn't even dent him, see? Run the whole track like crazy, see? See, his environmental restimulation is fantastic, it would have killed forty people, see? It just doesn't happen to bother him. He can handle that much, don't you see?

So it's the environmental restimulation on the one hand and the ability of the individual to front up to it on the other hand which gives you your difficulties of cases. It's those two factors in combination – see, these two factors in combination. It isn't just the environmental restimulation. Well, you see, there's fifteen office workers, and all of a sudden a concrete mixer sets up across the street. And they start putting up a new building, and one of them goes batty and the fourteen do all right. What's this? It's the same stimuli. See, same amount of environmental restimulation, but one of those girls had very low resistance – that is, low thrust-back.

Well therefore, if you simply studied the environmental restimulation and sought to reduce environmental restimulation by social or public measures, making it a very quiet life, you would make a lot of people go sane – this is perfectly true – but a lot more would go mad with boredom. See, so the do-gooder with his idea of "Peace, peace, peace, peace" is trying to get himself an environment that he can live in, that he won't spin in, see? Don't you see?

And these characters that go out beating the drum along this line as an exclusive thing, you see, they'll work the hardest at it because they're the most worried about it. But they create, in the final analysis, a very dull world, and therefore they get protested against.

For instance, people have hobbies. Some people have some hobbies, some people have other hobbies. Some people have the hobbies of knitting. Some people have hobbies of sitting still and daydreaming. Some people have the hobbies of riding motorcycles and some people have the hobbies of shooting down airplanes. See, there are various hobbies. This is how much randomness an individual thinks is necessary to the environment.

And you're coming back now to an old principle of acceptable randomness. Well, acceptable randomness is this ratio which I just talked to you about. People, for a long time, couldn't understand this factor; well, here's the understanding of it. It's the amount of restimulation of the environment measured against the amount of restimulation which the individual can withstand. And these two factors together give you a constant.

Now, it's very hard to work out this constant because we have no actual figures, but express it in terms of life: This individual is able to stand one dinner party. See? And he gets two funerals and a suicide. You see how you can work this out? And here's this fellow who can withstand two massacres, you see, and a wreck, and he gets as his environmental restimulation one dinner party. See, so you get these differences amongst people. And it makes them all look different, but actually it's on the same basis, and it's on this basis of restimulation.

Now, you're busy auditing: You're auditing this guy that can stand the randomness of one dinner party, and you audit him into an engram where he had a wreck. Now his environment consists of what? The ability to withstand a dinner party, but the restimulation of the environment is what you're running him on, which is one wreck. He's promptly swamped. He's promptly swamped. He can't run that kind of an incident. He just goes in over his head, don't you see?

Well, one of the ways pcs solve this is by not going in. And it is probably the favorite method of resolution. They audit only what they consider safe. This is almost line one of Book Three of Dianetics: The Modern Science of Mental Health, see? The mind monitoring – you know, it won't go in over its head. We got techniques now which can push a guy in over his head but that's beside the point. The point is that the mind tends to shut off any restimulation that will overwhelm it. It just tends to.

It's like, this guy can stand one dinner party. And you say, "How would you like to have two funerals and a wreck?"

"Uuuhgh, no!" See?

Actually, this gets so bad, that if two funerals and a wreck incur in his environment, he can actually just be completely – they didn't exist. They aren't real to him. He locks them up out there as not having happened. And so does he lock up his bank as not having happened.

In other words, his ability to resist restimulation is too low for him to face up to track, and there's your problem as an auditor. How are you going to get rid of any track with this boy, huh? How are you going to get rid of any track at all? How are you going to get anything

done on this case at all? Because that case is liable to sit there and not even come in close to its track, or ambitiously going in over its head all the time.

So cases actually divide into three categories: those who are audited easily, those who won't even approach the bank and those who are always trying to commit suicide in one.

We'll call these cases Three, Two and One, with the One, the case who can be audited, you see, and the other two, you see, as cases that always are going it too strong, man. In eating, you'd say their eyes were bigger than their stomachs and all this kind of thing. Then the other fellow who just won't – Two, you know – just the guy that just doesn't even come near the bank, he just doesn't have anything to do with it, see? "What bank?" you know, "What bank?" Engrams all over the place, you see; he just got through – just got through going through a windshield, see? "What engram?" you know? He's cutting his throat with it all the time. Doesn't exist, see?

And you say, well, "Let's run out this accident you just had," see?

"What accident? Where? No accident. I just learn to take things calmly in life, you see?" And he's sick and sick and sick, man. He's just learned to take things calmly in life, see? He's got something going there, see?

Well, how do we convert Case Two and Case Three into a Case One? How do we convert these two cases, one which audits at a suicidal level and the one which audits on a no-approach basis at all, and you can't get anything done. And that no-approach basis is your most flagrant example of the stuck tone arm, the low tone arm, the dead thetan – these misbehaviors of the tone arm, see? Don't come near the bank. Hasn't got anything to do with him.

Now, how do you convert that case into one that is auditable with good tone arm motion? Well, now I have – I've given you a lot of technical data here. I don't really expect you to do too much with it or think about it too much. I'm sure you understand it. But I'm giving you the actual technical background to the highly elementary material which I'm now going to give you. This material is very elementary.

All cases tend toward the safe solution. All cases tend toward the safe solution. You're making a note on it, write it down and underscore it. That's very, very important. That is an element of simplicity the like of which you never saw, see? Some cases – some cases – also adopt a vengeful solution: "Getting even with them by dying."

Now, when I say all cases adopt a safe solution, oddly enough the dangerous solution comes under the heading of a safe solution. This gets wacky, but "the safe thing to do is to jump off London Bridge," because it all comes under the heading of a safe solution, don't you see, but it's actually, sounds highly dangerous. And they very often go in over their heads. That characterizes, then, your cases that you're having any trouble with or having any trouble in processing. One has simply adopted a good, safe solution, and the other one has adopted a dangerous solution because it is safe. I know it doesn't make sense. That's what's the trouble with it.

Now, if you move these cases over into the auditable line, you will move them over on the channel of safe solution: All cases move over on the channel of safe solution – safe solu-

tion. Very, very important. Safe solution can be stated as "safe decision," "safe assumption," "safe treatment," "safe environment," "safe position."

You have a world here which is security-oriented. It is, for instance, trying to keep up the ideals and ideals of human rights. But we notice that human rights and human liberty are succumbing. Why? Because twenty bystanders stand around and watch the cops mess up a citizen's human rights, because they're all operating on a safe solution. So all human rights disappear down the channel of the safe solution.

That is the hole in the bottom of the bathtub. It's the most dangerous thing in the world to have a safe solution because that is the hole out of which sanity drains.

A safe solution inhibits observation. And anything which inhibits observation destroys. Whether a person is merely difficult to get over toward his bank or is going in headlong or in a much worse state – these are specialized states and are not gradients of the other state – is very neurotic or is completely psychotic (they are not cousins to these other states), it's just to the degree that they have adopted a safe solution. That's all that establishes it. That's the common denominator.

Now, you could make a lot of hay out of that – out of just that statement, just as a philosophic truth. And it is a philosophic truth. And that is the plow that plows the furrow straight down through the middle of the problem of the human mind as it has been approached and as it has been attempted toward solution by mental healing – granting this thing called "mental healing" that just plows it right up, man. That's the end of that. This datum underlies mental healing with the same sweepingness as "survival is the common denominator of existence," you see? It's actually another method of saying survival, in aberrated form. People make survival solutions which then become so safe that they become contrasurvival.

So you have entered a brand-new datum here. You've got a brand-new datum which is as compelling and as sweeping and so forth in the field of mental healing as survival is in life. People solve things in the direction of survival even when it means they have to succumb. When it gets into mental healing, you are actually investigating the difficulties people are having surviving. But the basic method of survival is the safe solution, and that makes the individual right and makes others wrong, and therefore, intends to enhance the person's survival by bringing about a position of dominance; permits him to escape domination and permits him to dominate others; and then at the higher level permits him to survive and causes others to succumb – he thinks. With great amazement, you'll find committing suicide as a survival computation as it becomes more and more aberrated. How to survive: not to survive, of course.

Everybody is solving that. The miser: How does he survive? How does he survive? Well, every once in a while in New York they dig somebody out of an attic or something like that; he's been dead for three or four weeks. And the guy has got no stuffing in his mattress at all, there's nothing in there but hundred-dollar bills, you see? And his method of survival is to have lots of money. And that's a very safe solution. But he's neglected, in his obsession with this safe solution, to spend any of it in order to live.

So as attention becomes more and more concentrated, it becomes less and less sensible.

For an individual to be totally wise, it is necessary for him to be able to observe his environment. He also must be able to permeate his environment. He has to be able to have reach.

It isn't good enough to have a couple of maxims tucked behind your left medulla oblongata to which you can refer in times of stress. The Arabian ruler, every now and then, would be calling up poets to help him out in his efforts to rule a flea-bitten population whose favorite pastime was executing rulers, and they would come up with such things, such gems, as "That, too, shall come to pass away." Very wise. Very wise. And yet if it were adapted totally, it'd kill somebody.

People have philosophy all mixed up with these witticisms, these platitudes. They look through philosophy for safe solutions. And you can take a philosophic textbook that has been down in the local library and has been read by pencil margin-scribblers, and all you're reading there are things which they widely agree with but which they also consider safe solutions.

Philosophy, then, is not a study of wisdom. Philosophy is simply a study of safe solutions. Makes it a very low-level activity, actually. For instance, Kant had himself a safe solution and I imagine that's what made him batty. He had a good, safe solution. A lot of things were unknowable. They were so unknowable that nobody would ever know about them. And this, of course, is completely nuts. If these unknowable things can never at any time be sensed, measured or experienced, how the hell did he know they existed? Well, he didn't. So he made up a fantasy over there someplace called the unknowable. And this made him very comfortable. He could live in the knowable.

And this is so general, and so forth, you even find it in Dianetics: Modern Science of Mental Health – says you don't have to know everything in order to know this. Well, that's fine. And that disarms one's thrust into this, and the amount of overwhelm; it lets him compartment things and look at things in sections rather than just be overwhelmed by the whole, don't you see? Well, that's an entirely different operation than finding a safe solution and then drawing off into a corner someplace with this safe solution and never looking at anything again. And that activity is what you will find most people engaged in.

Now, that safe solution is what we call a service facsimile. And that's all it is.

Now, you can be a very cunning auditor. You can be a very clever auditor. And sometimes (let me impart this to you on the side) you're going to have to be clever. You're going to have to turn up your genius to a cube level to find that safe solution in somebody. It'll be lying right in front of your face and you'll feel like a fool when you finally pick it up. But there it was. But to find out exactly what it is, and to use that, and so forth – it's very easy to state, very easy to do this. But remember, in the pc it is extremely alter-ised, complicated, and so forth. Even though it's sitting right on top. It's not believable. That's one of the things.

There could be thousands of them, don't you see? And it's picking out the one from those thousands. That's what's going to give you the most trouble. And sometimes you're just going to do this on sheer genius and find that you were dead right. And other times you're going to exert a great deal of time and trouble and sheer genius, and you're dead wrong. So the final test of it is, is did it resolve the case?

