Now, if you can digest all that that I've just been talking to you about, and you've got all of that taped, and you've got everything I've been talking to you about absolutely taped, we can approach the subject of a service facsimile, which we will do in a later lecture.

Thank you very much.

SERVICE FACs AND GPMs

A lecture given on 11 September 1963

Well, what's – what's this today?

Audience: 11th of September.

I didn't mean that, thank you for the date, but – yeah, just taking a look at you, I supervise a lot of your cases, more than you think. And every once in a while, why, with a horrible shudder you realize I've been looking over your shoulder but – I always take a look at you, my perceptivity on a pc is pretty good, I know how you're getting along. And as auditors, same way, I know how you're getting along, see – it's very easy. How caved in does your pc look. So you see, if you have a dominant number of the class caved in, why the auditors aren't doing so good.

Now, what's the date?

Audience: September the 11th.

Eleven September, AD 13, Saint Hill Special Briefing Course. And this lecture slightly exceeds its normal scope of lectures.

Have a lot of bad news for you – a lot of good news for you, a lot of bad news. And on May the 8th, *The Nature of the GPM*, says that the early GPMs contacted on the pc are implants and it says, down there its tenth, twelfth paragraph something like that – this does not mean that the pc's own GPMs do not exist. Do you remember that?

Audience: Yes. [comm lag – laughter]

The pc's own GPM has the power and velocity, over an implant GPM, of somewhere between a thousand or a hundred thousand to one. Actually, a much greater figure of magnitude. I just threw that in, just to give you an idea that there's magnitude difference, see. Now hold your hats. The whole of the implanted GPMs: between-lives area, screens, implant GPMs, the Minion goals, the Helatrobus Implants and the Train goals – all this sort of stuff, all of those GPMs, all those implant GPMs – are one RI in one of my GPMs.

Audience: Hmmm. Wow. Whew!

Interesting, huh? One RI.

One RI. The name of the RI is "goals" – "oppterm goals." Which is one of something on the order of a hundred RI personal GPM, which extends from trillions-thirty, to trillions-twenty on the time track. But which is actually still going.

Now several things are – need clarifying. A lot of you have been protesting, this – you wonder why this is part of the service fac – well, you'll get around to that in a minute – but

several things need clarifying. And one is the length of the time track. And a lot of you have had considerable protest on the subject of the length of the time track. Because trillions of trillions of trillions of trillions of years, you know, T-T-T-T-T-T-T-T-T-T, you know and, "Ohhh, my God, ho-ho-ho! Ohhh, ho-ho dear! Getting so long. Da-dsa-dya-dya-dya-ohhh! Uhhhh!" You hear that around every once in a while. You probably felt like that yourself, you know.

Well, I just have good news for you in that particular department. What I would choose to call "modern times" extends from trillions-thirteen till now. That's modern times. The stuff that's more likely to influence the preclear in present time.

Well, this is very germane. Because you now have your paws on Scientology III, just about the handsomest little package of stuff you ever had anything to do with, called a service facsimile. First introduced as Routine 3SC. Correct?

Audience: Mmm. Yes.

What you're doing is fooling around with the pc's current RI in his existing goal line of his current truncated goal. And you're fooling around with one little RI, see. And you've got this, and it's in present time and of course there's an opposition to it. And you can get your hands on the opposition, and you can get your hands on the RI and you can fumble and fool around with this, and almost any way you look in it, or almost any way you carve on the edges of it you're going to make a Clear. Well, what are you doing. You're actually clearing a dumbbell pair of the pc's own GPM out of sequence on the track, see. That's all you're doing.

You've got your paws on what he is doing right now. Well, of course in fumbling around it'd be very easy for some of you to lay your paws on what he was doing last night. Oh, take or minus trillions-five years ago, see. "Last night," you know, what he was doing. You're liable to get your paws on that. See, but that's still all right. But of course the pc's goal is going to fall out of this thing, with a thud, like Ann's did last night. Listed goals and one rocket read, and so forth. Wasn't listing goals, listing ideas on the service fac, you see. And one of them rocket read.

Well, it's the greatest probability that while you're looking for the service fac, that which rocket reads is the pc's own goal. So. Now, at this point you should however be very wary, as I told you in the last lecture. I've been aware of this, I've been holding out on you for a couple of days here, I've been aware of this. But I didn't believe it. I really didn't believe it very hard. And I had to do some more looking at the thing. That is to say, I just didn't believe the magnitude differences. I've been looking for enough – if you are a powerful character... Let's put it this way, if you are a powerful character that once had *muscles*, and played billiards with planets, and we've got to look for some order of aberration to reduce that power that's comparable to that power, right? The degree of aberration necessary to reduce that much power must be comparable to the power reduced. And we have there a law or a rule. Do you see that?

Audience: Mm-hm. Yes.

You don't take – you don't take – you don't take Big John from the north woods, you know, that was customarily picking up Douglas firs a hundred and seventy-five feet tall and

picking his teeth with them, you know, the Paul Bunyan type legends, you see – and drop a tack hammer on his toe and have him crippled for life. You see? That just doesn't happen. No, I'm afraid you would have to have – you would have to have quite a few forests fall on his head, see, for him to get a headache. Well, the forests that have fallen on the head of the thetan of course, are these GPMs.

Now, we look it over, and so, they put you on a monocycle, and you went *pocka-ting* down between a couple of rows of things that spat at you, see, and great. Great day, fine, all right, all right. I don't even care if I key you in, because what am I keying in? You can always scratch a mosquito bite, see. If you went down the line with these things barking and firing at you and that sort of thing and they said that you were *absolutely* no good and that sort of thing. Bull! The only thing they did was get you very confused as to which was your goal and which was their goal. And that little tiny GPM that they installed had the power of being installed backwards, and being installed according to the actual pattern of GPMs, had the power of getting a thetan confused. So he didn't want to really look over that; he didn't want to have too much to do with that.

You see why? It's backwards, you know, they implanted them from the top to the bottom. Well an actual GPM is run from the bottom to the top, the way it was lived. See, you don't run an actual GPM from its top oppterm down to the goal at the bottom. You take the goal at the bottom and you list it back up to the top oppterm, you got that? Otherwise it doesn't make any sense at all. They will list backwards, but you'll find yourself being thrust forward in time and it's hard to do.

The liability of reaching the goal is of course the goal is the furthest item from present time, being the bottom terminal, and when you get your pc to reach down for that goal, this is what I wanted to give you, as just a little tip. I didn't want you getting too adventurous here. Because when you have the pc reach for that goal and examine that goal, he actually is to some slight degree moving through time between that goal and present time, don't you see. And he lives up the whole track. And the wild part of it is it looks just like – well, I don't know if any of you have ever looked down the Helatrobis Implants, and just looked down between the row and it was all nice. It was all clean, you know, you could see all the stuff, and you looked down to the end and you say "I wonder what that item was, or that one." What happened, see? You got a sort of a tunnel of blackness occurs the whole way along, if you had some sensation of that particular character.

Well, that's what happens when you reach down the GPM. Well, the same thing happens when you make a pc reach down *his* GPM channel. Only this is something of the order of you can reach down a GPM in the Helatrobis Implants, you see and the pc manages it – it isn't so good. He doesn't like that, he didn't think that was so good. I mean, that's his – that would be his ordinary reaction, don't you see. But he looks down his own goal channel like this, and scrapes up and down his own goal channel, and mucks around in it any length of time, reaching back to the goal and reaching something else, and so forth. And it's something like having your head shot off with a sixteen-inch cannon, see, because the residual charge is – oh, I'd – it'd be almost impossible to state the difference of magnitude. The charge is great. I'm not trying to scare your own GPMs, but I'm just giving you an idea as auditors.

Now, let's say, let's say, that somebody has a goal "to be sexual" or "have sex" or something like this, you see, or "to create," "create my own universe" or something like this, see. Let's say that's the pc's own goal, see. And you're clobbering along here with a service fac, see. You're looking at a service fac, and he lists it. It's "to have my own universe" or something like this. You take this up and you put it in red, with a great big square around it on the auditor's report. You understand? So it's big. So that nobody can miss it while they're going through folders and that sort of thing. You put it up there because that's *very important*. It's infinitely more important than any implant goal, see. Put it up there so it's big. And then don't start mucking about with it. On any process except 3M2.

Oh, you can list it and get its oppterm and oppterm that, and so forth. You've got all the technology; it'll be back on your checksheets tomorrow morning. But, you get the – all the technology exists for this stuff, you see. Well, what if you used that "to have my own universe" as the service facsimile? Ho-ho-ho-ho! You're running something back at maybe trillions-twenty-one. You're not running a service facsimile. You're making the guy look down this channel, see? Because that the goal, clean statement of, you see, is the first RI in the GPM. No pardon me, pardon me, it isn't. There is an – probably an earlier one, which would be something like "a being with the idea that 'to have my own universe.'" "The being with the idea to have my own universe" may come previously to that, don't you see. Because he hasn't become the postulate yet.

But nevertheless, you've got something that's down there at the beginning of this track. See, and there's at least a hundred RIs between where you are and it. At least a hundred RI's and you go charging down there to run this as a service fac and yeah, it'll make a lot of sense and, yeah, you'll get a free needle, yeah, you'll get some tone arm action, yeah, there's nothing like that. But sooner or later somewhere along this line the pc's scuffing back and forth, commuting you see, he's gonna rough up the rest of his track. And oddly enough, it lies in a channel, which looks not unlike one of these implant goal channels. Of course there aren't any firing mechanisms or anything like that but that's all arranged.

A pc's own GPM looks like a black island. I've already given a lecture on this and described all these and so forth, a long time ago – spring I guess it was. And – but they – they look like a black island floating and so on, and they're quite meaty. And they have specific, distinct sizes and all of this sort of thing. Well, you get the pc scuffing back and forth, recognize that you're running him from the bottom of an island of solid mass maybe three-feet thick by seventy-five feet long, by maybe thirty-feet wide, and you're just running him up through the middle of this thing, you know and you're running him back through the middle of the other and you're running him back up there again and *uhhh!* Hey, hey! And all of a sudden no tone arm action, nothing else. You won't be able to continue your activities with a service facsimile. You see that?

Fortunately, not all is lost. All you would have to do in this particular regard is just break out your little pencil and a hundred and seventy-five reams of paper, and go to work with 3M2 – with all of its various complicated laws and that sort of thing, taking the first item you found down at the bottom of it such as the goal and working on through. And working out the GPM.

In actual fact the beauty – the beauty of the pc's own GPM as compared to an implant GPM is the pc's own GPM disintegrates. And the pattern of the needle action, you get quite a bit of tone arm action. When you start in, it's kind of stiffish, and then the needle starts getting freer and the tone arm starts waving more. And as you get down about three-quarters of the way toward the top of the thing, just as it's given on your early plots, those early plots, "to scream" and that sort of thing, they're all quite valid, you see. They're your own GPM patterns, you see. That's the way they look foreshortened, but nevertheless those releases are all quite accurate.

And you get up – you get up about three-quarters of the way, and you all of a sudden start seeing that thing start rocket reading blowdowns. Rocket reading blowdowns. *Psssww! Psssww! Psssww! Psssww!* Then you start watching this tone arm come on down here toward Clear read, *psssww-psssww!* and it'll just go on that way – it'll go on and it'll go on and it'll go on. Then you find another RI, you see. And then it starts going some more and it starts blowing down. And this thing practically disintegrates. You've got an automatic disintegration, is what happens.

Sometimes your pc'll sit there in session; he'll look at one of these huge islands, which has been black and is now turned grey and it'll be buckling and quivering and buckling – no, that's the wrong word. It's shaking. Something begins to buckle, you've got something on top of it. But you'll see it shaking and shivering and fraying. It looks like – it looks like some jello. It looks like a piece of opaque jello that somebody has left in the sun. It ceases to be so hard and fast, and it sort of drips away and it shatters.

Well, actually that charge isn't going through your meter or through the pc, fortunately. You're only getting a small indication of the amount of charge going off. I don't know how much charge is going off one of these things, but I should think an early track GPM is probably losing a megatron or something like that. I'd say, at least. But it's simply disintegrating into the never-never land and you don't notice it. But you do see it on this meter. And the pc is fended off from the thing, don't you see – he's – it's over there, it's over there, maybe eight, ten, fifteen feet away from him. And it's going apart rather quietly. But it's that much force that is dissipating. And you just get a kickback on the meter which is almost telepathic in its lightness. See, there's hardly any kickback coming at the pc. You understand?

Well, there's enough charge to make Paul Bunyan into a punk, see. See, there's enough charge to take a guy with the total capabilities of an OT and reduce him down to somebody that when the medico trims his fingernail or something like that, he has an awful time. You get the idea? See, there's enough charge to aberrate. Aberration must be equivalent to the amount of power aberrated. And it's the pc's own GPMs.

Now, there's various – various data extant in this particular field. It's covered under the techniques called R3M and R3M2 – was its final consolidation. That technology all exists. Now, what you – what this lecture's principally about; the technology all exists, the lectures exist, and so forth, pc has his own goals, his own GPMs, and these RIs have a tremendous amount of mass. One RI, you see, is maybe a hundredth or a two-hundredth of a big GPM, see. And this reliable item is the pc's own reliable item, is floating round here in present time.

In fact he's busy, busy, busy, busy, busy, the nut, making himself, making himself an RI and it has an opposition. He's busy, busy, busy, busy, busy. See.

Now, it has a central postulate of its own and it's dependent on the goal, also. In other words, all these RIs – oppterm or terminal – have in common the goal. They all have the goal in them. Because they're part and parcel of the goal. But they have their own significance with regard to the goal.

Let's take the goal, let's imagine there is such a goal, "to go to school." Such a goal would never exist, so we just take it so it's non-restimulative. All right. Well, you've got an RI up toward present time – got an RI up toward present time, that'll make you very, very upset, you see? Because it apparently won't have anything to do with anything. And you don't understand it really until you get the goal. But the confounded thing is baffling to auditor and pc alike. Because it's to – "to ring bells" or "to ring the bell" or something like this, you see. What the hell? What does it go up to? The guy wanted to be a fire engine laddie or what's he want to be, you know? I mean, what is this thing? What is this thing? A service fac "to ring the bell," see. It nevertheless will run because it's part and parcel of "to go to school." Naturally, why, in small schools, why, the better pupil was called on to ring the bell in the morning and that's – see, there he is, you see.

You might find something, "to get a gold star" and you think of gold star mothers and that sort of thing, and it's some confounded innocuous thing like, you know, "to get A." Or you're liable to get an oppterm of "people who bring their lunches." Creak your brains, you know? How in the name of common sense is this an aberrative factor in anybody's case, you know? Well, you don't have the GPM goal, so of course the RI all by itself doesn't make much sense. But it's hanging out everywhere and you can come around the perimeter of it and you can take your techniques which are given in R3SC, and they'll land you somewhere in the perimeter of the oppterm or terminal of the pc's *own* GPM as it applies more or less to PT or some old one that's in restimulation in PT, and will be the source of his present time restimulation as per the graph I gave you yesterday.

And of course you can knock that thing in the head and get yourself a lot of nice tone arm action – wonderful tone arm action – particularly because it's in formation, don't you see? It's an RI in Formation. And you can knock it all to pieces and you can pull its central postulate, and so forth, and you get all kinds of interesting meter phenomena and all that sort of thing. But when you try to make it make sense, it very often doesn't. And it may not make sense, it may clear the pc up very nicely, but make no sense at all until someday he's run on R3M and we find out this bing to ring – "to ring the bells," is the goal "to go to school." And he'll let out a war whoop in the session and suddenly add it all up, don't you see. Well, the GPM will be somewhat disintegrated already. You've already tackled this thing obliquely.

So that's actually what you're auditing. I thought you might like to know.

Now, well, you've got tremendous complexities enter into this situation. I hit one last night. I might as well tell you about. Now, you actually can assess for a service facsimile without a meter, on this basis only: Write a list until the pc seems easy and thinks it's complete and then just look on the list for the one that makes the least sense. [laughter] And you should know that as an auditor because it'll help you a great deal. You don't have too much to

do with significance on this sort of thing. But it's the one that makes the least sense. It's a lie, it isn't true, and so forth.

And we had a list going last night; I was being audited and one appeared on the list, "abandon all help," as a solution to anything that was gone. Now, you add that up, I couldn't! But it tore a somatic off of my jaw the like of which I haven't felt in a long time, you see. And the auditor went on another column of listing and nulling and so forth, and it went in and it went out, because it was being suppressed. It was worrying me, see. Not necessarily because it wasn't sensible – but because it wasn't sensible I suppressed it and it stopped reading. So another one or two which were only locks on it, started reading. They read momentarily, you see, because I'd abandoned it. They were reading by the bypassed charge on it.

That's an interesting solution, isn't it? "Abandon all help," if something is gone, you abandon all help. Well, it didn't make any sense at all to me, but I happened to know what GPM that it's coming from, it's the GPM "to be free." And it's simply an RI and it becomes completely sensible. One of the ways of being free is to abandon all help. See? Perfect method of becoming free. If you need no help from anyplace, why, naturally, you can be free. So you see, it makes sense in its own GPM but doesn't make any kind of sense at all. And yet, would audit – yet would audit very nicely. Pc cognited on it all over the place, and straightened it all out, and free up the needle and free up the tone arm and everything go along fine, even though it didn't make any sense. And wasn't compared to the goal, don't you see? Because the RI that it was being listed against was not the right RI, probably. But it just popped up because it's a PT solution, see, of the GPM line, so therefore it's an RI of the GPM line "to be free." Method of being free – abandon all help.

Well, that wasn't actually an RI. I don't even know what RI it is out of, but it's the central postulate of the RI. See what I mean? And what you're handling is the central postulate of the RI when you're handling a service facsimile, so you get a disintegration. I see I've left you adrift, here. You thought the central idea of an RI made the RI. Well, that's perfectly valid. But it all too often simply describes what makes the central postulate. See, we know a little bit more now about the RI.

Let's take – let's take the RI "a lame man." See, we've never really gone into the anatomy of a reliable item of a GPM, because we were dealing so many months now with these confounded implant GPMs and that sort of thing, I never bothered to go forward on the thing. Well, what makes this "lame man" RI hold together? Why does he assume the identity of a lame man? See? Well, he assumes it because it's got a solution in the middle of it, which is an *idée fixe*, which then prevents him from looking at anything else, and it may be "lameness." See, although the item is "a lame man," the postulate which brings that into action, you see, is "lameness." Do you see that it's not quite safe.

Now sometimes they are more distant than that. You see? "Not walking," let us say, is the principal idea. And you get that perfectly validly as "a lame man," don't you see? Or "an immobilized person." You've got that as an RI. Now that characterizes simply the identity of the RI. That is the beingness of the RI. What is the thinkingness of this RI? The thinkingness of the RI might be different. Not always, because sometimes the RI comes up as its own thinkingness, don't you see. But particularly a beingness RI, or some conditional RI, may

have at its core an idea. And it's this idea which is an automatic solution. Well, an RI always has an idea at its core. But sometimes you don't have the idea when you *have* the RI, don't you see, you've got – you've got this RI, "a lame man." Well, this doesn't tell you what idea lies in the middle of "a lame man," see. That you could list for and find. And disintegrate the RI. But it's the thing which has all the characteristics of what you're calling a service facsimile. It forbids inspection. It's an automatic solution. It's safe. It solves everything, see?

Now, that is *how* an RI is generated and that's all contained in R3SC without any further embellishment. Guy gets an *idée fixe*, he no longer has to inspect in order to solve, so therefore he never as-ises the mass, so therefore he gets caught in the middle of the mass. Bang! That's it.

Now if it's a goal that he does this with, the accumulation of RIs resulting from that goal – each one of them has this goal carried through into it, but it's a new idea which makes the RI, don't you see? And that whole mass come together, is a GPM. So you have this huge mass, huge block of energy with its separate items and so forth in it – it's hardly distinguishable as separate items because it's all squashed together, there's been so much attack and so little inspection. And this whole GPM is dominated by one idea – let us say, "to go to school," see. That's one idea. And that is common to every RI or identity in that, see, which is what accumulates it. But that idea all by itself is no inspection. Solve all problems, "to go to school," see. See, if you have a headache, go to school, you see. If you have something of the sort and if you didn't know something, go to school, and so forth. You get the idea, see?

It's totally uninspected. Totally uninspected solution. So because it's uninspected and automatic and fixed, it then generates into it this second step of identities which have this as a central idea, but the identities already have their own characteristics. See, they've got this – this idea is dominant, see, but their characteristics of the identity would be something like way up at the line, up here some place, you know, a terminal, after he's no longer able to carry out the postulate, becomes something on the order of "an idiot child," see. And you go into the basis of an idiot child to find out what it is, is "people like unintelligence," see? Or, just "unintelligence" seems to solve everything. So the central idea of this RI, "an idiot child," may be "unintelligence." But the RI is "an idiot child" and the reason it could get formed in the first place is he already had the *idée fixe* of the goal.

So you've got actually three ideas in connection with this thing. One is the GPM's central goal – which is the first postulate of that GPM – plus the central idea of the RI, which in itself, in its peculiar way forbids inspection, and the resultant mass, caused by the goal noninspection and the RI central idea noninspection, we have as an identity or an individuality. We have this as the third step. So we would say, the goal, "to go to school," central idea, "unintelligence," results in the RI, see, "an idiot child." Do you see that? Well, that's characteristic of all – of all RIs. And that is the anatomy of an RI and it also happens to be the anatomy of what you've got as a service facsimile.

That which is not inspected tends to persist. And that is your basic rule, this little Hobson-Jobson on one of our earlier ones, "that which is not admired tends to persist." And your little rule there – that which is not inspected tends to persist. Why? Because it's never as-ised. That which you look at will tend to – and inspect, tends to become – well, it doesn't tend

to remain in an aberrated state, don't you see? But that which is never inspected, of course, has this factor of uninspection which adds mass.

Now, because it is – not just because I just used this – because it is actually quite unintelligent. What happens? Well, a person gets hell knocked out of him, that's what happens. And he can never attack the right enemy. He's got some idea, you see, an idiot child is liable to attack bright kids, see. Something like that. Well, anything that's characterized as "bright kids," he attacks, see. So, it's a perfect invitation to attack. And because there's constant attack and constant overts going on and constant withholds going on and constant battle going on, it of course accumulates an awful lot of mass. And there's where the mass comes from of an RI.

It's quite interesting that an idea is most easily substituted for a thetan. You... an idea doesn't have any mass connected with it basically, and it appears to be – have some wisdom in it and that sort of thing. It's very easily substituted for a thetan. So somebody can walk around as "the guard." See?

He isn't a thetan, he's "the guard." Got the idea? And you probably had something to do with guards and they have rather unintelligent activities. You say, well, "I left my lunch on the counter in the washroom and I'd like to go in and get it."

"Yes? Hmmm. Do you have a pass? Hmmm! What department do you work for? Hmmm. Have to call the security chief, I'm sorry. I have a young lady out here, wants to get back into the building. Security section."

You can see it now, it goes straight up to the president of the company, the FBI is called in and so on. The federal government is justified for its existence, don't you see. There's telegrams going out in all directions and so forth, and you're standing there, you left your lunch in the washroom, see. I mean that was all there was to understand there. [laughs] But not the guard. He's the guard, see, and so he doesn't – it's not his to understand anything. He's just there to be the guard. Do you understand that? Well, that's an identity which is substituted for a thetan, see.

Well, now similarly, any idea is liable to become a substitute for a thetan! Because a thetan does it himself. He has some bad luck, see. He's had some bad luck. Last three or four mountain ranges he built, fell down. Bad luck. Overbalanced the planet and it started going in the other direction, you know. The poles appeared at different places than they were supposed to, you see. So, on the idea of planets, "never build mountains." That solves it, doesn't it? Well now, all the confusion of the accident which has just occurred, is now prevented from ever occurring again by "never build mountains." And that holds in place then, all uninspected, all of the confusion he just got into by building three mountain ranges where he shouldn't have built them, see. So all that confusion and randomness is held in place, because it isn't inspected, it's solved – "Never build mountains," see. That's it. Now, he's got it all taped, you see.

And that's his idea. Now, if we go along and follow his career, it's sooner or later, why we'll find him running a society which prevents the building of mountains. Society for the Prevention of Building of Mountains, you see. He shifted his identity only to the point where he's the president of it, you see. But you see, you've got the substitute of an idea for the being in this particular case.

He just had this as a solution. But this solution he kept working at, and it itself then gets battered and hammered by the environment. The environment that has a solution in it, you see, "never build mountains," rather tends to push against this bloke. See, so that accumulates more mass, you see, by reason of this thing, and then he fights back and that accumulates more mass and then eventually he becomes the idea "never build mountains," don't you see. And it might appear as some different RI, but you look there and you'll find, "never build mountains" has been substituted for a thetan, you see?

So, that's the history of a person's lessening abilities. See, these RIs, these substitutions, all of this sort of thing. All of his O/Ws and various things, all get piled up on one of these *idées fixes*. The biggest *idée fixe* that a person can have is a goal. Biggest one. That develops into a GPM. Not all goals develop into GPMs, but those he's got have developed into GPMs. So here's a GPM floating there, and finally life becomes completely unlivable, and he doesn't want anything to do with it anymore, so he abandons all that and gets a new goal.

If you want to see – the Helatrobis Implant people did an interesting job of tracing the deterioration of the thetan, but actually the Bear and Gorilla goals are a better one. They're a better model. And those which we turned out in the last year here – that don't have the positive items in it, you know – those that just show you the... you know like "to scream." You know, those GPMs which came out? They're graduates up the line. Well that's what a pc's own GPM looks like. Because he keeps moving off of these *idées fixes*, abandons those and has to have a new *idée fixe* to solve the situation which he's just solved, but which wouldn't stay solved. Once you start solving things in this peculiar fashion, you eventually wind up with GPMs. That's all you can say about that.

Now, you find this pc with R3SC, I'm not talking to you too much about GPMs although they come into this naturally, and because I'm also telling you what the score is with regard to them. Horrible feeling of exhaustion just swept over me in the idea of having to cover all the ground that we have covered before on the subject of R3M, and the pc's own goals and GPMs. And just to help you out on this, that ground is all there. I'm talking about reevolving it. The only part of it that needs reevolving perhaps is mostly done – and that's how do you find the pc's own goal and how do you separate it out from an implanted goal because they both read the same when you first find them on the meter. And it's much easier to find implant goals than it is own goals, and you try to run an implant goal, as though it were the pc's own GPM, and he doesn't have a goal under that heading, but there's only an implant goal, and you're running the Helatrobis Implants with the wrong items, don't you see? This is all very involved.

But if you keep an eye very cleanly out, while you're doing service facsimiles, why, the Helatrobis Implants and other implants of that character didn't have the power actually to do very much to generate the RI which you find as a service facsimile. They might have monitored it somehow, made the guy resentful of hockey sticks or something like this or monocycles. He probably can't stand monocycle acts in the local vaudeville. But what's your – what's your application here? That you must be very alert to anything you find that rocket reads while doing R3SC – and you must be very careful not to tackle it head-on as the service facsimile. Why? Because it doesn't run well with your service facsimile technology. You're going to run a GPM with your service facsimile technology? I rather think not. But

you can run one RI with your service facsimile technology. See, you can run an RI with it. You understand what I'm talking about now, do you?

That thing that rocket reads, *pssw!* Every time he gave you this solution which he's selling you as the service fac and cogniting on, well, don't shut him down in his cognition, but don't let him wander too much on the track either. Because you've got your hands on something which lies trillions-multiple in the past, see. And you haven't got anything – have anything to do with his present time. You've got something that belongs and can only be handled in Scientology IV.

But there are other ways of attacking this situation. Now the beauties of R3SC is it doesn't matter which side of this orange you start peeling. See, here's this RI that's monitoring his present life. It doesn't matter which side of it, it doesn't matter if you take out that little green thing at the top or the navel at the bottom or peel off some slabs or actually blot the oil off of it – you're going to do something, don't you see. And next thing you know you're going to start cutting up this RI – because it'll chop up just like anything else. And charge is going off of this thing madly in all directions and so forth, and he'll eventually become very calm about it.

Now, if you leave – if you find one of these things – here's another liability – if you find one of these things, if you find an RI and you've got yourself a pc on whom energy is going: *Nnwwaaam, waaaoooww, waaaoooww, waaaoooww, rrrrr, creak, rrrr, brrrr, brrrr!* He's left session, you see, and he's walked out three doors – only there's only one, you see. And he lays down at night in bed after the session and he'll *fowndeh* and it's started going: *whooooo, wawww-whoooooo.* And he got up and hastily turned on the light and four o'clock in the morning he's still sitting at his window looking out into the street and tr-trying-not-to-to-breathe-too-deeply-because-every-time-he-does, he goes: *whoooooo, wwwwwllll, whooooo!* It's ghastly! Most ghastly sensations, you can feel like, you know, these suction cups they clean out WCs with, you know, you could feel like you're inside one of those things, you know, being spronged and bonged. Or inflated and deflated rhythmically by an air pump or something like this. And things go around, creak. The guy's shoulder, for instance, moves over into the middle of his chest. And won't go back. And his chin suddenly moves up, as far as he's concerned, looks to you to be mostly – in fact he might even look better! But from his point of view the chin is apparently at the top of the crown of his head. Just occupational hazards. Factually not even very dangerous. But they certainly are frightening! Because you've come in close to the middle of a GPM.

Now, your first – your next reaction from this pc, you're entitled to know what it is. "The GPM is something else. I mean, the RI. The thing is something else. You haven't got the guy's service fac – it's all been a mistake. Actually, his service fac has to do with not liking Patagonians." That's far enough away from what he's just been in. [laughs] See, he's got himself – he's got himself a qualm. This is a new – a new illness that occurs in Scientology, and that is "the qualms." Q-u-a-l-m-s. And the cause of it is getting into or into the fringes of, the service facsimile and deciding that we have come close enough. See, he wasn't close enough in to be pulled into the thing, but he was close enough to be *whooooo, ohhhh, nooooo, ho-ho.* And he wants to change his mind. And he'll give you another service facsimile. So you get an invalidation of what you found, going on almost continuously in R3SC. And you can Q-and-

A with that invalidation. You can Q-and-A with that invalidation, just so much without restimulating the living daylights out of the case.

The way to repair it if you restimulated the case and he's apparently getting worse or something under R3SC – is go back and pick up everything that has been found on the pc. One of the first requisites is to keep good records. And pick up everything that has been found on the pc and guessed at as a service facsimile, and finish it off according to the rules of the game. Just finish everything off! Elementary.

Now, the best way to finish these things off is with the – with the lot. You give it the lot. That's all of R3SC steps. If you find "blackberries" and I know, you've said it was wrong, and it wasn't an idea and it wasn't a postulate, and actually it was an identity and it was an item, and it just turned on a – turned on a pain, and then didn't do much and it was abandoned and then you found – and you found "going down," for some reason or other, and that was just touched up lightly, but the pc couldn't see how it made anything wrong, don't you see, so that was abandoned. You look for another one, and then the pc went into the qualms and you found one that had to do with "to be little" or something of the sort, and this was awful close to it, and you decided that – you and he both decided that must be a GPM because it was too gruesome to be confronted. And about the fifth or sixth one along the line, you'll have gotten tone arm action, but you'll also have an awfully confused pc.

But you should realize that what you're doing is picking up a stable datum and leaving the confusion alive. And the net result is this: The pc's memory will, (quote) tend to deteriorate (unquote.) In other words, he'll just get foggy, don't you see. Because you've left half or three-quarters of the confusion, attendant upon that stable datum, still around. You've taken the stable datum out somewhat and you've left the confusion – but the stable datum couldn't be all the way out or the confusion would have disappeared! So the pc who feels confused, on R3SC, is either in the process of having a stable datum audited out, or you've – or some other auditor has abandoned stuff that is close in to the case and has left it in a confused restimulation.

The repair on it is just take everything that's been found on the case and worked at in this particular way and simply give it the lot – that is, all the steps of R3SC. Just give it the whole works.

Now, let me say something here about running this, because it's very germane, it's not out of place at all because you're dealing with RIs. The postulate is so far downscale, if you find the center of the RI, that postulate is so far downscale that it is probably twenty tone arm divisions below "hide." That's not just a hyperbolic statement, that's probably where it is. It's an idea that's turned into MEST – way down scale. And it runs to cognition. You only run it to cognition, but it enters at any one of these stages: A solution – making a good record of this – a solution, right-wrong process, make you right, others wrong – domination – survival.

It enters anyplace. Anyplace. And you run it to cognition. Now, you say to the guy, you say to the guy, "Well, would that make others right?"

"Oh, yes, it would make others right. It would..." – pardon me, make others wrong. He'd say, "Yes, it'd make others wrong, so forth. But, hey! It'd also make them right."

You say, well, it can't be the service facsimile, because it didn't make others wrong and make him right, and abandon it. Ha-ha! Wait a minute. The run was only – the run was a twelve-second run. It ran twelve seconds to cognition before it changed that level of that scale I just gave you. Understand? In fact one of you poor Zed students got sent to Siberia for doing that. The pity of it is, is the Zed students that that happened to, you know, they didn't have the data on what they were supposed to have disobeyed yet. [laughter] Unjust, isn't it?

Now, the upshot of this process... Now, this is – I should give you practically a whole lecture on just this process, and probably will. You'll be hearing a lot more of it. But if you consider this process here as this picture of survive, you know, I mean that's "help own survival-hinder the survival of others," you know, that sort of thing. "Dominate," which is "help you escape domination" and "achieve the domination of others." And "right-wrong." And if that's the way you look at it, and you always enter here at "right-wrong" and then expect it to go to "dominate" and expect it to go to "survive" – that's only gonna happen if you've got a first cousin to the service facsimile RI, of the pc's present time GPM series.

In other words, you've got something that does him a lot of good, don't you see, and he gets some automaticities on it, and everything is going along fine. But if you've got a real, honest-to-Pete, honest-to-goodness GPM, it doesn't go at this level. The idea doesn't come in here at right-wrong, and then proceed up to dominate and then go to survive, see?

Actually, this is what the picture looks like. Much more germane. It goes solutions... Well, let's take this at this level. It goes solutions, dominate – pardon me, solutions, right-wrong, dominate, survive, dominate, right-wrong, solutions. Horrible, isn't it? And here of course is your next right-wrong and your dominate and your survive. You understand this?

Female voice: Yeah.

And so, that it actually, actually just builds up into... You understand? It might enter here anyplace. Because it goes on – that's your top one, let us say, here. See, that band is okay and if it were a light perimeter idea which is still intelligent, and if you start abandoning service facsimiles because they're not sensible, you will only get this light variety. Because a real service facsimile is about as sensible as an admiral's hat on a cow, see. And so your entrance point here, your upper entrance point would only be in that proper, exact order, nicely, nicely, nicely – if the idea were still intelligent or still knowable or still sensible.

Ah, but the GPM does not look very sensible and when it's a rather weird solution of some kind or another as it would be if it were the center of the RI, it's liable to enter in almost anyplace down here. So, what's the net result of this? You find this thing, "to kiss cows," you see, or something like that or "cows are kissable" or something of this sort and it's on a list – it's on a list of "how to repair motor vehicles." "How would you go about repairing _____?" "What's a safe solution to motor vehicles?" And we get "cows are kissable." Well now, if we were psychologists, we would of course throw that one out because it doesn't fit the rest of the data. But that's what's wrong with it, it doesn't fit the rest of the data. It's the service facsimile.

Now, "cows are kissable," the pc may sit there for a little while and say "Right-wrong, eh? Wouldn't make anybody right. Wouldn't make – wouldn't make anybody right or wrong."

"Well," you say, "Well, all right, then, let's just abandon it." Or "Let's just prepcheck it."

Oh, no, no, the only thing he's done here is give you this scale. And you say, "Well, how does it fit in with domination? Do anything with domination? Do anything with survival? Is it just a solution?"

"Oh, survival! Well, of course! It's total survival. There's no question about its being survival. That's it."

Oddly enough, he's answered the question and cognited in that one sentence. And he's simply said, "It *is*." Which of course is a cognition, because it's a recognition. It *is* survival, see. And you say, "Well, how are we going to run a process on this, you know. We're auditors so we've got to run processes." Well, the way you run a process is try to find out what level you can run a process on and not cut the pc's itsa line while you're doing it. Because you then spring back to him – you spring back to him, "Well, has this been a solution?"

"Oh, yes, solutions, oh my God. It's a solution. All I've ever done is just solve this, solve that, solve the other thing and so on, and so on, and when I was getting prepschool and so on and solved that solution and so forth. And I always use this solution and so forth, when I have to do – when it has to do with buying peanuts. Every time I buy peanuts I use this solution. Of course, it's just been a solution and so on – it's been a solution, been a solution, been a solution – it's been a solution, it's been a solution, it's been a solution." It's half an hour later, you see. "It's been a solution." And he says, "You know, I don't think it's... I've just taken a look at this, and I – I really don't think it's the best solution in the world to buying peanuts. It isn't quite applicable." Cognition, see.

All right, now let's shift it. Now, let's shift it. And we say, "Well, how would it – how would it make you right?" Or "How has it made you right?"

"Oh, I've used it quite a bit. It – it does. It – it makes me right. That's why I use it. It makes me right."

That was the cognition. That's the end of that process. All right, "How would it make others wrong?"

"Oh, well, now that's another thing. It really, it's kind of hard to re – realize, maybe, but it makes others wrong and it – so on and so on and so on and so on and so on... " and fifteen minutes later, why, "... and so on. It also makes me wrong. He-he-he-heh. I didn't really realize that, but it also makes me wrong, somewhat."

That's your cognition. All right, you say, "How would it help you dominate others?"

"It wouldn't."

"Well, how would it help you escape domination?"

"Wouldn't."

"All right, well, how would it help you survive?"

"Oh, well, that's something else."

Twelve minutes later you have now found out, cognition, see, of some kind or another. Like, "It helps *everybody* survive. That's why I picked it up, you see, it helps everybody survive."

You're back there chipping it apart, you see. "Well, how would it hinder the survival of others?"

"Well, it wouldn't."

"Well, when have you used it as a solution?"

"Well, I've been damn fool enough to use it for a solution for a long time. But I answered that question a while ago, didn't you hear me?"

You've had it. What'd you stick your foot in that for? [laughter]

"All right, let's check this over now. Let's check this over now, let's check it on the meter. 'Survival?' 'Domination?' 'Right-wrong?' And 'Solution?' 'Wrong' still reads. How would it make wrong"

"Oh, well, yeah, I – I've been kind of withholding that, there's some other ways this works, that makes a lot of other people wrong, don't you see. If they had it, it would really make them wrong, if they had an idea like that."

"All right, that's fine. That's fine. Very good. All right, how is this thing going now?"

Well, you've put in a little whatsit line there and he tells you all about it, and so forth, and you uncork your Prepcheck. And you just give him an eighteen-button Prepcheck on the subject, and your tone arm action somewhere along that line starts to die down. Gives you a little bit more yip-yap about it and that is it. That is the end of it. Do you see how that's run?

Unfortunately – unfortunately, the auditor is always in the liability of hitting the GPM. And as long as this technique is around, you're going to have auditors grab "to go to school" and run with the ball and have a pc not going Clear on the service fac and get all chopped into something that's only resolvable with 3M2. Why? Well, actually they didn't pick up this pc's service fac, they got the pc's goal. This is counterbalanced by the fact that if you got the pc's goal you're rich, because it's very, very hard to sort the pc's *own* goal out of the implanted GPMS – it's because they both rocket read.

Going to – somebody's going to ask me the question, I'm sure, "Does the pc's own goal and own RIs rocket read?" And the answer is "Yes." In fact that is probably what makes implant goals rocket read. They're probably rocket reading off the top of the pc's own RIs. Secondary RR and that's the only thing that makes them rocket read. Pc's own goals rocket read.

Now every RI, including the one that the service fac may be in, may rocket read. And the GPM goal that the pc is sitting in is going to rocket read. That goal is going to rocket read. But your GPM does not need to rocket – pardon me – your GPM, to run it, has to rocket read, RIs to be acceptable have to rocket read, and not turn on mass when they do. But – just slide some 3M2 sideways in there. But the service fac doesn't have to rocket read. You're under no compulsion to accept a rocket reading service fac. As a matter of fact there's some liability in doing so.

It isn't necessarily true that you should reject all rocket reading service facs, but be perfectly calm about accepting a service fac that just goes on a little eighth-inch tick. Perfectly calm. You're not going to do anything to this character, anyhow. You're just going to have him straighten out his survival, and you're gonna loosen up the needle, and free up the needle and you're going to get some TA motion.

Now you actually have to be pretty knuckleheaded to do R3SC wrong, even though it has the liability of being part of the pc's GPM and so forth. You really have to work at it to do it wrong, and the best way to work at it is to be completely unthorough.

Go over little things and little things and little things and little things, and pick up this idea and throw it away, and not put it through the grinder, you know, and get that idea off of him and pitch it overboard and not put it through the grinder, you see. And then knock this one out and I mean push it into view, and pc says, well he's cognited on it's a service fac, so you say well, we don't have to run that then.

Because the end product will be a very confused pc. His – you've half – see, every time you restimulate a stable datum, which is what a service fac is – a very aberrated stable datum – they're a sufficiently aberrated stable datum to wonder – make you queasy about ever getting another idea so long as you live! I know I was thinking the other day, damn me, if I ever solved anything again I ought to kick myself. I mean, you see how much trouble you can get into with solutions. That fortunately is not the case, don't you see. You can go on and live life.

But, the point – the point is that every one of those things that are perimeter solutions on the center of a service facsimile, which is simply the pc's current RI... If you want to get very technical about what it is, it's his current solution, see, monitored by the goal, see? That's all it is. He's generating it, that's for sure! It's *his* solution. And it's aberrated as you can come, because it's an uninspected solution. He... actually, was a perfectly decent solution when he first got ahold of it, but now it's living his life for him, don't you see? And therefore it doesn't take care of the environmental restimulation. Doesn't even vaguely take care of his life for him. Doesn't write any letters for him, it doesn't issue him any paychecks, it doesn't box any policemen, it doesn't do anything. It just sits there and keeps him from doing anything. Well, when you move that thing, all the policemen he's not boxed, all the letters he's not written, all the inspections he's not done – start hitting him in their aggregate. So all you've got to do is disturb it and move it slightly out of the way, and some of this confusion starts generating. And the pc starts feeling confused. And you'll – running R3SC you'll have some of the most confused pcs in sessions you have ever seen. You've got to adjust to this as an auditor. You've got to adjust to this as an auditor.

Don't go arguing back at the pc because he says, "But you haven't started the session yet!" And you've said "End of session," so that the two teams on both sides of you are going to ask that you calm down, and so forth, and the pc just knows you never started session, that's all. Just knows you never did. And pc is going to walk out, and then suddenly come back and ask you to end the session, you know? And leave his books, you see, leave his books on the chair – leave his books on the chair and then get a taxicab to go home for them. You

watch this, see. Well, that is simply ordinary. That would be ordinary in running R3SC. Quite an ordinary state of mind.

Now, if that's an ordinary state of mind, what is the state of mind of the bloke who has had five service facsimiles picked up, partially run and thrown away, by the auditor. Now he's got five zones and areas of confusion which are knocking his block off. Well, man, if he can tell the time of day, he would be very, very lucky! It's not terribly dangerous, but it's useless to put a pc into this particular frame of mind. It's silly.

Now, you'll find out inevitably that this happens accidentally. Just in sorting them out, you miss one, you miss two, you see. Something like that. You couldn't get one to run yesterday. Something is sitting in the middle of what you are trying to do and you can't get the pc to talk about it, something like that. So you go on with your assessment. And you think you've now got one for that session. No, you've got the second one for that session, don't you see? Pc is so confused and stony he actually can't tell you about the one he got. See, the first one you got. Now you're already en route to the second one, without recognizing that you have found the first one, you understand? So it's a very good thing to review the auditing you've done every now and then and clean up what you've left behind.

There's no crime in having three service facsimiles up in the air like Indian clubs, as long as you're on the stage to eventually catch them, you see? There's no crime in having three in the air. The only crime is not being there to catch them as they come down, you see. Finish them all up in other words.

You're going to be fooled on a lot of service facs because they're so far downscale that they don't run according to the steps of R3SC, you have to jumble the steps, don't you see? Well, actually you don't really change the steps, but it just doesn't hit at this level, or hit at that level and so the pc says it isn't and it isn't – and then you tell the pc, "All right, well, then it can't be a service fac," you see, because it didn't enter at the level of right-wrong. Well, this is a serious blunder, in actual fact. It'll very often enter at the level of solutions; it'll very often enter at the level of "domination," quite often enter at the level of "survival," you see, when it won't enter at any other but the level it enters in on. That's the one. That's the entrance point.

Now that's – a real service fac behaves in a most outrageous fashion, in that regard. And something that isn't a service facsimile but simply gives you fine tone arm motion is more likely to behave perfectly. You still follow the steps of R3SC, see. You still do all those things. But, just because the pc can't do one of the steps is no reason to abandon it as a service fac and simply prepcheck it or something like that. No, try to enter these other points. Try to enter these other points, and you all of a sudden will trigger the automaticity, on occasion, that you've been looking for. You'll all of a sudden realize that you're running some perimeter thing. The main thing is to get tone arm action. That's the main thing for you to get. That's the big thing for you to get, tone arm action.

Administratively, remember to keep your weather eye peeled for the pc's goal, because this is the best goal finding method that we've had to date. The best goal finding method. You're actually unburdening the bank to the pc's goal. And all you do is run service facs – if you're actually hitting – you run service facs, until the pc's in pretty good shape, see, and has

handed you his goal. Elementary. Means some pcs will be on a long run, see, before they do. But if that's the case then they should be. They should have been on a long run.

Now, you're cutting down the environmental restimulation of the pc, constantly and continuously as you're addressing the service facsimile. Chronic present time problems, hidden standards, the other things, the very things which attract present time problems to the pc are of course contained in the RI of his own GPM which he is now in the process, laboriously, of forming, by being a blind nut. Naturally. He's got an RI, "a lover." That's the RI he's forming in this lifetime. See? On the goal "to be famous," not the goal "to be sexual." See, and there he is forming up this RI, "a lover," see. And its central postulate doesn't have too much to do with this, it's "to be good." That's its central postulate.

You find "to be good," you don't connect it with "a lover" see, and you certainly don't connect it with "to be famous," you see. You'd naturally say it's a sexual goal, you see. And "to be good" is a disciplinary goal of some kind or another, and all kinds of ramifications. And we don't dare run "to be good;" it doesn't rocket read, but it sounds like a goal, don't you see.

In other words, you can have a picnic walking through this forest of spears. You can have a picnic. But of course, that's nothing, because naturally the pc's whole bank is booby-trapped with these GPMs that have been implanted, so they read like goals, too. That's the one you worry about. Don't worry about doing these R3SC things, just go right ahead and do them, get lots of tone arm action and so forth. You'll get action, tone arm action, on the pc's own goal line – much, much, much, much better, infinitely better tone arm action, than you ever got on any implant GPM. And actually this whole thing has been resolved on the basis of looking for tone arm action. We finally come back to: Tone arm action is best found on the pc's own GPM channel.

You can use almost anything. You can use almost anything in the way of RIs, to do this R3SC stunt; you can do this stunt on any GPM RI found. The best way of handling it, however, is to oppose it with 3M2 if it's a backtrack thing, run it as a GPM. But you're not looking for that right now, you're trying to get down the environmental restimulation of the pc – calm him down, cool him off, and so on, so as to cut down the session environment restimulation and square him away. And you best do this with R3SC. R3SC will eventually lead in to a differentiation by the pc and by you as the auditor, of which is and what is the pc's own goal. When you've got that you can run 3M on it and actually the pc will fly like a bird. You won't have seen tone arm action the way you see tone arm action on a real GPM.

The only thing that puts it in the shade is R3M2 – is complicated, it is delicate to run, it is hell on the pc, you can miss items like crazy and the fact that you're running those GPMs over the top of falsely implanted GPM probably makes it a picnic, the like of which we never heard of.

So let's just quietly worry right now about R3SC and meet the other dragon when we turn the corner of the road.

Okay?

Thank you.

Service Facsimiles

A lecture given on 12 September 1963

Blue: needs to be checked.

Red: Omitted in the NEP tape.

Thank you.

Sorry to keep you waiting, I had to turn down the static!

I see my casualties here, are doing to badly. (laughs)

This is the what?

Audience: The 12th of September.

12 September AD 13, Saint Hill Special Briefing Course. And you're into the horrors of hidden standards, GPMs, chronic PT problems, service facsimiles, non-observation by the pc, a postulate being where the pc ought to be.

How's it feel to audit a postulate? I mean, you always thought you had a pc in the chair and you haven't. You got a postulate: a postulate which is designed to make others wrong and themselves right. I think that's quite interesting when you get right down to think of it.

We've had all these things in the past. This is Scientology Three I'm talking to you about, and as it flips over into Scientology Four. We've had all these things in the past, and the difficulties that a pc has in getting forward with his case are actually just those difficulties which I just enumerated. I'll go over them again for you seriously.

Pc has a hidden standard. Almost any pc that isn't making excellent progress, getting good TA action, and so forth, has a hidden standard.

What do we mean by a hidden standard? Well, he doesn't even know what he is measuring his progress by. But it's that which he measures his progress by. You say, "Did you make any gains in this session?" and he consults this standard of some kind or another. And then he says yes or no in accordance with whether or not this standard had shifted.

Now, this is your lower level of case that does this – not necessarily lower level, because you can get a case into restimulation so that I suppose he does have temporarily a hidden standard. Pc's got a headache. Had a headache for a week, been processed for some little time – a considerable length of time – and a headache has turned on. Well now, he's liable to measure his processing as to whether or not it turns off his headache. You see that all the time.

Well now, expand that. Of course you can take by gradients all kinds of aspects of things, and you can see that these tiny little things can graduate into very serious, overwhelming proportions. That is to say, any insanity or any complete spin condition is simply an exaggeration, *ne plus ultra*, to the exclusion of all other exaggerations, of something that is quite normal in most anybody.

You see, you eat. You see, you consider that normal. It isn't very normal, but you consider it normal. And that somebody is eating is not used by you as an auditor to measure whether or not the individual is Clear or not. You just don't pay very much attention to it. This is something you don't think about very much.

But as a case gets a little bit worse off, why, you have to start paying attention to it because this may become a very great exaggeration. And it can become an exaggeration: a not-eat or an eat-too-much or something like this, you see?

Now, several other facets of life drop out at this particular time, and if you took this same phobia at a lower-level case, you could get somebody who did nothing but eat – didn't do anything else, see? And you say this person is crazy. See?

Supposing they just ate everything in sight, see? Pencils, razor blades, rose bushes. See, you'd say they're crazy. And supposing they refused to eat anything of any kind whatsoever – similar condition, see? If you want to understand what is an aberration, it is simply an exaggeration of the positive or negative of the usual. You can take anything a thetan can do and exaggerate it, *in extremis*, and it becomes an aberration. That's anything, don't you see?

You could say even exteriorization can become "extremis," see? Somebody always flies out of his head; he is always out of his head; he cannot get near his body in any fashion or another; he worries about it all the time; he can't contact his environment via the body or contact the environment. Well, you'd say he's batty on the subject of exteriorization, don't you see?

Well, what is this then? It's simply an exaggeration of a condition which a thetan ought to be able to do well. Well, everybody is a bit batty on this particular subject at this particular time because practically nobody exteriorizes easily, or they're always exterior. See? There isn't any halfway measure on this particular line of exteriorization. That's because they are assisted to exteriorize by various means, don't you see? I mean, the implantation and other means to exteriorize them.

But this is an aberrated condition. But you see people around and they're not exteriorizing easily and you don't think this is odd. Then we look at that.

So that's an accepted neurosis, see? That neurosis is the common denominator of the society or the "normal." See, that's "normal." Well, just because everybody is doing it... Man has an interesting way of measuring up what's right conduct. He has it measuring up of what's "normal."

One day you get into a society where everybody in the society is terrified of spiders. You get into this civilization – everybody in this civilization is terrified of spiders. They're picking spiders off of themselves all the time, you see, and they sleep in their beds surrounded by spider traps, and they, you see, just go on and on. Well, there's practically no girl in the

room who isn't a little bit nervy on the subject of spiders, don't you see? You find a spider crawling across your nose, you boys would be upset, too, you see? But this society does nothing whatsoever but fight spiders, see – nothing known in its activity but that one thing.

But this isn't crazy because everybody does it, you see? So, according to those blokes in that society, they look at each other, and there's one guy there who isn't afraid of spiders, see? See? One guy there, so they say he's batty. He doesn't use spider bait around his plate while he eats, you see? Guy's crazy, you see? Obviously!

So this shows you, this shows you of course, that a departure from the norm – I use an old cliché – a departure from the "normal" is no indication of aberration. It is actually of no real concern of the auditor, because you're bound, sooner or later, to find somebody who doesn't put spider bait around his plate while he eats, you see?

This, by the way, what I'm saying here, occasionally causes auditors trouble. And they'll have trouble with some case – case runs too easily.

Supposing you found somebody that just clipped off engrams in chains: *bzzzzzp*, bong! – that's the end of that chain of engrams. Well, you have trouble with him, you see, because it's not a normal auditing response.

I remember old Ray Thacker, she used to be worried about auditing me after lectures and so forth. She'll tell you about it today, I think, and so on. Changed too fast. It's upsetting.

Finally got this thing taped. It isn't that I'm so good, but I thought it was rather amusing, you see? I run Havingness, and *zing-bang*, cognitions – *brrrrr* – and that's the end of the long chain of this and that sort of thing.

Well, that's a different auditing response from the normal, so you're not completely proof of making a mistake as an auditor, so long as you accept this normal or this average, you see, as the index as to whether or not a person is getting better or how he should behave in processing, you see?

Well, this gets booby-trapped, too, because you start processing somebody and he says he's out of his head and he's on the moon and he's here and he's there and he's taken care of the whole bank, and that sort of thing. And you're processing this bloke and you may find out it's not true, you see? And this upsets you.

So a few weeks later you're processing somebody who is close to an OT and is doing it and it is true, see? Well, it's just whether or not the guy can do the process – that's your thing – or whether or not he gains and whether or not he can get tone arm motion. Now there's a good index, see?

Pc get tone arm motion, you know? Pc stay in session. Pc go on willing to talk to you as the auditor. See, these are your indexes. And those indexes are constant. They have nothing to do with the speed with which a process works or the slowness with which it works; doesn't leave you, then, hung with this thing called "departure from the normal." You don't have to then have a normal for the human race (God help us all) as an index as to whether or not somebody is making progress in processing.

I dare say, if you went through an insane asylum, almost any insane asylum in the world, you would find in there somebody who was supernormal and who was not crazy. I dare say there's probably one per asylum, see?

But if insanity or neurosis, see, is measured by just this one thing: whether the person is "normal," why, then you run into all sorts of trouble in trying to adjudicate it. So what you'd stick with is your auditing tools, see? You find out whether or not this person gets good TA, see, on what you're running on him, and whether or not this person can do the process and can stay in session with the auditor, and if the expected gains and that sort of thing are made on the thing. And that's your index, you see? His behavior, his actual behavior in life is not of any great worry to you.

Now, I give you that as a word of warning, because as you move up the line with modern processes you very often go through periods of change – and particularly with a service facsimile and so forth – you go through periods of change which may be very swift. And a case does some sort of a flick of some kind or another and goes from A to Z without bothering to stop at any other of the letters in the alphabet. Or does it momentarily and hits a high and then does a slide back from the high, or something like this.

And if you were worrying all the time whether or not the pc had normal behavior, you've just added something into the whole problem of auditing which you just haven't anything to do with. That's all, see? And take it from me, it's of no value – no value at all. We don't care whether they're normal or abnormal or supernormal or something like that.

You can define various states. And it's easier to draw up a scale of abilities in life and try to measure somebody up against that, if you must study behavior, don't you see? Let's get a scale of abilities, only let's take a whole row of abilities, you see, and let's find out how the person measures up on each one of these ability lines, and so on. You might have some idea of his condition as a thetan, see? But that again would have nothing to do with normal, see? Nothing whatsoever.

You try to measure up thetan to thetan, why, that's rough.

Now, you get some case that doesn't behave well under usual conditions of auditing – and you are having trouble under usual conditions of auditing, don't you see? – well, you've got another problem staring you in the face here. And we don't care – that problem is not solved by saying the person is normal or abnormal. It is solved by the condition of restimulation of the case. That's how that is solved.

And I've given you a whole chart here which, by the way, has a great deal of value, and you could put any pc on this, or monitor any auditing against this particular chart, and start cutting down restimulation on the pc. And you can cut down environmental restimulation, you see, and cut this and that down. And you can cut down session restimulation in numerous ways, you see? Just don't give him anything new to audit, and that sort of thing – and numerous ways of doing this (anyway, those various zones I gave you there the other day), and you'll pick up the necessary TA action at some stage or another, see?

Now, that's completely independent, you see, of what process you are running on the pc. That, too, that doesn't come into it either. You could probably make almost any pc get

tone arm action on almost any process, providing you reduce the restimulation in various fronts and sectors till the pc's attention could be centered on it and the restimulation was at minimum. And you could probably get, on almost any pc, tone arm action on almost any process. But on some you'd have to be a lot more careful than others because the restimulation is very great. You see these as the factors with which you, an auditor, handle a case.

Now, let's take a look, then, at the fact that there are some case peculiarities.

And these case peculiarities all come under the heading of the material you've – that I've just reviewed this minute, see? Nothing in these things violate that. Now, that a person has a hidden standard does not make him subnormal or supernormal or normal or anything else. It merely means he has a chronic restimulation. That merely means he has a chronic restimulation of some kind that is throwing on to the case an additional amount of charge.

Now, that was given in your chart I gave you here about what's in restimulation, see? And that comes under the heading of that. And this thing is in restimulation; it's chronically in restimulation. Now, in service facsimiles and other reasons and so forth, we get the reasons why it's in restimulation. But we're not examining why it is in restimulation at this particular time. We're examining wholly, totally and only that it is in restimulation. You got that? Just reduce it to that simplicity. There's current stuff in restimulation. All right, if there's current stuff in restimulation, it includes, in some cases, this thing called a hidden standard.

And you say to the pc, "Did you have any gains in this session? Did you have any gains in this session?"

And the pc looks sort of hollow-eyed for a moment, and he looks back into his skull with his eyeballs or something of the sort, and he says to you – he says after a minute or two, he says, "No."

Now, what – what brought him to say no? What brought him to say no? Well, the thing that really brings him to say no is no tone arm action. So you can predict whether or not he's going to say no.

But this hidden standard is terribly interesting as a little mechanism all by itself. And it's a mechanism that you should look at as fascinating in its own gimmickry. It's in chronic restimulation. It's some engram, some facsimile, you know; it's in chronic restimulation. And if it was changed in the session, then he's had a gain. And if it wasn't changed in the session, then he didn't have a gain. You understand?

Now, that's what makes the pc say whether he's had a gain or not a gain. And, of course, there's the mechanical fact that if you get tone arm action, you must have been discharging some of that restimulation. So, of course, it will have changed this thing and he will say he did have a gain. See, it's as elementary as this. But, nevertheless, his gain is measured by this thing called a hidden standard.

So there he is, there he is with something which tells him whether or not he has had a change. He, actually, most of the time is not aware of this. Now, if that – if that was the only thing that happened in the session with regard to a hidden standard you would be in clover, because you could cope with that, because you just have tone arm action, see?

But that isn't all that happens. Unfortunately, that isn't all that happens. There is something else going on during the session that you should be very interested in. And that is the fact that he's taking this thing, whatever it is, into every facsimile, into every process, and is trying to fit the process to this thing. He is always trying to find, hectically, scramblingly, and so forth, what it is in the incident that you are trying to run on him, in the process you are trying to run on him, in the picture he's just been presented with, which resolves this thing. You got that?

In other words, he takes this little red wagon everywhere he goes. And he doesn't look at the picture. He says, "Did it wash up that little red wagon?" See?

Now, you're going to run – you're going to run some kind of an implant or something on this fellow, you see? And the stuff is spitting and spapping and burping at him and so forth, and he hasn't got really any attention on any of this stuff at all. He's trying to find out whether or not it's doing anything to the paint on this little red wagon, see? Which in effect is what? It gives a pc such an introversion in a session that he doesn't as-is anything and you don't get tone arm action.

And time and the tone arm fit together. Now listen to this one because this is very important: He drags this thing into every other incident or thing to fit it up, and therefore is misdating something for the duration of the session and all sessions. He's always misdating something.

That's worth knowing, isn't it?

The fellow with a hidden standard, then, is always misdating, because he's dragging the hidden standard – he's dragging the hidden standard into everything you're trying to audit. And of course that isn't the date of it. That's a fascinating little set of phenomena. He's dragging this red wagon, which may have the date of eight trillion trillion years ago, you see, and he's dragging it into yesterday and he's dragging it into the breakfast table this morning, and so forth. And he's dragging it here and he's dragging it there. If you tried to run birth on him, he would see whether or not it did anything to the little red wagon, you see? Wouldn't do anything to him. So, in essence, he's put eight trillion trillion years ago into birth, he's put it into breakfast, he's put it here and he's given it a new date every time. It's the most effective stopper of TA action there can be – the hidden standard. Misdate, misdate, misdate.

Now, there is a way of getting rid of it. A process which is called – was called 3T. Actually should be called, now, 4T, but could just as easily remain as 3T. And until we do a complete revision you can write it as "3T" – Routine 3T – which simply asks the pc (now, this is very germane to your service facsimile, because this is very cute, very cute), you ask your pc for his chronic psychosomatic. What does he mainly complain about in auditing.

Now understand, you have asked him bluntly and directly, "Hey, bud, what's your hidden standard?" But all he knows about it is that he experiences it and that it is always present. So, you ask him what he is experiencing and what is always present.

And he says, "This lumbosis, this – this lumbosis, this lumbosis."

And you slicker him. You slicker him. And that's just called R3T because the total action of it is you date it. You date it and let him get the itsa line in on it. And you'll find to a very marked degree, in most cases, that's the end of the hidden standard.

What you have to know, in order to understand this completely, is the hidden standard always expresses itself physiologically. The hidden standard is never hidden physically. It's hidden from the pc, and it'd be hidden from the auditor if he never inquired into it. It's that thing by which the individual measures his gains in processing. But that's actually just about as hidden as an elephant in the middle of a ballroom. It'll be what he complains about in processing.

And sometimes it's going to take you an hour or two of itsaing just to find out what it is. And that too is very good auditing. What's this thing he's been trying to solve in processing. What's the physiological condition which most worries him in processing and which he has been trying to solve? And he will eventually lay it out on the silver platter. And he will say, "It is my stomach pains."

Now he's got that all settled. Now, that, by the way, has already alleviated it to a marked degree, and has given you some interesting tone arm action, maybe where you didn't have any before.

R3T is one of these things you can use *in extremis*. You just put the itsa line in like mad on the guy's chronic somatic, you see? "What are you trying to solve in processing?", see? He gives it to you and he gives it to you and he gives it to you and he gives it to you. Now, the only difficulty with this: if he starts giving you problems, you've sort of had it because that problems isn't an itsa. You understand? So your question probably ought to lean in the direction of "What physical condition are you trying to solve?"

He'll eventually isolate these gut pains. Gradually, gradually, gradually, you know? Itsa line, itsa line, itsa line. It's good auditing, see? It's marvelous auditing. He'll gradually itsa this thing out into view if he doesn't tell you at once. Sometimes he spoils the whole process. He says, "Oh, it's my lumbosis!", see? I mean, you've had it, see? Then you'd have to go into it on the basis, "Well, when has this troubled you in processing?" Then you'd probably get some TA action out of it – sort of an anticlimax. But you could probably get some TA action out of the thing, even so.

And that may be the only way you can handle it, you know, is "When has this troubled you this lifetime?" or something, you see? But you can take that, with R3T, and you say, "Gut pains. Gut pains. Order of magnitude. Years ago? Tens of years ago? Hundreds of years ago?"

Keep going, man, keep going. Don't stop just because you've hit a trillion. Some people get allergic to this thing called a trillion. I don't know why. They got lots of them! [laughs] You have big problems in how to express trillions, and big problems in how to this... I've even had some suggestions that we invent a new unit of time, some kind or another. I'm all in favor of that, but I'm afraid it would have had to have been done some time ago for it to work on the thetan. Thank God we aren't measuring it in numbers of heartbeats!

Anyway, you just get that order of magnitude, see? And this is, by the way, good auditing to do this. You date very alertly, and sometimes you say, "I've got a read here; appar-

ently it's in the order of magnitude of trillions of trillions of trillions of years ago." And the gut pains go *bbzzp-brrp-booom*. And that's all you hear about it and that's the end of that process. That's the lengthiest process in Scientology in terms of numbers of years covered but not in hours of auditing.

One warning here: you try to nail this thing too closely, and you get yourself in trouble. And you find a pc is sitting in the engram, and you're going to have to shift to R3R right there. He's so stuck. And if he was in a GPM you'd have to shift to 3N. And if he was in his own GPM you'd probably – oh, well, 3M2. So therefore, you can make too much of a good thing out of R3T. See, that can be, too. So the dating – now get this – the dating is done with an eye on the pc as well as the meter. And that's what makes it a process which commonly will fail because it is simply overrun.

You find out this thing is thousands of years ago, and he goes *dllukglunk-tum!* And you see *hhhp!* It's almost as good as the meter, see? He'll go... [short comm lag]. And you say, "All right, I had a nice read on that. That was thousands of years ago. All right. Now, how do you feel?"

"Oh," he says, "I feel better."

And at that point you haul in the itsa line and go flank-speed ahead into your next process. You hear this? Why? He gonna push himself into things.

I remember, old-time Dianeticist, been around for Lord knows how long – he's down in Los Angeles now – and he was in at 42 Aberdeen Road, and I was showing him what Straightwire was. I was showing him, unfortunately, the difference between Straightwire and engram running. Unfortunately, see?

So I took his chronic somatic and his worry about this lifetime, and I straightwired it out of existence like that. I just spotted the time and somebody else had it and it blew, and that was that, see? He was the happiest man you ever laid your eye on, you know? He was just pleased, you know? He just was shining and pleased. And then I said, "All right, now we'll pick that up as an engram," proceeded to do so and keyed it right straight back in.

But it was actually a terrible cruelty to do that to the man, and I actually wouldn't have done it had I realized that he was setting so much store by it. So let that serve us as a lesson. It's a mistake I haven't made again.

What's the essence of this, then? When the pc drops this one off, bail out. Too much of a good thing here. You can even make up some homely platitude, you know? Something about "A little auditing goes a long way if a long auditing goes a little way," or something like that, don't you see? I know, it confused me, too! But there's something about medicine, you see, "If a little bit of medicine did a lot of good, why, a lot of medicine will do lots of good," and you can actually get caught in between this on this little process.

So the process is not greatly advertised. Terribly effective – it's been with us forever – because it's dating the somatic, you see, and getting rid of it. But in this particular case you're not dating the pc's somatic. You're asking him what he's trying to resolve in processing. You get the difference? And that's the only reason it has any importance at all, is because once you've dropped that off the pc, he then won't consult it to find out if he's made his gains, and

he won't be dragging the thing into every facsimile or anything else you try to run on him. So he's going to make some progress and he's going to make more TA action because he's not always misdating something. You got it?

But a little of it goes a long, long way. Slippy, quick, fast. I dare say – I dare say when you first use it, about 80 percent of the time you will overrun it, when you first start using it, and then you will get very, very expert and about 50 percent of the time you will overrun it. See? And you'll eventually, if you keep using it, time to time, why, you'll suddenly find out that you're getting pretty slippy; you're getting pretty slippy. You see, if it disappeared on the itsa line, you'd bail out. It *isn't* likely to, but if it did, you would.

You'll find out that some horrendous body masses come off of the pc by reason of this operation.

The only thing – the only thing it's used for is this thing called a hidden standard. You got that?

Now, a hidden standard is not always present in every pc to a point where it ruins the auditing. But it is present in any pc who has a difficult or delicate tone arm. So on your delicate-tone-arm cases you have another little weapon. And if you don't have a delicate-tone-arm case – this character is just running fine with the tone arm action and that sort of thing. It isn't always stop, you know, and isn't always this and isn't all that. And you find yourself going around worrying about somebody's tone arm, that is your immediate and direct answer.

If session after session you've worried about somebody's tone arm action and you're doing everything reasonable in order to get the tone arm running and you have not made it, and so forth, then you just remember this little point on the time track, or this little point on the tape, when the old man said, "Delicate tone arm: probability – hidden standard. Remedy: R3T." And remember, he also said, "A little of it goes a long way!" [laughs] You can get enthusiastic with this R3T; you could probably try to run a whole case with it.

All right – let's see how you can run a whole case with it. All right, now, "What are you trying to resolve in processing? What pains, agonies, illnesses or sicknesses or physical sensations are you trying to resolve in processing?" and so forth. Pc gives it to you. Order of magnitude: date it, date it to the second – you even have to do that sometimes – but you date this thing to the second. Find the pc stuck in the engram – find out it is an engram – shift to R3R, get that out. And then find the engram is stuck in the middle of the GPM, so you shift to 3N, you see? And you get that handled, you see? But then you find that this, in actual fact, is part of one of the pc's own GPM's RI, so, of course, you have to shift to 3M – R3M2. All right, now you've shifted to R3M2, and you find out actually it's reaching up into PT, so you run a service fac on it. Now, having run a service fac on it, you accumulated quite a few ARC breaks during this auditing, so you.... [laughter]

A little of this goes a long way! And you'll finally get expert at hitting the silk.

But you actually could take everything the pc was worried about, see, and do this whole thing. You could do R3T, even well done, on everything the pc was worried about in present time. Now we're being sensible, see? This isn't ridiculous, this is true, see? You say,

"What are you worried about?" You know, "What are you being processed to resolve?" and so forth.

And he says, "Well, my gut pains."

"All right, that's fine." R3T gut pains. Order of magnitude. What's – where's the gut pain? Well, to hell with that. That's the end of that, see? All right. "What else are you trying to resolve in processing."

"Well, my headaches."

"All right." R3T headaches. *Pssheww!* That's the end of his headache. "What else are you trying to worry about in processing?" and so forth. "What are you trying to resolve?" and so forth.

And says, "Husbands."

"All right, let's date husbands." And – fact, see? All right, *pssheww!* Order of magnitude on husbands, you see? "Your worry is back there at trillions-thirty-five. That's it." Okay. No itsa line. *Ahw-v-v-vh!* See? Trillions-thirty-five. That'd be good.

"All right, anything else you're trying to resolve with processing." and so forth.

"Well, I'm trying to resolve having a body – having a body. I'm trying to resolve having a body. Get in my way – get in my way all the time. You have to wash 'em, you know, have to wash 'em. And they dent, and they drip blood all over the place when you stick holes in them, and so forth. They worry me, they worry me."

"All right, body. Order of magnitude, - body." *Bzz-bzz-bzzz-bmp, zump, zump, zump, bop.* "Well, well, 208 thousand years ago. Very good, all right. That's it."

Pc says, "Yeah, there's an interesting – interesting thing there."

"Well, good! Good! Thank you." That's when you want to get that TR 2 in there, see? "Good! All right! Well, what do you know! Well, I'm certainly glad you found that! Very fine. All right, I'm glad you found that! Okay. Now, what else are you worried about, in actual fact, in processing?"

You see, you let his line go on the backtrack, and he's going to have you wrapped around into every process you ever heard of, man. You're going to lose control of that session.

When you finally finished up, you'd have a Clear. That is a method of clearing. Got it?

Needle would go free, TA would come down, and so forth. Impossible as it seems, it is a method of clearing. That'd be every hidden standard he ever heard of. Anything he could dream up here. But don't let him pull any back from the backtrack. Ha-ha-ha! That return journey – no payload. Return empty, see? Nothing, no baggage. Otherwise he'll start scraping that track up and bring it up to PT, and the next thing you know, why, you're doing "Oh, my God," see?

Now, the service facsimile – the service facsimile – has to be severely located on the time track. And we say "this lifetime," but actually what you're doing is circumscribing the duration. This is your absolute limit of your service facsimile activity – R3SC – is the pair of

RIs he's currently sitting in on his own GPM line. Now, that can be a pretty broad sphere. But if you limit it very severely to this lifetime, you could even work to key that out, don't you see?

But if for some reason or other this becomes so complicated and you can't get down to it, and somehow or another it doesn't come, and they just can't make it out, and you – and you get to wondering why you ever came to the session in the first place, you see, why, you've still got another string to your bow – You've got R3T – R3T clearing. You can still make a Clear; he can't stop you from doing it. You see that?

Now, this is with the pc that you can't seem to find a service facsimile on that runs over any period of time. You know, difficult, difficult. Now, I say you're going to get some difficult pcs – it's impossible to say otherwise – because the hidden standard in this particular case is the service facsimile. But it just happens to be, for some reason best known to somebody else, completely undentable.

Well, there's one thing that will dent it, and that's to pick it up, wrap it in a small black bow, wind your arm up around your head and pitch it with high velocity down the time track to a place where it belongs. And that has a degree of workability.

Now, of course, this is all under the heading of destimulation. So, because it's under the heading of destimulation, you have to be very careful not to run anything. See, that's why it becomes absolutely ridiculous to start running things. Because you start running things on the whole track on a case that you're already trying to destimulate – why are you trying to destimulate the case? You're trying to destimulate the case so that it doesn't have PT problems and so forth to kick your auditing session to pieces. So therefore, if you start a destimulation action – if you start an action of destimulation – what have you done if you suddenly start running something on the backtrack? Hm? And if the pc's service facsimile has in it "to make you wrong as an auditor," that's the first thing the pc's going to do: He gonna try to restimulate more than he already got.

Now, how do you keep the itsa line in on a pc who wants to restimulate more? That's your problem! How do you keep from ARC breaking this pc? How do you keep him from actually actively cutting the itsa line?

Well, the best way to do it, actually – and I will help you with this problem – is be awful damn careful of your whatsits. Use that whatsit line with great skill. Knock out of your auditing all social actions. That's the first thing you do. Avoid all violent attention shifts. Avoid all attention shifts that you possibly can which are directed by a whatsit. In other words, don't direct the pc's attention in such a way as to ARC break the pc so he starts to get even with you by restimulating more, or some weird combination like this occurs. Just avoid all that. See what I mean?

Be awful careful of those whatsit. Don't say "How have you been today?" You understand? That's a whatsit.

Gives him an opportunity to say, "Well, actually, I was sitting in – up in the lounge at the Bide-a-Wee Club, and so it occurred to me, you know, saw this figure in Roman armor."

See? You've had it. Got the idea? It isn't a matter of withholding something, unless you're obsessively social. It's just don't use them.

Now, the type of Model Session that is employed on a case that is very prone to re-stimulation – isn't getting much tone arm action anyhow – is your W Unit Model Session. That's your zero social. Oh, let him discuss anything he wants to after a session – discuss anything he wants to after a session – but he's aware of the fact you're no longer auditing him and he actually won't plow it in. You get the idea? Now, don't keep putting the brace on him and shutting him off and stepping all over his toes and that sort of thing. But in session: "How did that go?" *Hmmmm* – you're walking along the edge of the precipice, don't you see?

Any delicate-TA case, any case that you're having trouble with, any case that you're having difficulties trying to stabilize them into a process, any case – you know, overrestimulation leads to self-invalidation. You should know that. Case is invalidating his own case and he's chewing himself up all the time, and he doesn't know, and he this and that. Well, actually, the more you re-stimulate, the more he's going to self-invalidate and the more he's going to invalidate Scientology and other dynamics. You understand? This is a symptom of overrestimulation.

You can actually classify aberration into these two classes. There's the symptoms and reactions occasioned by overrestimulation, and then there's the particular significances caused by the service facsimile and other things, you see? The significances – the dramatizations the person goes through – that's one channel, and re-stimulation is another channel. Of course, re-stimulation gives you the degree of dramatization, too. If you raise the re-stimulation on a case, you can raise its dramatization.

If you handle these problems in the guise and line of re-stimulation and monitor nicely with destimulation, and handle a case very nicely like that, you can get the case up to a point of discharging a great deal of stuff and you can get a case to discharge lots of charge.

But if you go at it so knuckleheadedly that everything you say to the case leaves the case wide open to the re-stimulation of more actions, you see, on the track, everything you do with the case, and so forth, leads to more re-stimulation, and then if your queasiness in handling the case also gets in your road and prevents you from really running a process – or the pc's nerviness or overrestimulation – then the case is just going to get less and less and less and less and less controllable; less and less and less controllable. Do you see why? Re-stimulation is catching up with you.

So, therefore, the destimulation of a case is an art, and it is a peculiarly positive sector in the field of auditing. And most of you are on this sort of thing right now – service facsimile, see? Now, the service facsimile, discharged, decreases the re-stimulation that the case is subject to, even though it's just discharged right here in this lifetime – present time, a lot of action and so forth. Case is subject to less re-stimulation because he pulls in less present time problems in his environment, don't you see?

Now, the present time problem, the aspect of the present time problem, is another category of upset to you. Case with a tremendous present time problem does not make good processing gains. If a person's graph remained the same throughout a week of auditing, you can assume this case had present time problems. The way to handle present time problems is

to handle that factor in the case which causes the case to have present time problems. What causes the case to have present time problems? There must be something in restimulation to the case which pulls in present time problems.

I'll give you another method of listing for a service facsimile which actually nails present time problems with magnitude. You realize that there are so many solutions in the zone or area where we are operating at this particular moment – there are so many solutions to the thing – that it'd be very hard to give you a total coverage of all of these materials. And you're going to discover quite a few solutions in running somebody with an itsa line and handling service facsimiles and that sort of thing, see? You're going to discover a lot of these things.

There are certain standard ones, and this could be classified as a standard one: "What's a safe assumption about your environment? What would be a safe method of handling your problems here and now in life?" Now, a question and a list of that particular kind is going to drop into your lap, with a thud, the stable datum that the individual is holding at bay various sectors of his existence. So it comes, in that wise, a method of destimulating the environment. All you had to do is just list the list with some such question as I just gave you, and you'll wind up at the other end with what he uses to handle his family, what he uses to handle his job (that may be another one, see).

All right, now let's expand that process and let's take the pc's whole environment to pieces. Let's take this big sector we call the pc's environment. Let's take that whole sector and let's compartment it. Let's find out – in present time, let's find out where his life is in conflict or contact with what. Let's find out the whole lot, don't you see?

Now, this is terrific itsa line stuff. You're not saying "this lifetime," now, you're saying now, man. There's no opportunity to go restimulating something else, you see? It's now! And his idea of now will probably go back to yesterday afternoon, or it might go back for a year or so. Somebody living in a farm community or something like that and things are pretty calm, he may consider his present time, you see, much broader. You ask a London city dweller what his now consists of, and he will tell you about his sandwich at lunch, you see? That's about as far as his time goes. It's very hectic.

But let's just take this guy's environment, just in a social sort of an auditing way, because you've got such a terrific limiter on it, you see, that you can be very relaxed with your auditing. See, you can ask him almost anything as long as you don't throw his attention on the backtrack. All of your questions have to do with right now, your present time.

"The life you are living at this particular moment: what have you been in contact with?"

The person will say, "What period?"

"Well, you know, now. Now."

"Well, now I'm in contact with the session." This guy's too sane to ask such a question of.

So you say to him, "Well, in the last thirty days, you know, what are you in contact with?" That might not include his parents – they haven't had a letter for thirty days, something like that – but it's part of his environment.

Let's just get that environment all torn up, see? Let's get him to tell us, you know, where each sector of this is. This is terrific Scientology One. The guy's got the is-ness of his environment. How many people have ever sat down and seen exactly what their life contacts consisted of here and now? You talk about orientation, man! This is orientation. Well, that's going to throw you with TA action, and that's going to loosen your needle – just that.

Little innocent questions from you, "Well, where are they?" see?

"Oh, and I know the Smiths. I know the Smiths. The Smiths. I know the Smiths pretty well. She's pretty nice looking, and he makes awfully good rum nog and punches," or something, you see? And, "Yeah, I know the Smiths."

Well, he's just liable to go on saying, "Well, I know the Smiths," you know, "I know the Smiths." Your tone arm action will die down after a while.

Wake up. Well, what can you say? Well, it's like the questions you use in 2H, see? "Well, where are they? Where are they?" see? Now, there's – there you're running the locational process on him. You know, "Well, where are they?"

"Oh, they – they're – they're up at Eastbourne," see, "they're up at Eastbourne, and they live at – they – they moved. They moved. Let's see, they used to live at 13 Galloway Street, and they now live at 42 Yard Road – yeah, at 42 Yard Road. I don't know quite where that is. I was up in Eastbourne the other day – ." and so forth and so on. "Let's see, Yard Road..." and so on. "I think you come up from the dock. No, no, it's that one under the hill. That's – that's – that's the one. Yeah, that's where they live. Yeah, I've seen the place before. I haven't seen their new house, but I know where that place is. Yeah, I got that, see?"

See that tone arm action go there, man. You watch that fly. You see, "Where are the Smiths?" It's apparently got nothing to do with the price of fish, see? But now you've got the Smiths, not only categorized, but located, see?

And he works for the Bide-a-Wee Biscuit Company, see? All right, that's fine. Of course, you can reduce all this to a rote procedure that takes all the life out of it very easily. Bide-a-Wee Biscuit Company – he's telling you very interestedly about the Bide-a-Wee Biscuit Company. They get – they're located there, and he goes down there to work every morning, and so forth. And there's a porter there by the name of George, and George has always got his hand out for an apple or sandwich or something of the sort, and he's always got some wisecracks and so forth, and there's a lot of people around there. And they're pretty good people down at the Bide-a-Wee Biscuit Company.

Well, let him get away with this "down to the Bide-a-Wee Biscuit Company," you see, just so long. And well, you want to know "Where is this Bide-a-Wee Biscuit Company?" you see? He's run the tone arm action out of what it is, you see? Well, let's get some tone arm action, let's bleed it down with where it is, don't you see? And man, he gets the Bide-a-Wee Biscuit Company parked, and he's all of a sudden liable to have a terrific cognition. He all of the time, because he goes in the underground, it's lost sight of the fact that it is actually twelve

miles from where he lives, see? So, his Bide-a-Wee Biscuit Company... And then he realizes they got a lot of branch offices around here and there. And he's been to several of these branch offices. And you can just see this Bide-a-Wee Biscuit Company: He'll start to expand – take place, and you see the tone arm start moving on the thing. You get a lot of nice tone arm action out of it and so forth. And he finally – finally he gets down to the personalities on the thing. And you'll notice, it will be the things which he's having a gradient scale difficulty of confronting. And you'll build up this gradient, see? And you'll see his confront starts going up on his environment to the degree that you blow charge off of it, see? And his confront starts up on his environment.

And you can notice this in his kind of answers if you're very clever about it. You'll notice that he just goes down to the Bide-a-Wee Biscuit Company, don't you see, and he sees George. You know, George – that's the Bide-a-Wee Biscuit Company, you know? That's about all he's got of the Bide-a-Wee Biscuit Company, even though he goes there every day, is George. And the only important fact about George is the fact that George has always got his hand out for an apple. See? Something of that particular sort, see?

Now, however, he expands the fact that he actually works in a certain section of it and he has certain associates there who are something-or-others, you see, and they work in a little bunch of offices. And then he all of a sudden tells you all about George's family and where George lives, see? He'll revert to that and do a wider confront, see? And then he'll go up and then he tells all this and, of course, he finally can tell you who's managing director, and you'd consider his confront is adequate then at that moment.

But you'll see how pinned down his attention line is in the environment. It doesn't take a terribly clever auditor to do this, but it takes one that doesn't mind a pc being gabby. And you're just putting the itsa line in: What's his present time consist of and where is it and who's in it and where are they? Next thing you know, you got the guy permeating all over the place, see?

This is a lot of auditing. This is a lot of auditing. It's a terrific HGC approach, see? After that's happened to somebody in an HGC they'll know very well that the HGC has got their good interests at heart. Well, they have, you see? But they know that because a good Scientology One has been run here on the person's lifetime.

Well, when he's all through with this and he's got all of his environment laid out and his wife's relations and how likely it is at any moment they're liable to come to visit him and when he's got everything all taped every place under the sun, and you finally now decided that you've got his present time. Because you've used this, you see, "present time," a lot of times with him in the discussion – and you don't let him catch sight of that, otherwise he's going to tell you his war stories. False itsa line. False line. You don't want anything to do with that, see?

So what your lineup here consists of is his present time – got that all categorized – and then you throw in that process I just gave you.

Now that you've got all sections of it – and you could actually lay out a plot of it and draw a map – you now know where are his zones and sectors of problems and you know which one he's most fascinated with, because he gets gloomiest whenever he talks about it.

You don't need an E-Meter to tell you that. Although if you kept talking about it very long, it's problem, problem, problem, so your tone arm action would die down, you see? "Oh, well, there's my parents. [sighs]"

About that time even the most imperceptive auditor would notice that there were problems in that vicinity; he wouldn't even have to look at his E-Meter, see? But if he also looked at his E-Meter, don't you see, he would see all of a sudden that it started to rise and it wasn't doing any blowing down. Got that?

Well, that's a weird way to do an assessment. But that's a very accurate assessment. There's more problems there than he can confront. See, a rising tone arm is a no confront – always, you see? He can't confront this many problems, so he can't put any itsa into the vicinity.

Now, why can't he put an itsa into the vicinity? Well, you say you can explain that very well. "Sons feel odd sometimes about their parents," you see, and so on. You can explain and explain and explain, you see, and you can figure it all out and you can figure it all out and you could worry yourself to death. But let me point something out to you: The longer you spend worrying it out, you see, at breakfast, and that sort of thing – the longer you spend doing that – if you catch yourself doing too much of this, realize that you are not, at the time you are eating breakfast, putting an itsa line in on the pc. And even though you come to a total conclusion with regard to the thing, you won't have moved his tone arm one bit. And I point that out to you, see? You won't get any tone arm action on him at all.

Now, in your idea, you should be getting tone arm action on him; that's a reasonable assumption, see? So, use this as your assessment line. Now, isn't that an interesting assessment? It's not an assessment by tick and click and reading lists, you see? That's an assessment of zone. And it's an assessment by "Oh, yes... yes..." An assessment by rising tone arm. And you've located a zone where he has a service fac in operation. Right like that, see? Now we know. Now we know.

Now, why do you get a rising tone arm? He obviously isn't confronting it. Now, it's no good for you to assume that there are lots of reasons why he can't confront it and it blows up in his face every time he tries to confront it, you understand? That's nonsense for you to assume that, for the excellent reason it's not true. You're going to find out he can't confront the Bide-a-Wee Biscuit Company because "biscuits are no good." Stable datum. He never confronts the Bide-a-Wee Biscuit Company; he confronts, and is, a biscuits-are-no-good, see? So as long as he's got that problem totally solved in present time, he never has to look at the Bide-a-Wee Biscuit Company. So now he will continue to have present time problems with the Bide-a-Wee Biscuit Company.

I'll give you the most elementary type of present time problem with the Bide-a-Wee Biscuit Company: If he can't confront the Bide-a-Wee Biscuit Company at all, he's going to make mistakes on the job, and it's going to make present time problems for him. Doesn't have to be anything esoteric about it, you understand, because present time problems are in direct ratio to the no confront. The frequency of present time problems are the measure of no confront. And here's the recent datum stated at a terrific simplicity at the service-facsimile level. Here's this recent datum, service facsimile: No confront is caused by a substitute confront.

Now, that gives you a brand-new look at life. You always assume, you see, that the reason the thetan isn't confronting is because he can't confront. See, we don't care whether he can't confront, but that statement doesn't lead to a solution of the problem. That's all we need to know. See, so don't worry about whether he can't confront it or not. Yeah, colloquially we speak all the time, as Scientologists we're always saying, "Well, well, you know Joe, he's always in trouble, he just can't confront that," see? That's fine, that's perfectly true, in its limited sense. But in actual fact, that doesn't lead to a resolution of that guy's case, because it isn't factual. It isn't quite factual. The reason he's not confronting is caused by the substitute confront which we call a service facsimile.

It's something like he has set up a little radio tower in the middle of the Bide-a-Wee Biscuit Company on which has got "I hate biscuits" see? And that thing, that thing confronts the whole Bide-a-Wee Biscuit Company for him. And so help me Pete, as long as he's got that thing, the Bide-a-Wee Biscuit Company is going to cave that guy in and is going to knock down the case between sessions to a point where you're always having to handle the restimulation of this case in his environment. And if you're only auditing this case two and a half hours a week and the case is spending forty-some hours a week at the Bide-a-Wee Biscuit Company, in that two and a half hours you're not going to even come close to removing the gathered restimulation of the past week.

You add up the number of hours which you've spent with the case on the subject of the Bide-a-Wee Biscuit Company, you'll find out that they will vastly exceed, in efforts to handle his PT problems with the Bide-a-Wee Biscuit Companies, the effort you would make to simply compartment his environment with great care and find the stable datum that he uses for the Bide-a-Wee Biscuit Company. Find that and run it as a service facsimile with R3SC. See, that'd be the smart thing to do.

Well, the opening gun on a case, obviously is, if you've got the tools to do it, is to clean up his present time problem so he isn't going to be accumulating, continuously, this, see?

Now, the present time problem which generated in his environment is a different thing than this other thing I was talking to you about called a hidden standard, see? That's a different thing. Now, it stems simply from a bigger zone, however, of restimulation. But it's being pulled into restimulation arduously and forcefully by the pc, continuously, for some reason best known to somebody else. And the reason it's in continuous restimulation is just all these things are bits and pieces of the RI the pc is in. And it's interesting that you can put that RI to bed and take the thing apart in this lifetime. That's what's fascinating: that you can do it at all.

But this thing of Bide-a-Wee Biscuit Company, he does this all the time. It's one of the best things a thetan does. He gets tired of walking down the halls, so he puts a postulate in the hall, "I hate biscuits," and that's the end of the Bide-a-Wee Biscuit Company on his confront. But the damn fool continues to stay on at the Bide-a-Wee Biscuit Company.

You can put right conduct down, is "Don't remain places that you don't want to keep confronting." See, you can put that down as a little lesson in life, see, completely aside from processing, don't stay in places you don't want to keep on confronting, see? Because your don't-go-on-confronting will then lead you to stick up a stable datum of some kind or another

to do your confronting for you in that vicinity and the next thing you know, this is going to be a gorgeous piece of mass, and it's going to be giving you more present time problems than you can ordinarily count. And your life is going to become very restimulative indeed. That's a little social lesson I give you there, out of Scientology Five. Anyhow – how to get along in this universe, if possible.

Now do you see, in essence, the compartmentation of the environment and the selection of these little odd bits and pieces, you see, that he's using as stable data in his environment? And the knocking these things out, you see, with your R3SC processes and so on, you will find a very easy activity. That was what R3SC was originally designed against and for. It, however, goes a little bit deeper in that it can take apart a service facsimile. When R3SC is running very, very hard and very arduously, and your pc is being knocked all over the place by all of this sort of thing, recognize what you have collided with. You have collided with the RI which is the current RI in the forming GPM of this particular lifetime. It's very difficult not to collide with it. Well, it also surrenders to the techniques of R3SC, but makes a very much more arduous run of it, you see?

So you would say there's two versions of R3SC, see? But in view of the fact that they are both handled in the same way, we classify R3SC in terms of what assessment was done in order to find it. And we number the assessments. Regardless of what stable datum you find, you are going to handle it by the steps of R3SC. You could enter the thing at almost any of these levels. You can also enter it at a fourth level, solutions. "When have you used it for a solution," see?

But you've got this pattern by which you address a stable datum – R3SC, see? Now, how you arrived at that stable datum would be the assessment you did for R3SC, and there are several of these numbered assessments.

Now, I've just given you a very simple one. A good Scientology One done by a Class II-type auditor – but it's Scientology One, orientation and is-ness, you see? He just does this with the itsa line in and everything running along gorgeously and he gets his environment all oriented on the pc and he gets this thing all taped and he locates the most prevalent source of PTPs on his pc by an assessment of mostly "Ohhh," an assessment also with a rising TA, but that is less observable than the pc's attitude about it.

He's been talking about, you see, "Well, actually, I uh, I'm – I'm in contact most of the time with airline companies. I go down to airline companies and deliver things and that sort of thing and talk to a lot of people. Have to talk to a lot of passengers and so forth. And talk to hostesses – a lot of hostesses to talk to down there, too, you see? Once in a while I get to talk to pilots. And uh, I get out to the airport quite often and go over there. There's a girl at the magazine stand I like to talk to; she's – she's lots of fun, and so forth. And any of the toys get worn out, why, she gives them to me for my kids, and so forth. We have a pretty good time out at the airport, and I do that, and so forth."

Well, the real knucklehead of an auditor comes in after that dissertation and says, "Now, what stable datum do you have for the airport?" He isn't going to have any.

He'll finally say, "The dispatcher's tower." See, he'll give you something in the airport. You know, "The girl at the magazine stand." You see? "She's a good stable datum for the air-

port. She always tells me what's going on." In other words, you won't get one, see? So you have to be perceptive just to that degree, and....

Now, you're going along, and you say, "All right, now all right, we got all that taped and so forth. Well, how about the socialist club that you belong to – you mentioned a moment ago. What about that?"

"Oh... [sighs]"

Well, the auditor after a while should wake up and realize that what isn't being called on here is another whatsit. What's being called for here is a safe assumption for the socialist club. He must have landed right in the middle of it, because he obviously has a nonobservation. The easiest way to look at it is, if the pc hasn't got anything to say about it, he isn't observing it.

Obviously, then, it's being observed for him. Well, who's observing it for him? What's observing it for him? Well, that being, person, idea, thing, television set – that's a service fac for that zone or area. What do you do with it once you've assessed it out and so forth? Why, you've got it lying there and you – *voilà!* Just run your R3SC steps on it. That's all. "How would it make people right, and you wrong?" And the person said it wouldn't. "Well, how would it dominate somebody?" "Oh, well! *Ho-ho-ho-ho-ho-ho-ho-ha-wha-ha*. That's a different thing, huh? That's the most dominative stable datum that you possibly could have. That – that's – that – that – that – that's the most dominative that you could have. Yeah. That – that – that – that is. That is. Yep."

You keep sitting there waiting for him to answer the question. Well, hell, he's answered it and he's blown the level, too. See? Here you've got to come back in there and say, "All right, now, what's the – how does it get you to escape domination? Help you to escape domination in any way?"

"Ho-ho, ha-ha. Perfect solution!"

That's the end of that level, see?

"All right, how is survival with regard to this thing."

He's realizing things all the way along the line. It doesn't matter, you see, whether you flatten any of these processes or not at the first run through. When you finally check them over, just don't leave one of them hanging out unanswered, do you understand?

It doesn't matter how you chop these things up, see? Don't be neat, because it's not neat, see? At the end of the thing, get neat. See, make sure you've got them all now and it's all straightened out, and that sort of thing, see? Now be neat.

But he's – "What – what do you mean? What do you mean, 'domination'? Dominate – how would it dominate somebody, dominate somebody, dominating somebody? How would it dominate? I don't know how it would dominate anybody. I don't have any idea at all how it'd dominate anybody, you know? It doesn't dominate anybody. Haven't got any idea."

Well, of course the auditor's a real knucklehead if he says "Well, yes. Well, the question was – I'll repeat the auditing question for you. How would it dominate somebody?"

"But that's what I'm trying to tell you. Dominate somebody? It doesn't dominate somebody, and so on." See?

You say, "All right, okay." Take his answer – it wouldn't dominate anybody. "All right, all right! That's all right. How would it assist your survival?"

"Oh-ho! Well, that's a different thing. Come to think about it, it – it just is. It just is survival. It is – is survival. It's – it's – it's – it's – it just is. It's just life to me, you know? I never really looked at that before, but it is just – it's – it's life. That – that's what it is. It – it is. It's just life."

And the auditor who says at that time "All right, thank you. Now, how would it assist your survival?" is being a complete knucklehead. The guy has answered the question. He's not answered the question, he's answered the whole universe of questions with regard to it. He's given you the perfect answer, which it is. That is the most perfect answer there is about anything! Thing you got to do is keep your tone arm moving. And you do that sort of thing and you do it real slippily and only ask the pc what he can answer and only take it, and so forth; don't start getting hard or tough on the pc till you finish it up, see?

"Now, let's go over these things. *Tsk! Tsk! Tsk! Tsk! Tsk!* Ah, that one ticked. That one ticked. That one ticked, right there. All right, now, how would it make people wrong?"

"Well, I meant to tell you, but in actual fact I – I used to use this quite a bit, quite a bit on all of my girls. I've been reluctant to mention it. But there it is." And he clears this thing up and of course you're away.

In other words, you've got a variety of processes here that are all running more or less at once, and the reason why you have a variety of processes all running at once is you're running a variety of confusion, so it won't be very orderly. It won't get orderly till toward the end. Most of the confusion is discharged. You see, that service facsimile held in abeyance all the confusion that was there residual. It's that confusion running off which gives you the tone arm action. Your tone arm action doesn't come from stable data flying off. It comes from enunciating and as-ising stable datums which then permit confusions to fly off which have been held in abeyance by those stable data. So if your confusion flies off, you're going to get charge releasing, because charge is in essence a confusion. That's all there is to that, see?

It's elementary. You're going to untangle a ball of string, you're going to have string. If you don't untangle a ball of string, you're not going to have string. I mean, that's all there is to that. You untangle a ball of confusion, you're going to have tone arm motion. And if you're not going to untangle a ball of confusion, you're not going to have tone arm motion, that's it.

There's two reasons why you don't get tone arm motion, then: You're not untying the confusion or there isn't any confusion there. That's the only two reasons.

So you enter into this problem at these various levels, and you'll find out there's a beautiful assessment that gives you service facsimiles like mad. Now, how you run the service facsimile after you've gotten it, I've just covered. But it's always the same: You always handle a service facsimile in this particular line. You'll get very slippy at it after a while. It's slippy auditing. But the number of ways that you can arrive at what is the pc's service facsimile are practically uncountable.

Now, the very best method I know of, at this particular time, is the method I have just given you – not the method of picking up the RI from a pc's goal, see? That's liable to re-stimulate the whole GPM, particularly in very inexpert hands that couldn't rescue it, and list it out anyhow, if it did happen, see? But this other one is a doll. This other one is a doll. I can see you now, supervising auditing someplace or another, and you hand out this assessment sheet, you see, that the auditor is supposed to fill in, see? And you hand him this assessment sheet, you see, "Who are your parents and why not?" and all kinds of things, and they all go down the line. And the thing has got about three pages and you've got this assessment sheet.

And you say, "Now, you're running R3SC. Make sure to keep the itsa line in very, very well while you're doing this assessment sheet." And you give him this four-page sheet, see? Takes care of his job and his profession and where it's located and all that sort of thing.

The auditor bounces up forty-five minutes later and hands you the sheet all complete. We obviously have somebody there who "had to get something done," as an auditor, see? He just blew the intensive, that's all! And I'm sure this is going to happen to you. Every one of you that's supervising any auditing at all, this is going to happen to you. You just blew the intensive, see, for the pc. Now what do you do? Now what do you do? Where do you go from here? I mean, that's it. You obviously have to run some other process.

No, you can go off on to parts of existence and that sort of thing, but in actual fact, the assessment sheet was never filled in, don't you see? You just said, "Who's your father? Who's your mother? Mother's name? Mother's name? And brothers or sisters – got any brothers or sisters? Thirty-three brothers, four sisters and eight cousins. All right, that's fine. How old were you last birthday? Forty-seven. All right, thank you very much," so forth. And "Where do you live – what's your address? What's your address? All right, 933 North Elm. All right. Cincinnati. Very good. And what company are you with? Oh, the Bide-a-Wee Biscuit Company. Very good. All right, thank you very much. What's their address? Where are they located? What's the address? Oh, 29 Front Street. Thank you very much. Now, so..."

What's missing here? Well, the only thing that's missing is the total assessment. He isn't... he just missed the whole purpose of what he's supposed to do. You want to know all about this pc's present time and everything he's in contact with, you see?

Well, in a matter of fact, you could come back to the question I just asked you before, if you were scotched to that degree. You could come back to the question I gave you about assumptions about your present time environment, and that sort of thing. You could get a stable datum and you could get the pc to run without the assessment, don't you see? Look at all that gorgeous tone arm action that you missed out on, see? You might have missed out there two sessions, three sessions of gorgeous tone arm action. Marvelous, you see? The thing would be flying all over the place. The guy destimulated all over the place; the guy practically Clear and flying, see? It'd just be in the difference of emphasis of the assessment.

So the understanding of the assessment and understanding that an assessment in R3SC is to produce tone arm action, not data. We don't care anything about the data it produces. But the tone arm action! Now that assessment's supposed to produce some tone arm action, and you'll see that it's – an R3SC becomes a peculiar brand of assessment. And the individual in Scientology Three who has been carefully, carefully, carefully educated in doing an R3SC

assessment, keeping the itsa line in, keeping the tone arm running like mad, moves into Scientology Four and does an assessment for a GPM goals list with the itsa line in wide open. *Uhhh!* Well, that's one case we wrote off, see?

R3M, see, is done *pocketa-pocketa-pocketa-pocketa-pocketa*, see? No itsa line. Data, data, data, data, data. All of a sudden the pc cognites on something, you see? Oh, that's fine. He tells you something about it and so forth, see? All right, good. Data, data, data, data, data, see? Item, item, item. List, list, list. There *th-th-thuh*, "There's your item, bang! 'A schnook.' Got it. That's your item."

"Oh, yeah." Now let your itsa line go in a little bit. "In this lifetime I really had... Oh, yeah, a schnook could really – would really – really mow a schnack down, man! That – that – that – that – that's it, that's it, that's it, that's it. That's it."

"Fine, all right. Good! All right! Here's the next list. Who or what would a schnook oppose? *Tsk-tsk!* Rapidly, rapidly. Come on, come on, come on, come on! Come on! Give me the data. Come on and so on and so on. Schnook-oppose. All right. Good, good, good, got it, got it, yeah. Your next – come on, come on, come on, what would it oppose? Well, all right, you can cognite. Give you thirty seconds to cognite." Something like that. [laughter]

Give you the idea? That's 3M2. See, you could go dragging your heels doing one of those assessments and you'd wind up five intensives later with two RIs found, see? Pc in total restimulation, everything gone to pieces. You wonder what's wrong. You get the difference?

This lifetime, present time, itsa line in, assessment: "Well, I don't know, I don't know. I think we're going to have to get rid of Bill as an auditor, because he had one of these present time assessments and it only lasted him two intensives! He found out all about the guy by the middle of the second intensive. *Tsk*. Nothing else to do on the pc. Finished. Wrecked the case. Wrecked the case. Pc not Clear yet and he's got the intensive filled. Now what are we going to do?"

See, there's a different end goal in progress here, isn't there? Entirely different atmosphere involved in these assessments.

So you must keep in mind that there are two different moods of assessing. And if you don't keep that severely in mind, you're going to make an awful flub, because it's another auditing style. R3SC: leisurely, quiet, calm, drag it out endlessly, itsa line in. Because it's all guided, you see, by present time and a lifetime and that sort of thing, see? R3M2: *pocketa-pocketa-pocketa-pocketa!* "Gimme-gimme-gimme-gimme! What is it? What is it? Let's make it! Speed, man! All right! Oh, you only found four RIs in this session. Going to have to speed it up in the next session," you know?

Assessment: Do a goal-oppose list. "We did – we did – we did a goal-oppose list, and so forth. All right, it's taken us two and a half hours to find this next goal."

"What's the matter with you? It took you two and a half hours to find the pc's next goal? What's the matter with you? What's the matter with you?"

Guy had been doing Scientology Three all the time. "Well, I thought I had until the next intensive."

"Oh, man, you're doing another type of process here entirely, and so on. Let's get that goal-oppose list listed and nulled and that sort of thing, two hours. That's all you got. That's it, that's it. No more than that. So you understand?"

Why? Because backtrack, you got to keep the itsa line shut. Got it? Otherwise you resimulate the pc; your tone arm action disappears.

All right? I've kept you a little bit overtime. Start your sessions fifteen minutes late tonight. [laughter, applause]

Okay? Thank you.

Thank you.

WHAT YOU ARE AUDITING

A lecture given on 17 September 1963

Thank you.

Well, I know I shouldn't be talking to you this week, as a matter of fact you're getting extra lectures. Well, that's so that at any moment I can do a bunk, you see.

But there's so much data going by and we're in the middle of a summation – some of you are departing and I wanted you to get a good rundown on this. Because we're dealing with a pretty summated picture now, and unless you have a good aspect of how this is assembled, why, you might have some trouble with cases.

All right, this is what date?

Audience: Seventeenth.

What date?

Audience: Seventeenth of September.

Seventeenth of September – how did we get up here? Seventeenth of September, AD 13, Saint Hill Special Briefing Course.

[part missing]

Now, your – the picture of a pc is what we're interested in. We're interested in the total concept of what you are processing. And this is very important, because it can now be summated with great accuracy.

The idea of old-time psychotherapy has been... Ah well, forget it, you know? Ha-ha! You know?

They used to use camels to carry freight, you know, and ox carts and things of that character – well, those were practical, because they would still be of some use. But old-time psychotherapy has no use or value to you of any kind whatsoever and you can just forget it.

We make a very clean break. Now we've always gone along on the foundation and formation of some early work of this material. The historical value of it is interesting – curiosa. Curiosa of an electric shock machine, you know? The curiosa of when you were very young you thought a sexual thought, so now you've had it.

That if you talk for four or five years to somebody, he can then tell you at the end of that time what second dynamic shock you had in this lifetime that accounts for your whole difficulty, you see. I mean – man, this is something like shooting BB guns, you see, at the *USS Missouri*. I mean it's just about that level of comparable magnitude, you see. The only

thing we can say for them is they tried, and they made some interesting popularizations. And amongst those was the fact that something might possibly be done about it.

So we cannot discount their hope or interest factor in the matter, or the fact that they made man aware of the fact that a mental condition existed.

But when you take it – when you take it to that point, you have taken it all the way – taken it all the way. Now, in Dianetics we talked about the mental image picture. Very interesting. We have that whole technology surviving today under the heading of R3R. It's of considerable interest. R3R is of great interest. To be able to lay your hands on an actual facsimile or an engram on a pc that has never seen one just merely by getting its proper date and then getting its proper duration and there he is running the thing and that sort of thing – that was an outstanding problem of considerable magnitude, and that problem got wrapped up in R3R. And R3R, however, as far as the actual therapeutic value is concerned is – well, I don't know, shooting a rifle at a battleship.

Because you're dealing with free track and free track is relatively unaberrative. If you can run any engram on somebody, why, it wasn't terribly important. Its value – value, interest; cure psychosomatics with it momentarily or temporarily or even permanently. You can alter physical condition with it and so forth, and you say, well, these things should not be gainsaid. Well, they shouldn't be gainsaid unless you're dealing with the idea of order of importance or order of magnitude. Because this is still just a rifle against the battleship. This is free track. This is the problem of free track.

You could probably run free track for years without producing an OT. And, horribly enough, without producing a Clear. But it's part of the tools of the auditor. And it gives him a view of the bank. It gives him a view of experience. It gives him the whole anatomy of traumatic experience. Has an automobile accident, has a crick in the back of his neck thereafter – you run the engram and he doesn't have that crick in the back of his neck from an automobile accident. She loses her husband, this is a considerable secondary – you find the beginning of the secondary and you run this with R3R technology and just run that one engram, you see, not even finding its basic, and she looks young again and alive.

This is miraculous or magical technology when it works. And it unfortunately hangs one with a great many sporadic wins. And that is the trouble with it. Sporadic wins. You take this guy, you locate this engram, you run it through, he no longer has psoriasis, see? It's gone, see? See – bang! And take the next guy – he scales all over, and you run an engram and – he's still got it. You get the idea?

And your attention is still drawn to that magnificent job that you did back there at such-and-such a time. In other words, it sticks an auditor on the track with wins. And any technology which does not uniformly produce wins and which tends to stick the auditor with some spectacular wins, is a dangerous technology. Because he'll go on using the doggone thing.

You'll see – out in the field, you'll see somebody and by golly, he – he found out that you did some pat-a-cake as a part of the CCHs, you know. And he was doing this pat-a-cake with this little kid and this little kid couldn't talk and couldn't hear and couldn't this and

couldn't that, and he did some pat-a-cake with this kid and all of a sudden – bang! – on went the kid's total perception and the kid was in marvelous condition thereafter and eventually became a Rhodes scholar, you see. This kind of thing, you see. And my God, years afterwards you'll find him sitting there in front of pc after pc after pc running this same pat-a-cake. It hasn't produced another result since.

See, that's the danger of one of these big win techniques. But R3R is a marvelous training process. If you can handle R3R and move the pc around on the track and that sort of thing, and you get a good insight into traumatic experience, mental image pictures, that sort of thing, and it's just very – very, very nice as a training technology. Beautiful piece of training technology.

Also has an assist value. And an auditor should be able to carry off a good assist. He's got – Jones has just fallen off a horse and has a broken clavicle and you tie into it with R3R and all of a sudden, why, the guy's clavicle mends up and so forth, if it's going to. So this is a good assist level action. Good training, good assist, and as far as making Clears and OTs is concerned has a very small value – very, very small value.

An auditor who can run it can call himself an auditor. Get the idea?

All right, now let's take up a much broader zone of action – R3N, the handling of implants. The handling of implanted goals and the handling of implanted materials. And a lot of you have been worried about this because you kept asking yourself the question, "Because these implants have an effect on us, is this going to turn out that we were all implanters?" You see, you keep on working – where's the overt? See, how come? How come these things have any value at all on one? If we're all going to run these implants all the time, what's all this about? What's it about? What's it about? What's the relative value of all these implants?

Well, the exact value of an implant is that an auditor without an understanding of implant goals and implants and implanting can very easily get the pc's own actual track mixed up in them. And if he doesn't have a good grip on these things and know what they are, he'll keep walking around them like a stray dog walks around another stray dog, and he will always be confused on the subject.

This pc's got a goal "to be alone," and you – just an actual GPM, see. And we open up the meter on this guy and we say "to be alone," and boy, that really rocket reads. That – man, that really rocket reads – that's very fine. So we go straight to the implant area and start running a line plot on it – it would do the pc in or it wouldn't quite do him in or you wouldn't get tone arm action or you wouldn't quite know what's happening, don't you see? You're running an implant GPM when you thought you were running the pc's actual GPM.

Now let's say it wasn't the pc's actual GPM but only an implant GPM, and we start to run 3M2 on it – the old technology of yesteryear, see. All complete, all valid. Now we start running this – we start running 3M. We start listing. See, we start listing for *his* items. They don't sound anything like implant items, you see. And we list these things. And when we finish all the way up and down the line, what do we find ourselves sitting there with? Horrors! We have just run something that only exists as an implant GPM by cross-listing, as you would do a 3M2, and so have succeeded in spending a lot of time. And we now have a collection of about thirty-five or forty items or something like this, sitting right in the middle of that en-

gram, and every single one of them is a wrong item, a wrongly worded item, amidst two hundred and thirty bypassed implant items. And if you don't think that isn't going to take the pc's skull off!

So therefore, an able auditor should have a good training background on the subject of implant materials. In the first place, it gives him a beautiful idea of RRs. Gives him lots of practice on meter reading. Gives the pc practice on the form of the GPM and furthermore, the forms of those GPMs are quite accurate even though their item titles are highly corny. You get the idea?

There's – nobody's got a GPM RI that's got "absolutely snuff" in it. See, plooeey! You got no such thing, see. So therefore, if you couldn't – if you don't know a lot about implant GPMs you won't learn anything much about the form of a GPM. And you're asked to sail cold in on 3M2 and do all of the mechanics of a GPM on the pc's actual goal and so forth – nervous about rocket reads, nervous about this, what is the form of the GPM, what is this, what is that, what is the other thing? Do you understand?

Now you start tying a pc up in knots on his own actual GPMs and you've got trouble. You got lots of trouble. And the implanters – I don't care if it practically caved you in back along the track and certainly enough it did, there is no doubt about this at the time they occurred – but I don't care how many implant GPMs you've got; this is beside the point. This is beside the point.

They have practically no aberrative value, compared to the order of magnitude we're discussing. Practically no aberrative value. Yeah, you can get tone arm action out of them. But what's it do? It opens up the track. The little charge that you get off of these areas and so forth opens up the track sometimes so that you can find out a pc's own actual GPMs. And an auditor who is well advised on the subject of implant GPMs never gets the two confused. He's always got sense enough to say, "All right, 'to be alone.' 'To be alone.' Now, is that your actual – your own goal or is that an implanted goal? Oh, that is your own goal, that is fine."

Now, I – but – or "I get a read on both of these: implanted and actual. All right, good."

Now, at this point he can take his choice. Although it's of no great value to run this implanted GPM, if it's that stuck in the pc's craw, he of course has, because of the research that's been done on it, the line plot for that actual GPM and could sit down and he could run it out. Take a session, run the thing out.

Now say, "Is there an – do you have an actual GPM, 'to be alone'?" Clang! Got a bigger read now, see. And sail in with 3M2 and straighten the thing out, *bingety-bang*. Do you understand?

Audience: Mm-hm. Yes.

That is the value of it. It's an auditor's value to keep from wiping the pc off the face of the Earth by running implant GPMs with R3N – the technique for his own GPMs, you see – and running his own GPMs with implant GPMs line plots. Unless an auditor's got this fairly straight, why, he's sunk.

When you first start looking at this – and your first considerations with regard to this are liable to make you practically faint. But you'll get over it very rapidly.

You say, "Oh my God! What have they done?" Well, what they did was this: Some eager beaver dug up the actual form of a thetan's GPM and the bulk of wordings that thetans use in forming up their own GPMs, took a synthetic line plot and implanted them with it. Planted them with their own actual goal, hoping they would hit some of their own actual goals if they implanted them with enough goals.

So, you see, you get thirty, forty, sixty goals, see? In the final aggregate you'll find out that the pc's been implanted with in excess of a hundred different goals, and some of these many times. See? Actually making the total number of GPMs he's implanted with probably creeping up toward a thousand.

Well that's – that's been very confusing. That was very confusing to thetans when it was done. But why? Only because it was a parody and mockery on the thetan's own actual GPM and tended to key it in – and it didn't even successfully scramble it up. Although it was very hard on the thetan when this happened, although it probably helped his demise no end by making him sad about the universe, and undoubtedly influenced his postulation of his next goal or some of his RIs, undoubtedly influenced all this sort of thing – in actual fact the aberrative value of an implanted GPM is back in the "rifle against the *USS Missouri*" class. See, no value.

But with that in mind, the implanter then did us a great favor. Now, I know it loused you up and it was hell, see. But he did us a great favor. He gave us a training ground – gave us a training ground. And you can run with the greatest aplomb any quantity of implant GPMs, and you can train up an auditor left, right and center and he'll now know what GPMs kind of look like and what their anatomy is and how they go together and what's at the bottom of them and all of this sort of thing, and what rocket reads look like and how the pc can suppress things, you know. He can get the whole thing taped without wrapping the pc around very many telegraph poles. And there's any God's quantity of them can be found on a case.

It's hell trying to find the pc's own actual GPMs, but any quantity – you could practically take any man off the street out here and ask him for the goal "to forget" and run it. He'd be very happy to have it run! He'll think this is really great stuff. You can make it rocket read, don't you see, and so forth – so that any group of students running implant GPMs will eventually find out what a GPM is like.

A GPM looks more like the old bulletins on the goal "to scream," however, with more items in them – the original ones released – look – an actual one looks like that really a bit more than it looks like an implant GPM, because the implant GPM is being synthetic and so forth. Of course, an implant GPM has no application to the case. His case has really never been upset about being "absolutably snuck up on," or something, you see. He's never really been worried about this at all.

You'll find his item somewhere along the line – "a sneak." And when you hit this rocket reading own item, see, *psssw*, you know. And he'll say, "Yeah, that – that uh – that's sure so! That is true!" See, you're hitting him right where he lives. And you get this thing opposed, and the meter goes *bbzzzzrrmm* and clank and bong and thud, don't you see? It got lots

of action, lots of cognition – this is where he lives. He doesn't live on that implant track, he lives on the other track.