"Have I found the service fac?" is answered by "When audited, did it resolve case? If answer is 'yes,' I have found a service fac on case. If answer is 'no, it didn't resolve case,' I have not found service fac." And in the first ones you find, the most you can hope for is that you have found something that moves the tone arm and has moved you closer to finding the service fac, see? So you always willing to settle for that – always willing to settle for something that moved the tone arm because that, of course, will move you closer to finding the service facsimile. See, always willing to settle for that.

And sometimes, after you've found two or three of these – and each one you knew was *the* service fac, but somehow or other this pc didn't go free needle – actually, they've been very droopy for the next couple of days; *hahaha*, you know, didn't resolve the case. "We sure found the service fac on that pc, except it didn't resolve his case."

Yeah, I can hear you now, sitting around the table in the evening, coffee shop, saying, "Well, sure found Joe's service facsimile, you know? I sure found it. It was a very brilliant job. We managed to get these three coordinating lines, and they all crossed exactly in this place, and it was 'swallowing swords.' And he's always thought of that, and so forth. And we got his service facsimile," and so forth and so on.

Joe comes up and he's looking... [shows something, laughter] Or now he's in total prostration: "Yes, they found my service fac. Yes, yes, they found it. I feel terrible – I mean, I feel good."

So you see, the test itself – the statement is very simple – and the test of whether or not you found the service fac is also very simple: It actually reads on the meter. If you have found a service fac on the case, the needle will be looser and the tone arm in a more reasonable condition. See? And if you finally walked it all the way through to *the* service fac on the case, see, it's like all of these extra service facs you've been pulling off it are something like bands of trees and sod that lie up against the mountain peak, you see? You haven't got the mountain peak, but you sure got a lot of trees off of it, you know, and you got some rocks off of it, and it's looking more like a peak, anyway. It was just surrounded in clouds when you first located it, see?

The test of it, in each case, is looser needle, better-acting tone arm. See? So you're always willing to settle for that.

Now, the other rule that you come up against here is, that which doesn't run on the right-wrong when found, you prepcheck. And that which won't run on a Prepcheck, you run on the right-wrong. So you got it coming and going. This is pretty loose.

Well, let me see. You looked through the pc's folder, and you found "peanuts," and you found "brothers" – and this was other... you know, this is old-time stuff that's been found on the pc, assessments of one kind or another – you found "mechanics," and you found "dog biscuits," and you found "me," see? Various things, you know? You dug these up out of his old 2-12 and his parts of existence and his this and his that and that sort of thing.

Well actually, you could make progress with the case if you just applied this rule: is just prepcheck each one. Got it? You could assess the list and take the one with the biggest read and prepcheck that, and then assess the same list again. Because it must have some resi-

dence in the case, you see? And whatever else you find, prepcheck that, don't you see? And just prepcheck anything you found. See, just prepcheck it. And the second that you're not getting tone arm action from the Prepcheck, run... This is awful crude what I'm giving you right now, you understand, but I'm just showing it. You can take this gun that's been developing – that's R3SC – you can just take this gun and point it in almost any direction and birds fall out of the sky, see? It's marvelous hunting, I mean. Case is going to make improvement no matter what you do.

Well, that which you can't prepcheck with tone arm action you could treat as a service facsimile, see? I mean, just one, two, one, two, see? So it either prepchecks or it runs on right and wrong, see? "How would it make you right and make others wrong"

Well, a pc... it doesn't do much on a Prepcheck, and it doesn't do much on right-wrong: All right. All right. So there weren't any birds in that section of the sky the gun went off into. I mean, you haven't done anybody any harm.

You haven't done anybody any harm at all. And this is sort of creeping up on the mountain. You take a layer of clouds off of it and you cut a couple of trees on the slope and you bulldoze away an avalanche away from the side of the thing and so forth. And it's looking bigger and starker and so on. More clouds coming off of the thing, you see, and it's getting clearer and clearer to view. Because you can't keep up this type of action without displaying, eventually, the service facsimile.

Now, the funny part of it is, even the most obtuse auditor, if he kept up this type of action of assessing something or finding something that had been assessed, and he – prepchecking it, and if it didn't prepcheck well, run right-wrong on it, see? You know, run the steps of R3SC on it, see? If you can't prepcheck it, it's obviously turning on mass, so therefore, if it's turning on mass, obviously it has something to do with the service facsimile. So you run the right-wrong and you get that out of the road, and so forth. You just keep going at this sort of thing and keep a list of your debris of other things that have turned up, maybe, in the process of doing so. And your cleverness – your cleverness will pay off in length of time. The cleverer the auditor, the shorter time he can do it in. This is about the only thing you're narrowing down.

But the very, very clever auditor can be too clever. I'm not warning you against being clever; be a genius, man. Perfectly all right. But you actually can take this case – now, that's why I started this lecture with the restimulation data – you can take this case, and there is an assessment I'm now going to give you which is so powerful that this poor guy has the resistance of one dinner party, see, and you're going to present him with the guts of his whole case. You're probably going to spend the next few hours holding his hand, because the walls keep going *bloooo-zooong!* [laughs]

Now, I told an old-time auditor who is a guest here today, Mike, told him a little while ago, I says, "You see, we're auditing the stable datum out of the road of the confusion, so the confusion will flow off and that's what the flow is on the E-Meter." And he went *b-zz-zz-zz-zz*, you see, because he's been taught differently. He's been taught that you don't pull the stable datum out from underneath the pc or you'll get the confusion, see? If you do too sudden a

yank, you see? And he turned rather pale when I told him this. So you'll probably be rather pale occasionally. [laughter]

In other words, you can climb this hill too vertically. You can immediately grab the mountain and say, "It's gone," see? And the pc is saying, "My God, what am I doing in all this mist? Where am I? What is this? What is this? See, what – where, where, where, what? Ooh-oh-oh-oh! Something terrible is happening to me!" And he feels masses going this way and that way, and pains are turning on and off, and the end of the room – the boards all look like they're going like this, see? [laughter]

See, with great genius, you just, "*Tsk!* One mountain less!" [laughter]

So you see, it isn't necessarily the wisest thing in the world not to sneak up on the case. But this isn't going to do him any harm, providing you run R3SC on it until it's flat. Now, you do this assessment and drop it in his lap, this is going to be the immediate result. It's got to be audited, now, to make it all right. So you're going to see periods on pcs when they're not going to be happy about the whole thing.

Now, I told you that any pc is liable to say, somewhere in the running of service facsimile – one of the tests of a service facsimile is, does the pc say at any time, "I'm not quite sure that it is wise to get rid of this?" See, he's going to say that on a real, honest-to-God service facsimile, somewhere along the line. That's what he's going to say. Well, you find the service facsimile, he's going to say it all at once. "*Huhhh!*" He's going to try to put on the brakes all over the place. Of course, he isn't going to make it.

Now, you're not going to do anything very desperate to this person as long as you finish him up. Oh, so he's going to have a few bad days – it's all right. It's all in the business.

But you possibly, you possibly – now, let me give you this word of caution – will practice in a field of neurosis or psychosis at some time or another, see? You go into that field, you make awful confounded sure that you unburden the cliffs before you pull the mountain out by the roots. Because that person, by reason of being spinny, cannot withstand the environmental restimulation in the first place, so you've added the processing restimulation plus the environmental restimulation to somebody who cannot stand the environmental restimulation. So of course they can't take any. So, the only course you can follow with that case, even though he is standing there – and this will be true: he will be standing there nakedly saying his service facsimile. It becomes very tempting. You look at some of these characters and they'll be just saying their service facsimile. It requires very little genius to figure out exactly what the wording is to make that service facsimile there, because he'll be saying so.

Now, therefore, the environmental restimulation has got to be reduced to some degree on the case. You follow this? In other words, the reduction of environmental restimulation should always follow, and you should be able to make good that minimal environmental restimulation during processing will occur, must always occur and continue to occur during a course of processing.

You have any environmental restimulators present in the vicinity of a psychotic and you're not even going to come near it, anything, no matter what you know. See, because you add the environmental restimulation of processing to, you see, the actual existing environ-

mental restimulation, and it – guy is already in whelmed – overwhelmed by the environment, so of course he just spins, spins harder. So that's why you must approach this on a gradient.

Now, with cases that are just walking about, I don't really give you any caution about it at all, because it doesn't matter to me whether or not these cases go to bed at night and have holes fall in the middle of the floor and various other odd phenomena occur, because they're going to get processed again and the process will take care of the restimulation.

It's a ghastly thing to confront. And the better the assessment and the less the assessment has been approached on a gradient – see, in other words, the less slopes of the mountain you have processed before you process the service facsimile – why, the greater shock it is to the person. There's plenty of restimulation. You've just taken their whole difficulties of this lifetime and done an "ectomy" on it, just like that – bang! out, gone, man! There it is, you see, and you leave him with nothing but the confusion. There sits the confusion. And it hasn't any E-Meter to bleed through and no auditing commands to guide it off and so forth, so it just starts hitting the pc from all directions.

Remember, this pc adopted this because he couldn't stand the confusion. So he adopted a safe solution. A safe solution is always adopted as a retreat from the environmental restimulation – always, inevitably.

Well, therefore, doing a service facsimile assessment doesn't necessarily require great accuracy at first. There have been things found on the case, there's things this guy is worried about on the case. Take some little stable data, RIC type of approach to the situation, that sort of thing. It's very good for the case. And this becomes healing, you see, at Level II of Scientology. You've got healing now.

You say, "Well, what have you done for your lumbosis? Anybody in your family have lumbosis? What did they do for it?" don't you see? "What have you done about them?" Any kind of a crisscross that might occur on a valence shift or something, you just get the person talking about it.

But it's solutions. You're asking them for safe solutions, stable data. And the more stable data they have put in, the more safe solutions they have put in place about their lumbosis, the less the lumbosis will discharge. So you keep plucking these things out and eventually the lumbosis will.

But of course, when the environmental restimulation is too great, no charge will flow off of the case and you will have that percentage of case which, just by talking about a few things, won't give you a tone arm shift. And that's because this person is already pretty overwhelmed. See, the environment itself is the overwhelming factor.

But let's get back to the other. How do you raise – how do you raise the ability of an individual to withstand environmental restimulation? If this is a big factor, as I gave you in the beginning of the lecture, if that's a big factor, how do you raise his ability to do it? Well, you do – you pull his service facsimile. His service facsimile is what, in actual fact, reduces – besides his innate capabilities, which might be different – it's what reduces his ability to see his environment. The more safe solutions he has adapted, the more environmental restimulation he isn't as-ising, the more he isn't confronting up to, the less he can confront up to. This

becomes a dwindling spiral with great speed and rapidity. So therefore, the thing which reduces his ability to handle his environment, oddly enough, is the thing he has adapted to handle his environment for him. You remove that and you at once increase the individual's ability to handle the environment.

Because he's now seeing it. He's inspecting it. It might not make him happy, but that's not what we're trying to make. We're not trying to make a happy person, we're trying to make an able person. There's many a lunatic who is quite happy.