Now anybody, however, who's had experience in running 3N – the technique of running the implant GPM – is going to make good headway and so forth with actual GPMs. And it's very well worthwhile to get an auditor to run these before you put him on actual GPMs. Why? He can find them – bang! See? He can run them – bong! He can get it wheeling. He gets accustomed to handling the pc under duress in the midst of all this living lightning, don't you see.

Then he can turn around and go through the arduous of finding the pc's own actual GPM. And then he lists that out on 3M2, just as 3M2 was last released; no faintest changes in it. And there's your – there's your case – your case will really start flying now.

Now the tone arm action – this basic breakthrough of course all stemmed from discovering the value of tone arm action and how it is produced – and the tone arm action lies in the actual GPM. It is thousands and thousands and thousands and thousands of times more aberrative than an implant GPM. Unimaginably greater magnitude. And it's got action in it. It's got tone arm action in it.

But there's difficulties in getting to an actual GPM. You've tried to find pcs' goals. That's a sweat, man! That's miserable! List and list and list and guess and hope and list and trying to get something to rocket read and, *waaahh!* and list and mess around and hope and – that's it! No, that now doesn't rocket read, and *oooh-whooooo!* And, first place, an implant GPM will rocket read a few times and fold up; an actual GPM will go on rocket reading for one awful long time. It doesn't wear out, you see.

But if you've ever tried to find a goal on a pc that rocket read, then you know what I am talking about. And it has been in the past an auditor heartbreaker. So you could find implant GPMs easily, therefore it makes a good training ground. But to make the pc well and straighten him up, you've got to find his own, actual GPMs. And they exist – they exist no slightest bit different.

I mean the top oppterm is, of course, the bottom terminal, more or less, don't you see? And the bottom opposition terminal, which the pc started out as *against* – the opposition terminal to the goal as an RI – that bottom opposition terminal is what actually the pc himself eventually becomes in his struggle through this.

Those – those old GPMs, those synthetic patterns and that sort of thing are all quite valid. Nothing at all wrong with those things, and you'll get tone arm action. There's where the tone arm action lives. This is on the actual line. But the big stumbling block was how did you get the goal? How did you get the goal?

Well, this is not a simple action. But we have just speeded this up about a thousand to one. With what? The service facsimile. What is the service facsimile? A service facsimile is the top RI terminal of the pc's actual present time developing GPM. And that's what we call the service facsimile. It's the top RI.

And of course, in view of the fact that that GPM is evolving and he is sitting in an incomplete GPM, usually – truncated, we call them – we don't quite know which side of the

fence he's on for this thing. But we have there a wide-open door to finding the pc's goal while getting tone arm action.

Now, we have to ask this question: Why was the pc's goal so difficult to find? Well, it was difficult to find because present time, bearing down hard upon that goal – GPM – all of its RIs and in particular the RI of that GPM which lived in present time – that present time RI – kept the pc sufficiently overrestimulated that you had a stuck-up, messed-up tone arm – and his rocket read is totally suppressed, if you can't immediately find his goal. Do you understand that?

You've got a matter of environmental, auditing, other things that I showed you the other day, the various zones of restimulation in present time – all of those things are bearing immediately down upon the reliable item and its accompanying opposition terminal. The terminal and opposition terminal of the GPM as it lives in present time, those are the last two items of the goal he is now living with.

And all of those things are in restimulation because of his own postulates that make up those things so he is doing something there, don't you see?

And this present time environment comes down against those two top items with a crash, and everything stays gorgeously in restimulation, your tone arm hangs up beautifully, and the case goes nowhere in a great hurry. And that is the mystery complete – no additional cases or qualifications of it – that is the mystery of the stuck tone arm. And that's come right through, and that is the service facsimile.

When you eventually find the totality of the pc's service facsimile, you will be into the top or next-to-top RI of the current existing GPM. There you are. So therefore, the action of finding the pc's service facsimile leads you directly and immediately into two things: one, into the GPM he is now sitting in, and his RR on his own GPM. His own GPMs – Goal Problem Mass – will now RR, providing you unburden it.

Now, I'll give you an example of this. We're doing a service facsimile. Now, I'm taking you very rapidly across a great number of techniques. Probably you're catching up with these numerals one by one, and little by little – you'll make it!

But here's the situation. Present time is hitting this guy *bangety-bangety-bangety-bangety-bang* and he's so overrestimulated he doesn't know where to spit, and he's keeping himself beautifully aberrated with these stable data "horses sleep in beds" or something like that, on the goal "to ride" – and he's there he is, banging away, present time banging away at him, and he frankly is so restimulated his top is blocked so that there's no release of charge or confusion. It's just hung there. It's just hung there and he's just frozen in concrete, don't you see?

Present time is hitting him, kicking his head in; his present time environment is knocking his block off. Auditing might be right in on the top of it – take the goal "to leave," you see, with this present time RI of "not permit anyone to speak to me." What's that going to do to an auditing session, man? You see? And there it is – and he's getting his head kicked off and he's kicking off everything else's head, don't you see. And there he sits, there – he's right

there at the top of the line. He's so overburdened and his case is so stuck up with all this restimulation that he won't RR.

And that goal is overburdened. And that goal is so thoroughly overburdened – the one he is actually in – that if you find any goal at all, you will probably find one down the track trillions fifty or trillions thirty or something like that, see – some vast distance back. You try to run that one, you of course, are running the pc who is sitting in the present time GPM and you're trying to run him trillions-a-hundred down the track and his bank goes *creeeak! creeeak!* And you can't get tone arm action out of the thing because the present time restimulation is so great. And, of course, all his backtrack charge is smashing him right on forward up toward present time, you see. He's running like mad and you're trying to run this goal back there "to be," you see.

Oh, brother, you know! Nice, high-toned goal. And it's all in restimulation, it's pressing him up against present time and so forth, and his present time GPM, of course, is nothing as great as that, you see. It's – be something like "not to be slimy," or something. See? To n... And there it is, see. All your present time restimulation is hitting this goal "not to be slimy," and its top oppterm and top terminal. And you're trying to work this thing "to be," way back down the track at some unimaginable distance... The length of the time track is our most – is our biggest, fortunately, and not a serious error – but is our biggest error in Scientology. The length of the time track! That's silly, man! You write "trillion" on the board a hundred times and you have the medieval period! [laughs] Write "trillions" on the board thirteen times and you've got modern life! Trillions-thirteen. It's nothing for a GPM to extend over vast periods of time.

But here he sits – up here at the top of the bank. And there he is, being run at some vast, early distance. And of course, it doesn't answer any of his present time problems. It's totally unreal to him. And the reason it's unreal is his attention is pinned in present time and is being ordered to some vast earlier period of the track which is probably a dichotomy of some sort on the goal he's stuck in. And that's why he'll come up with the other goal. So it's totally unreal to him.

You start talking to him about trillions of years ago and why, hell, he's worried about the fight he had at breakfast. He's still trying to explain how come he always fights at breakfast. See, he's trying to explain this, you see. And you get the reasons why he doesn't like fortifications to exist. Well, man, he hasn't been a fortification engineer for the last four or five hundred years! It's the last time he ever had anything to do with it, see. And the last time he *could* do anything about it, or it was a present time problem to him, was maybe trillions-a-hundred.

So here he is, worrying about that fight he had at breakfast and that's sitting on the goal "not to be slimy." And the only thing wrong with breakfast is the eggs were a little bit firm. Because by this time, of course, everything must be slimy because he's gone to the top of the bank, you see. So you've got "everything must be firm," you see, as one of his items. So he's opposed to anything slimy, you see or something wild is going on, you see.

You see how far you are running him from his present time problem? And yet you couldn't really find this top of the bank. Because it's so overburdened and so thoroughly in

restimulation that any RR discernible on it will be almost impossible to reach because it's so overburdened with locks. Locks, locks, locks – practically everything in present time's a lock on these things. So he won't RR.

Now, I'll give you an experience which is interesting. R3SC, finding the service facsimile of the individual, just exactly the way you're going about it now – fumble and punch. If you're running this successfully, you found out the pc would occasionally have a needle fall. And as the case went on, in the next session or something like this – happens fairly rapidly – in the next session, if you'd been very observant you would have seen that needle accelerated. When he had a fall, it accelerated. But it accelerated on everything. Everything you were running you'd get a – everything you're running, see? Everything you're running.

Now, you've started to do some lists. This is the next session – another session, see. You started to do some lists, and three times on that list as you're nulling it, you see very sharp, fast falls. Next couple of sessions you're nulling some kind of a list, and you see little tiny rocket reads on about four items – and lots of steep falls, but little, little tiny rocket reads. So you get more tone arm action running on his present time problems, and that sort of thing, you get some more. And you're sitting there, and all of a sudden you see some gorgeous rocket read. You see something just go *ppsssswww!*

Actually you've merely reached in – you haven't necessarily reached the RI, but you certainly reached a lock on the RI. And the bank is loosened up enough so that the pc can differentiate on rocket reads on his present bank.

Now, you do – you're still working on service facsimiles and a day or so goes by, and you're doing this list and all of a sudden you see "to hide" *ppsssswww!* Hey! You had a goal rocket read. You come back and you call it, "to hide" – *ppsssswww!* There she goes, man, she's really taking off! Give it to him again. Prepcheck it. Do something with it. It always fires! Fires! Fires beautifully.

Then you say, "Is this an implant GPM?" No read. "Was this 'to hide' implanted on you?" No, no read. "Is this something you actually made up yourself? Is this actual..." so forth. *Psssswww!*

You say, "Well, well! We have arrived somewhere!"

But exactly where have we arrived? Exactly where have we arrived? We've arrived within the last four or five GPMs. That's – we can be sure of that. The last four or five actual GPMs. Now, if you took off immediately and said that's a very low-scale goal, "to hide," you have underestimated the state we're all in because of the immediate backtrack. We haven't postulated any high-toned goals to hide for several trillion years. That's a high-toned goal, man!

Now, how do you get lower than "hide"? Well, I think you can go down about twenty tone arm divisions below "hide" I'm beginning to see, on the scale. "To never be caught anyplace and have nothing to do and to be vis... invisible." Any goals of this particular kind. "To be – to never be found out," you see, "to have nothing worth taking," goes down to something like this. "To have nothing" that's a high-toned goal, you see. But, "to commit suicide," "to get

rid of it," "to go insane," "not to be so slimy," see? "To endure" – see, that kind of thing. You'd be surprised how far south this can go.

So you're within the last five. You can be fairly sure of that – you've seen a goal rocket read while searching for the pc's service facsimile. You've tested it out and you've found that the pc actually has that as a GPM.

You, of course, with vast enthusiasm wish to God it were the last GPM and the one right up into PT, because how wonderful life would be if that were the case. Unfortunately you have no guarantee of that whatsoever; it'll even read on the meter that it's the last one, and not be it. That's quite interesting, because you see it's – it's apparently right there, don't you see? You got your paws right on it, and – actually the bank is so jammed, and the GPMs are so jammed up as they approach present time because they're so much more susceptible to res-timulation, don't you see. But, it isn't – it isn't the last one.

Now, that doesn't say it isn't always – it always isn't the last one. Once in a blue moon you might have a little luck and after that become careless and wind a pc or two around the telegraph pole before you got back to battery and sensible again. But the thing to do with this "to hide" is lay it all out, test it just the way I showed you, see? See, use it anyway you can, trying to find that as the GPM, you see, and then oppose it. What goal would oppose "to hide"?

Now, you want your pc to be in pretty good shape at the time you do this. Why? Because he's just now going to be put through a lot of mischief. The last three or four GPMs; you're going to drag this pc through them. What kind of condition do you think the pc has to be in in order to be dragged through three or four GPMs – of his own actual GPMs – bodily? You want him to be in pretty good shape and you want the auditor to be no fumble.

Let's list this, let's list this. And let's find the next GPM. And the pc will be sure and for a moment or two you will be sure that this next firing goal that you get – you'll be absolutely sure, you see, that it's it. What would oppose "to hide," and that's going to be something wild or weird or peculiar, like "to have nothing worth taking," you know. And then you're going to be sure of it, he's going to be sure of it – in actual fact if you tried to run it, you're going to come a cropper, because it's probably not the present time GPM, see? So you be very careful about this, and you try to list it up to PT with "who or what would oppose 'not to have anything worth taking'?" see. Who or what would oppose that?

Now, the probability is, is you're either on it or right next to the present time GPM. So you scout that one down real carefully, whatever you found as a result of that, and the possibility is that you're on it. If you're not on it, do another oppose list and land in the present time area. Prove it out conclusively, ask questions of the meter, Ouija-board the meter, make sure that this is it. And the pc by this time has got a lot of restimulated track behind him and he's probably very uncomfortable. And he's been getting tone arm action like crazy. It doesn't matter, you see, you've hit him – you couldn't help but get tone arm action.

And now, list for the existing highest or the latest terminal of the final goal you found, "not to be so slimy." Just list for that. List for it. And you're going to find it. And you got his service facsimile and you realized, if you look back over your records that you were walking right in the vicinity of it all the time anyway. See, it suddenly adds up.

Lightning bolts go through the pc's skull from both sides, you see – "Yes, yes, yes, yes! Oh, yes, yes!" As a matter of fact if he's so involved in it, he could also have this reaction to it: If this GPM – this last GPM, the one closest to present time – if this last one up has already run its gamut and is about a hundred items deep and he's up close to the top of this thing, "not to be so slimy," is "to oppose sliminess" or something. You see, he's going on the opposite side of it – and he's on the opposite side of it. He's in the camp of the enemy, the terminal is now. And the oppterm is "a slimy thing," or something, you see. This thing has gone backwards because he's lived all the way through it.

When you start landing in the middle of this stuff, you just run your 3M2 straight on from there and you'll find out *bam-blam-wham-wham-bing-bang-bang-bang*. Pc's liable to be very sick, and what I was going to tell you is a word of caution. The pc: "Oh, I don't think this could be my goal," you see. Well, he's in the opposite oppterm, see. "Couldn't possibly be my goal, 'not to be so slimy.' I've always hated slimy things and I – I actually couldn't possibly be – it couldn't be my GPM, don't you see, because – I just... Couldn't be because I always opposed the thing, you see, and..."

It's at that point where an auditor has to be very alert, because the pc is in actual fact – goes into almost a total dramatization of the RI terminal he is sitting in, and it may have at the top of the bank reversed itself, so that he is now the enemy of his own goal.

And with that reservation and that realization you are running your service facsimile like a startled gazelle. And if it turns out not be a service facsimile at all, you just run it in 3M2 and you go *pocketa-pocketa-pocketa* down the bank. And the best way to run it, run one of these actual GPMs – little piece of data I'm giving you in passing, and which you will hear again – best way to run one is to list carefully for its top oppterm, take what you get and run it down toward the bottom as accurately as you can without missing any more RIs than you can help – but just keep finding RIs all the way to the bottom. Keep finding RIs, see. Find oppterm and terminals and oppterm and terminals and oppterm and terminals, and try not to shoot off into some other GPM. That's the only thing that can louse you up.

And get down to the bottom of the thing and you'll get a blowdown.

You'll see those rocket reads going by, man, and that tone arm going down, down, down, down, down, down – *pssew-pssew-pssew-pssew-pssew-pssew-pssew* – that whole goal is look – going to look like it exhausts. And then you turn around and go back up to the top again. Go from the bottom now, list it – terminal, oppterm, terminal, oppterm, terminal, oppterm – right on up to the top again. And you'll get the 50 percent of the items which you missed on the way down. And, of course, that thing will clean up like a bell.

That is, instead of trying to find every item perfectly as you go down, just discharge the thing and on the way back up find the remainder. Don't Q-and-A too much with whether or not it was a terminal or an oppterm and you've made a mistake so you've got to relist, you know – you're all wrong and the pc's wrong and the bank is wrong and – don't get into that kind of a monkey business because you can kill two or three sessions without finding yourself very many RIs, don't you see. What you want to do is just *pocketa-pocketa-pocketa* as best you can, get down to the bottom of the bank and get that thing blown.

In the first place, you can't list it from the bottom up. The second you put your paws on and try to list and find its opposition terminal to the goal as an RI, you see – "to catch catfish" down there at the bottom. Of course, "to catch catfish" in a real GPM is at the heart of every single RI which evolves from it.

So when you start listing that bottom and fooling around too much with the bottom, you throw the whole top of the bank of that GPM into violent restimulation. The thing to do is – you see, these things are laid in as they're lived. Implant GPMs are all backwards – you see, the top oppterm is the earliest thing. But that's not true of an actual GPM.

So you list it all the way from the top down to the bottom, turn around and list it all the way from the bottom up to the top – making careful that you don't go further south than the bottom because now you'll be in a foreign GPM. The only thing to be very careful of while you're handling these things – the only thing to be excessively careful of – is to not go finding RIs for goals, for – RIs for goals you don't have. You know, that's the old one.

That's the only thing that turns off an RR: is you're running item after item after item after item after item out of the bank and you don't have its goal, sooner or later that pc's RR is going to go off. It's going to close down, your TA action will stop and so forth.

You recognize that. You remember this from way back, some of you?

Audience: Yeah, yes.

You mustn't run RIs without having the goal. That's just as important now as it ever was. None of this old data has ever changed, you see. It's still there.

All right, what's interesting about this is that you are right now doing that with R3SC. You're looking for RIs for which you have no GPM. You got no goal for these RIs. And yet that service facsimile is one. So the question is only this: How long can you go on looking for these service facsimiles without running into finding RIs without finding the goal? How long can you go?

Your guess is almost as good as mine. Because you're shredding an RI up and chewing it up, and because it applies to all present time and so forth, probably extends the length of time – you aren't really just finding RI after RI, don't you see, and so forth – but I would say the low side of the estimate, well, I'd say it probably is not safe beyond fifty hours, and there might be a pc or two around where it isn't safe after fifteen hours. This is "be careful."

But that phenomenon doesn't occur until a goal – some goal has begun to present itself, so it's not anything very dangerous, providing you stay on alert for the pc's goals. I told you when I first gave you R3SC, when you see a pc's goal rocket read, write it down in a big box over to the side for further investigation – don't hide it anywhere in his papers. See, go right on running R3SC if that is what you're running, don't you see, but put that over to the side. And put that in plain view so that can be investigated.

Because all of a sudden the tone arm action might cease and the thing – what you want to do if the tone arm action suddenly and inexplicably ceased – you go back and you pick up any RRing goal the pc might find and let's go into one fast scramble to make sure that we

have got ourselves a goal. And then let's oppose that goal, and then let's oppose the result of that and make sure we're in present time. And now we've got the goal for the RR – for the RIs we've found, and all will be well again.

So it doesn't do to go too long on R3SC. You get why? You can key it out. You can do all kinds of wild things with it. It probably – I've just estimated it for you on the very, very, very supercautious safe side, you understand? You'll probably hear of somebody in... some field auditor and so forth, and he's run it on – he's run R3SC on somebody for five hundred hours and it hasn't disappeared yet, see? All right, he – trouble with it is, he keeps getting these RRs all the time, and they get in his way. "Can't read the meter too well because the needle is always going like that," you know – that sort of thing.

But the point I'm making here is that we must be alert to this old rule. Now, we haven't seen any search on R3SC turn off any RRs or turn off any meter action. We've not seen that yet. But we know this other point. We know we are looking for RIs that are at the top of the GPM line, and the action of looking for that RI all by itself could apply the old rule which we know to our bitter experience. All you've got to do is start charging down a GPM, go past it. Go past the bottom of the GPM, go halfway into the next actual GPM and all of a sudden you've got no RR, you've got no tone arm action, you've got nothing, pc is "*Whoaaa, creak!*" you know, "*Ooooh, horrible!*" you know, everything is going to pieces and so forth. And possibly sometimes, as we learned early on on teaching R3M2, one of the last things that the auditors at that particular time thought of was that they might have gone past the bottom of the thing and were already running out the next GPM. That's practically the last one they thought of. It's just the pc never put the goal on the list, don't you see, so it never demarked.

Well, there's – there is the score of what you are processing and there is just about the scope and limit of processing. There isn't very much more limit to it. But let's look at what this is all about. Let's look at what this is all about.

By using this type of analysis, by using a program of this particular type, by recognizing this put-together for what it is, we have probably programmed OT very well within reach. I would say we've shortened it considerably, because we've shortened all the difficulties of actual goal finding and that sort of thing. But something else has happened. Something else has happened.

We have found a method of straightening out PT which can be used actually at any time that you started to run into trouble at any stage of running any actual GPM. You can't seem to be getting anyplace and things seem to be pretty grim, and you mustn't immediately suppose that the old rule of finding RIs without the goal doesn't apply. You scout that one down first, you see. You've run out of... pc's all restimulated, you're not getting tone arm action, everything is going to pieces and so forth.

Well, for some reason or other you now have a condition where the pc's present time is in overwhelm as far as the RIs he's currently sitting in. So you could just go ahead with R3SC, you see. First, you would examine to find out if you'd been finding RIs that you didn't have a goal for. That's the main one, see. And then you could go on, find that goal and so forth, but you could actually destimulate present time at any time by using your techniques as you're – used in R3SC.

You could use any RI, any terminal, any oppterm – you can do all kinds of wild things with these things, you see. And you can disentrubulate his PT and you could practically clear him at any instant during the time of taking him to OT. And I know that sounds weird. See what I mean?

Given that you're not finding tons and tons of RIs without having the pc's goal for it – given that one horrible fact; that one cared for – you've run this fellow now, for seventy-five hours and you've found one and one-half GPMs, and that's the end of his seventy-five hours. You see, you unburdened his bank and you got it all, got – PT is all straightened out and you've got all of this first top one and so forth, and – this is a lot of work you did, you see – and you got the next half of the bank of the next one, see? And that's the end of his time.

Well, you could spend the last session or so trying to find the service fac for his present time environment. Just scouting out his present time environment. Of course, any application – the RIs which he has now found – you see, any application they have to present time will cause them to disintegrate. So you'll get a disintegration of the factors which are still hanging up in present time, his needle goes very floppy and you can hardly set it up and it's on the Clear read and so forth – and you could practically sit there and make a Clear out of it, although he's only halfway through a bank.

Of course, he's going to go creak, and he's going to talk to you, and he's going to persuade you and try – if you could just get to the bottom of this next thing, you see. That would maybe take you another twelve, fifteen hours just to get to the bottom of it – not to clean it back up all the way up the time, you see, it's something on that order. And where you've got to sever it off you've still got – you still got a technique which is analogous to R3SC. In other words, you could make a Clear at any time you were making an OT. And you can clean up his needle and his tone arm read at almost any time.

Very valuable thing to know. Because if you've seen the agony some people get into running actual GPMs, you would realize that it's well worthwhile to have a technology which straightens them out as cases. I'd – to program such a case, I would just make sure, if the case is sort of gummed up and in a bit of trouble and so forth, I'd make sure I hadn't been finding RIs for which he – we had no goal; make sure of that. I'd give him a nice bunch of ARC break assessments. I'd do a big case analysis on the subject: "Have we found any implant goals?" don't you see, "and thought they were your actual goals?" or "Have we run," you see, "actual goals as implant goals?" or – disentangle that – "Have we skipped any GPMs?" you know. "Have we found a lot of wrong items?" "Have we listed things backwards?" You know, the stuff that's in your list – do a sort of a case analysis along this line, make sure he was all straightened out in that line. And then I'd very eager-beaverishly start in on R3SC, trying to find the service fac for his present time now.

And, of course, we're going to find out he's now applying the goal, you see. And he's now applying the goal "to fly" or something like this to his present time environment. And we'd clear off a lot of locks and we'd get a lot of PT action. Blue smoke comes out of both sides of the meter, you know. Pc settles out and goes Clear read and the case straightens up.

Theoretically, this is quite doable, and if you got the other reasons out of the way why the case was gummy or feeling bad – that I have just outlined to you, no more complicated

than that – you would then be able to apply your R3SC once more and you could bring about a state of Clear. So your state of Clear is bring-aboutable at any time with this one proviso: The most dangerous time to use R3SC is before you find the first actual GPM. Apparently the simplest and easiest time to find it and to use it, you see, is in actual fact the most dangerous time to use it, because you actually are running at RIs without the pc's goal. Do you understand?

So that's – you can go at it with great aplomb. I don't know how long it'll go on. I can also tell you that I don't know, and there's no reason to suppose it would go on more than an hour in some cases. I don't want to scare you. But in everybody so far addressed it has gone on for a nice, long, comfortable time and isn't getting in anybody's road and there's no sign of these difficulties appearing. But by past experience, they're there to appear.

Therefore, it is very necessary that an auditor who is doing R3SC must sit there very alert to the rocket reading goal. If he gets anything on a list that rocket reads, why, he should mark it loud and clear, See. Put a big RR down after it, something like this, you see. Looks like the pc's goal – if there's any discussion of it ensues of any kind whatsoever (and that's very easy to have happen, you see, in R3SC) – mark it down: "Pc thinks this is his goal." Put it over there very clear.

Now, if the pc can be kept in session – let's talk now about not just somebody trying to clear, let's talk about taking it from there – you've gotten tone arm action established on this pc, this pc's pretty comfortable, you're – gotten some of the aberrative factors out of the pc's environment so the tone arm doesn't stick up every time you sneeze and you got a goal sitting there. Well, you'd better research this goal.

Let's find out what goal it is. Is it one back or two back or three back, or is it – is it this or that, or what should we do with it, and should we oppose this goal and find a goal that's a little closer to present time and then find an – what should we do with this goal? Let's search this thing out. It isn't as easy as, "Well, that is the pc's goal, let's list it," see. It isn't that easy, See. It's – the only goal you really dare run – and this is what gave all pcs trouble – is the last goal: the one closest up to PT.

Now, knowing all those things, you're going to go getting tone arm action. Your tone arm action there is residual on the long haul. Now, it's residual in the pc's actual GPMs. That's where the tone arm action lies. Now the very system that you understand as a service facsimile applies to every RI and applies to every GPM the pc has, and it is that system which has aberrated the pc. That is the system which has aberrated the pc. And all pcs have done this, and they've brought it all the way along the track, and it arrives till now. Actually, the service facsimile *cum laude* for a GPM is the goal as an RI. That is the big one.

And, of course, it accumulates to its subsidiary RIs – see, reliable items are accumulated to this basic one – and the whole of these in their associated pattern make up what we call a Goals Problem Mass. And that mass is quite actual. These RIs are – have diameter, they have mass, they have this, they have that; they're all very much in the groove.

Now, what are the – what are the symptoms of somebody running out of – well, you're running too many RIs and you haven't got his goal, your TA action will cease and the needle ceases to RR. Now, therefore, when should you dive for the pc's goal and start this goals pro-

gram? What is the dividing line? Well, unfortunately, it isn't as easy as X Unit and Y Unit or something like that, you see. That isn't that easy. It's different. It's a technical point. It's have you rehabilitated the pc's RR? And you run service fac (R3SC) until you've got a rehabilitated RR. And then it's going to be awful easy for you to find the goal.

Now, the question arises, what is the exact progress of the case run on this particular scheme of things? What's the exact progress of the case? Well, you run a case on the latest part of his aberration all the time. That keeps his PT cleaned up. By keeping his PT cleaned up, you're then keeping him nice and calm and so forth.

He actually isn't going to develop any skills to amount to anything as an OT. He's going to rehabilitate very slowly. Rehabilitation factor then is slow, even and gradual. It doesn't do a roly coaster type of action. You'll get – occasionally some guy will bang out of his head or something like this, but that's just not of any vast importance. What you'll get is an increase of ability on a steady, calm progress front.

Oh, of course, you're going to have your difficulties of you listed this thing backwards and you shouldn't have and so forth. These are merely technical difficulties as you go along. The pc's going to spend an awful time between session A and session B because you skipped a GPM – when you were listing down, you didn't get the next adjacent GPM, you got the one after that – and it's going to make him quite miserable.

But your actuality here is that the pc is advancing as a being in relationship to present time. He's getting an expanding perimeter of present time, but he is advancing with present time. And therefore he is advancing to a marked degree smoothly and calmly in regard to present time.

Now, this has two factors, one of which is relatively unimportant. You might not agree with me that it's unimportant, but I rather class it in that sphere. You're not going to get spurty, fluky manics turning on and off. And boy, they can get more in an auditor's road than you would think. Pc goes – the most dangerous thing of them is not damage that the pc does, but the pc goes tearing off in a manic, and this has been one of our main problems: He feels so good, he's so ambitious, you see, and he doesn't want any more auditing because he's going out and he's going to get busy, you see – and you know that he's going to take about three days to fall on his silly head!

Well, the reason for that is, is you've dropped back earlier on the track than the reality of the pc. See, you're earlier on the track than the pc's reality goes. This is a very important factor. If a pc's attention is thoroughly in present time, any effort to go backtrack, of course, brings about a feeling of unreality. There's a slight unreality involved on this quite normally.

Well now, multiply this to a fact that by taking him backtrack, you, of course, are bringing his ARC at a lower pitch than it might be, and he can't actually cope with the aberration which is being thrown at him and he goes into manics and he turns on somatics and he has a bad time and he sits around all day worrying because he can't tear up all the pavement of MI or something. You get the idea?

Now, that's all totally and a hundred percent simply because somebody is being run well over his head. The dangers involved in it are negligible, because he's so overwhumped

that nothing very serious could occur. But by taking him back down the track from present time all the time, actually the past is present time.

See, the past is being carved off in present time all the time, don't you see, and therefore the reality of the pc is continuously increased and you actually make – the more important fact is, is you won't be up against the hurdy-gurdy of restimulation and upsets and *rawf* and bing and bang – the pc will be much more cheerful and you won't be up against these sudden manics; you won't have any difficulty in this direction.

In actual fact, it is very doubtful if a pc could make it to OT unless you continually handled the application of what he was doing to the aberrative factors of present time.

The only danger in processing anybody up the line is somebody's going to get – go into some big snit of some kind or another when he's about three-quarters of the way through, don't you see, and he isn't up to it and that sort of thing.

Well actually, the – I don't think – I don't think you could keep him in session or push him in that direction or hold him in that direction long enough to make him – to have enough strength to misbehave. You understand? It takes a smooth run. This thing requires a smoother run, don't you see?

What you want is an even progress chart. And the way to do that is to take everything down as you go against the present time which the pc now has, and you'll get a discharge of it and probably reduce – this is the important thing – reduce the number of hours of auditing by at least 50 percent. Cut it back from PT. Now, we've been making a mistake by going early and coming up toward PT. It's very hard on a pc, because all of the RIs he's dramatizing are right in PT.

Now, let's say he goes back and he finds the goal "to have." Let's say this guy's been run and run and run and run and run. And he goes back and he finds this goal "to have." All right, that's way back, see? And there he's got this GPM "to have." And he gets into the top oppterm of the thing "to have." And he said – it's "want nothing to do with nobody nohow," see – something like that, see? And he's against capitalists or something like this, see. Or people who have things, or something like this. You see, the thing is reversed.

You'll find that the moment he enters that level, if you have peeled back the track all the way down smoothly to where he is, you'll find at that moment, his thinkingness is colored by the RIs he is sitting and confronting. His thinkingness is colored by these things. He'll get up in the morning and he'll look around, and say, "Well, I sure don't need three pairs of shoes. I could get along with one, you know." His thinking is colored in this particular direction. Well, that means it's directly discharging against PT.

So in actual fact, your discharge against PT, of course, accelerates the speed at which it goes. You needn't worry too much, or you're not really concerned with the ethic level of the pc, as auditors. I'm just talking about you as – your general attitude and opinion – you're not worried too much about the power or strength or otherwise of a pc. You never have been.

But, of course, you are approaching – you are approaching a point where this will become of interest to you. It will become more and more of interest to you. And be reassured – be reassured by the fact that an individual whose present time problems are not cleared away

doesn't have very much power to do anything. He's too involved and too enturbulated to exert any force or power in present time. Interesting datum, isn't it? Doesn't even really fall back on ethics. See, it falls back on that restrictive fact. Why? Well, he's sitting in a couple of wild stable data of some kind or another and he's resolving everything, and it's all mixed up any-way.

So his power and his difficulties are terrifically restricted by his present time involvements and confusions. And frankly, no pc ever really progresses beyond his present time problem. That's in actual fact the secret of processing. That's why, particularly, you can throw away the Freudian idea that a little girl was looking in the window of the boy's room when she was three, you see, and has been aberrated ever since, you see. No! No, no, no, no – that had nothing to do with aberration. Why, it's back there!

Now, if you were running the RIs formed at the time she was three and you had peeled back to them, you would find the pc oddly enough sitting in the present time problem caused by the inability to observe. Non-observation and non-communication. At any given moment during auditing, the pc is introverted at the level of what is now in present time. What is now live in present time, on that the pc is introverted. Therefore his power is consistently, continuously cut back to practically nothing. Consistently and continuously.

You see gradients work this way. You walk out here and pick up a – one day you can pick up a pebble. And the next day you can pick up a rock. And the next day you can pick up a big boulder. And the next day you can pick up a stone wall, you get the idea? You'd think in auditing a pc would move ahead on that gradient of ability. A pc will not move ahead on that gradient of ability.

A person halfway through won't be able to pick up the pebble. You mark my words and you watch it. If you carry it all the way through to a complete conclusion, it's when he gets all the way back to the other end of the line and all those things have sheared off against present time and he's got all those things straightened out and he hasn't become totally overwhelmed by it all and so on. He's going to be three feet back of his head.

Now, I've had a period recently of being up in the... looking around, and that sort of thing.

And I just got gorgeously confused with my present time problem. And I frankly became so involved with present time problem – it was a present time problem to me at that moment – that I was like to wrap beams all around my head and I was yo-yoing past the moon, don't you see. I suddenly couldn't hold a position in space worth a nickel. I was very introverted on the whole thing. I didn't quite know what my present time problem was – I was trying to figure out what my present time problem was, see. Present time problem, of course, was sitting right in the RI I was sitting in.

The odd part of it was it *was* a present time problem. See, it *was* a present time problem. I didn't think it was. And that's always the case with the pc: It *is* a present time problem. It's that the pc can *perceive* it is a present time problem. So all progress is measured on the pc's ability to perceive what *is* a present time problem. And on that you get a measure of his forward progress. And he gets present time problems which are years wide, and tens of years wide, and hundreds of years wide, and thousands of years wide, don't you see.

Present time problem is the distance of one inch – his forehead hurts, don't you see – to his room, to his world in which he immediately lives – that is to say, you know, back and forth, the route to the office and that sort of thing – to the planet, to the this, to the that, to off of this planet, to the confederacy, to all of the various connecting links of all the confederacies, to this universe, to the lot of beings in this universe, and to the formations of this universe, to this, to that, to that, *thup, thup, thup*. It's always the length and distance of the pc's present time problem.

It actually isn't even – that is on – his only measure of reach. It isn't how far he can reach or how many stones he can lift or anything else. It's just how wide is his present time problem. And in every case, it is his reaction to present time that is creating the problem. Beyond that, there are actually no problems. You got this? This – it's how – what's – what's his perimeter? What's his perimeter of problem?

So you can measure that, and as these RIs are peeled off against PT as you go back through actual pairs through the GPMs – you go back through these actual pairs and these things are up in PT and so forth – he'll be expressing this degree of introversion with regard to the ... Well, he's just got an awful worry, he's got an awful worry, he – so rapidly goes onto planetary affairs in think like this, it's quite dizzying.

He's got an awful worry. He's got an awful worry. He's found, the idea that he actually can no longer – he can no longer make waterfalls fall backwards. See, he isn't out there trying to make waterfalls fall in any direction – he's got a problem. See, his problem is he can no longer make a waterfall fall backwards.

And there's your consistent run of processing and the way it peels off and goes all the way back. Now, do you see then what the approximate anatomy is of what you're tackling? In essence, you have something I can draw you here – in spite of the lateness of the moment – I can draw you here this with great rapidity, and there's – I'll draw it for you again.

But here let us say is your pc, and he is being an RI – and here's – here's the goal as an RI. See? And this whole thing is one annealed GPM, and this is present time. The pc is being this thing and therefore it is his service fac. Right back of this is a bunch more – goal, this is a GPM. This is your current GPM.

Now, when we reduce this on this level, here's PT, and let's make it look like this and let's just draw a GPM, shall we? We're going away from PT, here, see? When you're looking for your service facsimile you're looking for this fellow right here – or this one here. You'll find one or the other of those.

First goal you find is possibly – you're looking for the goal, here. You see, this GPM may not be complete – may not be finished because he's still living it. He's postulated this goal, but you get a goal, and you – you actually found *that* goal. See? Goal found. So what you're going to have to do now is list a goal oppose, against that, to find that goal, and then that goal, and then that goal – and then as soon as you're sure that he's got this goal, and you actually list for those two RIs and peel down that bank and clean that bank up. That's the end of everything you're working with, with the pc. And also the end of all of his aberrations, all of his worries, all of his concerns, all of his upsets in PT, and isn't – well I won't say isn't life wonderful because he now has all these. [laughter]

Fortunately, by actual count, there is only twenty or thirty actual GPMs on the whole track. Twenty or thirty. You're on the sunny side of a thousand hours to OT – and I mean all the way. You're well on the sunny side of it. And knowing me and the fact that we discover things as we go and so forth, I would say we'll probably have that cut down a bit. But at this present moment I see no reason to change anything we've got.

We've just fallen back and taken up all the technology of a year ago, without changing a hair in it. It's all been done. There it is. We've investigated through this summer, implant RIs. You know how to run those things, you've got good ideas of what GPMs are, you're all neat away. You know how to run service facsimiles – you're learning right now. You can tear into that thing, find the pc's own goal and you're away! And you're really away.

So, it very well may be with other developments that you're looking at five hundred hours. It may be within five hundred hours. And if your case is very, very slippy indeed, and you audit very well, and you give very good auditing and receive very good auditing, and you're very good children indeed, you might be within three hundred and fifty hours! But that's might be – I can tell you for sure you're within eight hundred hours of it. That's for an absolute certainty.

Now, this is what – this is what it means, that is what you're processing, there isn't anything more that you are processing. The fact that free track exists, that implant GPMs exist, that all these other things – screen implants exist and so on. I ran about twelve, I think ten or twelve screen line implants off in one RI listing, couple of nights ago. Nothing. They were getting in my road. I was trying to put down items that were aberrative, and I kept running into these things – mosquito bites.

All right, but that's what it looks like. I don't care what else is on the track. That is all that is on the track that is important – right there on that sheet, right there in front of you. And that's in actual fact what antiquates psychotherapy. Who would have dreamed of any of that or of its considerable simplicity in its final analysis.

We had to know an awful lot of things to bring it down to that level of simplicity. And once you're studying it and grinding it through you won't think it's simple for a while, and then all of a sudden it'll fall apart and you'll see it's relatively easy. That is what you're processing, and that's the way it falls apart and that's it.

Anything that's wrong with your pc is *right* here – influenced by that first goal – anything wrong with your pc, that your pc is now – is real enough to know about. Because when he gets to here, he's going to have a whole new set! You understand? Of course, this is going to modify, he gets different changes and so on. Until he gets that whole GPM gone though, he's still going to worry about that idea, see. Sort of withdraw from it and be upset about it.

These – these ideas, we don't know what – we don't know what's going to turn up down here. Of course, he's got that much charge off of his case, he can handle it better, he's that much saner, life will go that much easier, you can get rid of it that much quicker. But down here, if this is the goal "to eat buttercups," he all of a sudden goes in for horticulture and starts worrying about these poor flower seeds lying around all over the place dying without being planted. He never worried before about it in his life. But now, it's a present time problem.

Well that's – that's your variations of case. That is a map of a case. It is that simple. There's nothing much more to it. It doesn't excuse anybody from careless auditing. It doesn't say you can't make mistakes – but it is basically very elementary. And there it is.

Thank you!

SAINT HILL SERVICE

FACSIMILE HANDLING

A lecture given on 18 September 1963

Thank you.

Well, now, this is the – ?

Audience: 18th.

The 18th of – ?

Audience: September.

September. What planet?

Audience: Earth. AD 13.

AD 13. And solar system. [laughter]

They're tearing down Alcatraz, did you know that?

Audience: Yes.

Did you know they were tearing it down?

Audience: Yeah. They are tearing it down.

Yeah, they're abandoning it and tearing it down, and I think that's awfully good news, and so forth. And we're of course going to follow suit with this planet. Anyway... No, no. Don't – don't get me wrong. We don't intend anything violent. I think we need a rehabilitation center and this one will do as well as any. Okay?

Male voice: Yeah.

Now today, today I'm going to talk to you about the service facsimile and the state of the pc and a Saint Hiller method of moving in with a service facsimile and straightening up a case.

Now, you have to know where the stops are on the organ before you can play an organ. This helps a great deal. You have to know where the keyboard is, and with the new elec-

tronic organs you have to know where the switch is and a few things of that particular character.

So you – just sailing in on a case with great nonchalance, you see, and not turning on the switch of the E-Meter and not finding out anything about the case's PT and having no safeguards of any kind whatsoever and not knowing what you're doing anyway might be rather adventurous, might be rather adventurous. In fact, I think every psychiatrist that has been along this ground is very adventurous. Never was so much done by those who knew so little.

This situation, however, stems from lack of technology and lack of know-how. Now, this know-how situation with regard to the mind is very, very hard to arrive at. There are so many suppositions that – just walking through a forest of favorite beliefs. And when you realize that every case and every practitioner in the field of the mind would be concentrated on one aspect of existence and then dedicated to not observing existence except through that one evaluation of existence, you see at once the tremendous limitations imposed upon the discovery of anything about the mind, and then, secondarily, getting any application of any truth known. Do you see that this, then, would be a self-defeating proposition?

Not only are we given a vast panorama of data, any one of which is – can be a favorite aberration (not a truth but an aberration, don't you see?) in this vast forest, but then we ask people who themselves are concentrated upon favorite data, you see – substituting for themselves to handle this situation – and you get a difficulty; you get a randomness right there.

Now, let's compound the randomness and realize that knowledge about the mind means freedom for life and beings in this universe. Once you recognize that as a principle, you will see that anyone who is dedicated to total enslavement or the dwindling spiral or caving anyone in and caving everyone in, and so forth, are immediately not in favor of total knowledge of the human mind, but quite on the contrary are in favor of great ignorance.

And there's two ways of accomplishing that ignorance. One is simply a denial of information, which is practiced but sometimes cannot be fully enforced. For instance, the Catholic church for many, many centuries made a great thing out of "ignorance is wisdom," you see? Everybody had to be good and stupid and so forth, and whether you're Catholic or not you'd have to admit that that was the modus operandi of the existing church over a period of about, oh, I think it must have been eight hundred years or something like this – is almost their total devotion was to ignorance.

Well, it doesn't go just that far. That sooner or later gets interrupted. But there's something that can be substituted for total ignorance and that is false data. And false data is probably a much more effective means of denying freedom.

One of the ways of going about false data, for instance: The fellow wants to get out of the woods and there are two trails. And one trail lies much deeper into the woods and the other trail goes out on to the plain. And all you have to do is put up a sign at the crossroads and point to that trail which goes deeper into the woods and say, "This way lies freedom," you see, and you've promptly trapped a lot of people.

And that is such an easy action that when it is added to the fact that everybody is sort of mired down in their favorite fixated data, this can become quite a vicious morass. The trick is, then, to find the exact mechanics – the exact, precise mechanics which apply to all minds.

Now, the moment you have found the exact, precise mechanics which apply to all minds, you can then get a broad agreement on the situation because they override the minor data on which the people are fixated. In other words, they also would have this broader perimeter of data and they'd recognize the truth in the broader perimeter of data. But the moment that you move even a sixteenth of a millimeter sideways off of what is generally applicable to all minds, you are again into the particularities and opinions. So therefore, if you had a broad sphere of knowledge which was true, and these were all high generalities and everybody would agree with them, frankly it'd be very easy to bankrupt and upset that whole operation by taking it, and by false relay – you see, bad instruction and bad relay of the material and dropping out a datum here and a vital datum there and substituting something or other – you eventually could then again effect a sort of a slavery out of that information.

In other words, even if you arrive at the technology, you still have the task of safeguarding the technology because, once more, it can easily turn and become a false technology.

These are the various ramifications that Scientology has had to deal with over a period of many years. And the solution to the difficulty is results because once the technology is applicable so that results occur by reason of its application, then of course, you don't get any arguments with these. You don't get the intrusion of a great deal of crisscrosses.

So the whole contest has been not for the achievement of certain truths – we have had many of these for years – but a workability so that we attain an application of those truths toward a rapid release of attention from favorite and fixated data. And in that wise, then, the truth is carried out by a demonstration that if it is used a greater freedom is attained.

And we have to look at how long is the attention span of a preclear. Well, in actual fact, as far as Scientologists are concerned, their attention span, their willingness to go along and try in this direction, is terrific. But the casualties which occur along the lines occur because the body of knowledge has not arrived in an individual in the release of his attention from his favorite data. Do you see that?

This fellow is sure that all horses sleep in beds. Now, it isn't only that he has this as a fixed datum; he also has this as a total datum. And any data that does not contribute to horses sleeping in beds he will discard. You see, it's not just that he's got this one idea. He's got this idea which then bends all idea toward this idea. And the truth of any existing situation is whether or not it fits this *idée fixe*. His idea of separating truth from falsehood is whether or not it fits his *idée fixe*. Now, if the thing is false, it doesn't fit his *idée fixe* and therefore should be thrown away. And if it is true, it does fit his *idée fixe* and therefore should be retained. All of which is rather interesting because if his *idée fixe* were "horses sleeping in beds," he would only listen to mental technology that affected horses or beds.

Therefore – therefore, the early discovery, and the long dormancy, arising in a greater use and application of the service facsimile means a great deal to Scientology. Means a very great deal to Scientology because you're now dealing with the one reason you can't get across

a general truth to a preclear. You're not trying to teach this preclear anything but you're trying to show this preclear that by reason of what you are doing you get a release of attention so that the world looks brighter and he can look further and he feels better and more powerful.

Now, if you do not attain this in a session with any given pc over – sometimes it can be a very long period of time – but if you do not eventually attain this, you will eventually lose your pc. Sometimes it lasts only an hour and sometimes it would last for several years.

Now, the degree that it – the pc will sit there patiently has direct ratio to how fixed his idea is. Now, the pc who will sit there for years waiting for a greater truth does not have his attention so involved with an *idée fixe*, you see, that he cannot absorb the greater application of the material which he is presented with to process. And he will get perimeter benefits even though his *idée fixe* is not touched. He gets these perimeter benefits solely and totally because he is not that fixed! Do you see? He's just not that fixed.

Now we take this bloke who says that horses sleep in beds, and that is the total modus operandi of life. We have to look at the totality which this can become. This is the eighth, seventh, sixth, fifth, fourth, third, second, first dynamic, see? All sex is answered by the fact that horses sleep in bed. The way to run a family is to have horses sleep in beds, you see? God is actually a horse sleeping in a bed, see? This has really got to be a fixed datum.

Now, to the degree the datum is fixed, he is not able to explore the perimeter of his ideas and therefore cannot see a greater truth. In other words, he's more entrapped and more imprisoned than the next one. Now, that is what is known as very bad mental condition: It's how fixed this one idea is.

Now, when you're dealing with neurosis, you have somebody who has an *idée fixe* which only occasionally arises to wreck his life, and he can see a little more beyond that. But when you have psychosis, you have only the *idée fixe* – only. Just as I just told you: God is a horse sleeping in bed, see? You'll find the institutions are full of these blokes.

Now, that's it. Now, that scares you when you start thinking about the fact that you, of course, have a service facsimile that is an *idée fixe* and so forth. All right. It's degree, then. It's degree. Your attention isn't so pinned down by that that you can't examine a greater truth or you wouldn't be sitting here this very minute. See, so immediately you're lifted out of the ranks of the insane and the neurotic. See?

Just by definition. That proves itself – quite self-evident. Now – you can see some wider idea.

But let's take Mamie Glutz or somebody, the cashier at the local service station, and we try to explain to her – we try to explain to her – that beings are beings and that each one of them has a mind. Let's just go that far, see?

Now, if she's got a very furious *idée fixe* of one kind or another, such as "all men are alike," see, this doesn't fit. So therefore, you become false. To her, you are false, do you see? Then any datum which you utter on the broad perimeter of life, if it doesn't add up to "all men are alike," is a false datum. You could have an elephant stand in the middle of the room, and say, "That's an elephant." Well, it's not a man, so therefore it's a false datum, don't you see? So that you're indicating that an elephant is standing in the middle of the room – and there is

an elephant there – you are indicating a false datum to her. And therefore you are saying something foolish.

She knows this. How does she know this? Well, she knows this because, naturally, "all men are alike."

One fine day you happen to tell her, "A lot of men are aberrated. In fact, most all men have aberrations of one kind or another." You're in there cooking; you're now true. This one accidental datum goes by and latches on to this service facsimile, see? Just one. Now you spake truth. And perhaps from there on, everything you utter, she will say, "That is true." But once more, it's without evaluation or inspection.

Now, get the degree, then, the degree of fixation upon an all-resolving datum and then you have the degree of enslavement of the individual. These things actually are not degrees of knowledge or ignorance but simply degrees of freedom or slavery. It is secondary – entirely secondary – that truth is truth and falsehood is falsehood. It's whether or not it leads to freedom or slavery that establishes your final amount of truth, because fixation is only upon falsehood. You can never get fixated on truth. That's quite a fascinating thing.

Truth is an all-freeing mechanism. If it is not all-freeing, then the truth to some degree must be limited – either limited in its conception or limited in its reception or limited in its application. So that you can say that anything you were worried about must have a falsehood connected with it. There is always a lie connected with anything that you are having a hard time with. You go out and you can't start your car. And you fool around with it and fool around with it and fool around with it, trying to start the car. And you finally realize that it must be the carburetor. So you have the carburetor fixed. And you still can't start your car. Obviously you conceived a falsehood about the car. It couldn't have been the carburetor because after you fixed the carburetor the car still didn't run. This is easily demonstrated in the field of mechanics, you see, because things run or don't run. So there was a falsehood connected with your analysis of what is wrong with the car.

Now you say, "Well, it's probably the spark," and you fix the spark in some way and the car runs. Therefore, that must have been the truth.

Well, we can't observe to that degree people running or not running. Their motors don't purr or stop and they appear to be all right when they're not and they appear to be not all right when they are. And very often an auditor has been very embarrassed at the end of session to sort of start apologizing for what a terrible session it's been and get the whole load in his face on the subject of taking away the pc's gains: "Why, I had a fine session! It's a marvelous session! Found out a lot of things! Had a terrific time!" you see, and so forth. Far as the auditor's observation was concerned, the pc was sitting there quite glumly and hadn't had much of a session.

All right, another way: An auditor is looking at the pc, and the pc is smiling sweetly and so forth, and so forth. And actually the pc is practically spun in by the session, don't you see? Now, you can make that observation of the pc a modus – well, a cause here.

Let's look at how far we have come in this direction. You are actually now in a position to determine, without the faintest difficulty, whether it was a good session or a bad ses-

sion for the pc without asking the pc. Now, that's rather terrific. This doesn't look like much, don't you see? But that's pretty terrific.

If the pc got an acceptable amount of tone arm action in the session, the pc by session end might have even been roughed up by something but still would have had a gain and will be fine the next day. But the pc who did not get tone arm action in the session will not feel good at session end, no matter what they say, and the next day will probably feel terrible. One session, no TA action: pc bad off.

Now, that doesn't look like much. That doesn't look like much. That looks like a datum which you now know and which you're living by and auditing by and it just doesn't look like much. Actually, there was more wisdom in that discovery than there has been in the former fifty thousand years of thinking man, because it immediately and directly took out of the realm of inspection, worsening or improvement as a result of treatment. There's no opinion about it now. We don't have to depend on the auditor's opinion or the pc's opinion. There's no dependency on that at all. Did you get tone arm action of an adequate amount? All right, then that pc is going to feel good at the end of session and the pc is going to feel better the next day. You didn't get an adequate amount of tone arm action: The pc is not going to feel good at the end of session and not going to feel better the next day, no matter what the pc says.

Now, once in a blue moon you can turn off a somatic and the pc feels nice about the somatic going off without getting a great deal of tone arm action – without getting a great deal of tone arm action. But you watch that pc during the next forty-eight hours and exactly the same result will occur. I mean, we haven't stepped sideways from the basic data involved in it at all.

Now, that's interesting. That's interesting. Therefore, just on that little grounds alone, we must know something about the mind and be able to do something about the mind which is in excess of what has been done about the mind. Look at the tininess of what I am giving you here, you see? That's hardly anything, you see? But that truth will hold up – that truth will hold up. You say, "Well, it's a mechanic truth, it's an application truth, it's this kind of a truth." But nevertheless it'll hold up.

As you go along and audit, you will find out that that truth holds up. In fact, you're finding it out right now. You've sat there over a stuck tone arm for two and a half hours, you've looked at the end of session and the pc has been going groan and creak, and it hasn't been going too well. And if you cared to look at the pc a few hours later, you'd find the pc sort of caving in, in various spots. Pc will be nattery to you the next session and that sort of thing. By the time you've gone three sessions without any tone arm action, you will start wishing you had never started auditing this pc in the first place, because the reactions are going to be rather extreme. In other words, this will follow out a general observation.

So therefore, we must be dealing, where we're dealing with the pc, in certain principles of action. Those principles of action are also very elementary. They fall back immediately upon the *idée fixe* – the stable datum and the confusion. And it must mean that all confusions are there, and therefore all masses are there, because they are held in abeyance so far as observation is concerned, and will never as-is, by a stable datum. A stable datum, then, prevents observation of the environment or these masses and therefore accumulates masses. A

stable datum is a dam erected across the river, and with that stable datum firmly in place no water is going to flow.

Now, what is wrong with a mind? Well, it must be that a stable datum was adopted in lieu of inspection. A person ceased to inspect. For some reason or other he fell back from inspecting, fell back from living, fell back from being anywhere and just let everything go to pieces. "Oh," he says, "well, I'll put this stable datum there and the devil with it all. To hell with it. I'm..." He either said, "I'm incompetent" or "I'm bored with it" or "I want to be elsewhere," or something of the sort. He said something. But he still put a datum there to substitute for his own observation and his own coping with life and the situation at large.

And at that moment he started to get an accumulation of confusion. Because you can write "I eat pie" on a piece of paper and put it in the middle of a bakeshop and it won't do a thing. It won't bake any pies, it won't buy any pies, it won't sell any pies, it won't do a thing. You can put "bakeshop" over the door so that people will know that's where the bakeshop is, and start handing out pies and selling pies and doing things like that, and you have handled a confusion just to that degree. But the moment you put "bakeshop" in the middle of the place and take the baker out, you haven't got a bakeshop. See, it's pretty obvious.

Well, when the thetan did a bunk and left an idea where he was, after that no confusion gets as-ised, but on the contrary, rather develops at a high rate of speed. You get more and more confusions and less and less as-ising. And eventually this develops what we call mass – mental mass.

Once you shake up that stable datum – whether you find the exact stable datum or not – once you shake it up by finding a cousin datum to it or finding something in its perimeter, you have taken some bricks out of the dam that is lying across the river, and water is going to start to flow down that river. And as it flows it tends to wipe away more and more stable data. And true, as in any hydraulic works, you're going to get more flow and more widening of the hole the flow is going through, the more flow there is. You've got to start the flow flowing.

Now, how does the stable datum become so fixed? It becomes fixed by the very thing it's supposed to confront. It gets fixed by the confusion it's supposed to handle and doesn't. And the more it is in place to hold back the confusion, the more confusion batters at it, so the more accumulation of confusion you get around the vicinity of this stable datum.

It's something like twirling a bowl of taffy or something like that – twirling a fork in it. You're just going to get more and more taffy on the fork, don't you see? Because it is there. If it weren't there, you weren't going to get any. Now, it might be there to remedy the confusion. Actually, it accumulates confusions. And you get more and more accumulation of confusion and therefore more and more mass, and more and more this, and more and more that, and more and more eradication, and less and less ability to inspect and communicate on the part of the individual. And finally the whole house gets full of these things and the guy has got no place to move anymore and he sort of sits there and he himself is one of these things. And you can't find the pc because he's just another stable datum. He knows, see, and so on.

And man, man has gone the route. Man talks about the brain when he talks about the mind. And if you want a commentary – if you want a commentary on a state of mental technology – just look for the degree that the thinkingness or beingness of the man is considered

to be mass. And the more a being is considered to be mass, the lower the technology extant will be found to be. Why? They're just dramatizing the stable datum and the confusion.

So you look for modern science. Modern science says, "Man's an animal – ha-ha." See? "Man is an animal. And it's – he's a brain, and electronic impulses go this way and that way and that causes thought."

What have you got here? What have you got here? You've got a brain substituted for the being. And if all mental technology believes that, what kind of condition must those practitioners be in? They're in the condition which you see them in today. That's pretty grim. They're hard people to have anything to do with.

Now, you wonder why they are hard to train. And they are hard to train. And one of these fine days you'll be training them. Just remember that their whole orientation has already added up to a tremendous confusion which has used a brain as a stable datum.

So you'd run a process like "Tell me all about the brain." "What decisions have you made about the brain?" And you're going to get tone arm action. And all the charge of the former confusions which have been stopped by false data is going to flow by on your E-Meter tone arm. And the next thing you know, they have enough inspection ability to learn. And that's why they're hard to teach. That's all. Because all the knowledge you're handing them, they do this with it – You say, "Now, there is the idea of a – flows. And when a flow flows too long in one direction it tends to get stuck."

And this is the way they receive this datum: "Uh, let's see, a flow flows too long – brain. They're talking about blood. Uh, this is a discussion, then, of the causes of coronary thrombosis." So they write down "Coronary thrombosis, diagnosis of." Get the idea? What's holding this – what – how come? How come there's no inspection? Well, because they're even depending on their own brains to do their inspection for them. You imagine a thetan getting so lazy that the brain is going to inspect everything for him.

Well now, this, then, is actually just putting your attention on the limitations of beings to the recognition of truth or falsehood. And that recognition is limited in direct ratio to the amount of fixation upon a stable datum. And that's the degree of limitation. Very important principle.

How then can an individual who is totally boundaried and bound in and totally fixated – and he himself is a stable datum by this time; he's no longer a living being – how can he be expected to get anywhere? What can you do for him?

Well, you think, well, let's see, there's two approaches here. You could take a datum of enormous magnitude and you could hold a gun on him and you say, "If you don't believe this new stable datum, we will shoot you." I'm not now talking about an unused method, see? "You say 'Heil Hitler' or you'll at once be talking to the Schutzstaffel," see, that's a substitution of a datum for understanding. He'll be talking to the Schutzstaffel, promptly.

Patriotism rises on every hand. See, everybody says "Heil Hitler" all the time and eventually the nation goes down in defeat. Why does it become defeated? Well, there's nobody there stopping any confusion or handling anything at all except a stable datum known as "Heil Hitler."

Mussolini's empire went the route. One of his boys was always expected to call Rome if he had to make a decision. Now, when the Allies first went into Sicily they had to appoint some of these blokes back into civil positions. First they appointed a whole new batch and found out they'd appointed the Mafia into total control of everything. And they had to reverse this and get some of the old Fascist officials. And they said the only thing wrong with them was they couldn't think for themselves. They always had to call Rome to know what to do with a piece of paper or something of the sort, and the lines were real busy. But that empire too went down to defeat.

So this method of holding the pistol or the sword or the fist and saying, "Accept this stable datum or else," and so forth, has a level of workability. And it is used, but normally ends up in greater slavery and certainly less effectiveness. It can be counted on to wind up with less effectiveness – less IQ.

Now, we made a study in Johannesburg – inadvertently, but made a study down there – of a bunch of papers that came through from school children. And we had one school that was tested from one end to the other down there in the test department. It was quite interesting to see the deterioration of the IQ of the child. I think the highest IQ that we measured in Johannesburg was a seven-year-old boy, if I remember rightly. I may have this data wrong. But he had an IQ of about 200. And that was about the highest IQ we had around there.

But studying the school at large as they had progressed from class to class to class to class, you saw a deterioration of the IQ. Well, that was an interesting commentary on the school because the school was never asked to inspect anything, never asked to understand anything. But they had to accept this as a datum, never inspect it in any way, shape or form, and let it stand as a substitute for themselves. Of course, you got a deterioration of IQ. Right?

Now, there'd be a whole new level of education if you said to somebody, "Look this over very, very carefully and decide what is true about it and what is false about it and what is workable and what is unworkable." That's a whole new zone and area of education, and a very interesting zone and area of education. But you see at once what limits it: With everybody fixated on his own special idea by which he's going to tell rightness from wrongness, that, as a totality, can't exist. But it's another idea, you see?

Now, this would be another method of going about this, and that would be to free up people's ideas so their perimeter of inspection increased, and having increased, let them inspect the data which lies before them. Therefore, you have a sort of a cross of these two schools of thought. You lead them up with a certain disciplined action that finally shows them their *idée fixe* – inadvertently, not even intentionally, but just leads them right straight to that. That then, knocked out of the way, shows them a greater perimeter of understanding and you could lead them forward continuously to higher and higher levels of understanding and to total freedom. Because remember that the individual is trapped to the degree that his ideas are fixed.

You're actually leading any person who is not Clear, then, out of a morass of entrapment, not out of a morass of ignorance. And he's trapped to the degree that his ideas are fixed. Therefore, it is of the greatest importance to you to find, first and fastest, the idea on which he is the fixedest. That's very important, then. And that would give you the speed of processing.

That determines the speed that processing is done at. It's how fast can you find the *idée fixe* and free the individual for a broader perimeter of inspection.

Exteriorization, even the state of OT, depends upon bringing about greater states of freedom, not greater states of wisdom. This is an important differentiation because the wisdom will take place anyway. But by concentrating on the wisdom you are all too prone to fall over into the idea of the implanted stable datum. But if you think of it in terms of freeing his attention, you then lead to freeing the being.

The only thing that can trap a thetan is his attention. That is all that can trap a being; stone walls do not, definitely.

You have a situation here where an individual is totally untrappable; completely and utterly untrappable by anyone except himself. What traps a being is his unwillingness to confront things which are not interesting to him, or to back out of situations in which he has lost interest, or to move off and go his way but still, somehow or another, be responsible for where he was. Various combinations lead to this situation.

Well, we are studying, now, how does an individual fix his attention and then substitute for himself or for thinkingness or for something else some inanimate postulate? Joe was here, you see? Here he is as a thetan, able to contest, confront and handle any of the confusions in his direction, see? And actively doing so.

Now, he says, "I have an unconscious mind that does all that."

How has he trapped himself?

He says, "This is an unawareness area which is going to handle these confusions."

Steen-trillion-squillion years afterwards, Sigmund Freud comes along and finds the unconscious mind.

Well, actually, the unconscious mind would be that totality of stable data which are holding back that totality of confusion which the individual is no longer aware of but is still doing.

Well, so much for freedom and slavery. That's all it amounts to: it's freedom and slavery – of the individual's fixed attention and so forth.

Now, of course, the individual can go to extreme and extraordinary limits. They say, "Well, you are the auditor and I'm depending on you utterly as my auditor to free me. And therefore my idea is fixed on you, so therefore I ought to be able to go off and self-audit myself, and so forth, because it's very bad to have my attention fixed on you as an auditor." Well, that's strictly ding-ding-ding, here comes the wagon. You're not part of his stable data. You're part of his environment. There's a slight difference. You are freeing his attention, not entrapping it. There's a difference. Now, how does all that add up in our modern swing and quick look around on technology? I have just given you all the important data. I haven't given you the ramifications of this data or how it becomes fixed in this and how a thetan exactly does it. I haven't given you any of the mechanics of the situation. But I actually have given you the fundamental rationale which brings about aberration. And actually they're – you can name a lot of parts to all this, but you've got it right here in just what I've just got through telling you.

There's actually no more in the essence of the broad theory to the subject than just what I have told you. There's really no more to it.

Now, the technology of how you free up somebody's attention; the exact method of how it is entrapped; the exact comparisons that trap it; the exact things he does to form these entrapments and that sort of thing: That's a broader field of technology. But it nevertheless has a total dependency on the data which I've just now given you.

And when you are looking for the pc's service facsimile, therefore you are looking for that thing in present time on which his ideas are most fixated – his attention is most fixated in present time. That is what you're looking for when you have a service facsimile. If you find any cousins, sisters, aunts of the service facsimile kicking around and knock those out – any other stable data that are around – you're going to get tone arm flow. There's going to be flow and it's going to express itself on that tone arm.

"Horses sleep in beds": you inadvertently hit on "bedside tables." Oh, you get lots of flow, because "bedside tables" is part of the bed, don't you see? And you get flow, flow, flow, flow, flow – "bedside tables," you see? You don't ever expect that it's connected with beds, much less suspect it's connected with horses.

But you've got your paws on "bedside tables." Therefore, you're finding something which is at least a first cousin to his service facsimile.

Service facsimile by definition is the last optterm or terminal that the individual has or is forming – has formed or is forming. It's the last pair of RIs in combination – it's that pair that makes it – last pair of RIs formed up at the top of the last GPM postulated. That's exactly what the service facsimile is. It isn't anything else. But you're going to find a lot of cousins sitting around in there. Of course, he's busy getting this one together, see? "Who opposes horses sleeping in beds, you see?" "A horse master," you see? So he's busy being a horse master, or something like this, and that's his beingness and stable datum for life, you see? And what he is opposing is horses sleeping in beds, but horses sleeping in beds he believes. You can get some kind of a ramification out of that. I'm not now trying to give you a neat picture of these last two items. That's beside the point, but just take it that they're there, see?

Now, sitting around in their vicinity you've got all kinds of things: you've got a horse master's hat, you see, so you've got a hat; you've got a whip; you've got boots; and you've got bed... or you've got posts, you see; or you've got sheets; or you see, you've got all of these little additional items, see? There are tremendous numbers of items scattered around here, completely aside, you see, from a horse master and a bed and a horse, see? There is much more stuff. You get your hands on any one of those little things and you're going to get some tone arm action.

Tone arm action actually depends on your getting your paws on one of those things. You can call any one of them, for just practical purposes, you can call them, "Well, I found a service fac," or something like that. I don't care whether you call it or not. That's not neat. That's not neat. You won't know whether it's a service fac or not until you've found the actual GPM and found its two top items. And then you'll know what the service fac really was. And your face is going to get somewhat red, see? It's "horses sleep in beds," you see, and it's something about horses in beds, you see? And man, you had it all figured out that it was bedside

tables and had to do with the second dynamic, you know? You had it taped. Didn't have anything to do with the second dynamic at all. It had to do with the fifth dynamic. Quite amusing. You'll nearly always find yourself that far off when you're just entering from the top with R3SC. So just expect to be. You'll be on the safe side.

The chances of your actually finding the service facsimile itself in a combination of two items is not merely rare – it's impossible. So get that well. It's impossible. Can't be done. It requires the illumination of knowing they are part of that bank before they are recognizable to the pc. Pc just won't recognize them, that's all. Even if you found them, the pc would reject them because they don't identify with the goal. You don't have the combination of the last goal (closest to PT, you see), and those two RIs and their relationship to that goal. And then, you've got to get those three things before you get a total "Hey! What do you know!" See? And then you get it, see? But before that, you could have actually had it on the list and it wouldn't have meant anything to the pc.

So you're not going to find the pc's service facsimile. Do you understand? But go ahead, try like mad [laughter] – because it's on that route that you're going to find the last GPM.

Every one of these little goofball things like "the bedside table," "a bedside lamp," "a chamber pot that sits under the bed" – any one of these things – you find these things, you know, and he adds them all up and that fits over there – and they don't fit any such place, but that's all right. He adds them all up. And you get tone arm action, tone arm action. You list for the thing. And he won't get any real relationship of how this relates with that. But he'll get some action. It does mean something in his environment – does have something to do with it.

By the way, tremendous subjects come into this. Somebody's suddenly going to cog-nite that we're dealing with, also, Freudian fetishism. This is Freudian fetishism. Some narrow perimeter of this would be fetishes. You know, the guy is absolutely fixated on getting ahold of women's dancing pumps, you know? He has closets full of them, you see? All of this sort of thing. That's a Freudian fetish. They went through all sorts of wild things along this particular direction. But they're simply objects associated on some distant perimeter with the service facsimile. And, of course, a person seldom is that fixated on any object. It actually is not common to all cases. But you will find these things around and it's rather fun to look at them. You'll find grandfather's pipe, or something like that, you see? Oh, you get lots of action on the thing, you see? Terrific, you see? Pc had an ally, and he'll figure it all out and he's got it all taped, and that sort of thing. And he won't have anything to do with it. When you finally get the service facsimile, service facsimile maybe has something about pipes in it, you know, "steam pipes" or something, not anything about smoking pipes.

But you got too close an identification, see? So all of these things get identified into the bundle because he is incapable of inspecting them very freely. They cross-associate and you can bleed charge.

Now, what has got the pc so restimulated that you can't get tone arm action? The two top RIs of the last GPM formed or being formed. That's what's got him so restimulated. That's what makes his present time so miserable. And that's what charges up his tone arm so it won't

move. It even cross-influences into auditing restimulation because his auditing is being monitored by these two top RIs.

So, when you get down to the – the final chips are in, you haven't got any choice but to find the pc's goal. Not the pc's backtrack goal "to be a giant," you see? That's a very nice goal, and we appreciate that he had that goal but that happens to be trillions-seventy ago. You can't even write trillions-seventy on this wall. You couldn't. Just writing along with normal-sized figures, just writing and writing and writing, you couldn't write them on this wall. That's a lot of time. And that's not present time!

You can, however, go skipping; by goal-oppose, goal-oppose, goal-oppose, goal-oppose, you can bring it on up to PT, see? When you get it up to PT, why, you'll see it ticking as the PT goal. And it ticks "yes" – you know, Ouija-boards your meter. "Is this the present time GPM?" you see? "Is this the goal you've last formed? This the goal closest to present time?" Tick, you see? All right, and whatever the goal says, "Is this a right goal?" Tick. "This a wrong goal?" No read. "Is it a wrongly worded goal?" No read. "Right goal?" Tick. "Present time goal?" Tick.

Then you look it over yourself and find out whether or not you think so. Like, it could be the goal "to be big," you see, or something like this. And that's a present time goal? Ha-ha-ha. Look! Self-evident: The fellow's here on Earth. That isn't his present time goal – self-evident. And he probably would have made some part of it if he had, don't you see? It may look too high-toned a goal to you, in which case you do another goal-oppose on it. And the worst that will happen to you – the very worst that will happen to you – is that you just run into greater and greater quantities of tone arm action. You're doing a goal-oppose, but it is the present time goal, so you're peeling off the lower goals off of it.

Well, you'll eventually see you'll just run into more and more tone arm action, so you just ask it on the meter, "Is this the present time goal?" And you get a nice read, now, see? And there it is, and you list for its top oppterm, you know? "Who or what would be the latest item formed or the latest idea formed concerning this goal 'to catch catfish'?" – whatever it is. List it out, get a reasonable list, not 189 pages, listing the guy back and forth, up and through and back and forth through his GPM, and back and forth through his GPM, and back and forth through his GPM, eye sockets getting darker and darker and face getting blacker and blacker, and back and forth through his GPM... "Well, we actually haven't run all the tone arm action out of it yet, we've only got 189 pages of listing..."

No, I'm afraid that isn't quite the sensible way to go about it. You're listing to find the top oppterm. However you find the top oppterm is how you find the top oppterm, see? You want the top oppterm – you don't want a list. And when you do this reasonable length of list, you know, and you got a clean needle – listing to clean needle is very excellent – and you got a clean needle, why, there you've got it. And you null it down and you see one of them goes click, of one kind or another, nice little slash or a surge or something. Let the pc cognite on it for a while, prepcheck it and you'll see the most gorgeous rocket read you ever saw, and you needn't have seen a second, momentary, even-for-an-instant rocket read the whole way. And that's a discovery. Now, the way you've been finding goals is you get the goal and you lay it

out and you prepcheck it, and if it doesn't rocket read it isn't the goal, and so forth. And you have to prepcheck it until it rocket reads, and this thing is falling off the pin, and so forth.

Hey, what if this goal is "to be God," trillions-hundred. And you're prepchecking some pc at trillions-hundred while his top RI is "auditing." What do you think is liable to happen? The RI, the service fac in which he is sitting and that he's frozen in right here in present time, is "auditing." And that's an oppterm. And the terminal is "a screamer" or "an ARC breaky pc."

Found that on a list the other day, and the auditor tried to sell it to me as a terminal. It turned out to be an oppterm, fortunately.

But look-a-here: There he is up here in PT with all that restimulation, see, in his environment and everything else falling in on his head. Those RIs are all ready to pull in. You take him back to trillions-a-hundred to prepcheck a goal? You going to get there? You going to see an RR? You're going to see an ARC breaky pc. Going to be a little bit too much strain, isn't it?

So what's this add up to? This adds up to the difficulties in finding pc's goals was getting pc's goals to rocket read. That was the difficulty in finding pc's goals, not getting the pc to volunteer what his goal was, because pcs are always giving you a big sell on what their goal is. See, that's easy. You say to somebody – so forth and so on. You can finally get something to read in this direction, see? But to get it to rocket read, to get it all polished up and laid out and that sort of thing, that was our trouble.

Well, you can do this whole operation without any Prepchecking and bring it off with only ticks up to the point where you have prepchecked the top oppterm. And your first rocket read is after you've prepchecked – after you've given the pc the top oppterm and prepchecked it – and then, and only then, do you see your first rocket read. And it'll be gorgeous. You don't even have his GPM rocket reading. You don't even have the goal rocket reading. You're not doing anything with it at all. And that's the way to find a service fac. Slippery. Sneaky.

Now, I'll give you the exact way you go about this, because I've left you rather stonied and it is not quite complete. I haven't told you all the steps either! Now, the first thing you do is to find what you fondly hope is, and which the pc implicitly believes is, his service facsimile, which gives you enough tone arm action to act as an anchor to windward. This is Saint Hill method of finding – it's not just finding somebody's service facsimile but actually clearing the whole case to OT. Here's the way you go about it, See? You just hunt and punch around enough till you know you've got your paws on something that will bring about excellent tone arm action. And then you don't use it. Well, what do you want it for? Well, just for this reason: If you run a session totally without tone arm action, your pc is going to be pretty miserable and he's not going to get any gain from auditing and his morale is going to go down, he's going to feel bad the next day, and you're going to get into a no-auditing situation with great rapidity, see? So we take this – this thing called a service fac; we hunt and punch around until we find something that can produce tone arm action. We know it can. All we've got to do is prepcheck it or run right-wrong on it or domination. The pc is trying to cognite on it, you know, and that sort of thing, and trying to run this thing desperately and get tone arm action and all that sort of thing. And you politely – you've found it, see? And for some reason or other you don't do anything with it. It's going to produce tone arm action, though.

Now, therefore, you can afford half of your next session, if not two-thirds of it, to flounder around where the GPMs are growing, with no tone arm action at all. And if you haven't gotten any tone arm action in the first half or two-thirds of the session, and you haven't really got anyplace or got your hands on anything and you made a few bum steers, you can still cheerily, cheerily, cheerily say to the pc, "All right, now we're going to run your service facsimile."

"Why the hell weren't you doing it earlier?"

"Well, that's right. That's all right. It's all right," and so on, see?

So, *pocketa-pocketa-pocketa-pocketa-pocketa*; get some TA action, TA action, TA action; the pc comes out of it feeling fine. He's got some auditing, right?

Next session he comes back in expecting to run "peanut boilers" or whatever it was; you start looking for GPMs, see? Half the session, two-thirds of the session goes by and you still haven't produced adequate tone arm action, you still got a service facsimile to run, see? So he gets a session, doesn't he? Everything's fine – his morale is staying up and everything is fine.

The next session – if you're going this long (you've just been a complete knucklehead up to this point, see?) – you do your other list, and you've ruled out a few things now and what you've tried isn't so good, and so forth.

Now, this one, about a third of the way through the session, you've found the goal "to be wonderful." And it went *tick!* And you said to the pc, "Is that your actual goal or is that an implant GPM?" And your search-out found it to tick every time you said "Is that an actual goal of yours?"

Well, we're not going to get that thing to rocket read because that is way back down the track. But we're going to go "What goal would oppose 'to be wonderful'?" And we're going to complete a list and we're going to find a goal and we're going to use this goal we find – it just ticked (the goal we find); just nice, healthy tick left in on the list, see? And we're going to ask about this goal. "This goal: Is that an actual GPM?" Don't you see? Going to go through the same routine as though we'd just found it, see, originally. "Is that an actual GPM? Is that," you know, "your own GPM?" and so forth. And "Is it... ?" so forth. And "Is it a present time goal?" And of course, naturally, it isn't, most of the time.

You got it all straight – don't prepcheck it or anything silly like that because we don't want it live, see? Now let's roll up our sleeves and do a new goal-oppose list, see, and it was "to be a schnook," see? So we say, "What goal would oppose 'to be a schnook'?" see? And we get "To be an evil being," or something like this, don't you see? That's pretty high-toned for present time. Do the same thing with it, sort it all out, don't you see? And we finally move him up. We don't care if we moved him through twenty of these things, see? We found this little tab out. There was one goal that he claimed was his goal, see, and we could get a tick every time we said "Is that your goal personally – not an implant goal?" He's always very interested in it.

You guys are very lucky. For instance, I can look right over here: Guy over there's got a goal "to understand," see? I can look over here; I know what goal you've got; just watching

your records, you understand? You know, because absorbed attention whenever you hit those implant goals, you know, boy! That ran, you know, boy, that was a – that was a good one. Got a big send out of this implant goal. Hell, naturally you got a big send out of the implant goal. It was your own goal, except that was the implant lock on it.

See, so you're rich. So anyway, you just take that goal – take that goal and say, "Is that your actual goal?" Tick, see? And so on. And do a goal-oppose list and move that thing by goal-oppose lists only, you see, up to PT. And you finally get something. "Is this your PT goal?" You're very suspicious of that because sometimes you can be three goals away from the PT GPM and it will still read "It's your PT goal." We just haven't discovered that other.

There's reasons for this, too, and I can give you the clue of what happens. When you've got the PT goal and you do a goal-oppose list against it, you don't land the guy up in the future with Buck Rogers, see? [laughter] So you just do your goal-oppose, your goal-oppose – a reasonable length of list, see? And you just list your needle clean, null the thing down – it ought to null easily – and you get your goal-oppose list item. And you've got a new goal; go through the same business with that. You could occasionally, you know, mess it up. You didn't get the right goal or you fell into an implant goal. But you'll sort all that out on a meter. So you just make sure that you got the pc's own goal and it's closer to PT than the goal you had last time, see?

All right. Now, when you finally get his PT goal you can still be suspicious of it and list "What goal would oppose it?" See? "To drown myself," see? That's a nice PT goal, see? "To drown myself." That's pretty real for PT.

All right. (Now, I don't say that'd be anybody's actual goal; that's why I'm paraphrasing it.) All right. So we list "What goal would oppose it?" and we can't make it. We can't do anything with this list because we keep developing more and more tone arm action.

We're not now developing less and less tone arm action, the way you do on a normal goal-oppose list, you see, if you're not up there. You're going to produce more and more tone arm action. This needle is going to get floppier and floppier and looser and looser. The pc isn't going to ARC break, mostly because you're listing toward what his ideas would be sometime in the future, don't you see? But you're actually unburdening this goal. And when you start running the PT goal, you just start running into more and more TA action, and more and more TA action, so you know better than to continue that list. When I'm saying "more and more TA action," I mean *TA action* – not .25 divisions every hour, or something like that. I'm talking about *TA action*, you know? You know, *TA action*. You know, it's *action*. You know? You know, action! Good action! Hot. And you start running and you find the further you run the hotter it gets. Now, you know you must be listing a goal-oppose against the PT goal, because there isn't anything there to list against, and all you can do is run out the PT goal.

You can also sometimes produce a blowdown. When you've picked up the pc's goal, you list against it, produce more tone arm action, you sometimes can produce a tremendous amount of blowdown by saying "Are there several of your own goals on this list?" *Psssssewwww!* See? You just picked up his goal out of thin air and started listing – it was the PT goal. Well, of course, you'll list backtrack goals off the thing. You won't find one of them. See, you'll just keep listing them. And you'll find out a lot of them will start reading little bits.

And the TA action is the thing to keep your eye on, though. You just – by listing against the PT goal, "What would oppose that goal?" – you just get more and more TA action, see? Becomes a fruitless task trying to find another goal.

Now you're real safe. The meter says that it's the PT goal, and the list and everything says the PT goal. Everybody knows it's the PT goal. All right. You want to list for the top oppterm. By this time, you no longer need this other service facsimile to windward, because you're producing so much TA action that you won't be able to record it anyway.

So the thing to do is to list for that top oppterm and get yourself a nice list for the top oppterm. Now, it isn't, probably, the top oppterm – the thing is truncated. So you really don't know and the pc doesn't know if he's started to oppose the goal yet or not. You can ask that on the meter and clarify it for the pc: "Have you started to oppose this goal yet? Or are you still on the side of trying to execute it?" One or the other will read, and you can tell the pc so he's got some kind of an idea of what to list for. But even that isn't totally reliable. But you could help a pc out to that degree.

You merely want the latest opposition terminal formed for this GPM or for this goal "to catch catfish" or "to drown myself" or whatever it is, see? And just have him list the thing.

All right, so he lists this and you get one. You null it down. You got to list it to clean needle – that's the main trick. And you list it down, you get a nice, clean needle and you null it. Don't have two rocket reading items on the list. All the listing directions apply here.

But I wouldn't worry too much about this or worry too much about whether it's the top oppterm, because – you know, I mean, don't beat the guy to death for fifteen sessions trying to find out if it's the top oppterm when it obviously is getting a hell of a lot of TA action – "Well, don't cognite yet. We don't know whether it's the top oppterm. Yes, shut up, now. Be very careful. We don't know whether it's – " so on and so on. When you actually hit the top oppterm the needle tends to go mad. I mean, if you hit the top oppterm and it went tick and you got no tone arm action, no cognition, I would think at that moment you probably didn't have the top oppterm.

This is the way to look at it. You know, the expected manifestation is that he's going to get a lot of action out of this thing.

All right, there you are, you've got the top oppterm now, and there it is. Let the pc cognite on it. One of the tricks of 3M2 is, after you've given the pc his item, you sit still. That's one of the tricks. You sit still and let him cognite for a while. When he kind of slows down on this whole thing, you put in your Prepcheck buttons – big mid ruds, just big mid ruds on this thing. Get as far as you can, or get as far as you can without annoying the pc. And call the item and you're going to see a gorgeous rocket read. And it's probably the first rocket read you will have seen in the whole operation.

See? That – real slippy. That's real fancy. That's cutting corners. That's driving with one hand at ninety miles an hour with your feet on the top of the windshield. You understand? That's going around every corner on two wheels. That's making sure of nothing.

Now, I did that whole operation I have just accounted to you – did the whole operation – in two hours and fifty minutes. I don't expect you to do it in two hours and fifty minutes, but I'm not talking a theoretical procedure which hasn't been done.

I didn't find the service fac as part of that two hours and fifty minutes. That took me closer to six hours. Something that would make the tone arm go *boom! boom! boom! boom!* see? So I could turn it on – unburdened the case enough so the case could run. But then, every part – other part of the operation I've told you, and (now listen carefully) the pc on no goals list had ever put the present time goal, including – including the operation I was conducting – had never put this goal on a goals list and didn't while I was straightening it out and checking it.

This was a goal that I had seen give half a rocket read four months ago. It went – . Just accidentally called it. It was in a channel of implant goals, and couldn't get the implant goal to run, and yet the thing went *pow!* see? I saw it do half a fire; couldn't get any – close to it. But ever afterwards, whenever you ticked it – called it – it ticked. Finally just said to the pc out of thin air, "Is that your own GPM?" Tick! And used it. It turned out to be the PT GPM. Interesting.

Now, that's what I mean by cutting around corners, because it's definitely against the law to give a pc a goal. Pc had never, at any time, had ever said that was the pc's goal. So that's definitely against the law and you shouldn't foist a goal off on the pc. And the only excuse I would have to do this is the pc did mention it at the time it went tick – you know, did half a rocket read. Pc speculated on it for just an instant, months ago, and it was seen to fire.

So there were several other goals in this category that had been presented up at one time or another, but none of those ticked as the pcs own goal.

You could call those off. "To disappear," see? "Now, is that your own actual goal?" – the deadest meter you ever saw, you see? To this, to that, you see? You know, "to be sexual," to be this, to be that, you know? Other kinds of goals that had from time to time been listed, you see? "Is that your own?" And all of them flunked; all of them flunked the test; none of them would read. And finally I remembered this other one goal that I had seen read and mentioned that and it went *ping!* And that was it. Never did see it rocket read beyond a half-slash four months ago.

So this is done fast and rapidly, just from knowing the pc or from examining the pc's record very carefully. Now, supposing you inherit a new pc? Well, he's mentioned goals and he's thought of goals and you look back through it again. And if you're real clever, you'll always draw a red-pencil box around any goal or an important datum of this kind so it's easily trackbackable to. See, that's very, very clever to do that on a pc's auditor reports, or print it big so that it's indicated well.

But in actual fact, I don't think the pc would have come up with this goal under interrogation. But there were several other goals, and on careful search I would have got one of those to read. Because when they were listed, laterly, they tried to do little quarter-inch RR slashes and they were the pc's actual GPMs.

In other words, here was a lot of points of interest. I'm just giving you the extreme case of an auditor, four months before, has seen a goal do a half-flash when the pc mentioned it – see, half a rocket read. And then the auditor just runs out of chances, just on an indifferent – you know, just shuffle out a few cards – the auditor says, "Well, I don't know. Let's see, what goals have I seen, what have I ever seen rocket read?" And pulls that goal out of the hat and calls it, says, "Is that your own GPM?" *Plang!* See? You get the idea? But this is just auditor observation of what has fired on the pc. Well, that's driving with one hand on the wheel and your feet on the top of the windshield on a curving road at ninety miles an hour. You recognize that? Because that's cutting it awful close.

All right, but what did one wind up with? One not only wound up with the pc's service facsimile, with this exact operation I've given you – not only wound up with the pc's actual service facsimile but in a position to run the pc all the way to OT. *Chugata-chugata-chugata-chugata*. See, twelve hours hence I will have that bank – the whole first GPM, every item found in it – all the way down and found back up to the top and cleaned up slick as a whistle, on the basis of an item every fifteen minutes, which is rather fast auditing but which can be done. That's one goal down.

But when you hit – when you hit that one RI, see, that first RI – when you really hit it right on the button – that makes all the sense there is to make. This accounts for all the present time restimulation. This accounts for everything. And if you're only looking for service facsimiles, that method I have just given you, I would very thoroughly recommend to you. Because it is safe to this degree: Supposing we had picked the wrong goal. Supposing on our goal-oppose lists we hadn't come anywhere near finding the next goal up. Supposing the many slips 'twixt cup and preclear had occurred. We could still turn around – put in the mid ruds for the session rather rapidly – turn around, get the pc some tone arm action before the end of the session. Pc would feel good, ready to go again, see? See, that's all to the good. See, you're working it both ends from the middle.

You finally wind up with it. And it tells you, then, that the reason we have not been able to find goals on pcs is because of the overburden of the top oppterm and the top terminal. Accumulating, as they do, all of the debris of present time, they therefore mask the top GPM or any other GPM we are looking for.

There sits the pc with the roof pulled in. And of course you can't get him to rocket read like that on his own actual goals. So his own actual goals have tended to stay a lost commodity. But we used to find them. Two or three years ago, we used to find them with a tick. Many a slip 'twixt cup and lip, man, but we still were able to find them with ticks. Now, if you find them and stack them in on an opposition – you know, "What goal would oppose (the goal you found)?" – and you're moving the guy on up to PT, moving him up to the PT GPM. You know now what it is. Now you list its top oppterm; you're going to find the pc's service facsimile. It's going to make all the difference in the world.

And all of that overburden is suddenly going to go *bluuhhh-floof!* And so, of course, at that moment you don't call the goal, even. Just ignore it. You just got the top oppterm. It's going to rocket read like mad. Well, anything that improved the rocket read to that degree,

you're certainly on the GPM line. You haven't got anything misworded. There aren't any mistakes here, man.

So you're going to oppose this thing; you're going to get the next one and you're going to oppose that; and you're going on to the next and going to oppose; next one, going to oppose; next one, going to oppose; and go on down to the bottom of the bank. And finally arrive at the bottom of it and you're going to clean that up. And you're going to list it right back on up to top again and you're going to see meter action, meter action, meter action, meter action, meter action.

Now he has a new problem. He has a new problem – brand-new problem now: He's against detectives, see – against detectives now. Can't read the newspapers without getting all restimulated – always coming into session restimulated. Terrible situation, you see? And we find that we've got a GPM something like that – "to be unlocated," or something, you see? We're running this and we handle it in the same way. Of course we've got it now. And by running it properly and running it on down you're going to be...

The only fault you have in actually running GPMs is not following a sensible routine. Overlisting, skipping banks, listing items backwards – these various traps and frailties and follies that you can run into; skip down over a whole GPM and start running the one below, leaving a whole GPM in place and then wonder why the pc is coming apart in the auditor's chair and not notice it.

But look, we have all of our lists – ARC Break Assessments. They're all data – assembly material now. You know what's going on. We got lots of things to prevent difficulties with, one way or the other. Used to do long, long, long, long, arduous, arduous, arduous, arduous – oh! terrible, aching, painful lists. A goal-oppose list of items to find a top oppterm, you see? Oh, my, my, my, my, on and on and on, a pc caving in. Everybody hated to do one of those things because it was too grim. Actually take the risk of asking the pc to do a "represent" on the top oppterm, see? "What might it be?" Do a list, you know? These things have simplified.

Doesn't say that you're not going to make mistakes doing it, see? Doesn't say that, because mistakes are there to be made. The picture I drew you yesterday is a picture of the bank and that's exactly what you're running. That way you not only find that datum which prevents observation in present time at any given instant, you also find the source of the datum, which is the goal, and all other data related to it and then all other lower goals on which it appends and all other actions of whatever kind. When you get to the other end of the line you got an OT. You're directly on your line.

That's how it is done. The only security measure that you take in it is to make sure that your goal responds as the pc's goal, and make sure before you start on a bunch of listings and fumbblings around, of one kind or another, make sure – very, very sure – that you got an anchor to windward: can you produce tone arm action on this pc?

All right. There's a very neat package of clearing. That is based on the exact essentials, the construction of the human mind and on the truths I've given you in this lecture.

Wish you luck with it.

Thank you.

Routine 4MTA

A lecture given on 19 September 1963

Well, you're very lucky to be at Saint Hill at this particular time. Very lucky. In times to come, why, probably this will be old hat – all be old hat.

What's the date?

Audience: Nineteen September.

Nineteen September AD 13, Saint Hill Special Briefing Course. Running the pc's actual GPM. A full and complete rundown thereof, including the new development of finding RIs by tone arm action.⁹

Once upon a time there was a pc and he was lucky because he was going to get out of it. But he'd been a very foolish thetan for a long time. He kept postulating goals. And he says, "The way to handle life is to get a very broad datum. A big broad datum and then I don't have to be there and handle life, see?" Which is your ultimate in no confront. "Don't want to handle life anymore, don't want to confront life anymore, so I'm going to postulate a goal 'to be a schnook.'" And he was. If he wasn't one before he postulated the goal, he was afterwards.

Now, I don't mean to be too hard on us because it would be equally self-accusative. But the mechanism which is in operation and which is the broad basic mechanism is just about the simplest thing you could possibly state. You'll have to probably do a lot of work on green Scientologists and so forth, trying to get them to understand what a confusion and a stable datum is. There were a lot of examples on this a dozen years – ten years, eight years, seven years, ten, five years ago. There's been a lot of examples of this kind of thing. But I found it was relatively difficult to teach. As a graphic analysis of the situation, I remember trying to teach it to HGC auditors at London HASI. And they had an awful time – they had an awful time trying to embrace the idea of a confusion and a stable datum.

Well, it goes like this. You, in actual fact, get less confusion by adopting one point of confusion as a stable datum. If you want to enter this thing of confusion and the stable datum – let us say we tear apart – and this is a graphic experiment which you can do – I mean you can show somebody this. You can tear apart a piece of paper and make a lot of scraps of paper, they're fairly light and float. And take this handful of bits of paper and throw it up in the air and when you've thrown it up in the air, it of course all exists one to the next as a confusion, don't you see? And then you say to the person you are demonstrating it to – pretend you're one of those pieces of paper, you see, and then that will appear to be motionless and everything else will appear to be in motion. Do you see how that would be? So, you can have

⁹ Editor's note: Per HCOB 2 Oct. 63, GPMs EXPERIMENTAL PROCESS WITHDRAWN, Technical Bulletin Volumes, Volume V, this process, R4MTA, was cancelled.]

a lot of motions going on and even the stable datum itself could be in motion, don't you see? But by adopting one of these scraps of paper that's floating through the air as the point of view of seeing the other scraps of paper, then of course you've reduced the situation by one scrap of paper which you at that moment of course pretend to be motionless. Do you see this? Do you see this? So it all starts with a lie. A stable datum in actual fact is in motion when it's fixed up like that. You see?

Now, you say you're motionless here on this planet. Now, I can count out to you by advanced physics – not as taught in universities but by real advanced physics – that there are at least a dozen motions to which you are subject while you are busy standing still. You are going through a dozen motions. This – this way, Earth is going in two different motions – just in the orbit and its own rotation – and it's undergoing a slight tilt all the time which precesses slightly. And then the solar system is in a tilt and then – it's tilting and at the same time it is moving. And you start adding this up – not trying to make you dizzy, but it's considerable rate of motion. You start in with the grossest motion, is the rotation of Earth, and actually you're traveling at the rate – just this very instant – you're traveling at the rate of one thousand miles an hour approximately. Just by reason of the rotation of Earth.

And yet you appear to be motionless. So, we don't then care about whether the stable datum is motionless or not motionless. You see? Or factual or not factual. See, we care nothing about that. But we do care that it is considered to be the one point which one presumes to be motionless. Now, that's a very crude example which I've given you and it's totally applicable to the field of physics.

Now, to go into what a thetan does and a little bit further than this, you get some more very complicated ramifications. This is all under the definition of space, actually. Space and then change which is time, and so forth. And space, of course, is a viewpoint of dimension. That is what space is and that is all it is.

Now, the point from which you're viewing naturally then establishes a perimeter of space. And if you want to give somebody a high old time, just conduct some of those ancient old Scientology experiments on the basis of "Space is a viewpoint of dimension." You can really turn on the winds of space and the whirr around him. Say, "Get the idea of planting two..." I did this to an architect not too long ago. He's used to working in a two-dimensional plane, you see. And it upset him no end. Get the idea – you know these flags that they put in golf holes – the cup, you know. "Well, get the idea of taking two of those flags and putting them out there in front of you," you see. That's one of the old experiments, you see. "Now take two more and put them in back of you." Of course, this just about tears the bank into ribbons, you see. Because you've put this individual who is used to viewing a sort of a flat perimeter, you see – he sort of doesn't confront it at all and you have given him a viewpoint of dimension. Of course, he immediately gets motion. He immediately gets motion.

Ceasing to view – getting very, very technical on you – ceasing to view develops the potential of motion. Why? Now, let's go over this again slowly. Space is the viewpoint of dimension. If you sit at one end of the room and look at the four corners at the other end of the room, you're going to develop yourself a sort of a pyramid of space from where you're looking at those four opposite corners of the room, see? Well, just doing that will develop motion.

Why? Because you don't do it. That is why. And in actual fact the entirety of the bank is a no-space proposition – as anybody who is busy listing with the mass coming in on him and the thundering thuds and so forth will convince himself of very rapidly. It's a no-space proposition because there is no viewpoint.

Follow this – this is very, actually, very comprehensible. You're making much more out of it than is really there. Now, let's have the pc sit in a room and look at the four corners of the wall at the far end of the room. Well, that's going to be a very dizzying thing. He's going to feel things move. Well, why does he feel things move? Why does he feel his bank shifting around? Because he will! If you don't believe it, make the experiment yourself this evening and you'll find out. You don't have to go to the extreme of taking two golf flags and mocking them up out in front of you and trying to hold them there and then two more golf flags and put them behind you. Put yourself in a cube of space – putting yourself in a cube of space is wow! *Zzzzzz!* Boy, the motion really starts going.

So, supposing – supposing we put in this room the person looking at the four corners of the far wall. That makes a sort of a pyramid of space between the far wall and himself, see. All right. Now let's take him away. Let's take the person away and let's have this piece of paper look at it. Well, you say, well the piece of paper won't see it – that's nonsense. That's right – that's nonsense and that's what the pc's been doing all these years. [laughs] Now anything then that develops in front of this piece of paper in its pyramid which comes from the far wall to the piece of paper is then uninspected motion in uncreated space, see. He said the space was there and then he is no longer making the space, so anything happens in the space, of course, is not confronted. Because he's got a stable datum confronting that space for him.

Now we take the piece of paper out and we put the pc back in. Because he's been gone, motion has been – potential has been developed in that area. And the second we put him back in again, it will start to move and right itself one way or the other back to space as a viewpoint of dimension, you see. He recreates the space, so therefore the potential motion in that space goes *bzzzzz*. Do you see? See how this is? Because, of course, when we put a piece of paper there to keep the space for him, it didn't and anything that happened in that area was uninspected and it was a mess. So, the second we put a stable datum in there to keep the space straight for him, naturally it apparently does so because it actually isn't creating any space. And this is a somewhat comfortable state of mind. He doesn't have to worry about this now. He's got a lot of subterfuges of one kind or another that he can lie to himself about, don't you see? At the same time he holds that piece of paper in there, confronting that space for him – and of course it doesn't confront – and therefore anything that happens in the immediate vicinity of that thing is uninspected, unaligned, unhandled. Everything that goes on, there's nothing looking at it, there's no space for it to happen in, there's no rationale of occurrence, but there is occurrence, don't you see, because there is some space there, because he made it originally. You see the mess that is coming up.

Now, we take our thumb and index finger in the form of one auditor with one E-Meter and we pluck out of that position that piece of paper. And we put the pc in it instead of the paper. He re-creates the space. All motion which was held in abeyance or stored in that area immediately starts occurring. We re-created the space of that situation and that time. See this?

Well, therefore, the idea of just throwing some papers up in the air and assuming the position of one of the papers and noticing if the rest of them then move in relationship to it and all that sort of thing, that's too simple – much, much too simple a description of confusion and the stable datum, see? Too simple. In actual fact, the space tends to collapse when we put that – assume that point of view, don't you see? Because in actual fact, with the stable datum we no longer have a point of view.

So the thetan, as he's gone along the line, has put in a false point of view called a "stable datum" which he hopes will keep the space and take care of that immediate area. And of course, it naturally by the rules of GPMs and problems and confusions, don't you see... He's here and this stable datum is supposed to confront that confusion, don't you see, and you get your RIs. Your terminal and your oppterm situation occur and this thing all gums up and the next thing you know, it's a solid black mass and it's that which you think the pc is finding very uncomfortable and that which the pc is finding very uncomfortable. That is what is happening. That is the situation. Now, you'll see this.

The pc starts going *vrrrrrr* and your E-Meter starts going up and gets sticky and goes up *rrrrrrk* and well, what are you doing, see? Well, you actually are – you got a piece of mass but you haven't found the position from which that space is being created, see, has been created in the past. And you haven't got him in toward the center of this thing, see, you haven't got the exact wording of it, you see, and that sort of thing.

So, you don't know what that stable datum is, but you're moving him in toward it and of course he's now viewing himself. So, the fact that he is viewing that zone and area of space, regenerates the potential mass of that old confusion and it doesn't discharge, of course, because he isn't viewing it from the right position. He's viewing it from over here, see, he's looking at it from over here. Of course, that isn't where it's being created from. There's a datum in there which is making all that for him. Don't you see? And he – he's over here, way over here on the right of the – you see, of the area, see, he's way over here and the datum is way over here, see, down toward the center of the thing. And so you get a stuck tone arm. Why? Well, of course there's nothing. The space isn't being re-created, so therefore there is no discharge of what it contains. It's just *ruummm*.

Now we move him back into the area and we say, "Hey, fella. Once upon a time, a long time ago, for reasons best known to you, you deserted an area in here which had an awful lot of confusion and you left a sentinel or something in there to create all the space for you and it didn't. When we get your attention back in there, it reactivates the sentinel. We've got to get you over here to the point which you occupied originally." The second we get him to the point he re-occupied originally we get *crreaaakk*, *brrrrrr*, *mmeeek*, *zzuurp*, *zip*, *zip*. Why? The space is being re-created and the energy potential stored in that space, of course, can now discharge.

So, we can conclude that so long as you do not have the stable datum for any extant mass of confusion, but have the pc somewhere in its vicinity, you're going to get a motionless tone arm. And when you move the pc over into the point of view from which it is being created, it is going to produce tone arm action. Elementary. If he isn't in the point of view from which it is created, see, no tone arm action, but you're going to get a stuck tone arm because

you're reactivating the area, see? You're reactivating it, but you haven't got the point from which it's being created. So it goes *crreaaakk* and stuck, see? Nothing is going to happen. And then you move him over and you get a little bit of happening – a little bit of happening. And when you get him over into the center of this area where he is really creat... was really creating that space originally and substitute the pc for the stable datum, see – make him go back and take a look at this thing you see – the second he reoccupies that point of view he gets promptly and immediately tone arm action. The whole thing blows up. Tone arm action will keep on going then, going then, going then until the confusion is discharged from that immediate area.

Well, now part of the discharge of the confusion of the area is finding out what the stable datum was erected to confront. And that's the other RI. So, there's another stable datum over there, but mostly a confusion, called the enemy. That's the oppterm. The opposition terminal, the enemy. And he conceives it to have a point of view. He conceives it to be a confusion. He has a lot of ideas about it and so it is all part of this space. But it, he thinks, is creating its own space and you'll have then two interlocked spaces. Because they are exactly and precisely interlocked, they float in time, because there is no motion involved in it. You have the stable datum of the oppterm, you have the stable datum of the pc. Those two points are staring at each other and have been staring at each other for a very long time. You move the pc into their vicinity, he reactivates some of this space, he becomes aware then that there (quote) "is something there." He is not looking at it from either the point of view of the enemy or his own point of view. Don't you see? And because he knows there is something there, you get your tone arm going up.

Now your next action – your next immediate action after this occurs – if you are moving the pc toward either his own point of view or the point of view of the enemy – his fancied point of view of where the enemy looked from, you see – we're moving him in right straight on top of where he had that idea originally – his recognition of the idea tends to give him a resumption – he tends to resume the point of view where he left the datum to make the space for him. Don't you see? Now, he tends to resume that point of view and the moment that he does, of course, you get energy discharge because you have created space. See, he is there, therefore he creates – re-creates the original space that was created there and you get *zoom, zoom, zoom, zoom*, tone arm action. If you don't put him in that exact point of view, you don't get tone arm action. You just get a high tone arm.

Now, there can be lock points of view which is quite interesting. Other little balls of massed energy cling to this big stable datum. Other subsidiary points of view. If you get him into one of those, you get a little blowdown and it will go back up again. In other words you can recognize – now listen to this carefully – you can recognize on the E-Meter whether or not you have brought the pc to resume the point of view of the center of that mass either of his own space or what he considered the enemy's space. And the second that you bring him actually to that center point of view to re-create that space in that time span, that meter just goes apart. Because there's nothing else can hold the space together, you see. That space now starts discharging, *zoom, zoom, zoom, zoom, zoom, zoom, zoom*. Loose. Everything's going to pieces. You can't get anything done, you know. You got too much tone arm action.

That's when you got him dead center on an RI – whether his own RI or the enemy RI. Everything goes to hell. That stuff won't stay together anymore, because he's re-creating the space on which that and all the locks occur. But if you have him merely on a lock, it simply disturbs it a little bit by resuming to some slight degree – you see, he's in close to resuming the point of view – and you get a little blowdown and then the arm will go up again, it will all rocket read don't you see, but you haven't got tone arm action as a result of finding it. You got that?

Now that in actual fact is a theoretical dissertation on the subject of what really should be redesignated now as Routine 4, because it's just Class IV, Routine 4M. But we could say Routine 4MTA. Now, it's practically the same 3M you did before. But it has this big difference. I have just been working this over. I've gotten my hands real dirty with this and I've looked it over and I said, is there any faster way that an auditor can absolutely guarantee that he will really get the RIs? Yes, there is. And that is by tone arm action, tone arm action. Now, you all know the phenomenon of finding an item and getting a blowdown. You give the item to the pc and the – your pc then says, "That's right," and you get a blowdown. If you did that, you found a lock. That's just a lock.

You should be – have two blowdowns. You should have a blowdown when he gives you the item on the list and then you should get fall on the next items, the next few items, fall, fall, blowdown, blowdown, fall. You see? And you list a little bit further and you got your tone arm action that's calmed down just a little bit. You go back and you check. It will be one of those items and usually the first one. The first one of that little series of blowdowns that you got.

Now you give the pc the item and you get a new blowdown. Only this time nothing can hold the meter together. It just goes *aaablalablabowbowbow*. You understand? You've pulled the plug out of the bathtub. You haven't just splashed some water on the floor. You understand?

Now, let me put this in more practical terms from your point of view. What you're looking for a service fac for and what's a service fac supposed to do? It's supposed to produce tone arm action. Why does it produce tone arm action? You pull it out of the way and the discharge will then go. Simplest way of putting it. You start getting this discharge of energy. That's because it's no longer there to block it. You're dealing with the same thing here, see? Now, if you get anything that's close in to a real service fac, anything that substitutes for it, you thereafter get lots of tone arm action. Don't you see?

Well, don't you think you ought to get even more tone arm action for a real RI? More tone arm action for a real RI? There are two things you can do. You can find a lock which gives you a *beautiful* rocket read. Nothing rocket reads as lovely as a lock. If you really want to see a classic rocket read, find a lock, that is not accompanied by a blowdown. And it'll just rocket read and rocket read and rocket read. Beautiful. Dial-wide. Gorgeous thing. Takes off with a beautiful spurt and has a curly tail on the end and so forth. Marvelous.

If you want to demonstrate to somebody what a perfect rocket read is, I plead with you, don't find a service fac or a real RR or... I don't mean to infer that all service facs should rocket read – what you're calling a service fac or can use with one isn't an RI. Find a lock,

find a lock on a pc's GPM. Start the list and see an RR and then don't go on listing. See one RR that is not then followed by any blowdown. Oh, it might be a little 2. – you know, .25 division drop. Little, little drop, doesn't amount to anything. And just don't complete the list. Of course, the pc probably will ARC break but that's all right, you can tell him to shut up while you demonstrate it to the class. Don't you see. Every time you say this – you see, the real item is "a sultan," see, that's the real item and it was going to come up in about six or seven more items listed, see? And you found "eunuch," see, on the list and you saw it RR, see, and you just stop the list right there. "That's it. Thank you! Shut up." You know. "That's it. All right. That's fine."

"Now, class, we're going to show you a real rocket read," see. You say "*eunuch*" *psewwwwwww!* "*eunuch*" *psewwwwwww!* "*eunuch*" *psewwwwwww!* Gorgeous. Marvelous. Nothing more lovely. It'll keep up days later. You put in the mid ruds on it and it'll fire, if you never complete the list. See, it's – just go on. Why? It's getting its power from the actual heart – the actual point of view – it's getting its power. And that power is leaking sideways and of course it will never wear out. It will just go on rocket reading endlessly, rocket reading, rocket reading, rocket reading.

All right. Well, let's take pity on the student a few days later and let's take pity on this person for demonstration purposes and let's finish the list. This is the way it will behave, see. "A eunuch..... scimitar," "harem," "camels," "grand wazirs," "sultan" – right away *psewwwwwww*. That moment that he says it, see. And then he will say "palace," "date palms," "desert," "Arabia" – tone arm action here, see. Every time he says one of these things he gets another fall or a blowdown. Gorgeous falls, gorgeous blowdowns, see. Well, you go on and he also says, "dates" – that didn't do much; he says "dates," "oil wells," uhmm – "NATO allies," you see, and nowhere – nothing – it's going on up now, see. It'll go up. If you keep going, you can get it pretty high – you can get it pretty high, you see.

You'll notice the pc is starting to look kind of black and creaky and torn up and so forth. Don't pay any attention to that, just go on, list it, you know – you get up – I think you can probably get it up to 6 if you tried. Why? Hell, you found it, man. You found it. What told you you found it? Because you got consecutive, now get that carefully, consecutive blowdowns. That patch of stuff can't hold together.

You actually don't find, now don't get this one wrong – you're not listing in actual fact to find an RR. You're listing to find a series – two, three, four, five – of blowdown items. You want a series of these things – you want a series. You're listing for a series. As soon as you find that series, you've done it. The only thing you have to do is list until you don't have the TA action quite so much. It's coming up. But you really actually don't have to go that far. All you need is that series, see. That series.

And therefore, although it's very nice to have your tone arm actions over on the side – you'll very shortly, by the way, have meter computers, that give you total TA action. We just had a conference with Fowler and Allen and they're building one and they equip onto old type meters, too. The new meters will be equipped with them. Don't know how fast it'll take them to get these things out, but they're up over the horizon here someplace. But that will give you your total action for the session. And if you're so busy sitting there writing figures that you

haven't got time to write BD or B, you know, for blowdown and F for fall, see – if you haven't got time to write your tone arm commotion – you're so busy, you see, trying to say, well, it went from 4.25 to 4.1, you see, and then it went from 4.5 to 3.5 and so forth – if you're so busy tracking figures while trying to write items, too, you'll soon find yourself lost in the dust and sand, you see.

So, the real BD that you want, the real blowdown that you want to record is how far the thing blew down totally as a result of having found it as an item. You could mark that in after you've given it to the pc, you see. Therefore it takes some mention of where your tone arm got to and so forth. But that isn't what I would read by. That isn't what I would read by. I would say... in the first place a blowdown isn't .25 divisions. Nothing ever blew down that little. You understand? That's not a blowdown. Not with this – I'm still trying to call it R3M – this 4MTA. That's not a blowdown. We want a blowdown! The biggest one that you're going to get is about two divisions. That would be considered awful darn good and rather rare, I would say. You know, maybe you got every eight, ten items – RIs that you found – you had one that on giving it to the pc you promptly and instantly got two divisions of blowdown you see. That's rather extreme.

.5 divisions I would consider minimum – minimum expectancy to be called a blowdown. So that leaves us up to about .75 or 1 division and so forth as what you would call commonly a nice blowdown, see. Phenomenal – 2 divisions. Minimal – about a half a division. Less than a half a division you can't read it without a microscope anyway. You understand? Go ahead and keep all the tone arm record that you want that is compatible with recording so that you can find out what happened. So when you put blowdown on something, well you know, this thing went down, see. This hit the silk, you know. Oh, I can see some auditor sitting there quietly, quietly, quietly auditing along and the needle moves and he gets .1 divisions of motion of the TA and mark that a blowdown. Now, that could leave you with a totally erroneous impression of the whole thing, you see. So if you're going to mark something with a blowdown, let's make sure it blew down, you see? Let's not fool around with it.

Now, the whole point is simply this. This is all you really have to get. That if you pick the RI – whether a terminal or an opposition terminal – out of that bank, if you pick it out, there ain't nothing holding the bank together. You understand. At that point there's nothing holding it together. You're going to get tone arm action. And if you pick out a (quote) RI (quote) (unquote) and it all stays together beautifully well and there is no tone arm action and you go on thinking you've got the pc's RI, then you're going to get into one of the wildest cat races you ever saw in your life, see. Because you're going to have locks opposing locks and locks opposing more locks and locks opposing more locks and you're going to go astray, you're going to be listing into the next GPM and over the hill into the next bank and – oh, you're going to have 5,682 items per GPM and oh, it's just going to be so involved that you, and so on. Furthermore, the items won't make much sense on the line plot. Locks, locks, locks. See.

But you list by tone arm action, you get an entirely different view. Now, you want a consecutive series of blowdowns. Now, we will settle for steep falls on the next two or three items, that also cause a tone arm action. Once you reach in to that bank and pull the plug,

well, naturally the next three or four items the pc gives are going to be in violent motion. Because the only thing that was holding them still was the big one.

Now look, you're trying to find service facsimiles to get tone arm action, right? All right. Find RIs for the same reason, while you're doing the pc's GPM and you can't miss. That's all the tone arm action there is to see or have. The most that you will get. What is the service facsimile of the pc. It is simply the top – either one of the top RIs of the current GPM, see, there it is. So, why do you think stuff out of the main bank would operate any differently? It operates just exactly the same. Every time you reach in there and pick up a great big handful of RI and yank it out, wow! Everything caves in, which means your tone arm is going to move and it's going to move right now and it's going to move fast. And he gives you another item – of course, he's sitting there in the middle, now he's reoccupying the space that he occupied before. See, he had it occupied with a stable datum. But now, he's reoccupying that space. So, he gives you the next one and that goes *booorrrrr* and he gives you the next one and that goes *pow!* See. The next one *boom!* The next one *bang!*

Well, how's it going to operate if you don't find the RI? Beautiful rocket read and the next one's going to go *click* and the next one's going to go *tsk* and then it's going to go blank for a few. Why? It's all in place. You haven't disturbed the bank any. He can live through lots of these being found. See the difference? You haven't in essence found anything that tore the bank up, so of course, if you didn't find anything that tore the bank up, you are not going to get tone arm motion. That's all there is to that.

So then, when you're going down the line listing *pocketa-pocketa-pocketa-pocketa-pocketa*, mark in those RRs, ooh, that's fine. There's nothing wrong with marking in RRs. You sure better had. You see something RR, mark it in. See? But auditors sometimes miss RRs. But it's very hard to miss a tone arm action. So, you notice this thing isn't centered. So, you better put down BD, see. "Sultan" – BD. Now, you'll get a lot of blowdown, a lot of items blow down a half a division so you just mark that. It's whether or not they produced a consecutive blowdown of items that is important. See, that's the important thing. So, if you've got "a sultan," you see, "a palace," "a kingdom," you know. And it was "a sultan" – BD. And "a palace" – fall, BD, "a kingdom" – BD, fall. See? Hey, we're riding up on this thing, you see. And "oil-well revenues," you see, fall. Now, it's going to be real quiet.

Well, I don't know, I don't know quite how you shut the pc's itsa off and sometimes they feel better for going on listing for a while. They get very engrossed and that sort of thing, because now you see they're occupying the point of view, you see. "Hey what am I doing here?" You know. "I haven't been here for a long time. And I'm very interested." You know. And here it is and so forth. "Gee, look at all this space." You know. And they'll go on. "Gold-plated Rolls-Royces," you see. "Turbans." "Diamonds," you know. "Robin's egg rubies," or something you know. They'll go on and go on. "*Good! Good!* Thank you. Robin's egg rubies, thank you, thank you. That – yeah, yeah, that's it. I think we got it." See. ARC break? No. [laughs, laughter]

But the point is – the point is, the pc gets so darned involved that they'll list their TA way back up again and you can go on, and on, and on, and on. And you start listing them around the corner and they'll go into other banks. You didn't go around the corner on the first

consecutive series of blowdowns. You hadn't gone around the corner. You hadn't gone anyplace, see. You're right there. But you keep going on to the next consecutive series of blowdowns, well, you probably missed an item. And you go down the next consecutive series of blowdowns and your TA starts looking awful high now. And then you'll start ducking around the corner and going into another bank and all kinds of wild little ramifications. This thing is now getting high, it's getting sticky. The pc's got bad sen. The pc's got bad somatics turned on by this time. And you say, well, just to be on the safe side, let's list all the tone arm action out of it. Well, that datum was perfectly fine for source lists, but it sure doesn't apply on any other kind of list. As a matter of fact, even source lists don't have to have the tone arm action out.

Now, this is all in the effort of shortening up auditing. The whole effort is how fast can you run a GPM. See? I ran one in three hours and a half last night. Whole thing. And I was riding right up on top of the thing and it turned out that the only mistake I made – the only mistake I made going down the line was I ignored a consecutive series of blowdowns, not having the technology, of course. And I finally sat back and said, you knucklehead, and backed it up again and got it in there and squared it around and it was all right. I said, well of course, of course, you're pulling the plug out on this stuff and naturally you're going to get tone arm action. I hastily thumbed through everything I had and I found out you always had this condition – you'll find you'll always had that condition.