Now, if you bring about a condition, then, at Level III, where an individual does not have environmental restimulation, he won't be interrupting his processing because of environmental restimulation, and you will be able to go at Level IV onto the backtrack because he's no longer fighting the environment. And that restimulation is not added to his case all the time. And it's that added restimulation which can be counted on to lock up his tone arm if he has any fragility of his tone arm, see? It's this little added restimulation of the environment. The environment is too restimulative, therefore he can't go on the backtrack, see? So it's very important that you get that out if you want a smooth, faster run to OT.

And now I will let you in on why I have suddenly gone into this line: is because I want a faster run to OT. I don't care anything very much about whether anybody gets Clear or not. That's just between you and me, see? Make a hell of a lot better human being, it solves neurosis, solves psychosis, makes a guy able, is a fast thing to do, it is not a slow freight through Arkansas. You can make a Clear by getting off enough service facsimiles. You can make a stable Clear so you don't keep apologizing for the fact he's only a Keyed-Out Clear, because he's going to stay that way longer, you see? And all this is better human beings, better human beings, and so forth, and that's fine. And it's a well worthwhile state to achieve, and people will be happy with this state, and everything is fine.

And just between you and I, I don't really care about the state at all – I want somebody to be able to hit the whole track, see? So it's been developed, and I put up the speed of development to cut down the length of time in processing at Level IV, which is already a sizable amount.

So by reducing the environmental restimulation off of Level IV processing by knocking out the service facsimile – which is what encourages the environmental restimulation – we then have enough attention free so that we can go whole track and erase things faster. And we're not always being held up by "The guy is a low-tone-arm case..... The guy has a high, stuck tone arm," "We started to do a GPM, we got a little bit mixed up, we went into the Bear goals, and then we got into the Helatrobis, then – ha! – *uhhuugh!* Didn't realize it but we were in the invisible-picture goals all the time!" [laughs]

Now, we don't want that pc's tone arm all locked up because of environmental restimulation, see? Session restimulation also drops because any difficulty your pc is having in session is actually environmental restimulation because the session is part of the environment also. So if he has session trouble and he has rough sessioning and that sort of thing as one of his difficulties, of course if you delete that off he can get a lot more done on the whole track anyway. So I'm just getting rid of sources of restimulation, don't you see, and reasons of res-

timulation in order to buck into the backtrack and really hit the things that have to be knocked out, so we don't have to worry about these other things, you see? That's important.

Now, what is this "assessment beyond assessment"? I see you've all got your paper ready to put down this assessment. Two or three of you are going to be very surprised; you're going to pick up some folders tonight and find yourself looking at it and say, "Why haven't you done this?" You know, I mean, that kind of an attitude. I'm good at that sort of thing. After I get something figured out, I have no patience with people who don't understand it! [laughter, laughs] Yeah.

Anyway, the assessment is a simple one. And we're back into our old, worn-out, creaking technology of listing and nulling lists. And if you don't know how to do this, man, you just haven't been around and I feel sorry for you. But I'm afraid nobody is going to waste much sympathy on you. There are many liabilities you can get into with listing and nulling lists, and if I hear anybody running a parts-of-existence list 187 pages, why, we've got a quiet place over at the other end of the estate where a gunshot won't be found and so, watch it!

Because this just becomes asinine, man. I mean, some people can take these lists and run their service facs crazy on them. Oh yeah, that's a fact! I mean, just run fabulous amounts of lists.

How long is a list? Well, a list is as long as it has to be to be nulled. It's got the item on it, and so forth. And I can see now, people fighting dirty needles and listing. And I can see now, "Well, did they get the service facsimile on Jay? Did they get the service facsimile yet on Jay," I'll be saying.

And "Well, no, they're still listing."

"Let's see, when was that? Oh, that was, see, let's – when did they start listing? Let's see the folder. Oh, well, they started listing a month ago." You'd be amazed. I've had this happen.

So come off of the corn. Come off of the corn. That's just nonsense. A list is as long as it is necessary to be in order to keep the pc from ARC breaking because it's incomplete. And it's just a list, don't you see? So we get into all that trouble. But that's perfectly all right. We can handle that, now. Any nonsense that we see about it, I've already given you what the remedy is, see: a quiet corner of the estate. Because I frankly am tired of this point of randomness.

My lists never go longer, never go longer than about eight, nine, ten pages, with about twenty items on each page, see? So I don't understand a long list. I don't see any reason for a long list. If your list isn't complete, it won't null, of course, but I've never had to do one longer than that in order to get the thing to null, so I don't understand all this other – unless it is simply safe to keep on listing! [laughter]

So anyway, you do a list, parts of existence. Now, some of you are highly – you're already rich because sitting right in your pc's folder will be a complete parts-of-existence list. Probably already been done. Parts of existence – thing has sometimes even been nulled.

So you do a parts-of-existence list and then you null it. And I frankly don't care whether it comes out to one in, two in, three in, four in, something in that range. I don't care. I

don't care if it rock slams, rocket reads. I don't care what the resulting item does, just as long as it expresses itself some way on the E-Meter. I don't even care if it is right, as long as the pc isn't in argument about it. That's the one thing that is subjected to here.

So you do a good workmanlike job of listing. Just try to get yourself a nice list and null it down rapidly, and so forth, to a point where you've got one item in. That's fine, that's fine. You do that job, bless you. But if it comes out that four were left in and the list probably wasn't complete in the first place and there's a lot of randomness, we'll just do the second step to all four levels left in. You understand? We couldn't care less. It's just as long as the pc isn't saying, "But that couldn't possibly – it's because I'm objecting to it, you know? I accidentally put down 'hoop skirts' and I don't know why I put them down, it doesn't have anything to do with my case at all! It doesn't even answer the question."

And the auditor says, "Well, it's what is in, 'hoop skirts'."

Because you're going for a service fac, so all things apply. And basically the individual is very interested in his service fac.

Now, the funny part of it is, the pcs will only come close to the mountain, and they'll go right on up. They can't stop themselves.

But there's a funny zone or area before you get close to the mountain, and they sure bounce off of it. Because they'll dramatize it; they'll only do what is safe; they'll only say what is safe. And they walk very carefully and won't tell you anything mixed up in anything like that. They're walking through life on a tightrope, see?

And therefore, you may have to do several approaches, and this whole assessment may have to be done several times. So the accuracy of your first do and the ease with which you can do it or the difficulties with which you do it, I don't care about. Do you understand? You probably already got enough in the pc's folder to prepcheck or run R3SC on for some time, you understand? But I don't even care if you use that – because nobody here is in a tremulous condition – or just drop the bottom out from underneath him with this assessment. Because if he's too bad off, he's not really going to give you the service fac, but he'll give its cousin, and that cousin is just as good as anything else.

Now, you've got a list of parts of existence, haven't you? All right, and you assessed it, didn't you? And you wound up with one, two, three or four bits in. All right, dandy, dandy. Now, we tried to wind up with one in. We hoped one would be in. Makes life simpler.

And then we take that item that we found, and we now list safe solutions for it, or safe assumptions about it, or safe decisions that can be made about it. It's what we can clear with the pc. What we really want are safe – what we really want is service facs with regard to it. But that's best expressed by "safe solutions" or "safe assumptions." And then you not make a list there. And once more this isn't 187 tight-packed pages leading out, because that isn't the processing. That's just trying to find something to process, you understand?

So, to the best of your ability, you get yourself a complete list that is nullable and that's got a significant phrase or item on it, and so forth, and you get that out. Now, that doesn't mean you've got the service fac. The item there is probably, however, either as close as

you can get to the service fac at this time or the service fac. It's one or the other. So we're going to treat it, regardless.

Now, we're going to take this item; we're going to work it over. We're not going to do a "represent" list on it, we're going to work it over. We're going to get this thing chewed on, the final thing that we found out, see? I don't care what it was – "wearing petticoats." I don't care what it is, see? And we're going to chew on this thing until we can get it till it's a solution to more than that dynamic.

We just meanly – we found "peanuts" on our parts of existence, and the thing to do with peanuts, the safe thing to do with peanuts, was "not eat them." That was our item, see? Now, that is the resulting item for "the safe solution to peanuts": "not eat them." See? All right.

Now, you actually could process this. See, you could prepcheck it or run R3SC on it – you probably won't be able to prepcheck it. Because it's too close in, it's going to turn on mass, it's going to make things pretty sticky. But if you talk about this for a while to the pc and ask the pc to phrase this up variously, "How might this type of an assumption apply to other dynamics? Is there anything else that this would...?" And the pc will have to give you a variation of it. We're taking the parts-of-existence list now, and we're trying to see if this solution fits any other parts of existence, and how it would have to be rephrased in order to fit other parts of it and "peanuts." Get the idea?

We're trying to do a subtle adjustment here that throws us into a broader version of our safe assumption, so it applies to more than one dynamic. And if we can do that, why, hurrah, hurrah, hurrah, see? We're probably sitting on a much bigger zone or area of the service fac. This is a way of graduating it up, don't you see? But I've told you, it's perfectly all right for you to just process it, just what you found, do you understand? But you're going to get very smart, sooner or later, and you're going to say, "Well, what do you know? You know, this fellow says 'not eat them.' Hmm-hmm. 'Not eat them.' 'Not eat them.' Now, let's see. Does that fit to any other part of these dynamics?" and so forth.

"Not eat, yeah, not eat. Ah, yeah. Uh, it fits, uh, yes, actually fits on the first dynamic. Fits on the first dynamic. Fits on the first dynamic," and so forth. "When I'm processing, I always feel like I'm eating my bank, you see, it's this 'not eat,' you know, 'not eat.' And oh, yes, yes, fourth dynamic. You shouldn't eat men. Yeah, fourth dynamic, and fifth dyn... You sure can't eat MEST. That's the best answer to MEST, is not eat it, you know?"

And so forth. Well, you've got it away from "not eat" then. This is your most elementary address to the situation. You see this thing is broader. There was just one little flag sticking up, just one little piece of a dynamic had this assumption on it. But this assumption doesn't actually handle peanuts: This handles the whole cockeyed sweeping lot. And when you've got one that handles the whole lot, man, you're sitting there with your paws full of service facsimile. And if you haven't got it, you've got to audit what you did get... You're going to prepcheck it; if you can't prepcheck it, you're going to run R3SC. Or you're going to run R3SC on it, and if you couldn't run that easily – you know, questions didn't come up – then you're going to prepcheck it. See, you're going to handle what you found.

And then you're going to do the whole operation again. Only it's going to be a new parts-of-existence list, because, listen, you've prepchecked a part of the service fac, so his lookingness is going to change, so he's going to give you a different parts-of-existence list. See. And then you're going to move in on that, and you're going to get whatever part of existence you now assessed, and then you're going to take that part of existence and you're going to list that, you know? Safe solutions to it, safe assumptions about it, safe solutions to it – whatever it was you could list that gave you things that sounded like service facs, see? You're going to get that list complete and then you're going to rip down the line; you're going to take one of those out. There it sits. Now you've got a nice thing. And it says, "assuming everything will destroy me." *Uuuuuughh*. Boy, you have hit the bottom of the barrel. Safe assumption. If you don't assume that, something might. And of course "eat peanuts," well, that's actually devour – "devour me," "destroy me." That's as close as he came into it. So on your second assessment he just moved in on the center of it, see? "Assuming everything is going to eat me up." That was the service facsimile. You just found an offbeat of it, don't you see?