If you're working on the right goal, if you're working on the right RI and the right list and opposing it right way to and it's all going along fine and you haven't skipped any items, then you're going to have a consecutive series of blowdowns that's going to last for two, three, four items. See. It's going to be commotion. When you see that commotion, it's one of those items, probably the first one. Undoubtedly the first one, because that's the one where you took the plug out. But you might not have noticed that one as it went by, so you take the one just before that.

Now, as far as neatness of RRs are concerned, the real RI does not have a neat RR. It's a disintegrating RR and is blowing up in your face. The thing is disintegrating all over the place. Actually, you really can't tell if it's an RR. It looks like steep surge or fast fall or what is it and it's so wide and so long that you just see the start acceleration – if you're lucky. You don't quite know when it's going to take off. You don't get a chance to see the end of it usually, it's too long. And the tone arm motion is falling too rapidly. Don't you see? You never see a good looking RR when you find an RI. They just – that's on an actual GPM – they just don't look good. They're too big, they're too long. They're falling to pieces as you look at them. Charge is blowing up in all directions.

So, you come back and you call the thing. You're going to get a nice – nice looking read of some kind or another. It's going to read. Now, here's the next little precaution. All of your listing stuff applies, but there is a precaution, that if you start nulling and you get two items to tick, any two items on the list to tick, well, you've missed. You shouldn't have two items ticking on a list, not for this technique. Not for 4MTA. No, no, no, no – you don't – you don't want two items ticking on a list.

You read "eunuch" and it ticks. And you read "date palms" and it ticks. I wouldn't pay any more attention to the list. Why? Well you've obviously left the plug in. The tub must still

be full of water. They didn't release. If "eunuchs" and "date palms" didn't get out of there and if they're still reading, you obviously haven't found the RI. See, it's elementary, my dear Watson.

You see the rationale? The area still must be charged up if something else beside is ticking. You actually don't need much of a test. Read a couple of items that you've seen RR, you see both of them tick, man, you haven't got any more RI on that list than the man in the moon.

Now, if you run into trouble on this, you've done something knuckleheaded. And there are very few knuckleheaded things that you can do. Most knuckleheaded of them is – is keep on listing with a high TA which is going higher. Pc has got heavy mass and is pulling in and it's all very uncomfortable – well, you just missed an item. That's all you did. You just went right on by.

Now, it's very easy to list an opposition to something. See, some series of blowdowns is the only frailty of it and find yourself in the wrong GPM. So this step is absolutely necessary. You can miss an item and find yourself wrong to. Thing doesn't list well, energy pulls in on somebody, see. You've skipped a pair. You've gone around a corner, you see and you've skipped a pair. Doesn't behave well. Isn't operating according to the textbook, see. Well, you better get busy. Did we skip an item? *Yorp*, we skipped an item. Well, let's go back and find that item, see. Not leave it there. Because this blowdown phenomena will not continue to occur if you've skipped items. See, the bank is still very well cohesed. There's some point of view the pc has not taken. So, as a result he can't assume the next point of view. He's sort of stopped right there. So, if it isn't working, what I'm just telling you, and this isn't occurring, then you've done something goofy.

Now, the other way you can do something goofy is to oppose something backwards. Ordinarily you ask the pc if the terminal had pain on it. You say, "Did that have pain on it?" and the pc said, "Yeah," and he'll point out the point where it had some pain on it. Well, that was a terminal. Heat, cold and pain is actually all terminal stuff. Winds of space, sensation, that sort of thing, that's your oppterm test. You don't need to strain at this too much. You normally can run it beautifully just on the – just on the terminal side without upsetting the pc at all, by just finding out if he had pain on it. Because if it was a terminal and you're operating on a center RI, of course he had pain on it. Don't you see? See, you keep your check there and you practically never list one backwards. It's quite obvious where you are in the bank ordinarily. The line plot is making sense and everything is going along gorgeously. You know where this is.

One of the main things that will get in your road as you're doing this is just: if it doesn't go right, you've done something wrong. I mean that is all there is to it. And the sooner you recognize it isn't going right, then the sooner you can ask those burning little questions like, "Have we listed one wrong way to?" And "Have we skipped an item?" "Are we operating an item that isn't part of this GPM?" That type of question, you see? Now, there's one question – and you can be suckered in on this because a pc is very often very obliging.

You must run this little formula on an actual GPM. It is totally missing, you see, on old 3N, now 4N – on old 3N, now 4N, it's totally missing whereby you check up and check up

your goal and all that sort of stuff. But that is *vital* in running an actual GPM, that you do all those little courtesy steps. They – all the little *bing-bang* steps, you see. "Would a sultan oppose the American government," or whatever the oppterm was, you see, that you're listing on. Check and make sure the oppterm doesn't tick. If the oppterm still ticks, man, you just haven't got the RI, that's all. Don't argue with it. You just haven't got it. And naturally, why haven't you got it? Well, the list is incomplete and you haven't had the proper series of blowdowns and all that sort of thing. Or the pc is busily listed around the corner. Well, if the pc is listed around the corner, he'll list back around the corner again if you let him just continue the list a little bit. Actually a pc sometimes will list himself down to seven banks below where he is. Not bank by bank, but he'll give you a couple of items from the seventh bank where he is and then give you items back in the bank where he's operating.

Well, unfortunately you once in a while can get a series of blowdowns from the seventh bank. *Aaaaaahhh, hahaha*. And the best way to check that is you say to the pc, see, "Would a sultan – how would a sultan relate or – would a sultan relate to the goal 'to be rich'?" And he'd say, "Oh, brother. Ha – ha. Yeah, yeah, yeah." All right. The pc says, "Well, let's see *da-da-da-da, da-da-da-da* ... Well, I guess it could, yes, yeah, it could," and so on. Don't be a fool, man, you've got a item out of a wrong GPM. Pc can't tell you, "That relates." Bang! Just like that. See. If he just says that, "Oh, well, hell yes, what are you asking me for, you idiot," you know, "Sultan. Gonna be rich. You're silly. I mean – ha-ha. Of course. Naturally."

Sometimes you think it's very obvious and you shouldn't ask the pc these little courteous questions that fit in at this particular point which are all given in the rundowns. See, you could omit these. Nonsense, man! That is the biggest test there is to make sure you haven't gotten in the wrong pew. You get – you get an item like "titillation." All right. Good. Now, you say to the pc just *rat-a-ta-tat-tat-tat*, how would that oppose and so on. "Well, it would oppose it all right." And you say, "All right. Now, how does that 'titillation' relate to the goal 'to be rich'?" you see. "Well, let's see, if you *mph-ha-mp* so on and so on, well it – it does." Brother, watch it. You haven't got anything out of that GPM. You may be fifteen banks to the left. See. Maybe completely wrong. It's got to fit, right now. Bang! See?

Now listen. If this 4MTA doesn't run by the book, it's old 3M, it's all done with the same steps, but if it doesn't run by the book, you've done something goofy. Something is wrong, see. The technique isn't wrong. The pc isn't different. Nothing else screwy has happened. This GPM is not constructed in some different fashion, you understand. See, you've done something screwy. And the only screwy things you can do you can actually plot out of the picture of a pc in a GPM, see. You thought you were in *this* GPM and you're actually in *that* GPM. You thought you were listing an oppterm and actually you got a terminal. And you thought this was the next item, actually you skipped an item. Don't you see? And you've done something goofy here, see. You could plot them all up. They're just elementary things. You just landed in the wrong viewpoint of dimension.

Naturally, in the midst of harems and sultans and that sort of thing this item "titillation" obviously, it comes up, it occurs to him. He actually pulled it out of some other bank. It's been lying in there for some time, see. It's not a neat plot. It's in from somewhere else. And if it doesn't go right and it doesn't go by the book, you've done something wrong. And if

any RI you find doesn't blow the bank up, as far as you're concerned at that moment, you haven't got an RI. You got a lock. And you start opposing locks with locks and I wish you "lock" because you'll need it. [laughter] Anyhow ... [laughs]

Now, actually you'll prob... there's far fewer RIs in a GPM than has been thought. There's a possibility that this is the case. You start finding nothing but RIs, see, with an exclamation point! You know, every time you get one it blew down and then was followed with a steep falling item and a blowing down item and a steep falling item and a blowing down item and you – you got it, see. You go back and you call one of these off, you'll find there's just one fire on the list, see. That thing is probably firing sloppy, too. Only one of these. See. There won't be one or two of them firing. One of these fires sloppy. Usually the first one that started the commotion and that will give you a beautiful fall or a surge or a blowdown of the TA or a rocket read or a commotion. See? After you get it all tamed down and prepcheck it, see, if you got it all prep... tamed down, you put in your big mid ruds on it. You got it all straight. You got it all calm. You got it all straightened out. Most of the confusion has blown off this immediate area, don't you see. And man, the pc has cognited all over the place. It's nice and calm now and so forth.

Now, you say it. See. "A sultan." *Psewwww!* You'll get that rocket read because that's the charge – that's as much charge as is left on it now. And that will continue to be left until you've opposed it or it's been opposed for the next RI. That's the only charge that's left on it, see. There's no more residual charge mixed up in it.

Another thing is, you don't want to give a pc an RI that turns on a lot of mass. You hand him this RI and it's some opposition terminal and some kind or other; "federal drug addicts," you see. Opposition "to be happy." You see. Goal to be happy. See. Federal Drug Addicts. And he sits there, you know – you get a little blowdown, you know. You say, "What's the matter?" "Oh, nothing's the matter and so on. There's all these pictures and these ridges and so forth and there's this black mass lying alongside of my head." You haven't got the item – you haven't got the item. Too much mass on it. Now, all items have a tiny little bit of mass on them or they wouldn't be items at all. But when you move him into the center of this thing see, why, he shouldn't have the mass sticking to him. It should be going *bzz-zzz-zzz-zzz-zzz!* see. And if you've got mass plastered all over his face or his head or something like that, you obviously have him about half in. See. You got him over here some place. He hasn't moved into that old viewpoint of dimension and knocked out that stable datum. You see. He's only halfway in. So, of course he's half ridge and half not ridge and he's messed up to that degree.

If you just consider this what it is, that the cohesion of the bank is a problem of the confusion and the stable datum – and you don't get off a lot of the confusion, you haven't got the stable datum – if you use it the same way as service fac, it all makes beautiful sense to you.

Now, of course the whole GPM is held in position by the goal. But the RIs are major exclamation-sized locks on the goal itself. But they are RIs in their own right. And each one of them gives this phenomena. And unless you find them, you won't get a blowout when you get to the bottom of the bank and find the goal.

You've got to list for these and you've got to crisscross and you got to bring them down. Every one of them is going to behave just exactly what I've been telling you about an RI. One of the mistakes that you can make – now listen to me loud and clear please – I don't care whether you test the goal going down the bank or not, if the RR's lessening, you haven't got the pc's goal. TA is going to hell. I mean you've got something wrong with the goal. You know. This is some elementary type business that an auditor is accustomed of running into.

But you're going on down the bank and you call the goal off occasionally, it ceases to read very rapidly when you really find an RR... Is. When you're really finding real RIs this goal ceases to read at an awful rate of speed. When you get down to the bottom, that goal exists as an RI totally independent of its influence on the remainder of the bank. And this is one of the goofiest and one of the strangest phenomena which you ever wanted to see. It won't fire as a goal, but it will fire as an RI. That is utterly nutty. Just exactly how that degree of differentiation can take place, I am completely flabbergasted. But it does. I just got through watching one. Call a goal you know. Call it and call it and call it and talk it and prepcheck it and worry about it and make sure that we're on the right goal and everything you know, and there's nothing firing because it's all blown apart, see. And is calling the goal and calling the goal and calling the goal. Not even a flick, just a perfectly smooth needle. Next item the pc put on the list was the goal as an RI, *pow!*, see. Spooky, you know. Thing just fires its head off. It's an RI now. It ain't a goal anymore, it's an RI.

Now, you turn around and take that firing goal and you use that fire as a goal oppose to the next list, don't come telling me how your pc is feeling kind of creaky on 4MTA, you see. Don't tell me, because you haven't heard what I'm about to say, so hear it. It not only fits down against the next bank, that goal as an RI, see. That not only fits down against the next bank, you see. But it also has an item over here that it opposes. And the way to go about it is to find the item or find the goal, but always find both. That's the most marvelous way of missing an item and lousing up a bank anybody ever did – is not realizing that the goal – "to catch catfish" let us say, is a goal for the whole GPM, influencing every RI and then in its own smug, little armchair self is sitting there as also an RI. And has an item which is holding in place as an RI. See, I don't care if you come down the bank on your usual zig-zag of listing and you finally wind up with this – with this goal, where you say, well, all right, that's the whole GPM. No, no. That's the goal as the RI. You got down to the bottom and it's still firing. Now, if you do a goal oppose list with it, you're in trouble. That – if you do a goal oppose list and go off and leave its opposition RI unfound, you'll be in trouble, because you've missed an item.

Now, very often between two GPMs there will be a floater pair. They're quite cute. We've got the whole GPM below. Its top oppterm, however, is below. This is quite interesting – unlike Helatrobis Implants and that sort of thing. We know a lot of things that the boys who originated those other – the – I mean the – pardon the boy – the punks, excuse me, I didn't mean to be... – originated those things, didn't know about. And that is, not always, but sometimes between two GPMs, there will be a pair of items which aren't related really to either one, which give you the reason the pc postulated the goal. See, he had a reason to postulate it.

Now, you've run one whole GPM – one whole GPM you see, comes up here to the two top oppterm. Its own – pardon me, its terminal and its oppterm – see, that's a whole bank.

Then there's a pair of items and then there's the goal as the RI and the item, you see, above that which opposes this and we're into the other bank, see. So the goal as the RI quite commonly will come down and hit one of those interim items. See, one of those in-between pair. And the goal as an RI being on the bottom of the bank when you get who or what it would oppose, it hits this interim pair. It doesn't hit the top oppterm of the bank below. It hits this interim pair. See, it hits the opposition of it and then you list against that one that you've just found and you find the other terminal which is across from that. And then when you list this other terminal, you get the top oppterm of the next GPM. See, if you don't know that... it's not always there. That's what's bedeviling about it, See? Some of you were neat and some of you just sloppy, you see.

It really just depends on whether or not the top pair of a GPM were adequate enough excuse to postulate the next goal. And if they weren't, why, you'll get then a couple of items of a goalless pc. See? And it'll be – you'll get some ran... a random pair of items. It'll be – the oppterm is "boredom" and the terminal is "to postulate a goal" or "to have a game" or – that won't be "to have a game," it'll be "having a game" or something like that. Or "having no game." And man there isn't even a GPM within miles of the place, has anything to do with a game and has nothing to do with boredom or anything else. There they sit. They really belong there.

So your goal as an RI, if avoided and simply used as an opposition, its RR will disappear. Because of course, it's being listed against "What goal would it oppose" to get the lower goal, don't you see? And that'll disappear. And you'll sit there and you'll have a sleeper. There's no trace or lead-in now to that pair of interim items that sit between those two banks. And actually, goal as an RI is just as alive as Punch, man, it's just sitting there with total dynamite. You prepcheck it for a little while. If you prepchecked it as an item, not as the bank, you see, why, it would start firing again, probably even if you listed it for two hundred items. You know, listed it down into the next bank for a goal. "What goal would it oppose?" "What goal would 'to catch catfish' oppose?" see. It'd still be sitting there.

So you can set up a situation where your pc feels terrible, where you've got the goal as an RI alive, but the fire, you see, has been vanished by doing your next goal oppose list. But it's still alive. It's still there. And you've got the two interim items which gave the reason why he postulated the goal. They'll be floating there completely unobserved. And you've got three hot items between the present time and the bank you're working. You'll have three items above you, all the time, all the time, all the time and boy, will you get in trouble. Pc is ARC breaky and he *unemememaunn* and you obviously have the top oppterm because, God, you couldn't get any higher on this next GPM you're doing, you see, than practically the goal itself as an opposition, you know. You couldn't get any higher. And you'd leave three RIs. So that's a common mistake that you can make.

Now, let's just sail into this as a fast résumé of how you go about it. Let's assume that you got a raw meat pc. Raw, completely raw. How are you going to find his PT goal? That's easy. Find his service facsimile with R3SC. After you've found four, five or six (quote) (unquote) "service facsimiles," you'll finally wind up with one that is hot enough to find a goal with. You just list goals against it. And you can say, you know, "What goal would it be part of – what goal of yours would this be part of?" Any – I don't – that doesn't give you an exact

wording. But I'm telling you what you're trying to find out, see. So use this fac... service facsimile to find out what the guy's goal is. Now, the funny part of it is, is you can find four, five, six of these service facsimiles before you actually reach one which if listed – if you listed goals against it, will give you that present time goal. It's quite interesting. Terrifically overburdened, you see. Bank in terrific overrestimulation from PT and all that sort of thing.

You can count on mistakes, so you found, oh, all sorts of divergent things, you see, you found marriage and you found sex and you found wisdom and you found investigating things and you found eating and... You want to look for the – not necessarily the one that gave you the most TA, unfortunately. You want to look for something that looks like it might lead into a goal. It'll be something the pc had *lots* of problems about. And the best indicator is, if you find a service facsimile for which the pc gives you, in answer, an automaticity of problems – you're heading right in there, man, you're riding right in. So, you take it or its first cousin, something right there and you'll be able to find the pc's goal with it.

You know what I underst... what I mean when I say an automaticity of problems. You're fooling around with this pc just using R3SC you see, and you're fooling about trying to find TA action and browsing around and you're combing out present time, some kind or another, and pc all of a sudden hits – hits the village square. Now, the pc doesn't tell you about the village square but tells you an automaticity of problems about the village square. Just goes *brrrppp, brrrppp, brrrppp, brrrppp, brrrppp, brrrppp, brrrppp, brrrppp, brrrppp, brruu...* "Yeah, I hate to tell you, but you can't get down, there's too many people in there, you can't get your car in there and so forth, and all the people around there. I'll tell you you can't get near the stores. I'll tell you there's an awful lot of difficulty in this particular area, because you see you can't get near the stores. And the police are always on the corner and so forth. And you try to get through there and it's got no traffic light. Nobody will do anything about it and there's – so forth and the pavement's all rough, as you walk over it with spike heel you sprain your ankle every damn time, you know. I mean – and – and so forth." I'm not – I'm not now just – just clowning, you see. I'm giving you this dope. I mean the pc goes problem, problem. *Da-daahhh!*

You're sitting right on top of his PT goal, man. You're sitting right on top of an RI. You must have come in close to this RI, you see. Or he wouldn't have been making that much space. When he makes this space, he gets his head knocked off with the problems. You haven't got the RI, but you've got its cousin, man. Now, you start running any kind of R3SC process, you see, on what you've just found – the village square is what this thing... You opened your mouth and said the village square and you got *poppeta-poppeta-poppeta-poppeta-pop*, mortar fire on the line. Well, that's all there is to that. That's easy. You know that the goal is somehow or another associated with the village square.

It'll be totally unlikely, but if you asked for goals listed against the village square, see – so what kind of – you know, what kind of – what goal would have something to do with you and the village square – I don't care how corny your listing is – you'll probably find out its – they'll tell you eventually, you see, "To never go to church." And you get a nice tick on it and that thing can't be driven out. Don't you see? You got a nice ticking goal. You examine it. Is this the actual GPM? Is this properly worded? Is it differently worded? You know, and is this

present time? And so forth. Or is this an earlier one? Go through a bit of an analysis of this particular character and it'll show up and the pc had never seen the fact that the village square has a church at the end of it, see. And the top RI, you see, isn't the village square at all. It'll have something to do with – entirely different. But you just moved in on a lock that close in, you see. It'll probably have something to do with tombstones which you can also see, you see. Or hymns or something – Just, village square – hymns, you see. They don't compare. So don't try to get too logical about this thing. But you give it to the pc, you've triggered in close enough that he'll fire off his goal at you. All right. That's a raw meat pc.

Scientologist – somebody who's had a lot of auditing over a long period of time, I've already given you the formula for this in the last lecture. There is hardly anything to improve on. "What goal you found is terribly interesting, is that your actual GPM, all right, what kind of GPM does it look like? All right. Let's list what goal would oppose it. What goal would oppose that? What goal will oppose that? It seems to be in present time. Is this your present time goal? All right. That's very fine. Good. Let's give it the most likely top oppterm for this particular thing," see. And that fires and we list it and it starts blowing down and you're on your way.

You run into trouble, doesn't go by the textbook, you've done something wrong, you see. You've taken the next to the last one, I mean, or wrongly worded goal or you've done something else, see.

All right. So you got the pc's last GPM. That's what you want, you got that and so on. You got the top oppterm for it. Well, that should have kicked a hole in the meter, see. Big TA action when you've found that, because hell, ifs the biggest piece of service fac you could possibly lay your hands on. It'd be the PT RI and that's what's got all of his present time res-timulation in high gear. You oppose that. Bang! You've got his first terminal. There should be pain on that, big bunch of tone arm action. All right. Just carry it down. Now, you oppose that with a list. You get your next opposition terminal and you oppose that with a list, you get your next terminal, and you oppose that and you get your next opposition terminal, and you oppose that and you get your next terminal. And every one of those things ought to blow, blow, blow, charge, charge, charge, charge, action, action, action, action, tone arm motion, tone arm motion. And you're running – you're running this process on somebody with the tone arm at 5. Brother, you have done something incredible, not just wrong, incredible. See. They just carry it down, you find the oppterm, top oppterm, whatever it is. Of course, you don't know how complete this GPM is. First one. All the rest below that are complete. But... everything else is complete, but the first one. And it may be complete. You're kind of on the spot with that one, though you're not too sure where it ends. And it follows, of course, the form and pattern of the earlier sample GPMs, like the one "to scream." That sort of thing. That's what they look like.

And you just list them down. You finally get down to where you get the goal as an RI, see. Well, about halfway down the goal itself starts... stops firing. Then it fires again gorgeously as an RI. Now, at the point of your departure you may, in having listed the pc up the line, found the goal just under this. If there's any way to know what this goal is without listing another list, use it. Don't monkey around. You listed opposition goals up to it, you see. Well, heck, you found the guy's goal. It's the one "to go to church." You see? It's – this one is "to

live a saintly life." You see. It's something like that. And you found that GPM. Well, list for its top oppterm. It's the first action you take on that. But remember to dispose of the other GPM that you just left. Let's get its opposition, see, to that goal as an RI of the one you just left. You understand? You found the next GPM – you better do something about the one you just left. So let's not corn around with it.

I don't care whether you find the goal first or you list the thing out against an RI first. I frankly don't care which one you take. Probably it's more comfortable on the pc not to find the next goal yet, but just get that goal as an RI opposed, see. That's probably the more comfortable action to take on the pc. But sometimes to get that thing opposed, he opposes it much better and more accurately if he's got some idea of what the next GPM is. That's the only reason I say there's a variation of technique at that point. But if you can, just avoid finding the next goal or something like that until you need it. Don't throw any more in restimulation, you see, on the pc than you have to. Take it easy.

All right. Now, let's take that – take that bank. Now, you've opposed the goal as an RI and you've got all the other items, they're all written up on a line plot and it all seems to make sense. You go over that line plot and you read them all off to the pc. Any one of them ticks or suppresses, you keep checking for Suppress, Suppress. Just keep checking for Suppress. Suppress is the one you want to find. Because if you find one ticking, there is something wrong. So the thing that keeps them from ticking is Suppress. Sometimes "Fail to reveal." The three that are suppressive in the extreme, of course, are "Suppress," "Careful of" and "Fail to reveal." It isn't really terribly necessary to get all those in on all those RIs. But you're looking for something wrong with one of these RIs and actually the thing that stands most in your road is it's suppressed. And you go all over that bank and everything you've found in it. You go right on up that bank. And you get the pc to assemble that bank and you work with the pc. But you're trying to get that bank put together. And you're trying to find out if anything ticks. Because if something ticks, you got something wrong.

Now, take off at that point and do an analysis sheet. Let's find out if you've skipped an RI or this isn't the RI or there's a missing RI. You just found a lock or – you see. Let's find out what's wrong at this point and let's straighten it out. Whatever it is wrong, let's straighten it out and go on back up. And the most usual action is to have left a pair at the top or more than a pair at the top. Two, four, six pairs at the top of a GPM. You might have that many pairs missing at the top. You get into mischief. So you want to check that over. Ouija board your meter. You know the Ouija board is something that the spirits are supposed to guide and it tells you the answers and spells out the name of the man you're going to marry and all this sort of thing. Good old 1890 – it was developed the same time as medical psychiatry and so forth. Has about the same degree of reliability. But when I say Ouija board your meter, you'll find some auditors doing this to the extreme, you see. Are you? Is it? You see. They're asking for the answers out of the meter. And they sometimes ask the most unlikely things you know that a meter never could tell them. You see. The data just isn't on file you see. Like, "are we going to have a happy session," you know. [laughter, laughs] But you can ask – you can ask a lot of questions.

You can ask enough questions of a meter to find out actually whatever is wrong. Have you missed items? Have you done one wrong way to, you know, has an item been listed

wrong way to? Anyway, you just straighten up that bank, add any additional items that you find in it, assemble the whole thing, make sure that no extraneous items come from some other GPM, you see. Make that just as neat as you please. And you're going to just be blowing charge, blowing charge, blowing charge, blowing charge all the time you're doing this, so it's quite worthwhile, you see. Well, you just clean that thing up and sweep the street, man. Don't leave a single shard or a bit of glass or anything else around there. Just neat that up gorgeously. Go on down – if you haven't found your next goal, find it. Repeat the same operation, of course, on your next GPM. Work from present time back. Never work from back to present time.

Never go on the basis that if you just find the earliest item, the earliest GPM, the pc's going to be in beautiful condition because you're working – I'm afraid that's going to be too unreal and too upsetting and too out of line. You'll be crowding the pc into present time. And none of the problems it solves have anything to do with his present time existence. So you've left the totality of his present time restimulation sitting on his head while you're trying to run the hottest stuff that he's ever come near. So, that's a serious mistake. You must work from now to then, never from then to now, except of course, when you're straightening up a GPM, you of course come back up the same GPM.

Now, when you make that real neat you'll find out your needle gets awful, awful, awful floppy and the next moment that you get into the next and actual GPM, your needle gets very stiff and the tone arm goes up and you have lots of trouble because now you, of course, have put the pc into a viewpoint of seeing it's there but not into any viewpoint from which he has really viewed it. And he's now in trouble, he's got somatics, his neck hurts, he wishes he hadn't quite started the session and he probably hasn't and you got most of your troubles all over again.

Now, working it that way, you can cope with the idea that the earlier you get the most – more savage these GPMs are. So your pc is in good condition all the way. He's coming up in a gradient sufficient to handle the degree of charge that there are – there is to be found on these things. You work it the other way to and of course you're taking this little tiny pc who's gone way down scale and you're putting him back in a great big cavern. And he feels mighty timid about the whole thing. You work it the other way to and you're going to find that your pc stays pretty happy all the way. It doesn't take very long to run these providing you run them against tone arm action, that you're very neat and you clean them all up all the way, too.

The speed of doing it is proportional to the accuracy it is done with – the accuracy it is done with. You have to keep working at it *pocketa-pocketa-pocketa*. But if you start finding lock RIs and you start listing items out of wrong GPMs and this GPM, you'll find you'll spend three sessions wishing to God you hadn't been such a knucklehead as to make the mistake you made in the first place because you won't make any progress. See? Actually, the fastest way is the simplest way, is the easiest way, is the textbook way and the first moment that it doesn't run like that and so forth, start bloodhounding the whole thing. [sniffs like a dog] "Are we going to have a happy session?", You know. [laughter]

Thank you very much.

SUMMARY I

A lecture given on 24 September 1963

Thank you.

Well, we – back in the running here, where we were a year ago. Twenty-four, is that it?

Audience: Yes.

Twenty-four Sept. AD 13.

Now, this is what you're going to get your talk about today. Summary.

Now, you may not be aware of the fact, completely in a concrete way, but from the 24th of July, the lecture of the 24th of July, on down to Thursday's lecture of this week, you have a complete summary of modern Scientology, on all levels and all processes on those levels – the tapes from 24 July on forward until the tapes of this coming Thursday, which is the 26th of September. And in those twenty-five lectures you have a totality and summary of modern Scientology. Nothing lying outside the province of those lectures has any great validity, as far as cases are concerned.

There's been work over a long, long period of time, all of that work has value. It's flabbergasting how much material exists, all the basic material of course is of great value, and quite valid. As far as technical application is concerned in the resolution of cases, you have from the 24th on through.

That also happens to include presentation of Scientology to the public. This is the direct and definite result of the sprint I started on in January to speed up research along this particular line, and the material which you have in your hands now is workable beyond all – anybody's dream on the subject.

It does not mean that a case is easy to handle, but it means that if you know this material and can apply it, you can handle a case. The finite results are beyond anything anybody had ever hoped for.

This comes oddly enough at a time when psychology and other nineteenth-century materials had thrown in the sponge, and the head of London psychology department the other day made the announcement that mental treatment did not work and nobody was ever made well by any mental treatment of any kind whatsoever. Interesting, isn't it?

They're trying to make wrong in the direction of our continued development – as one of the more fantastic chapters in the area. First they said you know, nobody ever changed, and we proved to them that people did change. So they haven't... then they said, well, they could

change people, and then they threw out and invalidated all of their own tests. And now as we're walking forward and so forth, why, the word is out that no psychotherapy works.

There is no such thing as psychotherapy. This from people who make their total living of psychotherapy.

I suppose they're going back to advising advertisers how to trick people with subliminal advertising, which was their basic function anyway. Psychology lasted its time out, and is mostly devoted today to getting somebody fired who wasn't nice to him in the canteen by giving him a bad personality report or aptitude test for his job. That's cynical, isn't it? But, actually the subject must have some use, and I think maybe losing people their jobs is about the highest they ever could have attained anyway.

It's really regrettable where psychology is operating on the part of industry, regulating this, because – regulating jobs and hirings and aptitudes – for the excellent, excellent reason that they will defame themselves you see, they'll get in trouble and then mental healing will get in trouble. But they're now in a position where they say, they're saying mental healing, mental treatment, things you can do with the mind, these things don't exist at all. This is the most remarkable thing anybody ever heard of, since that is the first basic on which they were founded, of course, that something could be done. They have no reason for existence.

Now, let's take off along that line. You of course have no existence as an auditor unless you can bring about a change in a case. That's terribly fundamental. That's terribly fundamental. Now, we're in the driver's position today, of being able to say that if you have followed the rules you will get a change in the case. Now, that is a horrible position to put a practitioner in, because the practitioner is then hung by the fact that if the pc didn't get a change then it must be the fault of the practitioner in some fashion or another.

Remember it can also be the fault of the pc. Somebody goes out and spends all night in the bar and that sort of thing and comes in for his session, somebody who is breaking rules in pushing his PTPs and overstimulation in present time up to the zenith-zenith-zenith, naturally is influencing his own case, too. I had an example of this the other day. I did my mail, US mail, Sunday, and it isn't that anything new or strange has happened, you see. But a terrific amount of restimulative material of one kind or another, which I immediately couldn't get at, that is to say, I couldn't get at the source of the situation right at that moment, I got restimulated and the first hour or so of my session was just about the lousiest mess I think I've looked at for some time. And for that to happen to me is a bit of a clincher.

There we were also running slight errors and so forth in the put-togethers of the GPMs I was running. But nevertheless, I had been working very hard and it stacked up a tremendous amount of correspondence and that sort of thing. Was trying to take care of situations I couldn't take care of very directly or immediately. And I just merely felt sorry for the Washington staff. I just got to thinking about sitting there and being slugged with all this bunk that's being handed out and around, living in a highly restimulative atmosphere, a governor – a government which has apparently turned insurrectionist and is against the people and so on. And it isn't that they're doing anything really different than any other business in the United States.

I made it my business one time or another to find out how bothered other businesses in the United States were and I did a little canvass and I went all around to find out, and they're bothered, man, they're bothered. Perhaps more than we are.

So that it isn't any direct action, it's just that they've got too much government, they haven't got anything to do, there isn't that much crime, so they have to invent crime, and so on, and they do. They invent it for the little shopkeeper, and for this person and that person and so forth. And I just felt – started feeling sorry for these people. Got restimulated to the degree of living in a lawless type state or government at the behest of the powers that were, and I – it simply just upset me to that degree that I went straight from doing that folder, you see, straight into the session, see, bang, bang, you see. Trying to cope with a bank, feeling sorry for the Washington staff, you see. Cope with the bank, you know, and so forth, and so on. Terrific – this condition, you've had it all on a present time problem, of course, but I was looking at something very directly because it wasn't a present time problem, see, beyond the fact that one can't immediately say [snaps fingers] and straighten it all out, don't you see?

There was no problem connected with it, it was just restimulation. Pure and simple, of one kind or another. Situations which exist which you can't do anything about. Don't you see, it doesn't even have to be a special RI. You see, get the idea? You don't have to blame it on the particularities or significances of a bank, don't you see, it's just you are a being, you have certain pride, certain belief in yourself, certain confidence, certain feelings that you should be able to do things in life. You have some kind of a belief or feeling that the sphere in which you exist should be calmer because of your existence in it.

You find yourself incapable of immediately effecting a result to straighten something out, and bang, restimulation. It doesn't have to be an RI on the basis of, well, you don't have to have an RI "government" to be restimulated by a bunch of guys shooting at you. You get the idea?

So, the upshot of the situation is that a pc has a great deal of bearing on this sort of thing. If I'd had any sense whatsoever I let – would have let it cook, you see, till next week, or something like that. Instead I do all this mail, I get all restimulated, I go into the session, the auditor has a horrible time. An hour or so, man, we're really climbing the wall, see? Too much – too much split of attention.

Well, this becomes a very important factor in processing. Extremely important. And it is so important, it is so extremely important, that this has been the – you probably think you have seen many breakthroughs. You have. You have, undoubtedly. But you think – you think that they lie hither and there. Actually, they lie right here in this direction. Finding the pc's own goal and his present time GPM and then finding as you can the two top RIs which is his service facsimile, becomes feasible, and running the actual GPMs of the pc becomes feasible, only when you handle that which hits the restimulation square on the head, which are the present time RIs which is also the service facsimile. Those two top RIs of the actual GPM that are riding in present time are the service facsimile. The interreaction between those two RIs – that is the service facsimile.

So you can approach it through R3SC, you can scoop this stuff off and get tone arm motion. You're bound to get tone arm motion in that area. Now you can go ahead and destimulate the person to the best thing that you can.

Now I'll get on with the rest of this story about this particular session. It took us until the next session to find an RI. You see, it took us until the next session to find an RI that even vaguely fitted this situation. But because one was simply – you know, something fitted the situation. And immediately we pulled that out, the restimulation diminished. But the RI wasn't even really directly connected with the restimulation, don't you see.

Now, the present time environment and the present time RIs are what you as an auditor are handling. And let's not get off into a whole lot of balderdash or monkey business, because that is what you are handling. I don't care what process you are doing. R1C or any process that you are doing. You are handling the two top RIs of the pc's last GPM.

Now, the reason it is possible to return to the technology which was first represented in the form of R3M2, and which is carried forward consistently under the heading of R3 and which is to be found in all the records under Routine 3, don't you see, consistently, and which has now got to be upgraded because of the new classification levels to R4 – that technology was difficult to manage simply because we didn't hit the present time GPM goal, and the two top RIs of that GPM.

Now as long as you tried to do the rest of the bank, the earlier goals, earlier GPMs, do earlier patterns, all of this kind of thing, your poor pc is sitting there being hammered to death on his present time GPM, *bow, bow, bow, bow, bow, bow*, and man, he hasn't got enough attention to put it back down the bank at all. You could almost redefine Clear, only you can't achieve it technically, but you could define it theoretically as somebody who had the two top RIs destimulated or out. Just the two top RIs of the last GPM, you understand?

Now, that GPM has got maybe twenty, thirty, forty RIs. See, it's got those reliable items. Twenty, thirty, forty reliable items. There they are, great, big cracking reliable items, you know, bong! They make a 2-12 item, you know, look like a – look like a – about as offensive as an ant at Sunday school picnic, see. As compared to a jet bomber landing in the middle of the picnic table, see. The difference is about of that magnitude.

So, what are we going to do? All processing then cones up against the two top RIs, the two top reliable items which are sitting in present time, from the GPM which is sitting in present time. Now of course that GPM stretches back and these GPMs – the pc's actual GPM plots against time, and the time is pretty vast for one GPM. It's also very interesting. They measure, I suppose, at the absolute minimum would be thousands of years per RI. The minimum. Now look at the cracks – how long do you think it'd take you to run out all the engrams of the past two hundred lives of the pc? How long do you think that would take? Oh, brother, you wouldn't be able to do it. And yet that whole period is probably covered by one pair of RIs. That's fascinating, isn't it?

Get those out of the way, get those things destimulated, and that whole area ceases to be aberrative, just like that. Two hundred lifetimes' worth of engrams gone up in smoke. Get some idea of the order of magnitude. One RI. Not just the whole Helatrobis Implants, but the

Bear, the Gorilla, Helatrobos, right on down to the Train goals and the between-lives implants. One pair of RIs.

Now, of course some of you have been diffident, and some of you have managed to put two or three in during the period, and here and there you're going to find somebody who was able to put a whole GPM in during the period. He was thinking about it all the time or something, he was worried about it, see. But as a general statement, I'm just giving you the order of magnitude of aberration. There's the jet bomber landing in the middle of the picnic table, see, as compared to one ant eating one crumb at a tree remote from the table.

See, a slight difference of value. And you've got two of these confounded things, sitting, riding in and forming in the pc's present time area. Either one of those things has more qualifications and significance than the whole concept of the reactive mind as advanced by Sigmund Freud.

It's quite interesting, the early definition of the service facsimile carried in the glossary section of, *Advanced Procedures and Axioms* in the glossary, the glossary section, the definition of it, carries the – I – carries the description of an RI. That is the embryonic description of a reliable item in that little definition. It's not more than a paragraph long. And it says the pc's doing it, and it says the pc's holding it in place. Quite – quite – quite remarkable. But that still holds good, see, we haven't veered off of that. Out of all the pieces and bric-a-brac of the mind, what is it that you have to hit? And that choice of target has been the problem in research and application of Scientology. That choice of target. What is the target?

Now naturally, one of these RIs is so capable of dispersing the pc, that research work on it always finds you veering. You get in toward it, and you veer and you get in toward it and you veer and you get in toward it and you veer, and you get in toward it and you veer. So of course it's been very hard to isolate it.

Aside maybe from some OT at some vast period of the backtrack, some vast period in time, who wrote – who found out, knew he was doing it perhaps, and found out the exact character of goals and RIs, and perhaps left it in a document form, which was then picked up by implanters. Aside from that, except for that, as far as I know, the data is not known in the universe. See, they – it must have been somewhat on that order, because if they'd developed Scientology with that information, as they very well could have, they wouldn't have had to go in for implanting. See? So they went a different route.

So the information must have come to them in such a way that it didn't de-aberrate the thetan. So therefore you can apparently find, just on a guess, because implant GPMs exist, you see, and because they did have something that looked like a GPM, then one must then assume that one can find these things without de-aberrating them. One assumes that you could sketch one out or do something like this without taking the charge off of it in some way.

Now you feel that that would be pretty difficult, and actually it would be very difficult. Be fairly hard to do. But nevertheless it's apparently, as I would say, probably been done. Otherwise they would have had something that resembled Scientology. And if they'd had something that resembled Scientology it would have won out along the line. Because theta always has more force than entheta, regardless of what you think.

It isn't that it always wins out, and that sort of thing. You actually have practically no experience with a theta communication on a social level. There practically isn't any. You say, well, if this fellow led such a good pure life, and that sort of thing, why is he getting his head kicked in? How do we know that he just isn't leading a totally withdrawn life, introverted, that is inviting the inflow? See? How do we know this? Well, we don't know this. In fact we look it over and all the evidence is that people have redefined what a good being is. A "good being" is somebody who doesn't communicate. I think the stories of Harold Bell Wright and his strong silent men which were appearing there at the beginning of this century, marvelous stories. These fellows are strong and silent, you know. They never said anything.

These fellows were set up as paragons of virtue. That isn't theta. That guy must have been crazy! Used to irritate me like mad when I was a little boy. I'd read these books, and they'd – I'd – my hair would stand on end, you know? I'd be horrified at this, you know.

I remember seeing an early silent movie one time, and the parents of some child were in vast trouble. I think I was all of about six. And they were in vast trouble and this thing was getting more and more complicated, see, and more and more complicated. And I finally was getting awfully bored with it, and the two companions I was with were more than bored with it, you see. And I remember explaining to them that the whole thing was silly because why didn't they just communicate with each other?

Now therefore, one very seldom sees a straight communication line. And the power of Scientology based on straight communication lines and that sort of thing – you see, over the years we've had a history that apparently, well, it permits somebody who was in Kansas City to write me a letter which was in my Standing Order Number 1 lines, yesterday, he had attended some original lectures, and he'd followed my ups and downs, mostly downs, see. I look at this, you know, with astonishment.

I suppose, when you – when you read an AMA regulated press or that sort of thing you might possibly get this wild impression, you see. Unless you looked at the growth graphs of organizations and other things, over the years. And you actually have to remember how it was maybe in 1955 or something, to give yourself a real shock. And here it goes.

Now you think this FDA thing, and income tax nonsense and that sort of thing in Washington DC amounts to anything. What it amounts to is I just saw – the kids are – staff there are upset, and it made me sad. About all. They haven't got a prayer. Those poor guys have been climbing the barber poles all over America. They've been trying to find somebody who would really complain about Scientology. And they released their witnesses the other day; we've not heard of them, we have none of these people in our – in our Central Files. We have no record of most of their people. But one of them was an FDA agent who attended class for some time and then blew. Name was Quinn.

And he – they advanced this as a witness and so forth. Well, now, what can that man testify to? That he's actually seen a meter cure somebody? No, not in an HCA class.

Actually, we're gradually – we're gradually mounting up a very heavy casualty schedule against the government. Very heavy. The FDA has now been forbidden to make such raids. Hmm! The uproar which has come about in general is rather historic up on Capitol Hill. People are nervy about this. You did a good job getting letters in to the government and that

sort of thing, you see. The attorney who first handled it has slowed down the government case like mad because the guy studied it for a long time and then went down with a very serious illness. He couldn't bring himself to attack this. The casualty figures are growing, and they still aren't getting anyplace.

Well, they're going to have a trial of some kind or another, and they're going to hear a lot of things. They've been going all over the place trying to find some evidence. But sitting back of that, I've already seen this function several times. They know they are lying, and they know, the more evidence they collect, that they are attacking something which is good and decent and beneficial. And they know they have to be lying in their teeth. And when they start somebody to investigate it, he comes up against the fact that makes him wrong. Makes him wrong. So he gets sort of enturbulated and savage and, so forth, but he keeps trying, but he just gets wronger and wronger the more he tries, don't you see.

And we have had far more serious things on the backtrack than the FDA. One of the things you don't realize is the old man sat there somehow or another and kept the lid on. In the early years I was very discouraged from – I mean everybody advising me never to say anything, see, about these things, never put in any itsa line on the stuff that was happening because it would enturbulate everybody. I think it was a terrible mistake, but in the early years I was overridden. You have to defer to somebody else's opinion on these things now and then, particularly in that zone and time. But much more serious things have occurred which had greater threat value in all directions. Why, we've had Federal court actions to seize every single piece of research, and so forth.

I have been sued for using my own name on the material. There are very serious actions along the way. None of these things succeed.

So if anybody had ever developed Scientology, you wouldn't have the universe you have. That's what you have to adjudicate about the thing. It'd be perfect – with perfect aplomb we could import it into Russia. We could give them all the plots for implant GPMs, we could give them all the material, we could give them everything that you could possibly think of, could give them the material, let them study it, let them fool around with it, let them fool around with set techniques. We must have techniques however that they can understand and do in an elementary fashion.

I was very interested – an old-timer was down here this afternoon and she hadn't been anywhere near Scientology for a long time, and she wanted to know how to handle her – one of her relatives who was upset with her mother's death, and I was very interested to be able to give her the itsa line on solutions, you see, and decisions with regard to her mother, you see. That's all she'd had to do and keep the girl talking. She dug this at once, that seemed to be a very reasonable thing to do and there it was, you see. Terrifically easy communication. Communication of a process. No complications involved in it.

Well, that's what makes theta, is actually the ease of reach, the ease of the communication of what you are doing. Entheta, enturbulated theta, becomes enturbulated only by going through numerous vias. It's vias which enturbulate the thing, because it no longer is a straight line. Don't you see?

I had a big problem the other day. Why don't thetans use weapons? That's quite a problem. I've been trying to solve it for some little time. Why don't they use tools? I got very intrigued with this. Why don't they use tools, and so on. And I remembered one bloke I collided with, much to my own disaster, by the way. A long time ago. And he was using tools. He was using a scoop of some kind or another to make a sea. He was a tool-using thetan. He really did me in at that particular time. I was in a queasy enough state to permit myself to be done in.

But, there he was using tools, and I wondered why we'd never used tools, you see. And I got to thinking about the cave man could defeat the tree-top man because the cave man used stone tools, you see, and the tree-top man wasn't using tools, and I could figure out – was trying to figure out how the free thetan, you see, lost his dominance, you see, and exactly how he sort of lost out. Huh. I've been trying to go over this and go over this. You'll find this is quite a problem. How has he lost out, don't you see? What are the factors involved with it?

Well, this is way up ahead, see, this is Scientology V. You have to know answers to the situation. And I found out finally why he doesn't use tools and why you never use tools and why you don't like to use tools.

In the first place, you don't need them. And in the second place, if you get the idea of using, well, let us say, using an ice cream scoop, see, over here, in the ice cream, see. Well, actually you've got to withhold the length of the ice cream scoop. Get the idea? See, you're holding back just to that slight degree, see. All right, well, let's take another one. Instead of knocking somebody's head off who is in your road, you pull a gun and shoot him. Do you realize that you just figure it out – this is a little fun to make a test on for yourself. See, you get the idea of doing something to somebody on a via. And if you go through the mechanisms of trying to do to something – to somebody on a via, you'll get the idea of withholding ability. And you suddenly realize that you're on a withhold. And then you begin to realize that you must be withholding ability. You're withholding the ability of knocking the guy's head off yourself. Why are you doing it with this gun, see?

No matter how intriguing and entrancing it might be to use a gun, it is still a withhold. You see, you start studying this out and therefore, thetans who are in pretty good shape have never used tools. And those who have used tools make up populations such as convict planet Earth, which probably is far higher-toned than the organization and political organization that runs this planet. All of which is speculative.

But as far as that's concerned, tools, tools appear to be so good, but actually bring about a downfall. How do you – how do you figure this? Well, why is it, why is it that there are races on the planet right now which are apparently stronger and more powerful than the white race? See, white supremacy. How white supremacy – they now talk of as a myth in most of these publications and so forth. Well, it isn't, but they talk about it like that.

Well, what happens? What happened? Well, actually you have a – you have some racial virulence you see, amongst those who haven't been corrupted by a lot of tools and dependencies. You see, you still have some vitality. I don't care if these fellows... it isn't just necessarily the colored races. Let's take – let's take some Berbers or something like this. And they haven't been sitting everyday looking at a television set, you see, and that sort of thing.

Now all of a sudden we move those fellows up within reach of the possibility of achieving some political dominance, don't you see. They have vitality, they have ideas. They have these various things, and they give the appearance, you see, of virulence, and, you know, muscles. They – they give this – they give this appearance.

Now, culturally – culturally, the democratic system opened the door, but in actual fact no aristocratic system... it isn't – it isn't actually a problem, you see, in nationalities. Not a problem in nationalities at all, or a problem in color or a problem in any of these things. It is simply a problem in what group is the least corrupted or decayed by modern civilization.

Now if you stop and think for a moment, the Greek civilization once dominated the entirety of Earth's civilization. It was well before the Roman, and the extent of the Greek civilization was probably wiped out by Roman history rewriting.

These blokes wiped out – the Roman wiped out the actuality of Greek history. You have to actually go out to India, and get your feet dirty with the red clay, to really find out that the history book, as you read in Western civilization, isn't correct. The – Alexander the Great didn't go charging out to India and say, "Oh, too bad, I have no more worlds to conquer," gather up his army, and come all the way home, and kick the bucket or something. This was maybe a shallow look at it, but in actual fact Greek administration was established in India. There was not a shadow. They were once administering India. What's this?

That's quite wild. Look at the sway and zones of dominance of early Greek civilization. And it was huge. It was big. And those commun... it was big enough so those communication lines still exist today. You go down to Athens, they think they own the world still, they haven't found out they haven't. They speak of "Our colonies in Spain. Our Iberian colonies..." The guitar, Greek instrument of course. That's right. They have sort of this atmosphere. And you look around, you'll see that there's an awful lot of Greek flags on the high seas. Tremendous shipping interests are Greek.

The lines, and shadows of the lines of that ancient civilization are still in, and if you don't think they've made the grade in some directions, Greek philosophy absolutely dominates all Western thinking. You're living in the shadow, you see, of an ancient civilization, and if you said today, if you said today, well, the Greek is a menace to world peace or something like this, and everybody would look at you sort of blankly. What a – what a weird remark to make. Don't you see, because the Greek civilization's not militant.

Greek went through a tremendous period, a tremendous period of conquest and dominance and her people were very, very down to earth, crude, rugged, tough, one-blow type gents. See? These were tough boys. And they spread their dominance out through the known world at that particular time. And then somebody started working them over, and the next thing you know they had this and they had that, and one of the reasons why the Greek nightclub, the idea of nightclubs is Greek, you see, and you get the reason why they are so adept. You by the way, go to a nightclub in Athens, you get – you'll get far better entertainment than the best one in New York, and this nightclub in Athens, you see, they think – what are Greeks – stand for as a floor show? Well it has to be a very, very high-level show, and it has to go on for hours and hours and hours and hours and hours. New York, they come out and do a tap dance and disappear, you see. That's not – that's not the Greek.

How did they get to this high level of entertainment? Must have been their last method of conquest. They can't any longer knock the invader out, see. But when he arrives they can say, "What a good fellow you are! And have a good entertainment. And have something to eat. And some nice wine." And the guy said, "These Greeks are nice people." That was the last method of defense. Do you see this? They could still handle somebody on a highly introverted basis, and so forth. They hadn't entirely disappeared along this particular line.

But there is – there is the – probably the greatest civilization on this planet. And look how far down you might conceive it now, because if I said this was one of the greatest powers on earth you would say, "What the hell's he talking about right this minute?" You see?

You fly over Greece, you see their denuded hillsides. You see – you see the stuff couldn't grow there anymore, that's all. And you look at their coasts, and the harbors and that sort of thing. It's shot, man! But what's going to happen?

You see another great empire, the Roman Empire, I don't know if there might even be some political official on Earth today, still he calls himself the Holy Roman Emperor. I think there possibly is one, isn't there? Who is it, the Pope or somebody? Or did it die out with the Hohenzollerns. I don't know. But I'm sure the title is active. I'll bet if you dreamed up in all directions and looked everywhere you'd wind up with the Emperor of the Holy Roman Empire, you see. Quite fascinating.

Various aspects have taken place, but Roman civilization is far more present right at the present moment than this. You see, you've got this cycle now going, the Greek civilization, you see about where it is. The Roman civilization is perhaps a little more so. We still had a – it still could resurge in the form of Mussolini and scare everybody to death before it folded up, you know, in World War II. It's still got a little power in it. You still have Roman lines, you see, out.

It's interesting that in England they're trying to get rid of their Roman Background. They say, "Well, it happened – it was a long time ago, and it's all different," and so forth, and up and down the street, walk these fellows, direct descendants of Romans, you see. You look at them, their faces, and everything, see, walking up and down the streets, same size, same everything, you see. You go around and you look at the ideas of British liberty and this country has got the greatest background for jurisprudence and material of that particular kinds and legislative system, and so on. It was just the furthest thing from Rome in which Roman jurisprudence was implanted. And it survived a long time. The Magna Carta, other stuff, you see, that's the old Roman Empire, you know, just going along, going along, doing its business, stable data, on this subject.

Of course, they have to kind of get rid of that. Kind of have to get rid of that, because it's a zone and area of dominance. There are various other reasons why it had to be gotten rid of, because this started to work when the Angles and the Jutes, and so forth, came in here. They had to get rid of this thing, and they had to establish first a Danish and then a Saxon civilization and so on, and they had to keep saying, "It isn't a Roman province, it belongs to us!" And everybody would say, "Heil." See? "You're the conquerors." And they never really did knock it in the head.

And these – this thing keeps revolting, because these ideas were good ideas, don't you see, and these ideas keep reaching forward in time, they had useability. And you have a very strong civilization here, which in its turn was a great empire. We're just now at the period where it's trying to give it away. I don't know why it's trying to, but it is. I don't know, I think it makes more Lords, or more seats in the United Nations or something, but a lot of – lot of stuff is going on at this present time. They talk more about the disintegration of the empire than it actually is, but I notice right now it's having trouble in Indonesia, you see. It's got new problems now. This new empire has new problems. It's a newer empire, it's now considered an old empire; it's now considered that the British... they don't even call it "Imperial" anymore, things are all "Commonwealthian," don't you see. Bits of it are being taken off one way or... Not really necessary that it go in this particular direction, but its force and power in the world today is tremendous.

Its amount of finance, manufacture potential and so forth isn't anything on the United States, and yet the United States looks at things British and says, "Aye aye, yes sir, yes, oh, yes, mylord." And they're really scared to spit unless they ask the permission.

So here is your next cycle, see. Here is the British Empire, see. And then they got Johnny-come-lately empire called the United States, see. And it's been going and trying to spread all these various sentiments in all directions, and handle and pound and buy friends, and do this and show everybody that they're all set, and put shipping lines in, their manufacturing potential is flooding into the rest of the world today. The same way that in 600, 500 A.D., or even in 100 A.D., the pots and linens of Rome were flooding into England.

And here we have this new – this new empire, see, and it's hardly an empire. You can't quite put your finger on it because it isn't the right thing today to say, "I own," don't you see.

And now – no, it's taken its responsibility in the world, it's pushed out ahead of everything, and it's going along here, at a great rate of speed, and trying to make its way forward and so forth. Don't make any mistakes about it, it's trying to become a dominant empire. Whatever it's *saying*, that is what is *happening*, you see? And it's looked on rather intolerantly by a bunch of other fellows who are sitting around who've already been the route and they say, "Well, yes, *hm-hm-hm-hm*." Got the idea?

Because I've been describing to you four GPMs on the third dynamic which apply totally on the first. Because that's just the way a GPM acts. Got the idea? Just as you to some tiny fragment at this moment are influenced by the Greek civilization, so you would be tinely influenced by the fourth GPM back. See? And just as today you are very much more, but not much really, influenced by the Roman Empire, you see, you still have some influence on it, but that's the third GPM back, you see. And now we got the American Empire, and it's actually blown its cork. And we have a new empire already forming called an "internationalism." And it's stumbling around, and it hasn't got a grip on anything, and mostly it's a matter of confusion. And that would be your present time GPM.

The two RIs on it right now, God knows, I don't know quite what they would be, but there are two RIs from the United Nations. I don't know what it was, maybe Wendell Willkie put it in when he said "One world," or something like that. The goal possibly "To have one world," you know, something like this. Yet everybody sort of believing and working dynami-

cally, very dynamically in the direction of creating just one world, see. And if you want to really get somebody's attention and so on, in a shop in England or in Greece and so forth, you talk to him about the decay of nationalism. And he will pretty well agree with you that it is now internationalism that exists, see. He'll kind of beat the drum a little bit with you too for internationalism and so on. That's a forming GPM.

We don't know where that one's going to go, but that's very truncated. We actually have already seen the top oppterm of the American Empire. We've already seen them. They're going into history rapidly. But still be influenced over fabulous periods of time, don't monitor, say it's less. But the new force is this.

Now, what are you affected by, right this minute? Actually, you're affected more by the decay of the American Empire, without tracing why. Well, it's got to have money, it's got to maintain fantastic commitments. It's got to maintain all kinds of defenses. It's in a frantic state. Don't you see? Its people are sort of agin it, but they're not for it, but well, their dream of liberty has dwindled you see, they don't have that anymore. Maybe it was like the goal "to be free," don't you see?

Something – something went on here, don't you see? But you still – we get the kick-back of this particular thing, but the dynamic RIs in the present time are – how can we live all together without having an atomic war? Maybe that's one pair back, don't you see, we might have another one forming right this minute. It would take a very careful analysis to look at exactly what was forming on the third dynamic that we could call the top. Existing top RIs, see.

Well, we certainly – we haven't gotten rid of these last two top RIs, international war and atomic fission, or whatever the two top RIs are, don't you see? You follow this? Well now, that's the picture with every pc you're operating on. That's his picture.

Now, we're going to enter his case see, we're going to enter his case, and we're going to say, "All right now, we're going to get..." I suppose a Greek civilization could have said, "to spread Greek culture," see, or "to culture everyone, if it kills them," some type goal. "To be cultured," maybe that would be its goal, see, something like that. Or maybe that was a later day goal. It was certainly "to conquer." Possibly "to conquer," maybe that's the GPM line. Maybe the Roman one was just simply "to govern well." But now, we take this pc, see, let's call him a world. You know, let's call him – this pc called World, we're going to say, "Now, we're going to straighten you all out now, World. We're going to run out the top RIs of the GPM 'Greek civilization.'" Go ahead, go out here on the street right now, and tell the world, you see, that you're now going to run out – you're going to make the world well, you're going to run out the Greek civilization. And do you know, I don't think you're going to get anybody to agree with you at all.

You could tell them, "Well now, look, if you just get rid of Plato, see, that's a big RI there, and it's a reliable item, and if you just get rid of Plato, see, you'd be all set."

"Plato? Plato?"

You'd list the thing, and the fellow would say, "Yeah." But he'd really only do that so long as all the other GPMs were in place, don't you see? There comes a time when he could

become very interested in the Greek civilization, don't you see. But not right now. The world would say to you, "All right, you're going to run out the Greek civilization. Well, what about these atom bombs?" Wouldn't that be the response which you'd get? And that's the same response you get from the pc. Only you're not given to know exactly what the top RIs are of the pc when you start auditing him. On the face of Earth, you can see quite obviously it must have something to do with international war and atom bombs. See, that's very visible to you.

But there's the pc sitting there. Now, what the hell is he stuck in? We don't know. But in actual fact the influence upon him in GPMs, his ancient Greek one – not that he was in ancient Greece, you see – "to conquer," see. That GPM, it's still influencing him. The Roman, "to govern well," see. British Empire, something on the order, "to have freedom of the seas," or something like this. I don't know what that GPM was. Whatever it is, see. Yeah, all those influence him. Oh, yes, you could get tone arm – little tone arm action, yeah, you could get some interest and so forth. And all the time he's doing that, he's got one eye cocked up at the sky to see whether or not that mushroom plume has formed yet.

"Yeah, yeah, Plato. Yeah, well, let's see, against Plato there were poisoners or that was Socrates. Let's see – so on... did you hear an airplane go overhead?" [laughter] "Oh, all right. Now, let's get back, let's get back and let's list this – let's list this – this out here a little bit, let's see now, Thermopylae, Marathon – and so on ... What was that? Did you hear something. Sound to me like somebody crying an 'Extra' out on the street, you see. I heard the word 'Russia.' What was it? What was it? What was it? Oh, well, wasn't anything, let's get back into session now. Wonder what the – what it was!"

Get the idea of split attention? Well, he's got two top RIs that are just split his attention just that much, all the time, all the time, all the time. And they might not look very logical to you but they'll sure look logical to him.

Let's say – let's say it's a – it's got an optterm "child murderers – child murderers," you see. And with the RI "police officer." See, they – the terminal "police officer" versus "child murderers," you see. That's his own actual GPM, it's sitting right up here in present time, don't you see. And you, miss, come to the auditing session as the auditor, in a blue dress with some brass buttons on it. And this particular session, you can't figure out why – you didn't get particularly much tone arm action, the pc was sort of nervous all the time, don't you see, and so on, and so, so, so – and – so, and so and so on, and he seems to be very fixated on you and he ARC breaks sort of very easily, and you can't find out what it was.

Actually, if you assessed the whole environment you might be able to find out something about it, and it might lead you in toward it, and I won't discount it as a method of finding somebody's service facsimile. But you're just looking at some restimulator of some kind or another, you see. Now, what are those things? Well, those things are the two topped formed items which extend from a goal which may be as new as the United Nations or actually as old as the United States, don't you see? It's a – it may be brand-new, and it may have very few items in it or it may be quite old as a goal and it may have a lot of items in it. He may be almost anyplace in the formation of that particular bank, but it is that goal which has its immediate command value over the pc. And you'll find as you drop back from it, you have, right into the top of the next goal just below, you will have influence on present time. You

won't solve all of his problems by – with those two top RIs only, don't you see, because you've got these other GPMs which are influencing him, and the influence, however, ceases. Well, let's put it this way: The influence has total command value. The two top reliable items of present time has total command value over the pc. Total. Unquestioning, unseen, just any flicker, any whisper of any of this of any kind whatsoever finds him going, "*tsk, tsk, tsk, tsk, tsk,*" salute, salute, salute, "Yes – yes, yes sir – yes sir, yes, do it right. Oh yeah, worry about it – yeah – oh – comply. *Aaaaaah. Uh-ooohf.*" See. Frantic, you know. Total.

And just below that, merely desperate. Desperate, desperate, desperate about something. The next two RIs, you see. Next couple of RIs, worry, worry, worry, worry, worry, worry, worry, worry, worry, worry all the time, all the time, worry, worry, worry, worry, worry, worry, worry, worry about them, think about them, hoping they won't occur, worry about them, but they're in a state of worry, and the couple of RIs just below that sort of thing, a sort of a dull feeling of apprehension. Constant and continuous dull feeling of apprehension.

Actually, all those emotions are combined in present time. We get much earlier than that. We get an idea of sort of enduring it, whatever the goal is. You know, well, we can – we must all die sometime, and be sick, and have to brace up to – you know, face it. You know, that type of a situation. But now you're about six pairs down the – I mean, six pairs down the line, you see. And that's the kind of present time reaction he would have to that. You know, "Well, we – we can live with it, I guess. Sort of hope. If I – if I confront up to it I can probably endure it." That type of reaction, don't you see.

And you get about eight, ten back, it's, "Oh well, that's life. Nothing you can do about that, that's just the way life is. That's life. Might as well be philosophic about it."

In other words, that's about how his attention is spread over the dozen pairs that are immediately adjacent to present time. His attention cones down in terms of less and less desperate, but still with him, see. And then it goes off into these things, influenced by life, and once in a while he's noticed that he's done something peculiar in this particular direction, he hasn't thought about it particularly, don't you see. You get earlier and earlier than... Actually his present time attention isn't on them at all. See, but can flip into them, and out of them, see.

All right. Now, these immediate RIs and the – that compose with their goal, the immediate present time GPM, see. Those aren't the things which make the pc concerned with present time. They're the things which make it impossible for him to be – to get his attention off of the things he's concerned with in present time. Get the idea? He can't change his mind. It doesn't mean that if those were all gone and he saw a kid's bicycle run over in the middle of the street he'd feel nothing, see. I mean, but the presence of those things means he can't take his attention off of it. His automatic response to the situation, you see, is big, and he's not able to sleep that night. He gets a very heavy high level of effect from this sort of thing, you see. He can't change his mind with regard to these things, so that observations which come in upon him have tremendous influence with him, to the degree that he really can't shift his mind on them.

Regardless of the significance of the operation we do know that he now lacks fluidity or power of choice over his reaction to his observations.

In other words, when something happens in present time he's *stuck, right there with it, and that's all he can do about it*. So he comes into session and you say, "We'll put in the itsa line on – on – on what you've been doing since the last session," and he's, "Hmmmm!" and so on, he talks and talks, and he's desperately trying to suppress and get rid of it. And he really can't get his head off of it, don't you see. *He-he-he-he has a hard time feeling better about it*. See the difference?

And you have to work and work and work and work and then you get – get half of his attention off of it, and now you've got enough attention to maybe run a bit of bank. Makes very rough auditing. Very hard on the pc. And it doesn't give you such a situation of tremendous send on the part of the pc by reason of auditing, if you, well, duck back down the track and take stuff that isn't in particular restimulation but he can run it, you can put his attention on it, you can do something with it, don't you see.

What you've got to do is tackle head-on. You've got to tackle it head-on with his case. Now, whether you call that RIC over things he's concerned with and has been solving in this lifetime, don't you see, that's undoing the two top RIs. Or whether or not you do it with a bunch of ARC break assessments, which is less good, but nevertheless is very spectacular as it works – R2H. Or whether you do it in the direction of R3SC – just as given. You're still working with those two top RIs and present time restimulation.

Now you can actually destimulate the case using in that gradient those processes which I just mentioned, bring it up to a point where the individual might be able to see a goal like he sees "to govern well." See? And he says, "Well, all right, that's a nice goal. Yeah, that obviously is my present time goal," that's good and safe, see.

He'll run it, and you can find a couple of top RIs and they don't seem to have too much to do with the situation, and his appreciation for wine rises. And say, well, that's interesting. In view of the fact that he doesn't drink wine, what good is it, see?

But you – you find you've taken off some present time restimulation, you're handling this situation, or you have reached back and found "to govern well," and you've opposed that, and you've gotten "to rule the seas," you see.

And then "to free everybody," maybe that was the United States' goal, you see. And then you've opposed that, and you've got "to have one world." Ah, oh man, we're getting someplace now, but boy, is that stuff hard to read. It is starting to fly apart – case is starting to fly apart – you're getting tone arm action like mad as you're doing this sort of thing. But there is a point and I warn you on this, and you need the warning because you will veer off, there is a point as you approach PT when the auditing restimulation by reason of the bank and the goal and that sort of thing, not from finding the goal, you can get away with that, see – but let's say we found the PT GPM, the kickback and the nonconfront of those top RIs is so great that it may obscure the actual PT goal. You may have "to free everybody," the one of the US Empire, don't you see, and go right along as though that's the top GPM, see. And everything reads that way and you're Ouija-boarding, the meter reads that way, and everything goes along here gorgeously, don't you see.

The top GPM, that obviously... don't be so amazed, after you tackled it for a while and tried to get its top RIs and done some other things with it, to all of a sudden find, "to have one

world." See? There it sits. Where'd it come from? And then don't be surprised if you have a very rough time listing the pc. Because you're running the pc in the middle of his living lightning, man. You're reaching into the middle of the gall bladder and pulling it out, roots and all, don't you see?

Now, it isn't the pc'll run badly, or anything like that, up to a point, you will be able to get in, but you will run into this action, that when you start approaching the last dozen pairs, it'll keep reading all the time that there are no pairs above them. Always read that you've got the last pair. You may have – you may have – you may have ten pairs above you, see, and it'll – oh yes, this is the two top RIs, you're Ouija-boarding it, see, his no-confront on these things is getting terrific, because it's right up here in present time. Damned atom bomb's liable to go off at any minute, don't you see? *Brrrrrrrrrr!* Dangerous to get near this situation, see, and *uhhh!*

Any solution you might have to it, like he's got an RI, let us say, "a duck," see, he – that's the solution to the atom bomb. "Duck." You get anywhere near that thing, why, man, you're running in charged-up bank. Because it's got hanging on it every part and particle of the universe he has any connection with in this present time. It's hanging on it, is restimulated by it, is cross-restimulated into it.

Well, this is why we didn't – weren't able to find it. It isn't that they're downgraded, it isn't – this is why earlier we veered off again and didn't finish up the actual GPM to amount to anything. That was because it required more technology to really tackle it well, because right now, with the technology you get, which is listing by tone arm, not rocket read, that technology right there, when you start for the last dozen pairs that are right up leading up here into PT, is going to give you not an ARC breaky pc, but an exasperated, worried, upset, frantic, desperate pc who won't be able to get the item on the list in most cases without going through a complete snit.

You'll hear things like this: "But I told you, I – I keep putting it on the *list*. It's already on the *list!* There *it is, it is!*" You're getting the incomplete list ARC break, see. "It's already on the *list!* I keep saying it! I tell you what the item is! *It's 'duck – fast!*" And that's *all* it is. And I've had the idea since you first began the list. I know what it is." He says, "I can't get it on the list. It – damn you, you just – never rocket reads for you! Why don't you look at your meter!" "All right, I'll list for a while longer. Farmyards. Parachutes. Caves. Holes. Quacking loudly. But it's the same one. It's the same item. I know what it is."

You can expect that quite routinely. It isn't really an ARC break. It's really not quite a dramatization. He actually quite honestly feels totally *desperate*. It's just that. He just feels totally desperate. So you want to make awful darn sure that when you start listing it on him you're already listing from a right goal. Don't make any mistakes like this, because if you make a little – a little bunch of technical mistakes at a slightly wrongly worded goal...

You see, you Ouija-board the thing. This is always – Ouija-board these things, when you start moving into this area, see. Ask questions like, "Is this a correct goal? Is this an incorrect goal? Is it correctly worded?" I don't care if you get it reading it's a correct goal, go on and analyze it, see. Have we skipped a GPM? Is it the PT one? Is there anything incorrect about its wording? You know, go through your little act, see, and look this thing over, and

you'll all of a sudden find there's a word missing on it or something like this, or it's too long. Don't call the pc out.

Because look, supposing you've just got a wrongly worded goal, and then you find a slightly wrong item for it, and it moves up into these critical pairs I'm talking to you about. And then you start listing against it, and you already have set up the probability of a desperate pc, who will get desperate before he manages to complete that list, see.

Oh, man, you've got good reason now for him to be ARC broken and desperate. You can half-kill a pc with it that way. With dynamite. You're listing dynamite, pure dynamite. So never take a chance, see. Every time you find an RI, you see. Is this an RI from this GPM? Is it from another GPM? You see, is it correctly worded, you see? Is it – so on. All these things, you go over with this thing. Was the list complete that it came off of, don't you see? And the test of the item you're listing from, does it tick? And how does it compare, you see. Go over this little analysis on that RI, because you're already putting this boy over the jumps, madly putting him over the jumps. Because if it's a right goal, a right RI, and you're opposing this right RI, it's an absolutely correct reliable item, and you're busy opposing that in the very best textbook absolutely correct fashion, your pc is liable to – not always, not for every one of them he won't go through this – but he's liable to get in a terrifically desperate ARC breaky screaming state of mind. He won't be able to quite approach it.

Don't you see, the reason why he can't obviously, it's data substituted for him. And he gets into the vicinity of it, he veers right off of it, don't you see. And he can list all around the edges of it, don't you see.

I had one last night, I sure know what I'm talking about. No-having, can't-have, I was going to pieces on the thing. Finally turned out it – to be "not having." See, just "t" missing. Yes, but the second it was hit, the bank went *bzzzzzzmmmmm-pheew* – one RI, splat. Blew up. Practically blew up the meter. But not "can't-have." That didn't blow up the meter. And not the other nine pages of lists which went with it. All of that, you see, delivering terrific tone arm action the whole way. But going up, up, up.

See, listing by locks, you would list the tone arm action out. That's your 2-12, listing by lock rules. Well now, you're doing this R4MTA. Well, if the tone arm action goes out of it, you haven't got it on the list. If there is the faintest, tiniest twitch, microscopically viewed, of the needle when he gives another item, you haven't got it on the list.

Now, your old R3M2 listing goes, well, you list it and you go 25 beyond that, it's all right, you didn't have any RIs and so you read the next-to-the-last rocket reading item and the thing didn't rocket read, you read the last item and it rocket read, and bang. That's all simple. That's 2-12 lock listing and it's absolutely guaranteed to give you locks. And you can oppose locks against locks against locks against locks, and you could probably find thousands of them in one GPM. Thousands of them. You could have a line plot five to ten thousand items long. You could take a thousand hours of auditing to clean up one.

It's how you got these long line plots. It's how you went skidding out of one GPM into another GPM. It's how you got items listed backwards. See? You've got to list the tone arm action into it, and only then have you got an RI. And then your tone arm – you'd be surprised how hard it is to do sometimes. And the pc says, "Well, that turned on a little bit of mass,"

and he just starts gratuitously give – well, that isn't it – gives you some more items and the next thing you know, that needle's going slash, slash, tick, tick, slash.

Oh, man, if the needle's going tick and slash on a list, you haven't got it. No RRs, it's just the needle – the list – the action of listing is giving the needle ticks and slits and that list is not complete. I don't care how desperate the pc looks.

You want to be awful sure, then, what you're listing up against. You want to be awful sure that that's a correct goal. No chances. You want to be sure that that RI that you already have found came from a list that you did have the main RI on.

Now, I've drawn you pictures of RIs, and they're great big, massive things, surrounded by a lot of ball bearings. And you can just find any God's quantity of these small ball bearing-type RIs and shells. They sometimes look like onions, too. You can find any quantity of layers on them, any quantity of items lying around them. They'll all rocket read. So the test is not whether it rocket reads, the test is it gave you so much tone arm action that it obviously has knocked the bottom underneath that particular vicinity of bank, and that listing further items doesn't give you a tick and a click or a slash.

The tone arm action is listed in. You'll occasionally see your needle go up to 4, 4.5. I mean, your tone arm go up to 4.5. And your needle has gone sluggish and sticky, you say, "Oh, my God, what am I doing?" you know? Because there it is, stuck, and your needle isn't moving very much, and your pc is getting edgy, and he says, "There aren't any more. There are just no more items on this list. There's no more. Nobody could think of another item on the list. There aren't any more. You can only say it so many ways. And I've said them all!"

It's up to you at that moment to be very diplomatic. "Well, just for fun, give me one more." And I even have pulled this gag, right or wrongly: "You haven't given me – you haven't given me 'feathers' yet."

"Oh, haven't I? All right, feathers." [laughter, laughs]

And you'll see that tone arm come down, come down, and all of a sudden you'll hit one of these blowdown areas. They'll give an item, it'll give a blowdown, be followed by a fall, be followed by a blowdown, be followed by another blowdown, *psssww!* And it's way down here, and it goes lower, and all of a sudden you're up and down and it's action and so on and so on, and you look over here and that needle will be slashing. Don't stop the pc to read them. The needle's moving, what are you doing? Why stop to read them? The needle's moving. As the pc lists the needle is moving, so obviously you don't have the item on the list. Because when you get the RI it kills all action on the list. It kills all ticks on the list. It kills all slashes on the list. It kills all RRs on the list. And sure doesn't kill TA motion. That's the one thing it doesn't kill. Because he just thinks about TA and you'll get *phhhhhh*.

And you will get blowdown motions of the TA. You'll see it going *pssswww*, *pssswwww*, *psssss*. Needle, see, going *phhhhh*. You try to read sometimes as you're listing through one of these blowing down needles. You can get these blowing down needles without finding the RI.

The question is, now when you read a little blowdown area back to the pc, did anything tick? Did it – did it slash once? You better make a list of these. Did it tick? Did it slash

once and then not slash again? Does it read when the pc says it, but not when you say it? Well, it's not the RI. That's not the RI. Did two items go faintly tick and the next one go tick? You haven't got an RI on that list. Because two items went tick.

"Ah, yes," you say, "but I'd better get in the mid ruds, I'd better get in 'Suppress' and 'Careful of' and 'Fail to reveal' and 'Invalidate' and 'Suggest' and 'Mistake' and 'Protest' and 'Anxious about' and 'Decide,' and if I've got all those in maybe I could make it read." Save your time, man, save your time. Get in your session mid ruds if you want to. But don't try to make an item read. Because you couldn't stop an RI from reading with an anvil parked against your needle.

So I repeat, just as you've just listed there, if you're – if you're – if it – you call it once and it goes *pssww*, and then you call it again and it doesn't do anything, that's not it. You call it once and it goes a little, tiny slash, and so forth, there's no sense in sitting there, "Has this item been suppressed?" and so forth, and so on. There's no sense there. *Dumph!* What's the difference? Did it give you a laggardly fall? No blowdown? When you gave him the item you got no blowdown? It's not the item.

I don't care if you didn't give it to him or not. You just said the item, you got no blowdown. Two items ticked on the list, much less two RRed, oh my God, you're getting up into orders of magnitude – two items fell, two items slashed, oh, forget it man, get out of there fast. If any item after it slashed, ticked, clicked, did anything, you haven't got it on the list. It isn't on the list. Because when the RI, an RI comes on that list, you won't – you'll get expert. You probably won't make any mistakes at all. First time, you'll say, "Oh, gee, look at that beautiful blowdown there, now look at it, oh, what lovely tone arm motion." Oh, yes, well, let's read it back to him. Oh, well, one of the items ticked, but the other one sure reads nicely – *Ha-ha!* So on. We'll give that to him, you see, and we'll list against it, and your pc will start getting sort of green, and *uuuuuhhhh* – this one is going off the rails in an awful hurry, you see.

You finally find the item you're listing from continues to tick. And if you eventually came back to it and continued your list, you'd find out that he would have put four more items on with the TA more or less motionless, and then all of a sudden you get twice as much blowdown as you had before, and twice as much commotion, so you say, "Well, gee, that's all the commotion a meter can produce! I've never seen that much commotion before on a meter, so that's obviously an RI. That Ron really knows what he's talking about because that really is an RI. Look at the amount of tone arm motion that thing fell. *Wow!*" See?

That isn't it. You'll have – you'll have experience with this. Can think nothing of going through six areas on a list where the meter falls apart and blows down and blue smoke comes out of the corners. Think nothing of it, before the real RI goes on the list. Because when it goes on the list it is totally unmistakable. Anything else a pc puts on the list now, as he says it, will not disturb the needle. But you'll be getting – you'll have to read between the fact that your needle is moving to give you TA blowdown.

But you – he says these items, and nothing happens. Says them and there's no slashes, there's nothing, nothing. You read it back to him again, it goes *pppsssww!* and blows down and goes and he cognites and everything, *bwaa* and he finally tells you that's it. You some-

times give him the item and the pc, if he has any honesty whatsoever, he – you give him the item and it flicked, ticked.

Aaaaahh! "Duck feathers. Things that come out from ducks." He'll start giving you items again. Quite common. He recognizes this thing turns on, it doesn't do anything for him, so on, you realize he's given you – you've given him a wrong item of some kind or another. So he just goes on listing. So never stop him from listing. Anything that turns on a lot of energy and mass and black ridges and that sort of thing, that isn't the item, that's all. And you just have to get used to it. You have to get used to, one, being awful doggone sure that when you find the pc's own goal – it's easy to find pcs' own goals today. But when you do find it, make sure it's the right wording. Make sure that you are listing the present time goal. When you find an item let's make sure it is the right item, and so forth.

And one little note before I cancel it off here, "coterm," there is no such thing as a coterm. That's the same RI appearing as a terminal and an oppterm in the same GPM. And very rarely appearing in two different GPMs. Same item appearing in two – but it appears as a terminal, appears as an oppterm, so of course it looks like it's a coterm. So it's both. And that was the mystery of a coterm. I've now plotted it all down and straightened it all out.

Drive you mad! I mean, this item, the inability to duck, or something of the sort, you see, that's halfway down one bank and it's the top opp – the top terminal, and the middle oppterm. And it just takes that poor bank and it just ties it in a pretzel. And you finally list against one side and you list against the other side, and you don't know which side you're on and so forth – well, go ahead and list it, but you know what you're doing.

Now anyway, there is the score, with regard of R4MTA. This is the final product of this sort of thing you're actually handling all the time. Whether you're chipping in on it from the top, tickety-tick, with a – with a little tack hammer, with RIC, that sort of thing, as long as you get tone arm action, you're carving down toward those two top RIs and you're carving down to the top of the GPM. And there's nothing else to carve down to. Doesn't matter what you run, you're running those, and when you find the GPMs and move it on up and get the guy's goal and get his present time GPM, of course you list for those things. Always be suspicious that you haven't got it. You might be twelve pairs away from the top ones, even though it looks like the top one. But keep trying for them. Keep moving them up.

You can always take what you get as the top, run down to the bottom of that bank to its goal, and run it out, and then go back and find the top. And you will be surprised how much top there was still on the bank. This is good programming.

But the main point I'm trying to make you is, is that is the zone where the pc's interest is. That is the zone where the pc's attention is. That is the zone which produces the overstimulation that makes pcs almost impossible to audit. And that's the zone and area that you're trying to crack. And it fits in across the lines technically and otherwise, and when they blow you have never seen quite the same result on your pc as when you get the real top PT GPM and the two top oppterm for it. And really get the pair that are really there – not the ones that you thought that were there at first – the meter said. But when you really get those, and when you get those top twelve, you'll have wondered what you thought a case result was. That I can

absolutely guarantee. But remember you have to be a careful auditor; you have to do a very good job, and you mustn't miss anywhere along this line.

Because you do something careless, and you do something stupid, and you do a proper – an improper analysis on a goal, and you do an improper analysis on the – on the RIs you find, and you start getting sloppy and goofing up, one way or the other, man, you will never have seen such a mess.

So you're going for the biggest win and the biggest mess. Therefore you have to know what you're doing in order to get there. But let me assure you, it is very, very well worth doing. Even the pc who is saying, "But I have put it on the list. I've put it on the list twenty times. I've put it on the list more than twenty times. It's duck eggs! I've put it on the list – duck feathers! Duck eggs! Ducking! Oh, well, all right, all right, all right, all right. Barnyards. I've given you the item before, but I'll give it to you again, I'll be nice. Barnyards. Barnyards, cows, picken – chickens, pigs, horses, farms, farmers, so forth. *Aaaaah!* Geese!! Geese eggs! I'll give it to you, I'll – all right, I will, oh, you want me to give it you, then I'll give it to you! All right, *rrrrrr* – if I don't give it to you first in some other way." [laughter] "Oh, wait a minute. Wait a minute. It's duck. Duck!"

Pssss! Your meter goes. Duck. That was fifteen pages of hell later. But he will say, even then, it's worth it.

Thank you!

Summary II: Scientology 0

A lecture given on 25 September 1963

[part missing]

What's the date?

Audience: 25th of September.

[part missing]

Twenty-fifth Sept. AD 13.

All right. Well, the lectures you have listened to from the 24th of July forward round up, as I told you yesterday, all phases of Scientology. And you may not quite grasp that at first glimpse because as you look back over this particular period of time it doesn't seem to you, perhaps, that there's too much in that period. I know you look at your notebook and you get a little staggered, but nevertheless, it didn't look like you hit too many subjects or ideas or something since the 24th of August – pardon me, July. Since 24th of July, just haven't hit too many ideas of types of things and so forth. Since that time you've covered the itsa line, you've covered ARC breaks, the auditing cycle, the versions of R1C. You've had the R2H Tone Scale and so forth. And you've had service facsimile and clearing by R3SC, and you have had the pc's actual goals on a rundown of it.

And now if we add to that Touch Assists and the CCHs, the Tone Scales, various scales, all the particularities of the ARC triangle, the Auditor's Code and Code of a Scientologist – you even had Project 80 in that period which is Scientology I, don't you remember? – and actually you've got the lot. You've got the lot. There's a lot of hellfire and brimstone can be added to some of these points, you see, like: "Oh, my God, if you don't do this – *ohhhh!*" and you know, that sort of thing. A lot of things can be added along that line.

Undoubtedly there's a lot of new ways to dig into a service facsimile. But you've got a roundup. You've got a roundup. And only two things add to this roundup that round out this series. Well, I just want to lay it before you that you're actually looking at the entire span of body of knowledge of Scientology. And that's quite remarkable. That's quite remarkable. And what I have to tell you now, the first of it is new, which is Scientology 0, and the other is finding goals, which is old R3, and that of course has always been difficult and is much easier now since you can find goals through R3SC, relatively simply.

But these two points are about all that is left out of that entire rundown, and these, I point out to you, are simply particularities.

Now, a lot of work exists which is thrown into this, such as the listing rules, don't you see? We haven't had too much about listing rules, but I've told you a new type of listing which

is by TA. And even that has been described. But this is a summary. This is a summary of all of the important points. And this is the data, covered as I have told you just now and since the 24th of July, which is very, very, very important data.

There are about five tapes from 1962, in the autumn, which talk about the theory and Formation of the GPM – the pc's actual GPM. Well, these are interesting. They're background theory material and they're quite interesting. The HCOBs on how you run R3M2, and that sort of thing, are contributive to these things.

Now, the whole body of implant GPMs and this whole body of knowledge has been examined with great particularity. It's a marvelous training area. But the value of an implant GPM is very slight. Aberrative value is very, very slight. I think of it now, those fellows working in the sun and the big moon of Helatrobos – I think of them now, sweating there, the temperature there was seldom below 85, you see. It was real hot and so forth. And there they were, sweating and keeping the poles greased and bringing thetans in and freezing them up and going through all these ramifications – and sweating and miserable about the whole thing, you see. Their consciences rotting away within them, you see, it's a terrific overt. And these between-lives blokes, you know, there they are, they're sweating away, you see, they're keeping that running, you know, and *ahaaa* and implanting, and they've got a trai... they wear out trains and trains and trains, giving those train goals, you know.

And there they are, going on right now, here in present time, and there they are, vast sums of money and so forth. And the amount of aberration which it adds to the case is something like a drop of water into the Atlantic Ocean. It's horrible. Because they would be so upset if they knew. They obviously don't know or they wouldn't keep on sweating at it. It's fantastic. It's all for nothing. It's all for nothing.

All they did was make the universe look more hostile. And they probably color the type of RI which the – or – and even sometimes the type of goal which the pc postulates. They undoubtedly have had an influence in this particular direction, but it's an influence of significance and not an influence of quantitative action at all.

Now, if they disappeared the world would look friendlier and people would have a better chance of destimulating, you see? The present time problem with regard to it wouldn't be so great and they would feel better about it. But this I – point I wish to make: is those blokes aren't doing it to anybody. See, they're just some tiny, small assistance. The thetan is doing it to him self. Which of course a lot of you during this period of this summer, going through these implant GPMs... and I'm very glad you did because it's a highly educational area, those that were in Y and Z. And if you think you've escaped them totally, why, those coming up now out of X, they're all set and roaring and so forth, and they're going to probably find on their plate some morning, "Run 'to forget' out of a Helatrobos series," before we let them run any aberrative GPMs.

The poor pc will be sweating there and his tone arm won't be moving much and the auditor will be trying to get those rocket reads and they'll be right back in there pitching again, don't you see?

One of the ways of doing it is to find the pc's own GPM and then find out if there is a counterfeit one somewhere on the track, and it'll run like a startled gazelle. Aberrative value 0

but it'll just run fine. By the time you've run three or four of them – "to be lost" or something like this – by the time you've run three or four you're not going to get any TA action because you will have restimulated, of course, the pc's own actual GPM to a remarkable degree and have to go ahead and run it. But it's an interesting practice area.

But I think of it now, I think of it now – the administrative agents; the FBI of the big confederation, you see; and the Bureau of Implants, don't you see – and there they are and they're all feeling bad about this and they know that it's all necessary and has to be. Hasn't practically any influence. It speeds up the dwindling spiral and it makes the universe seem hostile to people, but beyond that its aberrative value is nothing. One great, big, crashing RI has more value than the entirety of all of the implant series.

But it's a good thing for you to know what this universe is like. And if you really want to know what it is like, and that sort of thing, this is an exploratory area: what has been done, what people are devoted and dedicated to in keeping other people aberrated, that sort of thing. And it's quite interesting, as a review.

And you should consider quite valuable any experience you've had in running an implant GPM because you won't ever have any trouble with an actual GPM. Actual GPMs are far sloppier and nowhere near as neat and they're not preordained at all. And you're off into the blue and you're having to use judgment as you go along the line on these things. And you can make more mistakes in less units of time than in any other field of superhuman endeavor.

Now, that sphere and area is one that cannot be skimmed. And we mustn't skimp the technology of how you run an actual GPM; you mustn't skimp that. It looks kind of sloppy so you tend sometimes to do it kind of sloppily. And one mistake in that aberrative stuff is of much greater value than having gone – the pc's having gone through the whole of the Helatrobis Implants. So that's nothing – that's nothing to toss around lightly.

But that technology – that technology all exists and it's in the bulletins on listing and so forth. And the only thing modern of that has been covered since the 24th of July, and that is you list by TA.

Now I want to cover rapidly here, there's actually three subjects, I've got to cover more about handling this – today's lecture and tomorrow's – more about handling these, programing these things and so forth, in actual GPMs. Want to tell you right now – having gotten your goals all restimulated – I want to tell you right now about Scientology 0. And this is just a very brief, brief, brief coverage. We'll have much better coverage on this subject, but the essentials of this are of great interest to you.

Every level of Scientology contains, in vignette, all levels of Scientology. It's a nicely built little schema. Reg was busy pointing this out to me, he said, "Each one of them contains all the levels." That's right. Level II contains all levels of Scientology. Level III contains all levels of Scientology. What do you mean by all levels of Scientology? Well, levels of Scientology, each one, have its own designation. And these, perhaps, could be better defined and the material could be better released to you, but let me give you just a rapid coverage; and I don't say that these definitions particularly hold good because I'm just talking to you for your understanding, not for your memorization.

And that's simply this: Scientology 0, of course, would be the big question mark. This is the problems and confusions and wrongnesses; zones of chaos of existence – the identification of those zones of chaos.

Now, let's take a 3rd dynamic example. Healing has in it the medical profession. All right. They apparently got it all wrapped up. They're a marvelous solution, aren't they? Now, you've got to identify the chaos. Identify the falsity. Identify the upset. People walking around all over the place and they think mental healing is all solved. They think healing is all solved. They don't know that if you've got lumbosis you haven't got a prayer. See, they don't know any of the true data concerning this. What is the situation?

Now at Scientology 0, you point out this interesting thing: You point out the fact that these are unsolved areas or there are pretensional solutions in them. This is a survey area and a delightful area to work in. In fact, newspapers and so forth work in practically no other area because all you have to do is find falsities and wrongnesses. And that's it.

All right, now how do you use this? A bunch of people come in – PE class – and you're talking to these people, and they're sitting down there and they think something is all wrapped up. Well, at the level of Scientology 0 – and everything always starts at Scientology 0 – is, you say, "Well that..." You see – they – it's religion and God, see. Let's say that you unfortunately got into this particular zone and area, and so forth; let me give you a very flagrant example you would not use, see. And that is the church – let's put it in its crudest form – the church does not have the human spirit all wrapped up.

That's an interesting – an interesting approach, you see? But let's say you have there this bloke, he's sitting there and although he doesn't believe in religion, he believes the spirit is all wrapped up. In other words, man's going to go to heaven or he's going to go to hell and that's it; and the vicar knows best. See, he's got that. That's all packaged, it's all put away, and it's some mad zone of confusion that would hum out at him like a flock of bumblebees if he ever really lifted the cover on it, don't you see.

Well, the least you can do is warn him that if he lifts the cover on it, he's going to be hit in the face with a lot of bumblebees.

Somebody made a horrible mistake over at the FCDC the other day, by mentioning between-lives during the church service and learned immediately that he should have kept his mouth very shut. And was around at a... looking kind of scarlet-faced afterwards, and so forth. Well, he at least knew he had made the mistake.

But in actual fact, how much of a mistake had he made? Well, he had only made this mistake: He had opened up too much Scientology 0 too fast. That's the only mistake he had made, see? So it's a case of degree. It's just a case of degree of what you reveal or point out, and this is something. This is a powerful subject. It's a level of the operation of an aberrated world, an aberrated universe, see. That's the level of spotting.

Well, now if you stand up there and you say to the people, "Oh, everything is all bad. It's all bad over there and it's all bad over there, and it's terrible, and everything is going to pieces. Oh, yeah, and – and everything is bad everyplace and there isn't anybody good anyplace, and there are no – nothing but just false situations and everything else." They'd say he's

nuts. See, so this is just a level of degree. He might be making sense! I mean it might be perfectly factual. But that's too much Scientology 0, see. That's something like emptying the cough medicine down somebody's throat, and it's the wrong presentation, see.

Too exaggerated, insufficiently definitive, obviously opinionated, R-factor poor, not a convincing presentation, don't you see? I mean, all of these things are wrong with it.

Now compare it with this – let's take a typically British approach to this situation – "Government might not be the perfect answer." [laughs] See? That might be a too-little dose.

All right, what you want – what you want here – in Scientology 0, you merely want the people to become aware of the fact of what the problem is. Now this is an interesting level to work in because it doesn't have any tone arm action in it. And that's why you can easily overdo it. The only way you could get any tone arm action in it at all would simply be to talk about false solutions. You might get some tone arm action in it if you talked about some false solutions. But if you say there's nothing but problems, problems, problems, problems, problems, you've got no tone arm action at all on your audience or anybody else, see.

So you shouldn't infer that there are no solutions and only problems. Now, I'm just trying to give you the fact that people don't try to resolve anything or do anything if they think it's all wrapped up. And you'll find out that the complacency of the world is one of the basic things which keeps it gorgeously aberrated. The complacency is marvelous. The government has got it all wrapped up, but the FDA all of a sudden decreed that everybody had to take two quarts of fire extinguisher fluid a day to wash out the vitamins which poisoned them. They'd say, "Well, yes. Well, they know what they're doing, and so forth," and you see, the fact that a bureau has said it or something like that immediately decrees there must have been some sense to it. This is this terrific reasonability factor that drives us around the bend, you see.

And if they want 95 percent of your pay, don't you see, in tax, well, there must be some good reason for it, don't you see, and so on. And you might say, the last stable datum that anybody can get in is a toleration of the terrible condition. See, and they say it is reasonable or there must be a reason for it, don't you see, so therefore in some fashion it is all right. And that keeps it off their back as a problem.

But you, being more adventurous characters, are always lifting the lids off of things, you see, and you say, "Well, maybe that isn't quite all right." Don't you see? And you look inside this thing, and you don't only find that it is not all right, don't you see, you find out that there's an awful swindle connected with this thing of some kind or another.

Well, it's all right to discover all that, but Scientology I is getting off these solutions and falsenesses, see, so you're really not involved in Scientology 0 with running the false solutions, don't you see? You've got a little borderline there, and you put an itsa line in, but remember you're going over toward Scientology I slightly.

Now, it's simply – it's simply the level of existing chaos. And you say – here's a typical Scientology 0 question: "Is your family hard to live with? Do you find your home noisy?" Yeah, typical. "Are you worried about your job? Is there any part of life about which you have anxiety?" See, these are simply – these are simply questions which awake a person to the possibility that his life might be better.

And it all carries with it the possibility that the condition can be improved. And that is its sole and total therapeutic action: hope. You say there are these problems: bong, bong, bong, bong, bong and maybe something can be done about them. So its entire therapy level is this faint hope. "Maybe we won't always have a government." That's its therapy level and you find out this is quite workable. It's quite workable.

This is the lowest level of processing, is giving somebody some hope; lowest level there is. And that goes along with the fact that you say there *is* a problem – so let's now summate this level, see – "There *is* a problem" is its strongest statement, and the strongest process that is applied to it is "Maybe something can be done about it." See? It's just that.

A view of Scientology 0 is simply the world as it exists, and if we had no level of Scientology that paid any attention whatsoever to the existence or the is-ness of existence, you see, that is the conditions and problems which exist in the society, we would have no area to study society just as itself and we would keep on simply trying to resolve society all the time. We wouldn't ever look at society and therefore to that degree we're moved off from society.

So this is the legitimate level of inspection. At this level we can notice, somewhat dispassionately, that the greengrocer, every morning at 9:32 rushes out of his shop and throws rocks at the small boys and rushes back into his shop again. The therapy is, in that particular character, "We hope the rocks didn't hit the small boys, you see, and we hope he isn't too disturbed. And we hope he will be happier about things someday." You got the level? But you still could stand there and watch him rush out and throw rocks at the small boys and watch the small boys, and he goes back into his shop at 9:32 every morning, see.

We don't go around and say to him, "Well, why don't you make friends with them or communicate with them," see – *ha-ha-ha-ha-ha* – Scientology I. Called 0 because you don't do anything. At this stage there's nothing.

Now, a lot of this goes a long way. We say all the levels of Scientology are contained in each level of Scientology. Do you realize that in order to find a service facsimile, you have to ask the fellow what problems he has, or what he's worried about. This always comes into it slightly, doesn't it? So a little of this goes a long ways. And this is an assessment of problems or something like that. Well, that's the Scientology 0 aspect of the case. In this particular case, however, we aren't limited on the therapy angle because it appears in another one.

But we still have to have an H-factor in sessions, remember. You know, you can knock your pc in the head. Your tone arm's falling off the pin, see. Your tone arm's going *zing, zing, zing*. It's falling off the pin and so forth. You sit there – you sit there... and he's going on listing, see. He's going on, and he's listing and he's listing, and he looks at your face, and you... And he says, "Well, am I getting any place? Is – is the tone arm action – I mean – I mean, is it increasing, or anything is happening, or we still getting a lot of rocket reads?"

"What?"

And he goes, "*Uhhhh.*"

You see, the H-factor is still there at upper levels of Scientology. You say, "You're doing all right," see? "And if you aren't, I'll fix it up so you are." Little hope involved in this

situation, you see. That keeps up his confidence so that he will tackle it. And so even your H-factor's in there.

Now, if you said to everybody on a PE Course, "Everything's bad, all over, everywhere; everything is all bad. In fact, there's no place anybody can find where anything is good," you immediately would have gone wild with your Scientology 0 because, you see, you would have omitted the process. And the process is simply even if you said everything is all bad everywhere, you say, "But maybe it..." The faintest thing you could say, "Well, maybe it'll turn out all right," you see, or "Maybe if everybody got busy they could do something about it," or "Maybe if we studied this thing enough and learned something about it, it wouldn't have to be that way," don't you see? That's the least statement you could make. And even though you're then talking about entheta conditions, you've still got a theta line going along with it, see. You say, "Well, maybe we could even *ease* these things, or get rid of them or something like that."

Now, you'll find that this is very acceptable on a public level if you don't overwhelm them and if you apply just a small amount of hope and don't get too enthusiastic about the amount of hope and don't promise them the moon with a fence around it, because that isn't necessary at all. As a matter of fact, it's not acceptable within their R-factor. You give them something on this order – you give them something on this order: This fellow, he's come in and he's all gimped up one way or the other. He has a pretzel for a spinal cord. There he is and we say, "Well, so-and-so and so-and-so and so-and-so." "Well, your trouble," we could say to him, "your trouble – possibly that you're disturbed about something."

And you let him put in some Scientology 0 on it. So it works the other way, too. He says, "Hey, you're damned right I'm disturbed about something. My spine, you know. I'm in pain, agony all the time."

Well, there isn't any sense in selling him up too high, because you'll give him too high a hill to climb on his reality factor. You hear about it; he can't sleep at night and he can't this and he can't that and he can't something or other, don't you see, and all this is impossible and this is agonizing and so forth. And pick out one of these minor, minor, minor, minor, minor things that he is giving you and say, "Well, there's possibly some poss – ," because he won't believe you on any of the strong ones. And you say, "Well, maybe we can fix you up so you can sleep better at night."

This becomes very acceptable. Now he's got a goal. He goes ahead – he doesn't expect you to unpretzelize his spine. But he'll move ahead on this and you some degree have slightly bypassed the hidden standard, don't you see? You've given him a new little standard. If he's winning any, he'll sleep a bit better at night, see, something like that. Something you think you must possibly make out of this.

Wrong approach: "Oh, well, we'll have you walking 6 foot 6, and looking 16 years of age, and all the girls whistling at you as you go down the street." No, that's not acceptable. First place, that's too much. He has already learned to live with it. It's already part of his service facsimile. It has some method of making people wrong. You try to go head-on with him and take it away from him directly, or say you are going to, he isn't going to release it, man. All he's going to do is make you wrong.

So what you've got to do as far as that's concerned, remember, you're just working at Scientology 0, not at your processing levels, you see, is he tells you this and that and the other thing. Well, you just pick out the tiniest little one that slid in, any way whatsoever, and put some hope in on it. See?

Like, "What are we going to do about the government?" "Well, maybe we could fix it up so there are fewer politicians talk on TV." Got the idea? And you know somebody would – somebody – they got enough – they can face that, see. It's a gradient of confront is what you're working with. This guy could face perhaps giving up enough of his service facsimile, you see, to sleeping a little bit better at night, because he didn't intend to have his rest disturbed, too. He just wants to get even with people in the daytime. [laughter, laughs]

But, you're giving him a little bit to confront, and maybe these people on government, you say, "Well maybe we could get the people to – maybe get the politicians to talk less, you see, on TV." And by George, you know, you could probably organize quite an association, and quite a society. You could probably have people without saying two questions of it, or anything else, or doing anything odd about the association at all, but just going out and working like beavers and writing letters to people and visiting their parliamentary representatives. Well, they'd have a marvelous time, and so forth. And all they want to do is limit the amount of time which a politician can talk on the air.

Now, there's an adjudication between this, is how much is too little and how much is too much? And that is a piece of judgment that has got to be made. And a person who is working at Scientology 0 – and remember, you work at it every time you talk to a pc about what you're going to do – while you're working at this, that's the judgment that you must go: not too much, not too little; acceptable and confrontable by the person. What's confrontable.

Now, you're talking to a PE Course. You're talking to a PE Course. Now, this is the study of confusion. Now, the practical aspect, if you ever gave anybody a drill on Scientology 0, would – you would have a long sheet of beautiful confusions that have to do with the immediate family or neighborhood or the immediate dynamics of the individual. And you'd simply have him pick out which one of these confusions it was probable that the people he was talking to could confront. See, which one of these confusions could they confront? And you could train him up, see, to this degree. You could have a drill, you see. And you eventually wouldn't get somebody dashing out saying, "It's bad all over the place, and we're going to shoot everybody tomorrow," don't you see, as the immediate indicated confront. "We want you to go and shoot everybody tomorrow," you see.

Well, even though he has an audience that possibly under different case levels and so forth might have been perfectly willing at one time or another to have shot everybody tomorrow on a problem of the magnitude they are facing today, he is not at that moment talking to an audience that is going to go out and go down to the arms store and get the police permit and shoot everybody tomorrow, see? They're not going to do it.

All right. But they are going to do something. And this, then you always make as an assumption: that there is always something that you can get to be confronted on any dynamic. Always something you can get to be confronted on any dynamic. It mustn't be too much and it mustn't be too little.

Let me give you – this would be an absolute perfect formula for a social worker – going around, and the babies are falling downstairs in the tenement, and everybody's crying and screaming and there are three fights going on on two landings, and a flatiron comes sailing down through the area way, you see, aimed at the maintenance man or the janitor, you know. And Mrs. O'Leary has an awful lot of problems and her problems she's firing off at this social worker, and it's this and it's that and it's this and it's that, and so forth. And if the social worker says – Mrs. O'Leary's husband gets drunk all the time and never brings home any pay and furniture all gets stolen – it's always being broken up – and the rent's behind and so forth, and there's all these things, see. What's the social worker trying to do?

Well, the social worker always has to ask himself this question – the auditor always has to ask himself this question – the PE lecturer always has to ask himself this question: What is he trying to do? Well, if he's trying to make somebody happier in his environment or trying to get some action in some particular direction or something like that, then he uses and adjudicates his actions – he uses these formulas and he adjudicates his action along in these formulas.

He gets something done that can be confronted by the person he is trying to get to do it. This is all so elementary it sounds like you're talking kindergarten. But actually, there's a little bit of something interesting here. This is an undercut of such fantastic numbers of problems, that although it sounds very simple and innocuous, it has fantastic workability.

So he says to Mrs. O'Leary, and so forth, the social worker says to Mrs. O'Leary, she says, "And you can't do, this and you can't do that and can't keep the place clean. About the only thing, you know, just can't keep the place clean at all." And he notices that Mrs. O'Leary has emptied an ashtray for his cigarette see, as she's standing there talking to him and so forth, and he says, "I'll tell you what I would do. I'd start in on this thing a little bit at a time, and I'd get the place cleaned up. Now, why don't you keep the ashtrays emptied?"

Although she might even fly back in his face, see, at first glance, you look around here, what could she do? He's not processing her because it's sort of a one-command situation. Well, she might be able to keep the ashtrays empty.

You will be surprised. She might even natter at him a little bit. And when he leaves, why, she'll go around and empty the ashtrays. And all of a sudden a fantastic resurgence of hope may occur in that woman. See?

The trick is, there is something to be done about it – that's one level of hope – that *you can do* – is the other level. Naturally, it applies in all processing, too. Pc's in trouble, it's always a marvelous thing to sit back and ask – find out what the pc can tell you about it. You'd be surprised how often this works to pull a pc completely out of the doldrums. Pc can confront doing something. He's climbing too high a hill. Every once in a while a pc says to you, "I'm climbing too high a hill." Well, there's a point where you make him climb that hill anyway. And another point where you don't force him to climb that hill because you'll wind up in trouble if you do.

Particularly in Routine 4 processes, you actually mustn't force the pc forward. You mustn't force the pc forward. The pc's nattering, find out what the ARC break is about before you proceed. And if the pc is actually having a hard time doing, well, just take it easy and see

if the pc can't do it anyway. And you'll be surprised, if the pc is not pressed or pushed, how the pc will climb that hill anyhow.

All right. Well, this is a difference here, this is an oddity here, I'm throwing this in as showing you that it does fit at lower – upper levels. We left Mrs. O'Leary emptying the ash-trays. First doggone thing you know, she's liable to be getting highfalutin ideas she can do something about stopping her husband from drinking and coming home. She starts to get the idea something can be done about it.

This isn't the experience of the average social worker, now, to show you how missing this technology is. These people are, (quote) trained in social work (unquote) with an exclamation point on the quotes. Because they only complain to you about one thing, and if you talk to social workers they'll just complain to you about the fact they can't get anybody to do anything about anything. And for lack of this piece of information you get total socialism and total indigence in a society. And that's how big the datum is that sits at the bottom of it. Because nobody ever gives anybody anything they can do.

Nobody ever adjudicates the problems involved in the situation and then does something about those problems that can have something done about them and that somebody can confront to do something about them, see? So as a net result, a social worker goes down scale on a toboggan because he never gives anybody anything they can do.

Now, here and there, there may be some screaming genius of a social worker who is not bound by those rules or who has stumbled onto this data and utilizes it one way or the other. But such a person is, of course, vastly in the minority, because the social worker at large is terribly unsuccessful. Fantastically so. Always giving people: "Now, what you want to do, Mrs. O'Leary, is clean this whole place up; scrub it down from top to bottom, after all, we've given you soap. And get your children there and get them cleaned up and put in those nice new pinafores that we have had sent down to you. Now, I'll have a talk with your husband concerning his drinking."

And right at that point the social worker has – even if the woman – even if Mrs. O'Leary *would* have cleaned up the whole place, even if she *would* have put the children in the clean clothes, at *this* point she and the social worker part company violently, because the social worker has *told* Mrs. O'Leary something that Mrs. O'Leary *knows* by experience *cannot be done*. Nobody can talk to her husband about his drinking. She couldn't even conceive the United States Army, with fixed bayonets in a Little Rock charge doing anything about Mr. O'Leary's drinking. See, she *knows* this. And you've just run head-on, you know, *crrrrash!* See, into a stable datum.

Now, don't get peeved, for instance, at the Better Business Bureau, so-called; it's a swindling organization that uses blackmail to procure contributions for fear that they might say your business is bad. It operates in the United States. It's quite a racket. Mostly their bureaus are run by people with criminal records. But anyhow – they're the primary authority on how bad Scientology is in the United States, see. All right, now, these boys – these boys, because they're fed this by these two jerks at the AMA, see. All right, great. But these two birds up there feed them data and then they put this data out, but they don't put it out to be mean,

they actually put it out because they believe it because they don't think anything can be done about anything.

First, one, they don't know any problems exist, and two, if they did, they didn't – wouldn't think anything could be done about them anyway. Now, if you just accept it even at a level of the Better Business Bureau whose questions you see, one – well, their ethics and intentions are probably open to serious question. You probably could even sweep them aside if you used this particular type of approach and this data and kept your head on while you were doing it. Just used this, see? Because the Better Business Bureau says that nothing can be cured. And you could probably sweep this away by getting the Better Business Bureau to agree that people could be made more comfortable. I mean, if you were talking to them and arguing with them.

Your Scientology 0, then, would consist of the fact of there are a lot of people who are uncomfortable; your level of problem that they could confront, see. They couldn't confront the problem that people are sick and dying and being cut to ribbons on operating tables and the blood spattering all over the wall, you know, because this is a pretty gaudy picture, see, of what they're supporting. They wouldn't be able to confront any part of it, so they don't consider it's a problem because they don't see it, you see. You've got to snap them out of their service fac just to this degree: To give them a problem they could confront.

Now, "everybody is dishonest everywhere," that just plays right into the hands of their service facsimile, don't you see? No, you could probably get them to agree that there are quite a few people around who are uncomfortable, and by talking to somebody in a friendly fashion could be made more comfortable. Oh, they'd buy that. They'd say you were great. The AMA wouldn't even be able to convince them now that you were doing wrong. Why? They can agree that people are not comfortable. And they could agree that a friendly person visiting them could make them more comfortable. They could agree to this, see.

Well, that would be your Scientology 0 in all levels. There is the study of the problem, discovery – discovery of the general problem from your viewpoint. Then the discovery of the area the problem that can be confronted by the person you are talking to, and then finding some part of that problem, or doingness in that problem, that that person could face up to and execute. And all this is done in an atmosphere of hope. And you have your Scientology 0.

If you could do that uniformly to everybody that walked up to you, you'd have so many pcs you wouldn't know which end you were standing on. Guy comes out here, and he says, "I have an awful lot of trouble with my business. Secretary's always drunk and the workers aren't working and so forth and they came in and they opened the cash drawer and the police are always walking through the place in their muddy boots and – and so forth, so-so-so-so..." He's just talking – you're just listening to some kind of circuit.

And you say, "All right, now, I heard that. Now, what's really wrong here..." See, you can put the itsa line in just as well as he can. You don't even have to do an assessment of Scientology 0, you see – "What's wrong here..." It doesn't matter whether you put in the problem or you get the problem from him, see, we don't care which. And you'll find out this works in R – in R3SC. It's – you can't give somebody goals, but you can sure tell somebody what his service fac might be bordered upon and run it with considerable tone arm action sometime.

For instance, you've been doing lists, you look over somebody's old lists and you find out that every time he hits the subject of women, you notice that – bad women, good women, and so forth – this gives you tone arm action, see. Just that little period there. You know, you get a little blowdown and tone arm action and so forth. Just say, "Well, we're going to run women." See, you didn't do any assessment. That's a trick some of you characters lost out on last week, by the way. You were busy, busy, busy, busy, busy trying to find something wrong with the pc that you could pin a service facsimile on, and after you had done two or three dozen pages of lists on problems, of course, you didn't have any tone arm action. So you see, this has a broad application over into that sphere, because you didn't have anything – any business doing that with anybody who was getting no tone arm action anyhow, see. You didn't have any business doing that with somebody. Well, you didn't have any business listening to any problems and cutting his itsa line on listing and all this kind of bunk. This was the time for you to put the small crank in through the temple, and wind it a few times and have the little bell go *whirr-ping*, you see?

And say, "You know, every time this guy has a present time problem," you know – you've been auditing this pc maybe only a few days – but every time this guy has a present time problem, it actually seems to concern the course. See? [laughter] That's all, see. Or it concerns the girls around, you see, or it concerns something. Assessment – just use Scientology 0, see. Obviously, obviously this person has problems about it because he can confront them. He can confront the course; he can't confront the world; he can confront the course. You'll be surprised how often you will run somebody's best friend as a service facsimile. Well, he can confront his best friend but he can't confront any of his enemies.

Very often, by the way, somebody's liable to get mad at you. They won't be mad at anybody else in the whole world. They'd be sweet as pie to them. But they'll be mad at you. You're their best friend. They can confront getting mad at you. You get the idea?

They would be in a screaming rage at the rest of the world if they could confront it, but they can't confront that. But they can get mad at you. You should understand that sometimes as an auditor. Because you realize, it's always safe to get mad at your auditor. See, your auditor's bound by a code of ethics not to get mad back. [laughter] Furthermore – furthermore, your auditor *is* a friend of yours, you see? So that you might not be able to get mad at your bank, but you can get mad at your auditor, don't you see?

In actual fact it doesn't make the auditor less a friend of the pc. But that's the lowest level he can afford to get angry at. That's actually the basic secret of the ARC breaky pc. He's ARC breaky with the world at large and it's safe to get mad at the auditor. That's all.

Now, that's – you recognize then that here is this – maybe this little mouse character, you see. Why, she hasn't whispered on the street anything of the sort. And yet she's got a – gets into a session or gets into a group meeting, or something like this, and she realizes she's amongst friends so she can dare get mad at them. It's quite interesting. Quite a case gain.

I'd never criticize them for it, particularly. I'd just find something else they could get mad at. But what – that isn't a session use. Thing to do is find out the ARC break and keep going. Get tone arm action is the whole answer to that. Find the bypassed charge and get tone

arm action and, you'll bring them through anything. These are good, workable, sizable stable data that won't wear out.

But here's your Scientology 0 aspect of existence. And you don't tell people about problems that are completely unreal to them and that they know they can't do anything about and expect them to be in a wild, stampeding enthusiasm to get going in any particular direction at all. Works with the pc, works with a group, works with anybody.

Why, you can have the police shooting down rioters with machine guns right outside the door, you see? You could have rioters burning down every government building. And there'd be a very large portion of the population in the midst of all this mess, and so forth, that'd be – sit there knowing that everybody had it under control who was supposed to have it under control. See? I mean, the visual evidence means nothing to them. That explodes one of probably your favorite stable datum, that if somebody could see it with his own eyes, he would believe it.

See, this has such a limited workability. There was one of the high top aeronautical design scientists flew over here from Holland some years ago. Heard I was in London, had to come up and see me, and talk to me about a theory about something or other. And he talked to me, *brrr-bang*, for a while, and went back and climbed on his airplane and went elsewhere. But he told me a funny story. And that is after he had demonstrated that something was actually hanging in space and suspended, counter-opposed to gravity, the commanding general, in charge of all of the project and so forth, got down on his hands and knees and crawled all underneath the table and all around the room, trying to find the secret magnetic equipment and so forth that was holding this thing aloft.

In view of the fact that there wasn't even any cloth on the table, because there was no way to put anything under the table, this was quite remarkable.

Now, of course, his observation of the situation was simply that his word had been questioned, and he was quite wroth on the subject, so he was also limited in his observation. So he didn't really see how funny this story was. There wasn't anyplace in the room to put any such machinery. Yet the general even invents a table cloth to hide the nonexistent thing that is keeping the designed flying saucer, you see, in suspension, see.

See, he couldn't – he saw it with his own eyes, and he didn't believe it. We know this is chronic, this is customary. If you get to thinking it over, you could think of many instances where people see things with their own eyes and don't believe them. In fact, they're probably more numerous than the reverse. [laughter]

So, you never count on that as a stable datum. There's not even any particular – particular sense in being terribly good to prove to people you are good. Because if they're saying you are bad to that degree, then they are incapable of the power of observation to determine when you're good. This – parents and fathers and mothers are notorious in this particular line. Sometimes the son gets to be forty years old and his father still has never been introduced to him. He has a theoretical symbol someplace that he calls a son. And sons behave in a certain way, so therefore this fellow behaves in that way, and he'll even invent a whole false past and a whole series of false adventures to account for this image that he has, but this hasn't anything whatsoever...

And the child often goes, "*Gluuhhh*," practically spins on the unreality of this sort of thing. There is many a child who is always being challenged for the things they have done, which they haven't done. And they get in a woggy state of mind because they're doing things that they should be challenged for and nobody ever sees these. And it gives them a complete *zzzzz*! You see, it doesn't match up reality.

So this is the type of person, and this is the beingness of individuals when you're dealing in the sphere and zone of aberration, or when you're dealing with guys who are downscale far enough to be doing nothing but wear meat bodies, you know, and be on the economic treadmill. When this kind of thing occurs, you must realize the power of observation is out. And the easiest thing to relay in this particular line is an idea. But the idea must not violate the confront ability or the confront potential of the individuals being brought to. So therefore neither the problem, which is being pointed out in Scientology 0, nor the solution must exceed the reality of the person to whom it is being pointed out.