And you keep working on it, you keep working on it and keep working on the pc until you can't make your meter work. That's when you end.

Needle gets up toward the middle and it falls, see? And the needle – have you seen a needle that is too difficult to set? You can't get it into the set area, because it goes? And you can guess about where the TA should be, but really can't make it very well. Now, that's really a free, free needle.

Pc's sitting there. The pc's not worried about anything.

But don't think the pc isn't going to worry at some place along this line, because you're going to hit this point on every one of these things that you found. As you walk in on this, if you're doing any kind of a job of assessment at all, he's going to say, "Ooohh, I am not so sure. If I get rid of this... No."

Now, there's one other thing you must know about this, is you have sometimes processed something on somebody, let us say – well, let's just use "eat" – "an inability to eat." And you've processed this out gorgeously, see? And the pc is still in a horrible state with regard to it. There's one more step you can do with it. After you've finished it all up and the pc – the needle got looser and everything, but the pc, "Oh, I'm not so sure about this thing. *Theaa*." You've just cut the top of it off, see? So now do "a safe assumption about the inability to eat" or "a safe assumption about eating." You understand? You didn't get close enough to the service facsimile. You got the idea?

Let's say, "an inability to eat." Well, actually, I gave you a bum datum then: "a safe assumption about eating" is much more likely to produce the service facsimile. In other words, this is a flip-flop. He not only used "eating," but you only caught up to one portion of it, you understand? And you can work your way through this thing, you can get a better statement of what you just got through running and finishing up. And sometimes you can't get that better statement, at which time, of course, you made it with the first statement.

I'm just talking about the adjustments of the assessment, see? You sometimes will get something like "an inability to eat." That's a service fac. And it ran, he made people guilty with it, and you know, he made people wrong and himself right, and it all ran out and prep-

checked, and everything had gotten better. But you notice the tone arm still hanging awful still toward the end of this thing. It ran well for a long time, and still at the end of this thing the pc feels kind of...

You say, "How do you feel about, now, the 'inability to eat'?"

"Well, I don't know, I mean – *whoa*. There isn't anything for me in it, to eat, no..." and so on and so on.

Well, you've flattened everything you could flatten out on the thing, don't you see? Well, you better assume that you came close in on the mountain, and you'd better do a safe assumption about the subject of what you found before. That's the rule. There's some safe assumption with regard to eating that the person could make. You're sort of doing a safe-assumption list on the safe assumption, don't you see? Represent. And you get closer into it, and that tears up a lot more ground. Got it?

Now, that last one may have confused you. I couldn't care less, because I am not at any moment saying that you must not exercise the highest level of genius in doing this. Look for identification. Look for identifications – that is to say, $A=A=A$. You're doing this Prep-check; you're doing this Prepcheck on "dolls" – for some reason or other, "children's dolls," in this lifetime, and so forth, on "dolls."

And they say, "All dolls are cheap," or, "Dolls are always given away."

Just watch for it. This is a totally unreasonable assumption, don't you see? "If you don't watch dolls they are liable to attack you." Oh, yes? See? Completely unreasonable assumption. Draw a little box around it in your auditor's reports, because you've hit an $A=A=A$ computation that leads in toward a service fac, don't you see? It's a completely unreasonable assumption.

You know why the person is having a bad time in this particular zone. He's just said so. Doesn't resolve, but the person just said so. And you'll find out that's a cousin to the service facsimile, or dead on it, see? And you keep fooling around, and all of a sudden, why, the pc will come up with it, and you'll come up with it, and you'll come up with it and the pc will come up with it, and *ughh*, all hell will break loose, see? Confusion starts running off and knocking the pc's head off. And the pc can't sleep at night and has to have the light on until you get back and process it again.

But that's all expected randomness. This is what's keeping everything in restimulation for the pc, and in taking it out you get a certain amount of restimulation going. But there is the way you find it. And the formula I gave you of do a parts-of-existence list and then do a list of safe assumptions or solutions for the item found, and then using that as a service facsimile directly, you will find – will find most of the service facsimiles; or if it doesn't the first time you do it, will find the next time you do it, you see, because you can move in on it – or maybe the third time you do it. So you can do this on a crude basis, you understand?

Now, that – there will probably be other methods of doing this released. There will probably be other material developed on this. But let me invite your own lookingness on this subject and not at any time get over the idea that a certain amount of genius must be invested in it.

Okay?

Thank you very much.

Destimulation Of A Case

A lecture given on 10 September 1963

Thank you. Well, autumn has come. And you may arrive, too, someday. [laughs] All right, this is the what?

Audience: September the 10th.

Ten September AD 13, Saint Hill Special Briefing Course.

The lecture today concerns service facsimiles, Scientology III – capital I, capital I, capital I, don't go spelling it capital Arabic three, because it's not Arabic. It's – use Arabic numerals to apply to routines. When you're talking about a body of data, use a Roman numeral. I will clarify this a little bit better. I've been even... clarification – show you I'm getting around to chip into the odd corners of things, the clarification I've been hitting for recently has been as low level as fixing up some sample auditor reports, so that everything's in a proper place on an auditor report. I mean, things are getting awfully buttoned up around here.

I'm going to tell you about service facsimiles and how to find one on a pc, and I'm going to tell you something about the zones of restimulation in auditing. Otherwise you're gonna be sitting there in the auditor's chair one of these fine days and finds yourself with mo' restimulation on your hands than you could possibly imagine existed.

Now, you don't think you're handling an ARC breaky subject when you're handling Scientology III, but let me assure you, when you go in for service facsimiles you are handling stuff which can bypass more charge than any other single item there is. For two reasons. One, pc gives you the service facsimile, you refuse the service facsimile, you bypass the most vital charge on his case, and of course he blows his skull off, and you pick bits of bone off the ceiling for weeks. See, that's all that's necessary. I don't mean to frighten you, I just mean to terrorize you.

Now I learned most of this stuff the hard way, and you could probably learn it, too, the hard way, but I don't think we ought to expend one pc to train one auditor, or something like that. It's too high a cost, let's try to lead you along the line a little more gently. We expect a certain amount of auditing casualty, but we don't expect that casualty to be permanent. And when you are dealing with a service facsimile, you're handling what makes aberration "permanent" (quote) (unquote). Nobody's ever been able to do anything with this before, but it's funny that a lot of boys have nibbled around the edges. You'll see Freudian teeth marks

around on the edges of the service facsimile. Hadn't been dented any, but you'll see his teeth marks.

For instance, it's very interesting how many preclears have second dynamic service facsimiles. Well, the reason for this has nothing to do with life. But it merely has to do with your situation on this planet at this particular time. I know that sounds absolutely goofy, but the sickness, incidence of illness and so forth on this planet is unusually high for planets in this universe, for the excellent reason that the way to make everybody wrong of course is obviously to produce nothing. That makes everybody wrong, makes the government wrong, makes the between-lives boys wrong, makes everybody wrong, you see. Because they count on guys going ahead and making bodies and keeping the civilization wheeling to keep a thetan interested enough so that he'll keep reporting back through the – you know, the whole system is based on this.

But that's why the industrialist is in trouble on this particular planet at this particular time, is because he's producing. And going on a whole track basis, we find that a thetan is in trouble simply because of MEST. That's the way he looks at it, you see. He's in trouble because of MEST and if he could just have arranged at the outset of all this never to have created anything, then he wouldn't have anything now to be in or be in trouble with, don't you see the reasoning? Quite obvious reasoning, probably quite valid. So any creative activity is doomed to attack.

You'll find the artists and musicians of this particular planet always have some schnook alongside of them to cave them in. They always marry the wrong girl, you know, and get the wrong agent, and... Because they're creating. The industrialist, the manufacturer, that sort of thing, these boys, it's not because of any deep-seated communist plot, it's just they are in trouble, that's all. They haven't got enough force to protect their own creativeness, and as a result, why, people attack them. Elementary. Basic answer on the whole track, if you had never had anybody create anything, you would have no trouble. Nothing had ever been created, why, of course you wouldn't have any universe to be in trouble *in*. This is all very elementary.

And therefore you find a lot of service facsimiles that have to do with the second dynamic. And herein lies the difficulty. You take it as a service facsimile, you dust it off as a service facsimile. You operate as a service facsimile and you very harshly and tightly keep the itsa line in this lifetime. You preface any question you're asking in an assessment, preface any question you are asking in any list of any kind, preface any question you are asking as an auditing question with "in this lifetime," but severely, and you will get into a minimum amount of trouble so long as you do one other thing. Now, you see, that isn't something that's nice to do, that is something that you will be blowing your brains out one of these days if you didn't do, you understand? You'll say, "Oh, my God!" you know, "*Oohhhh!* Why did I get up this morning?" you know, because you just didn't use that. See, you didn't circumscribe the pc's attention line to this lifetime.

So that is the first thing we must know about the service facsimile. We're engaged upon a key-out. We are not engaged upon a bank erasure. That's the next thing to know. And of course that is contingent upon the other fact. If you're engaged upon a key-out, you'd better

damn well stay in this lifetime. And if you're engaged upon bank erasure of Scientology IV, well, that's another horse of another hue. And you certainly had better keep Scientology IV and III together, and that's the next thing you ought to know. First, preface everything with "in this lifetime," don't let the pc's attention skip outside of this lifetime, see. Just keep it there, man. Because it's going to go.

It goes with the greatest of ease. And this is befraught with many, many liabilities, because when you're circumscribing his attention that tightly and you refuse to let him put his itsa line on something he's just put his itsa line on, of course you bypass all that charge. Well, I leave you to worry about that one.

It's a key-out. That's your next thing I've just given you, it's a key-out procedure, it's not a bank erasure procedure. You're engaged upon a key-out. And I can tell you why. And your activities are all guided by the fact that one little step beyond what you're doing leads you into the bank. This is a thin-ice activity. If you recognize it as anything but a thin-ice activity, sooner or later you're going to get into trouble. A thin-ice activity.

The pc, unbeknownst to him, is walking across a thin crust of ice. And he's liable to go through it any minute, which is to say, go on to the whole track, swish! Now, the moment you combine Scientology III with Scientology IV, you're going to lose. Right now, you're going to lose. You've had it. Why? Simple. Elementary. You're doing Scientology III and you find a goal, "Yeah, well, we found this goal, we might as well run it out. Might as well go back on the track and run it out." You're now doing Scientology IV. You're erasing the bank, you're not keying out. You'll be sorry. You can get away with it, you can get away with it, but recognize you're no longer making a Clear. And recognize you probably have not handled the restimulative factors of the pc you started out to handle, and recognize that your backtrack is just throwing in more restimulation on the case.

All right. So how do we get around that? You word every question as far as possible, since it's not always possible so that you won't get a goal – word your questions, if you can, so that you won't get a goal as an answer on your list. And you avoid all rocket reading items as answers to your assessments. If it rocket reads, leave it alone. Because only a GPM rocket reads.

I know this is horrible, this puts you in a terrible situation. You've now taken the wrong item off the list. Haven't you? You go down, you null this list of "What's a safe assumption for coonbats?" Good, you get a nice long list, safe assumption for coonbats. And you get "tear gas bombs." See? You get this, and you get that, and you get the other thing. And you get "to be old." And you're going down the list, you're nulling this thing, "tear gas bombs" goes tick, and "to be old" rocket reads. Oh, look at that service facsimile, man, ho-ho! What a wonderful service facsimile. Oh, look at it rocket read. Oh, hell, you – the more you monkey with it, the more you're going to go sliding into the bank.

Actually, you could get away with running it, in this lifetime. You could get away with it, and you could key it out. As long as you don't oppose it, or you don't do anything to it, or don't run any 3M2, or don't list on it any further, and handle it very gingerly, and do your Prepcheck very neatly with "In this lifetime..." on every Prepcheck question. See, you probably could park it back on the backtrack, and you might be able to do the pc a lot of good. And

I don't say you can't do it. But you are already running a pc who was walking on thin ice, you see, and now you have turned a heat ray loose on the lake, the moment that you're using this rocket reading item, see? I don't say it's impossible.

Because you've got two liabilities now. You can take a wrong item off the list, "tear gas bombs," and run that with great occasional dissatisfaction of the pc. Or you can take this other thing, and just act as though you were prepchecking a goal, but only in this lifetime. See? So you can get around this. You can get around this. The moment you do anything else with it, you're running Scientology IV, and you're away, and you're no longer doing Scientology III, and you're not going to make a Clear, and your ambitions for present time restimulation are not going to be reached, and you haven't destimulated the pc, you have restimulated the pc. And the probable reason that you're doing Scientology III in the first place is over-restimulation on the part of the pc.

You see this? You see that as a distinct liability? Now what do you do? What do you do? What is the absolute textbook answer? You use your judgment. But by God, don't go back and run that goal, if you're going to stay with it. You can mark it down as a goal that you have now found for later reference. You can probably do a lot of things. But you're – you're in trouble.

So the best answer is to ask questions that don't give you goals, see. They don't give you goals. The question can't be answered "to be safe." Question has to be answered in some other way. Like "safety." Get the idea? You take a – you take a solution. "Tell me a solution to that item," see, that part of existence, or item, or whatever it is, see. "Tell me a solution." The guy's going to say, "To bip, and to bap, and to bee and to bot, and to bot and to buk, and to bow bowt, and uh... Well, you can't do anything about it, except sit there nervously." But the point I'm making is, is it doesn't produce actually the best service facsimile assessment. You want a safe assumption about it, or a safe assumption for it. Or you want a stable datum that you would have in regard to it. You're liable to get goals, but you won't get them with the same frequency.

You say you've got the – you've got the service facsimile spotted that has something to do with the law, see. And you've got something like "What is a safe assumption about the law?" You normally get, "That it will..." don't you see? "That it will..." "That it does..." don't you see? "That everybody is crooked," see? "That cops are no good," you know, stuff of this particular character. You say, "Give me a safe solution to the law."

"To run like hell." "To move." "To get out," see. Oh, boy! Guy's coming right up with a goals list, see. You don't want it, see. Service facsimiles are almost never "to..." – almost never "to..." but they could be expressed that way. But the moment they're expressed that way you're much more likely to key in a goal. So you're in trouble. Object of auditing is to get as much done as you can without getting any – into any more trouble than you have to. Auditing is not an activity in – where the auditor is always out of trouble. There is no such thing as a perfect session. There is no such thing as perfect intensives, where at no time does the auditor ever get into more hot water than he might otherwise have done, you see. There's – there's – no pc has ever run over a long period of time without an ARC break. Just make up your mind to this, see. First place, it's almost impossible to [not] bypass charge.

Now, you'll find that skilled Scientology III bypasses much less charge than unskilled or semi-skilled Scientology IV. You have a more gorgeous opportunity of colliding with charges to bypass with Scientology IV than you do with III. So the thing to do, the obvious solution, is to run III in such a way as to keep it out of IV.

Now, you should have a very clear-cut idea of what you're trying to do with Scientology III. Very clear-cut. Destimulation is its keynote. It is the technology of destimulation. And therefore, the more that you restimulate, the wronger you will be. It is possible to be wronger than wrong. The Aristotelian absolute can be exceeded.

The individual who is being destimulated is having a very worthwhile activity performed. Possibly, you might not have too clear-cut an idea why, because I myself just a few weeks ago did not really consider it worthwhile until I took apart all of its elements, and looked it over very carefully. Now I see that it is very worthwhile.

It became necessary to do this in the search for tone arm action. Tone arm action is very necessary. In auditing, a great many pcs on the whole track do not get tone arm action. You can run out GPMs with rocket reads and so forth, but you don't get tone arm action. And therefore, this is a very vicious proposition. You're going to practically kill somebody if you run him three sessions without tone arm action. You take a pc in a queasy state and run him two hours without tone arm action, you'll wish you hadn't. I mean, it's that critical. You want tone arm action.

Well, tone arm action ceases in the presence of overrestimulation. So the whole track is too restimulative to the pc, obviously, if it locks up his tone arm. Elementary. When tone arm – she stop moving, when tone arm stop moving, pc's in overrestimulation. If Confucius had said it he would be a very wise man. That's a stable datum about tone arm action. If you haven't got tone arm action on the pc, pc is in a state of overrestimulation.

There is another state that I can point out to you of no tone arm action, which is simply auditing nothing on the pc. You can put a pc on the cans and walk off to the other side of the room and sit down on the chair, and it's very probable that the TA will not move for hours on end. I just want to call this to your attention, too. But actually, that's quite rare since just the mechanics of auditing shift charge around, controlling the pc's attention upon himself or his environment will shift charge. So to all intents and purposes we're left with just one reason – providing any auditing is being done at all – were left with just one reason why the tone arm isn't moving. And the tone arm isn't moving for the excellent reason the pc's in overrestimulation.

Let's take an example of a room. Call tone arm action a moving person. We have a moving person in this room. Tone arm action, see. Now we fill the room half full of cotton bales. We call these cotton bales charge. Notice that this person moving around in the room can only move half as much. Because it's half full of cotton bales. Now let's put the remaining half of the room half full of cotton bales. Now this moving person, of course, can only move a quarter as much as he could in the first place and only half as much as he could just a few minutes ago. Got the idea?

All right, call these cotton bales charge, still, and let's fill up the room with cotton bales. Our moving person doesn't move. And a very green, inexperienced auditor who doesn't

know any of this tries thereafter just to get more cotton bales in the room. That's the hallmark of an inexperienced auditor. "Tone arm action is reduced, move more cotton bales in the room. Let's get some more engrams going, let's get some more GPMs in there. Let's restimulate a few more present time problems. Let's really shove it to this guy. We'll get tone arm action sooner or later." Yes, you will, too. Down. "Well, I finally made a Clear. There he sits. 3 – needle doesn't move at all. He's very calm, he's very calm; as a matter of fact he never says anything to anybody. Must be Clear. He went through a period of low tone arm, but I cured him of that." Well, of course, the symptom of all those disorders are – naturally are just the theory that if you put more charge in restimulation on the case you'll eventually get tone arm action. And I think this is the way the psychiatrist works. Medical psychiatrist.

By the way, did you notice that the medico is getting an awful beating on the subject? Did you notice, in the Times? Medical doctors want nothing to do with mental healing. They only had six lectures on the subject and didn't understand those. The medical doctor is not competent in the field of the mind and moving out of the field of the mind. Interesting, isn't it? Round and round the little ball goes, and where it stops, God help us. Did you notice this propaganda line that's going on? Well, keep an eye on it, because we got it going now. We're reducing false data out of the society – that they know what they're doing. Scientology 0 is at work. We've just developed a new one, Scientology 0. The illumination of unknown areas, and false data, as a prelude to the introduction to stable data. Scientology 0. Interesting.

Well, I bring that up at this time really because it's interesting, but I could use it as an example of what you're doing with clearing. You're getting all of the chronic restimulation off of a case, before you walk ahead with the case.

Now, what you're doing there is removing a lot of false nonsense off the case, service facsimiles and that sort of thing, you're destimulating this lifetime. And if you're very slippery, and you're very clever, you'll get the wildest tone arm action you've ever seen on a pc. In Scientology III, you'll never see tone arm like it, tone arm action like it in Scientology IV. You start hitting in close to that thing called a service facsimile, even close to it, sit out on a border of it someplace, and just start moving in, man. That needle starts loosening up, and that tone arm starts moving, and it's wham, wham, wham. An auditor really has to work to prevent tone arm action in Scientology III. He has to sit there with both feet braced against the tone arm to keep it from moving. It's almost impossible not to get tone arm action, providing you follow its very basic rules. Very difficult. You don't even have to have the service facsimile and you can get tone arm action. It's quite remarkable.

Let's look at this thing, then, called restimulation, since that's very important to Scientology III, since every case you will approach is in a state of overrestimulation. That's all cases you have anything to do with. They're all overrestimulated.

They walk in off the street, they come in from government agencies, they come in anyplace and everyplace, they leak out of the walls from the FDA, you know, out of the woodwork, come out from underneath the rocks from the American Medical Association, all these guys are in a state of overrestimulation. All of them. Thoroughly overrestimulated. That's the hallmark and the keynote to their activities and conduct. This is why they act the way they do whatever the screwball activities that they're exhibiting. However all this hangs

up, or why, or anything else, they can be said to be overrestimulated. And that would be a very accurate statement.

Because the way you keep somebody trapped, and the way you keep somebody sucked into it, is never let him go sit down on a rock and think it over. You've got to keep kicking him around, see, you've got to have economic pressures, you know, you've got to have this, you've got to have that, you've got to have familial complications, you've got to have problems, man. You've got to have trouble. You've got to have "finance." You've got to have banks. You've got to have currency control. You've got to have things like income tax, you've got to have rising and lowering costs of living. You've got to have booms and depressions. Things have got to be hectic, you understand? This guy's got to be kept worried. If he's kept worried long enough, and gets his attention extroverted hard enough and so forth, he will remain trapped.

The basic mechanism of entrapment of course is not just being on a pole someplace and trapped, you understand? Or just being in a body. The complications of entrapment are a little more broad and a little more complex than that. They have to do with Professor Utgat, at the local spinbin – I mean university – who is saying, "The economic situation is far too complex for normal understanding. But if you merely keep everybody in want, you will have economics. Uh – the idea then is to increase demand. Now, if you sufficiently increase demand, everybody will be afraid of starving to death, and uh – they will end up in actual want, and this will keep them from ever thinking a sensible thought. They will too be – be too busy with the ideas of survival and the worries and problems of life, and so forth." Actually, he'd be a very wise man if he spoke exactly like that, so actually his speech in essence is shortened to this: "Strive. Confuse. And that's economics. Now we're going to take up the principle of government. Uh – artistic harassment is our first subject."