Now, all right, this colonel goes around the army camp and he wonders how these fellows can be so involved in their company streets and their barracks and that sort of thing and operating in their tiny little spheres. You've probably had the funny feeling yourself occasionally, in going into a shop and wondering how somebody could work at that particular bench all day long and never move out of that zone or area, and it probably is almost giving you the creeps. But in actual fact – in actual fact, that person's confront potential on problems is problems of the zone of that particular little workbench. And his ability to confront solutions are the zone of solutions which he is applying. And therefore we say he's an effective person on the job.

Now, when his ability to confront problems gets up to the full zone and area of the entire camp, and he really is confronting the problems of the camp – not problems he dreams up, because this very easily goes on a lower-scale mockery – and he can confront solutions which are actual and real solutions to these problems or doingnesses in that particular direction, you no longer have somebody who is working at a workbench, you have a colonel. See?

Now, because of the system of labels which is used in this particular society, very often the guy who was commanding general in his last life is a private in the rear rank in this one. May be that his confront potential has not particularly reduced. He'll have quite a coterie in his immediate vicinity whereby he's pointing out the things that are wrong to the immediate troops in his vicinity and pointing out the solutions.

What's interesting is, is these are usually more real than the command decisions. That's quite amusing. And sometimes at a lower level of rank you start filtering around through the lower level of rank and picking up the grapevine on the subject of what are the problems of the camp and what are the solutions to it, and you generally find out those are the answers. But according to the staff, command level, you see, why, the problems are – and it's really, they'll start in this sort of way: "Well, really, it's very involved for an uninformed observer, you see, to realize the tremendous difficulties of coping with this situation, you see. And in actual fact, you see, General Smith here is having a very, very hard time trying to keep his number in the proper rank up, you see, at the Pentagon. And that is really the basic difficulty here, because we've got to make a better show with the – and..."

Well, your problem, you thought up to that point, was simply one of morals and drains, don't you see? No, we find out that they're very complicated. And if we listen to this kind of approach for a little while we get absolutely staggered, get completely overwhelmed. We don't know whether we're coming or going. We don't know whether there are any problems in this camp, or just lunatics, don't you see, if we listen to it at this level.

I'm sure – I'm sure that the FDA's opinion of what are the problems of the United States, and so forth, wouldn't stand inspection by a psycho. They wouldn't. I'm sure that if you sat around the press office and the administrative centers and so forth at the White House today and listened to what the problems of the world really were, you would sit there and your eyes would probably start an inch out of your skulls. See? Their Scientology 0 is wildly out. See, wildly out.

It's based on an inability to observe. Well, sometimes these inability to observe are quite real. In other words, you can't go there and look. But that doesn't mean you can't get it trustworthily looked at. That's always something to remember. You can get things trustworthily looked at.

For instance, all too often in Scientology some guy is kicking around and somebody suddenly says, "Well, he's no good and he audited a pc very badly," and all this kind of thing, "and therefore he should be suspended from staff," or something like this, "until he's had 8,000 hours of auditing," or something like this.

Well, there's some kind of a command decision, see. I mean, it's made by an Assoc Sec or somebody of this character. Well, as long as everybody's fate depends on this particular level of action, and as long as that fellow actually isn't observing what really happened or what the circumstances actually are, there is actually no justice or personal security possible. If you get just a freakish flip and "Oh, well, somebody's got to be hanged, so we'll hang this one," you know, that is not a possibility of solution. If you're going to have any justice at all you've got to have the situation looked at. Don't you see? The situation has to be intelligently looked at. That is as intelligently observed as it can be observed and as unbiasedly observed as it can be unbiasedly observed.

You've got to hear people who've said, "All right, he did a bad job," and so forth, and all right, and these other people say, "Well, yes," and you eventually get down to it and you find out the pc had a hangover that morning, don't you see, and something wild was in the lineup, quite ordinarily, that nobody suspected up to that particular time. There were contributing factors; there were all sorts of things.

Well, a person at command level has neither time, you see, nor the position from which he could observe, in order to settle it. So he'd better settle it with people who do have the time to observe the situation and then abide by what they have observed. That's a solution to the situation, don't you see?

In what wonderful shape you would be in if all during your career in this universe you had only operated, ever, upon the actual facts. See? So we get a branch out of Scientology 0. If a group is going to operate in any cleared level, you've got to take the service facsimile out of it as far as you can. And the characteristic of a service facsimile is: is nonobservation and a generality substituting for judgment. Now, those are the characteristics of a service facsimile.

Now, to the degree – you see, you cannot totally remove those on an absolute from all situations everywhere, see, because the very fact of removing them would become so complicated that you would now have new complications to observe. But you can go a long way in this direction. You can go an awful long way in this direction. What is the situation? That's the first question. What part of the situation is potentially confrontable? And what part of that situation will somebody do something about? And of course you've got the whole formula worked out to get observation and action accomplished in this universe.

There's many a – many a king, like Kennedy, swanking around, wants to get everything done tomorrow. I'm sure – I'm sure Kennedy, left to his own devices, I'm sure he would have the Cubans out of Cuba. Isn't that what he's trying to do? I'm sure he'd be able to accomplish this because he's a good, sincere man, basically, at heart, even though he's stone-blind and stupid. Now I'm trying to be fair. So he marshals up the whole United States Army and the whole United States Navy and the whole United States Air Force to solve this situation. And they go out and make fools out of themselves on the high seas for a number of days with tremendous amounts of rocketry, big guns, everything of the sort. They put a blockade all the way around Cuba that anybody can get through. They have an invasion on Cuba and it's carefully planned so that Kennedy, at the last moment, calls off their air support.

The revolutionaries and the people who know Cuba have now been disowned completely; won't have anything to do with them. Shoot them, they're – they're not, after all germane to the situation because they are out of Cuba already, see. So he accomplished that much. So we don't worry about them. We don't ask for any of their advice. It's starting to look wilder and wilder when you get right down and look at it, you see, and this is just a basis of generality substituting, you see, for actual judgment. And the generality got there in the first place because there was no observation of the situation. I don't think anybody's made a study of the situation at all of any kind of an impartial nature. I think everybody's just riding hobby-horses and big wild theories and that sort of thing.

Situation couldn't possibly maintain itself the way it is if somebody sat down and made a good, broad, wide survey of all the factual evidence and did all the personal observation that he could on the situation. He'd eventually wind up at the other end with an exact appraisal of the problems and situations as they exist in the vicinity of Cuba. And then, of course, he could pick up something which is confrontable about all this and start moving in on that quarter, and then start moving in on another quarter and the problem called Cuba would go *pssww!* That would be the end of that. Got the idea?

All right, you do with – this with a case all the time. And you ought to know this cold about cases. Very often, any time you've got a failure on a case, you have *not estimated* the state of the case; that is to say, the confusions and problems of the case. These you have not estimated. It's very often a great shock to an auditor after he's been auditing, out of the best possible motives, auditing somebody for two or three weeks to suddenly come up with a gasp and find out something new about this pc that he'd never known before and it completely alters the whole situation and program of which he was operating, you see?

Well, what's at fault there was an uncared survey of the case. He didn't look this case over before he began in on it, so of course he made mistakes. In other words, he cut out the

observational point. Then he, himself, didn't do what could be done, because of course it was based on unreal information. And then we get what is commonly called a case failure. You know, he didn't make good progress; it's that sort of thing.

Well, frankly, all case failures are addressed more or less into this zone and area. Somebody made an improper estimate of the case in the first place based on bad observation of the confusions and difficulties of the case and then didn't handle it on the basis of what the auditor could confront and what the pc could confront and, of course, we have a case failure.

Now the auditor, in looking this pc over, as he's listing these problems and difficulties and solutions is actually listing two different zones, or two different aspects. The problems he can see about this case – problems and difficulties and confusions about this case that he can see – and then, of course, there are problems and confusions and difficulties about the case that the pc can see. And these vary widely. These are two different points of view and they are quite different. And I've told you about the fellow that walks in on the crutches and tells you that he has a constant pain in his ear. That's what's really wrong with him. All right, he's apparently never noticed that he didn't have a right leg, you see?

This then follows through that there's the auditor's estimation of the pc's problems and difficulties, then there's the pc's estimation of the pc's problems and difficulties. Well, the auditor is too often simply content with his own estimation of the pc's problems and difficulties; he pays no attention to the pc's estimation of his problems and difficulties. This becomes a missing factor, then, in auditing.

Now, there's a certain level of these problems and difficulties that the auditor finds confrontable. He finds confrontable, see, or she finds confrontable. And then, of course, there is the point of the problems and difficulties – and now remember this is not a point of view of what the auditor thinks is wrong, but a point of view of what the pc thinks is wrong which the pc finds confrontable. There's one of these things – now get this – that the pc thinks is wrong that the pc can find confrontable. So therefore there's what the auditor can confront about this case, don't you see, but that's a confrontation of this totality of confusions and difficulties which the auditor sees; and then there's the pc's point of view over here, but that is a point of view of an entirely different group of problems and difficulties. You got that?

Now, the pc has some part of that series of difficulties which the pc can confront. See that? All right, then – then there's a certain point of level which the auditor's experience and so forth has told him that he could do on the problems and difficulties which he has confronted. So that actually is the doingness which the auditor is willing to attack – that's – attack with. That's what the auditor is going to do about the confrontable problem or difficulty out of the total problem and difficulties of the case. You see that?

Ah, but there's another one for the pc. There's the pc's attitude of what he could do about the problems and difficulties which he himself is able to confront out of all the problems and difficulties which he has some awareness that he has.

Now look at these as six factors, six factors, all stacked up on one case. You want to know how you get a misestimate of the situation, well, just draw this for your pc sometime. Just ask your burning question at each level. "What are the Problems and difficulties which I honestly think this case is in?" So-and-so and so-and-so and so-and-so. "All right, what part

of these am I willing to confront?" Well, so-and-so, that one's the easiest to confront, that's obvious. "All right, then, what am I willing to do, or know that I can do, with regard to that one I can confront?" That would be the auditor's estimation of the case and its progress. Interesting.

All right, then there's three more. What's the pc's estimation of his states of confusion and difficulties? What one of those problems and confusion does he find potentially confrontable? And what is he himself willing to do about that problem and confusion which has been found confrontable? In other words, big one, smaller two, smaller three, see. You've got six factors at work here then, in any auditor-pc relationship. This is all Scientology 0, and nothing else.

Now, the funny part of it is, is this isn't that important on a pc level because it's mostly taken care of by the fact that if you can get tone arm motion on the pc on a hunt-and-punch system and a push-about and so forth, why you're all right. But listen, when you *can't* get tone arm action, man, that is important and that becomes important and you haven't done anything about it.

A little serious discussion with the pc on this particular subject would entertain you vastly sometime or another. The pc may be talking about these *tremendous* things that he has in mind that he would like to have, or something like that. But that isn't the question we just asked. We asked the question of, out of this total sum of his problems and difficulties, which one is potentially confrontable by him and what could he do about that one problem or difficulty?

Now, of course, the greatest use of that particular survey is not in the field of processing but in the field of auditor advices to the pc; a field which we almost never touch, because we say, we shouldn't evaluate or invalidate for the pc. Nevertheless, it totally exists as a field and exists as such a broad field that not to call it a level of Scientology would be to disown what man is ordinarily doing with man all the time: He's giving him advice. And if you follow the rules which I've just given you here, you'll give some beautiful advice, believe me. It'll be pretty gorgeous. You'll be a very successful adviser.

Funny part of it is you'll actually be in total control of the situation before you know it because all the advices you give will be followed. And what stops people advising? Because the advice they give is never followed. But your advice in this wise would always be followed.

You've got now an estimate of what the person – not pc – but what the person considers problems and difficulties. Good. You've got that estimation. Now you've got what of all these problems and difficulties they would find confrontable. See, we only now wind up with one problem or difficulty, you see. Now what would they be able to face doing about that one problem? And you of course have smoked it right out into the clear, see? And bang, that... they will do something about it. They will then, to that degree win, they will then, to that degree, be able to see more of their own problems and difficulties; they'll be able to confront more of their problems and difficulties and the cycle can be repeated again. So now you will find out that a new review of the general situation finds out that they have an improved idea of what is potentially confrontable amongst their problems.

So you can now find out what they would be comfortable to do about this new problem and they would do that and that would give them another win. Now the only difficulty is, is they very often go up scale with too great a confidence and, like a little baby who has just learned how to walk, they go tearing across the room at a high run. And I'll call to your attention they usually fall on their face about the third step. They can get much too ambitious.

So you have to take *this* into consideration when you're giving that sort of thing and say, "Well, don't do any more than that at this particular time," you see. That would be giving advice. That would be social working and that sort of thing.

Well now, you have to enter this field as auditors because it is your duty to reduce the present time restimulation of a pc to a point where the session is controllable. So in that particular field you have to study out the situation sometimes and say *zit*, and *zat*, and *dit*, and get done what the pc can do about it. And he's handled some of his present time environment, don't you see?

So this is where this comes in. It comes in at pc – at pc level on advising the pc so as to cut down present time restimulation. It all comes – so comes down to wonder why the pc feels he's losing all the time. Of course he can't do any of this as the pc who eventually, of course, does all these things about his own case.

And then you get the – you get this additional aspect of the PE person – the new person. You get the people who can't audit, who are part of a group. You get these various zones and spheres and you have to talk to these people about things. Well, if you make it your business to rapidly – because you mustn't dwell on it because there's no tone arm action in it, you see – to rapidly get an estimation of what they think is wrong, then find out which one of these points they can confront, and then find out what they're going to do about that point that they think they can do, and then get them to do it. And at that point become terribly militant on the subject of getting that point done. Man! You have agreement with a capital "A." Agreement with a capital "Affinity" every time. How come?

You haven't told them anything that they think is false. And they've got an estimate of the situation. And they know when you're advising them on that estimate of the situation, they know then you speak true. And I'm a bad one to use for a model on this because in the first place in talking to you, I'm not talking to the public. I say, "You see that vertical wall? Oh, you've left your fly-shoes home, huh? Well, climb the wall. Just walk straight up. Now keep your back stiff." I know you sometimes feel like that when I hand you something to do. Slightly different relationship is involved.

Now I'm talking about the analysis of a situation in any given zone or area. People don't know what the world is all about. They don't know how to get any further along in life; they know they can't make any improvement in life. They know it's impossible to be any better at all, *yeahhhh*. Well, you could actually sit down and prove to a whole group that it is possible to get better. You can make them write it on a sheet of paper. I can see Allison down there in Cape Town doing this now in a month – few months. Have them write down on a piece of paper – and see the rest of you, too – "Write down on a piece of paper now, a short list of problems that you think are wrong with your life – the problems you have in your life. Just write this short list down," and so forth. "All right, which one of those is the easiest for

you to confront?" and so forth. "Now write that down, see? All right, now, now, write down what you absolutely know for sure you could do about that last one you have just written down. All right, write that down. Now you see what you've written down at the bottom of this page? *Do it!*"

They say, "My God, this fellow's reading minds! The guy's a genius! How'd he know I could do that?" It's quite fascinating, you see? You could then – and just leadership of a group in PE or a Scientology group or something like that – increase your agreement just enormously with the rawest meat you ever had – rawest meat you ever had anything to do with – and social work and in other ways.

Now, I notice every once in a while a Scientologist winds up as an adviser to some bigwig someplace. This is quite interesting. Every once in a while, once in a blue moon, I'll get a sudden letter from somebody or another, and it, all of a sudden, it'll really all be foxed up enormously. More power to them, you see, but there's – you can see that mahogany desk, you know, just imprinted on that letter, all over. And this will be "Mr. Bushbottom's Scientology Adviser." Every now and then it comes through my mail lines. Quite intriguing. And they land in these positions and they very often stay in them for years and years and years. What are they doing? They're processing this guy, you see, and they process his staff and that sort of thing. They don't do too much dissemination work and so on.

But that position and post does exist in Scientology and does occur. I'm not making any fun of it, because we make a considerable inroad. It's quite interesting. It's just a niche that Scientologists here and there carve out for themselves. If he did – was very careful to do nothing but Scientology 0 on his advisory capacities on that particular post, they would think of him as the greatest screaming genius that ever walked through that front door; particularly if he never pointed out a single problem, he himself never dreamed up a single solution to any of the problems, but just made people continuously estimate the situation and do that which they thought they could do about the situation, see. I've given you the perfect formula for this, see.

That is not all of Scientology 0 because it's a confrontation of what things are all about. That's what it is. It's the problems. It's the chaoses. It's other things of that particular nature. There are ways and means of handling these things. I've given you the most elementary material there is on it.

Scientology 0 has high applicability to any case level anyplace because it's simply an estimation of the case. And I point out to you that there are two actions always involved in Scientology 0 in all of its problems, and that's your viewpoint and the other fellow's viewpoint. And they are always those two, and they always lead to two different views of the exacting – of the same situation. If you can get the other fellow to estimate the situation, you seldom have to, which is the laziest way to look at it.

Of the two of them, it is slightly more important for the other fellow to estimate the problems and confusions – the potential problem be confronted and so forth, and what he can do about it – slightly more important for that than for you. But you shouldn't lose your gift in this particular wise, because life is successfully lived with Scientology 0 well in. And it's very unsuccessfully lived with it out. And probably the reason you came down scale and figured

out all those things to do all that confronting for you in those GPMs and that sort of thing, is because your Scientology 0 was out the whole way.

So I think it's time, after all this time, that we got it in to some slight degree.

Thank you.

SUMMARY III:

ABOUT LEVEL IV AUDITING

A lecture given on 26 September 1963

Well, how are you today?

Audience: Good, fine.

Well, this is the last of these lecture series – not that I'm going to stop lecturing, but I mean, you have to keep up with it to find out what's been changed. But this is the last of the review tapes – let's just sort of bring you up to date and orient you with regard to Scientology. And this is the what?

Audience: Twenty-sixth, seventh September.

There's disagreement here. What's the date?

Audience: Twenty-sixth of September.

Twenty-sixth of September, AD 13, Saint Hill Special Briefing Course.

You've had Routine 3 now since 19 – what was it? – 61. And this has gone through many vagaries and many vicissitudes and one of the reasons it has – it is just about the most complicated tightrope that anybody ever tried to walk across the Grand Canyon on. Do not underestimate Scientology IV, goals and pcs' actual GPMs, and that's the first word I can give you about it – do not underestimate the difficulty that you encounter in these. Just don't underestimate it.

The thing which saves the bacon today is R3SC which permits the discovery of the pc's goal on a pc who is too overburdened for the goal to read. The reason the pc's goal cannot be found is, of course, the case is too overrestimulated by present time exigencies for the auditor to get any kind of reads on the actual goal channels. That's why goals don't bang and rocket read when you first come close to them. It's just too much restimulation.

Now, getting the service facsimile out of the road, which means softening up the two top RIs which are the most restimulated RIs in the bank by R3SC, brings us into a position then to have a numerous category of things against which to list present time goals. I'm talking about a raw meat pc, and the finding of those goals is the most – has been the most time-consuming activity.

But with R3SC you get a variety of things which you call service facsimiles. And all you want to know is what goal do they fit. And you will wind up... If you've got five or six

things which you've found as service facsimiles on the pc, the one which produced the most tone arm action is the one you want to list goals against. And it won't be really the RI, you understand, of that goal, but it will give you the entrance point to the goal.

Now, let me give you an actual example: We get, without too much brainwork or fortuitousness or something of that sort, but just using your routine assessments for R3SC, we get some category such as "auditing," we get "insects," and we get "bodies," and we get "gathering data."

Now, these are the things which were run with rightness and wrongness and which produced tone arm action on the pc, and we look at these things and we find the one that seemed to be in for the long haul – well, it was a tie between "gathering data" and "bodies." And "gathering data," however, is picked off a list and wasn't assessed so it is somewhat questionable, but the other actually was listed to. You know, in other words it was chosen more carefully.

And although the goal was not found by this system, it was quite obvious that if one had asked the pc to have listed goals against "bodies," which gave excellent tone arm action – the pc, of course, would have come up with the goal "to be dead" which was the present time goal. It's quite obvious, you see.

The pc – right there on the verge of cognition, don't you see – what's – what goal would relate to "bodies," and, "Well, there'd be 'to live,' 'to be alive,' 'to kill everybody,' 'to be dead'," and that would be your rocket read and away you'd be – away you'd go. Get the idea?

So the R3SC opens the door on goals finding, such as we've never had it opened before, because it carries with it the – the deletion of – of the restimulative factors, so that you take the... The fact goals weren't easily findable was the overrestimulation of the top RIs of the pc's actual bank.

Now that's why goals were not easily findable. And that's also why you couldn't get nice, big, gorgeous rocket reads on your pc, because of the overrestimulation of those two top RIs of the present time pc's actual GPM. And it's elementary, don't you see? The more beefed up those two top RIs are, they're sitting right there in present time, and the more havoc is being created in the pc's environment because of the fixed ideas in there, naturally the more out of session the pc is, just for that, you see. He's not under the auditor's control, he's too worried about his present time problems and all that sort of thing.

Now, to parallel what the mind is doing is again and always has been the basic mission of processing. Find out what the mind is doing and then parallel that with processing and you're going to get large quantities of results. So what is the mind doing? The mind is holding in the pc's two postulated RIs which are based on his last goal and he's just busy, busy, busy, busy, busy. See? And those two RIs are right here in present time, and let's say one is "blackboards," you see, and the other is "chalk," to be nonsensical about it, don't you see. Now out of that we will have locks such as "teaching," "school," "instructors," you get the idea? "Studying" – all of these kinds of thing will come off of it.

We find – see, we don't have to find the RIs. We have to find the goal they fit to, you see? And "blackboards" and "chalk" are – let's say those are two top RIs, to use something

non... very banal – and we eventually get studying, see, and we get instructors, and we get some other things, as service facsimiles. Well, all the time we're doing this, we're taking charge off those two top RIs, you see? Now, there's what's causing – they are what's causing the present time difficulty. But of course, what's supporting them in place is the goal to which they are attached, which is earlier than them, and we find out that here they are, "blackboards," "chalk," but we get "studying," "instructors," that sort of thing.

Well, we eventually list – and we get "school" and so forth – and we eventually look at these things, and we find out that "school" produced nice healthy tone arm action when we were handling it on R3SC, you see? That was very healthy – very healthy. So we just list some goals against it. We just say, "What goals might relate to schools?" you see, or something like that. And the pc comes up with "to be ignorant" and that is the present time goal.

And then because you've under... you see, you've taken off the burdening that was on top of it – that burdening, of course, permits this goal now to RR, otherwise you might not get that goal to RR, don't you see? So then you know the goal for sure and you can recognize it easily. And if you miss on that goal and you pick up, as is quite common, an earlier goal on the track that is RRing, your checkout and so forth of that goal will then lead you in the position where you can oppose that goal with lists and get the present time goal.

See, so you can tackle this thing in various ways and it enters in various channels. And it is not uncommon to – after you've listed your R3SC service facs that you have found, so-called, you've listed those things – and it's not uncommon to pick up such a goal as, let us say, "to know." And – ho-ho! I don't think this is a present time goal, you see. I don't think so.

But you check this out (as I will take up in a moment) and you find out that it is not the present time goal but you still have entered the goals channel. You're still now in a very, very fortuitous position, because all you've got to do is oppose it. See, get a new goals list; you come up with another goal, checked that's the PT goal; it's not, so you oppose that; and check another one, you know, and oppose that, you know and check – you know. You get the idea?

No matter what goal you find then, no matter what goal you find, you – of the pc's actual GPMs – you can oppose it and walk up the bank and find the present time GPM, and then you can find by listing the two top RIs, and your pc goes off like a well-oiled bomb. Why? Because you've walked him back in to the guts of the service facsimile, and you're taking off the case rapidly all of the restimulative factor of present time, at one fell swoop, *crash*. And if you don't think that won't give you tone arm action!

You see the system of programing? Your mission is to get onto the goals channel, and once you're on the goals channel, to goal oppose until you get the present time GPM. And when you've got that, you want the top – now listen carefully, because this is a change – you want the top terminal. This is the way you handle a truncated GPM, because that top one is the hardest one to find the two top items for because it is not completed. So therefore the goal hasn't spent itself out.

It's very easy to get the top RI of a formed goal, because the oppterm of course is some direct conduct of the goal and the terminal; the pc now has turned against the goal, and so it'd be some anti-goal thing. See, that's very easy on a completed bank, but on these banks which

are present time GPMs, these things maybe have been formed in very recent times; there may be only a few RIs formed in the thing, and you don't know where to hit it. You don't know where to hit it. But it is easier to hit it as a terminal, for this reason: You can ask the pc "What are you in present time," don't you see? "What are you in present time that relates to 'to be ignorant'?" See? And he can list that.

But you say, "What would 'to be ignorant' oppose?" you see, you're just asking him "What's the whole bank?" or "What is the last item – top item of 'to be ignorant'?" or something like that, that is in opposition.

And well, what is it? You see? It might be a version of the goal, clear up at the top, don't you see? It might be down to the middle, just where the thing is turning, don't you see, some innocuous indifferent thing. This is too hard to do. But you can say to the pc – because you're telling him to go to the drugstore without telling him what town he's in. don't you see? And... very hard to do.

So the truncated GPM gives you a very special case. It's a special case. On all other actual GPMs you can list for the top oppterm, but not on the present time one. There you want the top terminal. And if you list for the top terminal, you're actually – he will Hobson-Jobson it over and ask this – answer this question, "What am I in present time that represents this goal just now?" See, that's more or less... and he can list that, because you don't have to send him to the drugstore to find the drugstore.

You say, well, "Who is going to the drugstore?" and he can find that. See? You don't have to ask him, "Well, where are we sending you to, from noplac?" And you'll find the pc gets very baffled at this type of action.

So then, you can now take that from the top and go on down the bank to the bottom, and take out the bottom plus one. You may have to find the next goal to get the bottom opposition terminal of the bank, but you want that discharged. You want the goal as an RI discharged, you want that reliable item totally flat, and you want what it opposes totally flat, and you want the pc out of that bank before you then repair the bank. Why? Because the goal as an RI, of course, and its opposition, hold everything fixed and rigid in the bank until they are gone.

So, the proper programing to take on any actual GPM – program of an actual GPM for any GPM, see – any actual GPM, no matter where it is located – is to find the top RIs, the last RIs, and they're very easy to find. I don't care whether you list for an opposition terminal or the terminal, you see, on an ordinarily totally formed GPM, don't you see? Doesn't make much difference. But it makes a lot of difference on that present time one.

So you find the top RIs and go down the bank, go down the bank clear to the bottom, and clear it all out all the way down as best you can, and then turn around and inspect the whole plot again to find out if anything is still ticking, that you have found. Anything you've listed for and found as part of that GPM, is it still ticking? And if you have one that is still ticking, you assume – now get this very carefully – you assume that the list from which it came is incomplete.

You see, it is not that it has not been properly opposed. Yes, it's been properly opposed, but it's still ticking, so that says it came off a list which was incomplete.

Now let me give you the idea: You've got the item "blackboards" ticking. And you've got "blackboards," you see, by saying, "Who or what would chalk oppose?" See. And you listed that, but you've got "blackboards" still ticking. So that means "Who or what would chalk oppose?" is incomplete.

This sometimes doesn't show up, by the way, until after you've done the whole GPM. I mean, you thought you had it at the time, but you come back later and you find out you have something still ticking. Well, students who had a bit of trouble with this – trying to get this straight – so I'll just tell you that is a point of trouble. So make sure you – you get this one. If you find something ticking on the repair of a bank, it means the list from which it came is incomplete. You don't try to do anything with that item. Actually, you abandon that item. And you complete the list from which it came. And now you will get a whole new series to do in the bank.

And you get a whole bunch of them now, and they go back and forth, and they carom this way and that way, and you say, "My God, how could I have missed this many RIs in this bank?" Well, you could of course, because they were all fixed in place by the bottom RIs.

Now what is, in actual fact, the reason we don't go from the bottom of the bank to the top? That is quite important. It's because the goal is germane, part and parcel, to every RI in the bank. So therefore, if you start listing on the goal and opposing from the goal up, you tend to beef up the whole bank. Do you understand? You tend to throw every RI in the bank alive – as you start from the bottom up, you tend to throw all the later ones alive. And the pc can't reach them. And he will have a heavier bank, he will have heavier going, and he'll have far more difficulty because he'll just miss, miss, miss, miss.

Now you'd look at it at first glance, you'd say, "Well look, you've got your hands on the goal, it's very easy to oppose the goal and get the next item and what's all this thing about oppterminals or terminals; they're very hard to find," and so forth. Well, all that's very reasonable. Everything is reasonable about it except it doesn't work. You could theorize on it until the cows come home, and you'll find out that you always have a bad time trying to go from the bottom of an actual GPM to the top. And you have a rather easier time going from the top to the bottom.

And one of the reasons for this is the pc is trained on running GPMs by this time, by implant GPMs, which are all backwards. He isn't putting his own GPMs in backwards now, but he – he rather tends to get the idea that you can go down them but not up them. Because, of course, he's literally had thousands of implant GPMs put into him backwards.

Well, that's one slight reason, not the real reason. The real reason is, when you start in from the top you are taking the burden off the actual GPM. It's the same thing as you're straightening up present time before you find backtrack. He'd always be more interested in those that are closer to present time which is top, the later ones. He's almost more interested in the later ones than the earlier ones. So he'd get many more cognitions.

And going down the bank this way, you get some of the most gorgeous tone arm actions and blowdowns which you ever cared to see in your life, going down the bank. But you don't get that same action coming up the bank. It's stickier.

Now, it's hard enough to find the top of a GPM and go down the bank. This is hard enough, without complicating it by making the whole bank beef up by trying to run it backwards. You very often will be in the horrible position of going up from the bottom and then going back to the bottom and think you are going on up the bank when you are not going on up the bank. You turn around and go down toward the bottom again. And all kinds of wild variations occur.

Now, what occurs when you do it properly, which is from the last formed RIs to the goal? Do it in that fashion as your first pass. What happens in that particular case is, the pc will just go on down, and you'd utterly be amazed at how many RIs he can miss, on his progress down. But you have kicked the stuffings out of the bank by the time you're at the bottom of it. And that thing is limp. You probably can't even get the goal to read. You probably can't even get it to do anything industrious at all. You're handling a relatively inert proposition now and your listings and so forth are – they're – I shouldn't use the word "easier." The listings are not so difficult.

So the program on a pc's actual GPM is something like this, from a raw-meat person: Get into the channel (the goals channel) through what you found as a service fac, listing goals against, but get into that goals channel. By goals channel, I mean your pc has thirty or so goals. He doesn't have very many. And he's got these goals – might be more than that or less than that from pc to pc – but he's got these GPMs, and if you can get onto the sequence of the GPMs anyplace, you can then do goal opposes and bring the pc up the line and list the one in present time.

Now of course, that restimulates the pc more than if you found the present time GPM in the first place. But nevertheless, this is acceptable and doable, and you will get an enormous amount of tone arm action ordinarily in doing this, which is quite interesting.

But you throw the bank more alive. It's a little harder to handle if you find something well on the backtrack. But that's all right, that's still acceptable. So long as you, so long as you don't go completely knuckleheaded and try to run the far-backtrack GPM. If you run anything in a far-backtrack GPM, you are committed to a completion of it, and you will now have hell on your hands. You're running this fellow at trillions a hundred with no reality on anything and it doesn't have any application to his modern life, and here he is sitting here, trying to solve his lumbosis and the trouble with him in that lifetime is he was having trouble with his lightning bolts. You see, they never quite went on target. And honest, he doesn't have this as a present time GPM.

His present time GPM is how not to get shocked when he puts his finger in the mains, don't you see? And he – he'll Hobson-Jobson it over, but because his interest is so much closer to present time, he then tends to list on wide sweeps, and he will give you present time RIs on this past goal and it just gets to be the awfulest mess. You can bring him through it and he'll survive, somehow, but it is very, very, very hard. It actually compounds the diffi-

culty of running so great that it has been known for people just to back off and not audit the process. It's just too, too straining.

And that strain comes from auditing the pc too far from his actual zone of interest. Now, why did you find this early, early, early GPM in the first place? Well, it must be a lock of some kind – the present time GPM of course is a lock on it. But there must be some restimulative characteristic. It may be a dichotomy, see. Maybe his present time GPM is "to be a slave," you see, and this very ancient GPM, this very ancient, ancient, ancient GPM, so forth, is something on the order – is "to free," see, or something of this sort. Well, "to free" will lock up on "to be a slave." So you find "to free," because it's – it's right there available, and it's also – seems to the pc to be safe to offer something up which is that far from anything that is wrong with him. See, it's a safe action.

Now, if you started to run "to free," and you just went *pocketa-pocketa-pocketa*, started to run this thing, oh man, you're going to be in trouble. It's going to be difficult.

In the first place, you'll have to complete it and it'll be very hard to do, and all of the pc's present time problems and worries are not being solved by auditing all during the time you are running it. So he's worried about his lumbosis in present time and the GPM you're running has to do with getting people out from underneath lightning bolts or something like this and doesn't have any application, you see.

So therefore – therefore, any goal that you find puts the pc in his goals channel and then don't run anything until you are sure that you have the PT goal. And go ahead and work now to obtain the PT goal. And when you're pretty sure you've got the PT goal, start running, and still be totally prepared to the horror of finding you're running a goal three back. See, still be prepared to find out that you've still erred here, but remember to finish the goal you started to run. Don't do anything else. Don't go off and leave it just because you found it was three back. Go ahead and run it, but you understand that it's going to be more difficult.

Now you can move up into PT, and move his – and find his actual PT goal and run *it*, don't you see? Be as careful as you can to find that present time GPM. Do everything you can to find that present time GPM. And then sit down to run something which you hope is it, and then if it turns out not to be it suddenly, you go on and run what you found. You go ahead and find the present time GPM, but you run what you started to run. Otherwise you're going to have your pc in trouble.

Now programing, then, comes up to that point of – find any goal, move it on up with goal oppose till you get the present time GPM, be fairly sure – as sure as you can be – that you've got the present time GPM, and then run it, and if it isn't the present time GPM, but the present time GPM now turns up, well, you go ahead and run what you started to run. And you finish that off, and you come back and find what you've now found as the present time GPM, you understand?

All right, and your next action is to start in listing. Listing from the top, and if it's the present time GPM, you'd better start listing the oppterm – the terminal, terminal, don't – don't list the oppterm on that first one. List for the terminal. And now move on down the bank as best you can, on down to the bottom, and get out the whole bottom of it. That is to say, the

goal as an RI, what it opposes, its opposition into the next GPM, which requires that you will have found the next goal.

So the actual fact is, you clean out the whole bottom, find the next goal, oppose the top optterm of the next goal, you understand now, because you're listing now for the top optterm of the next goal. But that's very easy. It's just "Who or what would the goal as an RI oppose?" You have to have the goal in order to list that normally. In other words, you're going to find the next GPM. And you're going to make sure that you got all the items at the bottom of the GPM you're working on, and then you going to roll up your sleeves, in spite of the sales talks of the pc, in spite of all of his answers about how he's now interested in "to be a snip," and he's no longer interested in what you've just done. Of course, that looks dead and flat to him.

Recognize that you've probably got 50 percent of its RIs unfound. And you're going to go back up now, and you're going to find anything in it that ticks and you'll find something that ticks inevitably, and recognize that the list from which it came is incomplete. Complete that list. It will give you now a rocket reading item, a nice rocket reading RI. Use that and start cross-opposing inside that bank. And I frankly don't care whether you go up or down, because you very often will think you're going up and you're going down. And very often think you're going down and you're going up. And you will be very surprised to suddenly find yourself in present time when you thought you were getting down to the bottom of the bank.

All sorts of wild things happen on these repairs. But repair is essentially a very easy action. The only thing that is difficult about it and so on is the pc sometimes becomes very exasperated because he doesn't seem to be able to get the item on the list. And that's just an auditor liability that you'll just have to face up to and come over with and be persuasive.

Pc was not really ARC breaking. The pc was just going to pieces from exasperation, as I've already told you about. "But I've put it on the list, it's on the list a half a dozen times," you know? So on. Tone arm has not given an adequate blowdown, you're still getting ticks, you're still getting dial-wide slashes that might be rocket reads and might not be and so on, as he lists. Obviously the list is incomplete. Have to keep him listing somehow or another.

But you'll find you'll eventually get that whole bank clean. That whole bank will all clean up and be very gorgeous, and so forth. Then if you want to really polish the fingernails of the whole thing and so forth, why, give the auditing of that bank a Prepcheck, and give the goal a Prepcheck, too. Just polish it all up, see. You'll get terrific tone arm action, terrific gains.

Every once in a while you'll find your tone arm goes up and sticks very hard, and sometimes it sticks very hard simply because the pc's interest is in the next bank below. And the pc is busy selling. And all you have to do is call this to the pc's attention and the tone arm will come down again.

In other words, you already have found the top crust of this next GPM all the time you were doing this other action. So therefore you're going to get a sales talk. And the pc will go out of session, wondering what it is – what it is, that confronts one-armed paper hangers – or something like this, you see. And just what is it, and so on. They come back into session, well, you just realize that his interest is actually on that next GPM.

Why? Well, actually, you've got all the kick out of the one you're doing and it's just dog work finishing it up, you see. But if you don't finish it up, it's going to give you trouble from here on out. Then, when you've got it all cleaned up and so forth, go on down to your next GPM and do exactly the same thing with it. Go from the top of it to the bottom of it and then come back up and clean it.

Now, if there's two items ticking, always take the higher item. In a – on a repair, if there's two items – two or more items ticking, take the one that is the highest in the bank, the closest to the top. Let's say you've got three items ticking in this bank as you – you survey your line plot. You read your line plot back to the pc, see, of this GPM that you're doing, and there's three items in it that go tick.

Now don't put your mid ruds in on these items, don't – don't try anything like that. Because if an item's got enough in it to hold the mid ruds out, it still – it's – something wrong with it, see? Mid ruds read because the things they are reading on are charged.

So you've got three items. You're going over this line plot. This line plot is all finished by this time as far as everybody is concern – as far as the pc is concerned, rather. Oh, he's – he's through with this. He – he's got to get on to this next goal, you see, and that sort of thing. Well, you're just a very bad workman if you just leave it like that.

So you go over that and you find that there's three items in it that are ticking, as you read the line plot of items already found, you see, to the PC, three tick. And if you want to make your choice amongst these things, take the top one, the high one, the one that's closest to the top of the bank. And you'll find that if you do that, you won't have to worry about the other two. Because as you go *clang, clang*, back and forth from one item to the next and so forth, these things will fly off and cease to be part of the list. You know, you've caught them on some other list as you went down the bank again, don't you see?

And you still have to check over the existing line plot now for ticking items, but very shortly you won't have anything ticking in that GPM; it'll be really dead. It'll be a gone story, it'll be history. Now is the time to do the next one.

Now, you're working back with this from present time into the past, GPM by GPM. I could call your attention to a lot of lectures about GPMs. People think maybe they're ideas and they think they're this and that. Well, so is a block of concrete an idea.

If you had an idea of an electric blanket, beautifully short-circuited, that was about 35 feet long by about 3 feet thick, by about 15 feet wide, or 10 feet wide, if you had an idea of that, coal-black, or fuzzy black with gray undertones and sometimes gray, and so forth – this object, which you actually could build out of – here out of plaster of Paris or something, or something that looked just exactly like one, you see, this object is a pc's actual GPM. That's not the series of GPMs, that's one actual GPM. Pretty – pretty remarkable.

Now, he gets these out of sequence sometimes and you as an auditor in listing can yank them out of sequence and maul them around most gorgeously. So let us say we have a carpet of these electric blankets laid out here which stretches about a mile. They're distant – one from each other – but we've got this straight carpet reaching here, and here is present time, and back at the bottom of that is the earliest past, you see?

Now you start listing and you start making a bunch of mistakes and you take the first – the one that's third from the beginning of track, see, you take that one and you yank it up into present time and insert it between the last two from present time back, see. Now we've got sort of three sitting here. Now we criss-cross items and make a big mistake in accepting the wrong item and it's from another GPM, and that sort of thing, and it turns out that we have an item from the fourth one back.

Now we pull that one and we pile it up on top of these three up here in present time. Now you do a nice case analysis on the thing, you straighten all this out, and those – two of those three separate out and park over here to the left, you see, about 25 yards away from the pc. They're sort of sitting there quietly. Now as you start doing some more, you find some more wrong items on the one that's ten back, don't you see, and accidentally get into that. As you list goals, the pc gives you one that's ten back, he doesn't give you the third one back, see. He gives you one ten back.

So you industriously run this, you see, and you find the wrong items in it and then it sort of goes out of gear and he says that's very far in the past. So actually he tries to push that into the past. So it goes back there now where these three that are out here 25 yards away should be, you get the idea?

I mean, you think you're running thought, but you're not. It's just longshore sort of work and you find them in wrong sequences, and you will, they pile up on the pc this way and that way, and they jam this way and that way and they go here and they go there.

Now in the course of livingness, he very often has found new use, new use for the goal "to be a God," see. He joined a church or something. And he found new use for this thing, and so on, and he pulled it out of line somewhere in the thing and he is – he's sort of using some of its RIs, you see. And it's been hauled up grossly over the track and it sits up here in present time also. So he's been at it and an auditor in the process of being at it, he gets at it. And the next thing you know, we don't have these big blocks of something or other lying out here to a mile or two away, you see. We've got these things scattered all over the doggone place. And if you do a bad job on that, this one is half-run, that one's a quarter-run, this one is over here restimulated, there are four chunks missing out of that one, and then the pc is stuck squarely in the middle of the fifth one back while you're running the second one back. And it – it's all very interesting.

But it is a mechanical proposition. It's as though you took the pc and maybe you made these things out of India rubber, you see, and poison gas or something, and you – you had them stacked around. Actually they're quite innocuous. But it's something like diving into tar pits, you know or – or something like this. It's that physically a fact, see. You're not running an idea. See, you're running a thing. And this thing has mass, man, and it has location in space and everything else.

Now, the big joy is when you do this thing – program right – you have the right goal, you found the items and so forth – you'll see this meter start going *pssww*, *pssww*, *pssww*, *pssww* – every once in a while. It's just repeating rocket reads, rocket reads. What's happening there? One of these blankets is folding up. And it's very funny, once in a while the pc as his perception rises – he'll eventually – he runs stone-blind on this you know; he just thinks

there's this room here, you know, and there's nothing else in the universe. Sometimes you get – you run two, three GPMs before he starts seeing these things. You know? There's this great big cog... the further they are back on the track, by the way, the bigger they are. These present time ones are little dinky things – Woolworth, you know?

And he's – he's looking at this and there's this huge – huge mass and it's going *bzzzz-z-z-z*, shake, shake, shake, quiver, quiver, quiver, quiver, *zzzzzz*. It's discharging out there, it's not discharging, fortunately, through you, through his meter – through the meter and his body, see. But it's going *bzzzzzz-zzzzz-quvvvvv-shuuugggg*. You know, and – and it's sort of just wisping away, you know?

Then it'll stop doing that and you'll find another item, you know, and it's at it again, you know? And he feels like – sometimes he's been sitting in a blown-up toy balloon and somebody's letting the air out of it and so forth. The physical sensations of these things going down are quite remarkable.

And these things go shudder-shudder-shake and they disappear and fly off into the far horizons and they – they eventually disappear. But when you half-run one, you half-leave one. It only shakes out to a point of where it went *bluuh* and it's still got left on it *bluuuhhh*. See? And you sometimes don't get that last *bluuuh*, until you prepcheck it or repair it, you see. Sometimes if you repair it you'll get it, sometimes when you prepcheck it you'll get it. But eventually it'll just all go *lluyyyaahh*.

And it isn't what happens to the mass, the marvel of it is that it stayed suspended in time to this degree. And that's all under the heading of how a GPM is formed. Of course, that's postulate-counter-postulate, the anatomy of the problem, the basic way these things were scouted out and discovered empirically, all of that material is germane to this thing.

But there's these black islands and the earlier they are on the track, the bigger they are. And of course, it's much better to have the pc tackle a small island, apply Scientology Zero, than it is something he can't even see the other side of.

Now, sometimes he'll look down the track, when he's looking when he shouldn't have been, you know, and he looks down the track, and you've just been listing something or other, you've been listing some goal oppose list, and he sort of reaches down the track to see what that is. And I do mean reach, you know. Just – just looking won't do too much, but he sort of reaches down, and all of a sudden one of these things will appear back there, see? And it's about fifty yards long and so on – it's backtrack. And it's almost frightening. The whole thing goes alive, you see, because he raked his thetan paw across it.

You can do this same thing to an implant GPM. It's standing there, all beautiful, there's these little poles, I don't know at what cost, you know, and what industry. It's the devotion of these fellows, you know – it's marvelous. God! Laboring out there in the hot sun, day and night – anyhow, these little poles all along and the little path, and that sort of thing. And it looks quite innocent in the facsimile, see. And the pc will stand there and look at it and then you'll ask him what goal is down at the end of it and he'll sort of rake his paw through it, down to the end of it. And it all goes black.

What he's done is reactivate his own suppress in the thing and all the items go live, all the way down to the end of the thing. And it looks like a black carpet has suddenly been laid out here, between these two poles. And if he does it again, why, even the poles will disappear. It isn't very heavy, it isn't very massive, it's fairly easy to handle, as you know, in running a – implant line plot. But you get the same effect in your actual GPMs. Except in your actual GPMs it is not just somebody throwing some old black cloth out on the road, you see – it's something on the order of a nonexistent island that nobody ever heard of – black, writhing and vicious, suddenly appears in the sky of the pc's own environment. Where'd it come from? So forth.

Actually, he's usually quite tame about these things. The only time a pc normally gets nervous, after he's up to being able to see them – of course his confront must have been fairly well raised before he does that – the only thing that makes him nervous is to be sitting in one that is warped around him in some fashion and he can feel the creak. And you'll probably hear more of that word, because nothing else describes it. It's all the corners are going out of adjustment of everything – creak.

And it's just creak, you know – and he's sitting in – in the middle of this thing, and there's another one over there someplace, and there's another one over there someplace – and he feels his face is sort of dividing in half, and he can feel this fantastic tension and stress. Something is trying to go south while something else is trying to go north. *Ooooh!* He feels his chin is being worn on his forehead, you see, or something like this. You know, it's all *creak!* He can feel these *foorces*, you see.

That's under the heading of bypassed charge of one kind or another. It's nonidentified charges in his immediate vicinity. The only thing that really permits you to run an actual GPM is what – a new subject entirely and you'll hear more of this because you'll get the list, called case analysis. Analysis – just let's call it analysis. Because there's a broad case analysis, there is a GPM analysis, that is the state of the case versus GPMs and goals, and that sort of thing. There's that broad case analysis.

Then there's the analysis for one goal. There's the analysis for – you know, about its items – and all this sort of thing. Then there's the analysis of *an* item. Analyses – this is a word that you're gonna, gonna hear a lot of. Because it's a saving grace, and it's a new development which you will just thank your stars for.

Just like you have often thanked your stars for an ARC break assessment list, so you'll thank your stars even more so for one of these, because the pc isn't necessarily ARC broke, he's just in trouble. And you don't know what's going on, and man, these things are so complicated that it's just this – *aaahh*, makes your brains creak.

But actually, the questions which you ask are very few. The number of things are very, very brief. So if you find an RI, you do an RI analysis on it. Oh, you give it to the pc and let it blow down and everything else, but before you do anything with that RI – you let the pc accept it and cognite on it – but before the auditor accepts that thing, he's got to do an RI analysis. He's got to find out about this thing. He wants to know if he's bypassed any RIs. He wants to know if it came off an incomplete list. He wants to know if the wording in it is correct, or if the wording in it is incorrect. He wants to know if it is in its proper position in the bank.

In other words, he wants to know all about this RI. And if he gets a big – cracking, big read, then he's saved himself from more grief than you can shake a stick at. He wants to know if it's from a proper goal. He wants to know if it – make sure it doesn't belong to some other GPM – get the idea?

It's a little list of about eight or ten questions and you just rattle those off at the pc and the pc will think – you'll think at first that it's invalidative of the pc's item. Well, it may be invalidative of the pc's item, but it saves the pc's life. And you'll find all of the problems which we had with running actual GPMs before, evaporate under this analysis idea. Because we don't then find an item from the GPM that's three-quarters of the way down the track and pull it up into PT don't you see, and then oppose that crosswise and then get that wrong way to, and pull all the mass in on the pc.

That's because we want to know all about this item before we use it – want to know all about the thing. Similarly a goal – we want to know all about this goal. We want to know if it's an implant goal or it's an actual goal. We want to know if it's also an implant goal, you see – and an actual goal. Because we might be running into something here sooner or later because the pc inevitably will start to list out of the implant goal sooner or later, and he'll give us some item or two out of the implant goal, and if we're running an actual GPM, we don't want that other item just because it's rocket reading.

Of course, that's small matter, but it's got creak in it. If he's got the actual GPM, it is also hung up against the implant GPM. You're not going to bother with the implant GPM, but you want to know it's there, because it's bypassed charge if it isn't. I can see you now with a raw meat pc, sitting down in a fatherly fashion on this dear old lady that you're running actual GPMs on and say, "Well now, well now, Mrs. Smith, I think it's about time I told you about the birds and bees. Once upon a time a long time ago, some people probably got mad at everybody or did something or other and they put a goal in just like this, but which isn't your goal." And you'll see a tone arm blowdown on the thing.

Then you can do such things – case analysis is vital, because you can get into – even with case analysis – such an idiocy as this: You start into the next GPM. You suddenly find out – because it's behaving wildly – you think you find out that it's a wrong goal. And then you do some more and then you get some charge off by finding some more items off of some other GPM, don't you see, and then you come back and find out that it was a right goal in the first place. See?

So – so analysis saves the pc's life. But don't expect an analysis to be totally completely valid – and let me show you for this reason – I'm not trying to invalidate an analysis, where an analysis reads, there is something wrong. That's for sure.

Let me show you something now. Let's – let's take this. Here is why – here's why an analysis doesn't work. Now I'm going to hold this crayon here, and you can't see any crayon here above this meter at all now, can you? See? All right, now there's just this much of the answer showing, and it isn't going to register on your meter worth a darn, because look-a-here, you see? You've just got this little tip showing. See that? All right. Now if you ran some more and got some more charge off, this would happen: "Oh," you say, "It's a crayon." See?

Or you say, "Oh! Oh! Oh! Oh – yes!" See? The more charge, more charge, more charge. These things are more visible.

So you get the idea, the case totally charged, you don't see – even see the tip of this crayon, see? No tip at all, see. You see nothing. So you ask the meter, is this a right goal? Is there a goal? Does the pc have an actual goal? Blank, blank, blank, blank, blank, blank – you see? There's nothing. I mean, there's not enough charge of it off The thing is still too heavily burdened for even the meter to see, much less the pc. The meter sees before the pc in any event.

And then we finally get up to here and we're doing a case analysis or we're doing a goal analysis or something, and actually, it's just the burden is off of it just to the point where you can just see this little tip, over the edge of the meter, see. Over the edge of this box, here, see. You've just got this tip showing.

Now, you tell me if you didn't know already, what is that tip? See, what's this – what's this scrap of metal that is showing above this box edge, see. Well, you can ask is it a right goal? Is it a wrong goal? Is it an upside-down goal? Is it an earlier goal? Is it – have we bypassed a goal? And so forth. We might even know, you know – we're assuming that it might even be something that we don't even know what it is, because you see, it isn't enough in view.

But if we keep running and keep getting tone arm action on the case, these things then, well, you get it up this high, you get it up this high, you say it's a crayon, see? It's now visible – visible to the meter. See? Now visible, so you read your analysis, you see, "Is it a right goal? Is it a wrong goal?" you see, "Is it – we bypassed a GPM here?" and so forth – and everything reads and smartly. "Is this a correct goal?" You know, bang! Everything reads like mad. It's all gorgeous, so forth.

Of course, you unburden it just a little bit further and the pc can see it and tell you. See, it's totally in sight. So the more a case is overburdened, the more a case is restimulated, the less visible it is to analysis. See?

So if your case is – if your analysis goes until you get an ARC break, you've got the violence of the ARC break riding on top of – see, it's just a problem in overrestimulation. See, you've got this riding on top of something that wasn't very visible in the first place, see? You say, "Is this a right item? Is this an oppterm? Is this a terminal? Is this your own item or is this something you oppose?" and so on. And the meter's just going *zzz* and *zzz* and *zz* – no answers on the thing, and there is nothing happening, don't you see? I mean, it – it's hard to tell. It's hard to tell about this. Got the idea?

So you'll find that the only time analysis is trying to you is you haven't got enough in sight. You haven't taken enough burden off the case. Got it?

So therefore we get a rule, for this and other reasons. We already have an Auditor's Code thing about flattening the process in – you know, not too much change of process. You can put one there to complete, given available time, to complete process cycles of action begun on the pc. And you'll see that in that wording or otherwise, added to the Auditor's Code.

This is this important – given available time to complete process cycles of action begun on the pc.

Well, that probably could take a five-hour lecture all in itself, see. But I'll tell you what it is, and I'll just – just put it down here in terms of emphasis rather than verbosity. This little demonstration I gave you might not look like much, but it'll look like an awful lot to you sitting there someday trying to sweat it out on the meter, trying to Ouija-board this meter. "Is this a correct goal, an incorrect goal? What have we done? Have we bypassed a GPM?" Pc's going *creeeeeak*, you know and *ohhhhhh*, my God, and there's force and power, and he's upset and so forth.

Remember that if you can get this case a little less restimulated in that particular area by removing charge, your meter will read better. So you get a rule of thumb action – a rule of thumb action. And your rule of thumb action must always amount to: Do a case analysis, and then complete what you are doing before you did it. Very important. If you can understand that, it will save you more grief than anything else I know of in doing actual GPMs for the pc.

Pc's going *creeeeeak*, you're listing – you've been listing – you were opposing "catgut" in the goal "*swiddlepump*," see, and here you are, and you're listing for that, and the case is going *creeeeeak! uhhhhh!* Awful time – awful time, man.

You now do a case analysis. And it tells you you're running a wrongly worded goal. Goal is wrongly worded. Now, to run a wrongly worded goal makes it very difficult. Very, very difficult. In fact it'll be upsetting. What you want to do is get the right wording of the goal if you possibly can, if you can do it rapidly. It's just like ARC break assessment, see. Get the right wording of the goal and then go back to opposing "catgut." You got that now? This is – this doesn't sound like much to you right now. See, I give you a broader application out of this. The pc says, "Ha – ha! It must have been a wrong item for this and it must have been a wrong item for that." No, you were – this was where he was hung up.

You got enormous amount of relief and you say, "All right, well, the goal was to – the goal was to – 'to *spoodlepaf*' not 'to *squidledunk*,'" you see. So, "Oh, well, we better list for the top oppterm now, of the new goal 'to *squidlepaf*,' you know? Uh, the new goal..." Oh, brother! That pc will be in more trouble and wrapped around more telegraph poles. Why? Just the factor of overrestimulation. You're encouraging overrestimulation by not completing a cycle of action. It requires some judgment. But this item was already supposed to be in that goal and it probably is, it is, and that sort of thing, but you've got a half-completed list there. You haven't completed the list. There it is. It now belongs to a differently worded goal, but it's there. It's there, and it's "catgut" that you complete.

Do a case analysis – remedy, rectify or identify any charge you care to and then go back and do what you *were doing*. And the only real serious trouble you will have from running a pc's actual goals and making an OT, will be at those minutes when you knuckleheaded and you did a case analysis and followed the case analysis. You did a case analysis and then followed out the actions of the case analysis. Then you did a case analysis and you followed out the actions of the case analysis. Now we got half a bank line-plotted here on a GPM and then all of a sudden the pc's going *creeeeeak*. He's got the creaks, you see? *Hell go mad! Rrrrr!* And we do a case analysis. We analyze this thing. "Is this the present time GPM? Is it actually

not the present time GPM?" *Ho-ho*, see – *thud*, see! Oh, there's another present time GPM? This thing showed as the present time GPM.

Well, there was some reason it showed as a present time GPM, there was some reason you were fooled about this. And you didn't find out about it until you removed some charge off the case, you know? We took the burden off, by running the GPM we thought was the present time GPM, don't you see?

So now supposing we got half of this line plot, of what we thought was – and we find there's a new present time GPM. That's – there's a later one.

And we depart, we depart from the one which is two back from present time, and we start now listing the new GPM, and we leave the other one undone. *Oh, oh, oh!*

It might have occurred that you did this and you audited perfectly fine the next day and you did perfectly all right the day after and then about the fourth or fifth day, something starts going quite wrong with the session. Things just aren't running right. And you don't look back there four days to the point where you abandoned a GPM that was half-run. You don't look back there, you look into your – you see, I mean, you would ordinarily just look interiorized into the session you're running, you see, to that degree, and you'd be looking into this to find out what's wrong and what have we found wrong, and that sort of thing, and we do another case analysis, and we – doesn't show up on the case analysis. And we don't know what to do, and it's not running well, and we don't seem to be able to find the PT GPMs, don't you see. Its items – and we don't seem to find its items well. You get the idea? The answer's back there four days. You half ran one.

Sometimes you get into a nervous fit of throwing away the pc's line plots. And you start in with the top oppterm and you carry the bank down about ten items. And then you find out there was something wrong with it all and you start in all over again – throw away that line plot, see, and then you start in with the next one, and you find a high item, and you go all the way down with that high item, then you find out there's something wrong with the thing, see, so you throw away that line plot. And what you don't realize is, every time you throw away the pc's – look, look, they were his items, they might not have been the central RIs or something of the sort, but they *were* his items. And you're just bypassing that much charge on the pc, just by the action of throw away his items.

If you don't believe it sometimes, take a lock item that you have found on the pc, and you thought it is, and put it down in front of the pc written on a piece of paper and X it out. Say, "Well, that isn't your item, I'm very sorry, that – that wasn't it," and watch the ARC break. ARC break the pc just like that. He didn't care anything about "biannuated coffee grinders," see, he cared nothing about this, right up to the moment when you said it wasn't his item. See, because you bypassed any residual charge that was in it. It isn't his superownership of the item, you've just bypassed the charge. You invalidated the item, you said it didn't exist, so you've hung him up in just that much charge.

Well, it was already a wrong item, so you hung him up in the charge of a wrong item. Now you've hung him up – not only the charge of the item, but you know, the additional charge of the wrong item. Take a pc's line plot sometime after you've listed a lot of lock items

accidentally and say, "Well, that's – that's that," and wad it up, and throw it on the floor. And you'll just watch the pc go straight through his skull. He won't know what's hit him.

Well, that's just one of the reasons you shouldn't throw away the pc's line plot. But when you do – now you've got this new thing called case analysis, see. And here's what auditors have been doing, because it pushes into sight what has happened to actual GPMs. And, this is, by the way, is not an isolated malady. This malady was good and broad. And this malady was sufficiently broad to make it impossible, really, almost, to make an OT. It was good and broad.

They would do a case analysis; however they did it, they'd find out, you see, that it wasn't, see – in some jackleg fashion find out there was something wrong, see? And then follow the analysis, see. Whenever they found out something wrong, then they'd follow the analysis, and only go on from what they found in the analysis. Perfectly all right to put right what you found wrong in the analysis, don't you see, perfectly all right, as long as you remember to come back and complete the action you were doing before the analysis was done. You must *always* – I appeal to your humanity, and if you're upscale high enough so you haven't got any of that – to your good sense. And if – if you're feeling awful shy on that during some session, I appeal to your allergy of randomness. And if your tolerance of randomness has gotten very, very high indeed so that you don't worry about that particularly, well – I appeal to your intentions to do some good for the pc.

And all it does is add up to just this and nothing more: That a case analysis is there to take the creak out. It's not there to follow. It's like an ARC break assessment. We're doing this goal "to free." We've done four items out of it. Not – misguidedly we did the bottom and the top, or something stupid, see. We got the two at the bottom and the two at the top, or something. That's pretty wild. That'll turn a blank – that tries – a GPM will never come around totally circle. But it will pick it up and bend the whole act. Let's say we've done something like this, and then we do a case analysis and we find out that there are several goals up to PT and the goal up there is "to be a slave." And we drop "to free," and we do and start in on the slave.

Tell me, who is going to destimulate what you have just done? You're now running with all that extra charge in the bank. It isn't going to wreck your pc, it's just going to make your pc feel horrible, however, and it's going to make him hard to audit. He's going to sort of be draggy about it; he's going to feel like life just isn't worth living. There's a lot of things that'll go wrong. But they all go wrong from this single thing. They don't always go wrong simply because you've done wrong actions. Pcs can live through a wrong action or two. See, they can live through some wrong actions. But they can't live through – in this actual GPM running – leaving cycles of action incomplete. It can get awfully, awfully, awfully grim.

So the rule of thumb – the rule of thumb on it is – is: do a case analysis, do an item analysis, do any other kind of analysis that you're doing, and then go back and do what you were doing. Find out anything you want to by case analysis, straighten out these things, and sometimes the creak is so great that you can't progress unless you do a case analysis of some kind or another. Anything, anything that you want to do in the line of a case analysis is straighten up the case, straighten up this thing.

And after you've done all of that, go back and complete the action you were doing before you found it out. And man, you will be in very, very small quantities of trouble, compared to the enormous difficulties that you can get into otherwise.

Now, all those difficulties actually stem not so much from the auditor's inability to follow the process or read the meter, we assume those things exist. Don't you see? But it's just from the fact that he's always chasing, he's supposed to be after the deer, and by God, those rabbits cut across that deer track, and there he goes. And another rabbit cuts across that rabbit's deer track, you know, that rabbit's track, and away he goes on that track. And then all of a sudden a deer track crosses that rabbit track, you see, so he's after that deer. And then a dog crosses the deer track and he's after that dog. And the next thing you know, he isn't even in the woods. And he looks up and there isn't even a pc in front of him and he wonders what happened.

Well, what happened was is he just didn't complete cycles of action. If there's any difficulty generated in any case, why, it's from that.

Now, there's a knuckleheaded way of following this rule. This rule can be followed in a very knuckleheaded fashion. Determine, after you have not completed the cycles you were doing, but did follow the case analysis, let's say you've been following case analysis and doing everything the case analyses have been doing on a case. So you've done some kind of a case analysis and then you've done what it said, and then you followed the case analysis and done what it said, and so forth, and you've been doing this for a long time. And you decide at this particular time to now be good. You're going to be good, and you're going to do right, and so forth, and you abandon a half-done list on a half-done GPM, and go back and do the first unfinished cycle of action that you can find.

This, too, can produce chaos. Pc by this time has had that earlier action pretty well destimulated. It sort of drifted out by reason of time or something, you see. And yet, all of a sudden you'll find out the pc will stop running. The tone arm will freeze up and everything else. Because you've added that to the restimulation of what you're just abandoning. And what – what you see in this knuckleheaded way of following it is you don't realize that you're abandoning the largest zone and area of charge, don't you see? To go back and put his attention on charge he now doesn't have.

So repairing a case – repairing a case over a series of goofed-up actions, on the basis that you must take the first time the case was goofed up and repair that now, as a means of answering up to this rule, you'll find out that doesn't work. You'll just get in more trouble than you can shake a stick at.

So you should complete the cycle of action which is most ready to hand, in which the pc seems to be interested, if you've got that kind of a case. And you'll get that kind of a case because you're Saint Hillers here, and they're going to be dragged in, ambulances backing up – that sort of thing, come in on crutches, and they'll be wanting to know – they'll be wanting to know.

And you'll find out that an auditor in 1962 find the goal "to spit," and then listed it all backwards – and it mostly has in it items from the goal "to catch catfish." And the pc's been doing very, very poorly since. And it'll be a great temptation on your part to say, "Well, let's

finish up this goal 'to spit,' and get this thing straightened out," because that's the earliest in-completed cycle of action.

Well, that is all very well, but remember, the pc is halfway through the bank "to spat," or "to not spit," right at the present time, don't you see. The thing to do, when you're faced with a quandary of that character, is just take an assessment of interest. Where's the pc's interest seem to be and then make the auditor be good from there on, you see. There's a point where you start completing cycles of action, that's my whole point to you here. And you can get so knuckleheaded as to make this an unworkable rule, see.

Let's complete the cycle of action of 1950. What engram wasn't run on the pc and completed in 1950? Pc's halfway through a GPM. Of course, put in those terms, it becomes absolutely ridiculous. But nevertheless it can be ridiculous at a lesser gradient.

You say, "Well, now I'm going to be good, I'm going to take the first – first GPM that was found on this pc – now, I'm going to stop working on these GPMs that we've been working on and try – try to find the present time goal. I think what I really ought to do with this pc is go back and finish off this goal that was first run on this pc in 1962." Don't blame me if you find yourself with a handful of overrestimulation. And a stuck TA.

No, you pick these things up in turn. The way to do that is to go back and finish them off as they turn up. Just go on and run the case. You'll find out these old flubs will turn up in their own order. Somebody has run the goal "to be stir-crazy," they've run it a quarter of the way, they ran it that way, got a lot of wrong stuff in it, messed it all up, so forth. It'll eventually turn up on the track. After all, you're going back down the track, it'll eventually run into the goal "to be stir-crazy." You'll repair it when it turns up.

You can defeat the rule, then, by causing – making the rule the reason why you won't complete the cycle of action you're involved with. You have to use some good sense as a guide in this thing.

Now, of course there's some more judgment involved in such a rule, is you find the item you were listing against, is a wrong item. Go ahead and try to complete that cycle of action! That's too intimate an error, don't you see? You're trying to do this item "roofs" and it's actually "chimneys." "Am I listing against a wrong item?" Well yeah, you're listing against a wrong item. Obviously the incomplete list was the one which was not completed just *before* this. See, you have to complete that list before you can complete your cycle of action, you see, in order to follow it through. You got the idea? So there's some judgment used in this.

But you find your main trouble comes from doing an analysis and then abandoning the cycle of action on which you're engaged and then following the analysis. And you'll find that in training auditors and in handling auditors here and there – that you'll find out that's to be their worst crime: they're rabbit chasing. They're just rabbit chasing. They do a case analysis and they find out that "Oh, there's a wrong item in this bank," you see. And my God, it's clear back up to the top of the thing, see. And that's why the pc's ARC broke or something of the sort. Got some creak. A wrong item up at the top of the bank, see.

All right, they want to go right up – leave this item which they're doing, down here toward the bottom of the bank – they're almost to the bottom of this thing, see, almost got this

first program step out of the road, see – and they're going back up and they're going to – going to complete that item up *there*. *Uh-uh-uh-uh-uh-uh-uh – slap. Naughty, naughty.*

Well, they say, if the pc's going creak and he's all ARC broke, well all right, just tell him there's a wrong item up there. He says, "I wonder which one it is."

"Well, all right, I'll tell you it's *ta-ta-ta-ta-ta-ta-ta-ta* – that one, that one – 'wagon wheels.' We didn't complete a list. The list wagon wheels – now 'wagon wheels' is your item, but there happens to be a more fundamental item from the list. All right, now we're going back down here and we're going to complete this next to the last item that we were doing." See? It's just that. That's all you do, see?

All right, there's three more goals to present time. "Well, what are they? What are they? What are they?" That wasn't part of the bargain, man. If you don't have to know them, don't find them. That's just adding restimulation.

"You've got three goals toward present time. This wasn't your present time goal. That wasn't your present time goal. The one we're doing right now isn't your present time goal. There's three more up to present time."

"Oh, there are? What are they? Oh, gee." See, a big sell, big sell. You always get this, you see. Big sell. "What are these things?" Well, you – you put the pc's attention on it. See? "What are these things? What are the goals, what are the goals? Oh, let's – well – go – shouldn't we list? Look, I – I've got some items right here. I – I've got some goals right here." [laughter] "I – here – here's some goals. Here's some goals." You see?

And you say, "Good. I'll –" make sure you make a note of those.

But the creak will disappear. And that's all you want to get rid of You thought you were doing the PT goal; there are three more goals between where you are working and PT. You go right on then, point this out, straighten it out, straighten out anything you want to do with it, you know? Pat it in the head, square it around, let him tell you what he wants to do about it and go on and complete the GPM you were doing.

I don't care how much creak there appears to be on it. You've got that one out of the road – remember, there was some reason it was in your road. There was some reason why it turned up first. And in making any case analysis, remember there was some reason why you got the wrong item. You got the goal out of sequence. See, there's some reason for this. Must be that the visibility was awful poor that morning. It must have been that the restimulation to which the case was susceptible at that particular zone or area threw this goal up before it threw up the present time goal. So this goal must be in more restimulation than the present time goal. You get the idea?

You're going off and leave this thing? Oh, hell man, don't do things like that. Make me nervous, just the thought of it. As long as you remember that – that guiding principle: do a case analysis, an item analysis, a goal analysis – anything you want to do. Straighten out anything you want to straighten out by reason of the analysis, so long as it doesn't take too long and doesn't bring much restimulation onto the case, always the restimulation is a factor you've got to figure here, see. You're trying to get rid of restimulation, so you're trying to destimulate. You do too much about it and you're going to restimulate more than you had before. And

then don't follow the analysis. Go back and complete your cycle of action – and if you keep doing that, man, you're going to be an auditor. And you're going to get terrific results because your pc is running these actual GPMs.

We are blessed with a case analysis. We are cursed with "rabbit-dogism." You see, the pc's interest goes to the case analysis, don't you see? There's lots of things – reasons why an auditor is persuaded not to do this. A pc's interest goes there. The auditor's interest is there. That damn thing is in my road. It was just – the case was just in the pcs road up till this time, see. Now, what he finds, it's in his road as an auditor. This is what was making the case go creak. They had this goal lying crossways up here or something like that, see.

And the auditor, he tends to fixate on this and of course he's always interested in new things and he doesn't want to go back and do hard work, you know – just carrying up bricks – he wants to get bricks up or make it all look pretty, you know, that sort of thing. And there's lots of reasons. The pc will sit there – sell, sell, sell, sell, sell, sell – God, you'd think they'd taken a course at Dale Carnegie sometimes.

"Oh well, if I just really knew what this goal was, if I knew what the next goal was that would be much better." And then so forth and so forth, and so forth. Agree with them perfectly, keep their itsa line in and complete the cycle of action you were already on. And boy, you won't be in very much trouble. A pc is in a heavy state of restimulation as he starts to climb this hill, it's a very steep hill to climb anyhow and therefore must be climbed with considerable care.

Now the processes we are doing at the level of going to OT are not processes that are handled clumsily or badly, somebody's – can't audit, you know, and you've got him doing something like this, man, it's just wow – can't make it, see. No, this is a skilled operation as you go to OT. And I don't care how much you emphasize that skill, because the amount of gain that you can get on a pc at Level II or at Level I is now greater than it's ever been, by these most elementary processes. So you have a perfectly right – good right to demand that somebody run the process with which they can get gains and that an auditor be confoundedly awful doggone good before he starts climbing this hill of the actual GPMs.

You let somebody do that: he's going to have nothing but loses; pc's going to be wrapped around telegraph poles, and so forth. This is a skilled area. This is a skilled operation of magnitude. You got R1C, you got R2H, you got R3SC – I don't know how long they could run on R3SC. You got your lower levels and so forth. What can be done today in the field of healing is absolutely phenomenal. Staff auditor has been – he's getting intolerably insouciant. If he keeps this up, we're going to be in very bad condition around here. We won't have auditing rooms or anything else. They'll be standing out here on stretchers, see.

The last couple of raw-meat cases that we tackled [snaps fingers] – medical miracles. And his insouciance is going to the point of running R1C with a little black and white processing thrown in. I think that's very cute! That's insouciance. Got rid of somebody's arthritis – solution to the illness is all, you see, that sort of thing – *bang, bang, bang!* We're getting very hot in these particular departments.

Well now look, if a partially trained auditor has processes of that character available to him, and if achievements of that level can be attained through lower-level processes such as

we've covered in this particular series of lectures, I see no reason whatsoever why somebody would want to commit suicide by trying to walk the hill of an actual GPM without proper training as an auditor. So I'm asking you to discourage it. I'm asking you to snap and pop and get right up there to a point of where you can do it.

But I'm also asking you to just trod thoughtfully on the instep of auditors saying, "Oh, I've got to find somebody's goal and so forth. We – oh, goals, is really find goals." "Find goals, man, well why don't you – why don't you cure some broken legs or something like that, you know? There's plenty for you there to do, you have plenty of ways to get gains, why do you want to tackle this hill? Why don't you get some wins and learn how to audit and that sort of thing and then we'll let you find some goals and go upstairs."

That's the way to handle this sort of thing. Otherwise, you're going to have lots of casualties. Because this is the area where casualties are made. This is the raw living lightning that you're handling and you start going up this hill and you start letting somebody go up this hill who hasn't yet found out how you grasp the handle of the toy wagon – he's not going to have trouble, he's going to have Armageddons. He is going to be living in the middle of the worst catastrophes possible that you could hand out with Scientology 0. So don't minimize it.

We've developed processes which are above the level of the pc to tolerate errors made in. We're awful good at it, we've got this stuff grooved. It can't be done without training and good sense.

All right, well, that's the wrap-up of the lot. The only thing we haven't covered is Scientology V, we've covered that to some tiny degree, we said it was that level of Scientology from which all other levels of Scientology came. That's good enough, so that actually gives you a total roundup of this.

Thank you very much.

ESSENTIALS OF AUDITING

A lecture given on 15 October 1963

Well, I'm glad to see you back. Where you been? [laughter] Have a good trip? Well, it's the first of these lectures in – well, it's the first one of these lectures now in two weeks. So what's the date?

Audience: 15th of October.

Fifteenth of October, AD 13. Actually, you would see to me all rested up, you see, from having not lectured for a couple of weeks, but frankly the lecture weeks are the relaxation weeks. We put 900 feet of film in the cans yesterday. It took us two days to put 300 feet of 16mm in the cans and yesterday afternoon and evening we put 900 feet in and we just shot it with luck all the way. This is – of course, we are shooting right on top of it and this is the Saturday congress in London.

This is Monday and the film has – this is the Monday shoot and the film had to be at the developers and so forth on Tuesday, and we hope we get it back with a print on Thursday. And we might even have a chance to edit it but we shot it with no editing. I just used – being an old Hollywoodite on these things – just abandoned all movie technology and threw in a lot of – just abandoned it utterly – and threw in TV kinescope technology, which is quite different.

And Reg got a beautiful Auricon 16mm magnetic sound camera from over in the States. You can line it up on one of these TV screens and it doesn't get the lines or anything, so it does a gorgeous job. And we can film demonstrations and so forth. That will be reduced down to 8mm, and 8mm with a magnetic soundtrack, and then these projectors – put in all organizations – and we can give them some material that will hold the line. And of course, yesterday's film – we just put everything in it including the kitchen sink. There was students and buildings and we had Nicky out here throwing a penny in the wishing well. And we had the kids saying goodnight and so forth.

You'd be surprised how long a half an hour is when you're making it up with shots, you know, different scenes and shots and that sort of thing. And we gagged it up quite a bit, and it'll probably – you'll probably see it next Saturday if you go up to the London congress, and you undoubtedly will see it at the US Eastern congress and the US Western congress and so forth; you'll be seeing this film around.

And the strain of it, however, was too great for us. The strain was too great. We began to crack up toward the end, you see, working on into all hours. And we were just so lucky that it's just almost impossible to estimate the amount of luck involved in the thing – so we'd shoot a shot and that was it, you see? And we weren't dropping ashtrays and other things like that. For instance, we shot a Model Session complete from beginning to end using Havingness as the process. I don't know what film footage we shot that on, but it was very brief.

Male voice: A hundred and twenty.

Only about a hundred and twenty feet of film for a whole Model Session from beginning to end with every step in it, and it all went off very flawlessly. And the only thing I did in error on the thing, I thanked the pc for the goals and gains after having gotten both goals and gains which is hardly anything at all because I've been doing that routinely anyhow.

But the score is that that film can do a terrific job of TV demonstration, you see, because you just give a usual routine ordinary TV demonstration and the camera is downstairs there in the lower studio or camera room, and it just takes the demonstration and you flick the meter onto the screen, you flick the picture on the screen. You could flick a picture of the pc on the screen, you see. You could put anything on that screen and then you shoot it off from the screen.

You say, well, what happens to the quality and so forth? Well, I think you'll see that Saturday. The quality actually doesn't suffer at all. It's quite remarkable. You don't see the lines of the screen because of the shutter – and you just don't see them show up. That's all. It just looks like a picture of something, not a picture of a TV screen. Your eye can detect more lines and so forth than a camera can detect on a TV screen. You can also set up the contrast so that it's much more agreeable to film.

Furthermore, a TV camera would shoot a picture in here now. Ha-ha. Try and take one on film. Now, you could set up two or three TV cameras, one up there and one up there, you wouldn't have to have any operator to it to amount to anything. You could shoot a picture of this lecture here, pick it up over in the lower studio and just by flipping the turret, shift from one scene to another scene, and the sound is just going right onto the camera directly, and so on. You got a picture of a lecture.

You wouldn't hear any whirring camera noises or anything like that. And you don't have to have the fantastic glaring light levels that are required for motion pictures. So we've done quite a job on that. I just thought you'd be interested in it and give you a little bit... There is a gag that I'll let you – I'll let you be able to whisper to the people. Reg is going to pull this gag. Right at the end when we finally broke down, why, Reg and I sat down to the – my organ in my office, you see, and got a picture of us going to play a tune, you see, and as we were about to strike the keys and playing on a duet you get the first of your end titles, you see. We just blank out, you see. And got that? And we carry on with a beautiful organ piece which plays out through the end titles.

And I'll let you in on a little secret. It won't be much of a secret because you listen to this music. It's actually the "Saints Come Marching In." [laughter] But in actual fact, it's being – it is the biggest pipe organ in the world. It's the Hub rink organ in Chicago, you see. I think 64 foot pipes the thing has got you know, and that sort of thing, and here we are sitting down

to this little tiny Wurlitzer. Well for sure, you see, there'll be people at the congress though who don't get the gag. [laughter, laughs]

Well, we had a lot of fun shooting that. But it was really high-pressure stuff. We'll be able to make training films, in other words, of the various types and activities. And we'll be using them here.

Now, here we have another system going in, and that is to say we can put a projector down there and put it on and throw a switch on the projector down there, and you get the picture on the TV sets here in the chapel. In other words, you don't have to have a blacked-out cinema in order to see the pictures. In other words, a little 8mm projector sits down there. This is all 16mm we're shooting this stuff on reduced to 8, you see? You can turn on this little projector down there and show a session or a demonstration or a piece of auditing, it appears on the TV screen. You watch the TV screen. And Mr. Skinner doing that – he even figured out when I asked him if it wasn't possible, why, to fix it up so that it would just shut everything off when it finished the film, and there'll be a small fee to the Instructors and so forth for that one.

In other words, you could set up a film, load it, and simply by just press a button, and you've got the – you've got the thing demonstrated from one end to the other. And then when it's finished, it doesn't even have to have anybody pay any attention to it. It simply shuts itself off. Shuts all the sets off. Shuts everything off. Turns out the light, sweeps the floor. [laughter, laughs] Well, we're getting this geared up.

Communication of Scientology materials to the auditor and the student is one of the biggest humps, as you could realize, that we must have. And there are many, many things – I'm just going to give you a talk on that sort of thing and give you some data concerning it that you'll find of interest. And that is that the TV systems, the bulletins, the graphs, the materials which you have, your live demonstrations, your live Instructors, all of this sort of thing is an effort to relay information. And the idea of education is simply taking an idea from one mind and putting it in another mind. And that is really the totality of education. It really doesn't depend on whether the idea is good, bad or indifferent, true, false or otherwise: The methods of education are all the same.

And they are basically the methods of communication, so therefore the ARC triangle, to a large degree, operates in these mechanisms. And one of the things: if you can take MEST out or take effort out of the communication line, you can normally get a fast, accurate communication line. But there is a point when the communication line, not having any mass in it, becomes unstable. In other words, you cannot hold a standard because it isn't down anyplace.

Let me give you an idea. One of you goes up to London, walk through the Central Organization in London. Well, I don't say stay out of the Central Organization in London. I don't say don't answer questions asked you. By all means, talk all you please, but it is quite ordinarily followed on a Monday by a catastrophe in the HGC.

Now, your communication line to the student or the HGC staff member or something like that was probably quite accurate. But what did he tell Joe? In other words, a standard wasn't held here so that you get weird things which are then attributed to the Saint Hill students going to London. Even one time it was contemplated not letting any Saint Hill students

go to London – go into the organization in London, see. That was once contemplated. Well, I finally put my foot down. I said no, no, no. I figured it out. No. They do them much more good than they do them harm. Because the false communication line does not come actually between the Saint Hill student and the organization. It comes between what – that the person who has heard the Saint Hill student ordinarily and who that person was talking to. See, you get some wild variations.

For instance, you might not know it, but you had all London in a complete panic just a week ago – just a week ago. They had heard that the TA required – minimum TA for a 25 – hour intensive was 400. And they all had headaches last Monday and so forth working at this horrible data, see. Well, data like that occurs in the absence of a fixed data source. It isn't written down in a bulletin, you see. It's adrift somewhere on the communication lines and so on.

Now, we sometimes sin to this degree. There'll be data which is given in tapes which never appears on bulletins. And there are little scraps of data of one kind or another that could make all that difference in the auditing session going on in Keokuk that have simply never been published. Well, to round up all this data and put it all together is a Herculean task. It would be to a marked degree up to me to do it. But well, for instance, Reg has been working on the last two years of bulletins. He's had his secretary working on the last two years of bulletins. Getting them all together and so forth. And they finally did get all of this material together. Now they're trying to get the last two years of tape notes complete. Now, if we did that, we would have two years of total research. But still, outside of it would be left the data which I have given you walking down the hall, see.

There is always some data escapes the fixed communication line. So you have to be very thorough and you have to sort out what are the fundamentals which should be taught, and therefore, in order to communicate and in order for anybody to assimilate the information on the other end, which is part of the educational act, you have to have a condition where the data is not in conflict and is not so complicated that it cannot be communicated or cannot be assimilated. So therefore you reduce things to their fundamentals. And this has two purposes. The one purpose is the educational purpose and the other thing, of course, is things which are reduced to their fundamentals are resolved or far better understood.

Now, the purpose we're speaking of now, however, is the relay of it. Now, the relay of that education and of data from mind A to mind B is susceptible to many alterations, many alter-ises, many omissions, many curves and so forth. It's almost proportional to mind A to mind B. All right, that's one set of alter-ises. Mind C – we have now added a new – that's mind B to mind C, that's a new set of alter-ises. Now we got mind C to mind D and that is a new set of alter-ises. And we've got D to E and that isn't alter-is by this time; it's unrecognizable.

Now this also occurs on the time stream. That datum, which was thoroughly understood in 1800, by 1900 has become unrecognizable. In actual fact, we probably have very little grip on what was actually thought in 1800 – very little grip, on the opinions and activities of the time.

But I well recall in just this first half of 1900, a tremendous change of manners, mannerisms, and so forth, brought about by other communication media, such as the motion picture, television and we mustn't omit the automobile as a communication media. It is because it's a particle that can travel rapidly and independently from A to B.

The telephone is earlier than that, but all of these things have influence and they influence a culture and they influence what is going on in that culture. But this we talk about in terms of an overloaded communication line now. And I'm not going into the five ways you can cut a communication line. They're the subject of a great many executive bulletins and all this sort of thing, but I'm infringing on that quarter right now. You can actually overload the communication line so that it doesn't communicate. There is simply too much data on the subject.

This – you sometimes feel like that. I know, see? And you wish, for heaven's sake, that you could pick out of it a few fundamentals that would sort of sum it all up and you would be able to wrap your wits around it and so forth. And that in actual fact is the subject of this lecture that I'm giving you; here is how you do this.

The situation, then, of an overloaded communication line is that there is insufficient time to peruse the material. You could get into that kind of a situation rather easily. So you can have too little communication. You can have too varied or too variable a communication. Or you can simply have an overloaded communication line.

For instance, I walked into the Explorers Club one day up in the library up on the mezzanine floor, and I wanted to know a little bit about ice, I think it was or something like that. I didn't – wasn't particularly hepped on it. I just wanted a little datum about ice, the conditions of ice and the temperatures at which ice became rotten, so called, and so on. I just wanted a little information. I asked the librarian up there. "Where's some text here on ice? Where's some text on ice? I want to look up something, some stable data about ice." And he looked at me as though I were mad or I'd suddenly gone mad or I was about to steal his whole library or something like this, and he waved his hand and he said, "Well, that cabinet over there is part of the material about ice." I looked at that cabinet over there and it contained something on the order of a thousand volumes, all of them thick. And you can frankly shut the door to learning in somebody's face with a dull clank.

Needless to say, I went down and found an old friend of mine that knew the Arctic, at the tea table that evening, and I pumped him on the subject of ice for a short space of time, and, "Oh, when does it become rotten?" "Oh, well," he said, "that varies," and so forth, and he gave me the variable edges and he tossed it off. It was very easy for him to toss off this datum for the excellent reason that he had tremendous familiarity with the subject. But my door was closed in the absence of this boy. My door was closed. I was to sit up there and read a thousand volumes hoping that somewhere in it I would discover something about rotten ice.

One volume said ice also becomes rotten through moss – certain types of moss. And the next thing you know, I was reading a chapter on biology. I don't know how I got off into biology. I was just looking for some rotten ice, man. See, you get off into these wild excursions and you feel like somebody who picks up a copy of the *Encyclopaedia Britannica*, and

he's going to look up anteaters, you know, and the next confounded thing, you know, he's reading with great fascination about armadillos.

He's been totally derailed. So too much information on a subject or too many volumes of information on a subject can effectively close the communication lines. We actually, oddly enough, don't happen to be suffering from that in Scientology. You think we are, but we actually aren't. We're actually suffering from a lack of text.

You would be very happy to have a text that says, "ARC Breaks Level I," and that gave a five, six, eight, even ten page breakdown of all possible sources of them that gave you the cross-index conditions of the pc for each one of them. Herculean task to do things, something like that. But, nevertheless, that would be a very welcome volume to you. Instead of that, our material is actually a research record, and you are looking at a research record. You are not looking at textbook material. And as soon as you realize that, you'll have a much easier time of it.

At any given instant on a research line, that which is known is believed to be true, and it wouldn't be there unless it had some workability at any given instant. But at any given later instance on that research line, you will find that that material has been reexamined and that certain data in it which are not important have been dropped and certain data in it which are important have been clarified and added.

Now your main difficulty is looking at a time span of development and trying to pick out of a time span of development a great many fundamentals. Well, the most remarkable thing in the world was how we got along, having started with the definition of auditor. Giving the sweeping ideas here. We got the definition of an auditor as one who listens and originally, one who listens and computes. All right. That's great. And we come up thirteen years, almost fourteen years later with this as a resolution of cases.

Well, that is certainly different on the research line. See, there's two different points here fourteen years apart, and one, it just says well, an auditor is somebody who listens and computes and most of the time the auditor thought the compute was more important than the listen. Then fourteen years later, we drop the compute and we put the listen in there for Level I. Wow! What a difference, see? What a difference. This little tiny change of emphasis gives us a sweeping difference in auditing.

So therefore, at some period during that fourteen years, some of the data concerning the definition of an auditor and his function must have been reevaluated from time to time, and sure enough, we see that. We see different TRs, we see this, we see that, we see the other thing coming along the line. And we see an enormous number of extraneous and additional data, all of which support what an auditor ought to be doing. Well, all of that data concerning what an auditor ought to be doing was, of course, an effort to clarify and explain to the student or to the potential auditor what his performance should be.

Well, it must have been there to this slight degree. It must have been there because the basic definition and understanding was not present. So, the more data in education... Now you can draw these extrapolations because we're not a bad model of education if you just remember that you are studying a research line, and it's up to the old man to someday grab it all together and put it together somehow or another and assemble it and so on. And my solution to

it right now is merely expect you to be geniuses at it, see? That's all. Simple solution. It saves me time. Funny part of it is you all too often measure up to it.

But the system now of data-summation, gathering of data and so on – adds up to a very interesting datum in the field of sciences, and that is this – this is an interesting datum. It's quite pervasive. It's quite useful – is the more arbitrariness or the more arbitrary didactic solution – you must, you've got to, you must not, and so forth – there are in a subject, the further that subject is from the actual comprehension of the basics involved in that subject. Now I'll state that another way to make sure you got it. The subject itself has arbitrary data in it in direct proportion to its distance from knowing its own fundamentals. That's an elementary remark. Now I'll clarify that. How about art? Just how about art? I remember old Don Rogers mentioned this a long time ago, 1950. How about art?

Man you've got nothing but opinion in art. Opinion, opinion, opinion, opinion, opinion. "This is a good picture because the Metropolitan Museum hung it." Oh, brother! I've met a director of the Metropolitan Museum; I wouldn't consider that a recommendation. "This is a great picture because it was analyzed by professor Joe Blow of Krapunkin as one of the great pictures of the Screamp Century." That's why you wander through a gallery and you see these four dobs of paint there, you see, running down into a mass of wrinkles, and there's a sign across the bottom of it and it says "Commerce." And *ohhhh*, which wall, see?

Well, therefore, a subject can be so way out that it is nothing but opinion. And when a subject is nothing but opinion, then you can safely assume that there is nothing known about the subject. That's one you can put in your hip pocket just as a snide method of analysis.

Now, for instance, testing: When you have tests which depend upon the opinion of the tester to say whether or not somebody is sane or insane or delirious or something, you see, and it's up to the tester to give an opinion, then you must decide two things: that little or nothing is known about testing and that no fundamentals on the subject of the mind must be known in that quarter; otherwise, the tests would not be so far out as to require only opinion.

Here once more we have the fact: The opinion present is proportional to the unknowns present. And you can get, then, all kinds of weird (quote) sciences (unquote).

Now, that's a little bit different than looking at a developmental line. A developmental line is simply a self-critical and active and ambitious effort to learn more fundamental materials to clarify and throw away irrelevant materials. Actually, it's a self-critical line that is trying to shorten its own volume. It's trying to reach minimal information.

It looks to you sometimes in this field of study as though it's trying to reach maximal investment of time to understand it. But if you will look at the materials, you find out that they are condensing, condensing, condensing. The data are getting less per section of the subject. But with that lessness comes a greater importance because they're more fundamental previously.

You can, for instance, take a Hindu philosopher's textbook, Krishnamurti or something like this, open up the chapter on time. A Scientologist would be very fascinated to read Krishnamurti science on the subject of time. He'd be flabbergasted, as a matter of fact – flabbergasted. How'd he know this?

Well, unfortunately, there's a little hook to it. His data about time, that are factual data about time, are sandwiched in at the same monotone of importance with about five hundred or a thousand other data about time which are *totally* false and to which he has given the hat tip of being fundamental.

So you can go through any body of writing, and you can find certain numbers of truths in it, but did the writer find them? I used to horrify English professors by saying – about witticisms and being very clever in writing and that sort of thing – I used to horrify these boys. You could just see their – the resistance of iconoclasm item go straight up in smoke, you see, when I would say, "Oh, yes, well, Sir Thomas Browne, anybody that would write that million words couldn't help but say something clever." Nevertheless, this has scientific application.

You can't write on the subject of time endlessly and take every stray thought that comes in your head on the subject of time and put it down on a sheet of paper without having in that mass certain fundamental and sweeping truths about time. Only, now, which is the drop in the Atlantic Ocean which is the important drop?

Reevaluation of information in the direction of arriving at more fundamental conclusions which have greater usefulness is the basic of this progressive research line which you are studying.

Now, it isn't true, and I am very happy to find out that it isn't true – I've been over this ground and over it – that you are necessarily studying Ron's case. [laughter] As my auditor can tell you occasionally, I go pale when we walk in toward a fundamental of Scientology when I'm being audited and think for a while that that might be the reason why I have called something something, don't you see?

This whole contest has been a much more dramatic contest. It's been the effort of by the bootstraps above the level of one's own case and have at it. And when I haven't succeeded in rising superior to my own case or items and so on, I am the first one to turn slightly pink. And it was quite interesting to me – it's quite interesting to me – for a while ago running into survival – to survive as a GPM, don't you see? Well, obviously, this would explain so much if this were the present time GPM. It would practically explain all, wouldn't it?

Well, when I found that in session that I had such a GPM, I *was* very, very blushing, you see. And so much so that I pulled it completely out of line, in the lines of GPMs, and put myself in a terrible creak because it actually belongs *waaaaay* back on the track lost with a lot of other GPMs, and simply had gotten pulled out by the recognition of the fact that survive was the basic principle of existence. And then that had turned around and taken this GPM and hauled it out of the backtrack and carted it up to present time with winches, and there it has been sitting putting me in a gorgeous creak, see? As soon as I recognized that this had been the action, bang! It went back into place. I haven't been troubled with it since.

The whole contest has been then to see things clearly, well knowing that one could not be on this planet researching things without having his opinions colored. And yet trying to rise above the coloration of opinion by one's own aberration and associations or even the penchants and enthusiasms of the age. These things also tend to color things enormously, you see.

Well, it's been – we have been successful to the degree that that has been accomplished. And has been accomplished to a considerable and remarkable degree. Now every time we ferret out a new fundamental, you actually lose out of your study data a bucketful of items, a bucketful of data until you begin to wonder, well, what is stable and what isn't stable in the past. That's fascinating. What is stable and what isn't stable?

Well, actually, the Axioms are in there in concrete. The Logics, the Prelogics, the fundamental material of the *Philadelphia Lectures*, the behavior of a thetan, the only thing I've seen it necessary to change in that particular line is the idea of exteriorization – is the only thing that's been changed recently.

What will a pc do when you bring him up to a point where he does not have to be in a body? See? And we used to think that he would move out of his body. And that is not what he will do. He will move his body off him because we have changed him up scale to a point where he can hold a position. And if he could exteriorize, the first thing he would have in mind, if *his* body was getting in his road in any way, would be to move it over there.

Now, I think that's an awfully minor – minor thing to have shifted in all that body of theoretical information. You have the Factors. You have all sorts of – you've got all of this what we are now calling Scientology One material, you know, and your ARC triangles and all that sort of thing, basic materials by the ton. These things are all completely accurate, see? Been no reason to change those at all. They're in concrete. So, therefore, the working field in which we have been engaged has been the field of *applied* technology. There has been no reason under the sun to alter our theoretical technology. Not even the datum I gave you just now alters the theoretical technology of Dianetics and Scientology – not a hair. That's still there. Theoretical technology? Dead accurate. Dead accurate. Nothing wrong with that.

Well, what then are you as a student seeing change? What do you see change under your nose? What's this that's going by? It's the reevaluation of data as applied technology. And you're seeing continuous reevaluation of data as applied technology. Now, because you're studying to be an auditor, not a theoretician...

As a matter of fact, I could confide in you, you would be having a breeze if you were studying at Scientology Level Five. That's the theoretical level out of which you evolve Scientology, you see. If you were only studying at that level, what a breeze you would have. You didn't intend to apply it to any case. You didn't intend to do anything for anybody. Maybe you – all you wanted to do was know about the organization of things, the principles of things, and that sort of thing. If you were studying at that data, you would say "good heavens, the unchanging monotony of this stuff is fantastic." So where is it shifting? Applied technology to cases. That's where it's shifting. And that's what's giving you a headache as a student.

But let's go just a little bit further than that. What's giving you a headache as a student in applying it – if you do have a headache as a student applying it – is trying to apply what you know to a case sitting in front of you so as to obtain a result. That's where the data mills around. And if you look over your bulletins, they're all addressed to this subject. Not just because you're a student, but that's the most of the outflow and information available.

It is so rare to release any definitions of communication from Scientology Five – it was a terrible shock to people apparently to release Project 80 – the definitions of Scientol-

ogy. There have been several complaints about these. Well, of course, there's been tremendous huzzahs – most sensible people have said huzzah, and so on, but there've been several complaints, too. It was a great shock, it's a great shock because they contain three words in them that are very upsetting in the United States particularly. It says the common people's science of life and livingness, you see? I think that's fascinating. That's what's wrong with that level.

I don't think that's what's wrong with that level at all. I just think it's the derivations or the reinterpretations that you can get into with this particular phrase. But the odd part of it is everybody has spotted the lie, see? In Project 80 there is one lie and that's that Definition. Only they don't quite know what's wrong with it. And they're picking on it. There have been several letters in complaining about this. Everything is fine except that one: "The common people's science of the mind" or something like that, whatever it says. Fascinating.

They haven't realized that they've spotted a lie. And they think that they're complaining about the common people. And they're not complaining about the common people. That phrase is not what they are complaining about. This dashed off as an example – you understand that that Project 80, this was an example of what these definitions should be. That was all. And this one was thrown in. No, that's a newspaper toss off. See? That's a newspaper definition toss off to get people to understand it. To get people to communicate it one way or the other, and that little particular phrase happens to be untruthful because if there's anybody uncommon, it's a Scientologist. The common people on the subject of the mind left to their own devices – God 'elp us! Because remember, this is a subject which confounds the wits and creaks the brains of, and has the best thinkers and philosophers that have ever been on this planet in its written history.

And through false modesty and because it communicates better, and so forth, one backs off that particular point. These are the problems that drove Socrates round the bend, see. And we're studying them and handling them as an everyday activity. Oh, wow! Of course, you can't say then this is the common people's...

You want to know why can't we get more people into Scientology, see? Well, you can get a lot of people into Scientology. There is no doubt about it. But if you get them in at Level I – or at Level 0 or at Level I – you've got to fairly rapidly make them very uncommon people to bring them on up the line. Correct? So it is a lie. They're not common people. This is nothing – this is nothing against those people who have been complaining about that. They're dead right.

That, of course, that particular phrase was taken out of a newspaper handout that I was kicking around and we were putting together, and so forth, and it just seemed like a good off-hand definition that was simply put off as an example of how you would define it, don't you see? Well, everything else in it is quite truthful and quite factual, but that one happens to be a lie, and there have been several complaints about it, all saying, we are not common people. See? And that is not ... Now, you could say the average person – I just got one from Detroit of all places – the average person's mental science. Now that would be acceptable but not the common people. You see how far that datum is shooting? See how far that is missing. Well, that would then become an aberrated stable datum and it would only stick because it con-

tained a lie. Now, out of all this other truthful material we find people paying a lot of attention to this one that: (1) isn't important, and (2) happens to be the only inaccurate rundown that we have in Scientology One, Project 80.

Now, what does that have to do with education? Why is Ron going off to this degree? No, the mind tends to fix on those things which contain an alter-is from truth. And conversely, an alter-is in the truth of the situation is the most resistant thing to the truth of the situation.

You've got the cowboys in the white hats and the cowboys in the black hats here, see. The cowboys in the black hats are aberrated stable data. Now, I'm very sure that at least one or two of you present, if not more, have become very worried about absorbing any stable data realizing that a GPM is made up exclusively as data which has become very, very stable indeed.

And if the whole source of human aberration – running your itsa line, and so forth, and taking out solutions – that the whole source of human aberration is actually derived from stable data assumed to hold back confusions. And I'm sure that to some degree you've been shaking in your boots about postulating any new stable data. Look what it does to you.

No – it's an aberrated stable datum. The common people's mental science, see? Look at the randomness of that thing. And suddenly confusion suddenly started entering into various parts of the country and even Detroit. See, confusion entered in. People started batting at this thing. They didn't like this. This is wrong, and so on, and so on. So any error entered into the line is apt to get battered at.

But a reverse fight also goes on. An aberrated stable datum will batter back at the truth. But where you have a slightly altered truth and you were trying to give it to someone who already has an altered truth on that same subject, the two will come into a conflict which promotes all sorts of bad applied technology. Now, this is something like saying, "Well, an aberrated auditor has a hard time auditing." You've heard that old saw, see. I can turn out a very nice session; I never pretended to be unaberrated. I don't believe that, see?

But I will tell you this: that a guy with some of his aberrations in place, some of these aberrated stable data... You see, the real hang-ups are: "The way to get on in life, you see, is to die." Oh, it'll hang you up because it's not true. It stops. It stops a proper flow of data.

All right. Now, if you, then, are studying material which has any place in its body at all, any alteration from the fundamental that should be there, and you yourself have an alteration – remember, it's an alteration – which is contrary to the datum – altered datum – you are trying to assimilate, you get a dog's breakfast. It becomes a real mess.

In other words, we're trying to drive a truck through a truck. We've got this aberrated, slightly aberrated datum and we're trying to push it through an aberrated datum. They've both got lies in them to one degree or another or they're slightly nonbasic or nonfactual and they won't mix. So you have this fellow with this slightly aberrated datum – "all horses sleep in beds," you see – regarding the datum "all beds are soft." You see, "all beds are soft" isn't true, and "horses sleep in beds"; that isn't true.

Now, how are you going to get these two data together? Well, they just aren't going to fit. And you'll have this fellow going around in circles and he'll have every reason under the sun why it isn't true that all beds are soft. Some beds have got to be hard. They've got to – in the first place, they've got to support up to a ton of horseflesh. Now, he actually at no time looks at what is really wrong with this datum he's trying to assimilate. All beds are soft. That's not true.

If you've ever been on an old-time sailing ship, you would know that. If you've ever slept under an airplane wing, you'd know that. In fact, I could think of some hotels that would tell you that quite rapidly. There's some landladies around here that wouldn't agree with that at all. They make it completely false.

So you've got – you've got this fellow and he's saying, "All horses sleep in beds. Well, 'all beds are soft' can't be true because if it was true they wouldn't support a ton of horseflesh. Imagine getting a Percheron to sleep in that bed, you see? Too soft; go right straight through the mattress. You know, the bed's got to be stiff, stiff, see."

Now look at the ridiculousness of this conflict. Is any part of this conflict going to resolve itself at all? He's finding the wrong thing wrong with the datum because he has a vested interest in trying to make this datum fit or unfit somehow with another stable – unstable, erratic, aberrated datum, see? So he can't get these two data together. Never the twain shall meet. He then tries to understand an aberrated datum through another aberrated datum, and of course he develops complications. Now, he's liable to get Professor Sweeney to write a paper on the proper softness of beds, see. He's liable to get all kinds of things, but he's actually trying to push home the data "all beds should be hard and strong."

He's actually trying to push into existence as aberrated a datum as he's being presented with. Now, out of this conflict and counterposition, vis-à-vis and one against the other, aberrated stable datum versus aberrated stable datum, you get a crush of superimposed opinions of one kind or another, all of which rise up into a fantastic potpourri that is called opinions, logic, demonstration of this and that, and so forth.

Now, you have a pc who is a walking gold mine of aberrated stable data. Now, if any datum which you're using to resolve that case is the least bit curved, that case won't resolve but develop new complications. Do you see this?

Therefore, the mass of technology which grows up in Scientology is, of course, centered around applied technology. And you get a swelling mass of this data which then will subside and a lot of it will be thrown away. And you get a swelling mass of this data and it'll subside and be thrown away. But it only subsides and is thrown away when a new clarification is given to a fundamental. So the greatest possible truth, in terms of fundamentals, has to be used in application. So it's my contest on a research line to leave no stone unturned to get at the most fundamental, clean, clearcut fundamental possible for the resolution of the case because the cases otherwise will not resolve.

Now, we've gone an enormous direction. We've gone a long, long way in this particular direction and we have made some tremendous gains in this particular direction. But is there any other zone – is there any other zone, now, where we get a randomness? Yes – the person who is applying the data.

Now if you, in assimilation of data, are assimilating to the slightest degree data up against a miscomprehension or an allness* which you're putting in place of the auditor, you don't get an assimilation. You have difficulty assimilating the data; but you can assimilate the data. Your trouble comes when you turn around and take the datum you've assimilated and altered in some fashion and then have tried to apply it to the case who is sitting in front of you. And the alter-ises in that data will then bring about a nonresolution of the case you are confronted with.

The only solvent is truth. And even though absolutes are unobtainable, truth – in a very refined form, the purest possible – is the only thing that will resolve cases all the way because it is the one thing that the aberrated case cannot argue with. Therefore, you as an auditor desiring results have no business whatsoever in letting yourself get bent around in circles or riding hobbyhorses with regard to the technology which you are applying because it will get furiously in your road if it has been twisted in some fashion.

Now, that looks like an almost insurmountable barrier. Actually, there's considerable tolerance and you get a resolution of cases within this zone of tolerance. There is a zone of tolerance. It doesn't have to be quite that perfect to make it work because the technology heretofore was too imperfect ever to work.

And it has been my task to bring about a recognition of fundamentals sufficiently great and technology sufficiently great to overcome a lot of this alter-is. But it is a task which is, of course, a thousand times greater than simply presenting the task necessary to resolve a case. We're not just presenting the material necessary to resolve a case. We have to present it so fundamentally accurate, so close to the purest of pure, that the auditor in applying it can still alter-is it, can apply it to a pc who is – because it's right up against his case – maybe as a person he'd be able to override some of this, but when it's applied to his case – being that makes something else – who is going to take that data already twisted and twist it further, such as in answering the auditing command, and still have a resolution of case. That's an heroic problem then.

Well, now you haven't too much to worry about along that problem line, but you do have this to worry about: The amount of difficulty you have with cases is directly proportional to the amount of aberrated or alter-is – aberration or alter-is that you're adding to the data that you're using. That's directly proportional. Now, of course, this also is directly proportional to the purity and assimilability of the material you are given to study. I already accept some fault for that, don't you see, because that is a difficult one to bring off. But we're in there awful close, don't you see? There isn't too much out.

That would get by if we didn't have an alter-is of an offered datum by the auditor which is then applied to a case which is just going to alter-is the living daylights out of it. The only universal solvent is truth. That's the only thing that will solve anything. Imagine it – we even know that the way you solve solutions is solutions. We even know how to cure cures. It's fantastic.

* Editor's note: see p.19, second to last paragraph, for further explanation about what is meant with "allness"

You know, there's practically no field of healing has ever gone in this direction at all. These are all undisclosed and unrecognized data. This guy's got lumbosis. Reg did the other day – asking what solutions has he had to his back trouble – he was asking some pc. The pc all of a sudden turns up with no back trouble. What – did he have back trouble? No. He had solutions of the back trouble.

Well, when you've penetrated that deeply into the morass of consciousness and unconsciousness, that you know what is cause and effect along this particular line, you're dealing with fairly pure information. But everywhere I have made the tiniest little mistake or thrown the wrong emphasis on something, you're going to have some trouble. And you might be able to get by with that – and might not, too – unless you took that datum – or took data – and then alter-ised it thoroughly and then shoved it at a pc, and of course, by the time it gets to that pc, the data is very far from truth and therefore is not a case solvent anymore.

Now, it's my task continuously to look up these holes in the technology, find out where they sit, find out what misconceptions people have about these things and reevaluate the information and re-release it again. This has been done at Level IV to such an appalling degree now that Level IV does the impossible. It brings about an OT but is actually only workable at a level of tightwire walk that doesn't permit a variation of an eighteenth of an inch from its procedure.

I'll show you right now how much you can vary Routine 4 and smash a pc. There was a hole in it, but the hole didn't appear until somebody wasn't asking the exact question. There was a hole in it – I've been looking these up rather rapidly lately – and that was simply this: There are three goals that will rocket read – three types of goals that will rocket read. And we started out with just one type of goal that would rocket read. That was old Routine 3, way back when.

And those are: an actual goal, an actual GPM and an implant GPM. There could be another type which is a phrase in an engram, but that will not necessarily rocket read. But the other three, any one of them, will rocket read. Now, as you sit there and look at what you've just written there in your notes, when you regard that, you say that's not much of a discovery. Well, look, we used to have one type which was a goal. We were awful glad to see a goal rocket read. And then through this last summer's work, I found out practically all there was to know about implants and implant goals and it was obvious that actual goals and implant goals were getting mixed up. And we got at least one case in Z Unit who does not know it, until this moment, I start giving this datum just at this instant, who's wrapped around a telegraph pole.

Actual goal, but it hasn't got any GPM connected with it. Isn't that a nasty one? Any GPM may have in it upwards to a hundred actual goals, but there's only one goal for that GPM. These others are totally superfluous. They're nothing. Do you realize that the goal a pc sets for a session is an actual goal? A pc's actual goal, isn't it? And do you know that they will every once in a while rocket read? And they haven't got any items attached to them at all. They are probably a lock on a reliable item someplace – just a lousy lock. And if you take one of these things as the pc's goal – GPM – and run it the way you would an actual GPM, you can find items. Oh, where do you get them? Well, you pull them in from the nearest implants. You pull them out of other GPMs. You pull them off other locks. Hey! You can just find

items, items, items. You can make the beautifullest line plot you ever saw in your life. But there was no GPM there in the first place.

Now, the patter I was using in handling Routine 4 was exactly as follows: "Is this an actual GPM?"

This is meter questions and these, by the way, are just dead accurate on the meter. You're just shot in the pants with luck because these things are always correct on the meter. There's a lot of things you can ask a meter, such as "Is this a PT goal?" and things like that. That's not accurate. It won't give you an accurate response. But it will give you a dead accurate response on this other information first crack off the box and that saves your bacon.

You can take this – I was asking these on the meter, of course.

Find a rocket reading goal, see, and say, "Is this an actual GPM?"

"Is this an implant GPM?"

"Is this no GPM?"

And that were the three questions I was using. Ah, fascinating, because auditors have been asking, "Is this an actual goal? Is this an implant goal?"

Oh, my God, what is this? Well, it's enough to kill somebody. You could frankly just wind somebody up in a complete *blang* with it. That's what I mean by the eighteenth of an inch off the tightwire. But there was a piece of technology missing where the pc's actual goals will rocket read and don't have to have any GPM connected with them. It's only those goals which have GPMs connected to them and have formed a GPM that you have any interest in of any kind whatsoever. And they're good, nice, great, big, smashing masses with – full of RIs and tremendous relief and they explain the aberration of the pc, and they can be opposed, and so forth.

You take one of these actual goals. It hasn't got any GPM connected with it. It's just some kind of a lock on some RI, you know, "to eat candy," you know. That thing rocket read. Do goals opposed list on it. *Ooooh*, we're going to get the pc in a mess. No, that's fine.

Let's find another one because we'll never find an actual GPM listing one against. So we're going to find another actual goal, aren't we? And then we're going to oppose that. *Ohhh*. And we're going to oppose that and we're going to finally find a present time actual goal such as, "to not get Infraction Sheets," you see, or something. And by God, we could sit down and find a top oppterm for it. That's what's frightening.

Where would we get it? Well, we'd have to get it from a few trillion billion squillion years ago or we'd pull it in from some RI someplace or another or pull it out of the actual present time GPM, you see. Just pull in a random RI – anything – but usually locks on RIs. We wouldn't really get RIs. But they'd fire because they sort of fit, you see?

And you would get a nice, beautiful line plot all on the pc – but there's no GPM that goes with it. Oh, you could probably keep this up for sessions and sessions and sessions and sessions, and you could probably get tone arm action and tone arm action and tone arm action. Well, everything's going fine, and all of a sudden the pc goes *deooooooooooooooooom-boom!*

Tone arm goes clink. Pc's starting to develop ulcers of the stomach, lumbosis. Frightening, isn't it? Just varied one word.

Instead of asking, "Is this an actual GPM?" ask "Is it an actual goal?" And you'll get a read. And then suppose that therefore, if it's an actual goal, it has a GPM attached to it. Around the telegraph pole; so that much variation in technology. But there was a missing datum there, wasn't there: that a pc's (quote) "actual goal" could actually rocket read.

It's a good thing, kids, that I'm totally indestructible because these things usually happen to me first, don't you see? It's gruesome, gruesome. A couple of weeks ago I was ambitiously listing on one of these things but it didn't feel right and it didn't look right and it didn't oppose right and nothing was going right. It was a mess.

And light finally dawned on me. I generally wake up just as I go down for the third time, you know. I can see this stream of bubbles over my head and decide I'd better surface. I said, "You're checking an actual goal. You're not checking an actual GPM. For God's sakes, check this thing for an actual GPM." No read. No GPM. It's the only thing that checks out, see? Oh, my God! See, just a little, little piece of technology, see? Hardly enough to bother with. Cool! And it can throw a curve into the works like that.

You know, you could go on auditing somebody for months with this kind of nonsense and wondering why they weren't getting any better and they never have any cognitions and life would just sort of be grim and they wouldn't quite be making much case gain – TA yes, oh, yes – but fundamental error in the case just taking them down one after the other; the reality getting poorer. Something – something is happening here that is incorrect, see?

PC ARC breaky, kind of hard to handle, you know. A little datum like that. Let me show you another datum. This is a spooky one. This is a very spooky datum. I might as well leave you all gray-headed in the next three minutes, which I'm just about to do.

Let's take Level I. Nothing to learn now in Level I, is there? Got it all straight, haven't we? There's our whatsit line, see? There's your C and E, and here's whatsit. Very nice. And there's your auditor over here, of course, you see, and here's your pc over here. And there's the pc as a thetan. Here's your communication line. There's the bank. And here is the itsa line: E, C. There's your itsa, right?

How many communication lines have I just shown you?

Audience: One, three.

How many? Come on.

Audience: Three, three, five, six.

Well, the drawing right here. How many do you see on this drawing?

Audience: Three.

You see three. Well, how many do you see in your pc? When you're sitting in an auditing session, what are the three important communication lines? And what is their order of importance? Some of you are going to say this whatsit line; that's the most important. Some of you are going to say the itsa line. And you're wrong.

It's this one. One – first importance; two – second importance; three – third importance. And anybody who doesn't think that that line is important has got the definition of an auditor wrong. It's this delicate. This is scary when you start looking at the delicacies and nuances of definitions. Willing to talk to the auditor is very easily interpreted along these ways: such as talking to the auditor.

So, the auditor cuts this line to get the pc to talk because it is this line, the itsa line, of course, that blows the charge, he says, and so cuts the pc's communication with his bank – cuts the pc's communication with his bank in order to bring about an itsa line, and wonders why he gets no tone arm action and why the pc ARC breaks. Because the cut communication line is not perceivable to the naked eye. Not perceivable to the naked eye because it's hidden, because the pc is a thetan unseen by the auditor – to the pc's bank, unseen by the auditor. Which causes the auditor then to basically – an auditor can do this: start running on only line three, whatsit, and itsaing on the meter. See, itsas on the meter and whatsit on the pc and therefore has this line cut and this line cut.

Now, you see the picture I've just drawn you here. This picture, taken up carefully with any auditor as to just exactly why this isn't true and just exactly what the score is with regard to this will disclose to some, some horrifying data. Horrifying! And they wonder why they haven't got tone arm action on the pc. Tone arm action has to be prevented. Well, this is the basic method of preventing it.

Now, here we are. Basically, I am to this degree on the research line – I'm not telling you I'm in error because you can't take anything out of whole cloth and then prove it and then continue to say you're in error about it – but I'm in error to this degree as far as the relay of this information. It was not all found out. And the evaluation of the importance of these three lines was not totally done. This line appeared on your early drawings but was not assigned its level of importance.

Now, this is a communication breakdown as far as I'm concerned because, of course, to me that would be all auditing was about: trying to get the pc to confront his own bank. So I'd simply neglect to say anything about this and then appear to be laying undue stress on just the itsa line, and then anybody looking at this and analyzing it and trying to pick it up and learn it with, let us say, a datum of this particular character: You can't ever trust a pc to answer an auditing question, so therefore you shouldn't get him to look at his bank because if he looks at his bank, he'll overstimulate himself, won't he? So therefore, the best thing to do is every time he starts to look at his bank, attract his attention to the auditor and get the pc talking. *Heh-heh-heh-huh-bloo!* You got that?

Now, there's probably 8,750,963 – 734.2 combinations of reasons why this situation can't occur. But once it's explained this way, and you see it clearly and you understand your way through it, the auditor is simply there to get the pc to confront his bank, you see. The charge blows off of it to the degree that it's confronted, and this is represented by the itsa line, and the itsa line is a report on what has been as-ised that gives it its flow. Now, that sounds, perhaps, to you like an entirely different explanation of the itsa line. No, it's the same factors we're dealing with. I have just weighted it slightly differently to make a better communication.

Now, the reason that communication could not be accepted or the reason that communication couldn't go through would be the reason why the auditor is having trouble auditing. So I'm giving you all parts of education now.

A research perception, an investigatory perception, of the actual truth of the situation with regard to the communication lines present in a session; the communications lines of auditor to pc on the whasit and then pc to his bank and then pc to auditor giving us the itsa, of course, includes its most important part – pc to bank.

But because it goes one, two, three in sequence, we're liable to take up that number one is the most important or some other aberrated consideration with regard to it and so auditing would not occur. But the breakdown is simply my failure to recognize exactly *what* these factors were in a lucid way and then to communicate it and have media by which to communicate it that would bring this through rapidly and then have it received. And you have all points of education and you have technical result occurring if that is done. If you don't have that being done, you don't have technical result. And that is about all there is to be said about it.