You're – you get into a large protest against this particular planet, not understanding some of it. You start moving up scale, you begin to understand some of this. You begin to understand it as simply an extended act of entrapment. The thetan wants something out of it. And he thinks there's some pay. In other words the trap wouldn't run at all, don't you see, unless the thetan was so busy in it that he never had time to look at it, you see?

So the idea is that you chase him hard enough, and you harass him hard enough, you worry him hard enough, why, he never has an opportunity to sit down and take a look at anything. So if he never has an opportunity to do that he'll make a lot of foolish decisions. And these foolish decisions, you see, are made to hold back foolish confusions, and the net result of that of course is he's now in more trouble than he was before. And if he'd made no decision at all he would have been better off, don't you see? So it goes from one entrapment to another type of entrapment, and so forth, in economics.

Just think, just think of being without money for two weeks. Supposing you had no money of any kind for two weeks. Well, it's quite fascinating. I mean, as a principle, because there's really no reason in the world why you should have any money for two hundred years. What's money? Money is a course in economics, at the local university, I guess. It's an idea and a fixation. Some kind of a representation of something for something. To begin with, it's a bum itsa. See, the – what is it? Doesn't even have metal behind it, now, see. Some kind of an

idea is afloat that it's exchanging from zub to zub, and here guys are going off skyscrapers half a mile tall and everything else to get a quick buck, you see. Absolutely fascinating. As a matter of fact you can take a handful of money out and buy most anybody on this planet. Why? Well, I don't know. But it sure is confusing! That you can be absolutely sure of, see. That's – it's pretty doggone confusing. He got the idea that if he gets enough of this stuff, you see, somehow or another he'll be free. Well, what the hell was he while he was getting enough of this stuff, you know? That's silly.

Look this over. You look over socialism, and you recognize it's far more complex than old capitalism was. But capitalism was complex enough. There's hardly anything left of it. But it was plenty complex. But capitalism, there was some time when you could buy off your debt to the local money lender, you see? There was a time. You could at least look forward to a time, you see hopefully, that there would be a time when you came out of it. There was a possibility that good luck and steady application and so forth would eventually cut this thing off and you'd no longer owe this debt. There was some hope involved. Well, in socialism, you haven't got a prayer. See, actually the end product of socialism is you're not permitted to save any money, so in – somehow or another you're trying to buy yourself off, in some way, but of course you never do get bought off in any way, shape or form, so there's no end to the amount of involvement in which you are mixed up. You see what I mean?

So you – what you see is a perfecting system of attention-shifting. All of these things are. They're attention-fixation, attention-dispersal, attention-shifting, all of these various things are all part and parcel of keeping somebody tied down.

Now, that isn't just a snide comment. That isn't just a cynical comment on our modern society, this is an actual – this is – if you don't have bars on the trap you can have principles of one kind or another, you see. You can have political solutions of some kind or another, each one a little more cockeyed than the last, you see. Now, you look around and you're in terrible protest about some things done on this planet, when as a matter of sober fact, that is what you're – probably what you're supposed to do. Protest. They are not there in the final analysis because somebody is stupid; they are there because somebody has been very clever. And they have provided a piece of randomness of sufficient magnitude to keep somebody consistently enturbulated. Thus overrestimulation continuously occurs. You have to keep somebody overrestimulated by keying him in and doing various things to him, in life. You see that?

All right, your pc walks into your session, subject to all these mechanisms of restimulation. There he is, see. And we call this environmental restimulation. This is all very elementary, actually, these are sources of overrestimulation.

Now your first area here is his PT environment, see. And we call this environmental restimulation. That's a source of restimulation. Here is your pc in session, see, he's about – he's right here, coming into session, see. One pc. And we're looking now at the restimulation, we're looking at the restimulation to which he is subject. And there's this environmental restimulation. That's the old lady, the old lady just flew another snit, you know. And that's odds and ends of this particular character, you see. There was a note on his desk that morning, which has begun, "Dear Jakes, in view of the fact that we are making less money than we

were before..." and then nobody finished the note. See? There's a story in the newspaper, you see, "All workers beyond forty years of age will hereinafter be reconstituted," see? He wonders what the hell that is. [laughter] Shoes are wearing out, and the shoe store no longer sells that design of shoes, you know? In other words, life is hell.

But it's just continuous little barbed arrows, you see, of restimulation, you see. Here's restimulation. We call it "r, e, s," not "R." "R" is "reality." [laughs] So this is all the lightning bolts, don't you see, this is all the lightning bolts that you run out when you say, "Since the last time I audited you has anything been..." You're trying to flatten that off, see, so that you can audit him. Well, you know that is necessary. But these things can get so continuous that your auditing can become very, very difficult, see?

And then there's this zone, this zone, here. See, that's all part of the lightning hitting him, here. Then there's this zone of action and that is restimulated bank by reason of service facsimile. So we'll just call this "service fac, restim" that's hung up here. And actually there's an interdependency between this first one, environmental restimulation, and service fac restimulation, are interrelated, so we actually can draw a circle around the two of them. He wouldn't have PT problems if he didn't have service facs, that's the discovery, see?

Nevertheless, we'll call this service fac restimulation, because there's another type of bank restimulation which he is subject to, and that – that he is battling along with here – is what has already been restimulated in auditing, see? See, so this is past auditing restimulation, see? That's what's already been restimulated in auditing and not erased, see? We've got to take that into account.

Now, here is your current auditing restimulation. This is what you're going to restimulate in a session, you see. This is what you're going to restimulate in session, you understand, in the way of engrams, and that sort of thing. See, that's what you're going to restimulate in the session. Those two things we can group together as a pair. See, that's what's been restimulated and what you're going to restimulate, or in the process of restimulation.

There's another one that you might not have paid too much attention to but which you're fighting with all the time and I'd better identify it and this is called session restimulation. Session restimulation is just restimulation by reason of being audited. See? High, high restimulation is attendant upon an auditor who is rough, rough, rough, see? You know, every time you open your mouth to talk, the auditor says, "No, I meant something else." Keeps the itsa line cut, and stuff like this, don't you see? Little accidentals. The better auditor, he'll just get an occasionally accidental flub, you see? But whatever that auditing skill is, it still adds up to, see, session restimulation. Now that's not bank restimulation. See? That – that's just what's happening in the session to kick somebody around. You got that?

Now, let's look at another one here. And this is the bank. Now, you see, that anything coming from this of course has to come up here to current auditing restim, may kick in past auditing restim, is being kicked around by session restim. Got that? Hooks up on this restim, got that? And actually only can operate from service fac. You look over that. That's sources and zones of restimulation.

Now, just put it this way. There's obviously several places from which you get restimulation. There's more ways of throwing cotton bales in that room.

Now let's go over these ways of throwing cotton bales in the room. Now there isn't just Scientology IV methods of restimulate a GPM, see. All right, that's throwing a cotton bale in the room, but there's also a – some bits and pieces and sometimes some mighty big cotton bales thrown in the room by rough auditing, see? So that's a source of restimulation, see? And then we look at what you're auditing on the pc here, as past auditing restimulation which is made up of bank which has been restimulated and not erased in past session. And that has two divisions, and what you are currently restimulating, you see, that's your other zone. And then there's the present time environment that he's living in and this of course is added to the other restimulation and then that, however, is kicked in, cross-restimulation occurs, you see, he's worried, and he's nervy, so therefore he has more ARC breaks in the session, don't you see. So it keeps beefing up the session.

Now, all that stuff is interactive. All of those sources of restimulation are interactive and the only core on which it sits, in actual fact, that can be touched, short of knocking out the bank, is the service fac. The service facsimile is what keeps environmental restimulation restimulated. It also has a great bearing, you would be surprised, but it has a great bearing on the amount of session restimulation which occurs. It has an enormous bearing, up here, on past auditing restimulation which hasn't been picked up because, of course, it was blocking the discharge, you see, the full discharge of everything. It's going to prevent you from discharging current auditing restimulation; even though you restimulate it, some of it is braked, don't you see, by the service fac. And actually his environment is in shambles all the time because of his service facsimiles, see. And so therefore it comes back to the service fac.

Now, the most notable thing, which you missed by the way in the quiz last Friday that was pointed out to you, again, but the most notable thing about the service facsimile is: The thetan is doing it – *ha-ha*. Well, of course in the final analysis he's mocking up his bank and he's the effect of his bank, too, and you could say that very circuitously, and at some long, drawn point, yes, he is responsible for everything that is happening to him, you see. But this is intimate, direct, and now. He doing it. He's doing it right now. Right now he's involved in making something and somebody wrong, and himself right. And he is doing it all off his lone little hatchet and it is just about as influenced by GPMs, see – it's him keeping that particular GPM in restimulation. See, he says – he says, "To crack walnuts, man, that's the way this life's got to go. *Ooh*. That'll fix 'em, you know, *ho-ho*." And there's some GPM sitting back there, "to crack walnuts," you know. Well, of course he keeps that in restimulation, too, but that isn't really what's making him crack walnuts, you understand? He's cracking walnuts because he's decided that cracking walnuts is the thing to do. You'll find out that before he got the GPM "to crack walnuts," he was also cracking walnuts. You understand?

So we've got two different problems here. We've got the thetan doing it and we've got the accumulation of experience knocking his head off, see? So we have two sources of lightning.

Now, to be very plain here about this drawing, you can see here, you can see here, that all of this stuff, see, all of this stuff, in combination, makes a very messed-up pc. Charge. He's got charge here. In fact, you're not really auditing a pc. You're auditing a live bomb. A live bomb liberally garnished with firecrackers. And the bomb may not go off, but you sure get a lot of fire crackers exploding.

Now, I don't want to leave you in the dark about what restimulation is. How does the auditor restimulate something? I want to get this in passing here because maybe if you live long enough you'll learn this. How does an auditor restimulate something? By putting or letting the pc's attention go on it. By putting the pc's attention on it, by letting the pc's attention go onto it. What's "it"? Actually, any charge, heretofore inert, which can be rekindled. Or if it has been restimulated already, then re-restimulated or increased in restimulation. Now that's very technical. And that sounds very esoteric. And I'm afraid that has the terrible simplicity of a mud pie dropping on a sidewalk. It's just about that complicated.

I'm very sure that you at some time or another in a session have rather wished that you had just cut your throat rather than come in to audit this particular pc, because you don't seem to be able to do anything right at all. Everything is going wrong. And you say therefore it is the pc's trouble. The pc is causing this trouble. Well, actually, the pc is totally incapable of causing trouble in a session. The auditor can sit there like a total knucklehead and let the pc's attention wander all over the bank, you know, pick up engram A, engram B, engram C, engram D, engram *waaa*, so on, *baaaw*, *baaaw*, *brr-brr-brr-brr-brr*, *whooo*, *whooo*. And the auditor isn't doing a thing. He's just sitting there being a good listener, see. He was doing everything right, and all of a sudden the pc exploded in his face, see? Well, that's just accidental restimulation. You just let the pc wander. Actually, the pc is wandering under the command of his service facsimile. That's what's commanding. He wants to make certain zones and areas wrong, and one of the ways to make them wrong is to get awful restimulated and collapse. I mean, that's usual.