Now, any auditor who cares to reevaluate or look over his considerations concerning this and why these things can't occur and what really exists here instead of this very simple rendition – you actually would be able to sit down and coach a fellow very carefully with this little drawing as elementary as it is and get all the reasons why and et cetera and what a pc is liable to do if you – and you know, and so forth, and what really blows the charge and where it actually exists and where it doesn't exist. Take this all up in full, you're going to find a whole hat full of aberrated data fall out: wrong stresses, alter-ises and that sort of thing. That's because you're presented here with a relatively pure datum. Therefore, that datum would go through and resolve the rest of the way.

Education, then, is basically successful to a technical end only when it is in a very pure, comprehensible state and is relayed well. First it must be conceived very purely and then it must be relayed well. If we were not teaching you toward the final devastating result of "did it work on the pc or not," if we had that horrible test out of the road, then we could teach Scientology V, and you would be sitting there being very happy to learn all the axioms by heart and straighten it all out and have some cognitions on the thing and everything because the data would never actually be subjected to any final result. That's what makes Scientology different than any other mental study that has ever occurred. Somebody comes along and says, "Oh, I know what Scientology is. That's just like Taoism."

Just like Taoism, huh? Who ever got "Tao'd Clear" or "Tao'd better"? Nobody. That's the answer to that. But it's a beautiful philosophy and there's a great deal of truth connected with it. But if this truth is never put to the acid test of performance, who cares? But your technical gains on your pc depends first and foremost to take responsibility for it – for the purity of the datum which you are given for application and then depends upon your ability to perceive that datum and apply it without a great deal of alter-is so that it arrives in the direction of the aberration in which the pc is involved in a sufficiently pure state to as-is and knock out of existence the case; that is, the aberrated condition which he is confronting. That sounds terribly elementary. That sounds terribly simple. Actually, it is terribly simple. It's an action

which can only be complicated. It can only be complicated. It can't much go the other direction. But there's the acid test of result.

Now, no pc – no pc is going to resolve in a minute because you're up against all the reasons he can't get well. But in an auditor who is altering data which comes his way, you're up against all the reasons the data can't be relayed. So therefore, education to this degree lies in clearing the line. Get the line cleared up so the datum can be applied. That becomes a highly important activity. And I invite you, one and all, to look at that little plot there as simple as it is. Look over those three lines and decide for yourself. Decide for yourself what the relative values of this thing are or how this thing all adds up and all the reasons why it can't be done or won't work. And you suddenly will stop cutting the pc's itsa line, and your pc will stop ARC breaking, and so forth, because you've laid out for yourself a series of clear-eyed understandings with regard to exactly what you are doing.

It is fundamentals of this particular character which make breakthroughs. The itsa line itself is a tremendous breakthrough. Now, a clarification of the itsa line is absolutely necessary. We find out the most important part of this particular communication pattern happens to be a totally hidden line. Where your auditor neglects that hidden line, where he doesn't understand that hidden line, where he can't integrate it or do anything with it, he's going to fail. But as I said, that long number I gave you is the number of reasons why and the number of methods why these three lines can't exist. And they will be voluminous.

Therefore, education also carries with it de-education. And when you're studying on a research line, you have to become very flexible indeed because you have to de-educate yourself by a clarification and understanding of materials you thought existed – and so did everybody else – existed in a more complicated state five years ago. And you'll find one of your great difficulties with an auditor is he's glommed onto and made an all out of one of these old data of some kind or another, and he's got it standing there in his road.

But all of this comes down to one other simple fact that I can't forbear to say anything about even though you're going to be able to come fifteen minutes late tonight. And that is simply this: No datum I give you is a substitute for you. That is the burning thing to remember as an auditor. No datum I give you is a substitute for you. You put a datum in an auditing chair and tell it to audit a pc and it isn't going to. It isn't going to. The only thing that can be in an auditing chair is a live thetan, because only that can handle the communications and confusions which arise.

Now, if you have a very complicated thetan – this thetan starts doing forty-seven and a half other things besides just sitting there handling the situation, he's riding on a bunch of data. But what do you have essentially.? You have some other data sitting in the auditing chair you didn't know was there. So the one thing for which there's no substitute – you've got to have technology because nobody was ever able to make a breakthrough on it or your technology exists and it exists in a fairly pure state – well, there's one thing for which there's no substitute whatsoever. And that is a live thetan in the auditor's chair. And no amount of textbooks sitting in the space which he occupies will ever audit the pc. And I think you see in that a purity of truth.

I notice that I do best as an auditor when I just sit there – oh, I use all the routines – but when I sit there and I handle the pc in the session, and I'm there and I'm alert and rolling along down the line and rolling with the punches and shifting this way and that, my eye on the situation. And I audit worst when I'm trying out a theory because there's a theory sitting there. See? There's a theory sitting there.

Well, let me show you this. We do know now that a successful session moves the tone arm adequately throughout the session. And that's the final test. Now, at higher levels not only will it now move the tone arm, but is the auditor proceeding along the line which will continue to move the tone arm and not have it break down somewhere up along the line? Now that – we're describing Level IV because he can get tone arm action on Level IV that dumps him over a cliff and gives him no tone arm action a week from now, see?

So we have this final criteria: Not only is there an acid test of the technology in the field of application, but there is also an acid test of an auditor. Does he know his business?

[Please note: this tape ends abruptly as did the original master recording]

THE ITSA MAKER LINE

A lecture given on
16 October 1963

How are you today?

Audience: Fine.

Good. Good. We have the 16th of October AD 13, don't we? Is that the date?

Female voice: 17th.

What's the date?

Audience: 16th.

All right. All right, you're outvoted. [laughter] One motion we don't have to table. Saint Hill Special Briefing Course.

Well, we have a lot of material, but the material you were most fascinated with was the examination of the communication cycle and the recognition that there was another communication line in it you hadn't really been aware of. Several auditors so far have been very, very delighted indeed, and I think several pcs already have been. And there will be a great many more pcs who will be delighted with this before we get through. I better give you a bit of a talk about that, in spite of the fact that I haven't hit on a final name for this line – we'll call it the itsa maker. Now, that possibly is not the most applicable name.

Let's take a look at this thing. This line is actually the line which you are guiding as an auditor and which sorts out the various things in the case, and which then reports – which then gets the material, you might say, that is reported to the auditor as itsa. Actually, the itsa itself occurs at the end of this line, not at the auditor. So actually, it's the itsa communication line that goes from the pc back to the auditor. That is the itsa communication line.

Itsa is a commodity. It's a commodity. It's actually the identification of isness – and, of course, time can enter into it and you will get wasness. Now, you get all types of variations, all tone scales and everything else fit into this commodity called itsa. You could ask for "failed decisions." Well, the pc says "itsa," see – he says "it's a failed decision," don't you see. It's a this, and it's a that, and it's something else, but you could even have a failure to identify. You could ask pcs for failures to identify. Now, if you were going to ask a pc for a failure to identify, you of course are on the borderline between a confusion and an itsa. See, that's the borderline in between there.

Times when you didn't find out something. Now you'd be surprised that occasionally you'll get a little TA action on this. But you will also stir up enough overrestimulation to mess

things up gorgeously. Now, the commodity called itsa is so simple – recognizing it can have tremendous variety – it is nevertheless tremendously simple as a commodity. There is nothing much to this commodity. You walk in the room and you look around to see what's there, you see. Well, it's a chair, it's a student, it's a ceiling, it's a floor, don't you see. That's itsa for the room. And that's all there is to it.

Now, until the itsa is recognized, it's only potential itsa. There is something there to be itsaed. Now, where you get in a lot of trouble as an auditor is you think you have a potential itsa where there's in actual fact a nothingness, and you're trying to get the pc to itsa a nothingness. This is the way you go about it. Let me show you just some of the problems that an auditor runs into with this.

He says to the pc – he says, "What's going on?" or "What's happening?" You see?

And the pc says, "I'm just sitting here looking at a picture of a statue." You got that now, see. That's the situation.

Now, the auditor says, "What is happening?" or "What is going on?" in some version or another. Now, the degree that the auditor can vary this, buries it from view of what he's actually doing, see.

The pc has told him what was being – what was there, see. He said "itsa." "Sitting here looking at a picture of a statue," see. Simple.

Now the auditor says, "What else is there? What are you doing? What else are you doing? How are you doing it?" and so on. "What decisions are you making about this?" You get this?

Well, the pc isn't doing anything else, isn't making any decisions about the statue and in actual fact there is exactly nothing else going on. Now, this is the commonest method by which an auditor refutes itsa.

Now, on a meter you call it "cleaning a clean." And you'd be very reprehensible at somebody who's saying, "On this (blank) has anything been invalidated?" And the meter is just absolutely sleek, see. "Oh, what was that? What was that? What was that? Wha-wha-wha-wha-what was that? What was that?" You know, you didn't get a read, see.

And you can count on the pc ARC breaking very shortly. "Oh, that. There isn't anything else. There's nothing else been invalidated." Protest, see?

"Well, I'll ask the question again. On (blank) has anything been invalidated. Oh, that reads. That reads. That reads. What was that? What was that? Wha-what was that? That reads." Well, yeah, there's something there now because he protested the fact that a clean – clean was, so he protested the Invalidate button, so now the Invalidate button now reads on Protest. You got the idea?

Now, out of this idiocy can get some of the most tangled situations. See, he cleaned a clean on the meter and the pc protested the cleaning of the clean, which made Invalidate read as a button. So now Invalidate reads, so now the auditor demands to know what is there. The auditor now becomes certain there is something there, don't you see. Reading on the meter, isn't it? And out of this, they can go wandering all over bayous and byroads and up in bal-

loons and so forth, and it just goes to pieces from there – all of which proceeds from cleaning a clean. You've probably seen this happen – you may have had it happen to you. It's a what – a very common error. Any auditor will do it sooner or later – he'll accidentally clean a clean. He just wants to be sure, you see. "Anything else been suppressed there?" you know. He's had a clean read, and he wishes to God he never said so, but of course Suppress can suppress its own read. So you're left in a bit of a quandary – and the pc said, "No, there's nothing else."

"Ah, ah – well, I see a read there now." Protest read or something like this sort of thing. Pc looks and gives four or five more answers – each one of which is protest, do you see. So the button keeps reading, reading, reading.

Finally, the pc says, "Yeah, but there isn't anything else here!" See, he's getting up into an ARC break situation. What's he being asked for? He's being asked to identify nonexistent itsa.

Now, this is the same trick as this: You take a wide, empty room. And you – this is brainwashing stuff, see – and you say to the person as you bring him in the door, "Describe to me the elephant in the middle of the room." And the fellow says, "There isn't any elephant in the middle of the room." "Oh, uh, uh, uh, uh, uh, uh, uh, uh – oh, no, no, no, no, no. Let's look *carefully*. Look carefully. Now, look all around the floor and see if you can't see those foot-prints and so forth. Now, you'll – you'll get – you'll get it after a while. You'll get this elephant after a while there."

I swear if you kept it up, you could make the guy practically mock up an elephant in the middle of the room, don't you see. But the guy would be very overwhelmed and very ARC broken. What you're trying to do is tell him that something exists which doesn't exist. Now, perhaps that is – aside from the definitions of it – the source of – or failure to understand the definitions and so forth of itsa – probably the source of the greatest difficulty is cleaning cleans. You've seen it happen on a meter, you've seen yourself get in trouble occasionally, too, cleaning it on the meter. Well, similarly, you can clean it without a meter. You can say, "What are you looking at?"

And the person says, "I'm sitting here looking at a statue."

"Oh, all right, good. Now what kind of a statue?" This is barely admissible, see, because that one might lay an egg, too.

"Well, it's just a statue kind of a statue." You see?

"Yes, but what does it look like?"

"Well, it looks like a statue."

"Um, all right. Uhm. Wha-what else are you doing there?"

"Oh, I'm not doing anything else. I'm just sitting here looking at this – or was sitting here looking at this statue – until I was so crudely interrupted."

"All right. Well, now who might have made the statue?"

"Well, I don't know."

"What time period do you suppose it's in?"

"Uh, sometime I guess."

"Well, where – where – where is this statue located? Where is this statue located now? Where's it located?" and so forth.

"Well, I don't know. Just here."

Well, the amount of tone arm action you're going to get out of that is horrible because, actually, there's nothing else to itsa, don't you see? The auditor is creating new things to itsa which aren't there. The pc was just sitting there looking at a statue and actually probably was just looking at a vague blur, and he couldn't tell whether it was female or a male or anything else. He didn't know where it was located. He knew nothing about it except he was just struck by the fact that he saw this thing, and he assumed it was a statue and so he was sitting there looking at a statue. The auditor comes along and says, "What are you doing?" you know?

And he says, "I'm sitting here looking at a statue." Now that is the itsa – and the way to really foul the pc up – and this is something you as an auditor just have to get straightened out yourselves, see – the way to foul the pc up, then, is to demand more than the pc's got. And you're not going to get itsa; you're not going to get itsa by demanding more than the pc's got because there's nothing else there to itsa! There simply isn't anything to itsa. You have got the itsa. But by asking again, you deny the fact that it has been itsaed. Now there's the real hook in all this.

You say – you've said in effect when you say, "What else" – oh, you could say, "What else are you looking at?" without disturbing the pc too much. He says, "I'm sitting here looking at a statue."

And the auditor says, "Well, what else are you seeing?" There would be a good example, see: "What else are you seeing?" Well, maybe he isn't seeing anything else. You see, this would be your thing – but you have in effect said, "I have not accepted what you have said." So now the itsa comm line is cut – as different from cutting the pc's itsa, see. You have not permitted the itsa particle to travel on that comm line.

You have not only cut the – you have not only refuted the itsa – you see, the itsa isn't cut – it's refuted. You say it doesn't exist. "You haven't said anything. You haven't said anything because I want to now know much more about it than you have said. So therefore, you haven't said anything." This is what you're saying. So you also cut the itsa comm line. See, you've not just blunted out the itsa but you've cut the itsa comm line and the pc will ARC break eventually under this kind of treatment accordingly.

So that then it appears to you that by cutting the comm line, you have caused an ARC break. So then you specialize in not cutting the comm line, and go on asking the pc ridiculous questions which knock the itsa in the head. Now you see how you could get fouled up on this? And your pc would ARC break like mad and be very upset about this and that and about his auditing and not getting any TA action and no gains and all this sort of thing, you see. Basically, no TA action. And the auditor could be quite certain what's wrong, you see, that he is inadvertently cutting the pc's comm line to the auditor in some fashion.

And so now, compound the felony by developing a new system which overcomes this – because he actually hasn't got the trouble in the first place, see. He's got a new system

he's going to develop to cure this old error, and he's going to say all the time, "Have I interrupted anything you were saying?"

Well, this is not germane to it, so would only compound the ARC break. See? He hasn't interrupted anything, so again he has cleaned a clean. In other words, he's put his finger on the wrong error. You see that?

This kind of a situation could develop: Auditor says the whatsit, see. The auditor says, "What's happening?" or "What are you doing?" And the pc says, "Well, I'm just sitting here looking at a statue." "Oh? What's the – what else is in view there as you're looking at the statue? What else are you looking at there in the statue?" He isn't looking at anything else – there isn't anything else there, don't you see?

So the pc says, "Well, uh, mm-mm, uh, mm, uh, uh, uh, uh, uh. I'm just looking at the statue."

Auditor sees a dirty needle, knows that a cut comm line turns on a dirty needle. Now says, "In some way have I cut your communication line?" Hell, no – he's forced the communication line, not cut it. Not only that, but he's invalidated – the sensation is that the – what the pc has said has been invalidated.

You would be surprised how well something runs when you say to a pc, "What's happening?" or "What are you doing?"

The pc says – said, "I'm sitting here looking at a statue."

Now the auditor who doesn't have an eye cocked on his meter at this moment... You know, an auditor should be walleyed – one eye on the pc and one eye on the meter. And notices – and you can, you actually can get nicely walleyed. You look at this thing out of the corner of your eye – you can see what's happening to a meter even while you're apparently looking straight at the pc. As a matter of fact, it drives my pc nuts sometimes when she gets all tangled up in something or other, she'll notice something like this and growl about it, you know. "But you didn't see that on the meter!" Well, of course, I have seen that on the meter. It looks to the pc like this, you see. Pc absolutely certain that you aren't looking at the meter. Not so. Not so at all. I've seen everything that meter has done, see.

I tell you how you do it – I tell you how you do it: You take the iris, you see, [laughter] and it has an inner reflective quality, see. And you actually look at the reflection of the meter on the inside of the iris. That's actually the way you do it. Anyway. Joke. But you actually can see this.

Now, you've got to establish – what are you trying to do? Well, actually, you're trying to get tone arm action, see – that's what you're trying to do. Because that is the most visible action of success. If you've done everything else successfully you get tone arm action; so you say, well, what are you trying to do? You're trying to get tone arm action. Don't say, "I'm trying to clear somebody, I'm trying to heal somebody's broken leg, or I'm trying to do this or trying to do that." Scientology Levels I, II and III, you're trying to get tone arm action. The significance of how you get tone arm action – oh, *btheaaaah!* No matter what you do with a pc, it's all got to be done thoroughly at Level IV. You understand that?

You can destimulate and put present time back where it belongs and dust the case off and let the case live, don't you see? You can do very remarkable things at Levels I, II and III – don't make a mistake. And on Level IV, you're going to find all the somatics again. It isn't that you haven't blown charge off the case at large – yes, you have at Levels I, II and III, but a lot of it was destimulated charge. You make it possible for somebody actually to run IV at Levels I, II and III. But the significances are the pc's actual GPMs, the pc's RIs, the terminals and oppterms, and that whole chain of actual goals back to time immemorial contains every possible reason why the pc is batty, except one. Except one. How did he get so batty that he started doing this in the first place! Well, actually, that's merely a decision. It's just a sort of "How do you make matter," see. Well, he easily comes out of that.

You want to know why the pc has pictures? He's probably got some GPM to make pictures, you see. You want to know why the – why the pc is getting less powerful? Well, he has some GPM to be less powerful. I mean that's a – see? That's – you want to know why the pc is terrified of height? Well, he's got an RI or a GPM to make him terrified of height, don't you see? I mean anything wrong – or if the guy has a broken leg, why, you're going to have – you're going to have some RI someplace or other that tells him to break his leg. You get the idea? I mean, the – they're – all the explanations are there. There's no sense in looking for explanations anyplace else on a case. You understand?

And that's very discouraging – but amongst us pros we can – I mean its very discouraging to the pc after he's just gotten rid of this and he feels fine about it and all is going along well, to actually realize that back on the track the real reason is still resident. But if we didn't recognize that as auditors, we would not be honest with our own technology because we know that to be true. He's got stuff back on the track, don't you see?

Now you've got to put a case in shape so the case will sit there and run this high-powered stuff at Level IV, and Level IV is the Scientologist level. You can talk all you want to about how easy it is perhaps to run raw meat and all that sort of thing. It is – it is, too. But remember this at Levels I, II and III: It practically takes an educated pc and a very well educated auditor to run Level IV, and the pc wouldn't know what to do with it if he got there.

So you've got two different brands of action going on here, see. You've got three gradients of one brand – Scientology I, II and III – and you've got another brand of stuff. And that other brand of stuff depends utterly on skill at I, II and III. But Level IV is the Scientologist level.

I don't think after looking it over for a long, long time, is I frankly don't think in spite of this – I know this is quite a revolutionary statement but this is actually based merely on observation – is I don't think, it's my own opinion after all the evidence is in, that anybody will make OT except a trained auditor. Now, that's the only – the only person I know of. In the first place, his confront is up to this stuff. In the second place, he knows what to do. In the third place, you're dealing with things that a pc would have to be educated into the nomenclature of before he could even run the process.

How are you going to communicate to a pc "actual GPM." Well, you could say actual Goals Problem Mass. What's that going to communicate? These are totally unknown factors. These are – these are factors adrift in the whirl-wind, you see. Nobody's ever heard of these

things before. And as far as somebody being able to become conscious of and concerned without his confront as an auditor rising, without an understanding of the various put-togethers of these things – *plooy!* I just don't think it can happen, see. I think that's the basic barrier on the track. The basic barriers to development of mental science.

If you specialized 100 percent on a total effect and total result by reason of a mental science – see, total; that was your goal – and you were not going to make a fully trained pro out of everybody you were going to do it to, see. At the same time, if you had – if you had a body of professionals over here which were barring out everybody else from becoming professionals – the same *modus operandi* that the medicos use, that the psychiatrists try to use, other people try to use, you know. They say, "Us educated people," see. And "We hold the holy sepulcher," you know, and "Worship Saint Pavlov." This kind of stuff, do you see?

All right, they bar all these fellows out, and then these other fellows that are supposed to be the fellows who have the effect created on them, don't you see – they're the patients or they're the recipient of the technology – and then all of these birds who are the pros, you see, they have all the know-how. And these other fellows over here, why, they're the recipients of the know-how, but they don't get any of the know-how and so forth. And I think that's a very effective system from ever – for ever keeping anybody from getting anything, or getting anywhere.

So your Scientology Levels I, II and III – particularly Levels I and II – are very adaptable to handling far in excess any requirement that the public at large has for a psychotherapy. It's wildly in excess! You just learn a few of these things I'm trying to teach you, and you'll find it's just wildly in excess. Staff Auditor here is having a ball on this stuff. I mean, case – oh, poof! Nothing to that, see.

Got to remember, he's saying the raw meat case – there's nothing to what? Making the case feel better. Making the case feel happier. Curing the lumbosis. Getting the case over this. Getting the case over that. Yeah. Ah, but there's a different mission which mental science could fulfil. Entirely different mission, which is a total sweep-up of the total case. How tough and how educated and how understanding do you think a pc has to be in order to stand up to the number of randomities which can occur at Level IV, because, don't kid yourself, they can occur!

Well, let me tell you: In two or three instances now, people have been carefully audited in HGCs at this particular level, and in two or three of those cases, even though they had a GPM or two cleaned up, they got a couple of RIs out of place. A couple of RIs out of place – you ought to have ten goals out of place sometimes. Ten GPMs smeared around backwards – you'd know what a creak was, man! "Well, we had a couple of RIs out of place so we had an awful ARC break. And we want our money back from the organization." Oh, slap my wrist!

They're going to run into that continually, so why – why say it doesn't exist? We could be hopeful and say well, wouldn't it be nice if it didn't exist? But actually what you have for the first time is really a body of pros who, by the nature of the technology as far as I can survey the technology, have a level of technology applicable to them who were possessors of a

level of technology which is applicable to the general public in the fields of mental and physical healing!

Now, this is a riches that you probably hadn't really totally looked at. When you finally get through and get it all summed up – summed up, the characters that are going to make it are Scientologists, as other people aren't going to make it.

I know I've done the research vanguard on this as a pc, because it would have killed anybody else – but I personally can't see anybody going through one-tenth of what I've gone through in the last two weeks, see. What, on the general public level? Oh, no. I can see you characters going through it, see.

Seen doors go out of plumb and out of plane and walking down floors which are suddenly tipping like the deck of a rolling ship. Somebody skipped a GPM or two on you, you know. They – they went for some... Everybody got brilliant at this particular point, and you had a GPM called "to catch catfish," you see. And they did a goal oppose list for the next earlier GPM. And they got "to be a horse." And the pc said brightly, "Oh, that's the next goal. Yes. 'To catch catfish' opposes 'to be a horse.'"

And the auditor says, "Well, I don't know if quite true." See – reasonable. You know it's, "I don't know if it would be quite true. It's uh – I guess it would be all right. Well, we'll go ahead and find the items in it", you see.

And the next thing you know, why, corners of the room are going at forty-five degree angles to the pc and their chin is over here a foot and a half from the bottom of their face, you see. And if a doctor would examine them at that moment, they'd say, "An advanced case of coronary thrombosis, you see." The pc's heart is leaping, you see – air bubbles coming out of his bloodstream. Like these divers in fish tanks, you know. Grim.

Well, actually, that takes an awful level of understanding. That takes an awful level of determined push-ahead. It takes a terrific amount of education to know what's happening to you. You'd say, "Well, *huehhh!* there's something wrong in the bank. I didn't feel like this on Tuesday. Let's see, what in the name of common sense were we doing on Tuesday? *Phhooo!* Didn't feel like the – what did we do on Monday? *Phhooh.*"

And finally after a few sessions of wrestling around and it gets worse, and it gets horrible, and now you've got half the bank found in the wrong GPM, you see, why – auditor gets enough Suppress off, and the pc gets enough momentary itsa on the bank and between the two of them, why, they suddenly find out that "to be a horse" – "to be a horse" was an actual goal but not an actual GPM, and that "to catch catfish" goal oppose list is not complete, and that they haven't got a GPM that they've been running items out of. That, in addition to jumping a couple of goals, you see. They didn't jump a couple of goals – they just missed them all, see.

Then all of a sudden – snap, snap, pop, tick, bang! – and no coronary thrombosis and the room is all level, and you meet the guy that afternoon and he's saying, "*Yabbledee-yabbledee-yabble*. Everything's fine. Everything is fine," and so on. He hasn't even found the next goal yet. They just found out why, you see. He's fine. Everything's fine.

And you say, "Well, how about that..." You can just see now some medical attendant in some organization who wasn't in the know, you know. He'd be coming up there with a little

black bag, "Now, Mr. Smith, how is your coronary thrombosis this afternoon?" The pc says, "Coronary thrombosis. What coronary thrombosis? You mean 'actual goal-osis'?"

No. It takes – takes a level of nerve. That's another comment that we can make on this definition of the common people, see.¹⁰ We're talking about a Level I, yeah, common people. But you're talking about – you're talking about way upstairs stuff when you're talking about Level IV. Don't kid yourself, now – don't kid yourself.

All you've got to do is make a bum error on the present time GPM and start running one that ain't it, and your pc's had it and so have you. And because you won't have a snowball's chance of getting anyplace. The pc will go into the creaks. Half a dozen banks should be there.

Do you know how – how far the mistake can be? Do you know how wide the mistake can be for a present time GPM? How wide that mistake can be? You can get the fourteenth GPM from present time registering as the present time GPM. And then every day or so find a new GPM that's closer to the present time that is now incontrovertibly the present time GPM. No slightest argument about it. Every day, find another one.

And finally discover that when you found that first one that you were sure was it and that checked out on the meter – meter rocket read! "Present time GPM?" Rocket read, see – Why? Well, actually, you merely found the GPM in which the pc was most firmly stuck. So, of course, it looks like a present time GPM. That looks like present time to him – so of course it registers. Nothing to that. And in addition to that, GPMs are timeless by construction because of the RI balance. They float in time like goals, so of course these GPMs will register as any place. It takes a considerable trick to date one. And after I've dated a GPM, I always say "maybe."

You know, done a terrific job of dating with the greatest care in the world. Everything proved out perfectly that this GPM was at trillions one hundred to trillions ninety-one. Proved it conclusively! Well, I will learn out of that, that probably it is not the present time GPM – maybe. Because these things – these things, of course, are constructed to be instantaneous.

Go back to your early material on GPMs. They're instantaneous. They haven't got any time in them. So of course you can't date them worth a nickel, so of course you can make mistakes of this particular character.

Well, I know one case that has had a GPM that people have been trying – it's perfectly valid GPM – that people have been trying to run items out of now for a couple of years. Sounds like a long time, doesn't it? They haven't found any yet! I think they got the top opterm once. It's probably – it's probably fifteen, twenty GPMs from present time!

No, it isn't Suzie. I've got – I've got several pcs that don't really know they're on my critical list, you know. But I watch this – I watch this. And I watch people trying to list for something and find something there and so on. There, you can't run it. It's just this: You can't run a GPM that is not the present time GPM! There's only one way that GPMs can be safely

¹⁰ Editor's note: This refers to something LRH mentioned in the SHSBC Lecture of 15 Oct 63, "Essentials of Auditing", where he discusses the definition of Scientology as "the common people's science of life and livingness".

programed, and that's find the present time GPM without any doubt whatsoever, and then doubt it, and get its top terminal and oppose it, and run the – now I'm giving you a different type of programing here – and you run that all the way back to the beginning of track – finding RIs and GPMs in proper sequence – all the way to the beginning of track without skipping a single pair of RIs, without repairing anything and without missing a single goal as you go. Got it? And when you get it all the way back to the beginning of track, and you get the first postulate that the pc ever made – let me call that to your attention; that's prime postulate – when you run this out of the pc, don't be startled if you see the rafters kind of go *errrrrutah*.

When you got that, then you go back and repair it. Go back and run it all again and find out if there was anything missing. But listen – if you try to repair it before then, you won't make it. I've got the later data on this. You cannot repair a GPM on the run. You just find the RIs for the next GPM you should be in. It's too horrible for words. Or you pull RIs out of implants. Or you pull RIs from elsewhere. You can always repair and find new RIs for a GPM you just completed. So you don't run them from the top to the bottom and then go back to the top and repair them. Because you never go back to the top and repair them. The only thing that happens is you find RIs out of the next one, without the goal. See, it's in a horrible mess. So, of course, you can't take any chances with this thing.

The odd part of it is that if you do it right, it runs off like a well-oiled dream. It is the most invariable process anybody ever heard of! It is just like a Swiss watch. It just runs off perfectly – runs off just exactly according to R4M2. It's just perfect – I mean there's nothing to it! Like falling off a log!

But you make one mistake, and now you have five hundred thousand words required of written material to take care of the repair. You got it? I mean, to do the process itself is very, very easy. You make one mistake and you got complications. It's nothing, for instance, to throw away three sessions, just because you made a stupid boob in one. You just can't find out what's happening. It just, "Ooh, *bleah, whoo*, my God." And you'll find out it is some stupid boob error. And then you get errors and then you lose the error, you know – and then you find what the error was, but then you lose the error – and you find out that wasn't the error but something else was the error. You got the idea?

It can get horrible. But the repairs of it are quite feasible providing they're gone at sensibly. But there is a way to run them. There isn't much to running them. You can run them very rapidly. I find an RI every ten minutes of auditing, routinely – *racketa-packeta-packeta-packet*. Takes me about an hour and a half to find a goal on a pc. Next goal. There's nothing much to this but it's a precision line of auditing. And it is no line of auditing to be done by somebody who hasn't got a tremendous grip on auditing itself, and who is still trying to find out which is the tone arm – "Oh, that's the tone arm. No wonder I couldn't find the goals list on the pc. It's kept in the tone arm, isn't it? I've heard..." You know? You can't do auditing like that.

So you wind up, of course, with Scientology Levels I, II and III, which is your professional address to the situation. You wind up with Level IV. If you think you're going to go out and find goals on the general public, you might as well just forget it. You're not – that's all.

Oh, you can find some goals. You can find some implant goals. You could – you could mess around with this. They'd say, "What do you know? This is unbelievable," and so forth.

You might even do something, accidentally. You might even do something. But what you'll pay for it in terms of a pc you can't handle, in terms of a pc who will chicken out, in terms of a pc whose confront and education don't even vaguely compare with what he is doing – do not make it worthwhile. You have now terrific processes at Levels I, II and III, so you'd better learn all there is to know about itsa and what makes itsa and all this, and be able to just sit there cold – knowing nothing much about the pc, you should be able to sit there cold – plug in your E-Meter, give a pc the cans and turn on thirty-five divisions of tone arm in your first two and a half hours on any raw meat pc in any place. Now why can't you?

And it'll be lack of or noncomprehension of some of this data like the itsa maker line, see. What is this line? Well, now you get fouled up as to what this line is and you're not going to get TA divisions. You know what this line is, why, it's like a breeze.

Now, let's get back on that. I was just trying to get your frames of reference in with regard to where this technology fits. Naturally, this same itsa maker is what's banging in at the GPMs. It's the same thing you're controlling in Level IV. But all Level IV is done with formal auditing. You try to do this other type of auditing and you're going to lay an egg. You're going to let the pc itsa his own GPMs? What – how many telegraph poles do you want this pc to be wrapped around? Plenty!

But, if you are doing Level IV without a complete command of the pc's communication cycles and communication lines, you will also wrap him around a telegraph pole.

Now, let me show you some misways of handling this situation. One is just not understand what it is. And the other is have some wild preconceived idea or – even some Scientology datum magnified out of all proportion, magnified out of all proportion to its actual relationship, such as "pcs never answer the auditing command." So there of course, you can never trust this itsa maker line. See? You can never trust it. So therefore, you transpose the itsa maker line over to your meter. So you do nothing but ask the meter what is going on with the pc; never ask the pc. You have now effectively shut off the pc's itsa maker line from aud... from the pc as a thetan to his own bank – that line. That's the itsa maker line, see? And you've cut that line. By doing what? By trying to read it all out from underneath the pc.

Now, the meter actually can operate as a sort of thetan. You and the meter can be a sort of a substitute thetan. You realize that? You got a bank sitting across the table from you, and you by putting in whatsits can kick things that – in the bank that read that the pc isn't perceiving. Well, this is absolutely vital at IV, which is why I've spent some time talking about IV – because all of IV and GPMs are sub-itsa. The itsa maker line playing over the tops of these things sees a bunch of black Alps – but the meter and the auditor can undercut that bank, since they are not influenced by those direct and immediate bumps and the significances in them.

So they can undercut these things and find out what goal it is, because it rocket reads while the pc is still wondering what goal it is. Yes, but you can get too much of that kind of thing too, very, very easily. You can say, "Well, me and the meter know and the pc doesn't know. So therefore, there's no sense in paying any attention to the pc." So we cut his itsa

maker. And we find session by session his R-factor drops on his bank. We try to do it all very mechanically. We should do it mechanically, but we do it mechanically by cutting his line. Now, we'd have to have a wild idea of what this line is, in order to pull such goofs as this. We say to the pc, we say, "Well, give me – give me a goal now on this list."

And the pc gives you a goal on the list and so forth, and you're asking the pc, "Is it an actual GPM..." – you're asking via the meter, see – "Is it an actual GPM or is it an implant GPM or something?"

And the pc pipes up and he says, "You know, I think this is an implant GPM. I can see the Helatrobos Implant areas. Yeah, I think it's an implant GPM."

Now here's the way to cut the rug right out from underneath the pc, see, is say, "All right. Thank you. Thank you. Is it an actual GPM? Is it an imp..."

All right. Here's another way to cut the rug out from underneath the pc: "Oh, I think," he says – you're asking these questions off the meter and the pc answers them, see – and the pc says, "I think it's a – it's an actual – I think it's an implant GPM because I can see the Helatrobos Implant areas. I mean they're right here. I can see them." And the auditor says, "Oh, all right. Well, is it also an actual GPM?" And the pc says, "I – I don't think so. I really don't think it is." "All right. You mind if I check it on the meter?" "No, no. Go ahead."

"All right. Is it an implant GPM? Is it an actual GPM? I get a read here also it's an actual GPM. What do you think about that?"

"Well, it could be. Yeah, as a matter of fact, it probably is. Oh, that's what that damn big black mass is floating over there – that's it." You understand?

But we know of the existence of this itsa maker line, you see. We know of the existence of the line between thetan we're auditing and his bank. We know of the existence of that line.

Now watch the first one again. "Is it an actual GPM? Is it an implant GPM?"

Pc says, "You know, I think this is an implant GPM. I can see the Helatrobos Implant grounds here."

"Oh, yes. Well, thank you. Thank you. Is it an actual GPM? An implant GPM?"

Now what, in effect, have you done? What have you in effect done? You've cut the itsa communication line, you have not permitted an itsa to flow on it, you have invalidated the thing that he is looking at and you have cut his communication line to his own bank. Now, don't sit around afterwards and wonder why you have an ARC break. You know, that's how many lines are cut by this simple, stupid action.

And yet you say, "It's the most obvious action in the world." And you say, "Well, Level IV is a very mechanical process. And you should do it just bang-bang-bang!" See? And all right, you're doing it bang-bang-bang! What gets in your road? This itsa maker line from the pc to his own bank. That gets in your road terribly! And you've also heard that you mustn't let him wander around on the backtrack because he'll overstimulate himself and you won't get any tone arm action, see. So every time you find him looking at the backtrack, drop your E-Meter. See, get his attention – get his attention over on you! And you won't get any TA.

You'll just have ARC breaks galore, all the time! So just start inspecting the number of things you could do with a careless action of that particular character. You just refuted what he said, is what it looks like in the first place, but you'll be surprised the nuances that can exist with this sort of thing.

Now, it isn't for you simply to be careful, careful, careful from here on out not to commit these crimes. That is the wrong approach. You just know what it is and know how to handle it. Even a nitro-glycerine expert gets so he takes a pint of a – flask of the stuff and shoves it in his hip pocket and goes out for a ride on a rocky road in an old Ford. And he never gets blown up. It's always somebody who wanders in carefully and stumbles over the cork that somebody's left around, see. That's the person that gets blown up, see?

You just move yourself up into the category of the nitro-glycerine expert, that's all. You're handling very deadly stuff. All right – know what it is. Examine it. Get familiar with it. And you won't go on being careful all the time not to cut the pc's itsa line – you just won't. And on occasion you may find good reason to do so. You know what's going on.

Now, all sorts of things – things we used to call intuition, an intuitive sense – can suddenly be born in you just like that. You suddenly develop the facility of seeing that the pc is looking at something. You don't just neglect the whole existence of this itsa maker line. You just don't neglect the whole existence of the bank and just keep running it on the meter, running it on the meter, see. You glance up sideways with this walleyed look, one eye on the meter and the other on the pc, you see – with the reflection of the retina, this is done. And you notice – you notice that the pc is introverted. And you will know exactly what he's doing – he's looking at a piece of the bank. So you won't keep wondering if the pc has said everything he wanted to say about something. You'll have developed the facility of taking a look at the pc and see that he's looking at something and leave him alone until he's through looking at it.

And he'll be sitting there – and actually – actually, it's quite visible. The pc's sitting there and he's looking at you and he's rather foggy-eyed most of the time, let us say, since he's somewhat introverted. And you say, "All right, now. Is this your item?" Or "Is that the problem that you were worried about at that time?" Or whatever the hell it is you're asking him. It doesn't matter, see. And you're saying this to him, "Is that your item?" And the pc goes sort of, "Uh... yeah. Yeah. I think it is." See?

And you just get so you can tell. You hear me? You just get so you can tell when that inspection is taking place and not go, "*Yeaow-yeaow-yeaow! Bark-bark-bark! Eba-eba-eba! Yelp-yelp-yelp, yap-yap-yap-yap-yap-yap!*"

Why do I say that? Because some auditors remind me of terriers or something of the sort of thing. What do they do? It's actually just like – if you visualized a piece of string over here from a thetan to his bank – it almost seems to the pc as though the second he starts to put this piece of string down to his bank, the auditor reaches over, grabs the end of it very hastily and puts it out here on the auditor. "This is where it ought to be. Now, what did you think about that? Where's the – why – why aren't you itsaing anything?" Got a hold of the piece of string, see? "Why aren't you itsaing anything? Now, I'll put – put your – put this piece of string down on some part of your bank and tell me something about it. No, I'm not going to let it go. You just put it..."

The pc goes, "Oh, my God – what's happening to me?" you see. "What's happening?" Well, what's happening to him is, is the itsa maker line is being carefully held out – carefully pulled out from any possibility of bank inspection – and the pc is being given whatsits. That's the actual situation. It isn't that the pc – it looks to the pc, and he will say, that the auditor is asking whatsits and he's not being permitted to answer. That's what he usually feels is happening and that actually is usually not what is happening. The auditor is perfectly willing to have him answer. But the auditor's putting in whatsits while not permitting the pc to look for the answer in the bank. The auditor's carefully keeping this string from thetan to bank pulled out so that the bank end of the string is over here on top of the E-Meter, or into the session. And of course, your pc's out of session all the time, all the time, all the time. What's the definition of session, see? It's only willing to talk to the auditor. Just willing, you know. Not talking to the auditor. Just willing. And it's really not – and that definition could be revised and made better – it's not just "interested in own case," but "passing this inspection line over his own case" – not passing it over the auditor of the session.

Now, one of the things that you get as an auditor is when you've grabbed this line inadvertently – and oh, count on the fact that you're going to make two or three blunders with this per session when you are a complete expert, see. Actually profess... perfection on this is unobtainable because you're going along at a mad rate and you're trying to push along through and get a goals list finished by the end of the session or you're trying to sort out a service facsimile, little list that you have in front of you, don't you see?

And actually in Level IV – Level IV particularly – your nulling is done "Bark, bark, bark, bark, bark, bark, bark, bark." There are very few auditors can talk as fast as the meter can respond on nulling. You just get it out of your mouth and you're reading the next one, see. There's that tenth-of-a-second pause to let the meter read. Didn't read – that tenth-of-a-second told you so, you've said it very fast and very rapid. Man, I tell you, a good auditor – a good auditor can take a cracking awful big list and just mow it down, man.

And you're going down this list – and all of a sudden, why, the pc says, "Hey! I – I thought of another – I thought of another – I thought of another item. It's 'a cat whisker.'" See? Something like this.

And you're intent on going down the list. And the pc – you don't – you don't really get the pc's lift of his head, you see, and his "going to tell you," see. And if you just missed it entirely, you'd get a hell of an ARC break – but you pick it up just a little bit late, you see. It's just a little bit crude and crummy and you realize you've slid over the last ten nulling items without the pc's attention on the list or something wild – it's usually the last two or three, don't you see. You've goofed it up one way or the other.

Well, no matter how perfect you are, you're going to goof it up sometimes or another. Pc's going to be sitting there and you'd swear he was bright, bushy-tailed, right up in PT, answering the end of session, and then my God! He was examining – he was examining his session goals and you were trying to ask him about his gains. You've overridden the pc's comm line. It's how adroitly you can wiggle out of what you get into, that is the mark of the expert. It's not staying out of everything.

Most of my auditing is highly swift and effective simply because it is very brassy. I know I can get a pc out of anything I get the pc into. And I know I'm not going to get the pc into any more than I can possibly help. So therefore, it just adds up to a "to hell with it." And I just know the factors I am dealing with and I shift those things round in a session – click, click, click, bing, bang. So this particular pair didn't quite mesh over here in the corner and the pc said, "Rrrrrr." And I'll trace it back to some auditing error I just made two seconds ago and so forth, patch the thing up in a hurry and I'm off and away, see.

One thing I do that I hope you will be able to acquire someday is spot the birth of an ARC break upwards to an hour and a half before it happens. Please develop that facility. Know – don't be so reasonable!

The pc is sort of saying, "Well, I don't know... Well, you kept looking at the meter. And so on and so on. I don't really know whether this item was less *yeaow-nya-wha-wha-wha-whaf...*" And you start to see some of this kind of stuff and you all of a sudden – not be unnecessarily cautious – but you suddenly recognize it for what it is. You've chopped up this auditing comm cycle somehow or another. Somewhere it is missing. Somewhere something has gone wrong. Something has goofed somewhere, and right then – spot it and pick it up right now, without nulling fifteen more new additional lists, you see, and holding up the pc for the next five sessions, you know. Get that quick. Recognize an ARC broken pc. And recognize how slightly an ARC break registers when it is actually beginning to form and pick it up then – don't ARC break the pc in order to find out.

Well, there are several ways to do that. One of them is not ARC break pcs. As I've just told you, that is next to impossible. Your own auditing enthusiasms will cause you to ARC break pcs. My God! I pulled one the other day you would have gotten an infraction sheet for and so on. I saw very clearly that on a list an item had rocket read and blown down which was not the right item. It was the very exact item which the pc was madly listing for, and the pc was actually tending to go into a strain on an overlist of trying to get this item on the list – and I said, "You just put this item down on the list just before this. Could it be it?"

And the pc said, "Why yes, I guess so. Put it on the list," and immediately was a little bit natterly about the pen scratching. And I took the item right back off the list and put it back on the other list and continued the pc and we got another one – and the item that was on that list, if accepted, would have missed two RIs. It came up two lists later as the right item. And the one which was the right item was very resistant. It was one of these – well, I'll say – tell you what the item was – torture. Very resistant item. You'd call the thing and it wouldn't – wouldn't fire. It'd start to fire. It – every once in a while you find some kind of a goofball situation like this. And you call it and it – *blhblhblh* – it doesn't quite fire. And it won't let go. And it goes, *ssshhh-kk!* It looks like it's up against springs. And ordinarily you say that's – that's not the right item – it's slightly misworded or something. In this particular case, after we'd listed enough charge off, the pc continued to assert that was the item and suddenly I called it, and it fired like mad and blew down. In other words, it had to be unburdened a bit by listing before the thing fired.

This is a very peculiar thing. Happens – the tops of GPMs are very hard to run. They don't fire well and so on – the tone arm tends to stay high. You get four pairs deep into a

GPM and it's running just like a river of hot butter, see – there's nothing to it. Those first few sometimes are quite resistant. So, what's the auditor trying to do? The auditor's trying to be too confounded helpful, and it was helpful to a point of actually evaluating and putting an item on the pc's list for him. Well, that's absolutely forbidden, see – absolutely forbidden. And yet there I sat with my big, blue eyes wide open and wanted to help the pc so bad that I just called attention to the fact that we'd had a firing, blowing down item on the previous list – *k-k-k-k-k*.

Now, that ARC break could have gone into considerable proportions. But recognizing that the ARC break had succeeded after an auditing action, see, immediately after the auditing action – picked the item up and put it right back where it came from. The ARC break went *phreeeu*, – that was that. It didn't even get a chance to form, see. See, there was just that beginning of the critical cycle, beginning of attention on the auditor. Now, this is not important, and I'm not talking to you about ARC breaks or beefs. I'm allowed a good, big, juicy mistake every thousand hours of auditing. That's – I insist on being allowed that. But the point I'm making is here – is apparently it was a wrong item that was causing the ARC break. Actually, that really wasn't the beginning of the ARC break. That pc was very introverted inspecting the bank.

Now, let's look at this inspection line. Exactly what happened to the pc's line from pc to bank, see? Just look at that line. Let's see how mucked up things got from the standpoint of that line. This line being invisible to the auditor, don't you see, you've got to synthesize what's going on and you'll rapidly learn how to do that if you realize that it's simply a line scanning over things in the bank. It isn't just a unit area, by the way – think, think, thinking. You know that. It's an actual line. It's between this bright spot called a thetan, the real beingness of the being – whether its parked in his head or he's extravagantly detached on a reverse flow exteriorization – we don't care where he is. He is looking from that bright spot. He is that bright spot – and he is looking at a thing! He is looking at a thing! It's as – it's as real as a pencil, don't you see.

And the bank is all laid out geographically, and it has numbers – a finite number of things in it as far as types of things in it – a finite number. And that line is stretched from where he is to one of those things. Well, what happened when I said, "This item appeared on two lists back"? What happened to the itsa maker line? The line from the pc to his own bank. What did I do with that line? Apparently, I picked up the line and put it on the auditor – took it off the bank suddenly and put it on the auditor. Now that was a sudden change or shift of attention, wasn't it? Well, we call it a shift of attention – actually, it was a sudden shift of the target of this line. Here's the line deeply engrossed in inspecting the bank, see. All of a sudden, auditor picks that line up and puts it over on the auditor and then moves it back two lists ago in the GPM just done two lists ago. Here's two shifts of attention – sudden shifts of attention – and then puts it over here someplace to recognize that an item has been missed because, of course, this other item was being suggested as a substitute for the right item. So there must have been a realization of that – but by this time the pc must have been pretty confused. So the pc, then, in defense of this confusion, picks up the inspection line – puts it on the auditor and says, "Your pen is making too much noise." See that?

What can be itsaed around here with certainty? Something about the auditor can be itsaed with certainty because the auditor has inhibited anything that should have been itsaed, being itsaed. You got it?

Now, there's probably a dozen different ways that an auditor can accomplish these things. There are probably thousands of different ways – we probably haven't dreamed them all up. If you don't learn this well, we give you the assignment of finding out how many ways each one of the communication auditing cycle lines can be cut by a new Academy student. I think you will find out they run probably thousands per line – they're probably fantastic numbers. It's easy to find out how to handle them right. That's the easier part of it. How many ways can they be cut? Enormous numbers.

You can refute, you can invalidate the itsa – the thing being itsaed – you can refute the communication line on which it is travelling. Like, "Don't talk to me now because I am busy writing your auditor's report." This is done in various ways. "Don't talk to me now because I'm busy trying to keep track of the auditor's reports." It's a – it can come about as a very studious action: a sort of a little tiny frown at the pc and then an enormously industrious writing, you see, of one character or another and reading over the meter and the pc's going on talking. Don't look at the pc and keep on doing this and so forth. Eventually, the pc begins to realize that you're not really writing anything that has anything to do with him and accommodatingly follows the auditor's order.

And the pc nearly always follows the auditor's orders one way or the other. You would be surprised how obedient pcs are. The bank is 100 percent under the control of any auditor at any time. And the pc – the greatest percentage of the time – is doing exactly what the auditor apparently wants. But get that "apparently." Now the auditor can say "Put your attention on the ceiling" and point to the floor. Now, the pc will do what the au – what he thinks the auditor apparently wants. Now, if the gesture is more forceful than the voice, the pc will look at the floor. You say, "Look at the ceiling." And the pc – the A greater than B, B greater than A, don't you see – will have a tendency to, "Well, he's saying look at the ceiling but he wants me to look at the floor," see. He gets confused doing this, but he obeys – he obeys, you might say, the most forceful apparent order.

Auditor's main goofs are made up in giving apparent orders that he doesn't intend to give. He doesn't intend to give these orders at all. For instance, you would never tell a pc, "Now stop inspecting your bank and put it on the E-Meter." That would be idiotic because there'd be no itsa and there'd be no TA if you asked this thing. And yet what is this apparent order? [fiddles around with an E-Meter, noises can be heard.] What's the apparent order there? "Take your attention off your bank and put it on the E-Meter," see – that's the apparent order. The pc will nearly always follow an apparent order.

Now, the bank is very idiotic and is always under the auditor's orders and will do what the auditor says. Therefore it takes the auditor's whasit and guidance of the pc's inspection line of the bank, you see – the itsa maker line – it takes both of those activities in order to get a bank inspected, see. So the auditor and the pc have got to be working very close together, and if the auditor cuts this line – this is going back to The Original Thesis, explaining some of the things in there, see – now, if the auditor cuts this line from the pc to his bank, of course,

he's now apparently brought the bank in on top of the pc and done other things which are undesirable. But he usually is giving orders he doesn't intend to give. Nobody is going to argue with the goodwill or the good heart of an auditor. The only thing I ever find any fault with is occasional knuckleheadedness. That knuckleheadedness can be pretty gorgeous. I just gave you an example of it. And yet any auditor is suddenly liable to this sort of thing.

Well, I'll give you another example. I'll have to run out all of this invalidation of my auditing after this lecture. But I did this inadvertently the other day in a session – don't think you won't. This wouldn't happen to you once in a blue, blue, blue moon that the pc can hear the pencil squeaking. That's why you use a special type of pencil that doesn't squeak.

So I'm busy writing the list, and the ballpoint ran out of ink. This wouldn't happen to you again in a long time, see. Ballpoints do run out of ink, and you always have a spare ballpoint around, don't you? So I hastily reached over to where the other ballpoint was handy and picked it up, and at this moment there wouldn't have been any slightest squawk, you see, there wasn't a tremble in the session, see. And I picked up the other ballpoint, brought it over here, and it had just enough ink in it to write one more item. [laughter] We still didn't have too much randomness going in the session, you see. Auditor beginning to sweat just a little bit about this time. I laid aside this ballpoint, but the other ballpoint was over on another table barely within the auditor's reach – a different color ballpoint, see. Barely within – but there was a ballpoint over there – over the top of a pile of paper. So as not to disturb the pc's attention, very carefully reached over to pick up this ballpoint and I said, "Well, I'm going to win after all on this," you see. And had to stretch just a little bit out of the auditing chair, and went out of the auditing chair. [laughs, laughter] Happen to you once in a blue moon. I don't think I've done a goof like that for ages and ages. Concatenation of silly circumstances, one on top of the other.

And what do you think happened to the pc's itsa line? Well, the pc's whole motion was not to ARC break, but to keep the auditor from falling out of the chair. [laughter] And got a motion and locked up a bunch of effort in the middle of the session, you know, of trying to pick the auditor up when the auditor went down. It took a couple of minutes to undo all this and we went on going at a – at a rate because I recognized that something had happened there that had to be undone.

All right. That's a very unsmooth but unlooked-for happenstance. Well, if I can do them, man, so can you. So the thing to know how to do is pick it up at once, straighten it out at once, and get the show on the road again without any more nonsense. Because, frankly, anything is liable to happen to you in an auditing session.

An auditor who feels absolutely serene and secure that all is going to go well from here on out – or if an auditor has allergies to anxieties or unpredictable circumstances occurring in a session – he ought to go to an old ladies' home or something and retire, because it's going to happen. The things that have happened to auditors – some guy's halfway through a screaming grief charge of one kind or another and somebody hears him down the block and the relatives come up screaming up to the door, pounding on the door, trying to get in to find out how Bill is being murdered or Joe is being shot or something, see. This has happened, happened, happened.

Now, how does an auditor keep his aplomb, handle the situation, repair the shift of attention of the pc – what does he do? How many things can he do to straighten it out? Well, actually, there's a lot of things he can do to straighten it out. In the first place, he audits smoothly so that when he does audit, he gets lots of TA. Got that? That's a marvellous cushion on which to operate, see. When something does happen – when it bothers the pc, but not otherwise – you know, occasionally a water tank can fall off the roof and come right down through the shingles, and the pc says, "Oh," and goes on and saying, "and then I – then I – then I said to Agnes..." See? You'll learn this – this goes all the way up to Level IV. Don't you ever fool with a case that is running nicely, see. Case is running like a well-oiled dream, you've got the PT going – you're going down the line. The only trouble that's going to occur from there on is actually goofs you make. Case is running fine – don't patch up a case. Don't patch up a case that's running well.

Case you want to patch up is a case that isn't running well, and you only patch it up when it isn't running well. So if the roof has fallen in or the auditor has reached out of his chair for a pencil that was out of reach and fallen on the floor, the first thing you must learn to observe is: Did it move the itsa maker line all that much? Did it affect or influence the pc? That's the first thing you learn, because if it didn't you're not going to repair it. Because, look, your effort to repair something that did not upset the pc can itself disturb the itsa maker line and all other communication lines to such a degree that you can cause an ARC break. Because what are you doing? You're cleaning a clean. You're handling an ARC break that didn't occur. "How did you feel about the water tank falling off of the roof and coming down through the shingles and so forth?" "Oh, did it?"

Do you realize it might be a considerable mistake to ask the pc how he felt about the water tank falling through the roof?

Many auditors are so conscience-stricken – there is nothing like having no conscience to be an auditor, see. Because an auditor gets so conscience-stricken sometimes, he gets so worried – well, I've gotten worried, you've gotten worried about cases you were running – but gets so worried, it causes the pc in – to go into just a spin of worry. Gets so worried about the case that he's putting in a whatsit – a whatsit all the time on the pc. He's ask – the pc's saying, "Well, what's wrong? What's wrong? What's wrong? What's wrong? What's wrong? What's wrong?" The pc isn't doing an itsa. The pc doesn't have his communication line into his own bank, everything. He's got a communication line from where he is to where the auditor is, wondering, "What does the auditor think is wrong? What does the auditor think is wrong?" He's trying to itsa the auditor's confusions or banks. Well, that isn't what the pc's for. That isn't what the pc's supposed be doing, don't you see? So it goes this nonsensically. If the pc's itsa maker line from the thetan to the bank is there and is functioning and your TA is moving, if a fire engine comes through the front window and it didn't seem to interrupt the session as far as you could tell – not by asking the pc but just by casual observation – you simply ask the next auditing question, because case repair also interrupts various sections and portions of the auditing cycle.

In other words, there's no substitute for auditing but auditing. And you only repair auditing when it isn't occurring. If you haven't got any auditing occurring, you better find out how you're going to get some auditing occurring. You can't get any auditing occurring, well,

repair the case and get some auditing occurring. But it's in more or less that order, not the order of "there sits a case, let's repair it."

"Now let's see. I know this case – this case had Georgie Burns for, you see, an auditor in 1958, and I've been audited by Georgie, and *uh-huh-huh-huh-huh*. And Georgie has this horrible habit of saying, 'Yip' all the time in the session. Every time she acknowledges she also says, 'Yip.' And I know that was very annoying to my pc, so the first thing to do is to repair Georgie Burns's auditing in 1958." All this without any investigation of the case at all. Well, that's repairing the case before you've got – before you find anything is wrong with the case, you see.

And you only repair cases when something's wrong with them. The case is running well with good TA, why move the case around? That's the way to stop TA. Why? Because you pick up this itsa maker line, move it out of the area it's in and move it into some other area, and you suddenly bog the pc down. You get him into areas he can't itsa or he isn't able to itsa or there's nothing there to itsa or they're all cleaned up or – you get the idea?

So this pc's sitting there – I can see it now, you see – the pc's sitting there happily inspecting his bank and he's running a service facsimile. You're getting about forty, fifty TA divisions per two and a half hours of session, TA flying beautifully. This explains the pc's fantastic penchant for burning dinners, see. And it's got – it's all going along fine, and all of a sudden, why, some auditing supervisor says – in the HGC or something, says, "Oh, have you taken care of that pc's lumbosis? Well, you know, she came in here originally to get her lumbosis fixed up." And the auditor, being very nice and sweet and obedient about the whole thing, turns around and starts working on the lumbosis at eight TA divisions per session. Lumbosis isn't going to resolve. That's a shift of the whole program of the case. Well, get that as a broad shift – it would be tremendous error, wouldn't it? Now let's move it down to a very short error. Auditor is sitting there, the pc is looking in an introverted fashion at a field of cows, you know. And he says, "Cows. I've seen a cow in this lifetime – cows, cows, yes, cows and so forth and cows and so on. Cows. I wonder what this countryside is like here. Cows – cows..." TA moving, TA starting to move.

The last whasit the auditor got in on the case, you see – the last whasit the auditor got on the case was "How would baking bread make others wrong?" And finds out that the pc is inspecting all these cows. He says, "Now, let's get back to what we were talking about there." Getting TA action, see, inspecting cows. "Let's get it back to what we were talking about there, and we were talking about baking bread making others wrong. Baking bread making others wrong. You've got the auditing question now." TA – clank! Dead still. What happened? Well, actually, the auditor thought the pc was probably being non sequitur. Trying to push the pc's attention, see – this line, this itsa maker line – over to baking bread. But he's got TA action, and it was just around the corner that the pc was going to cognite that bread and milk, you see, go hand in glove together. Big cognitions about to occur, and he'd been a ranch cook, see. He'd been a ranch cook but never, never, never had they ever had any milk to make bread with! This is right around the corner. If that attention line is just let go, just that – TA moving, everything's fine. The auditor all of a sudden – one way or the other, by a thousand different mechanisms – suddenly picks up that attention line, puts it on something else, you see? TA – no motion. Why? There's nothing there to make any motion, you see.

This is something like a guy's sweeping a street, see. And you walk up to him and you say, "Give me that broom. All right. Sweep the street." "Well, you got my broom. You got my broom."

"Well, you don't want that broom down on the pavement. Just – broom's suppose to be over here – be over here on the curb. Now, all right, we've got it here on the curb. Now sweep the street."

"Yeah, but – I got to have my broom. I mean, you know, how can I give you any – *huh-huh-huh*. How can I sweep the street with you – with the broom...?" so forth.

"Now, look. Now, look. I know what's best with this broom. I know what's best with this broom. After all, this is street cleaning department property and it must be preserved, and we're supposed to keep it over here on the curb and so forth. Now, sweep the street!"

You can see the nervous wreck that becomes the street cleaner. That's what you're actually doing to a pc. Pick up the pc's attention line one way or the other – grab it, hold on to it and then tell him, "Look at the bank now. Yeah, here, give me that line. Yeah, yeah – let's – let's – let's give me some itsa. Where's your itsa now?"

"Well, I uh – I, uh – so forth, and I think it has something to do with this facsimile..."

"Oh, oh, *bbbzzz* – the facsimile – oh ho-ho-ho-ho-no, no, no, we got to look at something else. Now, give me some itsa. Whatsit? Whatsit? Whatsit? Uh – uh – give – give me that line. Give me that – give me that communication line. Now, but don't-don't-don't-don't start moving any attention lines inside your bank now. And give me some itsa, see. Whatsit? Whatsit? Whatsit? Don't look. Whatsit?"

Well, you can figure many ridiculous examples on how an auditor can do this. As soon as you get these things taped, all of a sudden auditing just is – just – it's just very relaxing. And on Level IV, it is very, very industrious, but you're doing an excellent job the whole way of directing the pc's attention. You're getting that line directed because the materials of IV permit that direction. It's a very precise direction. If it's not precisely directed, God help you. It's something like shooting sixteen-inch guns, you see, without any pointers. Everything gets blown up if you don't point them in the right direction.

But this is the essence of the auditing you were doing, and any real trouble you're having with auditing, there's some misconception of these various communication lines or what you're doing with the pc's itsa maker line or something like this. Tell the guy to itsa something, then not let him look at anything to itsa, he'd go berserk. He itsas something – don't accept it. Say it must be something else. Something like this. Keep this rattledy-bang going up somehow or another – you get no TA and you get no auditing done and everybody goes around the bend.

All right. But I know you're not doing any of the things which I have been remarking. I know we're all agreed that I'm the only one that's making any auditing mistakes lately. So you go ahead and do a good job, huh?

All right. Thank you very much.

LEVEL IV AUDITING

A lecture given on 17 October 1963

All right, what's the date?

Audience: 17 October.

Seventeenth of October. Saint Hill Special Briefing Course. Going to give you a lecture today on IV. You've heard me stressing Level IV a little bit. Actually the lectures I have been making are not particularly usable in Academies and that sort of thing, because we keep talking about Level IV and interjecting it and that sort of thing.

And what – those of you in the lower units – what you're terribly interested in, of course, is how to get TA motion and so on. And so I'll salt this Level IV down with Levels I, II and III, you see? And reverse the procedure today. So you can still hear it and...

Now, getting – getting TA motion is a common denominator of all Scientology activities. And you will be happy to know that on the staff co-audit – feel a little self-conscious, just been watching that film we just made, you know. And good heavens! It's a good film. It's a good film. They'll like it very much at the congress.

But on the staff co-audit and so on, they at first didn't believe, of course, (and still some of them don't really quite believe) that you can simply sit there and let the TA move around at a mad rate, see. And they're – they're learning, gradually, however. And the learning rate is very interesting.

Really, they're not running anything different than they were running, you know. But they went into a terrible slump. They went into a terrible slump. For a while they were getting fair TA, you see. They were getting around fourteen, fifteen, eighteen, sixteen – that sort of thing – divisions per two-and-a-half-hour session, see. And this was it. And then I started leaning on them to increase it, and it went down to an average of about eight TA divisions per session, you see. [laughter] They just went all to pieces, you see. Got so self-conscious about all this, you know, that it was horrible. Now they've come out of that slump. And it's interesting that they're moving up a few more TA divisions per session.

Now, you say, well obviously the pc is loosening up and things are getting along better. No, that has nothing to do with it at all. The state of the case of the pc has practically nothing to do with TA motion. The sooner you get that out of your heads that the pc has something to do with TA motion, the more TA motion you're going to get. What you do is simply sit there and get TA motion, and I don't know why you're doing anything else. See, I don't know why you're doing anything else than just sitting there getting TA motion.

It's too easy. And it's something like looking for an elephant in an empty room, you know – and there's nothing else in the room but the elephant. And one day you say to yourself, "Let's see now, if I don't yank the pc's attention off his case, and if I give him anything at all to itsa, and then if I don't stop him from doing what I ask him to do, I get TA motion." And you'll finally come to that conclusion as a horrible recognition and wonder what the devil you were doing before! And so on.

Well, I wouldn't begin to be – tell you what you were doing before. Because they are too numerous. The variabilities are too great. One of the ways of reducing TA motion is to vary your Model Session. Every session run a different Model Session on the pc. The motto of no TA motion is: Be unpredictable as an auditor. When the pc expects you to put in the R-factor, get the can squeeze. Put in the R-factor after you've started the session. That's good. That surprises him. But next session, correct it and put it in before you start the session.

And then he says, well, his attention goes onto his case, you see, before you've started the session, and he has to suppress his case for that. Well all right, so next session just omit the R-factor. You get the idea. This makes life very, very, very unpredictable. See what I'm talking about? Pc doesn't know what's coming next.

Well, this is a method of getting the pc to whatsit the auditor. What is the auditor going to do next? The pc doesn't know what the auditor is going to do next, so the pc now whatsits the auditor. And the more the pc whatsits the auditor – does this auditor know his business, what is this auditor worried about, what is this auditor going to do next – why, the less TA motion you get. Because you've got the pc running a whatsit.

And the auditor can then, of course, run an itsa. You've got the auditor then itsaing and the pc whatsitting, and that is the reverse to getting TA action, and then you can carry on from there on out and get no TA action. You could settle down very comfortably into these particular errors, and sooner or later you suddenly get a breakthrough and a win, and then you're startled to find out that something must have been happening, and you'll suddenly say, "Well, this session – there must be something wrong with this session because it was too easy." See, this was too easy.

Now, one of them on the staff co-audit – to be congratulated on it and so forth, just rolling along the line – got thirty-six TA. Thirty-six down divisions of TA, see. Moving it up from about eight, and not running anything very remarkable. But I'm sure the auditor in that particular case thinks that what she ran had something to do with it. Yes, something – had something to do with it, but there must be a relaxation setting into this sessioning. Get the idea? So TA motion isn't being prevented.

Now, the auditor is in control of the bank. That's something else that you may or may not ever believe. You are in absolute, positive control of the bank. Just complete! The bank obeys you, and doesn't obey the pc. The pc nearly always tries to look at what you want him to look at. The bank always does what you tell it to do. It's this sort of thing: You remind me of somebody sometimes, when you get confused about this, who is rolling a marble along the walk, you see, something like that, and arguing – arguing like mad about the marble won't do what you are making it do, you see. And you kick the marble and it rolls along very nicely in

the straight line – the exact straight line that you kicked it, see. And then if you kick it with a little slice or a curve or something like that, it goes over into the verge of the walk, you see.

Well, there are people around who say, "Look at what this marble is doing to me." And these people take up golf. It enters into the whole nomenclature of golf, you see – you hear them talking all the time, you see. "The clubs are doing it," and "My drive has a slice," see. "My brassie gives a hook." Now, if you want to really fix a golfer but good – he's dubbing along one way or the other, he's getting... you know, he's fair. Got a handicap of two or three hundred. You know, just a golfer. And he – he's doing all right, see. And he can step up on the tee and there's the ball and he hauls off and swoosh, down comes the driver, you see, and wham, *zzzzt!* out onto the fairway goes the golf ball and so forth, and he's getting along all right, see. Occasionally things happen, like he tops it, you see, or undercuts it or something, but usually something happens. Now walk up to him and say, "If you just interlock your hands, you see, in the Snead grip or something, you see, and then if you'll flex your elbows just before you do this, and then don't take your eye off the ball and so on, your drives will be much better."

Now he's in trouble. Now he's in real trouble. Now he is facing up to the fact, he's not driving now a golf ball. He is interlocking his hands on the handle, he is keeping his eye on the top of the golf ball, he is doing this and he is doing that, and he's doing all these other things. But he is not driving a golf ball, and the answer is, of course, he doesn't. One professional lesson can put fifteen or twenty strokes on almost any dubber's score. Just one pro lesson, and he's had it. Now let's take some twelve-year-old kid, and we take him outside, and we hand him – we hand him a set of golf clubs, and we say, "All right, now there's the ball, and you put up on the tee and drive it down the fairway," and so forth. Funny part of it is, he's actually liable to connect. He's liable to connect, and he goes on and he fools around and he plays golf and so forth. Now we want to do him a big favor. He's going around in about a hundred and ten, you see, or something like that. Let's do him a big favor. Let's get him some professional lessons.

Well, for a long time his score will just increase, increase, increase, increase, increase, see. And he'll go into absolute despair, finally, on the thing. But somewhere along the line he starts to coordinate again and select out what's essential and so forth, and it comes back and he drifts back to a point where he is actually driving the golf ball again, and he starts making remarkable strides. Now, unfortunately, it is necessary for somebody to go over this period. Necessary, in order to play golf. Or to audit.

Now, Reg, on Sunday here, with the people he has here – he's got them chattering nicely to each other, you know, they're putting in the itsa line, they're auditing each other at home. They don't know what to do wrong, you see. And they very, very happily get along and they listen to each other and their fundamentals are this and that and they're all in and so on, and their TA motion's probably fair. And all seems to be going along very well.

Well, you look at this as an auditor, and you say those guys must be naturals. No, those guys are auditing unconsciously. They're ignorant. And ignorance is bliss in that particular case. And here's the test: The second there's just a little more sand in the trap, the second that there's just a slightly greater dogleg on that particular hole, they've had it. They're

through. The second that the pc says to them, "Well, I don't know, the pain's moved up to the top of my head now," they go, "*Huhhh! Huhhh!*"

They end the session instantly, and come back and ask Sunday what they should have done. And one fellow did that and he said this very excitedly about this, and all of a sudden he got a sort of a filmy look in his eye, and he said, "You know, I should have kept the session going, shouldn't I?" See, his own cognition. He found out something about it.

Those guys would be dead ducks if they ran into a ripple on the sea, if they ran into a pebble on the green, if anything happened, if the wind was a little bit higher that day, see. They're dead. Now, what makes a pro is actually being able to go over this hump and go all the way through it and get something at the other side.

Now, he becomes almost unshakable when he can do this. He'll carry on. He'll do the right thing. And when you introduce a new style of auditing such as Listen-style Auditing, why, the auditing of a lot of auditors shatters promptly. And one of the errors they make is to make formal auditing adapt itself to Listen-style Auditing, see. It's like teaching somebody to dance: You teach him a polka – as it says in the bulletin, something like that – and you teach him a waltz. Well, he doesn't differentiate between the fact that a polka is quite different than a waltz, and right in the middle of the waltz he starts polkaing, and right in the middle of the polka he starts to waltz.

Well, that's because he doesn't realize the tremendous difference – the tremendous difference between the two dances. And yet, a good dancer would be able to polka or waltz at will, knowingly, without going all over the place.

Now, I won't minimize the fact that formal auditing has been altered – has been altered to some degree, in that you should let the pc itsa the item or itsa the goal, and you shouldn't stop the pc from itsaing what the pc is supposed to be itsaing. That's for sure. But that is the only lesson in formal auditing that is learned from Listen-style Auditing. That's all. You sit in formal style auditing letting somebody itsa his bank or itsa his items or itsa his GPMs, and you're going to have a mighty sick pc on your hands.

"All right, what do you think your first goal is?" Now, sit back, inviting communication – Listen-style Auditing. That's it. Let the pc talk for two hours and a half. You're going to get yourself some tone arm action, that's for sure. Next session, "Now, what do you suppose your first goal is? That was the auditing question you were working on." Sit back and don't do anything. Sit back and invite communication, and you're going to get a little less TA. Next session, "What do you suppose your first goal is?" Sit back, invite communication, and you're going to get a lot less TA. Next session, "What do you suppose your first goal is?" TA stuck, 5 ½. Thud! Unmoving, frozen in concrete.

Why? Because the factor of overstimulation gets in your road. Very important factor. Don't let somebody wander amongst the GPMs and RIs endlessly if you want TA action. Why? Well, because they can't do it, that's why. Well, why can't they do it? Well, the reason they can't do it is contained in the RIs and GPMs. So you've got a circular activity going on here. You are locating the things that prevent them from itsaing. And therefore, if they restimulate the things that prevent them from itsaing, they won't be able to itsa. You see, this is the snake eating his tail.

You're dealing with very high-powered stuff. This is the backbone of aberration in the case. There is no greater aberration in the case than is contained in the goals – GPMs and RIs of the pc's actual goals as they roll on back.

Now, if you ever want any facts about this, if you ever want to see this in actual operation or action, and you want to practically smash up the pc to find out about it and establish the matter, all you'd have to do is, is: "You had a lot of goals given you back around forty-three trillion years ago in an area called Helatrobis Implant area. Now let's move you back there. Now, all right, now you just tell me all about the goals in that area that you were given." I know anybody that's been over this stuff would just shudder with horror. It's like – something like asking somebody to go up to the top of the Empire State Building and be a bird.

He's going to be hit left, right and center by charge. Everything is going to go black on him. The more he looks at things the blacker it gets. The more he tries to move, the more he'll become fixed on the track. The more goals he picks up, the more jammed he's going to get, the more mass he's going to pick up, and he won't recognize the mass properly anyhow, so he'll get all wrong masses, all wrong names for the items. He hasn't got the patterns, you're not giving him any assistance of any kind whatsoever. Now, just – just take that as an example. And if you doubt me, why – and don't have nerve enough to actually go the whole hog with somebody – just throw somebody into Helatrobis Implant area and watch the behavior of the tone arm. And then somehow, if you can, run the session out.

No, there's stuff on the backtrack that bites. Level IV is all sub-itsa. It's all sub-itsa. The thing which reduces the pc's ability to itsa is contained in the materials of Level IV. It's contained in those materials. So the restimulation, but not the discharge of those materials – and they will not discharge, because there's no way for him to tell what is what – the restimulation of that will therefore reduce his ability to itsa.

Now, if you're just looking at it as, "Well, all right, what's your first goal? Fine. All right, give me the two top RIs. Oh fine, I'll just write those down here. All right, that's good. Give me the next pair of RIs. Good, I'll write those down. Ah, thank you very much. What do you suppose your next pair of RIs is in that GPM? Oh well, good, I'll write those down. Oh, that's fine. Now, I suppose as you – don't say – there's nothing more much in that goal? All right, though – that's fine. Give me the second goal on the line. All right, that's what you say it is? Okay, I'll write that down. That's fine. Now give me the top RI – what's the matter? I don't seem to be getting any TA here. Have I cut your itsa line? Have I stopped you from telling me something? TA seems to be stuck up here. I seem to not be getting any tone arm motion. Let's see, now. Oh, all right – I'll do an ARC break assessment for the session, you see? All right, is this restimulation of an earlier cut communication in the session? Uh, is this restimulation of an earlier rejected affinity and so on? I don't seem to get anything to read here. Oh, well. Well, let's see. On auditing, now, how – what about auditing? What about auditing. Uh – yeah, what solutions have you had for auditing? I'm going to get somewhere now! What solutions have you had for auditing?" Half an hour later – TA now is at 5.25. "Well ... well, let's see, maybe I can send him back to goals of sessions – old session goals, you know. Here's an old session goal 'to lose my lumbosis.' Now, we used to have good action on that. All right now, let's go back into this again because we can really get someplace now. Now give me

some solutions for lumbosis. What solutions have you had for your lumbosis? So forth. All right! Good! Good." 5.5, stuck.

There is nothing known, and I'm sure nothing will ever be known, that will take that TA down, except Level IV. The right goal. The right item. It's just going to go on up, and it's just going to stick, and the only direction it's going to go is higher. And the more you keep at this type of nonsense the less tone arm action you would have. Your tone arm action would drop to zero for the session itself, and maybe on your "since" mid ruds and so forth, to one.

And then, if you kept up this nonsense, would drop to zero for the session and zero for the mid ruds and zero for everything else. And you'd see that needle start to stiffen, and that needle would go stiffer and stiffer and tighter and tighter.

And if you kept up this nonsense, you all of a sudden would take the pc backwards through 7, and find the pc sitting at 1. Now if you still kept up this nonsense, and so forth, you would eventually move the pc to Clear read with a total stuck needle – dead thetan, and a very sick pc it would be.

So it's all very well to talk about how you must listen to the pc. When it comes to Level IV, the liabilities of using Listen-style Auditing, the liabilities of using that as the exclusive approach, are enormous. Now, this is the level of the one-man band. This is the level of the one-man band. This is no time to have an auditor worrying about his hook into the trees. This is no time to have an auditor who gets spooky because he misses a putt. Now look, he has to keep in the itsa line and not cut the pc's itsa on the goals and RIs which the pc is supposed to be operating on. He's supposed to keep the pc out of trouble on the track. He's not supposed to let the pc wander all over the place on the track. And he's not supposed to cut the itsa line.

Now, those are two interesting counter-opposed data. You mustn't let the pc idly itsa on the track, and you mustn't really push the pc all over the track either, and you mustn't, of course, cut the pc's itsa. Now look at this as a problem. What's a solution to this problem? Pc starts to look on the far backtrack and the auditor says, "We're not going to go into that now." The bypassed charge of what the pc has already restimulated kicks in, and you've got a beautiful, roaring ARC break. You understand that?

So this isn't a minor problem. This is a major problem, and it's no time, at that level, to have an auditor worrying about his putting. Worrying about "shiny clubs or dull clubs – which?" See, it's no time to be worrying about any of the niceties of auditing. This auditor's got to know all the niceties of auditing. He got to be a pretty smooth article. This is no time to have an auditor who can't keep his Model Session straight. This is no time to have an auditor who is still queasy about "Let's see, what – what – what – what is a rocket read? Let me see, I – I've – I heard of one once, I wonder what it is. Uh – do you suppose that's – uh – where's the Instructor? Uh – what – is – is this a rocket read? This tick?" This is no time to have that kind of thing going on.

Level IV is the Scientist level. It's a one-man-band level. Do you know how you solve the backtrack problem? The solution to this – of not let the pc wander on the track and get his attention all stirred up all over the place – is a complex solution, but a very workable solution.

You just have to be able to audit like a streak of light. You just audit so fast, you list so fast, and you null so fast, and you keep going so accurately, and you never halt anyplace along the line, and the pc never gets a chance to have his attention wander. It's a case of attention wandering. You simply are so positive in what the pc's attention is on that the pc never has an opportunity to draw his breath and wander. Now, I'll give you an idea what's – what – it's very easy to make a pc wander on his attention. Very easy. Let's have an auditor – of course, the basic action of listing and the question is: Can you write as an auditor "I spit" fifty times and then read back "I spit" fifty times? Can you do that? Well, if you can – can't do that easily and without vast misgivings, you'll have trouble somewhere along the line of Listing and Nulling. Because that's the basic action of Listing and Nulling. Can you just do those two things? Not even look at a meter. Can you just do those two things, see? Can you write "I spit" fifty times and read "I spit" back fifty times, that's all! Because that's actually all there is to Listing and Nulling. You write down what the pc says and you read it back. I mean, there are no complications to Listing and Nulling.

Now, how long do you list? Well, that's all wound up in the bag now, there's nothing much to that. Goals lists are almost always underlisted, and item lists are almost always overlisted. And you can make the goals list as long as you possibly can and you may still have underlisted; and an item list, make it as short as you possibly can, and you may have overlisted. Those are the two great sins – the constant fight of a Level IV Auditor. The constant fight of a Level IV Auditor.

You go on, you're running this goals list on the pc, you see. And my God, you've gone fifty past your last RR, but your needle is still slashing. Every once in a while there's a surge. That goal isn't on the list. It's still going tick and clack and surge. About every third goal the fellow puts down, you get a nice big healthy surge. The needle goes across – *whoa!* That goals list is not complete! Complete goals list doesn't have any needle action. There isn't any needle action. Doesn't matter what goal he puts on this list now, there is no needle action. And on a goals list there is no TA action at the time the list is complete. No needle action, no TA action. It's all completely flat. And that goals list is complete, and that is the only safe goals list there is.

You'll get lucky some time, bless you, on a one-goal list. And you'll check it all out, and you've hit it right on the button. And the next time the pc will give you a one-goal list, and even though it doesn't read on the meter, you skip two GPMs, you start listing the thing, you wrap the pc around a telegraph pole, and you spend the next three or four sessions trying to unsnarl this God-awful mess. See, trouble – trouble with Level IV is you can get lucky. And every time you get lucky, you learn a bad habit.

I've seen a one-goal list that is perfectly accurate. And I've seen a pc cognite on his goal, and it was perfectly accurate. But I've seen a pc do a one-goal list that was completely inaccurate, even though the goal fired and it was used, and God help us! And I've seen a pc cognite gorgeously upon his goal on the list – done it myself – and it turned out not to be the goal for that list. In fact, it only turned out to be an actual goal, not an actual GPM. The next five hours of auditing after that fact I wouldn't wish on Khrushchev. Horrible! You're running with a wrong goal and you don't know it.

These are the liabilities of luckiness. Pc cognites – bang! He says, "Oh, my goal is 'to spit!' Ha-ha! I got it. That's it! That – ho-ho! That's it. That – that – that's the list." The auditor says, "Well, I just don't dare ARC break the pc and continue listing. The pc has said that's it, now I've cut the pc's itsa. If I – if I don't take this, I've refuted it." Well, you've got dodges such as this particular character: "All right, fine. That fired very well. Fired very well and blew down. However, I have to take all the charge off of the goals list between the GPMs so we'll just have to list here for a little while. And this is the auditing question – we just have to make sure, you see. Not make sure that it is your goal, it's – we're not interested in that – but we just have to take the charge off of this list. And the charge is off the list, why, fine, and if it's not off the list we will have to take it off." And the pc will sit there just, usually, like a little soldier and go ahead. Unless you've said, "Well I can't help it, I can't accept that goal. No, yeah, I don't dare accept that – I've got to have a complete list. No, that – I know, I know, you keep saying your goal is 'to spit,' but that – well, I – I can't pay any attention to that." Well, of course, you've got an ARC broken pc because you refused his goal.

So the trick is, of course, to accept the goal with wide-open arms, and do your job. See? Always do your job – always accept the pc's itsa and then do what you have to do. That's adroit. There is no substitute for being adroit. No substitute for a live auditor in that chair. He knows if he cuts the pc's itsa line he's going to smash up the session. And he knows if he accepts that pc's cognition without any further check whatsoever, he's liable to smash up not only that session but the next four. Takes the lesser of the two evils. He runs the risk of smashing up the session without cutting the pc's itsa. And boy, that is difficult! Sometimes that is very difficult. But you can be very adroit. "Oh, your goal is 'to – to spit.' Yeah, rocket reads." Reassurance. See, hope factor. Good real R-factor. "Good! Blew down. Blew down. I had a blowdown here on that." And he says that is, so on, and he goes on and he talks about it for a little while – oh, sure, let him talk about it.

And you say, "Well, that's all right. That rocket reads beautifully. 'To spit' rocket reads nicely. And that blew your TA down from 4.5 down here to 2.75, and that's very good. All right. Anything else you'd like to say about that? All right, that's fine. Good enough. Had a lot of good cognitions. All right. Now, we got to take the remaining charge off of this list, and here's the listing question – has no doubt about this, this goal, we've put it right here, I've marked it with a red circle around it and so forth. There's that goal. We've got to take the charge off this list. Charge in between the banks, you know." Pc will sit back and list for you. Perfectly fine.

And 50 percent of the time it turns out that "to spit" was it. But what if it wasn't that 50 percent this time? What if it was the other 50 percent? You get the idea? Pc will get used to this situation. Now, it's true that if you cut the pc's itsa at Level IV auditing, his R with his bank folds up and he gets less and less real. So you must do everything at Level IV to promote the pc's itsa. Well, you say, this is a hell of a thing, you have to promote the pc's itsa while cutting the pc's itsa! Well, there are many ways to do it. And I'll go on and give you some of these.

But first let's go back and take a look at this. How do you keep him from wandering all over the backtrack? Every time you sit back and draw a long breath, every time you say, "To uh, sp... uh, sp... I think – uh, wait a minute, what was this? Uh, to – to sp... uh, I can't quite

read my writing here, excuse me. To, uh – I guess it's uh s... oh! To spit! Oh yeah. To spit. To spit. All right, thank you. Got anything that's suppressed on that or anything. All right. Thank you. All right, very good. That's out."

During that period of time you were not in control of the pc's itsaing attention line – that itsa maker. You weren't in control of it. You weren't in control of the bank. You showed you weren't in control of the bank by being fumbly with a list. So you're in absolute control of the bank, and if you fumble a list the bank will fumble. So the bank fumbles, unseen to you, the pc's line is on the point where you fumbled, therefore the bank is shifted underneath that scanner and of course the pc's attention goes off onto other things, because you've shifted other things into his view, with your "Well, was it spa... uh, spa... uh what uh, spoo... uh, I have to get the mid ruds in on this now, because I guess I've made a mistake on it, haven't I? Huh-huh-huh! Sorry! Huh!" And that bank is going to move. And therefore your pc is going to get his attention on something else. And the pc's now going to say, "Say, you know..." You can always expect after you goof like this, if you're – if you're real observant of your own auditing, and you're studying a tape of you doing Level IV, which you should do someday, you will see that a short time after one of these fumbles the pc will come up with some yickle-yack. Not necessarily crude and not necessarily critical or anything like that, he isn't ARC broke in any fashion, but he's got a lot of comments. See? Adds another four or five goals to a complete list. Get the idea? Something else goes on. In other words, you did something that showed you did not have control of the pc's bank, you distracted the pc's itsa maker line, you see – you distracted that, and played it on something else, shifted the bank underneath it – with this goof you made with this list, see. And you're going to get some other stuff.

See, why? It isn't neat and clean. See, you're – it's all – it gets sputtered up at that particular point. All right, that's – that's the substance of an ARC break. If the pc has any bypassed charge at that particular time, it's that goof will key it in. Or cutting his itsa line will key in the ARC break – key in the bypassed charge and you'll get the ARC break. So that the more of these little goofs and yickle-yacks which you get into here, the more ARC breaks you're going to have per session. And the number of ARC breaks or upsets which the pc has the more wanderings the pc's attention has been. The more cut his itsa line has been. These things are all in coordination.

So a guy who's doing a clumsy job on Listing and Nulling: It's can you write "I spit" fifty times and read it back, see. And if you can't write "I spit" fifty times and read it back, when you're writing the complexity of fifty goals and reading them back, that additional complexity will show up the inability to do the simple action. And you stumble on these simple points. That shows you don't have control of the bank and so loses control of the bank for a moment, you see.

Do you know that if you read two goals backwards or upside down on a list you've disarranged the bank? Let's go back to – let's go up two goals and read one out of sequence just to see if it fired, and then drop three goals – no, don't read those – and read the fourth one down to resume our list. And you put the pc in a little tiny bit of a creak. Because what you've done is roll the bank backwards and then you haven't rolled it forward again. If you go back to read a goal, you actually should keep on going from that goal right straight on through, see. You should be able to write "I spit" fifty times and read it back, in other words!

Not take the forty-seventh "spit," get to the forty-seventh "I spit" and then decide that the thirty-fifth ought to be read again. Because when you do that you've disrupted the reel-off of the reactive bank. See, the time factor, you see – that bank is timed. And it's running off underneath the scanner, you might say, very nicely, until you all of a sudden get to the forty-seventh and read the thirty-fifth or, you suddenly don't read what's there. "I spatticated," you say, and, of course, it's "I spit" at that point of the bank, and so you've got an error point. These are not serious, they do nothing to a case, but they do a great deal to your session. At that moment the pc's attention gets dispersed, and that dispersed attention now leads into itsa all over the cockeyed time track. Do you see how that is?

It is so mechanical an action that it is almost unbelievable to an auditor that he could do this much to a pc with a little piece of randomness of this particular character. So he's reading "I spit." And he says, "I spat, I spatticated – I – I mean – pardon – excuse me. A little mistake there – I spit. Yeah, I spit. Oh, and the one above that, that was I spat – I said I spat, and that's actually I spit. I – I'll read that again. I spit. Now we'll go down three below this, and we will read, 'I spit!'"

And you, of course, stirred up that part of the bank, the pc is not quite able to confront it anyway, the pc disperses, his scanner line comes off of tension, because you've yanked it onto the auditor – one of the reasons. You've put it on – so that it didn't fit squarely up against the bank, it goes off onto something else, it restimulates a little more charge, don't you see. Next thing you know the pc's saying something else about something else. If he has any bypassed charge at that moment you've led – laid in the seed of an ARC break. You do that two or three times and if you've really got some bypassed charge in the session...

See, bypassed charge in a session will just lie dormant. There's always bypassed charge in a session. Always. You can't run a session that doesn't have some bypassed charge in it. Either from former sessions or the session you're running, or from the life around you. And if you're going to go through the beautiful dream of having a pc who has no bypassed charge of any kind whatsoever, knock off the hop. Wake up! You're just dreaming with the opium addicts, man! Because there is no such thing.

The key-in of bypassed charge is always some comm failure. All you've got to do is unnecessarily cut up the pc's communication line, refute his itsa in a dozen different ways, knock it around, knock it around and put some session charge in there, which bypasses charge in the session. That restimulates the bypassed charge which is waiting to be restimulated and only that gives you your ARC break. You can, in actual fact, run a pc with a wrong goal, without an ARC break. Of course, it's rough on the pc. I mean, he's got a wrong goal. You aren't necessarily running that goal, you understand, but you have found a wrong goal on the case. Well, now, man, a wrong goal will just about tear somebody's head off! And the pc can sit there actually with his head half torn off. And if you are a very smooth auditor indeed, you would audit without giving the pc a single ARC break. He wouldn't ARC break.

You see, it isn't true that bypassed charge equals ARC break. ARC break always equals bypassed charge. But bypassed charge does not always equal an ARC break. That formula requires bypassed charge, via rough spot in auditing, via session key-in – of a cut comm

or some other such thing – equals bypassed charge. I mean, equals ARC break. So that's only how an ARC break adds up when you look at it in reverse.

Now, an ARC break, then, does not always come about because you've bypassed charge. You find a wrong goal on the pc, this does not equal ARC break. This may equal a very uncomfortable pc. In other words, bypassed charge does not equal ARC break. But an ARC break is always traceable to bypassed charge. I'll go over that again for you, so there's no doubt in your mind. I mixed it up there a moment.

If you have an ARC break, there must be some bypassed charge. See, that's always true. But just because there is bypassed charge is no reason there's got to be an ARC break. Whether there is or is not an ARC break by reason of the bypassed charge is totally conditional – utterly and completely conditional – upon the auditor. Of course, the more bypassed charge there is in the session, the less mistake the auditor has to make to kick it in.

Now, this depends then on the auditor – some little goof, a little cut comm – usually a commu... cut communication of some kind or another or a refuted itsa. Got a bypassed charge here. Actually, three sessions ago, you inadvertently, when you were coming up the line, found a wrong goal. It's still sitting there, it hasn't given anybody any trouble up to this moment. The PC just feels a little creaky occasionally but is not complaining about it, see.

You've audited two sessions since – no ARC breaks, everything's going along all right – and the pc is looking around dreamily at the start of session or something like this, and the auditor takes over and starts the session badly.

Pc said, "I was having a little bit of a tough time this afternoon talking to so-and-so, and uh..."

"Oh, well, all right, all right, all right. Okay, okay, okay. All right. Now, all right with you if I start the session now?"

And that will sit there and it doesn't take the drop of a pencil to blow in a screaming ARC break. Now it's been keyed in, see. The apparent impatience of the auditor, you see, to do something. The cut comm. The auditor's apparent refusal to let the pc look at his bank. Just a little rough spot that gives the pc some dispersion, and then a cut line on that rough spot, and *pow!* you've got your ARC break. And every ARC break you get on a pc must have gone through that cycle.

There are no ARC breaks that don't go through that cycle, so don't kid yourself. Just because you didn't spot how you cut the communication, just because you didn't spot how you chopped the itsa – just because of this, don't think there wasn't a cut comm. If you'd had a tape running on the session, take my word for it, you could have wound that tape right square back to that point of the session, and you would have – where the ARC break occurred, and then go anything up to ten minutes to a half an hour (sometimes even an hour and a half earlier, it all depends on how much session there was) and you would have found, dead on the ARC break, you would have found some little misdemeanor on the part of the auditor. And then wind it back there anywheres from that point back an hour and a half earlier, you would have found a nice, nasty one.

Crude as this – crude as this, see. They're crude, these things. You're not actually auditing on a tightwire, see. I mean it's a big, broad highway and if you don't drop any stoves on it, you see, and don't cut holes in the concrete, you get along fine. It's actually that magnitudinous. You'll look back there but you... the tragedy is when an auditor doesn't look at these things as magnitudinous. And blames the pc for all this stuff happening, after pulling corny actions of this particular character.

So here's the pc, and the pc's saying, "You know, I – I think – I think we had a – I'm not quite sure, but I – I think we had a-a-a-a-a – overlist on something. I think we've had an overlist on something. Uh, I just think we have. I think we must have overlisted someplace or another. We – I think we went too far on an RI or something..." He's guessing at something, see. Like that.

"Oh? Oh? Well all right. All right, here's your next list question..."

Well, you say, well, that isn't bad. That isn't bad. No, no, that isn't bad, but then you will find out that it actually went like this:

"I really don't think we should go on listing on this list. Uh, there's something wrong here, someplace. I-I..."

"Oh? All right, well here's the qu... here's the question..."

See, there will be a forcingness of some kind or another will be going on here, see. Or – those are about the most innocent examples that can cause this three-day-old wrong goal to suddenly kick, see. Pc doesn't know what it is, he merely knows there's something wrong. And he usually says it very gently, in some particular fashion and the auditor just misses it clean, and slams the barn door on the thing, and he's got the show on the road. Now this thing is going to roll. He's opened the door to the hurricane.

And they always happen like that, and it's too bad that you can't review some of the more serious ARC breaks you had to – to give the – give the truth of this situation. It would cure you utterly of stumbling and fumbling and being unadroit at Level IV. It would just cure you of it, if you could hear exactly how corny the thing was. Because it's plenty corny. This is true of all these types of ARC breaks and misdemeanors.

Now look. The people that Reg teaches here on Sunday – they sit down and they look at each other, see. And they can audit – oh yeah, they're having a good time. They sit down and look at each other and one of them talks about life and so forth and they undoubtedly get tone arm motion and so forth. That is one God-awful distance – that's through the whole training of the game of golf – between there and the pro. See, that's a long, long distance.

And for one of those characters to try to take up with the pc whether it is the right goal or the wrong goal in such a way as not to ARC break the pc and handle that thing to a successful un-ARC broke conclusion is about the same as watching a man intently to see if he's going to flap his wings and fly off to the sun. He just wouldn't – haven't have a prayer. Well, there's where you're going, don't you see.

Now, when you've got yourself a good smooth grip on the situation so it doesn't worry you whether the pc is talking – doesn't worry you to have the pc talking. Doesn't worry you to

have the pc not talking. This – having the pc there talking or not talking, or doing or not doing and so forth is not a great subject of worry – to where you can move the bank around at will. You know, the bank moves to whatever the auditor says. And the pc looks at whatever the auditor tells him to. You learn that real good and you all of a sudden see what you're doing. Bank – anything will appear.

You can say the date 1492 forcefully to a pc and you've moved the bank – 1492. You can even, oddly enough, move the bank to May the 3rd, at 2 o'clock in the afternoon, 1492. You can move it to 2:01. You can move it to 2:02. And you will have exactly what the pc was looking at at that time and date. Now you may have to move him through it several times to obscure the intervening murk. You may have to have the duration of the incident if you landed in the middle of an engram. But it's like developing pictures. All the auditor's got to say, "1492, May the 3rd, 2 o'clock in the afternoon!" The pc's got it! That – that is it!

Now, if the auditor is so corny that he doesn't realize that he's put it there and then ask the pc what he is looking at very unconfidently, you see: "You – you're not looking at anything there, are you? I mean, there isn't anything there?" Of course, the auditor's moved the bank back out again, you see, by being uncertain of its location. And then if the auditor doesn't know that he has to get the pc to scan that area very enthusiastically, before he finally will be able to develop the picture, see, why, of course he will never learn that he can do this.

But it in itself would be a – almost an auditing practical exercise – a cross between the Auditing Section and the Practical Section. Move the pc to 1067 at 8 o'clock in the evening, and find out what he was doing. Oh, my God, how could you do that? How could you possibly do that? Elementary. Elementary. You simply say 1067, 8 o'clock in the evening, you know, whatever the date is. That's all. The bank will respond to that, and then all you have to do is tell the pc to put the old scanner on it and scrub it up. One of the ways of doing that is to move the pc, see – actually it's not moving the bank, you're moving the pc – over the area. Move him from 7:59 to 8:10 on a certain date see – certain hour. Move him once, move him twice, move him three times, move him four times and all of a sudden – *urhh!*

I did it with one guy one time. He actually was dead in his head, solid concrete – he wasn't a special type of case of any kind whatsoever. It's just patience on the part of the auditor. I even remember the date – I think it was January the 3rd, forgotten what year it was. January the 3rd, I think it must have been 1950 was the date I moved him to – and he couldn't see anything there. And took him at that hour of the morning when he – it developed that he had entered his office at that hour of the morning; I thought we'd get him eating breakfast or something. He entered the office at that hour of the morning; we developed the next half-hour. And we just got him to enter his office and develop the next half-hour. Entered his office and went through the next half-hour. Entered his office and went through the next half-hour, entered his office and went through the next half-hour, and after we'd done this about a half a dozen times he was reading his mail, word by word. Addresses that he had never even vaguely remembered were firmly printed on the envelopes in front of his face. He was highly intrigued.

See, it was a nonsignificant date. Nothing had happened on January the 3rd, you know. He first tried to figure it out, you know; figure it out, you know. Well, I didn't interrupt

this – I just kept moving the somatic strip, you see, just moving his time track through that particular time and getting the pc to look at it. And move it through that little time span, get the pc to go through that time span, and move it through that time span, get... An auditor would become very intrigued with the fact that he actually was moving the strip, and the pc was looking at whatever he said. These are very positive actions. There isn't any doubt about it whatsoever. Just because the pc doesn't see it is no proof that you haven't got the p... got the strip there, and got the pc's attention on it.

Now of course there is this bungle: You can move him into something which sticks him and then rough him up so that he and the bank don't follow any instructions, and not arrive. See, there are very, very many ways by which you don't arrive. But they're all along the lines of bypassing charge, refusing to handle the pc's attention line – the itsa maker, see – refusing to move the strip for something there to look at. And these things add up to an impossibility to do it.

But you can take almost anybody as an auditor, and a pro ought to really be able to do this: Take your landlady and say, well – maybe she's forty years old or something like that – and you say all right, well, that's forty years – twenty years ago – 1943, it might have meant the war, we're liable to walk him into a bombing explosion. If we go much earlier however... Let's take 1947. Let's take 1947. All right, now let's pick out a nonsignificant date in 1947. Of course an auditor's always going after significant dates, so you forget the vast number of nonsignificant dates which the pc finds very easy to confront, don't you see. You're always adjudicating whether or not the pc is there and confronting because you're running a hell of an engram – some dentist halfway down his throat, you know. "Oh, you can't confront it? I guess there must be something wrong with my auditing!" you know. Hell, he couldn't confront it at the time!

But let's just take – let's just take – let's scout around a little bit, discussion, and let's get – let's get May the 15th, 1947 and let's take it at random, about three o'clock in the afternoon. And let's find everything between three o'clock in the afternoon and four o'clock that afternoon, see. See, nonsignificant date. And you all of a sudden find that you're actually moving the strip and moving the pc's attention, and the pc's just doing it just like that, see. And next thing you know, "Well, I walk into the kitchen and I put on the teakettle, see." Pc will be very intrigued – I've never had them revolt against doing this. "Walk into the kitchen, I put on the teakettle and so forth." The next thing you know, my God, she's even tasting the biscuits, you know? Quite remarkable. Reading the tea caddy and so on.

Trying to get pcs to get pictures on the track – you get the date and the duration of the incident on the backtrack, you can turn on any picture. And R3R is a conclusion of old Dianetics. It's a triumph, because the reason we couldn't run engrams on some people, don't you see, is they couldn't see them! Well, in R3R you can always get them to see and be the engram, I mean, that's – that's dead easy.

But this nonsignificant gag actually doesn't really require this much nonsense. Of course, you could take somebody who's very aberrated, and doesn't know what the hell you're doing and isn't under your control and is ready to jump out the window, and is – he's sure you're the dentist and all that sort of thing; you're of course not going to produce a result to

amount to anything. They still will do what you tell them to do but they won't be able to report on it, that's the main thing. Their communication line is too lousy, and your doubt and the upsets you get into in trying to get them to do it then stir up things that disperse them and that sort of thing.

But ordinarily this is a very easy activity to take some nonsignificant moment in the person's past, move that nonsignificant moment under their attention, scan that moment and get it fully redeveloped.

All right. Now there's a very minor action. Supposing you didn't permit the pc to tell you what the pc was seeing. That's an elementary auditing situation, see. You see, understood in the session is a command that the pc sort of is supposed to communicate to you because you're doing it, so obviously you must want to know, see. So if you present at that moment, the bank, and then prevent the pc from reporting on what the pc says – and there are several ways by, which you can do this. One is to demand more than is there. That's the most effective ARC breaky method because you've got him now the missed withhold of nothing. And you can do various things with that communication line, all of them very mucky, which will upset the general operation.

And here we're dealing with a nonsignificant thing. We're dealing with from three to four on May the 15th, 1947, when she went in actually and put on a teakettle and made a pot of tea and went down and sat at her table there in the kitchen and ate some biscuits and drank tea. Total action. Significance absolutely zero. She may get confused, she's done this so often! How come – really is this May the 15th? She may doubt this or something like that. But all of a sudden even that doubt will come away and she will know that it's that time she did this same action that she's done thousands of times, you see. It's that sharp.

All right. Now take that situation – take that situation, and figure out the number of ways you could louse up that person; that you could prevent this action from happening. One, not believe that you were moving the date underneath the pc's attention. Do a psychologist's stunt of challenge the experiment all the time so it doesn't work. Psychologists are wonderful at this. It's no wonder they never find out anything. You ought to see a crew of those Martians work! You really ought to see a bunch of them work. I mean, you'd roll on the floor.

By the way, I made a comment on one of these lectures one day, of – that you really wouldn't believe what I tell you about what psychiatrists do to the insane. You probably wouldn't believe it, because it's just too, too extravagant. There's too much. And you possibly just think I'm talking. But if you – if you don't, if you think you have some reservation, why don't you go down to the local mental hospital and take a look at some of this treatment.

Well, actually, in a PE Course down in South Africa, an official in the government heard that tape which I gave you here. And he said, "That's a good idea. Ron says I ought to go down and take a look. All right, I will." So he did, and he wrote me a report which can't be released because he got it as a government official, of what he observed, you see. And you actually would be stunned by it. They just take 220 volts and bang it between somebody's temple and they all go blue and bust them up gorgeously and – it's real wild. Just a couple of nurses, you see, apathetically throwing patients down on the bed and doing this with them, and just a long assembly line. And he looked up at the wall and he saw a whole bunch of –

picture with a whole bunch of psychiatrists in it, and they all seemed relatively young, but they were marked off as most of them dead. And the head of the institution said, "Yes, that's true, most of them are dead. They just seem to all die young in this particular business." [laughs] Didn't seem to strike him as peculiar.

Now, of course, I shouldn't be releasing that much of the report. And I haven't released the actual mental shock report to you. But it was interesting. He went down and he found out it just ran this way, see. This is the way it goes, see. Unbelievable. Nobody thinks it cures anything, it doesn't do anything for anybody. You're even told, you see, that nobody knows why it works, *if* it works. See, it's just all "what wall?" He didn't believe something like that could go on in this planet.

Well, this type of attitude carried through on to a psychological experiment they did at the UCLA. Somebody – you were supposed to say a phrase to somebody who was asleep and then audit it back out and recover the phrase, you see. So the conditions of the experiment were set up: They were only supposed to say this phrase and they weren't supposed to say anything else. So they walked in, dragged the tape recorders in and made all kinds of comments and upsets and fell over the chairs and hooked up tape recorders and discussed the whole thing and then they knew it couldn't work and some of the – fellow says, "Well, he won't be able to remember it, anyway." And he went on – they went on like this for two hours! And then couldn't make up their mind what remark to give the fellow to be remembered. They'd neglected writing that out, you see. And at that time scrubbed the whole experiment, didn't try to get it back and concluded Dianetics didn't work!

Well, you associate with people hanging from trees, you get remarks of people hanging from trees. That's – we ought to find a nice forest for those guys. Anyway, this is their idea of a controlled experiment. Of course, you attack a phenomenon with that fantastic carelessness, of course you – nothing ever happens. You never get a chance to observe any part of it. Did anything happen? You couldn't tell, see.

Well, so you have to kind of wash all that out and stop worrying about whether he did or he didn't or would he or wouldn't he and so forth, and you just do it. And it works every time. In other words, the auditor's in direct control of the pc's time track, and the pc always cooperates, putting his attention on what the auditor says, and out of this combo you could do almost anything on nonsignificant moments and that sort of thing. You can do the most phenomenal things. Why anybody ever had to hypnotize Bridey Murphy, I don't know! I don't know. It just required a little bit of patience. If you wanted to know what somebody was doing – if you want to know what somebody was doing, you'd have to get a time span the person was in. The person might not have been on this planet five hundred years ago, you see, or something like that. There's that possibility.

So you have to get a time span in which the person actually was there and a location in which the person was there to make any sense. Because you can't say "1492" to somebody who didn't arrive here till 1493, you see, and didn't even know the date 1492 when it did happen. But you could take it on "years ago," and undoubtedly land with it very handily. So, move it back on any time span, any – almost any random date. See, because you're going after

aberration, you're accustomed to picking up the cause of a psychosomatic or the cause of this or the cause of that. And you overlook these other simplicities.

See, the total simplicity of the fact is that if the psychosomatic lies there, well good heavens, his drinking tea lies there, see. "Oh," you say, "well, he only made a picture of the psychos..." No, that isn't true, they've just been up there cranking away, man! That – they got that – they got that camera going! They can always replay.

You can just pick a random time, sometimes a rather fantastic time. You could pick seven trillion, four hundred and fifty-five billion, six hundred and seventy-two million, four hundred and sixty-three thousand, five hundred and seventy-two years ago. All right, let's pick that up. Now we could even add a decimal on the end of it – point nine three five. Give that to the pc. But you don't give it to the pc and have him move the time track. You simply, you know, hand it out to the time track directly, see. And get the pc now to go over that little – giving him a time span in that – of what he was doing at that exact moment. And get him to go over that a few times, a few times – just a little time span. Get him to go over the – the point nine two, see. And get him to go over that little time span. Over it and over it and over it and over it and over it. What's he doing?

Well, he's sitting here – he's sitting here braiding some leaves together. Now unless you go mad and try to find out what's his name, rank, serial number, how many wives does he have at that particular time – because you're liable to be rather embarrassed to find out he – he was a woman at that particular time, you see. Unless you start going goofy and demanding more than the pc has got, you will get exactly what is there and exactly what he's doing. He's, like, sitting there braiding leaves, and after a while as you develop it a little bit further – you're working a picture. Now, you have to work this for quite a while, and work a fairly decent span to get the consciousness which was present in that picture, too. And get the memory which was present in the picture. We're asking a little bit too much because the thing is just a picture, don't you see.

But you work that span over, and let's work over one of those years from beginning to end. Over and over and over and over and over and eventually you will even develop some consciousness. If you keep doing this with just one year span, working it over very carefully, you would even redevelop a language. If nothing horrible happened in that year you would for sure do it – if your auditing was absolutely smooth.

Now, *there* is a test of auditing. You're handling all the elements of auditing. Nothing happened – there was nothing alarming occurred at that particular period you're going through, you see. There's nothing to upset the person. Now, therefore, the only upset that can be present is you.

Now, if you can do that action that smoothly and that calmly and just get somebody to do that without introducing any falderal or blang-a-blang, then I think you could audit an engram very well for that period, don't you see. Because now, you've got an unwillingness of the pc. Slight unwillingness. He doesn't want to confront this. He really will, but – for your sake – but you put the engram in front of him, and you say, "All right, now, go through this now, kind of playing the itsa maker over this, and tell me all, what is it, what is it?" You know, itsa, itsa, itsa, itsa, itsa.

"Ahhhh," he starts, he gets a somatic, see – "gghuuuu." That told him he better not itsa it, see. And you got to get him persuaded you know, a little bit more. "Gghuuuu" – that's another somatic, and "Uhhh!" "Put your attention..." "hrgguhfhf" He's not quite sure he wants – "hrgguhfhf! Psssst! That thing's hot! Heh – heh. Hhuuhh! All right, well for your sake I'll go back to the beginning of it again," you see. He's being actually punished for going over this period of the track. Well, you know, he's getting a pain in his epiglottis or something, see, every time you go through this thing. And it's developing worse, and he actually felt very sad afterwards. And he doesn't want to face all those tears. So that requires a little bit higher grade of auditing, doesn't it?

The auditor now has got to be pretty purely straight. He can't be – see, he can't be dropping his E-Meter in between the scanner and the bank, you see. He can't be clubbing the pc around and failing to take the itsa, and having a lot of trouble writing down his auditor report while he is auditing the pc. He hasn't mastered the ability, you see, to make some notes while talking to the pc, you see. These little things he hasn't mastered. He's having trouble with all these things, you know. And nobody polished his brassie, so therefore he's hooking into the woods, you know. I mean, that – this is no time for that kind of thing to be happening. Not while you're running through this engram with R3R.

All right, now let's go a little bit further! Ha-ha! Let's plunk the guy – thud! – into a goal which was supposed to solve problems, which would have caused – and probably did cause – several nervous breakdowns. Plunk him into the middle of a GPM and put him into the totality of a confusion that got him killed at least fifteen thousand times. One RI, see. About fifteen thousand deaths in this RI, all of them painful. And you say – oh cheerily, cheerily – "Go on! Confront it! All right, itsa! Ha-ha! Yeah, itsa! Ha! All right, what goal do you think you've got? What's the RI? What are the two top RIs? Oh yeah, you think they are, huh? Oh, well that's fine. We'll take those. What are the next RIs? You got any other goals of your own? Oh well, just go on through it. You're sure you're there? Oh, you're trying to tell me about it. Well, I'm sorry I interrupted you and so forth – I'm sorry – a bell – doorbell rang. You don't mind, I'll – I'll come back in a moment. Uh yeah, uh yeah. What were you saying now? ... Yeah, well I don't think so. That doesn't seem like that to me. I really think that the goal might have been some other kind of goal, I think you had probably some other reason to have postulated than what you're saying."

Now, I'm just trying to give you an example of the raised corn. Nothing like that would ever occur. But what do you think would happen to the pc, man! *Garrh!* Now, you're handling the same tools. It's just how much nitroglycerin in each one of them. How leery is the pc of putting his attention on that particular stretch of bank? Well, anything that killed him fifteen thousand times will kind of seem a little bit grim. He'd have to have considerable confidence in his auditor that nothing weird was going to happen here, before he could put his attention on this thing and be free of his environment enough to submerge out. Right?

All right. Now you're going to put his attention on that, and this is no time to be putting his attention on eight other things. Now, pcs do take tours for their – through their banks. And pcs do suddenly pick up items and give you. And pcs do cognite on goals. And all of these things happen. And often they are right. And often when they tell you why they have an ARC break they're right, and they're often wrong, too. And after they've told you what the

GPM is, you find out it's an actual goal but not a GPM. And after they've told you the RI, you find out that's just a lock on a lock on a lock on a lock of an RI. You see, this stuff is just – is precision stuff.

All right. Now, if the pc, in his effort to please you and handle the bank and so forth, is forbidden to cut – and not give you all of those things which he's got and is discouraged from giving them to you by finding that they are very often wrong – you have cut down the pc's ability to confront. Now, that's one of the things a pc's got to have there, man! That pc's got to be able to confront. Because the itsa maker only works on those things the pc is willing to confront. And when the pc is not willing to confront something, he can't get his attention on it, and he will balk, and he will tell you that he can't go into it. And God help you if you try to force him into it, too. God help you, I won't! Don't ever force a pc on this stuff, man. If the pc can't go, there's something wrong. Always true. Pc can't go, there's something wrong.

Now, you don't want this pc wandering all over the track, and you don't want this pc itsaing a bunch of stuff he shouldn't have, and if you stop the pc from itsaing things, you cut down the confidence of the pc in looking at that bank. And therefore you've cut down your ability to direct the pc's line because you're invalidating that pc's itsa making line, and you're invalidating it all the time, all the time, and so therefore the pc is soon not going to be able to look at all. And, oh man, this is a one-man-band proposition. And you see the elements it's made out of.

This is no time to be wondering, "Where is the switch that turns on the E-Meter?" You get my point? Now, I'm not saying it is difficult. I'm saying that you make it difficult or you will make it difficult. And that is the whole thing. The pc – the pc will only have difficulty on what he can confront and do if you make a considerable difficulty for the pc. All the difficulties from that point are made.

These are easy. These are easy things to do. But they start out with being able to handle the pc's itsa, encourage the pc's itsa, get the pc to increase his itsa, be able to handle the pc's bank, be able to handle these various factors in a session. Get real comfortable in that and then you start gearing up into this other stuff. And now there are various things which you really have to be able to swing in and do. And those things you have to swing into have to be done rapidly and accurately.

You do a goals list – learn how to write quick. Going to get that goal down, man! Don't go saying, "Just – just a minute. Just a minute. I – I haven't caught up yet." Very usually a pc, if it's pointed out to him that he's giving goals too fast, simply slows down. Pc gets used to it. You don't have to be able to take it all in shorthand. But don't try his patience like mad. And when you get that goals list down, be able to read the thing back. Be able to write a goals list and never make a mistake on whether or not the goal read on the meter. Keep your tone arm record while you're doing so. These are all one-man-band actions.

But they're all extraneous to the basic things of auditing. Can you sit there and handle a pc? Well, can you sit there and handle a pc? Well, you can you sit there and handle a pc and do a bunch of other complicated actions at the same time? It's a one-man-band proposition. Funny part of it is, you do any of those actions well, you finally come out at the other end and you say, "What the hell was I worried about? There's nothing to listing a goals list and getting

a pc's goal. There's nothing to listing an item list. There's nothing to keeping the pc's itsa in. There's just nothing to these things! What have I been worried about all this time?" Somebody's gone Clear as a bell! Somebody's rolling right on down the line.

No, the additives. The additives. "I think this time I will cross my hands, and interlock the little finger and the index finger of the two hands, and then if I bring around the club this way, perhaps I will be able to cure my hook." I'm afraid you will look back eventually, when you've batted one 250 yards down the fairway and say, "For heaven's sakes, what am I doing?"

In actual fact, golf is a very difficult game compared to auditing. It's much more difficult. There's a lot more freaks and things that can go wrong involved in it.

Level IV is formal auditing. Very, very smooth formal auditing, done with great speed and rapidity. And you use speed and rapidity to overcome the pc's idea of wander. You keep out of trouble by never forcing the pc where the pc can't go. You fill in the itsa, every possible opportunity you can. You've got a nice long list you've just done, see – an item list. I say a nice long item list, it had twenty items on it, see, before you got one that could – would RR, see. A long items list and so forth. You've read this item back, and it's gone *ppssswwww!* And you say, "All right. Is this your item? Is this your item here? 'Tree ropers.' Is that your item?"

"Oh, yeah. Yeah, yeah, that's it."

Well, you – don't you say another word, then. Don't cut his itsa line by any action whatsoever. Let him sit there and cogitate. Let him look at the thing. Let him – let him feel around it. Let him cognite on the thing for a while. He stays introverted for a little while – just you be silent and let him do it, see.

All right, when he's all through and he's got all that cognition out of the road and so forth, take the list you just did and shove it over in front of him. And say, "How do these other items relate to it? Is that the main item on that list?" Of course, he has to look at all these other locks. Compare these other locks and you see the tone arm pump up and down and go back and forth. Promote yourself a lot of TA action out of it. "Oh yeah, this would and that would and the other thing would, and those two top items, they must belong to something else because they wouldn't. But this does. This solves all the other items. Yeah, this – that's the common denominator to it." Sort of proves to him he's gotten down to the center of the thing, see. It's him saying – self, saying so. "Yeah, that's the way it is. That's the way it is."

All right, he's done all that, you've – he's said everything he's said about that, he's studied that list all that he wants to, you know doggone well – this whole action – this whole action, by the way, of his cognition, everything else, took three and a quarter minutes. And the auditor wasn't doing a blessed thing. See? Takes that list back, looks it over. He'll see by this time that his tone arm is starting to rise. That tone arm hasn't got any more blow on it because of that item, you see. His tone arm now is starting to rise and he's back there, lickety-split. In other words, he drives like mad!

"All right. Here's your question. Who or what would resolve tree rovers?"

"*Bow-bow. Bow-bow-bow, bow-wa-bow, bow-wa-bow, bow-wa-bow, bow-wa-bow.*" He's had two or three...

"Thank you. Thank you. Thanks. Got it. Got it. You think the item's on the list by now?"

"Oh, yeah, I guess – yeah, I guess it has."

Otherwise you're going around the corner, see?

"All right, all right. Good. I'll just null this list if it's all right with you. *Bow-wa-bow, bow-wa-wa-bow. Bow-wow-wow-wow. Bow-wa-bow. Bow-wa-wow.* That fired. All right. *Bow-wa-bow.* All right. Monkeys! Is that your item?"

"Yeah! Yeah!" Now, you're not doing a thing, you know. "Yeah! Yeah, hey – monkeys. Ha-ha! Yeah, that – that's it, that's it."

"All right. How do the rest of these items relate to monkeys? All right. Is that your item?"

"Oh, I don't – I don't know, I don't know, I don't know, I don't know, I don't know. I thought – I thought the earlier item was your item."

"Oh, you thought the earlier item was! Oh! All right, I'm sorry. Okay. I'll just see what we can do about that! See what we can do about that, you see. Wind! Wind! Wind! I'll see if we can get it. See if we can get it here. Wind! Wind! Tell you what, let's list just a little bit longer and see if it fires."

"Bow-wa-wa-bow, bow-ba-bow, bow-ba-bow, bow-ba-bow. All right. Wind! Wind! Hey, that fires. Is that your item? All right, that's fine. Here's – how does these other items relate?"

"Well, those other items don't. I went – listed around a corner there and so forth. That upper item, that – that – that's it. Winds."

All right, providing that rocket read, it blew down, and everything's fine. I'd compound it by telling the pc – I always can – able to get a little bit more – after the pc has said it's his item – after the pc has said it relates to all other items, after the pc's got it all sorted out and after it's all square with the pc, then I tell the pc it's his item. And I'll always get another half a tone arm division. [laughter]

Now, this is a one-man-band proposition. This is no time to be hauling around and wondering about itsa. So in your lower levels, get very confident. Get up to a point – itsa, snitsa! Nothing to that! Move the bank! Move the bank, move the pc's attention. We want some tone arm action – here's forty-five divisions – swish! Get the idea? Not worried about it. Because look – that is just kindergarten. To that you've got to add up, up, up, up on a great delicacy, on a great perception of what a pc's doing. All these things come on top of those basic skills. And you probably have to break a lot of bad habits, such as the way to run Level IV – "I know how to run Level IV. You sit back, and you look at the pc. And let him talk about his goals and GPMs. I know how to run Level IV." Well, you very soon will find out you don't know how to run Level IV, because it's the greatest discipliner in the world.

But once you've learned how to run it, once you've learned how to handle a pc, once you've learned how to handle a bank, there's actually very little to learning the rest of it. And you'll wind up at the other end of it wondering, "How in the name of God did I ever think this

was complicated? What's so complicated about this? There's nothing complicated about this! This is awful easy." But sometimes it takes a long time to get that point. Sometimes you arrive at that point, and I'll tell you the fast way to do it. Do it!

Thank you.

ATTACK AND GPMs

A lecture given on 21 October 1963

Thank you. Well, what's the date?

Audience: Twenty-first.

Male voice: October.

Octubre veintiuno, huh?

Male voice: Si.

AD 13. The reason you're getting this lecture on Monday instead of on Tuesday is because along about Thursday I have to wear the Washington legal hats and go up and solve their various difficulties for them. And the situation is that I've got to go up Wednesday afternoon and so forth, so you'll get your lectures oddly on odd days this week. All of which is a bunch of nonsense.

It's a spectacle of people defending. Defending. You know, you can defend yourself into more holes. And it just never occurred to them on this one suit that has been going for about five years, to attack anybody. Oh, that'd be very dangerous! You know? *Oh-ho-ho-o-o-o-o!* Very dangerous, you know, *ooooh-oh*, don't attack anybody. It's silly!

Look at the situation. Every time the enemy offers an attack, you defend against it. And that's all you do. Any castle, to hold out, has got to sortie. The proper strategy for any battle is to find a weak point in the enemy lines and attack it. The reason the United States is losing against communism is simply on these same mathematics. That they are losing is patent. All they're doing is defending the points attacked.

Oh, several years ago – on the – this Berlin thing before it really came up to a hot boil, you know? The United States has no – is not claiming any piece over there anyplace, and so is never – to be able – going to be able to swap Berlin for anything. The proper action is to go find something to collect, you see, as a piece. That's a proper action. Yet there they stand defending, defending, defending, defending. Well, don't they want to win?

How about an auditor that sits there and defends and defends and defends and defends and defends against the attack of a pc? How about it? And he never looks for the bypassed charge? He never does anything effective to straighten out the case? He just sits there and defends himself. Well, he'd last about two minutes. About the most dangerous thing you can do.

Look it over. It's the most unthetan thing you can do, certainly. You can defend to a certain degree and you have to defend to a certain degree. But use seventy-five percent of your energies to attack and you'll always win.

Find a weak spot and attack it. That's the point. That's the point. And attack expertly and attack perfectly and don't flub with the attack, that's all. Always put your concentration on the attack and you win every time.

People look awful silly two miles in your rear without any supplies, without any ammunition – with no supplies, with no defenses and no place to go. They attacked, all right. The whole front of the battle shifts. They attacked and you didn't defend. You went and destroyed their supply dump. It's very embarrassing to have this sort of thing happen, you see?

Now, the whole of life is an interchange if you're going to live. It's an interchange – an interchange activity. It's putting out anchor points. And let's look at the gradient scale of how you would go about this. Supposing you're just there all by yourself. And there's no limitation to your putting out anchor points, right? And you can put out anchor points. There's no limitation to this. You can put out as many anchor points as you like, you see?

Somebody else shows up and they say, "You shouldn't put out these anchor points," or "I want to make some of this – I want to have some of this space, too." And they put out anchor points against your anchor points, so you don't put out anchor points quite so far, you see? – talking about the Factors, now.

All right, and let's supposing that every time you put out an anchor point, why, somebody else forbade you to put out the anchor point, and you complied and agreed and didn't put out your anchor point. How big do you think you would be after a while? That's about how big you are now.

See, that's practically the way you got there – the way you got there. There's nothing quite as disturbing and there's nothing quite so certain to throw anybody into apathy, is just continue to put out your anchor points. It's the most disturbing activity that you can engage on. Everybody says, "You mustn't put out your anchor points," and you put out your anchor points. Then they give you lots of reasons why you shouldn't put out your anchor points and you put out anchor points. They bring all sorts of duress to bear on you why you shouldn't put out your anchor points and you put out anchor points. What's going to happen to their morale? See?

Now, sometimes it's very difficult to continue to put out anchor points in this particular way; sometimes you just get cut to ribbons. And it's those particular times that you got cut to ribbons you tend to remember as lessons not to attack, or lessons not to put out anchor points.

Now, the gradient scale on the thing goes, put out anchor points – in other words, continue to create your space – to attacking that which is preventing you from putting out your space. Now, that's also putting out anchor points, don't you see? And you get down along low human levels, and what are you then involved with? You're involved with attacking those who are preventing you from putting out anchor points. Attacking them.

Now, you go down scale just a little bit further. You start defending yourself against attacks. This causes you to live good, to have good behavior, to have various socially acceptable characteristics – all sorts of things. These things are basically defenses against attacks, direct attacks. Now you can go down scale even further than that: You have the defenses against possible attacks. And this causes people to live in castles and you know, dig moats

that nobody will ever think of ever charging against, you see? Invent weapons that have no particular use; invent social characteristics that are impossible to attack.

This causes you, in other words, to go down scale a bit further. Now, there's further down scale than that: is imagining you are under attack. That you are defending, answers itself out – answers itself out in this wise.

That you are defending yourself – you understand, this is the – now let me point back to you the level of the scale just above this – possible attacks, see? Level – you know, possible attacks. You're not being attacked, you're simply preparing yourself to defend possible attacks. See, now just below that there is a point that because there are all these defenses, there *therefore must be attacks*. You see, it proves itself. Well, you got a moat dug all the way around the place! Obviously, there must be somebody going to ride across that moat.

Some of the screens that a thetan puts up are terribly entrancing. These screens are very, very entrancing, because they leave them up forever. Why did they put them up in the first place? Well, they put them up against a lion. All right, the lion might still be there. See, you would have to take the screen down to find out. You don't dare take the screen down because you'd be attacked if the lion were still there.

This causes a very funny action. You can get a thetan, you know, a pc, and get him to find one of these black screens and get him to pick up one little corner of it and peek around it real fast and it reads – sometimes he'll really have to get his nerve up to do it. And he will. Hell see something like a mocked up lion or a snake or something on the other side of the black screen.

See, one of his answers of confronting is cover it up so he can't – won't have to confront it, you see, black it out. There is the final – final mechanism of a defense. Permanent defenses lead to a belief that one is under attack. When you get way down scale, you – it's – must be that you're under attack because there's the defenses. Somebody must be ready to launch the rockets at you any moment because, heh! Here are all these radars waiting to detect them. And of course, the more one defends the less one becomes mobile – one is less and less mobile. So therefore, actually, he never gets out to look.

He never goes out to look, to see if there are any attackers. And I imagine there are nations on planets someplace in this galaxy, at this very moment, who have no neighbors but who believe implicitly that those neighbors are there with full armies ready to attack them; and that live a life of complete defense, complete immobility, never going abroad, carrying through all of the various survival activities, to them, to prevent an attack against nations which are no longer there, that have long since gone to dust.

A GPM, in essence, is such a mechanism. One has a defense up against an area of confusion. He has a stable datum all arranged to take care of an area of confusion that has long since ceased to exist. Thetan eventually traps himself.

The GPMs then are a long history of all of the things which ever attacked him, and those things might now be gone.

What do you think the chances of your opponents of trillions one hundred – get that enormous figure. Trillions one hundred. Trillions written one hundred times. Think of the number of zeros that this puts up: Your enemies of trillions one hundred, still being alive and kicking and ready to knock your block off. What do you think it is? And yet you have all the

defenses for that period all rigged and all the stable data already there with those defenses against those confusions and attackers of trillions one hundred. And that, in actual fact, is what a thetan is doing.

He still has up all of the mechanisms of defense, and he – these mechanisms of defense are usually stable data, identities, beingnesses. And he still believes implicitly in the existence of the attackers – these confusions and chaotic areas, and so forth – he still believes those things are still there ready to bite him.

He became balanced in his attack-defense characteristics. He was defending as hard as he was being attacked and quite accidentally brought about a balance. You wonder how did anyone ever sit down and plan all this to happen? They never did. They would postulate a hundred goals, but one of them worked so well that it lasted for twenty or thirty pairs of items. See, you got lots of actual goals. Why didn't all these actual goals crystallize into GPMS? No, there would only be one of them at a time would crystallize as the single solution – one at a time would become the single solution. And then it would accumulate onto itself all of the stable data and all of the types of attack which could be made by reason, by the way, of having the solution.

One never looked at the fact that the way one got all this trouble was to have a solution for it. He always looked at it that he had to have the solution to keep out of all this trouble. He never really thought that the reverse occurred, but actually it was the reverse which did occur.

Now, all of these various complicated attacks and defenses and methods of keeping his self going, and all that sort of thing, these things swept along, rigged up each one of them as an emergency action. An emergency action is basically a timeless action, so everything was rigged to go into instantaneous operation. And he licked himself by doing this. He practically ruined himself because all of these things are built to be instantaneous and therefore to have no time associated with them; so therefore, to float, in essence, in present time.

And the characteristic of a GPM, because it's an emergency characteristic, is to always be recontacted in present time.

So this is the genus, this is the genus of the pc's actual GPMS – the Goals Problem Mass. The problem inevitably is postulate-counter-postulate. There is the attacker, and he wants to do something – Lord knows what. And there's his characteristic. His characteristic as viewed from the terminal side is of course one of chaos, one of tremendous confusion, one of unpredictability. And yet, it is still a central postulate that is guiding that.

So, one puts up against all this confusion, of course, the counter-postulate which resolves the confusion. And when those things hang in exact balance, you get a pair of items which then accumulate tremendous quantities of mass. And if you want to see some fancy mental mass, you ought to start trying to swim through a GPM. Can't be done. It's just fantastic. You can only get through a real, an actual GPM by running it by R4M2. It has to be run.

And then it winnows away, because it's taken away and taken to pieces on the exact basis that it was built, but backwards. You see, you take the last feared attack and defense mechanism first, which is the end of the GPM, the top of the GPM. And you run that earlier down to the formation of it. And, of course, the immediacy of the situation runs backwards to the formation of the situation.

It was lived from goal to top, don't you see? Goal as an RI, to top. And when you take it apart, you take it apart from the top down to the bottom, and then it will all fall apart.

Actually, you can't pull the goal as an RI out from underneath the GPM because it's too heavily overburdened and won't blow apart. A GPM will never run upwards. You very often will be fooled as an auditor: You've decided to run this particular GPM, you've landed in the middle and you decided to run it up to the top. And you're not going to make it.

You will get all of these items, and they will all be very, very logical. And then all of a sudden you will suddenly realize that you have run from the middle to the bottom. It's very horrifying. It's very horrifying. You have the order, then, on the line plot, in exact reverse because you started in at the bottom and tried to go to the top. A GPM will always unfold from the top to the bottom, and that's the only way the GPM will unfold.

The goal as an RI will not discharge. And you really can't get the charge off of it if you pick it out from the bottom of the GPM and try to discharge it and one of its items. Discharge that pair against each other, and you get nothing. Oh yeah, so you get a blowdown on your meter and that sort of thing. It's interesting that when you go to the top and run all the way to the bottom again, then they are fully charged. Bang. You just run into them again, they're all fully charged.

Furthermore, it was very hard on your pc to grab those two bottom RIs – very, very hard on your pc to grab those bottom RIs and try to run them. Everything will really go creak with exclamation points.

Now, the general situation with regard to GPMS, then, is that they are mechanisms of defense of a certain kind of order; they're also, of course, mechanisms of attack. And the scale which I just gave you will be found in the characteristic of the various items. A person will be trying to do one or another of these levels and it all adds up to just postulate-counterpostulate – a pair of RIs and a GPM, see?

One of the most hideous of the items is the pass-clean-away type of item. Trying to list for that item will be the most lengthy thing that you undertook. The item which you were listing for – and you don't know what the item will be, of course, while you're listing for it – is "Who or what would oppose a bore," b-o-r-e, you see? And supposing the item that you're looking for would be "fainting." Or you can see some Victorian society or something like that, some girl is confronted with this fellow who is a bore, and she uses as a mechanism, you see, to faint, see? See? And the item is "fainting." And man, you will just list and list and list and list and list and list and list, and all of a sudden it pops to view.

It's the least conscious item, so the pc is least conscious of it. The length of the list, then, is to some degree regulated by this other factor of the consciousness contained in the item being listed for.

You will find a goal "to be brilliant" – taking it over into GPM goals – "to be brilliant" much more rapidly than you will find a goal "to be hidden." But this is monitored by the fact that the pc's ambition at the top is to oppose everything that is hidden. And sometimes, when they're too extreme, they reverse, and you find the most hidden ones first. "To be hidden" may be found with great rapidity. Why is this? The last pair, of course, finds the pc like someone opposed to hiding, and the oppterm, "hiding." So, of course, the pc will come up with this

goal "to be hidden." Bang, see? That's because the top RIs disclose it by being in reverse, you see?

Look over the old goals "to scream," that sort of pattern, you'll see what I'm talking about. The goal becomes an enemy by the time the pc is through with it, so you'll get a reversal. Conversely, because of this factor, "to be easily found" as a goal, "to be easily found" might be the last one that you'll recover on the list because of the reversal factor of the RIs.

These factors of variability, however, don't necessarily apply in the GPMs to the tremendous degree that they appear in items. The items, of course, there's nothing else to disclose it except the item and its oppterm – the terminal and its oppterm. And they are always disclosed to the degree that the pc's consciousness is reflected in their wording. "An aggressive person," list one item. See? "A retiring person," list length: twenty items. Get the idea? "A fainting person," list length: thirty items. "A dead person," list length: forty-nine items. You get the idea?

You almost know what you're looking for after a while when you know your business. You know how conscious this thing will or will not be, because you can establish it by the length of the list.

That's true of both terminals and oppters. The least consciousness in the oppterm, or the more danger in the oppterm, will reflect in the length of list. The confrontability of the thing is reflected in its dangerousness.

Actually, a pc doesn't so much sheer off of the dangerousness as the oppterm, as its undisclosed nature. "Hidden men," for instance, would be found much more lengthily than "visible people." See, "visible people." Bang! That's right there. That's one on the list, see? But "hidden men," why, that might very well go twenty-five, thirty items long on the RI list, as you're listing for it. Get the idea?

GPMs, however, do not necessarily follow this characteristic because of the pair on the top oppterm reversing the sense of the GPM, see? So, "to be hidden" becomes sometimes the most easily found GPM. But, a middle-ground GPM is therefore the most consistently difficult to discover; a null sort of meaning that neither offers itself nor hides itself. And those become the hardest to find goals. You might say, "to be average." That will become the toughest goal to find, "to be average."

You find a goal like "to need." Of course, it's liable to present itself, bang! Right now. Or, also to refuse itself. It all depairs [depends] on where in the GPM the person is stuck.

Anyway, give you – giving you some sort of an insight into GPMs in general, the attack-defense mechanisms of life are reflected in the GPMs. These are the conditions of actual livingness that the pc has lived through. And it is their variety and assortment that gives you the different personalities of pcs. And it is only this variety and assortment, unless of course there is a native state which causes a pc to postulate a different variety from another pc, which we're not in a position to examine well. And I would prefer at the moment to say it is the type of GPM which is monitoring the conduct of the pc. And as far as you're concerned, that's perfectly valid, because he made those GPMs in the first place.

It was *he* who imagined the attacking source and the confusion of the oppterm, see? The pc did that, all with his own little paws. And it was he who dreamed up the ideal answer to that situation. He did that all with his own little thetan-esque. It was he who did that.

So, the net result of the situation is that a GPM is the creation of the thetan. It follows out fantastically mathematical lines. Just as thetans made a universe which had so many molecules in hydrogen and so many in lead, so did they make in their personalities this pattern called the GPM, the Goals Problem Mass.

These things are huge black islands that float in the bank, and they have actual measurement – they have actual size, actual measurement, actual mass. They are not in the least bit imagined. They are simply there; they have been created in countless activities and attacks, each of those pairs have been created – the hard way.

The length of time which a GPM covers is – tends to be greater early on the track and lesser, closer to present time. In other words, it's taking a thetan, at this stage of the game, less time to make a GPM than early on the track. Trillions twenty-nine, that's trillion written twenty-nine times, to trillions twenty is about the length from goal as an RI to the two top oppters closest to present time of a GPM on the track, see, for that area of the track.

Now, we go back. Let's go back around the hundreds mark, and we may find that the goal as an RI, when the goal was postulated, would be at trillions one hundred and ten; and that the goal did not finish off until trillions ninety-four years ago, see? Hundred and ten to ninety-four, that's longer, isn't it? Considerably longer to take that RI to goal. And now we go back around the two hundred – trillions two hundred. We're not talking now about two hundred trillions, you know, we're talking about trillions two hundred. Trillions written two hundred times. Trillion, trillion, trillion ... Eh – see? A trillion, trillion, trillion – go two hundred of those – years ago, see? And we find that a GPM is more likely to occupy an area that would cover forty trillions forty. See, more likely that type of an area.

But remember, because of the nature of the time track, you have a shortening characteristic to time, which is one of the things that covers this. And those time spans earlier – now don't get me wrong on this, you become very involved – are in actual fact longer. Those time periods are actually longer. That's only an arithmetical trick that they're longer, it isn't that time was longer. It wasn't necessarily true that people moved slower. But you consumed more time for the same amount of activity.

Well, I'll give you some kind of an idea. The aircraft here on this planet at this particular time: a winged fan-job aircraft lasted about twenty-five years. It's archaic. Now I can't even get the kids to look at them now. And the total time from their development to their de-nouement, actually, the total lapsed period – I'm not talking, now, about the time of their commercial application, war use and that sort of thing – but the total period, the actual total period was really around about fifty years.

Well, in other times and places, and not too long ago either, a winged fan-jobbed aircraft of the same design was good enough for a civilization for a billion years. That's all the aircraft they'd have for a billion years, see? Now, we go a bit earlier on the track, and we find that aircraft not only would suffice for a billion years but it was the same kind of aircraft from trillions two hundred to trillions one hundred. You get the idea?

People have exaggerated ideas of the different characteristics of civilizations on the track and science fiction writers particularly. Ray Bradbury, and so forth, have got to fill everything up with *boogies and woogies and boggies*, and so forth. These boys have a ball. And they try to dream up these oddball civilizations of one kind or another, and so forth. Well, in

actual fact, man is not that imaginative. And thetans really aren't that imaginative. They tend to move up to this average type and very, very little off of that type.

So that a civilization, a humanoid civilization of 450 trillion years ago, it might be just a bit upscale from the 1920 civilization that has just passed by here on earth, but it lasted a lot longer. You see, you have to have agreement on the part of people and it takes a lot of people living a lot of pattern, you see, to finally agree that this is the beingness and doingness and havingness that amounts to this civilization. They all recognize it as type seven; medieval. This is type seven, medieval. Ah, yes! Therefore, we have varlets, you see, and we have funny looking church doors and we have a bunch of religious loops and we know what this is all about. We have Gothic architecture. Oh, yeah. Yeah. Oh, sure. So, if we're going to paint anything or we're going to evolve in any way, we evolve just exactly along type seven civilization, see?

You build a car – you build a car. Why is it that everybody knows this is a futuristic-type car that is a space opera age car? Because that is the car that is used in a space opera type civilization. I mean, it's as elementary as that. See? They've been building them since time immemorial, see? These things are as – much more ancient than the pyramids, and the funny part of it is there are pyramids much more ancient than the pyramids. The United States government carries this eye and a pyramid on the back of its dollar bill. It's one of – the back of the seal, the great seal of the United States.

It's very interesting that even symbols drift along the lines. That total symbol given there, complete, is an old entrance to a theta trap from way back about – ages ago, ages ago – something on the order of trillions eight years ago. There's the complete obverse seal of the United States – complete with the eye, everything else. Thetans used to approach it and get all snarled up in it, and get incarcerated in the pyramid, and so forth. A rather silly trap. The implant was done with cards being held up to slots in the pyramid. And I suppose the card lodges in somebody's head as a bill, don't you see, or something like that. So they somehow or other associate it: is that the proper thing to put on money? I wouldn't know what the hell. Unless money is a trap.

But the – you see, you're dealing with a basic response pattern on the part of a being and he responds to certain stimuli in his environment that he would consider normal for his particular type or characteristic of existence at any given time. And he adds up all sorts of things.

You give a certain number of these elements. You give elements. Well, let's give the elements of a Gothic cathedral sitting in the middle of a plain, you see, and some fellows in funny looking flare-top shoes with pointed toes. If you were just to go that far, some other thetan is going to come along and he's going to stimulus-response on this whole thing. And he's going to say, "Oh, I know now what we should do," you see, and fix up a cobble street, see, that has got a bad turn in it that you can't get a cart down, you see? It's very careful, you see?

And some other thetan will come along and put a certain type of inn – it must go out over the street, don't you see? And he knows what to do with – there, you see? And next thing you know, everybody knows what belongs here. I mean, you've got – the civilization is all built, you see? Anybody coming into it carries it forward – carries forward on this pat-

tern – because that's the only thing everybody else will agree to automatically. In other words, you got a prepatterned agreement. You see?

Well, that's civilizations. And if a thetan is exact on these civilizations, so is he exact on his responses in building GPMS. He considers certain things as dangerous and certain things as defensive. And he considers certain attacks as the best and certain other things as the best and certain things don't belong and he's got this all variously sorted out. And he eventually builds up a GPM that's very patterned.

You won't find any difference from one GPM to the next on any pc. You will find no difference whatsoever except the wording of the goal and the exact wording of the RIs. All else is the same. All the mechanics of the whole thing is the same. It's all built the same way, and so forth.

This fellow has a GPM "to be cold." And it's got thirty pairs in it. And the top oppterm, which is the furthest enemy he has, will be some expression of the first postulate of the goal. It'll be "coldness" or something like that. And "somebody who doesn't like cold" or "a warm person," will be its terminal. You see, it's reversed, now, up at the top. You get this, just GPM after GPM. Now all the GPMS are like that, and they all decline from way early backtrack to present time in the same order. The items are there to resolve. See, so the terminal resolves the oppterm but the goals oppose each other.

And one of the more serious mistakes you're going to make in all this is not making the pc answer the goal oppose question, as a goal oppose. You read some of these lists, man, they're wild, wild, wild! That's no wonder that the guy is never getting anyplace and overlisting himself and going crazy in the bargain. Because the toughest job is listing a goals list. This is most exhausting on the preclear; it is the least rewarding; it's liable to get you into the most errors. It's a rough – it's a rough one. It's a rough one.

After you've opposed this goal for two hours, it suddenly occurs to you to recheck the goal for an actual GPM, you find out the goal you're listing was only an implant GPM to begin with. Why do you learn that now? Well, because by listing you've under – you've taken away the overburden, you see? You've undermined it, so it'll now read more properly, see? And your list is going on and on and on.

Well, you don't keep on going on and on and on with this list. You better start investigating the goal you're listing from. And you'll find out that although it read as an actual GPM when you first contacted it, and everybody was happy and cheerful with it, in the meantime it has become sufficiently cleaned up that it can be recognized better in the mind. And we find out that it was just an – just an actual goal, it wasn't – it had no GPM connected with it or it was just an implant GPM; you shouldn't be monkeying with it anyway, and so forth. And you just have to abandon that because your incomplete list, of course, is the one you got it off of. So you go back and complete its list. And it takes you out to an actual GPM. And now this one checks out as actual far better because the bank in that area is – overburden is taken off of it, and you'll get that more reliably now.

Now you go ahead and oppose that much more thoroughly, and you go on up the line and you get a proper opposition. You say, "We're really swinging, everything is fine, everything is checking out, the pc is comfortable, you checking right on up to present time. We're going to do goal opposes right on up to present time." And you get about four later. And all of

a sudden the pc turns on the creaks, and you don't know whether he's coming or going and so forth. And you find out the last four you find, actually, belong earlier than the fifth back, and they're all out of sequence and they belong on the early track. Well, why could you find it out now? Well, you've taken enough charge off, so that now somebody can read the stuff.

So you start in again with the one that was five back, and you start opposing forward from it and you'll eventually make it. It's a horrible activity. It's really grim. It's hell on the pc; it's misery on the auditor; it takes far longer than you would possibly imagine. And you're starting out with a liability that you find it's very hard to find an original goal on a pc in the first place anyway. This is the roughest.

But the biggest thing that gets in your road as you go along the line, the biggest, roughest, meanest thing that gets in your road all the way along the line consistently and continually is the fact that the pc does not answer the auditing question.

Now, this is no reason you should nag the pc unduly, but it can be pointed out very definitely to the pc if it looks to you like the pc isn't answering the auditing question.

Let me give you an example: You will look over a list which is going endlessly, and the goal is "to be cold," see? And you're opposing "Who or w..." or you're opposing, "What goal would oppose 'to be cold'?" And that is your auditing question, see? That's your question that you're asking.

And the pc is saying ... I – don't pull him up if he lists one or two wrong, see, because he's bound to. But if it's – list is getting just absolutely filled up with this kind of thing: "To be old," "to be young," "to have a hat" that might possibly have something to do with "to be cold," "to be an engineer," might have something to do with "to be cold," don't you see? "To be tall," "to be tall," "to love someone." Well, you say, "Well, that might have something to do with 'to be cold.'" "Yes, yes, that probably is all right." "To be harassed," "to eat candy." Well, that also might oppose "to be cold." "To be lukewarm." Of course, that, of course, might oppose "to be cold." You're all – you're all right, see? You give him the benefit of the doubt, see?

But, when you go back down a list, and you start looking over a list, "to be cold," see? All right. And the goal is "to be a warrior," "to be rich," "to have fine things," "to like people," "to like my mother," "to have a hat," you see, "to jump a long distance," "to be cheerful about life," "to be optimistic," "to throw things." You start wondering what the hell is going on here, see?

What's going on here? Well, what's going on is the pc is answering this question: "What might the goal be?" See? The pc is running a new "whatsit" on himself. "What might the goal be?" And this is very common for a pc to do this; and it's quite destructive, it's quite disastrous when he does.

No, you want it *oppose*, man! "To be cold." "What goal would oppose to be cold?"

"*To be hot,*" "*to not be cold.*" You got the idea? *Oppose*, man! We want an oppose.

Well, you're up against – if you nag a pc too much, particularly with R4 technology, you want – don't want to nag a pc too much. But if I was having this trouble with a pc, I'd rather point it out to him. "Now, let's make sure that you're getting oppose. Oppose. What does it seem to you that would oppose this, now?" And also check, once in a while, until my

pc got used to it and got educated along the lines, "You're not answering what – what might the goal be, or something like that, are you?" Until he suddenly has learned better, why, I would keep a very tight rein on him. Because that can be the most exhausting thing.

Now, if you're going to cut into the goals line – if you're going to cut into the goals line someplace and list on up the line, the closer to PT that you can cut in, the better off you are. Now, nothing in what I've said has told you to nag a pc or upset him or invalidate his answers, because you're dealing with dynamite. It's just you be alert to this condition. Because when I tell you that when it exists and the pc is consistently doing this to you, you haven't a prayer to find the right goal on that list. You just haven't got a prayer.

Pc is answering one question, you're asking another question and it's "oppose." The next goal, believe me, will not be a goal that resolves, it'll be a goal that opposes. The items resolve with each other, but the goals oppose each other. "To be tall," "to be short," see? "To stay..... to leave." "To be alive," "to be dead." See? These are the way these things go. They're a flip-flop dichotomy all the way up the line, you see? "To be generous," "to be stingy." See? They just bang, bang. And until you learn this well from your own experience, you yourself are going to make a lot of trouble because you can't tell by inspection what's going on.

You have this goal – you have this goal "to sing a beautiful song," and you perfectly, willingly buy the next goal to it, as "to be responsible." And the pc will say, "Well, you see, it really figures out this way. You see, I mean, if you're – if you're responsible, then you haven't got any time to sing, and so forth, and so forth and so forth..."

Well, let him get away with it, don't ever argue with the meter; the goal read and that sort of thing. But let's just check this out real hard and let's be awful sure that there's no GPMS skipped, because you're liable to find out there's six, ten, twenty GPMS been skipped between these two goals. They're both actual goals except it skipped a lot of GPMS.

It's remarkable the gradient by which the goals change. It starts "to be hot" and "to be cold" and goes off gradually, you see, "to be chilly," you see? You know, and "to be warm." See? It's more positive and then less positive, less positive, less positive, less positive – but they're harmonics. And it isn't until you get to PT that you get oddball goals. Up toward PT in the last few trillion years there's some oddball goals start occurring.

Now, it doesn't mean that these things don't oppose. Oh yes, they do but they get trickier. Why? They're into the think band. You no longer have got this beautiful bang-bang-bang sort of a situation going on: "To stay!" "To leave!" don't you see? The guy has come down, now, on a dwindling spiral of harmonics until it's very hard to get an opposite.

How do you get an opposite "to be – to be scintillant" you see? All right. Well, all right, "to be scintillant." We'll get an opposite there, "to be dead." No, that wouldn't it. "To be dull." Oh, that possibly might be the opposite. But let's now oppose "to be dull," and we get "to say bright things." Now, that's a more complicated goal, you see, because it's got more think in it. Now, "to say bright things" – how do we oppose "to say bright things?" We're getting up toward PT now, you see? "To say bright things" is opposed in some outlandish fashion – it doesn't mean that you won't have a short, sharp goal there, either, like "to be secretive," or something. But it's usually "to be reticent around people," or "to be reticent" or something of this particular character.

It's slowing down, in other words. Now how will we oppose "to be reticent?" *Tsk!* Well, the guy is actually getting – getting hard put, you see, to get his opposites. We aren't in any positive communication line, here, you see? "To speak well." Now, early on the track it would just be "to speak," see, but now we're getting a modifier – "to speak well," and so on. And "to speak well" is opposed by "not to stutter badly." See, how it's caving in? Now, how do you oppose "not to stutter badly," you see? Well, this goes out "to have something to say," see, as the opposition or something to that.

Something wild going on here. We're getting a diminution don't you see? There's less latitude.

Early on the track – early on the track you're liable to get something like, "to be powerful," see, followed by "to be weak." See, that's good opposition, see? But late on the track, not that broad span, you see? And you can just pick them up on the Tone Scale. You can look at the Tone Scale – the big Tone Scale that goes all the way south. And you'll find these PT goals are all down around the lower part of the Tone Scale and are apt to be more wordy.

Well, so much for that. Your pc, in other words, starts out big, tough, strong, broad, *bang! Bang!* Opposites, you see? "To be black!" "To be white!" You know? *Bang! Bang!* You see? And he ends up "to not be so gray," you see, "to not be so gray" and "to be gray occasionally," you see? And you're getting a narrower span, if you get the idea. Very positive, he wants to be gray occasionally, see?

You haven't got this type of activity – *yayayruyruya*. He's going through life the same way, you know. Limp-gimp, limp-gimp, limp-gimp. You get these complications.

Now, the RIs – the RIs always match the goal, but they don't contain the goal's wording in it, in an actual GPM. That's only an implant GPM. You seldom have the goal wording in an RI. "To be weak" would have "a timid fellow" opposing "a bellicose individual," see, or something, or "bellicose people." You don't have "a weak person," you see, opposing "people who hate weakness." That was your – that was your GPM implant influence. You're much more likely to get something offbeat.

Well, it doesn't rule out, it is what it is. But you look down an actual GPM and you'll see – very seldom you will see the words of the goal; you'll only see the sense of the goal. You'll see the sense of it, but you won't see any of the words of the goal – or seldom do.

Although, up at the top oppterm, it's quite common to have the sense of the goal appearing as the top oppterm. It's also, occasionally, you go from the top into a dwindle. And on an implant RI at the – as the top oppterm, an implant, why, you'll get up there on a goal "to be..." – "to end," something like that, you get "ended." See? Well, on an actual GPM, it'll be something like "end" or "the end" or "ending" and that's quite common. But then it's liable to dwindle twice or three times after this, you see? "My own ending," see? It's liable to be a top-per top oppterm, and a little more to them.

In other words, they didn't know enough Scientology in order to audit these things right and so they didn't get the right pattern. The implant GPM gives you, actually, how close they could guess to the pattern, which gave you a – just about what they thought; because, frankly, between you and me, if they'd put in an actual GPM pattern, you would've had a hell of a time. An implant pattern as itself doesn't get in your road hardly at all except as the goal,

because the goals are quite accurate. Thetans do have goals worded just like that. That's dead-on.

So much so, that if you wanted to find somebody's goal, just take a whole list of implant goals – take a whole list of Helatrobus Implant goals – one way or the other. Read them off to the pc. "Which one of these is your actual goal?" One of them will finally go tick. And you say, "Good." Check it out, get it to RR, start goal opposing it, on up to PT.

In other words, their rendition of the goals was quite accurate but the rendition of RIs; they couldn't audit. They couldn't audit. They really couldn't get enough down in the bank to find out what they really were. Had they done so, we would be in awful trouble, because you couldn't tell your RIs one or the other. For instance, I always – you don't – if you're running a pc properly, you almost never get an RI with modern – an implant RI in an actual GPM line plot – if you're running it properly. You'd have to be overlisting, you'd have to have an ARC broke, chopped up pc, you'd have to be listing on a wrong goal or something would have to be wildly out of sequence. You'd have to be doing something real goofy. As long as you don't do something real goofy, you don't get them. And then you will see things start to appearing [appear]. The goal "to end," you see? Oo-oh. That is in an – that's in a pc's actual GPM? Like hell it is! We didn't know it earlier, but that's all implant RIs.

Actually, the goal declines with great speed in an actual GPM. Before it's gone a fifth of its distance, it's more or less around the bend as far as the pc is concerned. They're real short at the bottom. Quite interesting. It takes a long time for them to go to pieces at the top. But the crossover point – when the oppterm and the terminal tend to balance with relationship to the goal, see, they tend to be more or less of the same value – that crossover point is much closer to the bottom than it is to the top.

You sometimes go up the line eight items, just four pairs, and you get the crossover. And then you may go ten more pairs to get to the top of the bank. See what I mean? Ten pairs to the top of the bank and only four pairs to the bottom of the bank from the point where the pc is no longer on the – what you call on the side of the goal.

Do you a lot of good to look over line plots, implant line plots, and that sort of thing, just see how these things are. Of course, it's very hard to be analytical and rational while looking at that much dynamite, but don't try to run them on himself [yourself] and don't try to repeat them endlessly yourself and don't make anybody memorize one, and you'll be all right.

But, as far as goals and RIs are concerned, you have much more to worry about – you're worrying about much more than you really think. There's much more that you think there is there to worry about than there is. There's lots less to worry about, for sure. You can dream up more things in this to worry about than anybody could easily count or counter. The best way to put it is simply this: Run with absolute accuracy, R4M2 delivers the truth into your hands and through the meter and onto your line plots; and run with any variation of any kind whatsoever, will deliver you a bunch of balderdash.

When you're used to living with the truth for a while, and you've had it added up on *you* a few times, why, you get very used to what the stuff is and you ... Ah, well, it looks good to you or it looks false to you. Funny part of it is that R4M2 carried through without any departure, whatsoever, will deliver the right stuff. And that is quite a testimony to a technique, but it's that way worked out.

The varieties that you will get into – the variations you will get into, come on accidental departures that you're not aware of until they've already happened. Now I'll give you an idea of this now. Here's an accidental departure: You get a GPM and you're opposing it, and by golly, you can't get a GPM on the list. You go fifty past the last RI [RR] and the whole thing nulls out. *Uuulph!* What happened?

Well, R4M2 requires that you have an actual GPM as your departure point. And by some fluke or another, the GPM you got read as a an actual GPM and wasn't – some reason or other you missed. So you had this GPM "to sneeze," and you are listing "Who or what would oppose to sneeze?" And you were taking off, trying to get it up to present time, don't you see?

And you list a list, that goal oppose list. And the pc is answering the question, everything is going along fine. But you list fifty beyond the last rocket reading item, you list there actually till there's not any slash or bash to the needle, you know? It's just exactly according to the book. And you go back and these are all source lists, so you null them one by one, you know? I've seen more than one of them, the goal did not rocket read when put on the list. It only rocket read when the whole list was nulled. It'll drive you around the bend. So you might as well short-circuit any fancy actions; you just do the list and you null the list, that is all. And if the goal is on it, it'll read. It's as elementary as that.

Well, you've got fifty beyond the last RR, and there you are, and you've nulled it all out and you haven't got a goal and you're sitting there chewing your fingernails – "What do I do now?" Well, it's very elementary. The technique required that you take off from an actual GPM. And in this case it was "to sneeze." Now, "to sneeze" has been shined up and a lot of charge taken off of the area by reason of listing. Check it out again, and you'll find out that you were taking off from an implant GPM. *Heh-heh-heh-heh.* You're opposing an implant GPM.

Now if it still checks out – if it still checks out as an actual GPM, you – in other words, you check out your departure point again, see? – the goal that you're listing from. And if that checked out very nicely, then you had better look over this list and find out what happened that you didn't find the goal on it.

Now the first action that you undertake is to ask the question. And the question you should ask for test is this question: "What goal would oppose this 'to sneeze' GPM?" And then you don't hang the goal on the end of the sentence and so get a tick or a swish from calling the goal. But of course you append that additional syllable onto the end of it, and you will find that your list probably reads incomplete. It now ticks. So, in that particular case, we will be charitable and say you didn't miss an RR as you listed in that fifty, but we will extend the list. And you extend the list and you'll find out there were some more RRs all of a sudden. And then you go back and null what you added to, and you will find the goal staring you in the face.

This type of cross-check, in other words. You always suppose in R4M2 that the pattern has been followed. And if the pattern you're following – that is to say that the exact technique has been followed and if that has not then produced a result, you then assume that the technique was not followed and you look for where in it wasn't it followed. It's as elementary as this, don't you see? I mean, if nothing goes wrong, if you can get that firmly straightened out. Something...

The variations which you see will be all sorts of goofball stuff. For instance, you get into a lot of goofball stuff, don't worry about that, you will. Pc is in a horrible creak. The last four – everything is just going *brrrrrrrrr!* – and the last four goals which you found; you check them over; they're actual GPMS. They properly oppose the goal they came from – the opposed goal. There are no skipped or missed GPMS. Pc is in a creak. Well, where is it? Must be an incomplete goals list someplace.

Well, R4M2 probably... well, it wasn't followed with the fifth goal back. Well, you check out four, it didn't occur to you to check the fifth. You were taking off from the supposition – you're taking off from the supposition that you – the fifth goal behind you was accurate. And the next four goals you found were perfectly all right, but unfortunately they fit on the early track – as I just gave you earlier – they fit on the early track because the goals list that you did on the fifth goal back was an improperly done list. Grim, huh?

This is the sort of thing that you can shudder about happening to you. But it happens. The only thing you do to repair R4M2 is just go back and pick up and do R4M2. I mean, it's as elementary as that. You must have overlisted a list if you skipped items.

You don't worry today on item lists of having two rocket reading items. I have seen six rocket reading items on the same RI list. You went around three corners. You went this way and that way and that way and that way. You couldn't get the pc shut up, and they gave you the next four or five RRs [RIs]. Fortunately, they all fired. And you start nulling the thing, everything is firing. Maddest thing you ever saw in your life. Go back up and pick up the first firing item and give it to the pc; don't torture the pc by listing an item list forever. Never extend an item list. Always shorten item lists; only extend goals lists. Goals lists are ordinarily underlisted and item lists are ordinarily overlisted. The only item list you can be absolutely sure is not overlisted is a one-item list – be absolutely sure that it is not overlisted.

Anything else is to be regarded with suspicion. That doesn't mean it doesn't sometimes take the pc thirty, forty items to get his item on the list. Doesn't mean that it doesn't. But you start going at that rate, and you have a lot of blowdowns and a lot of fire, and a lot of this and that, you must have missed everything under the sun, man, you just better stop him. And then go back up and carefully try to find the first item you can make rocket read on that item list. Find the *first* one you can make rocket read. My God! don't find the last one. Got the idea? Because you're going to take him right around the corner.

You assume, in listing items – here's some new data on this – you assume on listing items, every time, that *if something RRs, it is an RI*. Anything on an item list, if it RRs, it's an RI. And you assume that the pc will put the right item highest on the list. He won't list around in a circle and back up to it. He just keeps going and lists himself into another GPM, or down at the bottom of this one. So make them brief And you don't care one continental cotton-picking moment whether it's an RR or a *raow-raow* or a *blu-yew* or whether or not it has a proper curly tail on its "Q," as long as that thing, when called, will send that needle traveling at least three-quarters of that dial away and *blow* down, we don't care what the characteristic of the read is.

Fall, long – long, fast fall, even a slow fall – if it blows down; if it doesn't blow down, it's not the item. But I've also rarely seen a pc fail to cognite on the item, and it wouldn't blow down. Pc saying, "Men. Men. No, no, that couldn't be the item. I detest them, you know, that couldn't be the item. Men. No, no, that couldn't be the item. No. Men – men just wouldn't op-

pose women, that's all. I mean, it's the same breed of cat, they're both human, that's just not the item," and so forth. The thing is falling every time, but no blowdown. And so forth, and "couldn't be... Oh, men! Oh-ho-ho! Oh, men!" *Psssswww!* Blowdown. I've seen that happen, but that's rather rare.

And there's the other side of the thing. The pc is saying, "But it's cabbages. It is cabbages. That is the item – cabbages." "Cabbages." It doesn't read. "But it is cabbages!" "Cabbages." You buy that, it won't read and it won't blow down; the pc is on a big sell. And you buy that, you're liable to wrap him around a telegraph pole and throw the whole bank out of line in an awful hurry. But once in a blue moon after you have listed a few more items, cabbages suddenly unburdens. And you go back and call it, and it reads and blows down and the pc sits there in an exhausted state. And he says, "But I told you it was cabbages!"

You don't read it unless you can get it to go *wham* and blow down. And I mean, you don't give it to the pc. But do everything you can to give him his item, if he thinks that's it, because very often he's quite right. It's just that he – you haven't got enough charge off it, or it's too suppressed, or he's asserting it too hard, or he's getting too desperate or some other reason.

I know one list that went three pages, which is unheard of in item listing. Three pages the thing went! And at the end of that time, the pc just going *zzzzulh!* see? Had been calling an item that was about the fourth item on the list. I couldn't make it read, see? And after three pages, went back and called the fourth item on the list and almost blew the meter apart. Freak, freak – little freaky exception to the situation. They are not the general run of things. They can happen. That's about the only thing that upsets you about things like this.

If you can't get a goal to read, don't ever give the pc a goal. Goals read beautifully when they read. But goals will sometimes hang up the same way. You only get a tick. Pc is saying, "Well, that's my goal!" and *raow-raow*, and so forth, and you only get a tick. And, *tsk!* No blowdown and only a tick? Extend your list; get a few more off, go back and read it, and it now reads. Pc sits there and says, "I told you so! I told you so! I told you so! *Nyah-nyah-nyah!*" Well, let the pc say that all he wants to. You give the pc a goal that won't rocket read and blow down, you give the pc an item that won't slash – you know, go – and blow down – and the pc is going to be in trouble.

Sometimes you have a hard time making them – making them read and blow down, but you can do it.

Now, the less mid ruds you use in this line of country, the better off you are. But you shouldn't eschew them utterly. It's suppress and invalidate that takes care of the goals and items, most ordinarily, just those two – suppress and invalidate. And you take care of the session with a protest and decide. Those are your best working tools when it comes to straightening up the session, and that sort of thing.

The only other thing I could say about this, because of the fantastically brutal nature of an actual GPM, the amount of charge that can be bypassed, don't ever, ever-ever-ever, ever, ever-ever-ever, don't ever, ever-ever, ever, ever-ever-ever force a pc to do something he has some resistance to doing. Never force the pc.

It even goes this bad: Pc doesn't think he wants to run any RIs this session, pc doesn't want to list for the next goal in this session. Well, the pc is either living under some fantastic

present time problem, or there is something wrong with what you just did. About the first thing you decide on is, until you establish otherwise... It's easy to establish, you see – it's a present time problem, just a few questions. The pc says he's so worried about the something or other, something or other, stock exchange crash, or something like that, and he can't possibly go on, see? And he is too worried about this.

Well, you can shift over and do something about the present time problem one way or the other. But if it doesn't seem to be a present time problem of any great magnitude enough to cause this, then you'd better assume that you've run in something wrong. And you try to push a pc through that wrongness, the pc will go through a sad effect. First he'll go into a flaring ARC break and then into the sad effect.

There's some bypassed charge sitting there someplace. There's either an incomplete goals list or you've just – the last item you found is dead wrong, or the place you're going is not where you ought to be going. You ought to be going someplace else. You've been busily doing a list against an implant goal, you haven't been doing a list against an actual GPM at all. There's something wrong here. And you're going to cost yourself the most auditing time by persuading the pc to go on when the pc has got his heels set. Because, he can set his heels so lightly that you sometimes don't notice it.

But you will just curse the day you ever go across this, because you are – every piece of work you're doing from that point on will be thrown away and wasted. Horrible to contemplate. Pc set his heels. Pc says – I don't care what reason he gives – he says, "I've just got my attention on you, I just don't seem to be able to list on the list. I've just got my attention on you, that's all. I just don't seem to be able to get my attention on... I - I - I don't know, I can't think of any – I – I've ju... can't – I just got attention on you." See?

Well, that'd be pretty broad for you to conclude that you were listing against the wrong goal. That's a lot of signal. That's semaphore, buzzers going, flashing lights and little bells going *ping, ping, ping*. The one you've got to look for is the pc looking at you rather fixedly and saying, "Haaaaa."

You say, "What's the matter?"

"Well, your pen's very noisy."

Now, you can also slow down and cause a no-auditing situation by looking for the bypassed charge every time the pc looks at you. So somewhere in this line, you've got to figure out where is it. But you will curse the day you ever go an inch beyond the protest of a pc. The pc is trying to stop the session one way or the other, you'd better find out why. This is no place – R4 is no place for the heavy-handed juggernaut type auditor, because he'll come a cropper every time. Every time. He'll go wrong every time. And when you think of the amount of damage that you can do a case, I don't – I use that advisedly, they can all be repaired, but sometimes who's around to repair them?

You can nail a guy going with his – panting and back agony! And awful headaches! and that sort of thing – usually results from being forced in a direction he didn't think he could go. You're not paralleling his mind, in other words. He knows something is wrong.

Now, if you expect him now, to put in the itsa line with him to tell you what's wrong, you need your own 'ead x-rayed. Because he never knows what's wrong. You sometimes can guide his attention around, read him a little bit of a list, and he suddenly jumps on the list – he

jumps down to, or something like that. And he suddenly cognites, see? "Ha-ha, that's what it is."

"Did you feel any relief?"

Did you the auditor – what you ask – but did you the auditor see any blowdown? Did you see a big change of that TA? If you did, you found it. The pc says, "Oh, well, I know what it is, I know what it is now. You dropped your chair day before yesterday, and that's the bypassed charge." And your tone arm sits right there where it sat before, and it sits right there, and so forth, and the needle is still dirty, and that sort... You haven't got the bypassed charge. These are the things that you've got to be getting used to.

So, the upshot of the thing is that R4M2 run expertly is absolutely marvelous in its effects – it's absolutely wonderful in its effects. And you have this to live with. That it cannot be run mistakeless. It is completely impossible not to commit some errors in running it, for the excellent reason that a pc's bank gets so overcharged that you can't get proper reads sometimes. In other words, you say, "Is this an actual GPM?" and it reads tick. "Is this an implant GPM?" no read. "Is this a no-GPM?" no read. After you've taken the burden off of this thing, listed it or done something with it, or unfortunately started to work with it, and so forth, you all of a sudden find out to your horror it's now reading, "implant GPM," rocket read! *Tsk. Sploow!* "Actual GPM," smooth rising needle.

And you say, "Bail out of here, brother, we're in de wrong place! That goals list was incomplete! Leave us go elsewhere, brethren, and drop that like it was a hot potato." Find the right goal that should have been there in the first place.

What gives you the trouble in this particular time is charge, and the charge is very often so great the pc in the first place is having a hard time seeing what it is. You with the meter can read further than the pc can, you're having a hard time seeing what it is, yet you have to know what it is; you have to proceed anyway and then you find out it wasn't. Something wild like this happens.

But most of your trouble comes on goals listing. There is nothing easier than items listing. Items listing today is a well-oiled dream. There's hardly anything to it. I'm afraid I'd educate a pc a little bit about what a line plot looks like, so on. Liable to give you all sorts of balderdash, otherwise. But I'm – I mean by that they won't get the top of the bank. You say, "See this 'to scream'? Well, you're listing for screamingness, and we've got this goal 'to be cold.'" They say, "Oh! Coldness."

"That rocket reads. Thank you very much. Now, I'll read you this item: coldness. Yeah, it does very well. Is that your item? How does it compare to the remaining items on this list?" Oh-oh, wrong script – only one item on the list.

It cannot be run totally errorless. But the best expert in the world is bound to make some errors, so if this is the way that it is run, then you'd have to be the best, best, best expert in the world, and then you'll make the minimal, minimal, minimal number of errors. You're bound to make mistakes on the sequence of goals; you're bound to make mistakes now and then on what the top oppterm is; you almost never will make mistakes if you're very good on listing for items. They'll go terminal-oppterm. You never even cross-check them, see? This is – well, it's just bang. Terminals all got pain, the oppterm all got sen – if you checked them. You'd hardly even bother to check them. It's just the next one on the list and it read, and the

next one on the list and it read, and the next one on the list and it read, and the next one on the list and it read and that's all there is to it.

Item every twelve minutes, TA action, blowdown! Boom! Everything is fine – I mean, it's blowing down beautifully. You get some more TA action out of it. How – is this the main item on the list? How do these other items compare to it? And that sort of thing. Oh, you get all the dope on this, you get a little more... All of a sudden your tone arm is no longer moving, your pc has finished with his it'sa, you're all set there; and he actually now when the tone arm stops moving, actually has his attention on the next one. If you ask him, "You got your attention on the next item?"

"Well, no, I haven't."

"Well, just put your attention there and let's list for it, here's your question."

And get him off of it, because to get your tone arm action...

Now, you should be able to find one of those every ten minutes – an RI every ten minutes – fully checked out, cognited on, it'saed, squared away, compared with the goal, all the courtesy steps, everything taken on the thing, and you're away listing for the next RR.

Thing that'll give you the most trouble, thing you'll make the most mistakes on is goals; thing you'll make the least mistakes on is RIs. You make – the greatest errors are made in underlisting goals and in overlisting RIs. And this all is very simple. Given those provisions and a lot of those cautions, and so forth, I've given you, this is a flying process. And this goes straight to OT. The only thing you've got to do is be good enough so that the pc lives to enjoy it! [laughter]

Thank you very much.

THE INTEGRATION OF AUDITING

A lecture given on 22 October 1963

Thank you.

All right, what's the date?

Audience: Twenty-second.

Twenty-two Oct. AD 13, Saint Hill Special Briefing Course. I haven't got anything to lecture about, actually, you know everything there is to know. And the only difficulty is just doing it. Small difficulty. But he who maketh difficulty with auditing hath service facsimiles – Confucius say. Your – your difficulties in auditing are all made. They're all manufactured difficulties. And the sooner you learn that, why, the happier you'll be. By the time you've run a tape through, and listened to yourself and you'll see how many difficulties have been made in the session, you'll be appalled. It'd be very nice if those tapes could be of real live sessions, or tape a dozen of your sessions and then listen back to one chosen at random. You see, because in that session you wouldn't be so careful.

But in this universe, difficulty has to be manufactured. Always. Let's take the case of an organization. Organization isn't doing well, somehow or another. Got a lot of willing staff and people, and so forth, and that organization isn't doing well. Well, somebody is manufacturing the "not doing well."

Living beings are theta beings, and they actually have to work pretty hard to be enteta beings. The natural bent – the natural bent is simply to be a theta being and carry on. One has to work hard to be otherwise.

That's quite interesting. Now maybe that labor is all unconscious and one is not conscious of the labor which is being done, maybe it's being done at a level that one doesn't recognize it, but nevertheless it is individually done – enteta. Now let's take the actuality of the thing. There would be no mass in the bank if it were not being created in the given instant that it has the effect on the individual.

Let's look at the harsh look – let's take the harsh look at all this. The cold, scientific, pitiless inspection of what is actually going on. And that is that a thetan creates his own bank. It isn't that he *has* created his own bank; he *is* creating his own bank – that is the difference, don't you see. Any bank, no matter how far it is in the past, is being created at this instant by a thetan. There is no such thing as continued creation. All creation must be done at the moment it is perceived.

Now there can be such a thing as unaware creation or utterly unconscious creation – utterly, completely unconscious creation. And that is in actual fact the source of the reactive mind. One is creating without knowing he is creating. Now the reason he is creating is contained in the things he is creating. Now that's very tricky. That's very tricky. The reason he is obsessively creating is contained in the things he is obsessively creating. In other words he creates for instance an item, saying, "creativity" and this item then forces him to create, but he is unconsciously creating the item and he has not confronted the fact that he is creating it and therefore it is gone.

Now, the difficulty of this creativity is: in view of the fact that he can create so much automatically he cannot differentiate what he is creating. So he doesn't really know what he is creating and what he isn't creating, and so therefore, he cannot see the central things he is creating. Do you follow my line? See, he could know he was creating. But what is causing him to create? What is he creating that is causing him to create? That question he cannot answer because it requires tremendous confrontation and differentiation.

Now, the easiest thing that an individual can do is create. If you see some artist laboring over a canvas and the sweat pouring off of his brow, you're perfectly entitled to go, "tsk, tsk, tsk." If you ask him very carefully why he is sweating over this creation to this degree, he would probably be able to analyze it to some tiny distance. See, he'd be able to analyze it slightly. He would realize – he would realize that he in actual fact, had put an arbitrary barrier against his creation, saying that the canvas must be created in a fortnight. Which is a very short time indeed, to create the amount of canvas he is creating, you see? This must be all completed within a fortnight. Well, that of course, makes it difficult for him to perform the creation because he has a time barrier.

Now, if you ask him further about the thing he would have a doubt as to whether or not it was going to be accepted at the academy, or by the client, so he has this barrier and he could spot that. "Yes, I'm very anxious, I'm very nervous, I don't know whether this thing is going to be bought or not, which ties in with the fact that I don't know whether or not I'm going to be able to buy my coffee and cakes, two weeks from now. I don't know, you see. And therefore, I'm anxious about this particular line."

And you'd say, "Well, could that affect the difficulty you're having creating?" and he would agree with you at once. And you probably would have as-is-ed it to that degree, and so forth, he'd realize that he had economic duress, as well as, the time factor first mentioned, mixed up in the simple action of creating this piece of canvas.

Now you go a little bit further, talk about his materials and tools, and you'll find out that he is working with Synco Company paint because it was handed over to him as a gift by one of his fellow artists, who may or may not be a friend, and it does not work well, see? Now he feels he must use up this paint, even though he could probably obtain other paint – paint isn't all that expensive. He feels he must use up this paint because he has it. There's another barrier to his creativity, you see.

So, even at a conscious level you could sort out with this artist, why the sweat was running off of his brow as he stood there gnawing the end off his paint brush.

Also a musician, you could sort this thing out. You could get the number of factors which he had put in his own road in order to prevent himself from playing music. Now that action followed out in its final form becomes R4. You audit out all the GPMs and RIs – and what are you doing? You're auditing out actually, the barriers which a person has put in his own road, in order to prevent imagined oppositions from having an effect upon him. In other words, a game of shadows.

Now, that it is a game of shadows tends then to make us pooh-pooh the idea that anybody could ever be in trouble. Let's go at it now, and that's the pitiless look I've just given you. Of course the fellow couldn't possibly... He's causing all of his trouble, he's the one who is causing all the difficulties, and so therefore, the hell with him! You see, that could be the adjudication. But no, you needn't add that last, you see – well, he is causing all of his troubles. That is the pitiless, factual look at the situation. Anything that's wrong with him, he is creating at this very moment. Anything that's wrong with an organization is being *created now*, in the organization.

Yeah, they can say, "Well, but three years ago we had a fire, and we've never been able to recover from the fire, and, and yap-yap-yap-yap..." And that so fixates them that they never look at the fact that the Registrar in the organization never comes to work – because they've got it all explained! They don't have to do anything because they had a fire three years ago and they haven't recovered from it, don't you see?

You'll find out that they've got explanations for all of their difficulty, but those explanations when swept aside would demonstrate and disclose that the individual was creating all of his difficulty here and now, and the organization was creating all of its difficulty here and now.

There isn't any real point in saying – well, in the past we so on, and so on, and so on – organizationally, because, they aren't actually stuck in a GPM. You just start looking around the bits and pieces in the organization and you find out – well, they never have anybody come into the organization because they keep the front door locked! I mean, there were some fifty-some reasons in Johannesburg why nobody could get into the Test Section, PE Course. They were enumerated – over fifty ways of preventing people from ever getting onto the PE Course. They included parking the bicycles across the pathway so that nobody could walk up to the door of the test room.

Now, this is all very well, don't you see, this is all very well to say, well, the reason why Johannesburg was in difficulty was because years ago, see, there was a so-and-so and so-and-so and that all affected the so-and-so, and then they had some creditor trouble and that got so-and-so, and that all added up to so... Well, that has nothing to do with the price of fish at all! And that's because you aren't actually dealing with the mass of a GPM.

So on the third dynamic it becomes more obvious than on the first dynamic. Now, you look at this poor bloke – now let's take the sympathetic look at it. Let's take the sympathetic look. Let's take this poor bloke and he's standing on a street corner and he doesn't know whether to walk up the street or down the street or get a job or buy a cup of coffee or go home or so forth – trouble and difficulty is just too great and he is overwhumped. All right. Now we

go up to this fellow – and this is what makes the human mind an interesting study – we go up to this fellow, and we say, "Well, why don't you go home?"

"Well, I'm a – scared to go home."

"Why don't you buy a cup of coffee?"

"Well, I'm afraid to spend my last sixpence because so-and-so and so-and-so."

"And why don't you walk up the street?"

"Well I can't walk up that way because I might run into a cop."

"And why don't you walk down the street?"

"Well, I can't walk down that way because it's full of mud puddles."

That type of analysis, with regard to this one individual, I'm afraid would not wind you up with a happy man. Why? Because the basic building block of all organizations is the individual. And you can get all the boys over on the Moscow party line, talking about "the masses" and talking about "the *people*." And you can get the US bleating about "the *people*" all the time, and so forth – but that's only because there's nothing there to bleat about, you see.

There is no "*people*." It looks like a "*people*," don't you see. Somebody moves in with this theory, into some Latin American country that is in terrible condition financially, economically, and so forth – that its people have never been educated, nobody's ever paid any attention to the individuals – and they just say, "Well, all we've got to do is move in here with communism." Or "with democracy," you see. "All we've got to do is move in democracy and we'll at once have a great prosperous country!" Aw, fo... Chri... ! Where are they going to start building, man? Where are they going to start building. Where's that one guy they're going to start building with, see?

Well, these people have not had education, these people have not had the benefits of any tools or help, for centuries. Spaniards had them running up and down carrying bags full of dirt they could pan out in the streams for more gold for Spain. They never did very much for them. Hideous – hideous past. Political background has been so enturbulated and enturbulent that any time anybody set up a government, why the indoor sport was to shoot it down and so on. Schools – nothing.

Until they look at this fact: to take one individual in the country and give him a few benefits and straighten him out, and then another individual in the country and a few benefits and straighten him out, and another individual in the country and a few benefits and straighten him out, and a few more and straighten them out, and a few more and straighten them out and a few more and straighten them out – they will then have a country which they can put democracy or communism into – and if they did their job well with the individual, nobody would be that silly!

These birds straightened out, might invent a political philosophy that was workable! None of these old corny things that have been kicking around lately – Actually there's been no real political developments since the benevolent monarchy. The only thing row – the only thing – the only thing that is against a benevolent monar... You know you can get a communist to agree, a socialist, people in democracy, you can get everybody that you ever thought

of, anarchists – they will all agree that the best form of government is a benevolent monarchy. They all will agree. But it has one fault – one fault – and that is you can never guarantee its succession. So you can't have it, because it might go wrong in the future.

Oh, I know that sounds very rightist but, unfortunately it's based on the actual discussion with socialists, laborites, anarchists, royalists, and everything else, see. And I found out there was only one meeting ground on which they could all agree. There's the ideal form of government – the benevolent monarchy. But, they all said, you cannot guarantee its succession. It might cease to be a benevolent monarchy, at any moment. So therefore, we can't have it. And that is the method by which they prevent it. They all agree that there are holes in democracies and communisms and that sort of thing, which are all present time holes, which put everybody in misery, don't you see. "Well, that's great, but we can't have those, you see. We've got to have all those holes, and everybody's got to be in misery, because they might be in misery."

Now, look at this as political thinking. I'm not even beating the drum for a benevolent monarchy. I think – I think benevolent monarchies are rather corny, myself I think there is no substitute for a benevolent people! But where your individual is concerned or where a group is concerned or where anything is concerned, you come down to this basic thing called an individual – a being. He is the only live, breathing thing there. I don't care how many administrative lines or how many stable data we park or how many RIs we set up, around, and call it an organization, when it comes right down to it – the building block is a guy. And that's the only – only living thing there. And incidentally that is the only living thing that will *ever* be there! And if you haven't got this individual in any kind of condition at all, you're going to wind up with nothing.

Look, you could read a book about a perfect marriage. You could read a book about a perfect marriage. You could straighten it all out on the basis of a perfect marriage. You could organize it all. You could organize the man's work, the woman's work and everything else. You could absolutely have this taped, completely – down to the last erg, you see. Child planning – everything else. You've got this perfect marriage, perfect. Textbook that thick, you know. I mean, everybody – so on.

But you haven't got a woman and you haven't got a man. Well, where's the perfect marriage? Or you've got a girl with a service facsimile "I hate men" – you got a man with a service facsimile, "I hate women."

Now, this one individual then, this one individual, this idea of the individual – when you multiply him and get another individual and another individual and another individual and another individual – you still have just that many individuals, that's all. But you can get an aggregate result of aberration. This, I think, is called "culture."

Now, in any given organization, there is however enough theta to make the thing whiz, unless everybody is being active – reactively or knowingly – to make it not whiz. Now in actual fact, the only livingness present is the livingness that is present. I hate to have to say one of these – one of these weird, A=A things – but the only livingness present is the livingness present. Now the livingness that is present is reduced by the amount of livingness invested in not-livingness. In other words, arbitrary factors. Livingness is invested in the maintenance of

an arbitrary factor. And the degree that the arbitrary factor is invested in, monitors the appar-ency of the livingness that is present. You follow this now?

You've got a pint bucket. And that is the amount of theta present – in spite of the fact that it doesn't have anything – you got a pint bucket. All right. Now, that's the amount of liv- ingness present. Let's say that's all theta, see. Now we've got a bunch of mud pies, see. Got a bunch of mud pies sitting around. And, they're not mud pies yet – they're just dry dirt. Now, the degree that we enliven this dry dirt – without banishing the dry dirt – is the degree that we will subtract water from this pint bucket and pour it in the pan that comes around it, do you see that? So pretty soon we apparently have no water present. We have only mud. In actual fact, there's just that much water still present. You haven't lost any because let's forget about the evaporation. The water is still present – but what happened to the water? It is all invested in the making of mud.

Now in auditing, the only action you're undertaking actually, is filtering back the mud pies and recovering the water into the pint bucket. Get the idea? Now, it's actually simpler to do it in auditing than it would be in the physical universe. Because all you've got to do is as-is the mud pie, and say, "mud pie A!" and everybody recognizes that it's mud pie A, and in- stantly the mud pie-ishness of it vanishes, and the water goes back into the bucket quite magi- cally.

You might say that's a recovery of attention units. You might say it's a recovery of theta. It's simply the negative quantity recovered because the thing is there all the time. The recovery is only apparent. It is simply not invested in mud pies.

Now, why can't you audit a pc who has a screaming present time problem? Why can't you audit him successfully? Well, there is too much attention invested in the mud pies of the present time problem. In other words, this is such an investment that it has taken all the water in the pint bucket and poured it into all the mud. There's no water left in the pint bucket at all. It isn't even damp. Don't you see? It's a temporary condition.

Now, the present time problem goes away and you now see an apparency of some wa- ter in the bucket. Now you've got something that you can invest. Some pcs are in such horri- ble condition that there is no water in the pint bucket at all and the auditor therefore cannot invest it because it isn't there to invest – it's all mud. Do you see what I mean?

So, the auditor's action is to find some water to get back into the pint bucket. And then invest it in an orderly fashion, to disappear the mud pies. This is programming, crudely stated, but nevertheless graphically true. You get some pc and he can't go into session. Well, why can't he go into session? Well, the bucket's empty. Well, what's the matter? Well, his attention is on so many factors in his immediate environment, his attention is so hideously spread and sprayed around that he cannot in any way concentrate any attention on anything else. And this is comparable to: there's no water in the bucket.

The auditor can't say, "Splash, splash over in that direction for a moment," because there's nothing there to splash, don't you see? So there's apparently no pc present. There's nothing but mud. When this condition is too multiple, when this condition is too chronic, when there is *never* any theta present, when there is only mud, and the mud is very badly

caked, they teach them psychology and psychiatry. Those are the sciences of making mud into more mud.

Now, you're trying to do something different when you're trying to audit, than just handle mud. But your attention could be so thoroughly muddified, that you don't recognize your action is to try to recover attention out of the bank. Now, when there is no attention – no water in the bucket – you have a condition called overrestimulation. You don't get any tone arm action. Tone arm action is the flow of theta to mud or mud to theta. And if you've got no attention, no spare attention on the part of the pc to invest in anything – well, therefore, the pc is totally tied up in the various concerns that his attention is already invested in. Therefore, you don't have anything left to concentrate on the stable data, aberrated stable data you must pick up in order to release some flow. Do you follow this? There's got to be some pc there. There can't be totally mud.

Well, let me give you the extreme action. Somebody's lying there unconscious. You actually can't audit them until you have run some CCH-type process, and caused them to come to and get into communication with you. See? Now there's the extreme condition of mud. Mud, mud, mud, you see. The extreme condition is unconsciousness.

All right, we take somebody who has fifteen present time problems and he's in a fox-hole. He's being shot at this particular moment. He is running out of ammunition, he has no food left and he has just detected a flanking attack in progress. To the right of him he sees mortar shells are beginning to bracket him in. And you say, "Would you like a session?" Well, what's going to be the response? That's how some pcs feel. That's how some pcs feel! They feel no other way! They just "Eeaahh!" "I don't dare take my attention off all this mud because everything will go to hell if I do!" There is no comm point in other words, that you could achieve, with which to operate from.

So, at this moment the only thing you can do is find out what the mind is doing and parallel it. And you'll be able to take some theta back from the mud. What is the guy doing? What is the mind doing? Well, you have to parallel it. There is no substitute for that.

Now, in Routine 4, a pc can get so muddified, so restimulated, so overrestimulated, have so many present time problems, and have so much keyed-in, that they don't want to be audited. They will kick back against auditing. They don't want to be audited. That may be the first expression. Actually, what they mean is, they don't want to be audited on Routine 4.

Let's say you've got some fellow who's easily and calmly finding items, one right after the other, *pocketa-pocketa-pocketa-pocketa*, finding items; and all of a sudden he comes to session; he has a tremendous present time problem, and he just doesn't seem to want to be audited. One of two conditions can be wrong there. The present time problem can be so overwhelming you can't get his attention on the bank. And the other thing that can be wrong is that you have restimulated something or something has gone wrong in the processing which you have not yet detected. In other words, you've bypassed some charge which has caused mud or restimulation. One of those two things is occurring.

Now, it's interesting that a person who has a quasi-present time problem – that isn't yet, you know, totally absorbing – but just on the perimeter of his consciousness, a rather, rather heavy present time problem but not a complete catastrophe, you understand that? The

session just before they got this problem you found ten RIs, in doing Routine 4. *Pocketa-pocketa-pocketa-pocketa* – you found ten RIs. Then they got this problem, you eased the problem up, but *in that next session* you only found four RIs; not because they were spending time – not because they were spending time, you understand, dwelling on the problem. They were working all right – the problem keeps occurring to them however. But they're working all right, they're listing all right, they're – they're behaving all right. You cannot really detect any vast difference in the behavior of this pc except one; you can't get things to fire easily.

You get the item on the list but you can't get a fire. See what I mean? You have to work it over. You list a little bit longer. You go back and you get to the item again, and you call the item, and you get the Suppress off of the thing. You list a little longer and the pc says that *is* the item. You can't make the item fire. You understand? And you finally manage to jockey it around one way or the other and finally you get your fire and your blowdown. See, it's a struggle, struggle, struggle, struggle. That's because you're running this pc in the presence of attention invested in too many PTPs – he is too distracted from the session, he is unable to progress easily. Well now, that's what happens to your tone arm motion in lower levels. The pc's attention is so absorbed in things you are not addressing, that there is no attention available to the auditor to put on and as-is aberrated stable data. So you don't get tone arm action. Elementary.

Now, oddly enough in doing I, II and III Levels of Scientology, you actually can have a condition where the pc runs into Level IV. Where neither the auditor nor the processed, or anything else is situated to handle Level IV. Awful. Catastrophe stares us in the face. Because there is actually more potential overrestimulation and present time problem on the pc's track than there is in his present time. When you look at GPMs and their RIs, there is more potential restimulation on the track than there is in present time. That's very interesting. In other words, he can be more restimulated by reason of keyed-in GPMs and RIs, than by simply getting knocked off or something like that in present time.

You can lock his tone arm up – *ca-rack!* – by keying in a GPM. Now, this is a tremendous liability for Scientology Levels I, II and III. It is answered by auditing goals with "in this lifetime" Prepchecks. Pc has put down a goal of some kind or another. You could audit that goal on a Prepcheck basis on a "in this lifetime" basis, and get rid of the Level IV potentiality. Probably.

But it's messy to work with. I won't kid you. And you never become more convinced of how messy this is, than when you're doing Level IV and you've already found the present time goal and you're going back down the track in an orderly fashion. All the hard work is done, see. And the pc goes to the bottom of the second GPM, where the goal as an RI is sitting there, you see. And you stop the session – at that point, because this is just the end of the session – and you pick this up maybe a week later and that pc's tone arm is locked up at 5 ½.

And you fool around and you sweat and you monkey and you scratch your head, and you have a hard time, all over the place – pc's tone arm is at 5 ½. They left the session at 3, and the tone arm is at 5 ½! Well, obviously something happened during the week to key them in. Well, it did – there were a lot of things happened during the week.

So, you put in your "since" mid ruds to get your new intensive going, so forth, you're all set, and you put in your "since" mid ruds – and the tone arm doesn't budge. And you talk about the things that have happened during the week and nothing happens – nothing. Needle's sticky, tone arm high – you feel you couldn't move the thing with a sledgehammer. It looks that stiff. And you'll say something happened in between.

Now, after you've got it all solved you'll find out what happened. But you go on with your R4 and list for the next goal. That's all you had to do. And immediately you get *bbtzzzzzzzz* – down comes the TA and everything starts to run. That next goal to be listed for, immediately below the third GPM which you were going to go into, you see, that next goal was enough to keep that thing parked. And then you say to the pc, "Did you think about this new list during the week?"

"Oh yes, I told Joe that it was possibly a (blank) or a (blank)."

It's held up by a wrong goal. It was only one of those. That simple remark was adequate to park that tone arm. There's been fire, flood, pestilence and disaster happening all week long. And yet the whole rudiments went out by saying, "Joe, you know I think my next goal is either 'to spit' or 'to be spat at.'" "To spit" was a wrong goal. It was "to be spat at." That was enough to key it in. Get the idea?

Ah, but you guys are walking around all the time guessing at what your goals might be! Then when you've got a pc running on the track all straightened out you can lock up the tone arm at 5 ½ just by their guessing at somebody what the goal was, and there went the tone arm. And no amount of monkey business and figure and figure, and service facsimiles or anything else that you would have done, would have moved that tone arm one hair! That's something to think about, isn't it? That shows you the wide-open hole and liabilities of Scientology Levels I, II and III. Those liabilities are all contained in Level IV.

Therefore, somebody certainly at Levels II and III should know the liabilities of Level IV. And should be able to do an ARC break assessment of List 4. ARC break assessment – what's simpler? You'll find a goal has been restimulated – an actual goal has been restimulated. Or an RI has been restimulated, something of this particular sort. Indicate it to the pc, and down will come the tone arm. Then identify which one it was and handle it and up will go the tone arm – because you can't handle it with anything really, short of R4.

If you didn't know the exact name of the goal, you couldn't prepcheck it – but you can at least kick these things out with ARC break-type assessments, or case analysis sheets. But nothing is going to happen with the case unless those things are patted on the head and rolled-over-Rover, see. We got to have this thing out of the road or we're not going to get any tone arm action.

Now, I see a lot of your ears going up at this particular instance, saying, "Aha! That's probably what's wrong with my pc! Why I can't get tone arm action." Well, there's a possibility that that is the case. A greater possibility is you haven't actually bled the technology itself for total tone arm action yet. See, that's the greater possibility.

Now, a pc out on the street here, raw-meat pc, isn't going around worrying about his goals. You're not going to run into this trouble so you're going to get lots of TA action. But

you take an educated Scientologist, and he's going to say, "I wonder what my goal is? There was somebody worked on me last October, and I just – so on, and we were guessing about it and it's – so forth and I'm just absolutely certain that I have the goal 'to spit.' Certain of it, certain of it. I react to it all the time," and that sort of thing. Comes into session – tone arm 5 ½! How did it get there?

Now, here's another oddity. Present time problems usually occur on the goals channel. In fact, they almost always occur on the goals channel. The present time problem of an accidental accident and that sort of thing might occur off the goals channel, but most present time problems are straight on the goals channel. And it's one or another of the pc's goals.

Now, the pc fondly expects that he is influenced by one RI, or two RIs – or that his entire character makeup is wound up in the substance of one goal. Oh, no – I beg your pardon! He will cognite, cognite, cognite all about his present lifetime – his present lifetime are being influenced by as many as twenty or thirty GPMs and literally hundreds and hundreds of RIs. See, he's being influenced – he's being influenced all the time.

So, this oddity exists: That you actually could see your pc with an enormous problem, you're doing a "since" mid ruds Prepcheck, and you see that you get a little tone arm action – you get some little tone arm action, on the subject of women. A little bit, tone arm action on the subject of women. Otherwise, this thing is stuck up like mad. But when you hit "women" – in doing the Prepcheck, see, doing the Prepcheck, "since" mid ruds – he touches on this subject two or three times, and every time he touches on it in one or another buttons, get a little tiny bit of tone arm action. He'll feel pretty good when you finish up. And you probably should leave it alone. But the truth of the matter is, if you now addressed women, on the subject, the gain that he just experienced is liable to vanish. Why? Because a present time problem ordinarily occurs by reason of a key-in of an RI or GPM.

What is the genus of the present time problem? The momentary present time problems we can usually handle, but how about these chronic, chronic, chronic present time problems? Well, certainly those *absolutely* are the result of the key-in of a GPM. It's a keyed-in GPM. Person has a PTP, PTP, PTP, PTP, PTP, you know, "Oh, my, yes, I got a PTP – PTP regarding drafts" or something. You know, or regarding automobile or regarding something of the sort – I don't care what it is – it just seems to constantly come up.

You take a List 4 or a case analysis type sheet – there – no case analysis type sheet has been published at this moment, but should have been published some time since. They simply ask if goals are backwards or one is beyond the other, or the actual goals or implant GPMs, or no GPM or an actual GPM, it's stuff of this character; it just takes a total analysis. Have we skipped any GPMs you see, and all that sort of thing. Case analysis just takes up every possible condition that these very easily mathematicalled, very easily blocked-around GPMs... You see if you just laid out twenty bricks in a row you've got the pattern of the pc's bank. I mean, it's very esoteric. Just lay out twenty bricks in a row. Label each one a goal, they're all in a string. You've got the picture – that's it.

Now, the fifteenth brick, let us say, has to do particularly with money. He gets a PTP – he's liable to take the fifteenth brick and bring it up into present time. It's now out of sequence. Makes him feel like hell, gives him a cold – messes him up. Now your situation then

– this is the source of this type of psychosomatic illness. I'm now giving you a better source for a psychosomatic illness than you have ever had – the fifteenth brick, see.

This psychosomatic illness to an educated pc will respond to a List 4 analysis. Or a case analysis of GPMs. You don't know what the goal is, see, you don't know what the goals are, you don't even ever find the name of the goal.

But it's on this basis: "Has a GPM been keyed in?" *Ca-lang!* You see. "All right, has a GPM concerning – is that concerning colds or something like that?" *Ca-lang!* You say to the pc, "You've had a GPM keyed in concerning colds." That's the end of that cold – providing you don't go completely knucklehead and ask the pc what's the name of the GPM – *eeuuuhhhh*. Don't, don't start fooling around with the thing, because you're going to give him a real good cold.

See, it must be the fifteenth GPM, out of line – it couldn't be the present time GPM out of line because it couldn't be out of line without being put back into the past – and life doesn't put GPMs into the past – life puts GPMs into the present. In other words, you could probably handle psychosomatic illness, if you had an educated pc, with a List 4 or case analysis form.

Tone arm action. You say, "Well, if this case..." Tone arm action isn't present, it is quite obvious, and nobody can make it go and the auditor is really doing a good job of auditing – then it is quite obvious that R4 has gotten in your road. Got it? Pc with a chronically low TA. Can't get any tone arm action out of him – no matter what you do – no matter how smooth the auditing is. You jump to the conclusion eventually, that R4 has gotten in the road. The way to get it out of the road is just to analyze the blue blazes out of it. You can spend a session or two analyzing a case.

Take goals that have been found and you can date the top of them and the bottom of them – you can do all sorts of wild things. You can date the top and bottom of a GPM. Don't ever try to just date a GPM – this is asinine!

This is like trying to – trying to, well, a GPM, you see – a GPM exists in – across a large span of time – and it's like trying to get an average date. And the top of the GPM and the bottom of the GPM where the goal as an RI is, you see, are two different dates. And are frankly trillions of trillions of trillions of trillions of trillions of years apart. They are a long way apart! So, you say, what is the order of magnitude of this, you see – order of magnitude of what? See?

Best thing to do of course is get the order of the magnitude of the top of the GPM. Get the order of magnitude of the top of the GPM. If you really want to fit one back on the track – *snick* – why, get the order of magnitude of the bottom of the GPM, and then the order of magnitude of the top of the GPM. Date both of them, and it'll move in like a car being parked on a ramp.

It's got span, a GPM has. So it doesn't have a finite date. Take somebody with lumbosis. All right – educated pc of course. "This lumbosis being caused by a – by a GPM? An actual goal? An implant goal? A no-GPM?" See. What's it caused by? Let's go over this thing, see. Even – is it caused by an engram? Is it caused by this? Caused by that? Anything that

could have caused this lumbosis? You see – giving very, very, very high priority to RIs and GPMs. That's most likely – this thing of chronic lumbosis, it must have been an actual goal.

Watch that meter. Get it to clank. You don't know the name of the GPM. Just tell the pc that that's what's been keyed in. Things might change all over the place. Things might go whir-click – you might not have to do any dating at all. A little further discovery on the thing and a little bit of it'sa on the part of the pc and the pc finally tells you, "Yeah! Well, there was a goal discovered on me, something, and I've had lumbosis ever since." And "What was the goal?" "Well the goal was 'to catch catfish' – discovered on me."

"All right. Very good. Very good, very good. Now, is that an actual GPM? Is that an implant GPM? Is that a no-GPM? Is that an actual goal? Is that an RI? Is that a lock on an RI? Is that associated with the Helatrobus Implants?" Implant GPM, see? "Where is it? Helatrobus Implants? Helatrobus Implants?" And run it down a little bit more and a little bit more and a little bit more. Get the order of magnitude on the meter. *Bzzz-bang* – no lumbosis. Get the idea?

This opens up a whole field. This is a very, very elementary field. It's far, far, far more complicated in your head than it is in actual operation. Number of GPMs the pc's got is from... it's actually just a finite number – I wouldn't state how many, because they probably differ and vary from pc to pc.

Let's say, we take thirty bricks, we string them out in a line. First brick is time zero. The last brick is present time. They're all strung out in a line. Every top of the brick has a date, the bottom of every brick has a date. You take one of those bricks and saw it up with a little brick saw, or a chipping hammer, or something of the sort, and it falls into forty sections – something like that. Those are RIs. And you can fit them all back together again and you'd have your brick again, see.

Twenty of them are oppterm; twenty of them are terminals. Elementary as this. Nothing much to this type of thing. I mean, it's very mechanical.

Strewn up and down the line of these twenty bricks is some tar – spots of tar. There's a little puddle of tar there, and there's a spot of tar on that brick and there's a spot of tar down – those are implant GPMs. No great value, except they get somebody's pinafore dirty. And then you've got engrams. And sitting out alongside of the bricks is a bunch of free track, in which nothing much happened. Rather minor activities of one kind or another. But it's contained with engrams which are enough for any pc to confront. This is the stuff you find in R3R, see – that's strung up and down the track.

Now, spotted in amongst the bricks, like flour or well, let's make it better than that – little bits of dough spotted up and down the bricks, here and there, but thousands and thousands and thousands of them, are actual goals. No value at all – except to make you make mistakes. Aberrative value, zero. These are actual goals. Pc said, "I want a lollipop." That was an actual goal, see. Well, that stuck somewhere on this track. And because GPMs are composed of goals, why of course, these actual goals tend to stick on them as locks.

That's the composite of a bank. What can get wrong with this? Well, a bunch of engrams can go into restimulation, and a bunch of implant GPMs can get in restimulation and

throw some tar up into present time. One of these big massy, oh, catastrophe, one of these bricks can come adrift and go floating on up to present time – or two of these bricks can get crossed up, so that one brick is after the other brick and both of them are kind of jarred out of line, see? The brick that should be brick sixteen now appears to be brick fifteen. And the brick that is supposed to be brick fifteen is now appearing as brick sixteen. That's enough to give anybody a cold or lumbosis, see. That is miserable! And you get two of these GPMs crossed up, one appearing to be later than the other – but actually being earlier than the later, juxtapositioned GPMs – *Tyaow! Creak!* Spinal Meningitis here we come! See. I mean, it's wild stuff.

Now, even a couple of RIs pulled up out of line, and sometimes you can get an RI – now this is – this gets very, very difficult. You get the fifth GPM pulled out of line – that's already pulled out of line. And then for some cockeyed reason the fifteenth RI in it, is so much like the twentieth brick GPM that it comes all the way up the line, pulling half of its GPM with it, and moves in on the twentieth GPM. And when you try to do anything with the twentieth GPM you run into this fifteenth RI. Maybe it's called "physical indispositions" or something like this, you see. And that is pinned to the goal "to be sick."

Well, actually these things are pretty neat – it's pretty neat. You think of the bank as chaos. Man, you shouldn't think of a bank as chaos, a bank is pretty neat. But it's stripped around and stretched around. Let's say bricks five to eight have been brought up and inserted between bricks nineteen and twenty. They won't be in line. Your pc won't feel good! That'll be misery, somehow or another.

Now, you busily, busily, busily start listing. And instead of getting the present time GPM, you get brick five. And then by some horror or another you get that what opposes brick five is brick nineteen. See, there's some reason they're out of line. Because the goals sound alike or something. And the pc just goes *zz-zzz-zzzz-zzz-zzz*. You've got brick number five – my God, the power and horsepower in brick number five compared to brick number thirty, you see, is enormous. There's a real beefy brick. So, you've got that up there and it's pinned up onto brick nineteen. And you start from brick nineteen on forward, and you can't seem to get any *plaa-aa-aa-ace*.

Lists don't pan out, nothing happens, and you can't get any fifty – past the last RR and nothing RRs on the list and the pc is going mad, and you've got ARC breaks going, and so forth and you finally get bright and start checking back over all the stuff you found and you all of a sudden find that brick five was gotten instead of brick eighteen, see. And there are two other GPMs hanging out here and they're all pulled out of line. Well the second you find this all out and straighten it all out, it all goes back on the track – clang, bang, you see. And brick five to eight, they go back on the track and they're on the track at five to eight. And then you get nineteen and you take off from eighteen where you should have started off from in the first place and you don't get brick five which was out of position, but now get brick nineteen, and the pc smoothes right out. And you move by goal oppose right on up into PT.

You start thinking of the mind as a vehicle of thought and you are already licked in handling it. It is not an instrument of thought. It's made out of bricks, tar, see? Things. It's full of things. Pc, as his itsa maker gets a little freer and so forth, he gets able to look at these

things and so forth, he can spot them – he can spot them. He can tell you, "It's brick number – I'm sure it's brick number nine. I can see a hole back here in the lineup, and brick – you know – GPM, that GPM is up here and it shouldn't be up here and there's something all twisted up," and you the auditor, knowing best, keep saying, "Oh, well no, really," and so on.

"But it fits, and my – but yeah, but I see a hole back here and I – I know that – that – that GPM shouldn't be back there, it should be up here. And we haven't got the GPM that should be here, I don't see anything here. And where we're supposed to have a GPM I don't have anything. But there's one missing back there and the one that's missing back there is the think – I think the one you're trying to put in up here."

And you, well you know best, so you don't do anything, and the pc starts going "*Ggguuuuuh-rrrrrr-ccraaawwk-bing!*" See. In other words he can actually start spotting these things. And they do – they look like great, big, rough, black bricks.

Probably the reason the Helatrobos Implant people covered up the planets with black energy – and they did, they made quite a campaign of it – was to stimulate everybody on the subject of GPMs. That was part of the restimulation. Black energy. And you show a thetan a lot of massive black energy and he gets kind of *ggguaeahh – creak!* Because it looks like his own GPMs, don't you see. So, that's enough to key him in and he's liable to feel rather weird.

Now, do these bricks ever go back together again and go back into place of their own natural bent? No! You have to roll up your sleeves, and find out where they're out of line and put them back in place. Well, that's normally done in R4 running.

But supposing all this happens while you're running R1 – Level I processes. Well actually, it shouldn't happen. Because Level I processes are normally being run on a raw-meat pc and they wouldn't know from nothing about it anyway. Supposing it happens at Level – well, if it happens at Level I, if you could imagine it happening at Level I, that's just tough. That's how it's solved, is that's tough. It'd take a Level II capable auditor to do anything whatsoever about it, or run any kind of an assessment or any type of action that would do anything about this, don't you see.

So, you just neglect these factors at Level I, because it would be dangerous for you to do anything else but neglect them. You don't get a Level I Auditor, in other words, trying to straighten out GPMs. He gonna make more hash, man! He gonna make more hash than he gonna make straighten out, see? So that's just something that you should say – in Level I, if you run into that kind of trouble with a Level I Auditor, well skip it or turn the pc over to somebody else.

All right. Now, your next levels however, should be somewhat educated in ARC break assessments. And if they aren't, they're going to run into the pc whose tone arm action is not occurring for the excellent reason that he has GPMs, RIs, something or other keyed in, and therefore, is locked up on the track.

Now, the way to do it is not to start to run R4 on the guy. Don't let a Class II Auditor or a Class III Auditor start running R4 on the guy, because the only thing you can do to ruin somebody's case would be to ruin his R4. Got that now? You get his present time GPM and find it all backwards and upside down and mix it up and get it so it couldn't read, and then go

down the line and miss the two intervening GPMs and take all the charge out of the next GPM – how the devil is anybody going to make this straight again? It's going to be pretty horrible. So you better find it and get it done right.

But there is something within the limits of R2 and R3 that you can do. You can do these Prepchecks on this lifetime on goals which have come up. The pc has announced certain goals, or appears to have certain goals or they've been found on him – you can do a Prepcheck on that goal, and "In this lifetime" and get a considerable relief. And you can do ARC break assessments or case analysis of a Level IV type or nature – however you get over the bridge of communication with the pc. That is the difficulty there. And do this type of analysis on the case and pat these things back into place. Find out what's wrong.

Now, there's a level at which this *can't happen*. Nothing will straighten it out. It's a case that has been run on R4 by an inexpert auditor and abandoned. Now you can only go so far in patching up this case – only so far. You can find the GPMs that are out of line and whether or not they were actually trying to run goals on implant GPMs when they were trying to run patterns on actual goals when they were actually implant GPMs. You can get these confusions out of the road and do quite a bit for the case – you can do quite a bit for the case. You can get a GPM that has been pulled out of line and missed, and so forth.

But an incomplete goals list is an incomplete goals list and there is no way around it – except to complete it. So, a case that has been very thoroughly loused up and I do mean thoroughly loused up – by a Level 0 Auditor running Level IV processes – GPMs pulled out of line, all torn up, messed up one way or the other, half-banks run one way or the other, skipped and abandoned – all of these various other things occurring, there is only one remedy – one real remedy. Because it takes this much know-how. And that is to get a Class IV Auditor to audit the pc and straighten the pc out and finish the goals lists. And finish the case up. That's about the only thing you could do about it.

You can make the case somewhat comfortable, you understand. You can kick GPMs that are out, as bypassed charge and you can do these things. But if that case has been run a great deal, inexpertly on R4, it's going to take a Class IV Auditor working like the mischief, wishing to God nobody had ever put his paws on the case, to straighten the case out. Got it? This is dynamite-type action.

But actually at Levels II and III – A GPM kicked out of line, somebody fooled with a goal a little bit, no real R4 ever run on the case, somebody found a goal on the case or something like that – just analyze the goal, pat it back into the place and the case will be as right as rain, see? See, you find out they found a goal but it was an actual goal or it was a wrongly worded GPM or a wrongly worded actual GPM, see, or something like this. You don't even have to find the right wordings for it. Just kick it out of line. Straighten it up.

It's quite remarkable what you can do with just giving a Prepcheck to a wrong goal found on a pc, too, by the way, you know – not even in this lifetime. In other words, some bird had at R3 – somebody enthusiastically found a couple of goals on him. Well, great day! Let's find out and dig up what these goals were. And let's analyze these goals by just your standard analysis form, you see. Is it a this and is it a that and is it a something or other and is

it something or other and all of a sudden – *clang, clang, clang* – it's an actual goal but it isn't a GPM. Well, that's sure the end of that. Charge indicated to the pc and he's away, see.

So, there are various things which you're up against in auditing at the lower levels. And it would not be friendly of me to omit to mention them. Now, that isn't the reason you don't happen to be getting tone arm action. You aren't getting tone arm action on the pc for an entirely different reason. You of course, got the itsa line cut and you got the pc whatsitting while you itsa – I know why you're not getting tone arm action! So don't include now, the reason you're not getting tone arm action with what I've just said because I'll just ignore it. That's a joke.

The truth – the truth of the matter – I don't think there's a case in this room that hasn't had GPMs pushed about and so forth, one way or the other, and who couldn't stand a case analysis on this level of action which would then restore tone arm action considerably to the case, see. But you see, from an instruction viewpoint I have to hold the point that there's nothing wrong with a case – it's just you, see. Otherwise, you'll never find out that an expert auditor can simply sit down and get TA action. But then you must know sufficiently well that you can get TA action. You must have enough confidence in it, you see, to know what is wrong with a case or that there is something wrong with a case if you're not getting TA action on it. You follow this logic?

You see, if the reason you were getting TA action, or the reason you were getting no TA action on the case is because you always had the pc's itsa line cut – every time he starts to look at the bank you drop the meter or something like this. Then you'd never discover any of these other softer nuances because you just get no TA action which would compare to no TA action on a case, don't you see.

Nevertheless – I'll be serious now – you should take up any case that has ever been run on any goals or any goal ever found on the case and so forth, in effort to get TA action, and find out what in the name of common sense is – makes with the bank, see. What is it all about? What is it all about? Your List 4 is actually good enough for a starter, but you need one of these case analysis sheets to really get going. They've had this goal found on them, "to film while rum is burning," see, or something like that. You suspect that the wording of this GPM might not be all that is desired, you see, and so forth.

Well, it takes a little bit of fancy, "Is this an incorrectly worded goal?" You know, and "Is this an incorrectly worded actual GPM?" There are various nuances here of analysis which don't appear on your L4 but you could figure them out, just by fooling around with bricks for a while. I mean – I mean fooling around with bricks for a while.

Just line up some bricks, and number them, one, two, three, four, five, six, seven, eight, every alternate brick is going to be the dichotomy of every single brick, you see. I mean every other brick is the opposite to every other brick, see. So each one's going to be a dichotomy. First brick is "to be white," "to be black," you see. "To be clean" and the next one is, "not to have tattletale gray," you got the idea? See, they're harmonizing, as you go up the line.

And the RIs in those things follow the pattern of the old GPM "to scream."

You actually could go out here and line up twenty bricks, and say all right, those are GPMs and lay some sticks along the line and say those things are – those are implant areas. There's four or five of these things later on the track. You see little groups and there's some implant areas. So they'll be implant GPMs, don't you see. And you scatter some pebbles around and say those are – those are actual goals. And this is the time track. And the time period of this thirtieth brick or twentieth brick or however many you've got made in – laid out there, it's time span is this. And recognize your time span is going to get longer as you go earlier, per brick, for the top and the bottom of the brick. And of course the ones that head – or the end that heads away from present time, that's the goal as the RI end. The name of the GPM is on that end, furthest from present time. And at the top of it, which is the end of the GPM closer to present time, the pc is deadly opposed to the substance of the goal and is himself something entirely opposite from the goal.

And you look at this and start playing with it, and its familiarity breeds familiarity and you eventually will know what in the name of common sense you're doing with this thing.

Because right now – right now you might be auditing somebody and you say, well, there's all kinds of these things, and they have a service facsimile poked here and that's a little quill pen or something that's stuck in here, they jabbed people with. And there's a this and there's a that. And you get befogged by the fact that there's so many pictures. You can't see the woods for the trees. Because a bank just has billions and billions and trillions of billions of pictures. And there's just so many pictures in the bank you never see what's in it, don't you see?

Bank's very entrancing. But the overall look at the bank shows you the important things in the bank, and the things really contained those things which you have to audit, in actual fact are just these thirty bricks. The other stuff is window dressing and it's taken us all these years to get through the trees to find the trees.

There's lots there to audit – you can find all kinds of things to audit. And so long as you don't disturb these GPMs, you probably won't get into much trouble. And the processes you have on Routine 1 – your Level I, II and III, those levels in actual fact are not apt to restimulate too much in the way of GPMs, but if you notice that it gets perilously closer to it, the higher the level. So that at Level III – at Level III when you start auditing service facsimiles, you're actually disturbing RIs and all of a sudden the guy comes up with a rocket reading goal. Well, it depends a lot on what you do with that rocket reading goal as to whether or not you upset the GPM pattern. Because it may not be the present time GPM at all. It may be the fifth GPM. Trillions, God help us, years ago, pulled completely out of line. And you're now going to prepcheck this thing, you see, *uuuuuhh* – dynamite!

Those are the objects which you are handling. They handle like macaroni or spaghetti or bricks or any other physical commodity – they got a lot of names inside of them and they look a certain way and they act a certain way and they're done a certain way and so forth. And if you're releasing them you get tone arm action. If you're leaving it all the same or making it worse, you're not getting tone arm action. I mean, you've got your perfect test, do you get tone arm action, see? There's a lot of – lot of material here.

Well, I've spent a lot of time trying to sum it up so that you could – into its bits and pieces and parts and that sort of thing – so you could take a look at it and know what you're stumbling over and all that sort of thing. There are bound to be some people, some students at first, some auditors, who will say, "Oh God, you – I don't see all that in the bank, I know what a bank is consisted of, a bank is consisted of this medallion." Somebody who's had Freudian analysis a great deal, well, it's actually considered with this circle and this arrow. And that's really what it is all about, and so forth. They're just stuck on the track looking at a single picture.

You start – you have to start shaking loose from this to see the rest of the junk – the mechanics of it. Well, how is a building built? Well, with a great deal more simplicity, particularly if the building was a child's building made out of play toys, bricks or something like that. That's the way the mind is built.

It is actually no more seriously built than a bunch of – a bunch of bricks lined up – it's about that. Each brick breaking down into component parts which are terminals and oppterm and which lie in adjacent patterns. You know the patterns are top, bang, pair, next pair, next pair, next pair, next pair, terminal-oppterm – all very neat. You're an idiot to build them that way, but that's the way you build them. And these things go on back to the beginning of track and so forth.

Now, why are these things continued in creation all the time? Well, you just underestimate your ability or the pc's ability to create, multiply. How much can a pc create and how much can he keep created simultaneously? It's fantastic! Your ability is absolutely fantastic. Everybody's ability is completely underestimated. You can create so well that you'd even stop yourself with your own creations. It's terrific! And you can create so well and so complexly and so unawaresly that you then can't find yourself – find your own way back out of your own mirror maze.

Now, there is no slightest doubt about the fact that when a person is sick, they're sick. And when a person's crazy, they're crazy. And when they're suffering, they're suffering. Because look – the last God-help-us number of years nobody has even guessed any part or corner of the puzzle called the human mind. And during that period of time a great many guys have suffered and gone through a lot of agony that they didn't want to go through.

We have the other factor. Does a person want to be this way? No. Can a person, by his own bootstraps get out of it? No. It's a rat race, and a mirror maze and so forth, that was very simple when you finally had its final anatomy. But right up to the moment when you did, you could only get lost in your own creations. And the actual fact in this universe, there is nothing to get lost in but your own creations. But where one finds a pc who is in trouble, the trouble is with the thirty bricks. With the free track going alongside of the thirty bricks, with the implant tar scattered over the bricks, with the bits and pieces of dough all over the place that mark the actual goals. And all this is lumped up into the form of matter, energy, space and time, included in the never-never land called his mind, which actually has space.

Some time, some thetan will make a tremendous effort to line these things up all by himself. He'll be exteriorized, between-lives area sort of thing, he's avoided it, he'll be trying madly to line these things up. Sitting someplace, thinking it over – looking at them – wonder-

ing what the hell these pieces of energy are. Trying – to get them off of him. Trying to get them off of his face. Trying, you know, like a cat trying to wash its paws, you know. And not be able to make headway on it at all.

And a great canyon, a huge canyon cleft in the mountains and so on, utterly filled with these GPMs, you know. He's looking at them; he's terrified.

Outside, he can of course see the walls; he can also see the GPMs, you see. His perception is greater. Fill up half the Grand Canyon full of the – full of these confounded GPMs, trying to, trying to – well, what the hell are they? Which – which way do I go? What is it? Nobody there, no E-Meter. It's all sub-itsa. He can't make it. He can't make it. Been tried! Even when you knew that close. Because you couldn't get the exact combination to as-is that then as-ised it and undid it, because it was all in perfect balance.

And there were too many possible combinations to sort them out. Even if you knew their anatomy, you'd raise hell trying to put them together. If you at this moment, knowing everything you know, were to be on top of Mount Ararat trying to take your bank to pieces so that you wouldn't be around the bend with it, or something like this – free and clear, no body to be affected, all the time in the world to do it with – you wouldn't have a chance. That is my condensed opinion on the matter.

Yeah, you'd come back and pick up a body. But you need a body to hold an E-Meter. Without the E-Meter you can't do a blasted thing for it. A meter isn't just something that helps. Now, I've tried to work out other systems which passed the E-Meter – which bypassed the E-Meter, which did things. Listing systems, of listing far enough, and finally only come up with the one goal, you see, a listing system of one character or another. And I've gotten exactly nowhere. Exactly nowhere, over a long period of time. And many times tried to throw out the E-Meter, and many times tried to short-circuit it and wonder why we had to have an auditor and wonder this and wonder that. Obviously an auditor is necessary, because a thetan, restimulated by his own bank, cannot perceive his own bank. But an auditor not restimulated by that bank he is auditing, can perceive through the meter that bank and therefore can audit it. So he can get out of the woods.

Well, the road out of the woods is well mapped. There it is. I've given you a talk about it and a graphic representation of what it consists of. You say, well, there are thousands of tricks of the trade which I don't yet know. Well, that's your barrier. There aren't thousands of the tricks of the trade that you don't know. There is nothing there that with a meter, with Model Session, with the anatomy of this thing and with the rules of R4N2, with a modicum of good sense and a good heart, you couldn't make the grade with a pc. Totally feasible.

It'll take you perhaps, if you're just starting in auditing this stuff, it'll take you for a while to realize that there aren't more barriers than there are. You'll have to fumble your way through it and find your own feet and get yourself into a situation where you're not holding your breath and your worry isn't getting you in the road and up the line someplace in a relatively few months, if you're just starting in on it, you will all of a sudden be asking yourself the question "Why did I find this so difficult? Why did I find this so difficult?"

And you know why I know you'll be asking that? Is because I went through that exact, same situation. I could not at the present moment possibly imagine R4M2 as being a difficult

process. There's just nothing to it. It is the easiest auditing I ever did in my life. It's a breeze. No matter how busy I am doing it.

Pc starts ARC breaking, you must have gone past the item. Pc can't get something to read; well there must be something wrong here; let's go back and find out what. The most extreme conditions which cause a balk – the most extreme conditions of auditing and so forth – and even those are dead easy. The most extreme conditions that you will run into in a pc, I have run into. And they're dead easy.

So, what you've got to learn is what I've had to learn. Is that there are practically no reasons why you can't do it. And once you can do that, all you've got to do is take this thread apart, from the PT GPM, with its top items, straight on back down the track, *pocketa-pocketa-pocketa-pocketa*, GPM by GPM by GPM by GPM, each one taken carefully apart, item by item by item with no mistakes as you go. Mistakes are perfectly obvious when you make them. Take them all the way back down the track; you're not going to get back to time zero before you've got an OT, man! You're not going to even vaguely do it.

Starting in, it's absolute hell on the pc. All the way up along the line. Goal oppose, goal oppose, goal oppose, goal oppose – oh, wow! He's got goals in restimulation, and you've skipped goals, and goals get pulled out of line and *oohhh!* And then he lists things and then all of a sudden you finally find the goal on the list but it's an implant GPM! And you go on, and the lists are incomplete and you can't find out why you're incompleting lists and you find horribly six goals ago you found an implant GPM which at that time read as an actual GPM because the case was too overburdened to read right. So you throw away everything that you have found and the pc goes into a decline because you have thrown away his GPMs, so you come back and you realize that that is what you did and you find where they do belong on the time track, move them into position, go back and take the sixth list, all the way back, finish that thing, and then keep on going to present time with it and finally you will get there – if you're alive and the pc is still alive. This is necessary to successful auditing.

That is the most hellish part of it. But once you're in PT without any mistake and once you've got the top RI without any mistake, from then on, you have to be a complete mutt to make a mistake. You know, you have to have – be auditing with both feet hanging from the ridgepole, you know, and the E-Meter – the E-Meter completely out of batteries and the pc long gone. It's real wild, see.

That's making OTs. You've got this whole band and span of auditing, up to that point of skill and capability – Levels I, II and III. You also, of course, have old types and styles of auditing. They are – still exist, and they're still valid. But as you go all the way up along the line on this auditing, remember that it is always the same bank that you are auditing. Don't get tricked into the fact because you have a different name or a different level, that you have a different bank in front of you – it is always the same bank. No matter what level it is audited with or what pc you're auditing. That is an interesting thing to keep in mind. Because you start getting too enthusiastic at Level III, you should realize that you are auditing a bank and that you are pulling RIs around in that bank in order to get tone arm action. And frankly the only level that really fills me with – *uuuugh* – horror is Level III. Frightening. Because I know what's going on.

And once you become very proficient as a Class IV Auditor, Level III will fill you with fits, too. Apparently you can get away with Level III only so long as you close your eyes as to what you are actually doing. [laughter] You're moving GPMs and RIs around – that's what you're doing at Level III and don't kid yourself otherwise. That you can get away with it, is a tremendous attestation to a pc's endurance and your auditing.

But there is the integration of auditing and the only other thing I would tell you on it, is you can do it. You can do it. The only reason you couldn't do it is because you conceive it to be more complicated than it is. You can do it. For instance, I've – I've been auditing quite a bit of modern R4, now, and I find this very satisfying auditing. No worries at all about tone arm action. Man, I get as much tone arm action as I find RIs and keep chuggety-chuggety-chugging and going on down the bank, see? I get as much tone arm action as I audit rapid R4. And let the pc itsa and not rush the pc, and let the pc be a pc. And not get the pc out of session.

"What do you suppose is wrong? What do you think is wrong? Oh, you think it's wrong? You – you – well, I'm having trouble here. I don't know what the trouble is, so forth..." and the pc starts, "What's he doing. Whatsit? Whatsit? Whatsit?" Of course, I don't get tone arm action.

And in actual fact, I can get as much tone arm action out of a session as I can drive myself to run. It's that "how much tone arm action." If I could audit just a little bit faster, not rushing the pc any faster, but if I could audit just a little bit faster, why, I could probably get seventy divisions per two and a half hours, see. I'm having a hard time, I've hit a ceiling. It's about fifty, sixty divisions, see. And I don't know how to increase it. And I might start writing in shorthand or something like that. That might increase it, you see. Now I'm in a sort of a contest of that particular line.

But this is auditing. This is the auditing you're going toward. This is the auditing you should be able to do. And this is the auditing you can do. And anybody that's standing around telling you how difficult it is to do this auditing, of course, is just filling the air full of entheta. Because the truth of the matter is it's very simple to do this auditing. It's the simplest auditing there is.

Probably Level I is more complex than Level IV, because at Level I you haven't got anything to do.

Well, there it is, I wish you luck with it.

Thank you!

AUDITING THE GPM

A lecture given on 23 October 1963

Thank you.

All right, who is this? What date?

Audience: October the 23rd.

October the 23rd? What year?

Audience: AD 13.

AD 13. Who said "63"? Shoot him! [laughs] Anyhow ...

All right. Well, your general – your general course of auditing affairs right now – I've been giving you a series of highly general lectures here just in the last few. And I hope you've been able to make something out of them – bits and pieces and scraps, you know? Trying to give you some kind of a viewpoint, let you take a little broader look at exactly what you're doing and show you some of the anatomy of what you're attacking.

The human mind is a very interesting mechanism and people can get quite goofy on the subject. Nearly every human being is so deeply enmeshed, so pressed down into life and livingness, opposed by so many present time forces – and opposing himself so many other forces, actions, personalities, considerations – that he finds it almost impossible to view this thing called the human mind. He more likely views human opposition. He more likely views human problems. He more likely views human considerations. He views such things as inhumanity. He views such things as justice. He views such things as rightness, right conduct; such things as honesty, dishonesty, criminality. In other words, he's involved not in the human mind, but in sociology. Do you see that?

So when a Pavlov or a Freud comes along, the primary motivation for his work is obtaining some sort of an is-ness of *his* immediate environment and *his* immediate conflicts. Let me call to your attention that all of those things I have just named are potential RIs in GPMs – all of them being dramatized to a greater or lesser degree. The being himself is being a solution, not a living being. Therefore, there has been no view of this thing called the human mind. There has only been a view of the particular RIs which a person is confronting or which he is being. One immediately sees a highly circumscribed horizon. He sees this horizon right close in to the individual, you see? The life and livingness of well, mothers are bad and fathers are brutal, and so forth. A study of the mind is a study of the RI called father, see? Don't you see how this is? And therefore he's going to study the mind. And actually he has made an identification between the thing called the mind and the RI "father."

This is the whatsit that he's not been able to itsa. This is the thing he's in conflict with.

So he wants to know more about the mind. I remember myself asking a question of this sort of thing. I was sitting down banging away on an electric typewriter, throwing out about a hundred and twenty-five words a minute of copy, and so forth, and I had to characterize somebody. And I sat back and I said, "Well, what the devil is characterization, anyway?" I think that was one of the primary entrance points to a study of the mind. I would have been very happy to know what character was so that I could characterize characters more easily in stories, see? This was not a very pressing reason to understand character of the human mind, but then in actual fact I've never had a really – a very pressing reason to do so, which of course gives one a much broader viewpoint.

I have personal reasons along in this particular line, but these personal reasons take the human mind as a solution of a lesser magnitude. In other words, the solution of the human mind is simply a small milestone on a much longer road.

But the situation as you see life and an understanding of life on this particular planet – and probably on most planets – is simply from the viewpoint of a person so immersed in life that he sees only those facets which impinge upon him and upon which he would like to impinge. And that to him is his entire horizon. That is his complete view. And he has no further view of the human mind than that.

I imagine Pavlov had it in for dogs. I imagine dogs played a very, very large part in Pavlov's GPMs. I'm sure he had an RI called "dogs." As a little boy he might have been bitten by a dog, do you see? As being many little boys in many times he's probably been bitten many, many times by many dogs. So he was sure trying to understand dogs. Maybe at some time or another, why, he'd been put on a solid diet of calves' brains or something like this, so that... Who knows? Who knows what these would have been? The fellow isn't available to us at this particular moment to go over his lineups. You may run into him someday. It'd be intriguing to know. What was the horizon of Pavlov that caused him to see the mind as a physiological entity which ran exclusively on punishments, even though he added rewards and punishments in his manuscript? Well, what was his horizon?

And Freud, living in a – in the mid-Victorian ages, surrounded by the hush-hush when – if a woman ever stepped on the steps of a horse car and had displayed an ankle below undoubtedly nonsanitary skirts that they had in those days – that skirt rising out of the dust an additional two inches and displaying that ankle could have caused a scandal throughout the entire town. You see? Just this balderdash of this particular time, you see?

Second dynamic – it must not exist, you see? And he takes this terrifically repressed second dynamic – well, who knows what went on there in Freud's background that brought him to a viewpoint to view the mind as: Repression of second dynamic equals insanity. And why did he pick out childhood? Probably he had an RI called "children," or something like that. You see? He's probably caught and was dramatizing within a sphere of less than five or six RIs.

His general view of the mind, however, led off into perimeters which are quite interesting. He considered such things as life in the womb, he considered such things as birth trauma, and so forth. He merely considered them, he never demonstrated they existed. He thought of a great many things and some of his students – undoubtedly said more than he

wrote – and some of his students became interested in past lives (such as Jung), druidism and that sort of thing. Well, it's interesting that when the past lives came up in the subject of psychoanalysis, that it became exclusively the English druid period. I think that's very fascinating. In other words, past lives equal chaps painted blue jumping about the oak trees, you see? That was the totality of past lives. It's fascinating. You actually would have to work very hard on a preclear to get him to recall this period, particularly if he'd never been in England during that period.

Now, here we have then – here we have the limited viewpoint – the limited viewpoint. And the only reason I'm calling this to your attention is so that you can see that that is not the only viewpoint and so that you, in teaching people and looking at things yourself, might possibly be able to bootstrap yourself out of too great a fixation along certain lines, too great a motivation for knowing about the mind, which is not germane to the mind, see; motivated to know all about the mind because of schoolteachers. Well, you see, in actual fact you will wind up specializing in RIs called "schoolteachers," and you won't know very much about the mind. You might not even realize that it's an RI.

Now, to make a statement like that to you is sweepingly invalidative. It's horrible to make a statement like that to you. And I'd never make a statement like that to you if I hadn't made it to myself.

Can one look further than one is looking? That is the question I am asking you. Can you look further than the horizon you are now looking at in the field of the human mind? Can you extend your vision sufficiently as to escape your own aberration? That is the mark of genius and yet you can do it.

You can recognize – and oddly enough, I know how well you can do this, because it's almost a hallmark of Scientologists. No matter how hard you are dramatizing, some tiny portion of your beingness, you, is still saying, "Boy, am I dramatizing!" [laughs] Screaming like mad at somebody or other, and yet while screaming, still say, "You know, I must have overts and withholds from this bit, or I wouldn't have that – this much of an opinion," you see?

That actually is the mark, not of self-criticism, but of self-enlightenment. And an individual who is capable of this self-inspection and so on, there's a great deal of hope for that individual. But the individual who is always convinced completely of his own sincerity of his own dramatizations, I'm afraid there's not much hope for him. And if you wanted to describe somebody who was totally sunk in humanism, who was totally – gone totally wog, and so forth, you would describe that person as incapable of realizing his own aberrations or realizing that he had any aberrations. You know, the man who asserts that he's totally sane is always the insane man. The rest of us – the rest of us always have a little glance over our own shoulders and wonder if sooner or later we're not going to act a little potty at some time or another, you know?

But this divine doubt never enters at all into the scope of thinkingness of the *very* insane. What characterizes them is their fantastic rightness. They are completely certain of their own sanity and in some brands of insanity completely certain of everyone else's insanity. These are *total certainties* with regard to these fellows.

The Scientologist to a marked degree – not because I have told him to – but just by the process of knowing greater truths – has rather uniformly attained this particular aspect. And it's odd to think of the fact that some of the greater schools of philosophy and some of the greater schools of wisdom have taught that one thing as the highest possible peak of attainable wisdom on the part of a being. The highest possible peak. They call it in various ways, you'll find it described in various ways, but it always amounts to the fact that they are capable of the divine doubt. They are capable of a slight view of themselves. They are capable of a self-inspection. They are capable of a realization about themselves as imperfect.

These various things have, of course, sawed through and become operations at various times. So that there have also been schools which said, "When you know you're absolutely insane, why, then of course you are totally sane; and when you've realized that you're completely bats, why, then we know that you are all right." You know? They've exaggerated this thing to a degree, but any piece of wisdom can be exaggerated into a lower-scale mockery.

But it's interesting that we have attained something which, in the field of the Stoics or other schools of Greek philosophy, would have been considered to be a very, very high point of wisdom. And any of you walking through the states of Greece of twenty-three hundred years ago or something like that, would have been looked on as a very, very, very wise being indeed. See? Saying no more than you say, doing no more than you do, you see? Not even auditing anybody. This would be very self-evident.

So you perhaps have not looked at Scientology from the viewpoint of philosophic attainment. And yet you have attained a philosophic level which is superior to and described as one of the great high levels of philosophy, while still scrambling around and thinking that you actually don't know much and you've got a long ways to go. Do you see that?