You wouldn't have any such thing as psychosomatic medicine unless every thetan had the computation – they all do have the computation – that, well, the best way to handle it is get sick, in the final analysis. Otherwise, psychosomatic trauma would never make anybody sick and it makes everybody sick, so then everybody must have the service facsimile that the way to handle the situation is to get sick. You see that? I mean, it's just open and shut because it's the definition of it, so everybody has the service facsimile of sickness. You try to run the service facsimile of sickness, ordinarily, oh, go ahead and run it, but you limit it to this lifetime otherwise you're going to wind up there trillions-twenty ago, you see. Because he had that for a long time. See, that's old. That – what comes under the heading of too much service facsimile, that's almost "pc," don't you see? There's some of these things are so confoundedly standard that you sometimes wish you hadn't started auditing them. You know, they go back-track too quick, too fast. Too upsetting.

All right. Now, this business of restimulation, let's get back on what this business of restimulation is, this is very interesting, very easy. And there's nothing much to it. If you want the pc's attention on a cow, you either let his attention wander to the cow, or you say "cow." I mean, that is how elementary it is. Very many auditors don't ever get the idea of how you – how they could possibly restimulate anything because they overlook the idea of the simplicity of the mechanism of restimulation. If you don't want the engram about a cow restimulated, then you don't say "cow," you got the idea? I mean, it's that elementary, my dear Watson. You don't want the pc on a GPM, so you don't say anything about the GPM and that's all. You want his attention on the GPM, you don't mention – you mention the GPM. That is all. That's

the basic thing. It's how many times you mention it, with what complexity, that fixes the restimulation and increases it. But to start in, all you have to do is say, "GPM."

Pc's going on and on, and you're going to be very agreeable, you see. And the pc's going on and on about this service facsimile in Scientology III, and he's saying, "Well – and so on – and – uh – to be goofy, that – that seems..."

"Oh, that must be the goal. Oh, I know, yeah, the goal we ran the other day on you."

The auditor doesn't look on this for what it is. That's getting out this twenty-foot pointer, neon-lighted, putting the pc squarely in front of the bank, taking the pointer and putting it directly on, says, "put your attention on that GPM there, square now, son, right there. That's it, right there, look at it now," get it all restimulated, and get sparks flying off it. I mean, that – that's all very fancy, but actually the whole operation is complete, "Oh, that goal we ran the other day. Yeah, I know." That's all. That's all – that's all the auditor has to do and he's restimulated the goal, don't you see. It's too elementary.

Just had an occasion of an auditor trying to find the time limiter and innocently asking for four engrams on an overrestimulated pc. You understand? He just said, "Well, what's the first time you ever had any trouble with that?" Talking about a physical injury, you see? Four engrams, *pang-pang-pang-pang*. Boom. Overrestimulation, bang. ARC break, boom. Simple. I mean, this is how easy it is to restimulate somebody.

But you shouldn't be afraid of restimulating somebody because that's part of the auditor's trade. But just know what you're doing, for the love of Pete! Know what you're doing. You've had four rough sessions with this pc, see. You say, because you want to get on the good side of the pc, "Well, I'm sorry we've had such rough sessions lately..." There goes four rough sessions! Pc says, "Wha – wha – wha – what? Who? Who? Where? Where? What's the matter? Who shot me?" You understand? Oh, but you said, "I'm sorry we had these rough sessions, lately." So your intention was not to restimulate. No, the mechanism of restimulate is simply *name*. That's the whole of restimulation. *Name*. And the more often you name it, the more it'll restimulate, and that's all.

Now I'll tell you the perfect way to produce an ARC break. Name it and not permit it to be itsaed. That's all you got to do, see? You say engram, no itsa, engram, no itsa, engram, no itsa; ARC break. It – it's terribly fantastically elementary. And that's actually all there is to a rough session. It's the auditor naming things, or preventing itsas of things which are named. And that's all that's going on, that's all that's going on in a rough session.

The pc is very nervous on the subject of Instructors or Supervisors, or something like that, he's it – I'm just talking about a student now. And he's got – he's got twenty infraction sheets to make up before Sunday, or he doesn't go up to the next unit, see, and so forth. And he – eventually you've got him calmed down in the session, don't you see? Pc's there, and he's finally starting to look at his own bank, and interested in his own case, and you're going along, just fine, don't you see, and then you say, "Uh – I'll have to ask the Instructor." And you say, this is an ARC breaky pc. No, this is just a blabbermouthed auditor. You get – you get how it is, see?

So you come back to the thing, all auditors talk too much. But the sources of ARC break become – come from this, that is, just – just naming, naming and then not picking up – see, in some fashion or another, naming and then not picking up the itsa. See? And then we've ensealed in what restimulation is there. If you're not going to pick up the itsa, don't name it. And you'll have the – you'll have sessions that are absolutely glass-smooth. You'll just be absolutely fascinated. You'll never see such cheerful, happy, appreciative pcs. See, if you're not going to pick up the itsa, don't name it, man. Elementary, my dear student.

There's the whole of smooth auditing. Now, there's another way to do this. Another way to do this, is let the session, and the activities of the session, bar the discharge of materials already restimulated. See, the auditor didn't name it, but it's been named. From some source or another, it's been named. And the pc, the pc's sitting there – the pc's sitting there, and it's been named, and the pc is saying, itsa-itsa-itsa-itsa-itsa, "Well, is it all right with you if I start the sess – uh – session now? All right, is it all right in the room, room's all right – uh – so forth, the uh – uh – uh – squeeze the cans uh – yes, yes, uh – pardon me, squeeze the cans again. Hmm. I didn't quite get that, squeeze the cans again – all right. Now, now, uh – all right with you if I uh – start – start the session now, huh? Is it all right with you? Okay, all right. All right." Gives him a session start, I won't start a session for you, and – "What goals would you like to set for this session?" and is absolutely horrified to have, "Well, I don't really care to set any goals for the session as a matter of fact." And the auditor says, "What could I possibly have done?"

It's just elementary what he's done, don't you see? There's a source of restimulation. Now, auditors very often ask silly questions to be sociable, right before they start the session. And they get an itsa line going, and then stop the itsa line by starting the session. You can actually sit down in any session you've had that was a rough one and if you had – particularly if you had a tape of it, you could say, "Oh, my God!" You say, "How've you been?" Pc says, "Uh – well, all right."

"All right. Is it all right with you if we start the session now? The room's okay? Uh – chair's all right, is it all right if we audit in the room?" We get down to goals, see. "What goals would you like to set for the session?"

"Well, huh! Don't care to set any goals. Well, to live through the session."

This whole thing then is completely mysterious to the auditor. And the mystery is complete. He didn't do anything. Hell he didn't! He put an itsa line in – or he put a whatsit in. Throw the pc a whatsit. I know an auditor who has a rough time all the time ending sessions. Always puts a whatsit in at the end of the session. Then never lets it be itsaed, and then gets an explosion. Do you understand this? See, this is – this is elementary. This is all there is to an ARC breaky session.

Well, let's take a look at this, now, and we see then that the auditor is in control, to a very marked degree, of what's restimulated.

But on an uncleared pc, the service fac is interacting with the existing restimulation so the pc is actually putting in a continuous restimulative factor in sessions. And you get restimulation trouble as long as the pc has a prominent service facsimile. Now if you add, then, to this bank, we go back to this one – if you add now, if you add in restimulation – all this is

in place, see. And you add in some restimulation from down here, to here, see. Mathematics of the situation! There's fifty ergs of energy in overrestimulation on the case right now. So you pull in a GPM from the bank which contains another fifty ergs of restimulation, you now have a hundred ergs – capacity of the pc for easy handling is probably ten ergs to begin with. So you're now auditing on an overrestimulation factor of about ten to one and you sit around and you say, "Well why doesn't the tone arm action move? Why – why don't we get tone arm action here? Why – you know? What's the matter with the tone arm? Well, maybe we're running the wrong GPM, uh – do you suppose we're running the wrong GPM here, pc?" *Uhh!* What's the pc going to do? He's going to look at each GPM that he's had anywhere around, see? He's just picking up them cotton bales, you know, and shoving them into that room and that tone arm just locks up harder and harder, freezes more and more and drifts lower, and so forth. You see the exact mechanism in progress?

So it's actually very, very much to your benefit to get rid of the service facsimile, at least out of this lifetime and the auditing environment. Because then we can possibly get rid of this, service facsimile hangs up that – past auditing restimulation. You're not restimulating anything very much on current auditing restimulation if you're being very clever in handling the service facs, so we maybe cut out half of that. We cut session restimulation down to, very small thing, because we can be incautious with our speech without restimulating all this stuff that's already live. Do you see the benefits of all this?

All right. Well, see that and see as well that it's pretty adroit business finding a service fac without kicking everything else in. Do you see what you're trying to do? Audit smoothly, of course, that's the solution to your session restimulation. Restimulate no more in your current auditing, don't start naming a bunch of things, see. Don't start pulling up a bunch of things. As far as past auditing, give the pc frequent Prepchecks, you know, "on auditing" Prepchecks. Every fifth, sixth session, you can keep that cut back, you see. Present time environment. Don't audit the guy one hour every three weeks and expect him to hold his own. Actually, do you know that two and a half hours a week is really not quite enough to hold down environmental restimulation on most cases. Which is interesting.

So we can cut these various things down. We can get the pc in a less restimulative environment – the way you would, by the way, handle the insane or the severely neurotic. You'd simply put him in an unrestimulative environment and be very, very careful that the sessions you gave him were totally lacking in restimulation. All the restimulation that's necessary to the auditing of this case has been done for a long time. You don't have to – you actually don't have to restimulate much else. It's all in restimulation.

You can do these various tricks to cut down the restimulation on your pc. You actually should remember this graph here, these zones of restimulation are things that can restimulate the pc, because you could sit down with the pc and you could simply say, "We're going to audit this bird and he's having a hard time. Well, now, what would be practical to cut out?" Normally the auditor's responsibility simply goes into trying to reduce the auditing restimulation. Because they're trying to reduce it they very often goof. I mean, they overdo the job, you know. Get nervous and won't interrupt the pc and they're afraid to cut the pc's itsa line and let the pc wander into all kinds of things, you know. They don't provide good specific small tar-

gets in auditing to center the pc's attention on them and clean them up. They're always taking a bit bigger target than the pc can grab hold of and that sort of thing.

In other words, there's various things you can monitor and that's mostly what we study. The various things you can do in auditing. But look. Look, that's one out of one, two, three, four – see, that's one out of five. And you could actually sit down with this little chart, and subdivide it. You could subdivide that present time environment restimulation over there into about at least eight different categories. You could just break them down into the dynamics. You sometimes have to do this.