Well now, that's actually added, that is simply an added bonus. That wasn't part of the philosophic level. But that you know you have a long way to go implies that you know something or have some feeling of where there is to go, see? So now, that is a greater level of wisdom. You have some feeling about there are greater levels to go to. Well, I'm afraid that that was totally absent in all former schools. At your lowest level, you have attained this bit of self-doubt, this bit of self-inspection, this – this attitude which was the highest peak of former philosophies. And yet you additionally know that you have a long way to go and you also, then, must have a feeling that there is something to go to, so therefore, you must then understand something of the wholeness of a being. And that has never been understood in the whole world of philosophy. The potential of a being, that is a completely neglected subject.

We read "man is evil." We read man is this; we read man is that. "Man is born of sin and dies in sin." We read this philosopher and that philosopher and that religious preacher and this writer and we read the Koran and we read the Bible and we read the early teachings that Christ imbibed; we read Indian philosophies of some kind or another. All of these things – all of these things have a very debased idea of the character of man. They do not perceive him to be anything that he is. If you ever wanted to read a tale of lies – is a description of the beingness of man written in other times and places and periods.

What is man? Oh, man. *Tsk!* What is man's potential – is a completely new field. What is his potential?

Now, they say that – once in a while a poet comes along and he says he can attain to the heights of stars or something like this – just talking in some metaphorical vein – but actually doesn't embrace the real beingness of man.

What is the total potential beingness of a being? And that is a subject that you are grappling with and that is the subject which you actually grapple with in auditing. If you are not grappling with that subject and are only grappling with the fact of, "How do I prevent myself from being impinged upon certain types of characterizations in life," and "How do I myself impinge upon certain aspects of life?" – if you're still involved in that and trying to audit, I'm afraid that you will have many failures in auditing. You'll have some successes, but you'll still have many failures in auditing.

Let me give you an idea of that. A failure in auditing could stem from this basis. Now, don't think this is uncommon. You have a great deal of difficulty with horses. See, you've got a lot of trouble with horses. And you've had a big auditing win on the subject of horses, so you promptly and immediately audit nothing but horses on your pc. That means, immediately, that your aspect or your viewpoint of the human mind must be that of just life and livingness – little symbols that don't amount to a hill of beans, you see? This is a person who is so thoroughly in contest with the environment about him that only those factors in the environment about him that are dangerous to him could be dangerous to anybody. It's a lack of flexibility. It's an inability then – let me show you where the auditing failure is.

It would be an inability expressed like this: Little girl comes in – little child comes in and she's crying and she's shaking with terror and so forth. And she says that – she says the wind – the wind is moaning past her window. And you as an auditor – you as an auditor – this is a piece of life and livingness, not a piece of session, you see – but you as an auditor happen to rather like wind. And you rather think that's a pleasant sound. And you conceive no danger in it whatsoever. So therefore, because you have that different viewpoint, then you say to her, "Oh, nonsense. Wind is a pleasant sound." Now, there's no great danger in doing this, but let me point out to you, you have absolutely done *nothing* for that little girl except knock her itsa down. Do you understand?

In other words, if your knowingness about life is totally based on what you yourself are afraid of or given sensation with, and so forth – that's totally based on that alone – and you have no additional perception that other people might be upset about different and other things, then you actually can never extend yourself out of the RIs you're sitting in far enough to understand what the *other* person is going through. You have to at least be able to say – this doesn't require much; there's no great difficulty here; it's just something that you should recognize. You should be able to say – you should be able to say, "Well, Joe over there, or Bill over there, don't like women. This is silly, but they don't like women," and *know* that they don't like women. And although you have an opinion that this is silly of them not to like women, to still be able to understand that they don't like women.

If you haven't got that viewpoint, you will never permit them to itsa any difficulty with women. Do you see how that would limit the auditor? And it's on these little mathematics alone that you can adjudicate the success of an auditor. In other words, is he capable of understanding that wind could frighten somebody when it doesn't frighten him? See? Can he

understand that there are other conflicts for other people, see? On that alone – on that alone, you see, you could get auditing failures if he hasn't grasped it and auditing successes if he has grasped it.

Pete comes in. Pete is just going all to pieces. Pete is in shreds.

"Well, what is the matter, Pete?"

"Oh, my God! It's my car!"

"What about your car, Pete?"

"I just worry, worry, worry, worry, worry all the time about my car. I keep it in a locked garage, and so forth, but I just know it's going to be stolen. And I just went out a few moments ago and found that I had left the ignition keys in the ignition and the door unlocked."

The guy is shattered! He's practically in tears! Now, a person who can't project himself, see – you didn't even have to project yourself, but just understand that he might be sitting in a bunch of other RIs than you've got, see? – is liable to handle this situation like this:

"Well, your car's insured, isn't it?"

"Well, yes."

"Well, you keep it in a locked garage, don't you?"

"Well, yes."

"Well, all right. What are you worried about? Now, let's get onto something that's really aberrative."

He just let him sitting there in a wild present time problem, because all these concerns are goofy – even yours! See? These concerns are *not* usual. They are *not* ordinary. There is no average set of concerns which makes a person sane or another average set of concerns which makes a person insane. There are no such common denominators. They're *all batty!* And the difference between a Scientologist is he can see that his concerns might be a little batty. He hasn't automatically assumed that because he has these concerns they are therefore the average concerns of the human race.

Now, a fellow who didn't have any RIs about lost property would have Pete come in. Pete's in shreds. He starts in the session, and so forth.

"Well, what happened? What happened, Pete? What's the matter?" Tone arm is high and the guy is shaking and looks ashen. "What happened?"

"Well, I – I just went out and I found I'd I – eh – left the car – uh – and the ignition keys – I – I have left them in the ignition. They've been sitting there – *ulp* – all morning – *ulp*."

And you'd say, "Well. Oh, is that what you're worried about? What is the car – car worried about? Is it losing things? Um – property? Um – property?"

"Property! Huh-huh!"

"Property. Well, give me some way that you've safeguarded property, Pete."

"Oh, well! Ha-ha! God! Oh, yes, and ever since and so on and so on." Tone arm action, tone arm action, tone arm action, see? Everything going along fine, present time problem evaporates and you get the session underway and you're all set. In fact you've probably got your session. If you're not running R4, you've got your session in the bag, see? All because you didn't assume that he was batty for worrying about something that wouldn't have worried you.

Now your gap gets wider and wider the better you get. The better off you get as a case, the wider this gap gets. So it's something to shed if you have it and shed what little of it you do have, because you very readily get to a case gap between your viewpoints and a pc's viewpoints when all of his considerations along in this line look *completely* batty. You'll get to a point sooner or later where the fact that he eats and has to knock off for lunch will seem very, very foolish to you. But because you have been there yourself, you're not liable to cut his itsa line on the subject of being hungry by saying, "Well, that's silly. How could anybody get hungry?" Because you know that you could get hungry, see?

But this gap gets wider. And your gap already is sufficiently great that mixing in amongst even Scientologists, you here at Saint Hill were reported at the congress of shining up to a point where everybody – anybody could spot where a Saint Hiller was in the audience, see, whether they knew them or not. It's quite interesting. This comment has come back to me. In other words, the Saint Hillers are head and shoulders above Scientologists who are head and shoulders above raw meat. Your gap is already pretty wide. You don't ever know how wide your gap is – that's what's interesting – because you are always in the condition you are in at the moment you are in it. There's very seldom any comparative data.

I was looking over the factors of growth in Scientology, and these factors by the way would startle you – they'd startle you. They are not necessarily represented by the accounts sheets of organizations or something like that, but they certainly are represented on the dispatch lines of organizations. And opening up old folders of dispatches and going back just two or three years and looking at what was being said and worried about two or three years ago, is illuminative. It's startling! The various factors present are no longer present in organizations; many of those factors are no longer present in organizations. They have been surmounted. Organizations and the people running them, particularly – mainly the people running them – have moved up above concerns of that particular level and they're no longer worrying about these lines. There's various things that they have shed coming up the line. There are various problems which the organizations had at that time. There's the frequencies to dispatch and that sort of – say, of five years ago. And what was contained – these things look like something from another planet!

These are the factors of growth and these factors are very, very easily measured when you look back and have a comparative stick with which to measure them. But you seldom have very much to measure it by, unless perhaps you – you wrote a diary many years ago. Let's say you had a diary and you start running into this diary and that sort of thing. And you say, "Good heavens!" you see, or "How amazing," or "I'll be darned!" you know? This would give you some type of aspect.

You very often will experience this from an auditor's chair. You run out a whole GPM out of a pc that completely changes all of their considerations and the pc goes waltzing along – life pretty shifted, see – without any real recognition of the degree of shift, see, but just simply take up the new values which are there and go on rolling along with these new values, and they've simply discarded the liabilities of the old values and they aren't a matter of comment.

This will very often baffle you as an auditor, because it's a process of negative gain. You very often will feel somewhat slapped in the face because of this very thing – negative gain. It's a very interesting phenomenon and an auditor has to live with this thing and be able to confront it. This fellow's not been able to sit up. He's always had a badly curved spine or something like this and he'd always sit up like this. And you get to running down the bank, particularly running some GPMs or something like that and you all of a sudden get to that series which have that degree of influence on the body. And all of a sudden the fellow starts to sit up and you never again hear about the curved spine. He doesn't mention the curved spine. He doesn't even think, usually, to tell you how nice it is not to have a curved spine. And the reason he doesn't tell you how nice it is not to have a curved spine is now he has not got a curved spine to the degree that he has no level of comparison with having a curved spine, because you've also wiped out the experience of having a curved spine.

And you're going to face that as auditors, and sometimes it's really going to baffle you. I've had it happen to me and I still never – that doesn't totally leave me cold, even today, see? Change a person's whole conduct, aspect in some sphere of existence in just a hatful of RIs or something like this, you know? Just improve it, utterly! Knock down barriers in all directions. They're just shining now, you know? Well, let's take some subject like miserliness, you know? Before they were always worried to let anybody know they had a sixpence, you know, and they were always afraid to give anybody anything. This is all vanished, see? They're now completely sensible on the subject. They have more money, too, you see? And never have a single word said on the subject of, "Gee, I'm glad I'm no longer wrapped up in all that miserliness," see? Never have a word said on the subject.

If you want to be paid as an auditor your observation has got to be terrific, because it's – nine times out of ten will only be your observation that thanks you. Oh, people are basically very appreciative and they say so-and-so and so-and-so and so-and-so and they talk about it and that sort of thing. But every now and then you strike one of these things of the curved spine, see, you know? Guy's always been going along this way, you know? At the end of some session or several sessions all of a sudden there's no vestige of this and you never hear a word about it. You've wiped out all anxiety about it, you've wiped out all interest in it, you've wiped out all communication lines about it and it's gone.

Now, at the same time you occasionally hit somebody and you – they're up against the gun. And if they've got some present time comparison... Let us say they're going to be operated on for lumbosis, see. And they are going to be operated on and somebody is going to tear out the whole epiglottis and reverberate it, you see, and so on. And you come along as an auditor and you cure it up and they don't have to be operated on. Now, they've got the doctor or somebody, is still nagging them, you see, to have a lumectomy, you see? And they are now happy that they don't have to have this additional duress. You see, that's slightly different.

Now, that person is liable to thank you every time they see you. See, because it's being driven home from some outside source, don't you see? But just the fact that they couldn't read or couldn't see, or something like this and nobody's – there isn't any exterior bang on it, and you ... They can read now, they can see, or something of that particular kind, that doesn't matter a bit – apparently. Of course, they are basically appreciative. They'd be terrified if they thought they would be returned to that condition. But they just neglect to say anything about it.

You had somebody here in the last few months who had gone blind. He was really blind, man! We made him see again. And, by George, you never heard very much about it. I never heard anything about it. And right down to the last moment, right down to the last moment, nobody ever said, "Thank you, Ron, for returning my sight." Because it was there, don't you see? There was no point in doing so. I wasn't even sitting there waiting to be appreciated particularly, but I was struck by the fact that the subject was never mentioned. See?

You very often run into this. So, therefore, you better be able to observe because occasionally you'll pull off a miracle and nobody will ever find out about it but you. [laughter]

Now, when you go into this on the basis of Pete and his car keys, you'll have vast quantities of trouble just because you cannot conceive that anybody would be upset about the car keys – which is the threat of somebody stealing his car – and you find out he's never even had a car stolen in this lifetime, see? And you say, "Well, balderdash!" see? Well, you won't let him itsa it. See, that's one of the main, basic mechanical penalties of this kind of thing.

All right, now let's take somebody as he goes up the line. He goes up the line and he gets into a more extended perimeter, a more extended view of existence. And here is existence spread out in front of him and he can understand that that person over there feels sad because that person over there has an aberration about something which demands sadness when a certain circumstance is encountered. Being able to perceive just that, you can get lots of tone arm action; if you can achieve that, you can achieve tone arm action.

Well, you're never sad about having eaten too many chocolates or eaten up all the chocolates, let us say, see. You're never sad about this; this does not make you cry. In fact, you think this is quite ridiculous. In fact, you don't even really like to eat chocolates because they put on weight or something like that, see. So this person is crying – this person is crying and they've eaten up all the chocolates. Well, this is quite mad. You immediately pronounce it as being quite mad and so you do... You might even be led to process it because you know they are mad. But you sooner or later are going to make a little bit of a mistake about this kind of thing, because your own incredulity on the basic situation that having eaten up all the chocolates should make somebody cry – doesn't seem sensible to you.

Now, it doesn't have to be sensible to you. The only thing that has to be sensible to you is that other beings immersed in life have different viewpoints and different RIs which cause them to feel differently about different things. That's the only thing you have to conceive of. If you can conceive that, you can get tone arm action off most anybody, you see?

In the field of writing, in the field of writing – this is a very poor thing but it's anecdotal and it might amuse you. A fellow by the name of Eric somebody-or-other went out to Hollywood. Well, this is a – this in the old days was a horrible place to be transported to anyhow,

with all the glamour and glitter and so forth. And it was particularly appalling for a writer, because a writer always has the idea that he can write and he has proven it by having written and published, you see? But everybody in Hollywood has the idea that he can write without the small step of having proven it or published it. So, you see, all directors are writers and all producers are writers and all accountants are writers and all the actors are writers, don't you see? Everybody's a writer. And writing, actually, is a fine art and it's quite a craft. But because you're surrounded by all these writers, you see, you always get all kinds of writing suggestions, you see, and so on, and they are quite insane.

Well, I remember this fellow Eric went out there and uh – I think he was a Western writer or maybe that wasn't the same chap – he was a Western writer and they put him to writing musical comedies. And he was going along. And when he first got there, why, he was a very unhappy man. And he had sort of filtered on down the lines and he had become the quasi level of success that people who stick with Hollywood used to become. And – ran into him one day and I said, "Well, doesn't it sometimes get on your nerves, Eric, all the advice you get – gratuitous advice?"

And he said, "No," he said, "I have finally gotten used to it." He said, "I have finally gotten used to it. Now," he says, "when they tell me to put a fire engine in a beauty shop, I put a fire engine in a beauty shop." Total apathy on the subject. See, total apathy on the subject.

No, we're not – I'm not advising you to assume this total apathy on it, "Well, all right, so he gets tone arm action on that; so he – so he gets upset about eating chocolates. All right, I'll – silly to me – but I'll go ahead and I'll process him on eating chocolates." [laughs]

Let me point out to you – let me point out to you that this would be somebody who was asserting that his entire existence should be the entire existence of everybody else, don't you see? And so asserting it, would then combine into a resignation on his part to accept this other existence, no matter how batty it looked. Let me point out to you that is the *wrong* direction to go; that's the wrong direction to go.

You forward this through understanding. If you understand the mechanics of the mind, then you actually don't resurrender any aspects of it at all. You truly understand the mechanics of the mind. You understand that this guy is sitting in a different goal and has different RIs, so then he, of course, has different viewpoints and different reactions, that's all. His experiential track added up to his postulated track gives him these GPMs and RIs and gives him a certain behavior pattern. And that behavior pattern is understandable because he has got a bunch of RIs.

Well, even if you're running Level I, II or III type processes on the bloke, nobody is telling you you can't understand this. Then, of course, it rather leads you to understand that some of your – your favorite ideas about the environment in which you live and that sort of thing, that these things are borne home upon you by the RIs that you're sitting in. Well, nothing quite increases that understanding like having a few hot RIs run off of you. And you all of a sudden say, "Oh ho, yeah!" Your – the right PT GPM and down the line. "Oh-oh. Well, there's an RI. Ho-ho-ho. There's an oppterm there, an oppterm 'toads.' *Tumpf*." Through your mind flashes the terror and horror and so forth of gardens, of going anywhere near ponds, of being in a damp atmosphere or anything else. Here's this confounded oppterm, "toads."

Give you an idea that it doesn't – you don't have to relive your whole life in order to de-aberrate, which is the Dianetic idea. You don't have to relive that whole life in order to de-aberrate. An auditor operating rapidly and competently, just competently, running R4 could in actual fact – could in actual fact take all of these terrors, fixations, upsets and *yalp-yalps* that this person had been worrying about – you know, I mean the real obsession that this person was sitting in – in the course of a few little motions of the tone arm, the blowdown and the little pumping as the pc cognites and the rocket reads as it compares, within the space of ten minutes, have listed it, found it, done the courtesy steps and totally discharged it to no fear of toads. See?

Now, that fear, that RI's duration, the duration of that one RI, might have been many, many, many lifetimes. The duration of the pair, I should say better, see – many, many, many, many lifetimes. Think how many engrams are contained in all those lifetimes; think of how many other aberrations and complications; think of how much else. But you hit it dead center, it's 'toads.' It wasn't – he wasn't afraid of gardens because of rose thorns or he wasn't afraid of ponds because he had drowned in them – this he'd always kind of sort of thought. No, he's afraid of them because they have toads in them. All is explained, the thing as-is, and *bow!*

That lays the terminal to view – well, what did he have to be in order to handle toads – which you may get before or after it, whichever one you're running – and he finds out that this – this is his basic fixation all the time of, "to not – to be imperceptive," you see? So he gets "an unperceiving person." That was his solution. And he always thought it was because he couldn't confront life that he had trouble with his eyes; and he has always thought it was this and he has thought it was that and he's thought it was ten thousand thousand other things. But it's just "an unperceptive person," and one is an unperceptive person because then won't see – one won't see toads. Between the pair they're all explained. And packages that would have turned Freud pale are just gone in that flash of an eye. That is what it consists of. Yet that pair of RIs might have lived for many, many, many, many, many lifetimes – it takes a long time to form up an RI, either side, or a pair.

Well, take a look at this. If you have an understanding of the actual mechanics of the mind and how the mind is put together, and if your understanding of that is both objective and subjective – you've seen somebody recover from these RIs, you see; you've seen somebody recover by blowing them and you yourself have had an experience of a few cognitions and taken a look at it yourself, and so forth – this enormously would improve this ability to see that another being is sitting in the same mechanics but with different significances. And that, in actual fact, is all you need to perceive as an auditor: same mechanics, different significances; same patterns, same pattern type of goals and everything else, but they're different significances – significances are all different.

One fellow has as a top GPM – has a top GPM, "to catch butterflies," and another fellow has as the top GPM, you see, "to swim under the sea," you see? This gives you entirely different sets of RIs. And even if you had two people side by side, each one of whom had a top GPM, "to catch butterflies," you would still have in those two people different sets of RIs. Even if two people have the same goal, they've got different sets of RIs, so they have a different interpretation of significances in that same goal.

All of this is basically a dissertation I'm trying to give you – trying to give you a view-point here of – perhaps you'll be able to see the pc that you're dealing with more clearly from this point of view. Perhaps in looking back on your past auditing you will see why you just never under God's green earth did anything for Mamie Glutz, that famous person – why you never did anything for her. And you begin to realize that she talked all the time, all the time, all the time about her feet hurting her; and you realize that you just could never conceive anybody being that worried about anybody's feet hurting, see? And it just was not something you would have naturally itsaed. So, of course, on this PTP of Mamie Glutz, you never got any itsa at all and therefore, you never got any tone arm action, you never discharged the PTP, so you never did anything for Mamie Glutz.

This explains to you, then, differences amongst pcs and differences amongst auditors getting results on pcs. See, it explains it in this particular breadth.

So anyway, an auditor – an auditor looking over a case if he is a real expert, if he's a real, real pro he should know – he should know very, very well the layout of that bank. He should know that if you take thirty bricks and lay them in a string end to end, with a bit of a gap between them – and I didn't tell you in the last lecture, the bricks are long way to, you see, they string out the long way – and the long way, laying them out there, in the longest line they would possibly make with a gap between them – thirty bricks. And those bricks, as you come up from the early track, are dichotomies – one to the next, one to the next, one to the next, one to the next. And these things just roll on up and every one of them has twenty-thirty RIs in the thing, and those things are fitted together. These are the GPMs; these are the goals and so forth. And that these have wound into them implant GPMs and there's free track floating out alongside of them. And that the pc as he sits in present time, is sitting in a terminal and is confronting an oppterm of that line and is *in* one of these bricks. And that every one of those bricks dismantles into the component parts. And *basically* that the first one at PT (the latest one on the line, the thirtieth brick at PT) can be found and when found will be found sometimes to be cut off. In fact, most of the time it's only half a brick. He hasn't had time to grow a whole brick, see?

And the pc – the pc can be moved forward, can be moved up to the top terminal of the present time GPM, now formed – the latest one formed, you see – can be run back down the track RI to RI to RI to RI, GPM to GPM to GPM to GPM; that this can happen, that it can be done accurately and that the potential beingness of the individual can be recovered by doing that action as difficult as that action might sometimes prove.

Once you've seen that, what I've said just in the last few words, you actually are looking at the totality of this thing called the human mind. That is all that's in it that's important. There are so many gimmicks in it, there is so much glossy hardware in it, there are so many data, there's so much fact, there is so much livingness done by the pc, that it doesn't look like red herrings; it looks like a blizzard of red herrings when you try to see this thing at all, see?

Now, what I've just told you is what is there to see, and it's the only important things there. I've just spent three months chasing every red herring I could possibly chase to make sure of the totality of the GPM. I know about every kind of implant anybody ever invented anyplace, and they're about as aberrative as a pinch of snuff. There's time fouling up, time

track jamming GPM – implants, there's motion implanting implants, there's implants that have – that are just absolutely salted with false RIs and so forth – whole GPMs implanted. Strings of twenty, thirty – it was no accident, you see, that they chose twenty-eight goals in one Helatrob series, see – strings of GPMs from beginning to end, you see, all of them matched up, various things and so on. Between-lives implants, wipeout stations, traps, all the liabilities of life in this universe, and when we shake it all down *you conceived there was an opposition so you invented the solution to it*. They invented a lot of solutions, but on this particular solution – there was an exact balanced solution – you then accumulated enormous quantity of mass because you weren't there, it was. And you didn't do any as-ising of it at all. It was just an automatic – an automatic response. It was noninspected action. You knew what to do.

The engram has some of this in it, too, but not to this degree at all. The order of magnitude is fantastically different. An RI in a GPM? Oh, I don't know, a hundred million, five hundred billion engrams. It's some order of magnitude of this character, see? How long do you think it'd take you to run a million engrams? See? Well, you probably run a hundred million engrams with one RI. Takes you ten minutes to run an RI. Gives you some comparative idea of how far processing has advanced in finding the true state of affairs in the mind, see?

Well, you look at all this thing, you look at all the mischance and adventure and all of the fallings from grace and it's certain that your environment did influence you to postulate certain goals and it's certain that your environment did cause you to influence you to postulate certain terminals and it's certain that your environment was pesky enough along some particular line to finally compose an oppterm; but you had to select it out and compose the oppterm yourself even though you're having nothing to do with it. That's all very certain, this is all very true – and that you are now mocking them up, that's all very true. But the truth of the matter is, you made your own bed of spikes. I don't care how fancy the pinwheels were, see; I don't care how fancy the spider traps were; I don't care how boggy the bogies were, see? I don't care how many times you were lynched – five hundred lifetimes. You'd be walking down the street; you hadn't committed the murder; you were unjustly arrested and illegally hanged – painfully. Aberrative value: pish!

You see, actually a thetan doesn't consider anything valuable except his own postulates. He sheds everything else. And he sure hangs on to his own.

You see, the enemy never even named itself. The enemy might have had a goal, "to capture Chicago," see, or something like this. And that's what they call themselves, that was their GPM. But in order to get them as an oppterm, the thetan had to say "the invaders" or some other such designation. The enemy doesn't even name themselves. I mean, you even make your own oppterm. It's pretty gruesome when you come right down to think of it. So it's your own postulate there in the oppterm. So you're fighting your own postulate in the oppterm. That gets to be pretty grim when you get to thinking about it. And if you don't think one of these RIs – one of these RIs doesn't possess beef, get one out of line sometime or another; get the whole force of somatics of an RI of your own.

These cases of arthritis, these cases of lumbosis, these cases of citizenitis, birds up here in the hospital being carved up into fresh pork – pardon me, long pig – these birds up here being hacked on and slitted and anesthetized, and emergency-ward-tened – these charac-

ters, you know – these characters are not suffering from bad livers, bad spines or any other confounded thing, you see, they're not suffering from these things. They're suffering from RI-itis. It's fantastic.

You get one of these things out of line, up against your heart sometime or another – your chest. Let somebody skip a goal on you sometime if you want to – if you want to get a real reality on things. Let them skip a whole GPM and go from, "to spit," you see, "to whirl." "To whirl" opposes "to spit." *U-uhr-uhr-uhr*. How many are missing in between there, you know? They don't oppose each other. And all of a sudden, after the session, notice that you have coronary thrombosis in an advanced state. You know, these little divers they put in fish bowls, you know, that they have the stream of bubbles coming out of their helmets, you know, that sort of thing. Well, that's the way your bloodstream must look to cause that much somatic, see? *Puckle, puckle, puckle, puckle, puckle*. Coronary thrombosis, man – true advanced case. If a medico got ahold of you at that particular moment, he'd examine you, man, he'd have you in with EEGs and PDQs! He'd blanch!

I've already seen medicos blanch on just running an engram. Ran a guy through measles one time, got him – doctor took his temperature – ran him through a measles engram. Halfway through, why, the doctor stopped me and took his temperature again. He was running a temperature, I don't know, a hundred and two, hundred and three, something like this. And the doctor immediately went into a screaming fit and says, "I'm sorry, I have to order this patient to bed at once!" [laughs] I said, "I'm sorry, this is my consulting room at the moment, sit down!" and finished off the engram. Doctor took the temperature of the patient, it was normal, the patient felt fine; the doctor thought he'd gone crazy because he'd even seen the spots of measles. All the symptoms of measles had been turned on and turned off, complete with temperature.

Well, if an engram can do that, what do you suppose a GPM can do? I'm not now talking about an RI, I'm talking about a whole GPM, see, just missed, clean and clear. Well, I'll let you in on something. You're going to miss a whole GPM on any pc you operate at some time or another. You just can't avoid it happening. So you better begin to understand and stop, because the amount of worry which is going to start entering your skull in the absence of the understanding of what is going on will completely unman you or unwoman you!

The essence – the essence of the situation is comprehension: know the tools of your trade and know what's happening. And also know that there is no perfect method of inspecting a zone or area that you yourself cannot visually see. Only the pc can see this zone or area, until you get up to be – God-help-us. You won't be auditing then; you'll be giving planets a little additional revolutions. You get up there. We got need for you up there, too. We know of three or four planets that need a lot of additional revolutions. In fact we have ten or fifteen times the revolutions planned for them. Crosswise, at right angles to the way they're now going! Now, that's – that's a secret. I sh... I should take that off the tape, that's a secret.

But the point – the point is here, your comprehension must be up to your line of action. You must realize that there is no way of looking at it and taking a look at the pc and seeing where his GPMs are located and what the GPMs are and what each one is, except by the systems of processing. You can see it through a meter and the recognition of the pc who may

or may not see them. Pc starts itsainging them and so forth, well, he can go so far in itsainging them without plowing himself in. He's itsainging them, he's still getting TA action, well, you let him go ahead. But you're *huuh*, you know – you know what you're dealing with, you know what the mechanics of it are and you very readily become experienced in knowing whether it's in line or out of line or what you're doing. There's certain tests that you can lay in. And you must also become completely, completely – not resigned to – but completely expectant of a few misses. You start running it perfectly and you worry yourself silly! An auditor couldn't live with himself at all. Because it's impossible!

I'll give you some kind of an idea of how difficult it is. Found a PT GPM. It was obviously the PT GPM; it checked out beautifully. Did a goal oppose – ran it out. Very fine. It – very nice. Ran out the next GPM; ran out the next GPM; found and ran out the next GPM; found and ran out the next half of a GPM. That's two and a half GPMs, see – two and a half GPMs now, including – I mean, in addition to this (quote) "present time GPM." Case all of a sudden is unburdened enough; pc suddenly looks up and says, "You know, I never have accepted the present time GPM as my GPM."

"Oh?" [laughter]

There's some English family that my family was connected with at one time or another; they had a beautiful coat of arms. It was this enormous rook who was about ten times as big as the castle, sitting on this little tiny turret, see? And the motto was, "Be surprised at nothing." That's a good one to adopt. [laughter]

Thing ran beautifully, was giving beautiful tone arm action. But this is the case of, "Don't repair a case as long as the case runs," you see? As long as that case was running without any difficulty – no repair, nothing, pc didn't say anything. Well, in the last couple of sessions, going down the line, we all of a sudden started to have a tone arm which was parking itself at 5½ and 5.75. Here was trouble. Tone arm action was diminishing. Something was wrong. A GPM had been missed – something is wrong.

However, still didn't make any trouble for the pc, because still getting within the limits of a permissible tone arm action and RIs and making it all right till all of a sudden it's the pc who itsas it. Says, "I never have accepted the present time GPM as my GPM."

"Oh? All right. Very good."

Took the second GPM from present time, which had already been run out but which was obviously an actual accurate GPM or it would have wound the pc around a telegraph pole; assumed that it must, therefore, be the second or some such order; and although it had been found by opposing a wrong GPM, it still was the second GPM. Did a goal oppose list against it of a page and a half long; found the right present time GPM; prepchecked it – almost blew the meter apart, such fantastic tone arm action – went up, counted the number of RIs in it...

Here's the trick for you. How many RIs has this thing got in it? Has it got five, six? You see, truncated present time GPM would not have the full complement of reliable items. So, well, how many does it have? That gives the pc some idea of how to list it. Is it up to the crossover – the middle of it? Or is it up to the top or is it still on the winning side, you see,

toward the bottom? Gives the pc an idea of where to list. "How many RIs has it got in it? Has it got two, four, six, eight?"

"Th-th-th-th-th-"

"How many RIs?"

The pc says, "Th-th – I think six. Yes." And six is rocket reads. There's six RIs in this GPM.

"Fine. Let's list for the top terminal."

And bang! bang! bang! and the pc gave me the first service facsimile found on the pc. Slightly different wording, but there it was, rocket reading like a bat, man! Just going to – bingety-bang. And it just checked out as the top form – opposed it, opposed it, opposed it, opposed it. In three hours and about a half, or something like that, of auditing found that top GPM on a repair basis; found it, found all of its RIs and two RIs that had been missed in the second GPM. The two top RIs had been missed because they were too closely connected with the missing GPM. Threw out the old present time GPM; it now proved to be no GPM even though items had been found. Items had been found but they'd been pulled out of implants and from other actual GPMs. That's where *its* items came from. There was a whole phony GPM sitting there already listed, see?

The other one now in place, pc running like a startled gazelle, tone arm moving between 2 and 3, no longer assuming the heights of 5½ or 5 or anything like it. That's about three hours and a half for the whole operation.

All right. There must have been a lot – lot of auditing going on there. Yes, there was an awful lot of auditing, but it was basically this: Pc said, "I have never accepted the present time GPM as my GPM." And I'm sure that this was as much a surprise to the pc as to the auditor. The pc up to this time had more or less bought it but had some dim objection. But coming up scale enough to actually recognize but didn't accept it, don't you see? So there was a correction which could be done, but only when it had to be done and only when it was pointed out by the pc that it was going awry. Interesting.

Oddly enough, learned something else at the same time. All of your long RI lists – all of your long RI lists – are from wrong items. We already knew that with 3M2. We knew, but we knew it this way. You look up the line plot and find an item ticks. If the item ticks, then the list it came from is incomplete. That's the rule. Well, actually you can do that a little bit better. If you're listing a list and your pc ARC breaks, the item is – tends to be rather long – the list tends to be rather long and you don't seem to be able to find anything and nothing will stay in, the pc is ARC breaking on overlisting and that sort of thing – you are listing from a wrong item. That solves, actually, long lists in listing for GPMs, quickly, for the auditor. It'll help an auditor an awful lot to know that.

These are little gags of one kind or another; they actually become very forceful rules. We knew before how you did this – you checked the items out. But that checkout is not actually a totally reliable pit... situation because it might be suppressed. No, it's only when you run into a long item list. And when you run into a long item list and you can't find an item on it and the pc is ARC breaky and he's tired of listing and finds it hard to list, just assume you're

listing from a wrong item and correct the list just before the list that you did. Extend it, don't you see? Get the right item on this. The case will just run off like this and your tone arm action is quickly and immediately restored.

All this is rules of the game, tricks of the trade, ways to make this cat jump. And when you get right down to it from the word go, you have to be auditing every minute. But what is it that tells you? Do you know that there have now been four mistakes on the present time GPM? Four. At one time a bunch of RIs out of the second GPM were run as the first GPMs RIs. All right, that was gotten rid of and got over that. Another time, tried to go up into PT with this present time GPM – that is, get closer to PT, find items that were apparently missing and read that items were missing – so ran a bunch of irrelevant items which didn't even belong in that GPM, see? Earlier had made two mistakes of a minor nature. But nevertheless, this all added up into patch-up, patch-up, patch-up. Well, fine. But the pc getting tone arm action of a flying nature all the way. And the case is only being patched up when the case has to be patched up and the case isn't being worried to death all the time.

Now, how can one go ahead and do that? By knowing the anatomy of a case, not worrying about this case but just knowing the anatomy of the case and having some idea of the number of lousy mistakes that you can make in running R4M2 and just accepting that as a liability. Since it's not really the auditor's liability, it's the inability of the pc to perceive sufficiently to let your meter read just *below* that level of perception. Your meter always reads just *below* the pc's ability to perceive. Your meter can read *more* than the pc. It is sub-itsa that you read just below what the pc can perceive.

Now – now – now look at this, look at this, because there's another piece of this. Your meter is not under any circumstances going to read *deeper* than the pc sub-itsa level. If the pc has got, you see, can read – pc can itsa at a certain level and then the meter can run at a sub-itsa level and itsa just below that level – that is a constant distance – the distance between what the pc can itsa and the sub-itsa line. Do you understand? That's a constant distance. And when the pc can't itsa something at all, of course, the meter can't itsa it at all, don't you see? So as the pc's ability to itsa improves, of course, your meter's ability to sub-itsa improves, don't you see?

So until you've got that well improved, don't start cussing your meter, just recognize what – what this limitation is. Until that's improved, you're going to make mistakes. It's inevitable that you're going to make mistakes because you're running there at a sub-itsa level which is unbelievably close to the surface and you've got GPMs piled in like mad. And in actual fact, the present time GPM was *not available* in this case until half of the GPM it was pinned to – the third from the top – had been run, because they are so close together – their harmonic is so close – that they were entangled and smashed together. Couldn't be sorted out. When you run half of it, all of a sudden it sorted out.

Pc at this time makes the announcement, "I've never accepted the present time GPM." That's because the other one is now free, so it's knocking on the corner of the skull, saying, "Hey! Tsk, tsk!" So the pc says, "I wonder if there's something wrong with *this*, because that seems to be knocking around here." Do you see?

So inevitably, inevitably, you are going to make mistakes, if you want to call them that, in running R4M2. Inevitably. Because you can only run as deep as the meter can sub-itsa. That's all the deeper you can run on the case. And the case is so jammed up and the itsa is so close to the top, particularly when you start the case, that of course perception is very difficult.

Now, if the perception of this is very, very difficult, how thorough does your information on what it consists of in its basic mechanics have to be? Are you in any position at all to be fumbling around with, "What are the basic mechanics of GPMs and the mind and so forth and what does the mind really look like?" Are you in any position to be fumbling around with that when you already got these troubles of the pc can't itsa any corner of it and the thing is so jammed up and overcharged that we can't sub-itsa with the meter worth a nickel on it and we're making mistakes with – there – at the same time, do we have any time to be coping with a noncomprehension of what we're handling? Well, the easy part of all this simply hangs up on this one fact: The comprehension of it is simple because its anatomy is very simple.

The mind could be a very fancy... You could probably write billions of words describing the number of phenomena and significances and odd bits and types of this and that in the mind. And they're all very interesting curiosa. And a very accomplished auditor would know about an awful lot of them, because he would have run into them at one time or another.

But a few minutes ago in this lecture I was able to sum up everything in the mind in a relatively few words – that is, everything in the mind that has any bearing on aberration or is touched by auditing when auditing is successful.

And it's just a little hatful of stuff; it's just your thirty bricks – the goals, that sort of thing. But those bricks can get tangled up with the implant GPMs, you know? They all have goals and they'll rocket read, too. They actually derive their force and rocket reads, by the way, from the actual GPMs.

You got these various things; there they are stretched out. Your pc's got them, except the probability of his twenty [thirty] bricks – even though he's lived them and laid them out – the probability of those things being in a string or being undisturbed, of all the items being neatly in the proper brick, of all the bricks being separate – the possibility of this occurring is not remote but nonextant. There's no slightest possibility that this is going to be the condition of the bank when you begin to operate on the bank. It's a jam mess. A jam mess.

The GPMs have helped jam it. But the pc has been enthusiastic in jamming it, too, one way or the other. These things have gotten pulled out this way and pulled out the other way and pulled off some other way and chipped up this side and hauled down that side, and so forth. Oh, they're all neat. And when you audit them they go all together like a well-oiled clickity-click machine. If you've got GPM eighteen and you've run everything down to GPM eighteen, then you can find the top – the top oppterm and the top terminal and every RI in it just as neat as you please, right down to the goal as an RI; the whole thing will blow down and blow up and that's the end of it. Oh, yes, it'll all perform – it'll very, very neat.

But your difficulty comes when the eighteenth brick from the beginning of time is pulled up in advance of the present time GPM. And your listing for the present time GPM

finds the eighteenth brick, "to be God," you see, something like this, you know? Good, sound present time GPM, you know? Crunch!

Present time GPM: "To not use my powder puff so often," you know? [laughs]

There's ways of recognizing these things. And when you – when you get this stuff really down, why, you'll see what these things ... But it goes together just like that. There's less to learn about it than building a mechanical toy or building a little block house out of kids' blocks – there's less to learn about it than that. But the point is, learn it and respect what you've learned – understand what it amounts to. And then you've understood – you've understood all the basics of existence. This is what somebody is doing. This is how he did it and this is what's wrong with him. This is what you're untangling and this is what you're straightening out and so forth.

And a solid command of this delivers a fantastic amount of ease into your hands, at whatever level of auditing. This guy comes in, he's going "*Rrww, rrww, and smmmllll-daa-daa-daa-raa*" and so forth. And this is only Level II you're doing and so forth. Let's do an ARC break assessment on a List 4, phrasing it in some way or another – "Has a goal of yours been disturbed?" You know, "A goal of yours that has mass with it, has that been disturbed?" It'll register in some fashion or another and pat some GPM back into place, see; straighten out some RIs that he doesn't even know are RIs. You could get very, very smooth at this kind of thing. You could practically put him back together again without auditing anything, don't you see?

You should be able to handle these things well. But basically you should be able to understand these things and you should be able to understand the mind as the mind, as a mechanical piece of stuff; not as a bunch of significances and not as "a divine creation which is given man to speed his learning and thinking and has made man into the being he is today, lord of all creation." [laughter, laughs]

Just deliver some of that understanding into your hands and you'll have a lot of luck with pcs and so forth and you will be disabused at once of tremendous worry over your pc. Because you'll be able to perceive much more rapidly what's wrong and at the same time deliver into your hands a lot of power to get results over your pc. And those two things are very desirable, as I think you will agree.

Thank

you.

ROUTINE 4

A lecture given on 29 October 1963

Well, winter has arrived and you are all ready now with your mukluks and parkas but there'll be no dog sleds. They bark, you know, and interrupt sessions and so forth.

What's the date?

Audience: Twenty-ninth. October.

Twenty-nine October, AD 13, Saint Hill Special Briefing Course.

[part missing]

Well, I was going to talk to you today about R4, but you look a little weak. And I better talk about it anyway.

Now, if you only knew the truth of it, the whole mind is composed of R4. And you can get somebody into more trouble with incorrectly done R4 and somebody into more high levels of beingness with correctly done R4 than anything you've ever seen.

This R4 doesn't compare to being shot, being burned alive, being dumped out of high buildings, going through wars and things like this. It's much more effective on a thetan.

The truth of the matter is that every now and then somebody, relatively expert in auditing, who is doing R4 or some old-time pc, also an auditor, who is being run on R4 will look up and say, "My God, how could raw meat ever do this?" And that's the truth of it. They couldn't. And I've just been through – we're right up to the top of the bank fooling around with my PT GPM and so forth and – I've had a lot run out below it, but moving in on the thing for the kill, you see.

And we were sitting there doing an analysis of having missed the present time GPM and gotten into a muck which consisted of running items without having the GPM with a shut-off RR, see. The RR had shut off.

The only thing that shuts off an RR or R/S or falls or stills the meter or anything like that – the only thing that does this – and I underscore that's a terribly important datum for you – is running items without having the goal. And they shut off, clank! Off goes your surges, off goes the lot, off goes your TA action, off goes everything else and especially the RR. That goes off. Your R/S shuts off. In other words, your meter becomes completely inoperative and inactive.

And the only thing that does this sweepingly with a crash and an exclamation point, the only thing that does this, the only thing that does this... I – I wish to God that when you're looking at a stilling meter, a meter that's going still on you, you're doing lists – not a goals

list, now, that naturally runs out of its RR, don't you see, and it runs your tone arm action out of the list. I'm not talking about that, you see.

But you're doing items. You're doing items. It's an item list and you're doing items in... you see the – the needle is getting less active. *Aaaaaah*.

Now, if you're very, very clever, very, very, very clever as an auditor and you're very, very observant and you're right on your toes and you know your business all the way through, you're just grooved, man, grooved, you all of a sudden will – will watch this phenomenon. And the funny part of it is, the next slash is slightly less, the next RR is slightly less, the next RR is slightly less, the next slash is slightly less, the next blowdown is less, don't you see? See, you can get a good – you can be fooled, you see? – you can get two good blowdowns on items, then the third item – and it doesn't blow down at all, hardly. And then the other one doesn't blow down, and so forth. See?

But the slashes and the reads of the needle is what you're really taking here, not the blowdown. And you all of a sudden see that you're looking at a stilling meter, you're running a wrong goal.

You are busy, busy, busy little beaver getting items out of a GPM for which you do not have the goal. And the pc will go, not necessarily creak – this isn't what turns on the creaks, it's bad enough, a lot of things turn on the creaks – but the pc feels like he's getting in a sort of a dry sandpaper. Mass is getting very, very thick, and things are getting very heavy and so forth.

And the next thing you know, why, he just goes stuck and he'll go completely leaden. He'll feel just very leaden. He'll feel like he can't think and can't act, can't operate, can't spark and oddly enough, he won't necessarily ARC break. How do you like that?

He just sits there woodenly. You're running in a GPM "to have fun," see, except you're calling it "to be sad." Doesn't even have to be that far opposite. It's just "to be funny." That's good enough. "To have fun," and you're running it as "to be funny." That's enough.

The next thing you know, surges getting less, meter getting less active, everything getting less active. And you find another item and you find another item and you've got less action and less surge and less this. And you knucklehead, you then went ahead and found another item and you found yourself looking at a completely stuck, still needle. No matter what you do with that needle.

Now, of course, the thing to do, isn't it, is to immediately put in all the mid ruds. That – that's the best way to then clobber the pc. Put in all the mid ruds. Of course, that – that's something like pouring gasoline on a fire. That's just nonsense. Nobody can suppress that hard. *Can't* be done. And you do your regular bypassed charge because you can't get anything to read now and you'll get a nice flick on "wrong goal" or "incorrectly worded goal" or something like this.

And there might be a much stronger one lying in your case analysis form such as "Are we..." – because this is the most serious thing that can happen in auditing – you can add a line in there that says something to this effect – something to this effect: "Are we running items out of a GPM we don't have the name of?" Some such wording, see?

You haven't got the name of the GPM, you see. You haven't got the goal for the GPM and you're running items on it. Well, that will lock up a case gorgeously. Now there's only one cure for this. One cure. There aren't any other cures and this is not necessarily a difficult cure, but there is only one, one, one. And that is: Find the *right* wording for that GPM. Find the right goal for that GPM, see?

See, a GPM is a thing. It's a great, big, massy island of mass, black and uncouth and filled full of items which are all opposed to each other and it's all packed in like mad. And if you had one of these things in here – it – because a thetan is mocking it up, you see, it doesn't necessarily have a lot of weight.

But as you get one in the middle bank, why, it's about 65 feet long, about five, six feet thick, maybe 20, 25 feet wide. And it is a thing, in other words.

It's a rather uncouth looking thing. Big slab and irregular edges. And if you had a tractor someplace and pulled one of these things out into the front yard, you see, it's just mass. And it's just mass. But the significance of that mass is its goal – is the goal. "To... (something)" or "not to... (something)," and it's much easier to run implant GPMs than it is actual GPMs because implant GPMs have predictable wordings.

An implant GPM is "to spit" or "to be spat" or something like this, you see? It's always "to be" or "to not" is about as complicated as an implant gets.

"To not be," see? "To be cold." "To not be cold." Seldom the nots. The nots are very infrequent in implant GPMs. It's more likely "to be warm" versus "to be cold," see? And "to run" – that isn't an implant GPM but that would be the sense of one. See, nice and simple.

It isn't the end wordings that's simple. It's that "be" that is simple, see? It's either a "be" or it's missing, see. It's "to move," see, or "to be moved." See, that's the total – the total. There is no more variety, see? There's no more variation in these things. They're quite predictable.

Somebody that's listing for implant GPMS, say, "To have a very good time" and so forth. Kick his shins. There are no such implant GPMS. Couldn't be. See, that's – carried forward by the limitations of those squawk boxes, you see, and those things had to put out a meaning and they had to put it out briefly, and electricians are expensive and people who implant are chichi, see.

They always follow these very, very simple patterns. But an actual GPM is a horse of another hue. Now, an implant GPM doesn't have one of these big islands with it. It's more like an alley. Actually, it has black mass connected with it, but it's more like a little alley. It's a couple of – well, it's a couple of rows of parking meters or something like this. Sometimes they're all centralized in one location with the snaps and bangs up on the poles and the squawk box – speaker box right on the platform they put the thetan on. These vary, but they make a little bit of a mass, see?

They do make a mass. And a thetan who's relatively uneducated, and even one who is pretty well educated, sometimes looks at an implant GPM and... because he's in the middle of it, don't you see? All cats are black, you know, and you can't see out of the middle of a small dark room any better than you can see out of the middle of a big dark room, you know?

That's the same – same piece of business. You can't see, in other words, so you don't know what you're looking at because you're sitting in the middle of it. And an implant GPM looks like it had a little alley about three, four feet wide, but longer. But longer. It looks much longer. They're normally about seventy-five feet or eighty-five feet or even a hundred feet long, you see? Sometimes longer than that.

Thetan stuck on a pole was pulled down between these things, you see? And once in a while you think the pc's running an actual GPM and he says, "What is this parking meter?"

Well, this is not necessarily meaningful because the implant GPM might be part of the RI which you're running out of the actual GPM. You see, the actual GPM is enormously senior to an implant GPM. Implant GPM has the power to aberrate of key-in. It has no native power in itself to aberrate all by its little old lonesome, because it isn't that strong. It doesn't amount to much.

Oh, well, you getting stuck in the middle of them with the pings and the bangs going from left to right and your jaws are hurting and your eyes feel all inflamed, and so forth. There's nothing to be sneezed at. Has about the same power of aberration as breaking your leg or something like that, don't you see?

But I suppose any pc has got 8,760,272,943 ½ broken legs, and he's still functioning somehow or another. You see, it's quantitatively nonsense. It doesn't matter. But here you've got a situation where the pc's sitting in the middle of this implant GPM suddenly doesn't recognize what it is as an implant GPM because it's all black mass.

Well, the black mass, oddly enough, is his suppress. The black mass doesn't much come from the implanters. It comes from the suppression of the thetan. You put the button Suppress in very much on implant GPMs and you'll wish you hadn't.

Engrams and implants you really mustn't run mid ruds on. They mush and they do bad things. If you run an implant GPM putting in lots of mid ruds, why, you'll very soon be in very sad trouble as an auditor because the mass is beginning to mush and so forth. It can't stand up to it.

It's not true of an actual GPM. It's not true of an actual item. These things are big, strong and tough and you can run all the mid ruds you want to on the things and you're not going to get in any trouble.

But getting back to what I was saying there, the individual running a wrong goal in an implant GPM actually gets a similar effect. You can run out of RR and RI if you're running 3N-implant GPMS, you see? See, you can get the same effect. You can run out of RR.

You think the goal is "to be cold," you see, something like that. And it's actually a bit worse than this. It's "to be dead." Rather common goal, "to be dead," in these implant GPMS. Seldom "to die." Usually "to be dead." In fact, I don't know of any implant GPM which is "to die." They're all "to be dead," you see? It's very easy.

But getting back to what I was talking about there, you get into trouble just running the wrong goal and implant GPM. What do you think happens with this great, big mass for which you don't have any name?

Well, you can start running items in it because the pc has no guide, he doesn't know where to go, he doesn't know what the name of it is and so forth; he's going to go over the hills and far away. And he's going to go into other implant GPMs.

And very shortly – running an implant GPM will happen this way, too, but in an actual GPM, this gets very serious.

You're running a goal with no name, see? You haven't got the goal. You're running the GPM and you haven't got the goal for the GPM, and you run RIs and now listen carefully: It isn't so much a problem that you run out of RRs, see, and blowdown, you know, and needle action. That is not really the problem.

The problem is that you almost never find – almost never find the item for that GPM. You usually find an item in some other GPM or an implant. If you haven't got the goal... in other words, it isn't just that your slash and surge and all that stuff shut off on your needle. It's the fact that you now give the pc the wanders. And with what ease you will pull in an item out of an implant GPM. That's very easy to do now. You have no guide, you see, so the pc will pull an implant item in and then you oppose that in some knuckleheaded fashion and you – you all of a sudden will find an – your hair should start standing on end now – you'll find an item in some other GPM, actual GPM, see? Not even the one you didn't have the goal for. You understand me? You're already running one wrong, see. You haven't got the goal for this GPM. But now because you are finding items in it, you are very likely to pull an implant GPM into that GPM.

Now, you got that? That's bad enough. Now if you persist, you then will pull... this is great stuff for an auditor's nerves – it – if an auditor can live through these R4s without going mad and if he – if he can hold his coffee cup without it slipping out both sides, while auditing this on somebody, why, we call him a steady auditor. Only slipping out one side, we pass him, see? Nervy stuff. Because you see, the next item you find is going to be out of another GPM; out of another actual GPM. So that brings – now, it's all right now at this point to start looking pale – this brings another GPM out of line and pulls it up and yanks it into the GPM you haven't got the goal for. Got that?

Now, as you oppose this one, since you're already skidded on the track – it isn't that you just don't have a guide, it's just that there's some – actually some mystery about all this... How come all these things go wrong when you just don't have the goal for this GPM?

Well, it's almost – it's almost magic how wrong it can go, see? It isn't that the pc just doesn't know. Just don't put it down to the fact well, he doesn't know what the goal is, so he doesn't know what item to list on it. It isn't there.

These other things just go wrong just for the hell of it all on their own, see? So now you oppose this one. Now you've got another GPM in here, see. You've already pulled an implant GPM into the actual GPM.

Now you've got your next item and that took a GPM down the track up here 65 feet, 5 feet high, 20 feet wide; and that towed that up the track and pulled that into this GPM that you didn't have the goal for. You got it?

Weirdly enough, pc's still in the GPM you don't have a goal for because there's where he is dying, item by item, see?

All right. Now – now we oppose that. We oppose that one and we're very likely to reach way to some other corner of the bank and tow up another actual GPM and pull that into this one.

Pc by this time, he looks like he had a cross between yellow fever and typhoid or something like this, but at this point, of course, he ceases to be certain of his auditor. For some reason or other, at this point he has some lapse of confidence. And he doesn't necessarily, oddly enough, ARC break. He just gets puzzled and starts to whatsit like mad and he'll say there's lots of things he doesn't understand about what's going on. That's usually what you get out of this kind of a mess.

He doesn't quite understand what is going on. Well, of course, the auditor at this stage of the game, if it's a very persistent auditor who knows he had better get on with it and get his job done because the thing to do is to find items, you see, doesn't notice this tone arm is motionless by this time, you see? And is likely then to go on and compound the felony and pull another series of implant GPMs in on top of this one.

Pc by this time can recognize nothing, see nothing, have nothing to do with anything. Got the idea? I mean that's – that's – it's too horrible for words.

Now what happens?

Well, actually, your proper action is to find the goal for the GPM you thought you were working with in the first place. Your proper action is to do everything you can to find that goal whether you had to do it by represent lists or inspections of the meter. It's very tricky. You can ask does it have something to do with the subject matter, you see, that you're already handling.

You thought you were running "to be cold," don't you see, or something like that. And your subject matter, "Well, does it have something to do with being cold?" or "Does it have anything to do with cold?" and so forth. You can get a fairly good rendition off of your meter; you can at least block it out, you see?

And you can say, "Well, give me some represents," you see. "Give me some goals similar to this goal," or something like that. You're not really doing a goals list. It doesn't follow the rules of a goals list. You're just tinkering with this thing, trying to put it right and find the goal. You'll find yourself doing this every now and then, particularly if you didn't do a good thorough goals list job in the first place.

There's no substitute for a good goals job in the first place, see? But nevertheless, even though you do do one, you occasionally run into this other condition.

Now, you think that's the end of it. You found the right goal and all of a sudden *ahhhaahhhhh*, the guy's RR. You see this thing, the goal RRs and you can tell it's the right goal because in this particular instance the only thing that will turn back the RR is not some similar goal – a similar goal won't turn on an RR. It's got to *be the goal*, you see? Right down to the last comma, see? It's got to be *the goal*.

And you read this and you see the thing RR, you know you've got it because the RR is back on, see? You won't find some other goal. Nothing will RR until you find that right goal. Interesting, isn't it?

And now, because you've sinned and went on and on and on without having the right goal for that GPM, you now have to take every one of those items and identify it, analyze it, identify it and put it in its right place, and try to pat the track back into some kind of condition.

And you do that by asking, "Is this an implant item?" "Is this an actual item?" "Is this from the GPM we were working?" "Is it from some other GPM?" "Is it a lock on an RI?" "Is it a lock on an implant RI?" "Is it a lock on an actual GPM RI?" "Is it something or other?" You see, you just go on with questions of that particular type and you get that thing identified, and all of a sudden the pc will say, "Ah, oh, well, yeah. Ha-ha. Well, yes, yes." And you suddenly see your thing start to blow and a 65-foot-long GPM is hooked up and it starts moving back into its right place.

You've got to undo this ball of yarn that you have undone and tangled, see? You've got to undo that tangle and put it back into its proper order again. That sounds pretty wild, doesn't it. It sounds pretty wild.

It's things like this, and this is only one of them. I want to cheer you up today, in cheery mood. Really, the first day of high furnace heat. I just want to make you – make you feel happy about this whole thing. That is not all of the problems connected with R4. That's just one of them.

It will happen to your pcs. Don't think you can avoid it. It'll happen to you as a case. It's fairly inevitable. It's happened to me twice, and – three times, I think, in running an awful lot of GPMS. But all of a sudden, why, notice that the auditor's gone white as chalk, not feeling too alert yourself, you see? And start to run a whatsit and it turns out that your RR has been shut off for the last item or two. So it can happen, don't you see? This is not an unusual action. And just to cheer you up, is only one of the problems connected with R4.

It's not enough to be an expert. That's the first lesson you've got to learn. You be an expert and then work like hell from there on. First be an expert and then work like the dickens. Because you'll find that an auditor who's an old hand at running this type of – this OT-type processes will give you this – will give you this as a maxim. And you yourself one day, regardless of whether I've told you this here, will one day be sitting there after a complete – particularly arduous session, and you will come up with this as a datum, and so forth, all on your own bat as how you run it.

You do the very best you can. You do everything as best you possibly can. And then you cope with the things that go wrong. You don't try to run a total perfection. You don't try to run this right from scratch, perfectly, with the expectancy that it will be perfect. You try to run it perfectly with the expectancy that every now and then you, canoe, barrel, pc, are going to go over Niagara Falls, see?

You can expect your pc to, one fine morning, not appear. And when found they will be staring emptily at the ceiling in a total creak. And everything looked right on your meter and everything was the best you possibly could do and so on, and yet this occurred.

Now you've got the task of unsnarling what you don't know is wrong yet. You don't know what's wrong, and yet you have to unsnarl it. So you have to find out what's wrong and unsnarl it.

Now, there's no real sense in getting superemotional about it. That is what you can expect. You do the best you can and you cope with the things that go wrong.

And there's no sense in thinking, "Well, this is all just a walk in the park, see? There's nothing to it, you see. And you just sit down and Ron's given me some little rules here, and it's all fine, and I can just put the rules in the chair and they'll run the case and we just sit back and itsa the whole track, you see, nicely and the pc emerges at the other end, OT."

Well, unfortunately that is not the case. That is not the way it's happening. And I can tell you that there is absolutely no faintest possibility, no faintest possibility at all of that condition improving to any great extent. I can give you absolutely no hope of any kind that technology will move an eighteenth of an inch beyond that deadline.

R3M2 has been in existence for a very long time and has been run in a lot of areas. It is being improved. I can give you little tips here and there that have improved the living day-lights out of it. Recognize a new way of recognizing something wrong, don't you see? Something like that.

But there is no substitute for an auditor here and there is no possibility that the technique or auditing it will become any easier in the future. Because the tips I can give you still require an auditor. They still require the same address to the case and the hurdles are still there. And none of those hurdles are going to be mounted by any little set of rules. Any new set of rules, rather. They're not going to disappear simply because I tell you that there is a new address to this particular problem.

Those hurdles are there. And the reason why this hits this horizon and the reason why this process is in this condition and will continue to be in this condition is the matter of a meter.

The meter reads just exactly the same distance always below the pc's ability to itsa. A meter will not read any deeper than that. The sub-itsa. In other words, this meter can see further into the case than the pc can itsa. Well, that's a godsend because it, in actual fact, can see far enough to barely get us by.

As the pc's ability to itsa improves, the sub-itsa level on the meter rises. This is a constant distance. The meter is never going to see deeper. Now, I've experimented with meters for a long time. I'm going to make a very, very antipathetic statement to any research man when I say this meter is not going to be improved. See, that's antipathetic to a research man.

He likes to sweep statements like that aside. Remember, I've been trying to improve this meter. We've been working on this meter one way or the other. We have spent quite a bit of money and time in very recent times trying to improve meters, and the limiting factor on

the meter is a mental factor, not an electronic one. And that is that the individual itsas at level A and the meter reads always then at level B. And as you cannot develop a meter which is more sensitive that will then read to level C. Do you understand?

And this meter's already at the zenith. You get anything – you get anything more sensitive than that meter, it gives you more trouble and has more variations and vagaries on it and gives the auditor more trouble than it gives him help, don't you see?

So as you begin to make this meter more sensitive, as you begin to switch around and change and alter various factors in it, you start entering in various other things.

Now of course, the modern medico approach, Pavlovian, he's got the answer. You stick the electrodes into the brain of the patient. I've had these dogs actually propose this seriously as a solution to an E-Meter.

I mean I'm – I'm not joking now. That we use an E-Meter whereby we bore holes in people's skulls and put the electrodes into the brain and this gives you a more sensitive reading.

Now, I've tried to inform these fellows, "Haven't you slightly mistaken our purpose? We're not trying to kill the patient. We're trying to help him, you see?" And these fellows look at me with complete blankness. They had never realized that we had any idea of helping anybody. Why, they thought we were just trying to find out.

Now, therefore, you can look at no real help from the electronics of a meter. There wont be any. You can put these things... we've tried oscilloscopes – but these things have terrible liabilities. I think if we'd invested a billion dollars, we would probably come up with a slight improvement. We would probably have moved the B below the A maybe a thousandth of an inch. See. Hardly worth struggling for, see, the improvement.

You can put oscilloscopes – great big – you can imagine you auditing with an oscilloscope, you know, great big dial you see here and the thing is going back and forth, you know? And you know these old singsongs where you have the ball bouncing off the words, you know. This thing going back and forth, you know, and ...

I'll tell you something about that. Societies sufficiently electronically advanced to conquer space and to put a spaceship through the air at trillions of light years – trillions of light years an hour, that fast, have not conquered two problems. They've never even come *close* to the problem of the human mind or any other mind, never come close to it. It's something like a small boy shooting at a squirrel in Germany by being in Denmark, see? Not even a miss, you see? Just another state. And they have never conquered space communication.

These very fancy spaceships can go so much faster than light waves and so forth, they can never telephone home and say, "What do I do next, Joe?" You know? That's what causes the warfare state of this universe: the inadequacy of a communication wave. You can never communicate to anybody.

Space fleet sent out is, of course, immediately beyond any possibility of communication or control. This and that and the other thing. A lot of problems add up around this sort of thing.

If you have a crash, for instance, even if your telephone or radio was preserved and so forth, you would never be able to call home and say, "We ran into a telephone pole, Joe. Send the wrecker." That's the end of that. People look for you for a long time on your predetermined course lines or something like this.

The answer to communication is life – a living being. And you can always, of course, release an individual from a wreck to return to base and tell the boys what happened. This, by the way, is the only method which is used in space opera. Didn't mean to get off onto space opera, but I'm just giving you relative development. So they turn the guy loose out of the wreck and he goes home and he says, "Hey, the boys are wrecked over on Pluto." That's the only answer they've had to it. But they couldn't improve that because they didn't know anything about life or the mind. Ho-ho. Interesting, isn't it?

Didn't know anything about that, so they couldn't improve that which left them totally, really without communication because the times you can exteriorize somebody and send him back to Pluto or send him back to home base from Pluto and so forth, reliably, he'd have to be in pretty terrific shape. But this has a limiter on it.

The second you apply a real science of the mind, you get powerful beings and you get fellows who are very able and capable and that sort of thing, and one, they wouldn't be riding in a spaceship to Pluto, so the situation is actually not a neat statement. It can't be made as a neat statement as you unprove one or the other. But these two things have never been improved. Communication in the universe runs up against a factor of this particular character and knowledge of the mind. And that has – oh, they've done quite a bit in this particular direction. They know how to implant people, and so forth. But – they can make people worse, and so on, but making them better: the easier route is to make them better. And yet they haven't been able to do that.

So those are dead-ended lines. And it's my contention that if the great electronic civilizations where the way you get your coffee in the morning is to roll your head on the pillow, you just roll your head over to the other side of the pillow and sleep for a few more minutes and the coffee appears on the side table, brimming hot, exactly to the temperature you like to drink at that particular moment, you see, and simultaneously, why, the living room is swept up and somebody has informed the office you are now awake and the... you see? Any gimmickry that you can possibly think of, you see, way in advance of any gimmickry we've even dreamed of on this planet, you see? If they haven't been able to develop anything that reads the mind, we haven't got a prayer. See? That's as far as... because we're dependent there on another line of science. We're dependent on the electronic development of the age.

And that we had managed to milk this out of the electronic technology extant in this time and period is absolutely miraculous. Absolutely miraculous. And that the – what somebody laughingly called the other day the United States government – busy seizing, trying to seize this, is actually no accident at all.

That, by the way, isn't a very serious suit. I just got a full report on it in the midst of everything else, and the last two weeks have been legal weeks. And that isn't now considered a very serious suit. If it ever went up for trial, we'd win it like that. They can't find anybody to

testify. Even people we've ARC broken, upset and so forth won't come in and clobber us. Government's having a hell of a time. Feel sorry for it. The poor government.

I don't happen to have any items in that particular line. I'm developing some. [laughs, laughter]

One of their ideas of fighting this case, by the way, was showing that I was mad because I thought tomatoes talked. These guys can't even read, you know? Well, we expect – I always knew they were lip movers, but I didn't think they just couldn't read anything.

Anyway, they're trying to clobber this meter. Trying to clobber this meter. This has given me some puzzlement as to why they were trying to clobber this meter because I wondered if they weren't getting orders from someplace or something, you know? I was trying to puzzle this thing out and then I thought well, they're just nasty tempered, ignorant louts, and that explains it, so I'll just let it go. The fact is – the fact is, this meter has been eighty years in existence. This is not a new meter. This is an old thing, but we've grooved it up and sensitized it up to a point where it performs our function. We know more about these things than other people have ever known about them.

We know the voltage it best operates on, and nobody ever dreamed of running these things before at 7½ volts or something like that. And we've done a lot of – lot of work this way, and all this is limited – limited technology because it's limited by the state of development of the period in which we live.

So just take a tip from me. The possibility of your meter getting better – from a standpoint of its guts – and therefore reading deeper on the pc than meters now read is not improbable but nonexistent. Forget it.

Now, I stirred up – stirred up a cup of genius the other day and whipped up a meter that makes it easier for you to list, that it's easier to handle and that sort of thing. That's – and that's in production. I saw the prototype of it the other day. But that's in design. That has to do with physical design of the case. Has nothing to do with the guts. And there's a glass pane, and you look through this glass pane to write your list and therefore you don't have to look sideways and develop that mirror inside the cornea. And this is a very tricky meter. It's a listing meter and you look through this meter and you see the needle floating in thin air on the glass panes, you see, and you look through these two glass panes and your hand is here on the other side of the meter so the thing actually is – it's a little thing. It's much smaller than this, by the way. It's like this. And you look through this in order to write. And of course your line of sight passes through this floating needle. And of course, that needle can't wiggle without you seeing it, see?

And it goes out of set, that sort of thing, why, of course your thumb is right there, bang! because you see that it's out of set. You don't have to pick your eyes up off of what you're listing in order to see if you've had a read on it, in other words.

There are various adaptations of this. This meter, by being wired just the other way to, could be set in a desk – now they're getting really fancy – with a projection light underneath the meter, with the knobs that controlled it over here someplace, and you would have the

shadow of the meter projected on the paper you were writing the list on. It's actually the same meter. You hardly have to change it at all to do that with.

This is very fancy, don't you see? Now, if you took that meter and put it in a desk like this so that it projected its light against the back of your list and you had a video – not a tape recorder, you see, but a video that gave you the picture and everything, and this video machine was running over here and that just had a couple of click buttons, it would be so rigged as to take a picture of your meter, you see, while you were auditing the pc and record your voice and the pc's voice and make a total record of the session, don't you see?

Now, if that video was improved electronically a little bit further, why, of course, every time you moved the tone arm, it would put a certain number of clicks on the video tape and then by running the video tape back through, why, it would also give you the total down divisions of TA for that particular session, you see.

Now, you could fix this up so a Coca-Cola would also appear, probably chilled. [laughter] You see the direction – you see the direction this could move from there on. We actually cease to deal in sensitivity or workability of the meter and simply get into – into flubber-jubber stuff. Foofaraw. Word of another age and time.

Anyway, this little meter with the pane of glass in it answers all these things. It's very lightweight. It's tiny. It surprised me that it could come up so light. And it's a lemon – the plastic on it and so forth is lemon-colored. It's rather – rather smart and it comes in a beautiful British leather case. Gorgeous, gorgeous case. But that case isn't going to read your pc, see. And nothing else is going to read your pc, and you being able to see the needle better on top of the glass, that isn't going to read your pc any better, don't you see? That's going to make it easier on the auditor.

In other words, your developmental line is to make it easier on the auditor, see? Make it easier for the auditor to read and see what is going on but not actually more sub-itsa from the pc. That limit is there.

All right. Let's look on the – looking further on the horror of it all, your pc is of very little assistance even when he's itsaing. In fact, sometimes quite the contrary. The number of things he will assert then causes these things to read on the meter. He's asserted this is an actual GPM, so when you read it on the meter, it reads as an actual GPM, don't you see? And you don't quickly put in your rudiments and say, "On this has anything been asserted or suppressed or invalidated," or something like that. And then read it, you see? Well, of course, your limitation is you haven't heard him assert anything, so you don't do that, you see? A slippy, sensible auditing approach here.

But what's – what have you got? Your pc is sitting there. He's being hammered and pounded by the biggest, toughest aberrations that he has ever been able to develop and they're flashing back on him in a – in a solid avalanche as he goes through this stuff, and as he's being knocked around. And his itsa is just what he can actually, factually realize. And it's not very high because the thing which is reducing his itsa is what you're running. You see, this is the case of the snake eating its tail. This thing defeats itself.

In other words, you could run these things out easily if the pc could itsa better. But the pc can't itsa better because he's got these things. The thing to do is to clear him and then have him itsa these things and tell you what they are. You get all kinds of wild and silly solutions of this and of course that's an automatic limitation. Now, as far as techniques – techniques that improve this condition, you've had one in just an analysis of what is itsa and the itsa maker and the whatsit line, and TA action and get TA action. All these are just general improvements of auditing. And if you can do these things, of course, you can improve the pc's ability to itsa.

But it improves only to a certain extent. And after that – after that, it can only be improved by R4 because the thing which is preventing him from itsaing now are the items which are contained in R4.

But nevertheless, as you find these items, getting a little more TA action than you would normally get, auditing a little more smoothly, making a – fewer mistakes. Not making no mistakes, but making fewer mistakes, and you continuously raise the pc's ability to itsa, and the job gets very good.

So it requires, basically, very smooth auditing. It's auditing. It's smooth auditing is what this requires. Now, the rules of auditing apply to all R4. And if an auditor is basically a rough auditor, he's going to have trouble. He's going to have more trouble on R4 than he would ordinarily get because he's going to reduce the pc's ability to itsa, reduce the pc's meter abilities, so he won't get the right answers off the meter, you see, and then you get into more confusions and more upsets than you'd – ordinarily wouldn't give.

So it comes down to *basic auditing*. So you got to improve basic auditing and improve your ability to audit basically, you see?

This is the cornerstone on which R4 must be built. We already see a process here which is going to go to hell in a balloon at the least chance, you see? It's going to go bang! Well, let's not make it go bang because of a bunch of fumble-bum auditing, see?

I'll give you an example. Pc says, "You've – I think you've overrun the list. I think the list is too long. I think the item back on the list is 'cheesecake.' Now, I think the item's back on the list earlier, and I think it's 'cheesecake.'" And the auditor is insufficiently alert to see that when the pc said "cheesecake" there was a considerable – there was a beginning of a commotion on that meter, you see? And is insufficiently schooled to realize the list is already too long and goes on nulling down the list and ignores this pc statement, "cheesecake," see? Just kicks that out a window. Just ignores it or plows on further, you see?

Well, you're going to have a lot of trouble there, man. You've now added some more suppress, and you've added a potential... you've got a cut comm line on the pc, and the pc's ability to itsa has been reduced, and so forth. Well, it isn't much in itself, you eventually go back and find out that it is cheesecake. Or you go back and find out that it wasn't cheesecake. But the net result is that the mess has resulted from just unsmooth auditing, see? Pc says something, at least give him cheers and say, "All right. You say it's cheesecake." You audit with the pc, not a system, you see?

You say, "Oh, it's cheesecake. Cheesecake. Cheesecake. Anything been suppressed on it?"

"No."

"All right. Well, I'm sorry. That doesn't read. Doesn't read yet. Might read later, but it doesn't read now."

And the pc's itsa has been handled to this degree and not totally invalidated, you see? And the pc – you very often find out that it was cheesecake. You see, the rolling RR; that's what almost knocks you off. You make that list one item longer, and the RR moved one bit further. It isn't that all – each item has a different RR. The RR all comes from the goal. So the RR coming from the goal, therefore and thereby, operates to move as you list.

So that you went – the item that fell three from the top is the item, and yet you went five down and had another one that fell. Now the RR lives at five. The right item is at three. You call three. You say, "Cheesecake. Cheesecake." And you don't whistle the RR back because it has moved further down the bank and the pc's attention is now stuck deeper into the GPM. And so therefore, you can't get his attention off the GPM and back over to the cheesecake - *arrhhhh, arrhhh* – till after you list it a while longer. And finally the pc puts cheesecake back on the list again or does something like this. And you all of a sudden, if you're lucky, you'll see *cheesecake*, and it'll read again.

Well, what happened is you moved the RR, the rolling RR. You moved that thing out from underneath it, see? I shouldn't be using RR because you don't list by RRs these days. You list by surges.

The stable datum is – it took me twenty minutes or ten minutes or twelve minutes or something like that to teach somebody (whose name I won't mention) the other day, a datum. One datum. One datum. One datum. And that is this datum. And you'd better know this datum. I don't think you will. I think you'll do something else with it and then eventually come back to it and know it.

An RI in an actual GPM is anything that surges, falls or rocket reads while being listed. And that is the point of assumption from which we adjudicate an RI. And it doesn't happen to be true, see? It – it's not a total truth because you could also find an implant RI on the list someplace, you see, and it would read, too. But it's still an RI in a GPM someplace, isn't it, even though it's an implant GPM.

You consider anything that falls, anything that does a – well, you know, surge, RR, any kind of a left-to-right-as-you-face-the-meter action – anything that does that – you assume that any item which when said by the pc did that, that was an RI. That's an RI.

What's an RI? It's an item that does that, regardless – of course, you can now describe it in a geographical position in a bank and what it is and how it composes and compounds and all sorts, and you go into that endlessly. But the truth of the matter is, the point of assumption from which we are operating today in the auditing of items is just that point of assumption. And it doesn't have anything to do with anything else and there is no additive to this, and that is itself. And many of you said, "Oh, now, then when you list, so therefore if something appears on the list..." That isn't what I said. I call to your attention, all I have told you is that we

assume that – this is a point of assumption – that anything which moves the needle from left to right, anything that moves the needle from left to right in a surge, in a fall or an RR – that's *or, or, or*, see – was an RI in a GPM. And that's how we define one as far as it's assumed. If it did it, that's what it is. GPM, see? Elementary. That is it. And that's the RI in relationship to the meter. That isn't even anything in relationship to a list, don't you see? That's just the datum by itself.

You get out of your skull this datum that an RI is something that RRs only, that an RI is something that does this only or does that only or does something else only. You just throw that datum out. Just pick up the lid of the garbage can and dump it in because this other datum is the one we have to operate from to find and work – make R4 work. Otherwise, you're going to get in trouble if you don't operate from this datum and know this datum well.

What's an RI? Well, we assume anything is an RI which causes action on the needle from left to right as you face the needle, which we would call a fall, a surge or an RR.

Now, somebody's going to – going to modify that on you sooner or later. Somebody's going to change that on you or you're going to change that. And the moment you change that, you're going to be in trouble. You're going to be arguing around and you all of a sudden are going to have something on the order of, say, "I didn't think that one inch was a fall. I didn't think one inch was a fall." You get the change of datum? Somebody's going to get around this, see? "Oh, I – I – but it RRed so I didn't really give it to you because it shouldn't have RRed. It should have disintegrated."

You get the idea? You get the number of variations here that can go on this assumption? And just know this about that assumption. That there aren't any, and that's the primary assumption that you have to have firmly in mind with R4. Otherwise, you're going to get yourself in all kinds of trouble.

Now, you notice I haven't said it's something which falls when you call it back to the pc. I haven't connected this with auditing in any way, shape or form. It just lives in pristine purity all by itself as a datum uncontaminated by application. That's an RI behavior on a meter.

Now, if you know that, you recognize that and you see what the score is with regard to that, you're going to have very little trouble. Very little trouble, because this now can be used in listing. It can be used in nulling. It can be used in testing it. It can be used in this, that and the other thing. Now, the basic listing datum which you should use is the first RI or the first item on a list that can be made to fall, surge or RR on being called back to the pc – that's the earliest one on the list that when being called back will fall, surge or otherwise – is probably, we hope, maybe, the item that goes in that position. But that by overlisting we can move the read on the list down.

Now, knowing that – knowing that, you get into a very simple situation here. It gives you a terrific number of one-item lists.

The best answer is to know what an item looks like on a meter. Undescribable. It looks a certain way on a meter for each pc. It isn't the same for all pcs, but it's pretty close to the same for all pcs.

So what you must do is recognize an item when you see one on the meter. But until you do, in listing, follow the severest rule – again, not necessarily – not necessarily the right rule – it's: Don't let the pc list beyond the first fall.

You say, "Well, we'll cut off his itsa if we shut him up."

You better cut off his itsa. That RR will be rolled right on down the bank and the right item won't be – won't be readable now. Wow!

So you get things all arranged with the pc. You say, "When the quarterback says so-and-so and hits the wicket with the cricket bat by saying 'thank you' or 'that's it' or something like that [laughter] – 'thank you' is probably better – you're to *shut your mouth* and you are not to say nothing else." Now, this is very hard on somebody in W Unit who has been shot very recently for having dared shut the pc off, do you see?

But, boy, you better get to that valve and close it tight right now because you're going to be in trouble if you don't.

Now, you get – take the first datum I gave you, you'll see why. You'll see why.

So just list till you see an item on the list, using that earlier definition as the item. Just list till you see an item on the list. And without startling the pc unduly, say, "Thank you. That's it. Got it? All right. Now I'll read this item back to you. All right. I'll read the item back to you."

"Well, I – I was saying..."

"Oh-bo-dut-dut-dut-dut-dt-dt!"

"I was, but I had – had it – now – I was trying to..

"Ssshhhh. Cheesecake. Cheesecake. It reads. Is that your item?"

"Well – well, as a matter of fact, it is. Yes, yes, yes. Sometimes, however – no, no, that wouldn't oppose it."

You usually suspect not that the list is incomplete but that it is overlisted. You probably had an earlier item than cheesecake which you didn't notice read. So you go on these various data.

In other words, you've got to shut that pc up. You can't let that pc list, man. Don't let him list and list and list because he's going to be in trouble. Any item – any list that tends to get long – "long" is used advisedly – what is a long list? Well, it is a long list. And any item which is used advisedly like this – any long list comes about because the item you are listing from was the wrong item.

That's also true of goals. That's true of anything. The item you were listing from was incorrect to begin with.

Your list gets long, see? Your list gets long. And you just can't get anything to read back, and the pc says "Battercakes," you see, and you say, "Thank you," you know. "Thank you."

"Battercakes. Battercakes. Battercakes."

It fell beautifully when he said it, see? You can't get it to read back? *Uh-uh-uh-uh*. Well, let him list a little bit further and he comes now with cupcakes, you see? "Good. Thank you. Thank you. Cupcakes. Cupcakes. Cupcakes. Cupcakes." And you sometimes see a – this is the mark of an amateur and it's also the mark of a very harassed pro. "Cupcakes. Cupcakes. *Cup cakes. Cup! Cakes! Cupcakes!* This item been suppressed? This item been suppressed? That's all right. *Cupcakes!!* Sorry. It doesn't read."

You get into too much of that sort of a situation, you see, and your list is going for, oh, I don't know. It's going for 30, 40, 50 items, or something like that. And you still can't get anything to read. You have to assume that what you are listing from was incorrect in the first place. And the usual assumption is that there was an earlier item on the list than the one you gave the pc. That is the usual assumption. You don't now continue that other list.

In other words, listing items is not handed – handled by extending lists. They're handled by rolling back the RR, if possible, under the item it should have been under in the first place. Do you follow me?

R4M2 is nearly always overlisted on items and underlisted on goals. The only thing that really follows all of the rules of listing is a goals list. That follows all of the rules of listing, beautifully. Two items reading on the same list, shoot the pc. It's not complete, see? Two items reading, this, that, all these other rules that you know, they apply to goals list. The list is incomplete. The list is this. The list is that. That applies all to goals lists. And they are usually underlisted. Auditors tend to list too few goals. That's the tendency. Because a pc begs off all the time.

"Well, it's on the list now. I know it's on the list. It must be on the list, and so forth. Well, you haven't had an RR for a long time, have you?"

"Well, no, I haven't had one. I haven't had one."

"Well, how many?"

"Well – it's – uh-uh-uh – 27. That's 27 since the last rocket read."

"Oh, well, 27 since the last rocket read. Well, that's all right, I guess it's..."

Boy, if he'd only put the 28th on, he would have gotten another RR, don't you see? And then he takes a goal from an incomplete list and it is then messed up because he has skipped a couple of GPMs and the pc's attention is dislocalized or moved from where it should be on, don't you see? All these. A lot of – a lot of things happen, see? You've taken an item off an incomplete goals list and doing something with it and oh, it – it's a mess. So an incomplete or underlisted goals list gives bounteous trouble. Oh, that's lots of trouble.

And most of your horrible psychosomatic responses to R4 stem from incomplete goals lists. Nothing wrong with item lists but something wrong with the goals list, see?

All right. Item lists, listing for items inside a GPM, tend to be overlisted, see? Goals lists tend to be – you see, they tend to be underlisted. And item lists tend to be overlisted. You'll see some auditor with what enthusiasm going on on his item list, you know. Bang! Bang! On and on. Boy, he should have shut up and moved on, stopped a long time ago, you see?

Item lists must be as short as possible. You only want an item list just long enough to be able to get the item on it.

You'll have a tremendous number of one-item lists. You'd be surprised how often the pc comes up with the exact, next item. The pc sometimes also in a blue moon skips one. But you'd be surprised at how many one-item lists you've got. So much so that there is a certain way of writing up the list so that you don't have to keep copying the item you have just found. You just circle it and draw it into your next question and then circle that and draw it into the next question, don't you see, and circle that and draw it into the next question, just for rapidity of listing. You can list fairly rapidly this way. You've got to call it back and it's got to fall and blow down and it's got to do all these things, and you got to do your courtesy steps on it. And there's no reason you do these things slowly.

But you'd be surprised how seldom you have to list a long list on an item. And if you do list a long list on an item and you can't get anything reading back easily and it isn't making good sense, why, you assume already that you have just got through finding a wrong item, and you backtrack one list, and then fix that list up. And it usually is an earlier item on the existing list. It's not something that you extend, don't you see?

That's the way you handle these things.

Now, even with that, you'll make a mistake occasionally, but these are fairly infallible actions that you start extending item lists endlessly and you're going to get in trouble.

Now, we've done tests. We've done a lot of tests one way or the other. Tests of how complete lists are and mathematical count lists, you see? I mean like 25 beyond and 12 beyond, and we've done all kinds of list tests of various types, you see? There's a lot of this work has been done. And there is only one listing that works. And that's the one I've just described to you. So all of those other listing systems are not only kaput, but dangerous.

You don't want RRs. The next-to-the-last rocket reading item on the list and the last rocket reading item on the list – you remember that system, and so forth. That just finds tons of wrong items.

But this one – this one – now another thing is, you say, "Well, gee-whiz, this-this-this item rocket read beautifully. Just rocket read beautifully, so therefore, you know, item, therefore – therefore, it must be the item because look at that beautiful rocket read." Well, a rocket read proceeds out of solid mass.

Therefore, you expect goals to rocket read. But you don't expect items to. If an item rocket reads, it's inevitably the wrong item. *Ooooh!* Horrible, isn't it?

You've got to have a disintegrating read and it more looks like a fall than anything else. But if that item rocket reads with a beautiful, stylized rocket read, it must be gripped in a very solid case to rocket read that beautifully. So therefore, it isn't disintegrating; so therefore, it wasn't the next item to come up. Do you see that?

The reason a goal rocket reads so beautifully is because it's got that 65-foot by 20-foot by 10-foot case, see? And that imparts this beautiful rocket read with the whip start and the

hook end and – perfect. Of course it's perfect. You'd be perfect, too, if the thing was that much encased, you see?

Now, very often implant RIs – implant RIs that are RRing are also suspect a little bit, but implant RIs tend to rocket read more often than actual GPM RIs.

Now, you don't throw it out because it rocket reads – if you see that it's a stylized rocket read – but you regard it with considerable suspicion. You wonder if you didn't miss a fall just earlier on this list, you see? You don't get any wild, scurvy, whirling dervish dance over this thing just because you made something rocket read. The least valuable commodity you can have is a rocket reading item. See? That's something like yesterday's newspaper or something. It's going to be wrong. Anything that it says is going to have some difference in it.

A goal, on the other hand, that doesn't rocket read is something to be regarded with considerable suspicion. This goal blew down and, oh, smoke came out of the E-Meter, and everything went bang, and the pc was delighted with it. Cognited all over the place, you know? Rave notices in all directions. Felt so much better. But the auditor could never make it rocket read.

I know the history of several of these things, one or two of them in particular. Blew down, did all the things I just said to you, gorgeous, everybody was very delighted with it, but later on it transpired that it was a lock on an RI in the first bank.

Of course, the power that the thing had was the partial disintegration of an RI. It wasn't even a GPM, don't you see? It wasn't anything. It was just a lock. And there are tremendous numbers of actual goals hanging around the perimeters of RIs in actual GPMS.

You see, it's very hard to do, but if you knew what the goal was – if you knew what the item was before you found the item (this is very hard to do unless you find some out of sequence and ARC break the pc like mad) but if you knew what the item was before you found it, then you could probably tailor-make the goal that would also read.

Give you an idea. Thirst. The item is thirst. See, that's the RI. Thirst. And if you knew that that was going to be the item, you could then read "to thirst" or "to be thirsty" or even "to be dry" and get a fall – get a falling goal of some kind or another. You'd get a goal response. These goals would do something. It's quite intriguing to watch this even though it's almost impossible to test.

I know this because I've seen them in reverse, you see? I've seen a goal fall and then later on found out what RI it was connected with and got a big meter response by suddenly adding in this. These are actual goals, don't you see? They're actual goals of one kind or another which are salted through these GPMS.

Well, they don't have any decent read to them, and they – they don't do anything very much. And you can analyze them out rather rapidly. One of the easiest things to get rid of is an actual goal if you know an actual goal exists, you see? They're usually just locks on RIs. I regarded this with some suspicion for a while, wondering what – if RIs weren't expressed as goals ordinarily and so forth. But they're not.

Funny how these things hang on the perimeter of it. And there are many trips and traps for the unwary with regard to these things. But the point I'm making is that goals – now dealing with goals, you expect rocket reads.

You should know all about rocket reads. If something doesn't rocket read, you sit there and cry into your Kleenex, you see, while the pc pats you on the shoulder sympathetically.

The subject of goals is then a subject of rocket reads. Anything that is a real goal can be mid-ruded up to rocket read, you see? You can fix it up.

First, it'll start rocket reading on just the Suppress buttons. It itself might have just ticked when you first found it. And you get Suppress in as you run Suppress on a real GPM's goal, see? Why, you'll see that thing start to rocket read. Suppress rocket reads. You say, "On this goal, has anything been suppressed?" *Pow!* See, you don't get – you get an instant rocket read on Suppress and that will clean up and another button or two will clean up, and all of a sudden you'll call a goal and maybe once out of three average, why, it'll fire with a rocket read.

Doesn't fire three out of three with a rocket read. That's really asking for it because the pc is anxious and he's wondering if it's his goal, you know, and you call it once and he anticipates the next one. Suppresses the thing. And of course, the next time you call it, it *ha-ha* – what a dog's breakfast trying to get one of these things to read sometimes.

And an actual GPM will blow down, but not much. It'll blow down, but blowdown is no requisite for it, whereas an RI has to blow down. If an RI doesn't blow down, it isn't an RI.

Sometimes an RI doesn't blow down just because the pc is waiting to find out if it's his RI. He's got the brakes on the thing, see. "Cheesecake," see? And you – he's sitting there and, "Well – well, did it read or didn't it?" See? The auditor didn't say it read or anything like that, see. Hadn't really said, "Is that your item?" Had just said, "Cheesecake" and looked alertly at the pc, you know?

The pc says, "Well, is it or isn't it my item, you know?"

"Well, it read. It read. Is it your item?"

"Yeah." *Psssseeww*. You see a blowdown.

Sometimes the pc doesn't dig it, see. It's "Siberia," see. The item is "Siberia" see? And the pc can't see how this relates to Instructors. [laughter] Siberia, Instructors: you see, so on.

"Oh, oh!" And then you get your blowdown.

In other words, lack of comprehension can sometimes hold up a blowdown. Blowdowns, however, usually just happen and they require no other things, but they can be slowed down.

So an RI always has a blowdown. Always. Invariable. An RI that doesn't ever blow down is not an RI for that position.

Now, you'll get some of the ramifications of this definition I gave you of that earlier. It was an RI, but it didn't belong there. It belonged someplace else. In view of the fact the pc's got many thousands and thousands of RIs, actual RIs, and he has in actual fact, well, I'd say at

least a hundred locks – that's being very, very conservative – for every one of these RIs, you see how many things in the bank can be made to read or can be made to function or operate with or be found or something. You got complications on your hands here.

But the point I'm making is that an RI, if it is in the right position, will fall – surge usually – and blow down. But it always must blow down to be the RI for that position. See, that doesn't change the definition for an RI I gave you earlier. If it's in the right sequence, it'll blow down. Very often it's quite correct as an RI, but you weren't supposed to get it for two more items and it won't blow down yet. And this sort of thing. You have to ride this horse.

Now, we look over – we look over R4M2, we find there's a lot of other little rules of various kinds or another. They're not things, however, that trip you up. I've given you the important, salient factors of this process.

There is one more stable datum that I think I ought to peel off, however, and hand to you. If the case is running well, you don't repair it.

You only repair cases when they have ceased to run well. Person's not now running well, you repair the case. Case running well, leave it alone.

I had a case running like a startled gazelle and went back up to repair an upper bank. I shouldn't have had anything to do with that, man. I found about six items, then found out they didn't belong to that bank and found out this and found out that and oh, my God, why should I have gotten up that morning, you see?

But I was repairing a case that didn't need repair. We – all of us learn this lesson many times, and I just am not giving it to you as something you must know now, but something which I am inviting you to relearn every time you do it.

Another guiding datum – another guiding datum which is of great use is: Never force a balk. Never continue to audit across a balk. Never, never, never. Pc balks – Q and A, man – you balk. You're doing something wrong. You try to drive down a one-way street wrong way to, or you're doing something weird – but the pc will instinctively balk.

You never really pay too much attention to why the pc is balking. You don't necessarily say the pc is wrong, but you don't necessarily say he's right, either. The pc doesn't want to go on. Well, then you'd better damn well find out what's wrong with the R4. I don't care what he says, what she says; I don't care. You find out what's wrong with that R4 because there's something wrong with that R4 right now, man. Right now.

And the sooner you find it, the better off you're going to be. And you start to push past any kind of a balk of that kind, you're going to be in trouble, the pc's going to go into a sad effect, you're going to wrap that case around a telegraph pole. Usually the pc can be counted on balking when something is going wrong with the case. It's fairly reliable.

The pc can balk as faintly as this: "I don't really think I ought to have a session today." See, that's a faint – that's a faint balk. "I really can't – can't seem to list on this list." That's a balk.

Now, there's something wrong. And you take those things up at once. Never push past them. Don't, in R4, use the datum that the auditor must go on, summer storm, winter snow or

night, the auditor must not pause in his flight, you see? [laughter] That's the wrong motto. That's the wrong motto.

You try to shove down the wrong rabbit warren on R4 and you got yourself a hat full of trouble and you're going to have trouble and it's going to get worse and it's going to get worse and probably the hardest lesson you have to learn in R4 is not all of its complicated rules and how you stand on your head in order to list. That sort of thing – don't worry about all of that sort of thing. You just – basic auditing and sensitivity to the pc. You notice a balk on the part of that pc, man, find out why right now and analyze it right down to the end of the run, square it up, man, square it up.

Notice those balks. And don't push past them, and you almost never run a pc up an alleyway. Get sensitive to balks, in other words.

The unwillingness to be audited: "I don't feel well these days," "I don't think auditing's doing me much good"; balks, see. Find out what they are. You'll find they're always connected with finding a wrong item, skipping some items, a wrong goal, something out of sequence, GPM skipped. You're running an implant GPM when you thought you were running an actual one.

You know, horrible things are going on here and they're actually – the first notice you have of them is a little bit of a light balk. And sometimes an auditor is not sensitive enough to see a balk when he sees one.

Pc gets right up to the point, "I won't go on." Puts the cans down, you see, steps back from the chair, puts his hands behind him, you see, and is about to walk out the door. The auditor says, "You know, I think that might be a balk." See?

Well, that is a long way and a far cry from where the auditor would – should first notice this balk, which is simply that "I don't know. I don't know. I just..." – and so on. "Do you suppose it's doing me much good to find these items? I haven't cognited on very much here lately." That's a balk.

Find out right away what's wrong, and don't be satisfied with little things wrong. It isn't that you listed the list and invalidated something on the pc, you see. It's that you listed the list through the implant GPM down to its bottom, and you have now been opposing the implant goal as an RI instead of the actual GPM goal as an RI, or it's something horrible that you were just sitting there and all of a sudden this happened, you see? It's that sort of a process.

How anybody ever gets to OT, you will sometimes wonder. Cases are on the road, however, and cases have met up with these conditions and are running through them. It is not a process of sitting there holding the sprig of violets, smiling. No, it's more like one hand full of lilies of the valley, you see, and the other hand full of clouds. You're not quite sure which direction you're going to wind up. It's a – it's a desperate situation. It is fraught with many difficulties, many upsets, and so forth. Winning through this for the auditor and the pc is a considerable task. It is very difficult and it is not an easy process to do, and I would be lying in my teeth if I told you any differently.

The road all the way to OT is the road that you're taking with this. There are lesser roads and there are lesser heights and lesser goals. You're going all the way to OT on this.

There's only one way to do it, and that's right. And even when you do it right, it'll go wrong. And there's only one road to OT, and that's the road over these confounded cobblestones and corduroys and tax.

And so there it is, and just thank your stars that it's there and cry quietly to yourself on your pillow because it is so damned rough. That goes for a pc and an auditor. This is a rough, rough shot.

We know all the answers to this. We know all the answers, but we can't get over an inability to do basic auditing and we can't get over an inability to read an E-Meter. We can't get over these corny ones. But the rest of the road, we know all the rules and in knowing all those rules we can impart this information. I can tell you how to do this. I can show you how to do this. But I can't show a datum sitting in a chair how to do it. You have to be alert and on your toes and you can do it. You can do it. It is doable, and you can do it, but it isn't easy and there isn't any easier road.

I've been looking for many, many months now that we have had this process, trying to find some easier road, trying to find easier roads through it. I've perfected listing a little bit. I've got a little bit better meter coming, so forth. These improvements are so minor that it simply dumps it on our lap and leaves it up to us to simply audit to get through and somehow or another make it.

Thank you.

R4 CASE ASSEMBLY

A lecture given on 30 October 1963

Thank you.

Well, you were supposed to have a demonstration today. Got a prima donna on your hands. I didn't feel like giving you a demonstration. I just had a case repair run on me. And I was running right on up to lecture time madly, developing a present time problem because, you see, end of session must approach at once.

And also, you've got to know more about R4 and I'm not at all unhappy to give you a lecture on the subject. This is particularly valuable material to you in actual fact.

I can see some of you now that haven't got any R4 on your checksheets.

This is what?

Audience: Twentieth-thirtieth of October.

Three-0 Oct. 13. All right. This is a talk on Routine 4. And a lot of you haven't had this on your checksheets, you see, and actually haven't got any bulletins to amount to anything, don't you see. And not having any bulletins to study and all of the listing bulletins being out of date, and although it's all the same as R3M2, it is all different – I can see that sooner or later... Now you thought I was going to say that you'd go into a confusion – that wasn't what I was going to say.

Sooner or later out of self-defense you would figure it out. That's my little mechanism here for putting you on cause.

Now in actual fact, quite a few here allegedly running R4 – that's alleged. That's all very interesting. But practically none of the actual HGA Class IV Course exists at this particular moment. That's something for you to think about.

This course is very well grooved in, beautifully grooved in for HSS Class III. And there's some of you caught in a bind here having to learn IV without that being smoothly, beautifully organized. Because that's still to some degree on the – has been, it isn't now – but it is so fresh off the research assembly line because R3M2 had to be patched up and smoothed out, don't you see.

Although that – all that work was done, the communication of it for easy assimilation by a student doesn't exist. So I'm making up for that to you in these lectures.

You perhaps are also – you're perhaps fortunate in this, not totally unfortunate. Most of you have tangled with goals, one way or the other. You've tangled with these things and you know that quite a bit of randomness exists on the subject of goals and old R3, and so forth.

Now, we've had this around for a long time. And it has emerged into a very precise-very, very precise piece of technology. It's about the neatest piece of technology that has ever been developed in Scientology. There's more research hours been spent on it, and so on, in smoothing it out, than any other single piece of Scientology. Naturally, because it's the road to OT – it's the road out. It's the very backbone of cases.

And whether you like it or not, those of you who are at the moment in W Unit and those of you who are at Class I level auditing and so forth – whether you like it or not, you are handling R4.

This is an unescapable fact. We can turn the blind eye to the telescope and say there just ain't no bank and we will sit there and listen to the pc rattle on expansively. We can take up his session goals, we can do this, we can do that, and we can do everything else. But we actually are looking at R4. That's – would be what's at the other end of the telescope if the Class I fellow looked.

Not that he will someday get up to a point as an auditor where he will be able to handle this technology and that sort of thing. We're not looking at his study course. We're looking at the fact that the pc sitting in front of him at that moment and in every session and in any kind of a session, under any auditor's hands, anyplace in the world, is handling nothing but R4 materials and nothing else.

You understand that? Levels I, II and III are devoted to handling R4 materials without admitting it. They're devoted to getting tone arm action by shoving around GPMs, items, goals, locks – I don't care what you call these things – service facsimiles. Call them anything you want to.

Well, I'll give you an example. You remember that session – this is very hypothetical – you remember that session you had in an HGC one time or another and you had such marvelous tone arm action and you felt a lot better afterwards and so forth. You remember that session? That was a good session, wasn't it? Well, you handled an item or a lock or a goal in R4. You did something to a GPM that made you feel better. Period.

And you remember that pc you audited back *rruh-rruah* and this pc sat down there and all of a sudden – Wow! – and there was this terrific result and so forth and then he didn't have any lumbosis and so on. You remember that? You know, that was *miraculous*.

Somehow, some way, you ran out, keyed out, triggered out, did something with R4 materials. You did something with goals or actual GPMs or implant GPMs or items or lock items on actual GPMs – lock items on an actual goal, lock item on an actual GPM's goal, a lock item on an actual GPM's RI, a lock item on an implant GPM or an im... a lock item on an implant GPM's item RI. Get those various combinations.

One of those conditions existed and you did something with it. Now, I don't... I've never – I've never tried to pull a punch with you. I have held up – I have held up carrots, I have given you hope, I have kept you rolling one way or the other – all very factually, all very factually, because the end was attainable.

But I have never pulled the punches on this sort of thing – when I know something to be true I tell you. And the facts of the case are that it's all very well for you to sit and talk

about a service facsimile and it's all very well for me to write about a service facsimile and it's all very well to observe and explain the pc's behavior in terms of service facsimiles and talk about that. But you're doing a double talk when you're talking about it. You're talking about an RI, a lock on an RI or any of the things I just mentioned to you. See, you're talking about doing something with those things.

Now there's a tremendous liability in doing anything with R4 materials. R4 materials are the materials of the bank. There isn't anything else in the bank. That's it. There's tremendous liability. You shove a GPM north when you should have shoved it south, you shove an item out when you should have put it in, you do something with this when you should have done something with that and you've got disaster staring you in the face.

I don't mean you've got a difficulty in the session. No, you could very easily have disaster staring you in the face. This is the total liability of working in the field of the mind. There is no other liability of working in the field of the mind.

There isn't anything else in the mind. There's a thetan and this is the mind he's got. These are the things which that thetan has been up to over the course of, God 'elp us, how long. These are the things, these are the items that are the things – look, they're items just like this crayon is an item, they're items like the meter is an item, they're mass like this desk is a mass, don't you see?

They have various significances. They have – everything in the Know to Mystery Scale is included in these things. These things are visual, they serve up like hamburgers or they go cold down the drain. It's stuff. It's stuff. You're actually handling stuff. You're not handling, now, a compulsion. You're handling the source of compulsions. You're not handling an obsession. You're handling the source of obsessions. You're not handling an aberrated idea. You're handling the source of aberrated ideas, you see? You're not handling insanity. You're handling those things that cause insanity.

All right. Knowing that – knowing that, I have to ask you to be brave and square your shoulders up to your meter and recognize what you are doing. If you're auditing in the W Unit or doing Class I auditing or even Class II – you're sitting there and you're saying – you're inviting – you're inviting some comm from the pc, see. And the pc says "*Yipple-yapple, yipple-yapple, yipple-yapple and yupple-yopple-yopple-yopple-yipple, and yipple-yipple-yipple-yipple-yipple.*" And you got some tone arm action or you haven't got some tone arm action. That's the Level I type stuff. You've got it or you haven't got it. And the more you chop him up and the less you let him talk, why there's luck involved in Level I, you know. There's luck because you're not directing his attention very strongly, so therefore not directing his attention, of course, it's sort of luck as to whether or not he talks about problems or talks about solutions.

And it's luck as to whether or not he has suppressed all the things he should talk about because you're not using the Suppress button, don't you see. And this character might have suppressed his lumbosis and you're not using the Suppress button to clean it up so how are you ever going to get any tone arm action with him talking about his lumbosis?

These are the factors. In other words, those factors make it an element of chance as to whether or not you get tone arm action. Of course, the smoother you audit and the easier you

can handle this thing, the more likely you are to get tone arm action. The less crudity you add into the session, why, the more tone arm action you're certainly going to get. It's – that... But you don't really add tone arm action to the session by auditing, don't you see, because you're not directing his attention very much.

There's minimal direction of attention. If the pc's going to get some tone arm action, he's going to get some tone arm action. This is the level of chance in which you're operating at that level. And everything that pc is talking about and everything that's wrong with that pc is R4 materials.

I don't care, you sat back and you said – and you said, "There it is. Start of session," you know, and he starts talking and so forth, and he says, "I *yipple-yapped* on the *yupple-yup*," and so forth. He's pushing around RIs, goals, GPMs, implant GPMs, so forth – these are the things which he is shoving around.

Now, you get into less trouble at this level simply because the auditor does less shoving around. So the mind will wander through these various labyrinthine things and pick up a little bit of charge and blow it here and blow it there and the pc feels better. You see? But it's almost – it's almost by chance, but it looks safe and it actually is fairly safe, see?

It's safe. It's safe. Because the auditor's doing practically no control, the pc can't get himself into very much trouble.

Now we move up into X and we get selectivity. We get selectivity of what the pc is to itsa. Now, the crudity of the auditor very much can interfere with the itsaing of it and shove things all out of line and that sort of thing.

But the element of chance here is what does the auditor choose to itsa? And he could pick up his great big gumboots and walk right into the middle of a GPM and reactivate it and then in some crude fashion, through pushing the pc on where the pc didn't want to talk about something or something like that, mix up the fifteenth GPM with the sixteenth GPM, pull the sixteenth GPM up to the position of the third GPM and about that time the pc comes down with hyperlumbosis. You understand?

Although you are apparently doing Prepchecking, problems this lifetime, *yik-yak*, other things, you know, and it's all lined out and it all looks very fine and that's all very smooth, and in actual fact you are doing a blind juggling act.

Actual GPMs, implant GPMs, actual RIs, locks on actual RIs, implant RIs, locks on implant RIs, locks on implant goals – these things are what you are juggling with. Even an engram run runs into RIs. Even running engrams.

You run an engram, this one runs and that one doesn't. Why? Well, one's closer into an RI than the other. Some engrams won't release till you get the RI that's holding it in place and so forth. That was the limitations of Dianetics contained right there in that phrase, because Dianetics – reactive mind. Dianetics describes the reactive mind and says it's full of engrams. All right, that's good enough for this lifetime, because this lifetime is only partially formed RI ordinarily, so you can run engrams and clean up this lifetime to a good degree.

You can destimulate a tremendous amount of stuff so you get this condition of Clear, and that sort of thing. You can destimulate engrams and that sort of thing.

All these things are understood. But the final truth of the matter is that those con-founded goals, actual GPMs, implant GPMs, all these RIs and their locks and everything else are sitting right there and those are in actual fact what you're shoving around. Those are what you're playing chess with at Level II.

Now, in view of the fact the pc has some reality on what he's doing – he has some re-ality on what he can run – that is to say, if he knows about it, why, he's got some reality on it. You understand? So you're taking that first line in Book Three of *Modern Science of Mental Health* and you're taking that first line and you say – if you can parallel what the mind is do-ing, why, you've got it made. Paraphrasing it, see? Find out what the mind is doing and paral-lel it, and you've got it.

Well, that's the byword of Levels II and III – find out what this boy is doing and sort of parallel it and so on and take over automaticities. We've had it in the past, all this kind of thing.

You can do this sort of thing. You've got Prepchecking now and that sort of thing. So, a very safe course here is to have something... and by the way, I didn't happen to think of this; it was one of you who thought of it on the basis of, well, just take his session goals and do something with them. That's fine. A rather obvious step, but a very clever one.

You take that, now he's got some reality on what he sets as a goal, right? He wouldn't set it as a goal if he didn't have some reality on it. So therefore, you could it'sa this and get someplace.

Now, of course, you uncork a Prepcheck on the thing – those nice old buttons – and you start pushing and – around on this particular goal that he's set for the session that gave him a little tone arm action when he wrote it down and so on. You're going to get some nice tone arm action, your pc's going to have a win and that sort of thing.

But we mustn't avoid the fact that in actual fact you are pushing around actual GPMs, goals, actual implant GPMs and the RIs connected with these various things. Those are the things you're still juggling with. You're throwing those up in the air like somebody on the London Palladium Theater, you know. Indian clubs this direction and that direction. And you're doing it blindfolded, which is pretty good.

I hope I'm not ruining the nerves of some of the lower-level students. You can say to yourself, "What in the name of common sense am I pushing around at Levels I, II and III? Well, *awhhhhhhh!* What is this? Well, what are these – *oooh.*" Pretty mysterious, actually. We know what an RI is, it has an actual face and it has pointed ears and horns and so forth. And it's a little model thing that sits in the middle of the bank in some fashion – they don't know what this thing looks like. And *oooh.* Grim. What are we pushing around? Well, that's what you're pushing around.

All right. When we talk about R4, then, we're actually talking about the actual compo-sition of the mind that brings about all and any of the aberrations of the mind, how the thoughts, postulates get encysted in the middle of energy and mass and influence each other

and how they float in time and how they affect the pc and how they group up into large masses which are governed by a goal and all of this sort of thing. The progress of a thetan in aberrating himself.

You've got sitting on top of this thing overt-motivator sequence, you've got a lot of shallow-draft actions that take current energy lines, you've got – you've got shallow-draft activities that sort of handle locks on locks on locks and still give you tone arm action, don't you see?

But nevertheless the thing which is generating the stuff that you're after which has got your pc held down, which gives him lumbosis, which makes him think that he is a turtle – all of these various things are contained in the R4 materials.

So therefore, in the final analysis there is no substitute of any kind whatsoever for knowing about R4. The way we're actually training an auditor from scratch and so forth, from all the way through and we're going to train him for a long period of time and that sort of thing, I'm afraid you'd teach him R4 first, see.

So therefore, the materials I'm giving you here are not ungermane to Levels I, II and III of Scientology. Make my point? It's there. If you're auditing the pc, you're auditing it.

Now when these things get out of line in life – and it isn't just auditing that puts them out of line, you know. I mean, that is not the prime villain here in disturbing the bank – when life starts throwing these things out of line one way or the other and the various environments of the pc, you've got sport on your hands, man. Because life does it without an E-Meter. Life does it very stupidly and unintelligently.

The guy has got these GPMs, he's got these RIs and life shuffles them around on him like mad. Groups them up, puts... and he'll have a bad accident. He's got one – trains or something like this, is an RI in the tenth GPM, tenth actual GPM. But he's – but in that place it's an oppterm. Trains are an oppterm in the tenth actual GPM.

So trains are a terminal in the third actual GPM. One fine day, trains meet trains head-on and there goes the third and the tenth – grouped. After this we have somebody who has to be operated on by the medicos and is worth a fortune to the medical profession. Worth an absolute fortune. Have to have operation after operation after operation. Have to have things removed and unremoved and re-removed and renovated and polished and dissected and so forth. No matter what they cut out, the somatic is still there, see?

Trains and trains, that's what's wrong with the guy.

Now this is a very extreme view and the medico would not say – would say, "Oh, well, that's just – well, it's one school of thought, you see, and there are many schools of thought." No, there aren't many schools of thought. We are the school of thought which explains schools of thought.

See, that's the difference. We're not another school of thought. Because we are handling the materials which build and create a body.

Anybody accusing us of being interested in healing should have his face spat into. I mean, if – particularly if he's associated with the main professions, see. Because, as a matter

of fact – as a matter of fact, we don't ever heal anything. There is no particular point in healing something when you can remove the cause of it. That's a different operation.

Errors – physical errors are just about the auditor's least possible concern, even though they are the thing the pc fixes on the most easily. If he – if his cheek hurts, then he is very aware of his cheek hurting and it's very up close to him and he would like to have his cheek stop hurting.

Well, now, healing means – in some extrapolation of the situation – solving his hurt cheek. Well, we don't do that, you see? We don't move around to other side of this hurt cheek and later on the track solve what is wrong with the hurt cheek. You can pick up the cause of hurting cheeks and knock that out and he won't have not only that hurt cheek... You know it's impossible to (quote) "heal" just a hurt cheek, you see, because you start working on it and you get the other cheek and you get his headache, too. You know. It's very hard. Because – that's because you're not selectively picking up these things.

Now let's look at this from this basis. You are dealing with the stuff which builds a universe. This is how universes get built; all the materials of how the stuff goes together is in that. You come far closer to a physical scientist than you would a medico, but I wouldn't even insult you in that direction either.

You're dealing with – you're dealing with the basic building block of all a thetan. And your study is – and knowledge is – of this beast: a thetan, see. This breed of cat.

Now what does he do? What will he do? What does he construct? What errors does he make? How does he arrange life around him? These are the subjects of an auditor's interest. If we realize that what is wrong with this beast, a thetan – if we realize what's wrong with him, is the fact he's been solving everything or curing everything or healing every error which then amounted to a fantastic concatenation of error, we'll realize what's going on here. You can't go around and give him one more solution. That's what he doesn't need. Aberration is that series of solutions which have had to be solved. Aberrations are a series of solutions, each one of which had to be solved in turn.

You have condition A. Now nothing was wrong at condition A unless the thetan considered it. He had to consider that the condition there just before A was wrong, you see, before he decided to do anything about it. Now there's – you can have an opinion about any of these things and usually at this stage of the game the fellow doesn't care whether it's right or wrong or if there is a condition there, but just to have some game or interest or something like that he decides that this thing shouldn't be. He decides to do something about dancing girls or something like this, you see. Life is dull.

So there is the condition. Now there was a condition, even if it was the condition of simply having nothing to do, there was still a condition. So, the first solution is A – the resolution of the first condition.

Now out of A we get condition two, which is dancing girls solved. Now, if you want to know about an overt act, just solve all the dancing girls for all time, see. That's a hell of an overt act, if you'll pardon my French. I mean, imagine anybody taking off to solve all dancing girls for all time. What an overt act! See? So that's condition two, dancing girls solved.

Well, that sure reduces the game, but it makes lots of problems. Makes lots of problems. If only the problem of the tired businessman coming to town there to be sold Wheaties by the carload lot by his business confrere and he hasn't got anyplace to take them, don't you see. He hasn't got anyplace to take his tired confrere in order to sell him Wheaties or something of the sort, because he's solved dancing girls, see. That's it, you see?

So we get solution B. Solution B solving condition two. And this probably is "drink," see. Can't have – dancing girls have all been solved, you see. They're no longer dancing. They're sort of in stages of this, you see, and now we've got to do something for our tired confrere, so of course, we can solve this status by introducing the item "drink." See.

Well, that's great. So that's solution B solving condition two, see. All right. So out of "drink," out of "drink," however, it becomes surfeit, see. You get sick drinking and all that sort of thing. And too much drink gives us condition three. And that's a bad condition, you see. His confrere doesn't want to have any – have anything to do now with drink when he comes to town to be sold Wheaties, or something like that, because he gets horrible hangovers, you see. And it's a bad condition.

So maybe condition three is hangovers, don't you see? That actually solved – drink, you see, solved that, but drink led to a new evil. Because, you see, we're alter-ising these things – look at them – they're nothing but alter-ises of a condition. So we're alter-ising by solution. So we get an alter-is problem.

Nobody solves the problem by eradicating it in the first place. All they do is alter-is it. So therefore they get another one of these conditions. So we get condition three, which is hangovers and therefore hangovers require some solution or another, so now in order to get anything done here at all, which is the basic impulse, we've got to have solution C.

And solution C is drugs. See, you drug the guy and hypnotize him or something like this, you see, in order to sell him the Wheaties. And out of this, you see, come bad contracts, or something of this sort, so now we've got condition four.

And condition four, of course, is the fact that he wont come to town at all, because he's been slugged and mugged and bugged, you see, and so on. So were still trying to solve this basic problem, you see, to sell Wheaties, you see?

We get condition four, which is an absent buyer. Well, that's great. So now we have to have solution D, which is lures. We've got to – got to have better lures, don't you see. And here it goes. And finally, finally, it becomes absolutely apparent that not only – not only can we not sell Wheaties, you see, but that we better be dead against them ever getting sold, see. So to sell Wheaties eventually becomes, as the conditions deteriorate in selling Wheaties, becomes condition – oh, eighteen or something like this, which is selling Wheaties.

See, it actually did wind itself back to the basic goal. The guy who was at the last throes of the thing is starting dimly to realize that it was the basic goal that he set in the first place that was getting him into all this trouble and he's now agin it. So he solves it by being against the goal.

Oh, that's great. And you now have the model of a GPM. That's how it comes into existence, you see. Guy decides he wants to do something, there is a condition, he solves the

condition – and of course you recognize in the A's, B's and C's – you recognize those as terminals. And the numbers I've given you, those are conditions or confusions which are the opterms. You see that?

Well, every one of these things, unfortunately, accumulates a great deal of its mass and so forth, and if you could get the thing detached from a GPM you could roll it around on the floor. And it's an RI. The condition or the solution, equally alike, form up these balls and mass and they – if you ever tore one of these GPMs to pieces visually – what I mean without – you know, I mean without running it out, because they discharge fairly rapidly – the miracle here is that we have something to run these things back that does discharge them. That's the miracle technique that does so. We could even understand them and not be able to take them apart.

But let's just say we took a big GPM and we ripped one of these RIs out of a corner of the thing and so forth. We'd have some kind of a – of a mass. Mental, thin and so forth, so that it doesn't have any great weight, but it nevertheless has weight and it does occupy space. And we could roll one of these things around the floor. It's quite interesting. Anybody's got them.

Now, anybody who's picked up body weight has just got too many of these things plastered on him. He's collided with too many of the things. Your pc who – who leaves the session looking all right and comes back at the end of the session with his eyes as red as fire and his hair being blown back as though in the wind and so forth, has simply gotten one of these things into restimulation between sessions. I don't care if you get rid of it by putting in the session mid – between-session mid ruds, you see. "Since" mid ruds, that got rid of it. But what hit him was an RI or a lock on an RI, that's what hit him. He went down to the post box and he saw a woman putting a black-edged letter in the box, don't you see, and this was enough to key in some RI on the track and so it hit him and he comes into session. He's got a high tone arm and then you put in a Prepcheck on him, "since" mid ruds, you know, and what you do is, accidentally without identifying it, collide with this particular incident and you come near enough to it to; key the thing out and the tone arm goes down. That is all.

You're handling these things all the time as an auditor. So the final analysis is you should know what they are.