We had somebody one time that used to go home every night after the auditing session and go through a bunch of voodoo exercises. I think it was voodoo or some such practice. And I think he was repeating over the words of a half a dozen GPMs simultaneously or something like that. Actually, the way we took the case apart was simply the auditing supervi – well, Mary Sue, just told him, "Hey! You're doing so-and-so and so-and-so. You quit that." And he quit that, and we made some case progress. See, that's just reducing that. You could take his present time environment, in other words, and you could compartment it into various sections and zones of restimulation, don't you see. You know, his job, and his family, and so forth.

"While I'm auditing you..." we notice that he always has a present time problem about the wife, and he has a present time problem about this, and present time problem about that "...take a week's vacation and don't live at home." See? You've actually reduced that much current restimulation, maybe you can get some progress with the case, see. That's – that's the crux of a lot of these things. But you could actually take that chart and find out what you are going to cut down.

Now, of course the responsible agency here that's going to give you the most trouble is the service facsimile. Because that's what he is holding in restimulation to make people wrong, and he's liable to make you wrong.

It's very interesting, occasionally I'm trying to make some student right with auditing, trying to give some auditor a win, and the auditor will go *bzzzz*, in some fashion or another try to make me wrong on an auditing instruction or something like this, by just not applying it, or crossing it up wrong, don't you see. Therefore, trying to create a rightness is debarred by the – by somebody's service fac getting in the road.

Now you see, that even comes true then on the supervision of auditors. That's rare, but occasional, don't you see. It just doesn't work somehow. It doesn't happen very often. It's usually inadvertent, and it's always easily explained. Like they didn't quite receive the despatch, or they didn't understand the despatch. Or they told the pc all about the direction before it was done or something wild happened with regard to this auditing direction, you see. Or it all turned off too quickly so that we couldn't go on auditing it or something, you see. A little goofy point. It's all explainable. But you recognize, if you look through it, and you were to rehearse the service facsimile of that particular auditor and so forth, if this was a consistent occurrence, if that occurrence was very consistent, what we'd have to do of course is find out the mechanism he's using to try to make somebody wrong. Now that would there – would therefore bring about a kickback.

Now, he apparently consciously doesn't know what he's doing. You understand? And there's several ways of handling that. You can simply bring it sharply to his attention that something is operating here that is preventing something from happening, and usually, why, he'll take a look at it and laugh and straighten it out. That's normally what would normally happen. You can engage upon some duress or something like that. As I've said I've been known to put a head on a pike just to make everybody follow my instructions for a little while. Just did it, as a matter of fact. And their heads are still on their shoulders; it wasn't very vicious, but it was to their attention that a little more attention could be put on this particular point.

Now, what are you going to get out of something like this? Well, you'll get less restimulation for the pc. One of the things that's going to happen, they'll be a little bit more careful. You get less restimulation for the pc. Of course, you're liable to get more restimulation on the part of the auditor so he doesn't follow the instructions any better. And all of this randomness simply occurs because of a service facsimile. Now, one of the reasons why the auditor goofs, and the four guys I just shot down in flames will be rehabilitated in a short while – were shot down, actually had this as part of its element.

They were auditing toward the service fac, therefore the pc was trying to make them wrong. You understand? So you can count on this occurring as you move toward the service fac. If you do anything inadvertent – no in... the tiniest little goofs that don't amount to a hill of beans and you're just approaching a service facsimile, then the pc targets you as the one to be made wrong. You get this? And I'd say, in all – these four students I was just snarling at – that that had occurred, you see, to some degree.

In other words, the auditor was already enturbulated by this situation. All right. Now an enturbulated auditor, an enturbulated auditor, has to be given a new stable datum to some degree, so just do it – do it – do it, is the best stable datum that you can give him. Offhand, let him get a win. Let him see the breadth and understanding of this particular zone, exactly how this thing is operating and let him sit back and take a look at it, because obviously that pc must be very restimulative to the auditor or he wouldn't be as – so adventurous as not to follow one of my instructions. Get the idea?

So one of the ways you can do it, one of the ways you can do it, is shift auditors. See, you get a new pattern of make-wrongness from the pc, don't you see? And the auditor's wits can settle down on the situation, don't you see? And then you apprise the auditor one way or the other, something for him to look at with regard to all this, see. It'll straighten out. Well now, that's a method of handling it. But it's all handled on the basis of restimulation.

Now, if you make a practice of handling all of your auditing actions on a basis of restimulation, your adjudications and judgment with regard to your auditing sessions and your pcs and so forth, on the basis of restimulation, you will seldom be very wrong. Even a poor solution, based on lessening restimulation, is better than some heroic solution, like shoot the pc, you know, like they do in the medical profession, see? Any solution that reduces restimulation, even if badly put into effect, very often delivers the goods. Any pc that is running badly then – now get this one, because this is pretty sweeping, and I'll be lecturing again on

the service facsimile of course, we will take it up, exactly how you do this. But all this is a very necessary prelude to this sort of thing.

Any pc, and anything wrong with that pc, is there because of overrestimulation. And any resolution of the auditing situation or the case has to take into account a reduction of restimulation, whether by discharge or destimulation. One or the other. You key it out, to destimulate, and you just blow it, of course, to discharge it.

Now, of course, you've got a room full of cotton bales, you're not going to get anybody moving around in there, it – there's so many cotton bales in the room, don't you see, the guy can't move around to throw the cotton bales out. So that's it. You're not going to get any – you're never going to empty the room. But you can still look in other directions to reduce the restimulation. I've just given you a map of them. You could actually audit, particularly amongst the neurotic and so forth, simply on a basis of giving advice against that little chart I just drew for you. Just destimulate the person's life somewhat, and the person will recover from some of the most amazing things. It isn't esoteric at all, see.

Something in his vicinity is naming things that go into restimulation, that's all. What is restimulation? A restimulative environment simply contains things in it which put his attention on things which are in the bank, and restimulative. I mean, it's as easy as that. He's got a – he's got a naming environment. And remember that with his service facsimile, he's doing some naming, too. So the service facsimile is naming a bunch of things to go into restimulation. See?

So if you reduced the other sources of restimulation, of which you have five there, and if you reduced – if you reduced the session restimulation, your current auditing restimulation, what you're auditing, your past auditing restimulation; you reduced your environmental restimulation on the pc, reduced all those things, you see – in the – the various ways you have of reducing these things, you see, and then audited out the guy's service fac – even though this took quite a while to accomplish on reducing these – well, reducing environmental restimulation: Let's have the guy go live in the hills for a year before we audit him, you get the idea? You know, simple as that. Have the guy get a – some kind of a very calm job of some kind or another.

It – no matter how bad his case was, don't you see, we – it's all solved on the basis of reducing restimulation. And now we take his service fac, and we approach it head-on, and we audit out the service facsimiles, which he is in, for one lifetime, and get ourselves a nice free swinging needle and we give ourselves a nice behaving tone arm.

And then we go at a very – we've got accomplished all that – we of course have now set up practically an unrestimulative environment, auditing situation, bank and so forth. So we can naturally then reach into the bank at this point and pick up the string of almost anything in the bank, because you've just got a basic map of the bank. I mean, you got... say, "All right, let's get the goal 'to be dead,' you know, first goal of the Helatrobis Implants," and for the next month or so, why, just audit out the Helatrobis Implants. You can audit them all out with good TA. Particularly if you give an occasional Prepcheck that cuts down the past auditing restimulation and cuts down your accumulated session restimulation, see. The guy's going to make it.

And that's any case, see, that's any case, that makes any case an easy running case. Now, a case is as hard to run as it is restimulated. It's as hard to run as it comes to you restimulated and as hard as you have restimulated it improperly, see. That – that's as hard – that's how hard is a case to run. The case is no harder than that to run. A case is as difficult as it is restimulated.

And you get some guy walking in, his hair's wild, and he says, "The world is coming to an end tomorrow night!" you know, and "Watch out, I've got to get rid of these bugs," you know. Aw, don't pay – no reason to put any attention on the case. What do you know? Something right away you know. Case is overrestimulated, naturally. He's gonna sit in that auditing chair and pick up the cans and answer sensible questions about his service facsimile in his life? Well, I don't know, you might be able to get him into session. Get him to tell you about world's coming to an end – if you kept him in this lifetime, carefully controlled his itsa line. You might surprise yourself, you might get a lot of tone arm action. He might be quite auditable. But the chances are he wouldn't be. The chances are you're not even going to get him near an auditing session and if you did, the auditing would produce no tone arm action.

Actually you know about it, that he's got a stuck tone arm. In he walked, what's his tone arm condition? Must be the same as for any overrestimulated case. Stuck. So how can you approach or attack the case? Well, of course you're validly auditing the case to the degree that you reduce restimulation on the case. So there's probably a lot of ways, looking at this little chart up here, that you reduce the restimulation on the case, see. A lot of odds and ends. He knows – he knows psychotherapy; he's had electric shocks and that sort of thing, see. You can develop a whole bag of tricks just out of that fact, see? You destimulate psychotherapy. See, you sit there, you don't say anything. You don't do anything. See? Don't do anything. When he leaves, you say, "All right, thank you, thank you, Joe." He'll finally get pretty calm around you.

Well, that isn't – doesn't look like auditing to you, but actually it's destimulation. Compare this with "Prepare Number 62 for electric shock and a prefrontal lobotomy in the morning. *Hrrmph-hrrmph*, we've got to cure him! Ah, *ha-ha*. Get the wet packs, the cold packs, the green packs, the purple packs and the ice packs. Oh, yes, we've got to fix him, rouse him up, rouse him up, yep, yep, yep." Looks to me like these characters are adding more environmental restimulation than they can pick up so, of course, they have a lousy record of cure. In fact, they all carefully explain to you how insanity is incurable. It may or may not be incurable, but is it, that's the main thing. Is insanity? And the answer of course is no.

The – there is however an overrestimulated pc. There is an overrestimulated being. So if you look into all this very carefully, you'll see that you can cut back restimulation all over the place. And you get all hepped up on the subject of all you've got to do is get your E-Meter and put the guy on it, and find the service facsimile and run right and wrong on it, and that sort of thing, and so forth, you're going to lose. That – that's fine. That's fine.

Develop confidence in this particular direction. But you realize, there are going to be a lot of people who can't sit in a chair and can't pick up an E-Meter. People that are unconscious; well, you can bring them conscious by running Touch Assist sort of thing on the sheets.

But he can't talk to you, he's afraid of you, he can't sit down in the chair, he this, he that, see, all these other things.

Well, actually, it's the same problems you have in auditing. It's a problem in destimulation, or discharge of existing restimulation, it's one or the other. And normally you'd select out destimulation by simply decreasing the restimulation of the various zones from which he can get restimulation. You'd select those out very carefully, measure them up and give somebody some advice on the subject of it and his restimulation would reduce. The next thing you know, "Miracle worker in the field of the mind," you know, and people will say he doesn't do anything. "We don't understand, we don't understand how Doctor Jones gets results, because all he does is sit there and nod and the patients come in and nod when they leave, and they seem to get well. Must be some tremendous personality that he has," you see. We've reduced treatment restimulation, you see. He didn't even pick up a pad and issue any orders, see.