Now, I'm going to ask – I'm going to ask somebody here to get us some plastic – some of this stuff they use in kindergartens, this plastic clay – not the kind that slurps all over your clothes, and – and so forth, but I think you can get it in gray – gray-black and I think you can get it in some pale yellow, or other. But getting two colors of these things and a lot of them – going to have a table built, long, narrow table – and I'm going to get you one by one, not by six and six, to mold a whole GPM from one end to the other. And then a whole channel of GPMs and then show some way a bank could get disarranged after you've made a GPM – show that it is slewed around and it's out of gear and so forth.

Because all this is susceptible to visual interpretation. It's all visual. It's visual anyhow. It doesn't matter if your pc can see them or not. That's what's going on in his bank. That's all there is to it.

This isn't peculiar to one pc. This is why you are here. This is why they are here. That is why people get the way they get and this is where a guy's power is totally absorbed, is in the obsessive construction of these things all the time and so on.

He used to be able to throw a lightning bolt Lord knows how far. He can't do it now. Why? Because he's gone the route down these GPMs. So anyway, by taking a narrow table, maybe two feet wide or something like that, with tall edges and quite a few pounds of clay, you can make alternate GPMs, you see. And then maybe we can get some black clay and you could even dream up a few – a few implant GPMs and shove them into the flanks of the actual GPMs, you see. And dream it up, see. You can make a bank. It'll look like a bank. And that bank, then, becomes mobile. You can move it around. You can move these blocks around. You can move them out of shape, you see.

You can name these goals and so on. You can see how they oppose. This thing is terrifically susceptible to visual interpretation. We will also take films of these things and do quite a job on the situation. But I think it would do you personally a lot of good to play patty-cake with Plasticine on a board and knock together one of these GPMs. Tisn't enough to sit around and draw pictures of them because they aren't pictures. See? They're blocks of mass. They have a very definite shape, they have good appearance. They do get pulled out of line and they get pulled out of line and pulled into other conditions.

And these are the strains and stresses which occur in the pc. These are your psychosomatic illnesses and so forth. You don't get a psychosomatic illness because an RI is called "to have a pain in the head," so therefore you get a pain in the head, you see. I mean, it would be nice and sweet if this type of thing existed. It isn't, you see, however, that.

It doesn't much matter what the RI is. It's about as subtle, if it gets pulled out of line, as hitting the fellow over the skull with a croquet mallet. See. You got this RI, and it is just clanged into the side of his head. So he's got a pain in his head. I mean, it's as simple as that.

You put him in a vise and close the – the screw on the thing, just so tight, he's going to get a pain in his head. I mean, that's a... See, you can think yourself into a lot of complications. And people have never understood this because it's too simple.

These masses exist, and guys get caught between them. For instance, just before this session here we were undoing – we were undoing some bank materials and we had a couple of errors on repair getting ready to – for a long run, on my case, and we found that there was an item which had five or six GPMs grouped. And we got this item and the tone arm flew and flew and flew and flew and the meter smoked and the tone arm flew some more and more charge came off this thing. Then some more things were found out about it – found to be two items, not one, which were grouped; they were in different GPMs – had the GPMs grouped. Interesting condition.

But this grouping, then, did not permit an it'sa of the sequence of the GPMs. Because you certainly can't take a double handful of mud and tell which of that mud is muddier than other bits of that mud. Do you see? What is more mud than mud, you see. And you can't do it.

They've got to have some spatial relationship or be straightened out before you can say, "It's this piece of mud that is later than that piece of mud." Don't you see. You've got to

have some recognition of the situation. As long as these things were that thoroughly grouped up, you couldn't then say for sure what belonged where, don't you see?

But now you could say what belonged where because they'd been ungrouped and an item had been found which was causing the group. An item which had a duplicate item in another set – in another GPM. So of course everything between those two things being grouped had smashed all the GPMs together. Apparently the GPMs had been riding there for quite a while, but this one item, which was actually two items with the same name, or nearly the same name on the two, continuously getting restimulated. And getting restimulated had pulled the bank together, see?

So therefore – therefore you are operating – although later GPMs forming, you still had the impetus and the key-in of the earlier GPM, don't you see? So that was making a nice big creak. Pretty gruesome. See how this is?

Well, now, if you knew the exact spatial relationships – type, kind – if you knew everything there was to know – and actually there isn't any more to learn about it, really, than there is about a kid's Erector Set. I mean, I'm telling you the truth now. You've got an item that's called cats and it opposes... an item called dogs, don't you see? And so on. It solves – it's – cats solve dogs or something like this. Or dogs solve cats, don't you see? And these pairs go together and that mass gets all together and in a ball of the item cats, don't you see? Anything pertaining to cats accumulates on cats, don't you see?

It was when the pc was going by this particular period that he did the most work on it, but it actually never really ceases to accumulate. Something you probably didn't realize. These things aren't dead, gone, buried and so forth. They are formed. They are nicely put back on the track and all is well and then one day a cat goes "*Hccch*" and there's just that little scrap moves back and adds itself to the item "cat." Got the idea? Thetan is very neat.

So these things behave in peculiar ways. Now you can get a restimulation of that item. You can get that item misdated. Now, it's interesting that merely running them misdates them. That is such a slight misdating that it passes all the way with just a recognition of the fact. But it is nevertheless a slight misdating of the item.

It's being run at a different time than it was formed in. That's very faint – that's very faint. There's – that's hardly worth worrying about, although you should pay a little attention to that. But now an item which is really misdated – a really misdated item – we've got the item – we've got the item "jewel thief" – "jewel thief."

By the way, this stuff is all fraught with story material – it's terribly interesting material. I mean it's dramatic, it's this, it's that, it's fascinating in numbers of ways. In fact, the significances of it are so great and it's so fascinating, that people completely overlook its purely mechanical basis, you see.

You got "jewel thief" And good heavens, "jewel thief" is back there – oh, it's ages old. This thing is really old. It's about 5-6 GPMs back from present time, see. "Jewel thief." And the pc has been a detective in this lifetime and has committed some overts against some jewel thieves. And you'll find him sitting there then, with his bank bent around, and the item "jewel thief" misdated. It's brought into present time, see. He's opposing it.

So he brings the item into present time. He doesn't go back to the item. So he's got this item grouped up here in present time. So that item is misdated. That's what's wrong with it, actually, it isn't that it had more added to it.

It appears to be in near present time, don't you see. When is actually – it's that long, long way back on the track. Do you see that?

Now, where we have, then, RIs we have dating, we have proper position, we have a location in the universe for them – very unimportant – dating actually not terribly important. But we have sequence: one comes after another, not before the other, don't you see? You can get things twisted; you can get one earlier than the other. Well, you can get GPMs one earlier than the other when they should be later than the other, don't you see?

The order you think goes 1, 2, 3. Actually, it goes 1, 3, 2, see? That's the way it's actually sitting in the bank and the pc will have a lot of creak on this. You find – you find goal 3 – GPM 3, when you should find goal GPM 2, don't you see? *Whhoooh* the creaks are out and so forth.

Now, it's any disarrangement. It's any disarrangement like this. It's any miswording, particularly of goals. RIs seldom misword, but they – but the goals and so on – miswording. Misworded goal – oh, man. Misworded RI doesn't amount to much, but a misworded goal – ow! Ow! Ow! That is gruesome.

Things out of sequence, as I just said – the various things, things that have been left unopposed; items that have been found or restimulated when they shouldn't be. All these various things – they all add up to case repair. And what is very, very, very, very, very, very interesting is that all you have to do to repair a case is to know all the stuff I'm talking to you about this plasticine. You know, you make up the bank and you tear it apart into its items and so forth, and – well, all you have to do is just put the bank together so that it is neatly the way it should be, see.

You know, so that it goes from a PT goal 1, 2, 3. Not 1, 5, 7, 2, you see. And so that RIs that have been found, for instance, in goal 5 and so forth, aren't hanging up here in present time, don't you see? And so that an RI which is supposed to belong to the GPM "to sell Wheaties" actually is found to belong to the GPM "to sell nothing." You see?

And you've got an implant GPM over here which is "to eat," and somehow or another this has gotten hung up on "to sell Wheaties." See? And they're substituted, one for the other. The pc thinks one of them is the other.

And in other words, it's just mix-up. All you've got to do is straighten them up. Call a spade a spade. It's like sorting out a deck of cards. That's all. Without really restimulating any more than has been restimulated before. That's one of the things you shouldn't bother to do. Enough has been restimulated.

Now, in trying to straighten this out you want them to go 1, 2, 3, 4, 5, 6, 7, 8, 9 – you want all of the GPMs to be assigned to their proper sequence and you want the RIs assigned to their proper GPMs. Those that have been found, you understand?

Let's take 2-12 RIs. All right, well, let's find out where they belong. Well, we don't have to have the name of the GPM in order to assign it. We can say, the third back from present time or something like that. We can count them on the meter, don't you see?

And you can take your meter, and the only – the only inspection port you have, unfortunately for you, is your E-Meter, but you're fortunate to have that. And these things normally will read if the pc can itsa at all on the subject and isn't flying around in circles in PT problems, you actually do have a port. You can say, "Is this before that, and is that later than this?" and you get your answers and you can sort this thing out. You get null reads which means no, and you get flash reads which means yes, and you can gradually work this thing out. And you can get all these RIs back neated up into their proper GPMs and the GPMs in their proper sequence and find any of those that have been found and misworded, and you can just get this whole thing.

To draw up an analysis sheet for you as an auditor to use on a pc is actually an insult to your potential knowingness. Because you should be able to use some modeling clay and mock up one of these banks and show all the things that go wrong with it. And when you're inspecting a pc and you're repairing the pc you should know this well enough so that you just say, well, these various conditions can exist and they just rattle off and so forth.

Now this is nothing to teach a Level I Auditor. Except at Saint Hill. We expect you to know this at Saint Hill. By osmosis – another learning process that you perhaps weren't aware of.

But there actually is no sense at all in your not knowing this. It's – it has no more complications – not as much complications as a kid's Erector Set. Now that we know it, it's just like – like fitting together some kind of a puzzle game. And "Is it out of order?" and – is the first question. If it isn't out of order, don't try to put it into order.

And then you've got your next thing: is there any goals been given this pc, ever? Does this pc think he has any goals of one kind or another?

Well, let's find out. Does he have them rightly worded or wrongly worded? We don't necessarily have to find them, but just find out was it rightly worded, wrongly worded. And if it was rightly worded, why – when – we kind of spot it as to where it was by count, how many back down the line that goal was or something like this, you see?

And if it was wrongly worded we simply tell him so, you know. And he looks it over, you know – it was just – if it was an implant GPM and he thought it was one of his actual GPMs and so on, why, we've got to straighten that out.

There's just so many elements that can go wrong. If an RI has been found, let's find out where it belongs. Elementary.

Let's say a 2-12 RI. In 2-12 people found a lot of RIs, you know. Well, where do they belong? What GPMs do they fit with?

You can actually, without finding the GPMs, find out what GPM they fit with. That's pretty good, isn't it? Let's find out – well, that's a very early one. If – even if it's this crude, you see, that's a very early actual GPM. This one is a lock on an implant GPM, and therefore

is simply a lock on an implant GPM. Oh, yeah. Well, all right. That means it's not very significant.

This one? Well, that's an actual RI from an actual GPM. And it's – it's this many back down the track and so forth. Yeah, there it is. Number 5. That belongs about the – about the 5th GPM. And the pc will see tone arm action going here and all sorts of things going on, and the bank's getting back together again, the pc's lumbosis is disappearing.

There's a great deal of magic connected with this type of auditing that I'm telling you about right now. There's a lot of magic connected with it. Pc's got lumbosis like mad and you say, "Well, have any items ever been found on you? Is there anything you were ever audited on that was particularly potential or something or other, or in life, what was – what was your main concern?" or something like this, and ...

"Well, I was just never able to clear a See Check question on the subject – never able to clear a Sec Check question on the subject of 'eating porridge.' "Oh, is that so? Well, all right. Was this 'eating porridge,' was this... ?" – see, you're taking off from nothing – "Was this 'eating porridge' an RI from an actual GPM? Was it a lock on an RI from an actual GPM? Was it a lock on an implant GPM? Lock on an RI in an implant GPM?" Was it this, was it that? "Where did it fit on the track?" "Is it from the Helatrobus Implants?" you see. "Is it from the Bear? Is it very early on the track? Is it fairly late on the track?" – is it here, is it there, is it something or other? Don't you see?

So that any cross-fitting around – anything you do on this, you see – you get the thing, locate it. Now the funny part of it is, you can date it. "Eating porridge." All right. Date it by order of magnitude. Years ago, you see, tens of years ago, hundreds of years ago, see, thousands of years ago, tens of thousands, thousands of thousands, trillions – and you finally find it's trillions of trillions of years ago, "eating porridge."

It'll go back – *brrrrr* – back down the track, and that's the end of that aberration, see?

You can... This is all just putting the bank back together again. In other words, you can set – this is a new aspect of R4, you see – that you can sit exterior to auditing the case, consider the case has been audited by life, find the various items and GPMs and goals that the person has had and just tell them what these things are, like you do an ARC break assessment, see? But actually fit them in fairly accurately, and kind of slam them here and there on the track and say it's here, it fits here and it does this and it does that and that sort of thing.

Well, that is an enormously broad field of activity. Probably could experience considerable expansion. Probably could be improved enormously. Probably opens up a gate to a certain type of auditing, which is probably more important than anything except R4M2, see?

Now, what does this – what does this mean, then? What does this mean? It means that you have to know that before you can do anything with R4M2. You got to know how to put a case together before you can take the case apart. Now, if you can do that you're a very safe auditor indeed.

Now the rules of how you audit R4, how you find GPMs and that sort of thing, stand entirely independent of this activity of hanging the thing back together again. You don't have to know how to audit it at all. All you have to know is its composition and what these things

are, and know that they can be slipped and slapped back into place again by you. That's all you have to know about this and you can accomplish miracles – absolutely miraculous activities may take place as a result of this single piece of knowledge.

So it stands, of course, separate to then auditing R4M2. It's a different type of activity – it's a different process, you might say. You can't even call it case repair. But believe me, if you can't do this, you see – you don't have to know how to run R4M2 in order to do this. But let me tell you if you don't know how to do this, you for sure will never successfully carry off R4M2. You've also got to know how to do this in order to successfully accomplish R4M2. That pair does go together. Very neatly.

So the upshot of the thing is that R4M2 and so on comes after, in actual fact, somebody is able to reassemble a bank that's been knocked about – by life and other things, you know. And if he could do this – if he could just do this he'd be able to do nothing but this for the rest of his existence, and make a fine way of it and so forth. He wouldn't make any OTs, but he'd make some awful comfortable, happy people. So there's a whole zone of auditing in R4 that you might not really look at as auditing.

Now, we get to the business of making an OT. And that has all sorts of little bits and pieces and ramifications and know-how and so forth, connected with this. It all makes it easier. And the only reason you need all the bits and pieces and odd bits of know-how and that sort of thing is because you stray off of the exact relatively simple procedure. The procedure R4M2 is so foolishly simple – it is in actual fact so easy to do – that it is a very, very treacherous bog to walk into.

You read these things, why, so there's nothing to that. You just sit there and you ask the person, "Well, goals and present time – what might your present time GPM be? All right, we'll make a list and we'll get it," and so forth. And that's all there is to that. And then we take this and we check it out and then we ask these questions. We don't get a read on – if we get proper reads on these questions, why, everything is fine.

And we list for the top oppterm on it and then we go – top terminal, rather – and then we go flicker-flack back and forth down the bank and it all runs out and everything is fine. All we'd do is a list – it's the first thing that falls on the list is probably the item. We just call it back to the pc. There's hardly anything to this, you know – see, it's very easy. You get down to the bottom, any idiot can do it.

The only thing that gets in your road is the pc's itsa, of course, is not up to the bank. That's why you're running it, you see. So you're running it sub-itsa and sometimes the sub-itsa – because the pc's itsa is not very high – is not very accurate. So you can find in consecutive order five different, separate, contradictory present time GPMs.

You try to run one, you try to run another one, and of course you run a GPM which isn't in proper sequence, you're going to wind somebody up around a telegraph pole with a dull thud. And now is the occasion for case repair, don't you see?

You make a mistake – it isn't your mistake, it's the pc's inability to itsa at that particular level, see. So you come a cropper and now you fall back on the technique called bank formation and you put the bank back together again. You find out, was it, and where does it

really exist, and was it a real one or was it a false – you know, was it a wrong goal – incorrectly worded goal? Slightly incorrectly worded, grossly incorrectly worded, not like that at all – this type of thing. And you go over this and you're back into the put-it-all-together-again-smoothly department. See?

So you go ahead with this very simple technology which is – all you do is make a little list and what rocket reads on the list, why, that's it and so forth. And you take that and you go up to the top of that and then you get this and you – the item lists, you do the item lists, and anything that falls you call it back and you call it and you get your blowdown for the pc, circle around and you say, "Is this your item?" and do your courtesy steps and so forth. There's nothing to that, sneeze – nothing to it; nothing to it. Nothing.

As long as you don't run into any difficulty. See? The technique itself is idiot simple. But it's an idiotic technique that takes a screaming genius to run it. You see that?

For instance, the smarter auditor pulls out quicker from an error and gets a pc into less trouble. Pull out fast, you see. You're going down this list, you're listing, all of a sudden that list is getting long, you call back, you see that the fall doesn't – something falls nicely and you call it back to the pc and you can't make it fall for the pc and you get – list a little bit further, and you get another fall, and you call that back, and that doesn't do it. And you go up on top of the list and you can't get that first fall to fall, and you can't get anything to fall, and nothing is calling back and so forth – well, that's a matter of a very few minutes of operation. You don't make a week's profession out of this thing. You just realize what's wrong: you're listing from a wrong item, man.

And you fall right back into case repair. You see. You get another item to list from. If you can't get another item to list from, then you go back and find out if that's the wrong goal you're operating on. You're running out of RR. And you run it right straight on back but you're into case repair at once.

Second anything goes wrong you're into case repair. Case repair is not a long activity that takes the next five sessions. See? Case repair is as long as is necessary to repair the case. And a very clever auditor can repair the blunder which he has just committed in an hour or a half an hour or ten minutes, depending on the magnitude of the blunder, don't you see. It's repaired right now – is detected – immediately detected, what's going on – he can straighten that up and so forth. And somebody else has gone on with error mounting up on error mounting up on error till he's *really* got a mess to repair and so of course it takes him five, six, ten hours to repair this thing, see. You get the idea.

I mean, it's how quick the auditor can detect the case running wrong. And this is all monitored against another very interesting point, just to scare you spitless. Another interesting point about it is that if you repair a case which isn't running wrongly, you will mess the pc up also. If the case is running just fine and you start to get your ulcers up and start to repair a case that doesn't need repair, why, you are ARC breaking the pc because you're invalidating all of his materials, of course. So you have to know when a case is running well and when it's running badly.

Case is run badly, they're ARC breaky, nattery, you can't get much on a list, your lists tend to be kind of cockeyed and long, the tone arm is running at a different place than where a

tone arm should run – either very high or very low – you're not getting much tone arm action per session, the needle tends to stick, you don't get nice blowdowns. All of these various things. That case isn't running well.

But you're running a case at 45 TA divisions and you're getting RRs and everything is flashing, big blowdowns, and everything is just running like a startled gazelle, pc cheerful, happy, everything going along, swinging, and you all of a sudden get worried and start to repair the case. The fact that you tried to repair the case will now give you a high tone arm or a low tone arm or a nattery or ARC breaky pc. You get the idea?

So you have to know when to do these things and you have to be familiar with the anatomy of the thing. The anatomy of the thing is very simple. There aren't any more things in the anatomy than I have named in this lecture. It isn't any vast panorama of things. There aren't this many parts in a kid's – there are more parts in a kid's Erector Set. See? There's more to learn about stamp collecting or something like that, by far, see? There's more to learn about Parcheesi, in actual fact, than there is to putting a bank back together again.

But there is something to learn and it is finite and that is it. You've got to know that, see. There's not a whole bunch of ramifications. You can't have a whole bunch of false data about banks and repair a bank, don't you see? You got to know what really is there. Is there anything else there? No, there's just those things there, that's all.

So the upshot of all of this is this: R4 – R4 then divides into two divisions. And one of those divisions is putting a bank together without running – or finding – goals or items. Just assembly in proper sequence. There's a whole field of that in R4. And the other one is the technique called R4M2 which is how to find goals and run out GPMs. See, those are two broad fields of activity.

The more useful of the two, the more useful of the two, of course, is the repair area. Putting everything back together again. That's really more useful as technology because it's useful at all levels on all cases. And the only difficulty is, it merely makes people comfortable; it doesn't make OTs. So it has a more limited target and a broader application. See? And probably a lot of things can develop out of this.

But R4M2 is the only – the only – technique – the only technique, there is no other technique, there is no biochemical assist. There is no electrical shock assist, there is no "peyote-squirt in the gluteus maximus" assist, there is no "hocus-pocus Dormaphone yourself to Clear," there is nothing – there is no "hypnotize yourself into insanity," so forth – there is none of – none of any of this, see, that will get anybody to OT, see?

No matter how widely advertised, I wish to point out to you the number of people who aren't and the length of time these things have been around. Implant yourself by installments, you see? That doesn't lead to OT. It stands there as the single, isolated, lonely technology – as the only route to Operating Thetan.

Been worked on for a long time; that it exists at all is absolutely miraculous. That it functions is fantastic. And it nevertheless exists. It, however, in the absence of the first broad field of how you assemble a case, you see, how you assemble GPMs and so on, tried – if you try to handle that, R4M2, in the absence of knowing how to assemble a case – *huup!* You've

had it. You've had it. You don't know how to assemble a case, you're going to run R4M2, don't make me laugh – I've got a sore lip.

Your pc is going to be in agony, agony that is absolutely unbelievable. You, as an auditor – your hair is just going to turn gray minute by minute, as the sessions wander on. Worse and worse. You're going to dig yourself into more holes, because you don't know the first broad sphere of how you assemble a bank. See?

You don't know how a bank looks, you don't know where it should go together and so forth. You're operating too blindfoldedly. And operating too blindfold, and there is no way that anybody can be taught this as: you stick a key in the hole in the side of an auditor and wind it up, you see, wind it up and the auditor sits there and turns on the E-Meter, see, and says, "What is your present time goal? I will write it down." It's not that kind of a technique.

It is that kind of a technique as long as nothing goes wrong. But one pebble slips on the path and it instantly reverts to this broad knowledge of the bank. You've got to have a broad knowledge of what the bank is all about. Now you understand?

Audience: Uh-huh.

This is how this stuff works. This is how this stuff goes together. You can do some miraculous things. It's – just to give you a carrot – not intending you to... you can actually do some miraculous things. I don't care whether the pc – I'm not interested now in the communication barrier between you and the pc – try to do this on raw meat. But I can think of one. You could have a bunch of plastic clay over in the corner yourself and say to the pc, "Now, that's what we call a so-and-so," and finally put him through a drill. He's handling the stuff with his paws that he'd be handling in his bank and it looks exactly the same to him, you see.

And it means the same, in other... translate it into English. Teach him how to talk bank, see? And the second you teach him how to talk bank, why, then you could communicate this and you could put it all back together again. That's a crude solution, but is a solution, don't you see?

Now, you have to do that anyhow. I don't know how a pc – an uneducated pc... this is a Scientologist process, man. Everything I've been talking about is a Scientologist process, today.

You might carry on this education. After you've educated the guy thoroughly, why, he'd be partially a Scientologist.

The situation that you're involved with, then, is the real McCoy, all there is to know about it in form of anatomy of a bank. You see. That's it. And that is combined with the technology of how you handle that anatomy. And you have to know both sides of this in R4 to have anything really like success and not disaster. And R4 is peculiar in that it is the one technology which can lead to disaster.

That is the source of this thing called classification. This is why auditors are classified. Because somebody who has no acquaintance with this at all or minimal acquaintance with this, who are trained out in Keokuk or Podunk and is trying to wrestle with this stuff – *na-ha-ha*. He going to kill somebody, that's all. He's just going to kill somebody.

It isn't that he'll get away with it with one case or two cases. He won't even get away with it with one case, see. I mean, it isn't that sooner or later – it isn't adjudicated – classification isn't based on: well, sooner or later he's liable to make a mistake on a pc and hurt somebody. Where R4 is concerned, if he uses it on pc A, pc A sooner or later is going to hit the long chute. See.

Sooner or later. Maybe in the first session, maybe in the tenth session. Don't – don't minimize it, see?

You're looking at the stuff which can aberrate a body and make a two-headed monkey, practically, see. This stuff is velocity. It's got *scrunch* in it. Find a wrong goal on somebody, you know? The guy's – has an actual GPM of something or other. He, oh, has lots of them – just find one wrong goal. Not "to sell Wheaties," but "to buy Wheaties," or something like this, you see.

All right, you say, "To buy Wheaties. All right. That's your goal." He agrees with it. You check it on the meter at the moment, he hadn't had a chance to itsa it – the thing is still charged up, you see, like mad and your meter doesn't give you the straight dope.

You start to run "to buy Wheaties." *Ta-da da-da-da-da-da-da*. You battle your way up to the top of the bank. You battle your way up to the top of the bank. And you find the top GPM of the bank – meter says so, pc says so, it all appears so. And you start to run it and then find out it's the tenth GPM.

Well, break out your violin, brother. Because this pc is going to be in a mess. Right now. Right now.

'Tisn't the ARC break. It's the creak. It's very funny – I mean, the darnedest things – the darnedest things – but they're all just disarranged elements from the materials I've just been telling you about. You disarrange or miscall one of those elements, getting its wrong relationship to some other element, find something out of the fourth bank and infer that it's out of the first bank, don't you see?

You get these things disarranged or you get bank 3 and bank 2 out of sequence – that is to say so that one is where the other should be in sequence. You get these little elementary actions and those things result in lumbosis, scrumbosis and medicalosis.

And this stuff, in untrained, unskilled, noncomprehending hands and so forth, could make doctors absolutely rich. And I'm agin it. I'm agin it. I think they ought to be paid for exactly the good they do. I think medicos should be paid for the good they do. I think they should be held exclusively to our code on this. And so forth. And in view of the fact that they would then be paupers, why, we wouldn't have to worry about them at all.

I sound bitter. I'm not particularly bitter, but I do hear every once in a while how they gouged out the kidney or the – or the – took off half the head of somebody or other, trying to do what? Trying to get rid of a somatic of some kind or another, see?

This g... organ or ear or something has been under constant pressure, you see, from the bank and so has managed to infect or become aberrated in some particular fashion as a physical aberration. Then they start in with surgery. Well, their surgery did not cut out even one

tiny chunk of an RI. And that RI, unless by some accident, is still pressing against that ear area.

A quack is somebody who is a fraud. And I think they're doing well to conduct their campaign for Doctor Quack. I think they do well conducting a campaign against quacks. I think they should do more of this. They should conduct more campaigns against quacks. I'm glad they are conducting that campaign because we don't have to.

A quack is somebody who is paid for something he doesn't do. Or claims he is doing something he doesn't do. In the final analysis, what they are curing is caused by misalignments of the reactive bank. And the anatomy of the reactive bank is just as I have given it to you and nothing more than that.

Now you say, "Well there is such a thing as germs." Yeah, there is such a thing as germs. There is such a thing as matter. Yes, there is such a thing as matter. There is such a thing as this universe. Yes, there is such a thing as this universe. Yes, that's all true. There's no doubt about that of any kind whatsoever. There is an actual GPM called, "the physical universe." The only question I'm asking is whose is it? [laughter]

But this is the level, scope, breadth and what you should know on Level IV. 'Tisn't really very much when you come down to look at it. The technique itself is idiotically simple to do and repair is something you learn simply by knowing the parts and being imaginative as to how many – how many ways they can go out of gear. How many ways they can get scrambled and how to put them back together again. These things you can learn, these things you can do. And the reason they can learn them and can do them is (1) they are simple and (2) there is no other route. Okay?

Thank you.

R4M2 PROGRAMING

A lecture given on 31 October 1963

Well, you have a day here. Hallow's Eve. Allhallow's Eve. Isn't that the date?

Audience: Yes.

Well, we'll talk about ghosts. Are you a ghost? Children plague me with this. They get a lot of Scientology around and it gets in conflicts with their children's textbooks. And – and get quite confused with definitions of what is a ghost, you see, and that sort of thing. We frankly – we need undoubtedly a small textbook on this subject, you see. *Scientology One Junior*.

A thetan is not necessarily a ghost, you see. But everybody is a thetan. Body – thetan minus body equal ghost.

October 31 – that the date?

Audience: Yes.

All right. AD 13 Saint Hill Special Briefing Course. Another lecture on R4. Your morale I can see sinking steadily, steadily, steadily. Small, tiny pennon showing, just the tip of it as the ship sinks beneath the waves, you see. Sort of a feeling of "Good God, how can we possibly climb this hill," you see. I mean, it's all too complicated and too much is being demanded of it. And I can't possibly do it, I can't possibly audit." You know. This kind of feelings that sweep across one or feelings like "Good heavens, what will I be doing to a pc? Is it – is it really safe?" "Oh, God," you know. "Well, do I dare say anything to the pc at all? Everything I say is wrong, and so forth. And it's all too complicated," and so forth. Well, you're right except for one thing. It's not all too complicated. You are. See, you're too complicated.

For instance, there are certain little things that happen in auditing such as when the needle is moving nicely in blowdowns and the TA is going down the auditor who opens his yap is a fool. See, I mean – you don't even have to put it elegantly. And when the TA isn't doing anything and the needle isn't doing anything and you're not getting any tone arm action, the auditor who doesn't do something is a fool. You got the idea?

Now, the auditor who only acts when the TA is moving and who never acts when the TA is motionless, well, he of course is making more trouble for himself than you can shake a stick at. The basic rule, very simple, very simple: When you've got TA motion in progress, shut up, be quiet, don't do anything. Don't even lift your pencil. Just sit there and watch it move. Take some delight in the smooth sweep of a down moving TA, you see. And keep on taking delight in it until it's no longer happening, and you'll be ahead every time. And when the TA isn't moving and when the needle isn't moving, do something.

Actually that's auditing against the TA. It's simply coordination. You've already got the rules in a bulletin. Undoubtedly that's one of the most important rules there is right now. There probably is no more really important rule than that in handling pcs and meters. Just that, see.

Well, you say, "Well, we move into R4, of course, all that is swept aside." Oh no, no, no. Everything you know how to do at lower levels you do at R4. But at R4, of course, you are expected to be in there pitching quicker when you got a motionless TA and a motionless needle. And you're expected to be in there rapidly. You're not supposed to sit there for the next half an hour to find out if it's going to move, don't you see. Because this is – this is quick stuff. This is auditing by quick step. And when that TA starts to move and that – you get an occasional blowdown on that meter and that TA is moving down and so forth, well, you shouldn't be doing a thing. You shouldn't be trying to find a new goal and you shouldn't be trying to make the pc list. And you say, "Well all right, the pc should be talking."

Well, that's a mistake somebody's been making around the W unit. The pc must talk in order to have the itsa line in. What is an itsa line? It's the pc talking. No, that's not the pc talking. That is the pc itsaing. See that, itsaing, a pc who is itsaing is simply looking at and identifying something. And you get a totally motionless pc who is sitting there with his eyeballs swiveled around 180 degrees looking into his skull and you'll be getting beautiful blowdowns on the needle and so forth. Well, the auditor who gets busy and ambitious at that time ought to have his shins kicked. See?

He can stop all of his TA motion just by getting active at that moment. Well, we don't care if the pc sits there for twenty minutes without anything being done by the auditor at all and nothing being said by the pc. Perfectly all right. You got TA motion during those twenty minutes – you got TA motion during those twenty minutes, the pc must be itsaing. Must be, because the tone arm is moving.

And you'll see a tone arm sometime go down and pc's looking, "Is this my goal? Is this my goal? Let's see if this is my goal. And so on and so on and so on and then so, so on and so on and if I don't so on, so on and I have... well, when I was four or five I used to worry a little bit about this, and so forth, yes, and so on and when I was ten I did, and so on." Of course, he's not saying anything, he's just sitting there. That's what's really going on, you see, but he's – to the auditor he's just sort of going...

Now, the auditor who cheerily, cheerily at that moment realizes he's got to be interesting and wake the pc up and that sort of thing, just isn't paying attention to his meter. You'll see that tone arm go down and halt and stop for a moment and climb and then go down again. And you'll see blowdowns, large surges and that sort of thing going on now and then on the meter, and so forth. Well, that's what you're supposed to have happening in a session. See, see? You see, it's just emphasis on what's supposed to happen in a session. Well, if you think a session is something in which an auditor does something or a session is something in which a pc talks or a session is something in which an auditor and a pc have ARC breaks or if you have any odd definition of a session which throws this out, of course, you won't grasp this very readily at all. And you actually will miss the boat and there goes your TA. Bang! Then you get to the end of the session and don't record any TA. Why?

Every time the pc started to get his attention on something and get the itsa maker running on the thing, you know, and looking at it and the thing started to blow, the auditor said, "Yap, yap, yap, yap, yap, yap, yap, yap, yap, yap, yap." And the pc – the pc says, "What – what? Oh, we – oh, yes, yes." And of course did a suppress and that stopped the blowdown and of course you got no TA. That's it. See, you finished it right there.

Well, what's supposed to happen in a session is you're supposed to have a TA moving. You're supposed to have things happening to the needle and the TA. And if you don't have to do anything to make things happen to the needle and the TA, well, that hasn't anything to do with it either. All you're supposed to do is have something happening to the needle and the TA. And when nothing is happening to the needle and the TA, you of course have to audit like mad. But when something is happening you better not do anything. See, it's as simple as that.

And if you can get it, it's as simple a mechanism as when the car is running forward you leave the clutch out. When the car is motionless you put the clutch in. Do you see? I mean it's that kind of a datum, see. Well, that's how you drive a session. It is no more complicated than that. Don't you see?

The only mistake you make is once in a while you'll fumble it just to this degree. The pc has got ahold of something, isn't quite seeing it and for a moment or two nothing happens on the meter. It doesn't start to blowdown yet, don't you see? And the auditor says, "Well, it's a motionless meter so therefore I'd better ask a question," you see. And he says, "Did..." And just at that moment it starts down, see. And he's goofed, you see.

Well, he's got to be a clever enough auditor to adjust the clutch accordingly, you see. Right now, adjust that clutch, see. Why did I open my mouth? It's as simple as this. This is driving an E-Meter. And there's really nothing much to it. And you get more complicated about it, why, you're in grad [great] trouble.

Now, as long as a meter is moving then, as long as you're getting down TA divisions and so forth, no great skill is required of the auditor. He just goes through routine activities. For instance, in R4, well, he finds the item and he calls it back to the pc and it fell and then he waits until the tone arm motion is gone out of the thing and then asks the pc the courtesy questions about it, you see. "Is it your item?" you know, and other things like this. As long as he isn't getting any motion, he goes on with his job. As soon as he gets motion, he stops going on with his job. Well, that's all very routine. You don't run into any trouble, really, with that.

You could memorize and perform – if you – if you know this thing about driving an E-Meter, you could then memorize and perform the other steps necessary to the execution of R4, well perhaps, in a couple of hours. It's pretty hard to sometimes coordinate all the – write and watch the meter at the same time, and so forth, but that's just coordination, see. Just coordination. When do you shift gears without stripping out all of the – all of the teeth, see. It's that kind of a lesson, you know. You're supposed to say so-and-so and so-and-so, and you're supposed to write down so-and-so and so-and-so, and you're supposed to see a meter reaction. When you see that meter reaction you're supposed to say, "Thank you," and call it back to the pc. And then it normally falls and that was the item.

That's all there is to it, don't you see. I mean, these are very simple actions – elementary. If you just look at the set of actual actions which you perform based on this driving the meter plus these little other elementary actions which you take. Don't salt it down with eight thousand seven hundred and sixty-six billion rules, see. You just be there in the session and do those little simple actions which comprise R4. And actually as long as the case is running perfectly, you've got it made, see. You got that – that little spook phrase in there. As long as the case is running perfectly, you've got it made. And actually, almost any idiot could learn how to do this, see. Anybody could learn how to do this.

Now, if those simple ac... if you're going to make those simple actions complicated then you better un-complicate in an awful hurry because those actions are terribly simple. Drive the meter, do something when the meter is motionless and don't do anything when the meter is moving. Get that coordinated. You know what to list, how to head a list, what to write, how to watch the meter, when to stop the pc, when to read the item back to him, how to do a goals list until you've got an absolute smooth flowing needle, you see? And then null the whole goals list back rapidly to the pc and get the one that's in and put a couple of mid ruds in on it and make it fire like mad, see. Those actions, see. They're very simple actions. You should know those actions perfectly and so forth. And actually there's not enough complication in them to actually study very hard, you know. They're just things you do. Fine.

Now, get that line of simple actions. Now, understand that just as a little parade of very simple actions. There are – they haven't got any big rules and so forth in connection with them and they're just there and there they are and so forth, see. Give you such things as you underlist, you normally underlist – the big faults are, is underlisting a goals list and overlisting an item list, then you just know your item lists have got to be pretty darn short and your goals lists have got to be pretty darn long. And – you get this – this is awful easy, terribly easy to assimilate. Very. There's nothing to it. You can learn how to do that. If you're putting your big concentration in on learning how to do that, that's something on the order of learning – it... you get into the swing of this, you get into the swing of this. It took me – took me quite a few hours actually, in actually auditing the stuff to come up with a total confidence on the thing.

For instance, for some months I wasn't doing any listing on a meter. I wasn't doing any of that particular type of a – of research work or anything that required me to list against a meter. Don't you see. Well, I wasn't doing anything like that and I got a little bit rusty and it took me a very short period of – I got so that I didn't quite know whether or not I would see the motions of the needle, don't you see, the next time I did a list. The next time I did a list I said, "Well, now I'm going to list this thing and I wonder if I've got this coordination in."

For a few minutes there I was sort of queasy. You know, was I seeing all the motions of the needle while I was writing and then all of a sudden it just went back into gear and that was it and I haven't worried about it since, see.

A meter can't pip without my seeing the thing. I don't care what I got my eyes on, see. And these are the kind of things that – they're little coordinative facts, you see. This is something like the pride with which you rapidly can shift gears in a sports car or something like that. How smoothly can you shift the gears, you know. Never miss. That kind of thing. It's

just – they're little mechanical coordinative actions and so forth. You learn these with practice and so forth.

And as long as nothing has gone wrong, that is all there is to R4. See? That's all there is. You needn't be skilled beyond just these mechanical actions.

Now, now, the still meter, dat meter what just rises up. It gets up there to 5.5. It gets up there to 5.75. Man, it isn't blowing down. You can't get anything to read. Your pc is developing lumbosis in a hurry. Politis is normally what they get in running this. It's the pole they use in implant GPMs that goes up the back of the pc – politis. Actually, the source of lumbosis is actually politis.

Typical medical remark. You take a mythological disease which doesn't exist, you see, and give it a mythological – not a mythological but give it an explanation and source, you see. Quadam neurosis is caused by kleptomania inverted with arsonism. See. Now, if you memorize that you'll be a psychiatrist and all that kind of thing. A whole bunch of double talk, a bunch of nonsense.

But there's that meter and it's not moving and there's that pc and that pc's got creaks. And that list that you did, that didn't come out to the perfect item. And that meter didn't blow down and you've now got no motion going in any direction. Now, that requires an auditor.

Now, there's no substitute for an auditor in the chair at that point. Now you got trouble. First trouble of this kind which I ran into in running goals and so forth, my back hair stood up and vibrated. Sparks were flying out of my fingers; my nerves were going *zzzzzzzzzz*, see? I was getting some lumbosis myself trying to sit and look calm in the chair. Cup of coffee after the session or something like that it chatters against the cup like a widow maker tearing up pavement, you know. "*Wooooohhh!* What the hell's going on here?" Worry, man. That's a – that's an occupational – that's an occupational illness on this subject. Worry. Did I get enough TA, didn't I get enough TA?

Somebody in actual fact has lost a whole night's sleep worrying, because the pc did not get TA in the session just run, you know. What was wrong? Well, add that up to the fact that it wasn't just not TA, the pc's TA is stuck at 5.75. The meter is so dirty, the needle is so dirty that you can't even analyze anything. You can put your fingers on nothing and the pc is ill. You can get nothing to RR or R/S. You can get nothing to read. No list is traceable back. Where are you? What have you run into? And the cup as you try to drink a cup of coffee chatters against the saucer. Man, it sounds like a machine gun.

Whatever little worries you run into in I, II and III are multiplied enormously at Level IV. When I first ran into this sort of thing causing a big blunder of this kind or that kind, RR shutting off and so forth, I didn't know what the score was to a large degree. I was doing research lines and so on. And I was interested in wrapping a pc around a telegraph pole in the last week but good, and arriving at all the conditions just described, and my emotional reaction to this was a bit of concerned sympathy for the pc for feeling that bad, but my emotional reaction or my puzzlement as to what it was all about and so forth *pah!* No worry, no concern.

The fact that the RR and falls had shut off on the meter simply indicated to me we must be running a – running items when we didn't have a goal. So that just said the goal was

wrong. So it was just a matter – we got to find the right goal for this and find out why we can't find the right goal for this. Just untangle this skein of yarn. It untangled fairly rapidly. Pc feeling quite disabled for a couple of days, but so what, see. Brought it all off at the other end, everything going smoothly. Get the idea?

So your nervousness at R4 stems from lack of knowing. All the answers are now there to know – be known, you see, and you just don't know them. You don't really need any of them – any of those answers till you run into trouble. Now, in view of the fact that the little run-off techniques of "Well, you do the list, you do the goals list and you get a goal and it fires and you check the goal out and you do an analysis on that and you run it over here and you do items for that and you run down the items and so on." All of those little actions – smart, brisk – you should be able to do all of those things. But you should be able to do all of those things actually without knowing what you're doing. And those little actions even if perfectly done will inevitably run a pc into a brick wall sooner or later someplace, because you're not dealing – you may be dealing – you may be perfectly auditing but you're not dealing with a perfect bank. You see that?

It was a dark and stormy night and the pc was standing out in the rain. And they were big, black, oily clouds rolling by. And all this happened in 1936. And it keyed in a GPM, "To never be saddened." And this GPM oddly enough has been pulled fully and completely out of its position and yanked up to 1936. And you're busy doing all of your little actions and these would be perfectly okay if the bank were perfect. But the bank isn't perfect because there was 1936. You see, don't you go blaming Scientology and auditing all the time for what's happened to your pc because life has done a thousand things to him for every tiny little thing that auditing has done to him, see? You see, auditing – it's easiest to find the auditing goofs because they've already been disclosed to some degree. But the livingness goofs, they haven't been disclosed, so livingness itself can disarrange this bank.

All right. Well, that's bad enough. But let's look at another one. Trillions three years ago, see, somewhere around a trillion trillion trillion years ago – you don't have too much to do with these dates now in R4 – but at that length of time while the pc – you've gone down the bank now from present time GPM and you're going along *pocketa-pocketa-pocketa-pocketa-pocketa*, just everything fine, everything fine, everything fine. And trillions three years ago the pc got implanted, cross-implanted and upside implanted with a bunch of goals that were reversed to the goal of the GPM the pc was on at that particular time. Everything has been running gorgeously but this put the track in a group.

So you list for the next GPM. And you're listing into a bunch of wrong goals and implant goals and the pc doesn't know they're there and you don't know they're there and so everything starts to fire and nothing fires and eventually you come up with an – something that reads to be an actual GPM but it isn't the actual GPM, it's merely a goal but is quite like an actual GPM and is so undifferentiated that the sub-itsa, you see, can't reach. It's too burdened. This is too chewed up at this particular point.

So – but you do get a goal and it does check out and you run the items for that goal and you run halfway down the bank and you all of a sudden realize that this pc is riding at 5.5

and is getting less and less blowdowns and there's less and less reads and you say, "Whoa, we've got a wrong goal." Well, judgment comes and when do you hit the silk?

So, you check it all over now and it's been unburdened enough to find out, yeah, it sure is, that was – that was a wrongly worded goal, you see. Something like that. So you go back to your original goals list and you do your original goals list again. And *pocketa-pocketa-pocketa-pocketa*, you're doing your original goals list and you're extending it, you see. You're extending it and you're extending it and you finally get one. Oh, it fires and everything is fine and checks out and it's an actual GPM. Oh, ho, *pfffaaooouuu* see. So, you're going to find the items for it now. You go *pocketa-pocketa-pocketa* find an item, find an item *wo-da-da-da-da-da uukk*. The RR restored, but all of a sudden you haven't got any – it isn't even falling now and your needle's getting very still and it doesn't matter what you list and the pc is now coming down with a good case of politis.

And you say, "Well," – if you know your business – you say "Well, we've run into something here that didn't register right." So you analyze the goal you're now working on and you find out that it was an implant GPM you were busy running without the pattern.

So you haul off then and you come back and you start all over again and you extend this goals list and this goals list won't move and nothing will move and you've nulled the thing all three times and you get in your mid ruds and everything else and then you finally come back to the beginning of them and find out it was the first goal on the list. And it suddenly fires like mad. And you go up to the top of the list and this – now you found what? You have found two separate oppters for wrong goals – two separate top oppters – so this particular position of the bank is some – getting somewhat like Times Square, you see. Just getting a little jammy. So you try to list into that and get something to read there.

Well, you finally take refuge in the fact of finding out how far you can go on the list without ARC breaking the pc. You find out how far you can go down the list until the pc ARC breaks. You can't make anything read, you see. You got the right goal now, but everything is so jammed up that you can't do anything so the only thing you've got left is assessment by ARC break. You know if you go across the item on nulling, that in the next few items the pc will ARC break. So you carefully watch the pc's ARC break and then backtrack and ask the pc, "Well, which one of these items is your item." And the pc picks up the item and all of a sudden it fires and you're away.

And of course now the top terminal, that is – also looks like Grand Central Station or something like this and you can't get anything to read on that, you follow out the same system then suddenly you get big blowdowns and lots of charge is blowing off and all of a sudden you get one of the things to read and you've got the action going and you just proceed as before.

If you didn't know your business at the time you reached this trillions three point on the track a pc would be finished. 'Tisn't a case of they got a slight cold and recovered. You just finished a pc – finished him. Unless you can untangle that, you've finished a being.

Horrible, isn't it. But let's look at the elements it required to untangle that. It required a knowledge of what the bank was all about, of the things that could go wrong. You realize that you walk into too thoroughly an overburdened area, that the more overburdened or charged

the area is from whatever cause the less accurate your analysis by a Ouija board and this E-Meter is going to be. Is this an actual GPM? Yeah, that flicks and that flashes and so forth, and for the moment is correct. But the area is *so* thoroughly charged that those errors creep in. And so you take those things and the more charged the area and the more guth... goofed up the whole situation is at that particular point of the track, why, the harder off you're going to get. The worse off it's going to be, the more unreliable your analysis is and the more mistakes you're going to make.

You realize, you learn eventually that the way you handle a mistake is to remove all possible charge before analyzing. That's the way to cut – minimize such mistakes. Get any charge off that you can get off before you do an analysis. In other words don't do an analysis and then remove charge. If there's any opportunity of removing charge before you do the analysis, for heaven's sakes do so. One of the ways of doing that is to get the pc to itsa what you've just found, before you turn to the meter.

"Well, does this – does this add any effect on your life, do you suppose?" You've just found something, you see, that read, "Does it have any effect on your life? What do you – what do you think it might be? Oh, yes. It's so-and-so and so-and-so. All right. Is there – has this ever come up before? Oh yeah." And the pc will spot this and spot that and spot the other thing and get him to itsa a little bit, see.

Give you another one. You've found an implant GPM. You know darn well it's an implant GPM that's of similar wording to the GPM you're trying to do, or opposite wording to the GPM you're trying to run, you see. And you can't be sure and you've gotten into a track jam of some kind or another. And you know, it hasn't run well, you've – pc's been wrapped around a telegraph pole. And here you are, and so forth. Well look, you're not sure of the actual GPM but you're sure sure of the implant GPM. Because the pc actually has a visio on the parking meters, you see. Well, you got a line plot in your kit and run it. Take the charge off, see. Take the charge off the implant GPM before you check out the actual GPM. Get the idea?

In other words, the rule is, if there's any opportunity of taking off charge before you do an analysis, at a sticky spot on the track – because I'm talking about now a tough, overburdened area – if there's any opportunity whatsoever of taking off some charge, take that before you establish what it is you have found on the list. Got it? Then you'll get your reads more accurately and you'll make fewer mistakes. Take the charge off first and then analyze what it is.

Well, of course that can only go just so far. If you're trying to take charge off but aren't getting any tone arm action then of course you've got to find out what it is. See, it's only whether or not you can get tone arm action on this.

I'll give you an idea. You've gotten into a jam and the pc has a goal "to spit" and you can get an implant GPM there "to be spat at." There sits the implant GPM. You analyze it very carefully and it's quite recognizable as a Helatrobis Implant. Well, you got the pattern right alongside of you and you've got the goal and it's firing very nicely and actually every time the pc says anything about it, you get rocket reads, but you speak of the actual GPM, you can't get much and you're not sure what the actual GPM is. Well, naturally you're more sure of the implant than you are of the actual and it's a lighter charge. Well, let's just take the old

Helatrobus Implant GPM and *pocketa-pocketa-pocketa-pocketa*. Actually, you should be able to get rid of it in a couple of hours. Take the whole thing off if you're – really can audit. *Bong, bong, bong*. You take the items two at a time, make the pc call one against the other item and bleed down the rocket reads on the thing, bang, bang, bang, bang. And you got a lot of charge off the thing. You got your tone arm moving, the pc feels a lot easier and so forth.

All right. Let's move back to this actual – (quote) "actual" GPM "to spit." Let's move back to this actual GPM "to spit." You know, sometimes you won't even find it exists. You're saved from a fate worse than death. You had an actual goal which was a lock on the implant that you were busy testing, you see, something like that. What you can get your hands on for sure, in other words, that will get charge off, well, you get charge off with it.

Rules of this particular kind: Never try to find, without – an unrun, further-from-present-time GPM, by listing. These are the things you learn the hard way. We've got a present time goal "to spit" and our next GPM is "to not spit" or something like that. Well, listing from the present time actual GPM to the second GPM is impossible. Listing from, counting from present time, GPM four to find GPM five when GPM four has not been run, you understand this? I'm talking about unrun. You're trying to get a chain of goals together, see. You're not running them. You're just trying to get this chain of goals. Well, you got the goal for four, now trying to find the goal at five – I don't know why you'd want it anyway – but trying to find the goal at five is impossible. I don't – not difficult, you heard me now. It's impossible. It requires luck of a nature you never heard of. You just wont find it, that's all.

The only way you can goal oppose is toward present time. You can take two full GPMs – let's say five and four – and you've got number five and it's a full unrun GPM, you see. You can't run items if you haven't – there's only one way to run items on this. Just make up your mind to that. That's from the present time GPM back. But you've got number five and you want to know what number four is. Well, you do a goal oppose, see. What goal would oppose the name of GPM five. Do that list and you'll always come up with GPM four.

In other words, you can do a goal oppose toward present time but you can't do a goal oppose back from present time. It just won't work. It just is impossible. I won't even go into the ramifications of why. You always wind up with a mistake. Except once in a blue moon you will be very, very lucky and find a goal below. You'll find a goal below. But you cannot guarantee that you haven't skipped four or five goals. And you can put no reliance on it and eventual – eventual analysis of the case as it eventually turns out, yeah, you skipped about three GPMs, see? It doesn't list back but it'll list forward.

Now, that's – just let me put this in. You have to list back from a fully run GPM. You've run all the items out of a GPM, now you got to list to the earlier GPM back from present time. That's an ordinary action. I'm talking about you can't run down the track without running any RRs – any RIs, don't you see? And you get to GPM four and you've completely run GPM four. GPM four is all beautifully run and polished up and you got all the RIs in it. Now, you list a goal oppose to find GPM number five from present time and you will come up with a goal every time very beautifully. That's because GPM four has had all of its RIs run out of it.

Well, you say that's not even a very important datum. Well, it's important to this degree, that if you take off – this is modified to this degree – that if you take off four or five RIs from the bottom of a GPM – you know, it's got four or five RIs left in it at the bottom and for some weird reason you might decide to do this at some time or another – you never find the next goal. And it can look like you must be listing against a wrong goal or something because you can't find the next goal. Actually, all you find is the next RI. You'll find the next optterm or you'll find something stupid on the thing. But you won't find the next GPM's name because you're listing away from present time and you're listing over the top of several unrun GP... RIs. Interesting, isn't it?

All right. I see that that confuses you to some degree. Well, if it confuses you, you just haven't got the – I gave it to you partially for this reason – you just haven't got the mental facility. Oh! A GPM, that's it. *Bop pow!* And that's an engram and that's an implant and so forth and of course, it's a this and that and naturally they lie in this kind of a situation. And they go plus and minus down this way and bang, bang, and there's nothing to it and RIs sit in the middle of the package and so on. And all visual and we know what it is.

How the h... how the devil are you going to fix a radio set if you never heard of a valve, a condenser, a knob, a dial, an off-on switch or anything else, see. So, you get – you get my point? If you had any difficulty following my explanation of what you shouldn't do about listing, don't you see, then it's because you don't have visual acuity on the bank. Otherwise you'd say, "Oh yes, of course." Nothing to that, you see. You still must be fumbling around a little bit with nomenclature and so forth. I'm not trying to lay an egg on you because I could make you understand it. You can't because what I've told you is perfectly factual.

It isn't very important data that I'm giving you because why the devil would anybody ever want to list from... he's trying to find the present time GPM to go back down the run without finding any RIs, you see. But why would he ever list away from present time? See. Well, he wouldn't. You also can get hooked occasionally though by leaving four or five RIs in place at the bottom of a bank and say, "Well, we'll at least find the next GPM before we knock off this intensive so the pc will know about that," and you try to find it over the top of these RIs and you can't do it. I've tried it several times. You can always find the one closer to present time. And you can run that out very easily.

Facility, nomenclature, what's the orientation of this stuff? Well, actually if you regard it in the situation that you're just dealing with a bunch of child's building blocks and it's actually no more important than that. There's no reason to feel any great awe of these things. Because the only thing awful about them is the fact they remained completely unknown for so long. There must be a large vested interest in having everybody weighted down, don't you see. Somebody's been enthusiastic.

I'm sure the Ford Foundation, an organization of great ethical standards, would have engaged with some success in this direction if it really had intended to do so. You know, they folded up all their mental research. They said we'd done it. Did you know that? They actually put out a bulletin to that effect. Official bulletin of the Ford Foundation. Ford Foundation no longer engages in mental research because it's all been done by the Scientologists. They sent a fellow – years ago they sent a fellow down to Phoenix to go through the organization to report

on it – a report. And they got a full report where we sat with mental research and they decided it was in good hands and they knocked it out, because they had to have money for other purposes, of course, so this... But look at the interestingly easy surrender. They never even tried; they never even tried.

But possibly one of the reasons why all of this escaped view is because it is as idiotic as a kid's set of building blocks. We're very shortly going to – you're going to be drilling with this stuff. This is a GPM. Make you model one, hang it together, name goals. You'll get to a position, I know, where you will eventually walk over to the board with your pc and have the pc arrange the GPMs to show you what his bank – what he thinks is wrong with his bank. Don't you see? You've got – it's that easy, see? I mean, because everybody thought – everybody was stuck at – everybody was stuck down at think or mystery, probably at mystery on this subject, see. And at mystery there are no masses, so the mind of course was very mysterious and you mustn't go into the mind. So nobody looked to find a bunch of little kid's building blocks that had nothing much to do with anything except this.

Now, that's the magic which you've got to put time in on. That's the magic which you've got to put time in on. And you very rapidly will learn this sort of thing. I had my brains creaking last night on one of these problems, because these are problems. These are, you might say, auditing tactical problems. What are – what – what is the misarrangement here that we have run into which makes it impossible for us to get this next goal.

We know, of course, at once that the area is overcharged. That's an idiot statement. What's got it overcharged? Why? Why is everything grouped in here? Why do we keep overcharging it by finding new wrong goals, don't you see? And I found that the pc had had a goal run "to be happy" in the Helatrobos Implant series. Only there is no goal "to be happy" in the Helatrobos Implant series. There is a goal there "to be unhappy." And the pc had an actual GPM "to be happy," which of course made this implant goal very easy to mistake – made it easy to make a mistake on this, don't you see. And of course you get "nix absolutably unhappy" and it sounds like happy after you've pulled all the reverses out of it. So of course it tends to read very easily as a lock.

Now, let your brains creak over this one. An implant GPM "to be unhappy" had been run as "to be happy" which was the pc's own actual GPM. Got that? So the implant GPM "to be unhappy" very easily collapsed on a positive-negative basis on the pc's actual GPM. So that the moment we started into that area, we'd already, you see – it wasn't the auditing that had made the mistake, it was the fact that because this condition already existed in the bank that mistakes could now be made. You see, you wouldn't get nice clean reads and that sort of thing. Everything is kind of muddy. Easy to make mistakes.

Now, look at this. The goal "to be happy" appeared on the goal oppose list from the bank just before, but wouldn't fire, because the pc kept saying it was an implant GPM. Pc knew this, that it was an implant GPM. So therefore every time it'd come up it might tick a little bit but then go splat! So of course then it just wouldn't read. Two wrong goals in addition to the "to be unhappy" wrongly run goal were then stacked up at this point on the track after that. One error plus these two other errors.

In other words, three wrong GPMs. One right after the other came out of that mix-up. It looks like one of these pileups on the highway. See. Somebody wrecks a small car and then a couple of other cars run into it and then a Greyhound bus hits the lot, do you see. A block on the road. In other words, because this condition existed of overcharge on the bank anyway, then mistakes could be made in that area, don't you see?

Now, the auditor eventually had to be smart enough to sit there calmly and undo and guess at the lot and figure it all out as to what was and all of a sudden the pc comes up with broad cognitions because enough attention has been directed into the area and enough charge has been brought out of it to straighten it out. Got the idea?

But here's – the genius in the auditing is that goal even then wouldn't read. The goal – the actual GPM "to be happy" never had been run – wouldn't read on the list, wouldn't read until the pc finally started cogniting and then cognited more and more and then cognited more and more and more and then cognited more and – oh, you're getting blowdowns on this, you see. And he started to get blowdowns and blowdowns and blowdowns and blowdowns and blowdowns, and only then – was never found by nulling then, it was found by pc recognition of what it must be, after the thing was all disentangled by the auditor. Get the idea? Well, that was very smart auditing. But what kind of auditing is this? This is simply the auditing that when you hold up a poker, the name of it is a poker, and you hold up a shovel, the name of it is a shovel and so forth. You aren't wondering if the shovel is a poker. Don't you see. There's no confusion there.

How many – how many things could be wrong? Well, that's a real brain creak, man. That's a misrun, wrongly worded implant GPM run as the pc's actual GPM on the implant... You let your brains creak over this thing. That's a wild jam, see, on the track. You run into these things, you see. You run into these things and it's rough getting through those points.

So as I told you yesterday, in yesterday's lecture, there are two zones and areas of R4. One is the key in the side and wind up the auditor and as long as the TA moves the auditor has solenoids connected, you see, so that they forbid him from saying anything. And the moment the TA stops moving then the auditor goes on with the remaining action, like you run washing machines, you know. It's just as – just as stupid and automatic and crisp and precise as that.

And then there's this other field of knowing what you're doing. And that's a great, big, broad field and that requires knowing all the parts and knowing how they belong and knowing how they can be scrambled. There aren't many of these parts and they aren't very complicated. But there's no substitute for knowing these parts.

Now, by knowing both of those zones and areas, you'll get through R4 like a breeze, given the basic ability to sit there and audit, see. You'll get through R4 just like a breeze. Pc will catch hell every once in a while. After your first two or three mad collisions and pileups on the roadway you'll suddenly realize – you'll have seen it with your own eyes, that when you run a wrong goal, why, the RR shuts off, eventually shuts off. Tone arm goes high. Doesn't require an Ouija board of saying, "Is this an incorrectly worded goal?" and tick, and that doesn't require – well, how much sign board do you need, see?

You were finding items for which you had no goal and that's the only thing that shut off an RR and the only thing that would shut off an RR, so it must be a wrong goal. We don't care what the pc is saying about it. We don't care about anything else. That means that then we had an incomplete goals list and we'd found a wrong goal on it. So we got to extend the goals list and find the right goal on the list, see. Elementary. You'll find it one way or the other, hunt, punch and sweat. And the quicker you get the situation in hand, the easier it is to remedy. The longer you let one of these situations go wrong, the harder it is to remedy in the long run.

So it's these two zones in which you're operating. And there's no substitute for expertness. You should be able to sit there and, big key in the side, and wind yourself up and *pocketa-pocketa-pocketa*. See?

"Who or what would solve a psychiatrist?" You see.

"Sasa-sa sa-sa."

"Thank you." See?

"A shot gun. A shot gun."

"All right. That reads. Is that your item?" Silence from the auditor. Blow, blow, blow, blow. Pretty soon, why, no more action left in the thing. Looks quiet. Two or three minutes later it's very quiet, the meter and everything. The pc's talking a little bit and itsas a little bit.

"Very good. Thank you. Now, would a psychiatrist – would a shot gun solve a psychiatrist? All right. Thank you." That bled you another rocket read and a dial wide. It's fine. You see. All right. "How does the item, 'a shot gun,' relate to 'to be crazy.?' " Fall. "Thank you." Now, you'll notice that your TA is now up. You're not going to get any more motion out of this. You bled it.

You say, "All right. Here is your next question. Who or what would a shot gun solve?"

"Da-da-da da-da-da."

Thank you. Read you back... Just *ha-ha-ha-ha-ha*, you see. Little man, little wound up thing and nothing to it, see. It's all just *zazazazaza*. All perfectly patterned actions and so forth.

It all goes along this way. And you're doing this – you're doing this list and you say, "Who or what would solve a psychiatrist?"

"Ah-bla-bla-bla-bla-bla and ah-bla-bla-bla-bla-bla and ah-bla-bla-blable-bla."

"Thank you. A shot gun, a shot gun, a shot gun, gun. All right. Could you give me a few more items please? Who or what would solve a psychiatrist?"

"Da-da-da-da-da and da-da-da-da-da and da-da-da-da-da and da-dada-da-da and da-da-da-da-da and da-da-da-da-da. Arsenic."

"All right. Arsenic. Thank you. Thank you. All right. I'll read you this item. Arsenic. Arsenic. Arsenic. Arsenic! All right. I'm sorry that didn't read. A shot gun. A shot gun. All right. I'm going to null this whole list now. *"Da-da-da-da-da da-da-da-da-da, a shot gun, da-*

da-da-da-da-da-da-da-da-da-da, arsenic. All right. We'll have to continue this list. Very good. Who or what would solve a psychiatrist?"

"Da-da-da-da-da da-da-da-da-da da-da-da-da-da-da. Ah! Brickbats."

"Okay. Thank you. Thank you. I'll read you the item. Brickbats. Brickbats. Brickbats. Brickbats. Arsenic. Arsenic. All right, I'll read you these – these interim things. A shot gun. *Da-da-da-da-da* and a *da-da-da*."

X, X, X, X, X. Something is wrong.

Now, at this moment, at this moment, rules will not save you. You could be given now a brand-new pattern with a key on the other side and it wouldn't do you a bit of good, because you're running into variation. How many things can be wrong here? Maybe a lot of things can be wrong here. You might be – have all of a sudden run out of – maybe you're running an incorrect goal. Maybe you're running an implant GPM. Maybe you're running with an actual GPMs type of pattern, don't you see. Horror of horrors. Maybe your analysis in the first place is right. Maybe it's so simple, the first thing you would choose is the fact that a psychiatrist is a wrong item. So you continue that list and adjust it from that point because your list is unduly long that came from it, so your first assumption is that a psychiatrist list must be wrong. And the first assumption on that list is the psychiatrist is late on the list and there is an item earlier on the list that should have read in the first place. So you go back and pound that list to pieces trying to find out some earlier item on that list than psychiatrists.

And if you can't get anything on that list to read now, you got to start assuming other things, that something is wrong with the GPM, that you're running implant GPMs, something – *awwsomsomawww* what has happened here! *Ahhhh!* I should have gotten up this morning, don't you see.

You generally find it's something simple. But of great moment to the pc. Small matter, like you're running the opposite wording to the actual GPM or you're running an actual goal that has no GPM, neither an implant nor an otherwise. Or you've gotten a little bit of charge off the thing now and it reads up more truly what it is, don't you see. And you go back and analyze this thing and your hair stands on end.

Now, fortunately it's only wrong goals or mix-ups between implants and actuals and things like that which cause the pc to get ill. If your pc is getting ill, it isn't because you missed an item or something like that. It's because you really put both feet straight into it, see. You're running something real goofy, see. You're running a GPM where there is none. You've skipped a couple of GPMs. You've done something, but good.

All right. Now, the only thing you can do at a point like this is shift gears and go over to the other zone of the thing and know your business, know your business. What are these parts? What is an implant GPM? What is an actual GPM? How the – can these things get crossed? What do these things look like? How do they rearrange themselves in the bank? How many mistakes could we possibly make here? Cover all those available mistakes.

You'll get to be an auditor on this stuff the day you throw away your little – your little pat sheet of case analysis, you can think in terms of these items and entities, you can think in terms of those, throw away your sheet and you'll be all set. Because there's probably, probably

a hundred different combinations of errors arising out of only these eight or nine elements. See. There can be a hundred different complications of errors, don't you see.

You can be running an actual GPM with the wording only of the implant GPM, don't you see, and goofy things like this. You can be running a lock RI, you can have found a lock RI or misworded something or other or something or other or something or other. You can skip some items, you can – oh, it's on and on and on. But this is just the elements, it's just these few basic elements in different arrangement, don't you see, constitute the error.

All you have to do is know what these few basic elements are and you got to be able to crank your wits up to the point of juggling these things, *pangety*, *pang*, and well this might be against that and that might be against that and, oh, I see here. And you look back on the thing and you all of a sudden see here that this is some kind of a figure-figure oppose. I gave you a good figure. Let me see if I can dream up a good figure-figure oppose. "To have a good time opposes to be old." Goals always go by oppose, don't you see? To have a good time is of the sense of to have a bad time when it opposes, don't you see. But you see the pc figures it out this way. To have a good time opposes to be old because if you are old then you can't have a good time, see. And actually GPMs never figure out that way. And this suddenly dawns on you that this looks mighty corny.

See, you've got – you've got "to be rich" versus "to be tolerant," because if you're tolerant then of course you can't make enough money so of course you wouldn't be rich. These are not goal oppose, that's all. See, that's figure-figure oppose. Pcs and their anxiety to get the next goal and their hatred of listing will figure themselves around two or three corners, don't you see, to say how it's all true. To be old opposes to be young, you see. I mean, it's *bang! bang!* And if the auditor can't understand it, why, it usually is not comprehensible. Pc's trying to make something out of the thing.

Pcs sometimes all of a sudden alert and say, "Well, an elephant does not oppose cheese crackers." You know. You might have noticed – you might have not noticed it. You don't ever call attention to significance unless the pc gets in trouble. And then you start to examine these types of elements and you say, "Well, that's certainly a funny looking goal to be opposing that. It's either a wrong goal or we've skipped two or three GPMs obviously because it doesn't fit. See? You know that it doesn't fit because you know that goals – "to be black' opposes "to be white." Don't you see? See, "to be black" opposes "to be white" and that doesn't oppose "to be human." "To be black" does not oppose "to be human," no matter how much somebody might figure this out, it doesn't do it.

You'll get some oddities like this, you see. You'll get things like "to be pleasant" opposing "to be hateful." See? It goes that far afield but that's very comprehensibly an opposite. But you get "to be pleasant" versus "to be an opera singer" because they're so unpleasant. You don't even have to know much about significance to know that that is in error. The thing adds up to what it adds up. You don't even have to add in your significance but you get smart enough after a while that you even notice these things. That by the way is the last thing you notice, is the significance of the situation.

Is the thing an implant GPM? Have you gone into a lock RI? Was it only an act – was it only a goal? Didn't have any GPM connected with it? Have you got an implant GPM mixed

Why are you standing around the corner of the drugstore? There isn't another girl going to walk by all day.

No, sir. The thing for you to do – the thing for you to do at that particular point is: "What other goal has been found on you? What other goal you've speculated with? Did you ever have a goals list in which you found a goal that you were very interested in? What item has been found on you in 2-12? Oh, all right, what was the first one? What was the one that stuck out in your mind mostly? Oh, all right. That was the one that stuck out in your mind mostly. Oh, oh, good. Good. Good. 'To caterwaul.' All right. That was an item in 2-12? Sounds like a goal."

"No, it was an item. It was a goal."

"All right. Well, let's find out. Is it an item? Is it a goal? You know that thing is a goal."

"Oh?"

Tone arm action, tone arm action, tone arm action. Blowdown, blowdown, blowdown, blowdown, blowdown. *Yeah-bluuu-oo-uuuuuuuuu-ooooo*, "I never noticed that before and it was very peculiar and so on and so on and so on and so on and so on, so on, so on, so on, so on." Tone arm rising, tone arm rising, tone arm rising, tone arm rising, rising. Doesn't go down again. All right, very good.

"Well, what about this thing? That an actual GPM? Is that one of your actual GPMs? That doesn't read. All right, one of your – it was an implant GPM? Oh? An implant GPM? Well, that reads. It's an implant GPM?"

"All right."

"Well, let's see where it's from. Helatrobos? Bear? Gorilla? Where's it from? How far back on the track? How many years? How many years ago do you suppose this was? Trillions? Trillions of trillions? Trillions of trillions of trillions? Trillions of trillions of trillions of trillions of trillions? It's trillions of trillions of trillions of trillions of trillions... It's long back, to hell with it."

"It's a long time ago, implant GPM, that's it."

"Oh, is that so? *Da-daa-dadaaa-dadaa*." Tone arm action, tone arm action – stuck.

"All right. Fine. Now, what other 2-12-2-12 item have you had found on you?" Get the idea?

Now, somebody who hasn't obligingly had some auditor digging up things for you to work with, you got a little bit harder job. Don't get the idea it's because he's been audited and found these items, that this is all very bad. This is a straighten up, don't you see, and the auditor's already done part of the job by finding them. You've got the additional job of trying to find something to dig up.

"Have you ever been unhappy in this lifetime? Oh, is that so? Yeah, what period was that? Huh, well, what were you unhappy about particularly?"

"Oh, well I was most unhappy about being married."

"Good. Let me see. Yes. All right. Very good. Part of a goal? All right. Good. Is it an actual RI?"

See what I'm talking about? "It's a lock on an implant reliable item?" See. "Or is it just something you were worried about? Well, unfortunately this has no foundation in fact in your case whatsoever. It's merely something you were worried about at the time" – implant, implant, tone arm, tone arm, tone arm, *bang! bang!* gone, gone.

"Ever so... Is that so? What do you know about that."

And, "I was all worried about it. I thought it was something fundamentally wrong with me."

"No, it isn't anything fundamentally wrong with you. It's just an idea you had. All right. So..." [laughter]

Finally there's no more tone arm action on this thing, you see. "You ever goofed up about anything else?" I don't care whether you speak elegantly or not. "Yeah, well, I used to worry all the time – I hate to tell you this, but I used to worry about all the time when I was a little boy – I used to worry about not going to the bathroom." "Oh, Freudian analysis. Ever been an-analyzed, you ever had any Freudian analysis? Ever had any Freudian analysis? Oh, you have, *ha-ha-ha*. Isn't that interesting. All right. What was found in this Freudian analysis? Oh, keeping girls' petticoats in your bureau drawer. All right. All right. Good. Keeping girls' petticoats in your bureau drawer. All right. Now, is that part of an actual goal? Part of an implant goal? Part of a this? Is it an actual RI? Is it..." See. You get the idea. "Oh, I'm sorry we've just found out that was part of your analyst's imagination." [laughter, laughs]

Now, look at what you're actually doing here. You know the parts of the mind. You've educated your pc, or your pc knows the parts of the mind, don't you see. And you're not in the dark as to what you're talking about. And you can straighten these things out and put his bank into some kind of a condition. What's absolutely fantastic is the bank goes back into condition again. It doesn't go back with total totality until it is completely run. But I mean there will be a trace of the stuff, the RI – the GPM that has been pulled out of place very often leaves some frayed edges where it has been pulled out of, don't you see, and so forth. But you straighten this kind of thing up. This guy's starting to feel pretty doggone classy. See, everything is starting to feel pretty good. Starting to look pretty good. Lot of fundamental errors and maybe some chronic illness he's had in this lifetime and other things of that particular character come up.

You start doing a case analysis, the pc's liable to – you are also liable to hook into this one. You're saying, "Is that an implant and so on and so on was that so and so on. This came up in your case and so on and so on." And you're going through all this and all of sudden the pc looks kind of round-eyed and says, "You know, I've got – I got something sitting in front of me here that says 'riding.' You know it's been there for an awful long time. That's – that's the – the pain that I get across the bridge of my nose. Right up here, 'riding.' 'Riding'?" It is, it's

'riding.' It's right here, across the bri... And you know that's what I've been trying to get audited for. I never realized it but it's right across the middle of my nose."

All right. "Riding." Just analyze it, see? What is it? Where is it? What is it doing? What's it part of? Get the idea? Just as sloppy and as crudely as you can do it, but rapidly and so forth.

Now, because that's a newly found item, not found by listing, you're in, of course, a little bit of trouble and your case analysis is suspended. But the test is, do you get tone arm action. Oh, you're going to get tone arm action like crazy. See, this is the kind of item that might have been found in 2-12 and relieved all kinds of symptoms, don't you see. But you're now going to get tone arm action. And you're just dumb if you do anything while that tone arm action is flying unless you've got a deadline on your session or something, because your tone arm will keep moving and your pc keep itsaing this thing and look at it and so forth. And finally say, "Well, there are probably two of these things. See. One is 'galloping,' you see. And – and I – I think that's – I think that's – I think I'm against galloping. But riding, I'm for riding but against galloping. It's all very confusing."

"All right. Well, where does 'galloping' belong. *Ada-da-da-da-da*. Does it belong in an implant GPM, does it belong in *da-da*, and so on. Is it an RI? Is it a lock on an RI? And so forth. And where does it belong on the track. And about how old is it?" You don't even have to date it, you know. But get some kind of an idea.

"Oh, that's way back on the track."

"Oh, yeah? That's right up here in present time. That's part of the present time GPM. What do you know about that? Very interesting. All right."

There – one of it in. The pc's go... saying – he's saying, "And I so and so on and so on and so on and I – I so on, and well, if that's an opposition terminal then no wonder it's locked up and it must be part of two different GPMs. We ought to really find the goal that this thing belongs with."

Ah-ah-ah-ah-ah-ah-ah-ah-ah-ah. You is being vacuum cleaner sucked in where angels shouldn't be treading.

You've already found something that didn't exist on his case before you were doing a case analysis. Now, don't be a dumb fool and find something else, too. One little error like this is permitted. He ran into it head-on, he cognited on the thing, he recognized the thing, he gave you wild tone arm action. He feels much better for having collided with the thing. Fine, let a dog lie. See. Let that dog roll over on his back in front of the fire now and snore. Because the right way to get that dog is to do the proper programing. That's to go up to the top of the bank and roll on back and you'll eventually run into "riding" and "galloping" and another two or three thousand equally fascinating items. Don't you see?

This is trying to short cut the auditing. So there's a point where analysis stops in that. But analysis is not, "Did you have an ARC break with an auditor because your so and so on."

Now, ARC breaks quite commonly will attend stuff that is out of position. See?

You're liable to find a pc ARC broken. But that tells you the elements are in error. Some misarrangement of the elements have taken place. An ARC break is symptom – is merely a symptom of misarranged elements. Somebody who doesn't want auditing now and doesn't really want to audit now and all of that sort of thing, some – he just – he's just got his GPMs wrapped up, that's all. See? Something – he got GPM five – did – not even in an auditing session, don't you see – he got GPM five moved up to position where the two should be and two shoved out and moved back to where ten should be, don't you see. And the bank scrambled up. And he's got stuff pulled out of line and that sort of thing. That's why he doesn't want to audit and he doesn't want to be audited and he doesn't – then he feels sick and that's also why he had lumbosis when he was two.

You see, Scientology is so intimate to this material that it's, of course, easiest to blame it. The thing that gets blamed right before Scientology is something that's more intimate to the session than Scientology and that's the auditor. You notice it's always the auditor that gets blamed. Well, after the auditor gets blamed, why, then they blame the subject, you see. Well, it's all in the same grade. The guy has got some misarrangement that is causing bypassed charge that's causing an ARC break and that's all there is to that.

You let somebody drift off in that kind of a condition, you're quite culpable as an auditor. And if you know your zones – this big zone of how you put a bank back together again, it just won't happen, see. Now, I could give you L4 and you can assess L4 and you can tick it off and you found a misarranged RI and so forth and it's all very cute and all very mechanical but my contempt, man – you should know where those things are. What are you – what are you – what are you doing with L4? Well, that's – just can call a few things to your mind. That's the best it can do, don't you see? Because there are a lot of other things that can be wrong. You can't put everything – well, do you realize that thing would have to be two or three hundred lines long to get every possible combination?

I'll give you an idea. You're just now – you're doing items and you seem to be in an ARC break on account of items. Well, why are you worrying about anything else but items for a little while? See, you haven't been doing goals or goals lists. Everything's been going along smoothly and you all of a sudden have a – have some kind of a mess-up occurring on the subject of items. Well, there's only a few things that could have happened. You could have found a wrong item or you could have skipped an item or two or you see, you could have skipped into another bank and found an item from another bank and you could have missed in two or three fashions. All of which you would understand if you knew the arrangements and mechanics of the mind, you see.

So, you just say well, what could happen to items. Well, it's one, two, three, four, you see, of items. One, two, three, four and we had item one and we opposed it with item four and therefore left items two and three unfound. And the bypassed charge must be there, don't you see? And it doesn't require a seven foot thick textbook or lists or something to put this home. It's just a certain few things can be wrong, you see. Or we found item one, two, three and we never found item four, but we found an item over here in another GPM, to oppose three and therefore this guy's feeling terrible because we've got two GPMs we're pulling together. See, that's visual, visual recognition, see? They're all visuals. They got spatial relationships and designations of this particular character and there's no sense in not knowing them. Because

they're elementary. They're only a few of them. There are a lot of errors that can accumulate from these few little elements, you see?

So what you doing with a long-screed ARC break assessment, don't you see? There's no substitute for being able to say "Well, so and so on." Well, you flunk it yourself. Well, go ahead and get a long list and see if you run into something accidentally. What things can happen in a session? Well, you should be able to call a session ARC break stuff out, right this minute, bang, just like that, without looking at a sheet. Just looking at your meter, saying, "Did I cut your communication? Reject some affinity? Reject some reality? What's happened here? Do you think I've falsified something?" Whatever – whatever could have happened, you see. "Did you think you knew something that I wouldn't take or..." You could run down any element there is.

The benefit of this is you know what just happened just now in the session. You know what happened in the session. Well, I don't know, why blind yourself to knowing what just happened in the session, you see. There's – this might have struck the pc only in two or three different ways and therefore you settle the ARC break just *bang! bang! bang!* you see. Ask three questions and so on and so on. It's obviously that. That's it and bang.

If it doesn't settle like that, you say it must be something more fundamental – must be something more fundamental. But it's germane to what you're doing. Did you kick in another GPM? Did he take a look at another bank? Is there an engram mixed up with all this, he's run into? Something of this character.

Now, there's some excuse for running a longer list. Some excuse because the thing is out of your hand. But nine times out of ten, you just know right now on an ARC break. It's quite obvious to you what it is. So you ask questions – you don't tell the pc what it is. You ask questions related to what it is and see what reads on the meter. Thing reads on the meter, bang! Well, that must be the subject of the ARC break. Let him tell you all about it and that's the end of the ARC break, see.

Fruitiest source of ARC breaks on lists, of course, is incomplete lists. Or bypassing the character's item on the list and – while nulling. If you're nulling and the pc ARC breaks, you know you must have passed his item. It's as elementary as that. And if you're listing and the pc ARC breaks and you're still getting action here of one kind or another it's obvious that the list is incomplete or the source you're listing from is wrong. It's one of the two things. So that's the only two things you verify when a pc ARC breaks under those conditions. You learn these things quite rapidly. There are only a few things that can go wrong. That's all I'm trying to teach you. There's really – there's so few that there's really not much excuse not to know what these elements are and what they combine as, see?

Now, as far as running cases are concerned, we haven't gotten into this very long. I'm just trying to still give you a viewpoint with regard to R4. I want to read you very rapidly here, as an addendum to this lecture and not actually as part of this lecture this, and I'm going to read this very rapidly to you just to give you a good grip on the situation. This is a program, this is a program for a case. This is a standard program for a case.

In one: Do a complete slow case analysis using all ARC break lists and general questions and clean them all up one by one and anything the pc brings up in the way of items and

so forth and be very thorough. Get that all cleaned up. Got the idea? The case analysis I've been talking to you about, you do on the case extensively. See, before you do anything else.

Number two: Put in the big mid ruds by fast check on listing, items, Routine 3, goals, on your pc. That's fast check BMRs on listing, items, Routine 3 and goals. Put BMRs in on listing, on items, on Routine 3 and on goals.

Third step: Fast check big mid ruds on any goal the pc has had that he was given or thought was his.

Now, you've already done some case analysis on these goals, don't you see? You've already got them padded back into place. Everything is fine. But there still is some residue left there. Now, that pays particular attention to favorite goals or... first priority is wrong goals. Has this person had a wrong goal run on them, see? Well, it was all right to put it back in place in case analysis, but if this person's ever had a wrong goal run on them that you found in c... in that analysis form. See you make a note of these things on your auditor's report, particularly a wrong goal. That's the root, see?

Number three: You uncork the fast check big mid ruds on that wrong goal. Now, you can go with all the eighteen buttons of a Prepcheck, all by fast check, on that wrong goal. You understand? You can go the whole lot. And if you – pc's getting lots of tone arm action out of it, you'd be very foolish – and you notice now the big mid ruds are the early part of the Prepchecks and that's so – one of the – one of the values of this is so you don't have to memorize two lists – but that's so that if you're going red-hot on your early part of those Prepcheck buttons, why, you can continue on through the eighteen buttons. But if you're going slow freight, not much TA, you can unload. In other words, you can just stop this Prepcheck because it's not getting any tone arm action so it can't possibly be doing anybody any good, see. All right, that's to get rid of these big goofs – number three.

Number four: And this is where you really start that – these others are just preparatory steps – you list the question "What is your present time GPM?" is the auditing question. And you complete it to a *smoooooth* needle with no faintest ticks or flicks or falls seen on listing. Test question, sure it's clean, get in big mid ruds on list, fast check and then null the list and you'll probably find the pc's goal sitting on that list. Or you'll see the goal next to the PT goal sitting on that list. You probably will see the pc's present time GPM sitting on that list. You hope. If it isn't there, extend that list. If you've nulled it and can't find it, extend the list. Pc ARC breaks, you've bypassed it. Open-shut case. Got that?

Number five: Check out the goal found. Is it an actual GPM, implant and so on. In other words do a good solid analysis on this thing. Be awful sure of this thing. And do some big mid ruds on it. Get it to read but beautifully, see. And then start in at the top, it's usually truncated. You find the terminal, the first terminal, on all other banks you find the oppterm but on the first bank you find the terminal on the truncated bank because it's easier to do. And you just do these little tiny short lists.

And the first thing that you can get to read back to the pc, you see, the first thing that falls you can re... read back to the pc, you read back to the pc and you give him your – those items. And you just run them on down, *pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa*. And you get to the bottom of that thing. Do a goal oppose list by the usual rules of

listing. Get your next goal and do the same and the next goal and do the same and whenever you run into trouble do a full case analysis to find out wrong items, wrong goals *arrarara-rara*.

That's the way you ought to be tackling this cat right at the present moment. That's what you ought to be doing in order to get you somewhere. And that for my money is the very best method of doing so. To cut in late and do goal opposes up the channel just because the pc couldn't do this list, actually is a secondary action. Some pc has had a big goal of some kind or another that has been run that wasn't his actual GPM and you do have your hands on that goal. You possibly could do a goal oppose up there. But the best method by far is simply list for the present time GPM. That's the best method by far. Got it?

The other is fraught with many horrors and terrors. I know, I've been over the road myself. It's wild. Trying to list GPMs to GPMs that are all full of RIs. Wild, man, wild. But oddly enough your pc very often will give you the present time GPM, just like that, and it checks out via the actual goal and all is well. What if you checked it out and found an implant GPM? If you can run implants, well, run it as an implant. Anything to get charge off the case.

And there's programing – there's programing. The way she is did. There is a good, fast, rapid review of R4M2, the way it sits in its most optimum condition right at this moment. And that is as workable, man, as can be. Man, that really runs. It's the easiest auditing you ever did in your life until you go over Niagara Falls and put your foot in it and you've struck an overcharged area and you find the pc's actual GPM, only it's a misworded implant GPM which comes from this, until you really analyze it a little closer and then you find out that it was an actual GPM after all what – misworded, and then you get the miswording of that and turns out to – it really was an implant GPM. You're in for a picnic at that particular point. So between now and the time when you go to run this, learn all the elements there are in one of these cases. Learn what they look like. Learn how to handle them. Learn how to juggle them and you'll never really – really you've got it made, you got it made.

Now, your morale was very, very bad. I hope your morale is better. I say your morale is bad. It – your morale is actually – that's a joke – your morale is – holds up pretty well. I sympathize with you on many quarters and so forth. You're going into the unknown at a high flight and it's pretty tough sometimes and it looks very nerve racking. You don't quite know what's ahead. You don't quite know what it all consists of. Basically you don't know what you're doing wrong and so forth. Actually, you're being far more complicated than it warrants. It breaks down to a rather elementary proposition all the way down the line but then you have to find that out, See.

And what you're moving toward is not so much a bunch of data which is handed to you on a silver platter, but your own reality on the actual simplicities that have been discovered and found workable. And when you arrive at those one after the other, there will be nobody cockier than you. And when you pick up your coffee cup, why, the Rock of Gibraltar will look nervous compared to it.

Thank you.

THREE ZONES OF AUDITING

A lecture given on 5 November 1963

Vas da date?

Audience: November the 5th.

Five Nov. – a Russian month. Five Nov. AD 13, Saint Hill Special Briefing Course.

Now, you're facing a cataclysm in auditing – a cataclysm. You haven't recognized fully that *you can be found out!* Not as a pc, but as an auditor. We've gone through the stages of finding out pcs; now we can always find out the auditor.

The tone arm. The motion of the tone arm finds you out. And if you are still in a state of wondering what it is wrong with the pc that you're not getting tone arm action, then you have already been found out. Because an auditor can get tone arm action at will. An accomplished auditor can get tone arm action at will.

Tone arm action has to be *prevented*. There are numerous ways this can be prevented. Numerous ways. There are at least ten or twelve ways per auditor. Now, if you multiply the number of auditors by ten or twelve, you will possibly have some approximation of the number of ways that tone arm action can be prevented. Because it's prevented by additive complications and a failure to recognize basics. A failure to recognize basics.

Today there are three zones of auditing. Three zones, not of just auditing, but three zones of applied Scientology. One is basic auditing. Two is case analysis. And three is R4. Now, that means – that means, then, that there are three zones of expertness and you should recognize these as separate and distinct areas of performance. It's, in driving a car: can you steer, can you handle a gearshift, and can you start, stop, and run the motor via the accelerator? I mean, there are these three separate areas of action.

Now, this tends to reduce the amount of complication that you're confronted with. Because there's many an auditor will be doing R4 and falling all over himself, but doing it perfectly: writing down the items perfectly on lists with a calligraphy that is beyond reproach, who is reading his meter down to the finest point, who knows every rule, who knows every law connected with all goals finding, lists and item finding – knows it cold – and who somehow or another will go *splat!* And the pc won't make it and so forth.

Because there remain two zones: basic auditing and case analysis. And he could do the techniques and processes of R4 with the most surpassing perfection without once colliding

with a win – not even accidentally. His basic auditing could be out or his case analysis could be out. He can do all the actions; he has no ability whatsoever to visualize a bank. Two goals in juxtaposition, to him means nothing. It means it's a thought in advance of another thought or it means something. He's playing mumbletypeg in the dark and getting his knuckles cut to ribbons. Because he doesn't know what's an engram and what's an implant and he doesn't know this and doesn't know that. And he just hasn't got his paws on these items at all.

He can do the technique perfectly, you see. That – he can do that perfectly, but the other – *bluaah!* What's he getting with it? Well, he'll get all sorts of balderdash for one thing or another. He'll do a perfect list and come out perfectly by the rules and he finds a goal "to be, do, have and find catfish." Well, bunk, brother! There was never such a goal ever invented anyplace by anybody! And he has found this by opposing "to dance." It just doesn't make any sense. But because he doesn't know what sense it's supposed to make, he then buys it lock, stock and barrel.

You see, the mechanical actions... When I'm auditing these days, I actually do just about the most mechanical job of auditing you ever cared to watch. It's just *pocketa-pocketa-pocketa-pocketa-pock*. Totally mechanical. Pc says, "waterspouts in the firebox" – that's all right with me, you see. I'll write it down. Pc says, "to spit," and then says, "to orangicate," and "to jump over the moon," and "to wear hip boots," and says, "to spit" again, I'll just write down "to spit," because that's what the pc said at that particular time, you understand? And then says, "to catfish," and "to be a tiger" and so forth, and "to spit" – I'll just write down "to spit" again, because the pc said it, you understand?

All right. Now, he's running along and as long as he runs I don't pay any attention. I'm just there and I read the meter, and if something falls, I mark it "fall"; if it blows down, I mark it "blowdown"; and if it's there it's there; and if it isn't there... When I start nulling, if it falls, I mark it as a "fall"; and if I find two falls on the list or two RRs or two anythings (except a couple of ticks), I just tell the pc to continue the list, I don't care what the pc's saying and so on. The pc says, "Oh, well, that 'to spit,' that's my goal," and so forth.

And I say, "All right, thank you, I'll check it out here. To spit." I'd say, "well, it doesn't read yet. Let's get some more charge off and see where we sit here. Now, here's your auditing question..." Just mechanical, you see. You drop a nickel in the player piano, man, and it grinds off the roller. You get the idea?

Now, that phase comes to end at one of two points. Either everything has gone off according to schedule and I'm sitting there looking at a goal or whatever it is, or it hasn't. And I've got a pc who's looking ragged and red-eyed and who's getting awful droopy and so forth. And at this point I become a case analyst. See? You can't even hear the gears click, but I've moved over into an entirely different department of auditing. New department. New sign on the door: "LRH, Case Consultation." I don't quite change my collar and hat, but I think if you were watching it you would see almost that amount of change occur.

Pc's been running things up to now and he fell on his head. See, I'm perfectly willing the pc go on and tell me anything. See, as long as it fits up and so forth. But now this thing has run into the wrong pocket and the thing has gone awry and I've got a goofed-up pc, and I've got

things that are a bit not running right. See, it isn't all by perfection. Or simply the action – the mechanical action of finding something has been concluded, see?

See, if something went wrong, I consider the mechanical side of the picture is concluded. That's it. See? Just like you're coaching somebody, "That's it." Well, that's all with the mechanics, boy. You have just lost your amanuensis and you have just inherited a case analyst, see?

All right. The action either completed its cycle and finished, or it went wrong and couldn't complete its cycle. So it's quick like a bunny, out with the drawer, off with the robot auditor and on with the other hat, see? Now. Now. All right. Uh-huh! Now – now we're in the case analysis department. "Why did your grandfather have to marry the girl?" You see? We're going to get down to basics here.

Now, the data I'm using now is an entirely different set of data. It's how do banks go together? Does the goal "to be, do, have and find catfish" oppose "to dance"? That's just me, see; I asked that question. I look at this thing that's been found here, see, "to be, do and have catfish," you see, "and find catfish," you see. Does this oppose "to dance"? "Nope," I say, and I'm afraid at that point the pc could persuade, plead, do a mammy act down on his knees and would find me adamant. I would let him itsa all of his reasons – as long as I was getting tone arm action. But that's as far as I would go, because that's over in the field of basic auditing, which never completely deserts you and which we'll go into in a minute.

But he says, "This 'to be, do and have, and find catfish' was originally found in Los Angeles by one of the best squirrels there. And you see that it rocket reads." And it wouldn't matter much. It wouldn't matter much. I'd let him tell me anything he knew about it as long as I was getting tone arm action. And after he got all through telling me all about it – because he's now gotten enough charge off so that maybe my case analysis is a little more accurate – I'd just go through my act and I find out what's wrong here, because I know something is wrong.

Now, it isn't a matter of "Is this list complete?" or "Isn't this list complete?" because I'm not now being the listing robot, see. I'm being the case analyst. And I want to know *how* come this list is misbehaving! That's what I want to know. That's the first thing I want to know. What's it coming from? Is it something wrong here? Has the pc not been answering the auditing question? I don't count on an ARC break. You don't become a case analyst just because you have an ARC break and only because you have an ARC break. No, no, no. We want to know "How does this bank add up? Which GPM has swapped ends with what GPM? How has the pc managed to get himself into this mess now?" You get the idea? And I'm going to find the answer.

Well, there's a dozen potential answers – fortunately, very few more than that – and I'm going to find which one of these things apply and I'm going to straighten it out. And after I got it all beautifully straightened out, we find out, in this particular instance, that it was very, very simple: The pc has been guessing "What goal harmonics on the goal before the goal which we have just been listing?" That was what the pc was listing, you see? "What goal is an upper harmonic of the goal we had before the goal," when he's supposed to be doing "Who or what would 'to dance' oppose?" See, that's what he's supposed to be asking, see. Or the pc is saying,

"What problem would 'to dance' resolve?" See, there's something goofy going on here and I'm going to find out what it is, or I'm going to find out what bank misalignment.

When we did "to dance," in all innocence – because I take it at any given instant that having gotten more charge off, our analysis will be more accurate than previous analyses. So I never count on any analysis carrying forward in time.

No analysis is valid after the date of the analysis. Why? Because the accuracy of an analysis depends upon the amount of charge taken off the case. So at any future date, if you can audit at all, you have taken more charge off the case and so you'll get a more accurate analysis.

All analyses are subject to inaccuracy by reason of charge! Therefore, tone arm action in the interval, having removed charge from this particular area, will now make it possible for you to get a more accurate analysis. Any analysis you do is succeeded by a more accurate analysis until there isn't anything there to analyze. You got it? That's the only time when you never reanalyze or requestion anything.

On Tuesday – on Tuesday, we have found out, *absolutely! equivocably!* with exclamation points! with rocket reads! with a pc sell! with a total auditor agreement! with everything just flags going up in all directions! you see, small Guy Fawkes fireworks coming out of the E-Meter – every sign points to the fact that "to dance" is an actual GPM!

Yeah, but that was Tuesday. What will it do on Thursday? We are now analyzing a case on Thursday. Well, then, my analysis is never based on the *comfortable* feeling that Tuesday I had a right answer. At any given instant, on any analysis, it is only the factors present now which are analyzed. That's the only safe way to do an analysis.

You can make some of the most *colossal* mistakes. Let's say you're going up the bank, trying to find the PT GPM and you found the goal "to play golf" and you marked that down very carefully as the third GPM. You're a nut if you just keep on believing from here on out that when you come back down the bank, having removed two GPMs off the case, you're going to find "to play golf." Probably hasn't anything to do with it. See? It's probably a lock on an RI in the third GPM, "to recreate." Got the idea? But at that time, when you first were going up the bank, you checked it over: "Is this an actual GPM?" *Brroow!* You know, fireworks, rocket reads, everything! Oh, the pc – cognite, cognite! Oh, everything terrific, you see. Blowdowns, oh, marvelous!

It doesn't cut any ice on Thursday. Because Thursday is two more days of charge off the case, don't you see? So you're always approaching a more accurate potential analysis, right up to the moment that you attain OT. You're going to be horrified. You're going to run some goals perfectly correctly, absolutely, every item out of the thing and yet a few months from now when you're going – somebody's going over this case, they're going to find out that half the items were missed and three-quarters of them were wrong. Somehow or another you got by, however, and so forth. Well, that's the case analysis with the case that far upgraded, don't you see? So of course the analysis I more accurate.

Analysis is not dependent upon the auditor's ability to read an E-Meter. It is dependent upon the pc's ability to itsa. And therefore it's going to shift. The fond beliefs of Tuesday are

where most case analyses come apart at the seams. Because on Thursday, with two days of charge off, you're liable to get some different answers that make a lot more sense. You understand?

You never take a case analysis for granted. These things are always taken conditionally. Always conditionally. An auditor needs a nice, full saltshaker sitting around under the corner of his E-Meter, you see, so he can always take everything with a grain of salt.

A case analyst is a skeptic. But his skepticism must not be so high as to undermine the pc's confidence. So this, again, is another frame of mind. An entirely different frame of mind. Your robot frame of mind: Well, the guy says, "I spit" and so forth, and he puts that down, and that's a goal and oh my, you got another one and that's another goal and he puts it down, "to spit" again and so on. And you – your frame of mind is, "Well, he said it, so we write it down. And the meter said this, so we write it down and..." There's nothing going on here except that's what you're doing, you see? You can sit and dream about the weather, as far as that's concerned. There's no mental strain here of any kind whatsoever, see. That's an attitude. That's the attitude of the auditor running the process, you see?

Now we shift the hat. We get a different attitude. Not a challenging, invalidating attitude with regard to the pc, but an attitude of – which is best attended by the song, "It may be so, I really don't know, your story sounds..." you know. This – it's not really a skeptical attitude, but it's the attitude of somebody listening to the tales of several travelers who have just come back from a far land they have not been to with different stories.

It's not a buying attitude, it's not any kind of an attitude. "Well, that's what it is, so we will try that one on," see? "Well, this is the best we can arrive at, so this is what we will use to proceed with – warily. Expecting all trucks to come off the rails at any given instant." See? We're proceeding warily under this.

The case analysis is always as good as it is at the time it is done. And is no better than that. And there's no reason to get misemotional about it just because on Thursday you got different answers. I've seen auditors go out and contemplate suicide, you see, just on this basis. "But on – but on *Tuesday* – but on *Tuesday* it was an actual GPM, and – and – and so forth. And it read, and everything ran, and everything ran along beautifully on *Tuesday*. And – and now I find out it's just a lock, not even an RI; it's a *lock* on an RI. And *ohhh, deeeear, ohhh!*"

Well, there's no reason to be like that about it, because the reality of the situation is, is that Thursday, of course, with more charge off, is going to give you a better answer. So you can always look for a better answer. All answers are taken conditionally. And everything you know about a bank and about a case and about how the thing ought to stack up is used. There's no stops. It isn't a basis of, "Well, I can't make the pc wrong by saying this, 'to be, do and find catfish' doesn't sound to me like an actual GPM. You mustn't say something like that, you see, because that would be invalidative of the pc. No, the thing to do is accept it and let the pc run out of RR in the next few minutes of play." Oh, yes? Yes? Like nonsense it is, you see.

You don't want to speak invalidatively. There's a trick of doing this. I'll show you an invalidation. The pc says, "You know, I – my goal – my goal is really 'to be, do and find – have and find catfish,' and that's – that's my goal."

And you say, "Oh, yeah? All right. Okay. Okay. You want me to check that out? All right. To be, do, have and find catfish. To be, do, have and find catfish. I'm sorry, that doesn't read right now." That's not an invalidation.

This is invalidation – this is invalidation:

The pc says, "My goal is 'to be, do, have and find catfish.'"

"Oh? Mm-hm. To run. To walk."

Say something else to the meter rather than what the pc said and you're in trouble right now. I'll give you an idea. The pc says, "There's some more suppresses on this" – this doesn't just apply to lists, see – "There's some more suppresses on this."

"Okay. On so-and-so, has anything been invalidated?"

"Yes, goddamnit. What you just said has been... Me! I'm invalidated." You know, ARC break, here we go, see? That's a direct invalidation, because it's basically a disagreement, don't you see? You've gone through all the actions of a disagreement. So you don't care what the pc says, you don't immediately throw it in his teeth and say, "Under no circumstances is there such a goal as 'to be, do and have – find catfish,'" without even checking it, and start answering. You know, well, check it. The pc wants it checked, check it! No skin off anybody's nose – it'll read or it won't.

But you got this on the list – "to be, do, have and find catfish," – and that's supposed to be the last item on the list, and this is supposed to be what is opposed by "to dance." Not in your bank, not in anybody's bank. It ain't never happened, and it never going to happen.

The kind of a goal you'll get... It's very hard to imagine what it'll be before you eventually see it and sometimes you get beautifully surprised. But you have an idea already of the kind of goal you're looking for. What would "to dance" – what goal would "to dance" oppose? Well, probably "to be sour," you know, to be something. It'll be some different type of action, you see, "to be funereal," you know, "to drag," you know, "to sag," you know, or something like this. It'll be some kind of funereal goal. Sometimes they're very clever. Sometimes they're very tricky and you can miss them. And they – you have to think about them for a moment, and all of a sudden you see that it would. But it definitely would oppose it. It *definitely* would oppose it. Not resolve it; it oppose it!

Bang! Goals are in *opposition*. It's white today on this bank, and it's black tomorrow on that bank. You get the idea? I mean, *bang! bang!* Direct oppositions. They make a dichotomy, you see?

"To be happy" is followed by "to be sad," and it's no more complicated than that, you see? So you can figure yourself to death in case analysis and so forth. But you should have a general idea. You should have a general idea about what you're going to get there. And sometimes you're very agreeably surprised – "to dance" comes out as "to be a funeral director." See, something like this, you know? And it's just a little bit offbeat, and then sometimes it takes you a little bit by surprise. And you could beat yourself to death by not accepting it, and so forth. It is or it isn't. But because you know case analysis, you know what you're looking at.

Now, if you got a goal like that, however, "to be, do and have catfish," as "to dance" oppose – ahh! If you just got through running "to dance," and it didn't run out of RR, it obviously was the goal. There's no doubt about that. But there's something messed up here someplace and you better find out what it is. Maybe you overran the bottom of the goal. Maybe you got items in that goal from something else. Maybe the analysis of the goal. Or the goal looks all right, however; it doesn't seem to be bad off. So it seems to be – have the right line plot and everything, so... You're not being critical in this particular line because it looks all right. So you finally – you decide, well, "to dance" – there's nothing wrong with that as the source to list from. That would be the first thing that would give you some wild goal like this as the only goal you could get on the list, you see. "To be, do and have catfish," see.

So there's nothing wrong with the source you're listing from, it looks all right, it checked out, you've run it and so forth. When you're just doing goal opposes, trying to get to present time and so forth, you're running it blind because you really never have a second check of running it. Final check of a goal is "Will it run?" not "Will it behave on the meter?" see, but "Will it run? Do you get a line plot off of it?" That's the final test of a valid GPM.

Now, then you must assume other things. Amongst those is the pc might have been out of session while he was listing it, might be an ARC break involved here that you hadn't suspected; you throw those things aside or accept them. Or the pc wasn't answering the auditing question or something of the sort.

So we go into some kind of a dissertation with the pc, finally decide the pc couldn't have been answering the auditing question. There's something wrong here. So you ask, "Exactly what were you doing as you were listing this list?" and so forth.

And you finally get, "Well, I was trying to list the harmonic on the list which just came before this, and so forth. And I was – I knew what it could be, because, you see, on – on just before 'to dance' – 'to dance,' you see, we had 'to be sad' and – and so forth. So obviously it's something about being leisurely, or – or something, and that would be what it..."

All right. Have you found the answer? Well, you'll find out that when things are wrong, your tone arm is wrong. Always. You're not getting action on the tone arm; it's stuck high or it's messed up in some way, but basically you're not getting tone arm action. When you don't get tone arm action you either have just run... if you're running, why, the tone arm action depends on getting the next item. But this thing – this tone arm action is pretty extreme and you've made an error of some kind or another. Well, when you get that straightened out, that tone arm action will correct. Soon as you get your tone arm action corrected and looking a little bit better and you got the answer to what this is all about and so forth, you got the answer.

Now, at that moment you *remove* your hat as a case analyst and you put it in the drawer and you take out your hat as a mechanical auditor and you put it on, and you say, "This is the auditing question. *This, this* is the auditing question. The auditing question is: What goal would 'to dance' oppose? Now have you got that? You know we went a little bit astray just a moment ago."

The pc is saying, "*Rrrraah, rrrraah.*"

"A little astray, you know, just a moment ago, not answering the auditing question. So let's make sure we answer this auditing question real good, and so on. You're doing fine, all right, but let's get the auditing question answered now. Now, what goal would 'to dance' oppose? All right. *Th-th-th-that, th-th-th-that, th-th-th-that, that, that,*" and you get the list. Go through all the rules and – just mechanical – and you come up smiling bright.

That's all there is to it. There's two hats and one of them is always in the drawer.

The speed with which you shift these hats is sometimes rather bewildering. But it's actually a hat shift. So it isn't something that you should get all tangled up about and get your feet all wound up in the rope with. Because in actual fact you are never the mechanical listing auditor and the case analyst at the same time. And you are never the mechanical auditor when there's something wrong with the case. You can't do the job, so you obviously are a case analyst. And after the case is straightened out, there is no more need for case analysis. That's another point you should keep in mind. If there's nothing to analyze, don't analyze. If everything's going along "smoothly" now, why, you go along "smoothly" back to your mechanical auditor hat, see. Let's not start making trouble for the pc as a case analyst. Let's not start showing off.

You've found the answer; you've restored the case; the pc is cheerful; the tone arm is now in a reasonable situation; life, it looks much brighter to one and all. Well, this is the point where you should take off the case analyst badge – hat, and put it in the drawer and put back on the mechanical auditor hat, *Da-da-da-da, de-de-de-de-da, de-de-de-de-da, de-de-de-de-da,* just all sweetness and light. And you're not saying, "Is that an actual GPM? Are you sure you're listing right, now... You... Well, I wonder if that is... So on and so on. You're doing *uvruh-rrhur-urh...*" No, no, no, it's just all sweetness and light, *ta-da-da-da*. The pc says, "Oranges are black"; you say, "Okay, thank you, good, fine." Anything he says – "All right." Got the idea?

Well, so that takes down your complications to a considerable extent – to compartment your actions, see. If you try to run both of these actions at the same time you'll go mad. You'll be under such tension that you will develop GPMs with it. [laughter, laughs]

Now, there's one hat which you wear all the time. All the time, all the time, all the time. Even though you're shifting these other two hats, you've got another hat on the back of your head. And that is the basic auditing hat. And if you can't do the basic auditing hat, then it doesn't matter how brilliant you are as a case analyst.

It doesn't matter how marvelously mechanical you are – and believe me, it's marvelous to be that mechanical, you know, for just your R4 hat. It takes a lot of skill just to sit back there and just do nothing but "So, the sun is shining and everything is fine."

The pc says, "There are fire engines in the beauty shop," and you write down "There are fire engines in the beauty shop," go to hell, we don't care. Everything's fine, but your basic auditor hat could be wrong and prevent you from doing that.

If your basic auditor hat is wrong, *both* of these hats go wrong no matter how well skilled you are in both of them. You could be a case analyst with exclamation points halfway down the wall. You could know R4 backwards and upside down, count the name, rank and serial number of every bulletin which ever carried a listing rule on it and so forth, and be able

So the woof and warp of basic auditing can get *terribly* complicated on this basis – on this basis, this fundamental: You ask most auditors, "What are you doing?" they will tell you what they were doing. But if you asked them this question: "At that point in the session, what happened?" they will inevitably tell you, "I did this, I did that, I did something else." They're more likely to tell you, "I so-and-so and so-and-so." They're not telling you what happened; they're telling you what they did. That isn't what happened. Because all basic auditing actions are coordinated with the pc. An auditor may be just going through some mechanical motions of some kind or another, but he is still handling another thetan and a full bank. And what happened in the session combines what the pc did, what the bank did and what the auditor did and what read on the meter. And there's four elements that comprise what happened.

Now, this is asking you to extend your perimeter of permeation. When you are so sucked back to your chest that you can't see beyond the other edge of your E-Meter, the chances are, you aren't going to be able to do the TRs either. But you're handling a pc and you're handling a bank and you're handling a meter – in addition to your own actions! And frankly, your own actions in a session are completely unimportant.

Ninety percent of a student's worry is about his own actions in the session. How did he hold his little finger of his right hand while he asked the auditing question? And did he have the right vocal intonation when he asked the auditing question? Was his diction absolutely proper when he said, "Thank-*gulp*-you!"

That's the most wasted show in the world. It has no audience. There's no audience, there's no applause, there are no observers. The most unseen character in the world is an auditor in session. He actually, unless he's a born exhibitionist, is about as visible – about as visible as a drop of water in a running stream.

It isn't that he isn't there, it's just that he isn't visible. He's an almost perfect example of a thetan that isn't packing mass. And if he understands that his actions in a session are not the important actions of a session at all... They're not the important actions of a session. The important actions of the session are the performance of the pc, the pc's bank and the meter. And the auditor's actions are completely unimportant. Except where they get in the road and fail to promote the actions of the pc, the pc's bank and the E-Meter.

So an auditor consistently worrying about his own actions and what he's supposed to do right and what he's done wrong in a session... I'm learning some of this from critiques people are making of their own auditing. Yeah, that's right. They're all critiques of their own auditing. I couldn't care less. They don't realize that I have yet to receive a proper report of an analysis of a session given on a tape. I have yet to receive a proper report. I'm still waiting for one to come in. There are some that are almost proper, in spots. But they all – most of them concern what the auditor did. *Who cares?* Do you realize the auditor is not going to get Clear on his own actions in a session?

Now, this is impressed on you by your Instructors, by the fact they do TRs – by your coaches – you're supposed to be able to do this, do that and the other thing. But a little study of this sort of thing goes long, long ways.

An auditor's actions can be anything they care to be as long as they are not destructive of the continuity of the session. An auditor, actually, runs mostly on a lack of action. See, he

doesn't have to do this and do that and do the other thing, and not do this and not do that and not do the other thing. That's a bunch of balderdash.

Somebody's orienting his auditing on the subject of "I should not" and "I should," and "I should." I-I-I-I – Oh – wha... wait a minute, wait a minute! This is an auditing session and that's a third dynamic activity. The auditor's merely running it.

Now, it's only when the auditor starts putting his feet on the desk, and getting the shoes in the pc's face that we run into the not-do's. Or it's only when the auditor sits there tongue-tied and the pc's going into a big ARC break and the auditor's saying, "Well, let's see, the right way to it'sa is to... Heh-heh." You know, you ought to be in there pitching. What the – what – what cooked here? What happened, see? He apparently is not adding anything into the session; he's not getting anything done in the session; he's not directing the session; he's not getting the session running in any particular direction, so that's an absence of auditor.

Now, the pc ARC breaks and the auditor sits there and says, "Oh, it's perfectly reasonable. I have goofed, so therefore it's perfectly reasonable." You know, a lot of pcs been knocked in the head with this. In fact, I know of one auditor (this, actually, is not fully the story of it but just in passing) saw everything the pc was saying so reasonable... The pc was already – for other reasons having nothing to do with the auditing – on the way out. The curtains were ringing down, the between-lives areas were yawning, and the auditor, however, did have a last-minute chance in order to make a grab back, see. The pc ARC broke over a period of days, actually, and the auditor sat there and said that everything the pc was saying was reasonable and so never tried to cure the ARC break. Well, the pc died. Sad story. But I wish to drive it home. That happens very rarely, but this isolated incident did happen, purely and for that exact and only reason!

The auditor knew that everything the pc was saying was reasonable. The auditor did not know how to audit well, the auditor did not know how to read a meter, the auditor did not... You get the story here, you see? So therefore, the auditor sat and agreed that this was all true and a pc never ARC breaks for those reasons. A pc ARC breaks because of uncompleted cycles of action, bypassed charge. And when that's kicked into view, the pc ARC breaks and his attention fixates on the auditor.

Now, a session ARC break is where the auditor has gorgeously goofed, and has yanked the pc's attention with violence off of some charged object, thus not completing the ARC – the cycle of action of the pc's inspection. And so this causes a collapse which is very painful to the pc and the pc will take it out on the auditor. But in actual fact, an eradication of that sudden yank of attention is what is needful to cure this ARC break.

So the auditor who gets in a reasonable frame of mind about his auditing, an auditor who gets in a reasonable frame of mind about his ARC breaks, or gets unreasonable and starts protesting against it, simply doesn't understand the mechanism of an ARC break. His auditing really had very little to do with it – very little to do with it, except where the basics of auditing are violently followed. The pc is saying, "I've got a – I've got a large cat here on the table." And the auditor says, "Well, I'm not going into that now. Get that nasty cat off the table!" you see? That's liable to produce shock. But why? Not really because of what the auditor said, but because the pc's attention was yanked suddenly off the cat, the cat collapsed on it and you had

bypassed charge right there, right then. And then the auditor did nothing to restore the attention and get rid of – locate the bypassed charge. Do you understand?

Auditors running R4 may go on for days, weeks even, with a big section of bypassed charge and the pc nattery and ARC broken. The auditor's saying all the time, "This is a nattery and ARC broken pc." No. That is an auditor who doesn't know his basic business. He just doesn't know his business. Had nothing to do – even case analysis. He just doesn't know his business! ARC broke pc – something big wrong. See? So that's the time when you take the basic auditing hat and add to it the case analysis hat. Basic auditing has gone wrong, so you add case analysis to it to make it work. That's all there is to that.

Auditor's never reasonable about an ARC break. If there's a big ARC break, then there's something big wrong with the case. It isn't that you have slightly misworded some little tiny RI in some corner of the case – *ugh-bluh!* You got a couple of goals wrongly worded and backwards, brother! Great, big, husky GPMs are pushing this pc's head off. And then, of course, basic auditing failed slightly and produced the necessary lock to cause the ARC break to swing up into session. It all requires a little error in basic auditing to trigger the ARC break. A wrong goal can sit there a long time without ever being fired into an ARC break, until all of a sudden the itsa line is cut or imagined to be cut and the pc will flare on that lock into an ARC break.

That ARC break means only this: that there's something God-awful wrong with that case! That's all that means! Something's gone wrong in the case analysis department! Not in the basic auditing department.

The basic auditing department can *always be improved*. Always. And improved 100 percent, to absolute perfection, will not avoid ARC breaks; will not, all by itself, make a case run smoothly.

Given errors in the case analysis department, no basic auditing in the world, no personality, no, "I am a holy man, and everything in my vicinity, of course, runs calmly. I permeate peace." That's not going to prevent an ARC break, brother. You found a wrong goal and you listed it upside down. There's only one thing going to straighten that out, and that's finding it's a wrong goal and that it was upside down. You understand?

So that comes back into the case analysis department. But basic auditing is something we do smoothly, not self-critically. We do a very smooth job of basic auditing. And that's what we do in basic auditing. We don't do *de-de-de-de-da*, and then not do *de-de-de-da*, and *bu-da-da-bup*, but if you *de-de-de-de-da*, you will *dav-dva-dva-dva-vaw*. And – and if you get criss-crossed up, and if the pc says, "*A-wig-a-wag*," you never say, "*Ka-pow-pow*," you see? Bunk! That is the wrong way to study basic auditing! I mean, that is the *wrong* way to study basic auditing.

Basic auditing does really not consist of a bunch of do's and don'ts! It consists of a thetan sitting there in the auditing chair running a pc and the pc's bank, and verifying it on a meter. And keeping up the auditing cycle, whether the big one, or the little one – just keeping it kicked ahead and keeping it going. And there's really no rule or trick in it anywhere that solves all of its problems and so forth, because it isn't that complicated an action. You make it far more complicated an action than it really is.

You say to the pc – you say to the pc – you – you're into techniques in "How do you produce tone arm action?" You're not into basic auditing – not really. But basic auditing will produce tone arm action if it's being done.

The auditor says, "How are you today, Joe?" I don't care what the whatsit is. "How are you today, Joe?" This is basic auditing, See. Joe says, "Well, when I woke up this morning and I wasn't feeling so good, and so on. I still have a little bit of a headache, and so forth. And I think it was that letter I got from Aunt Susiebelle and so on, and she so on and so on and so on and so on..." And the auditor sits there and basic auditing simply requires that as long as that tone arm is moving, you don't do another ruddy, *rrr-rrr*, goddamn thing. See? Heh! It's almost too elementary. See?

And finally the tone arm steadies down, and the pc's finished saying what he's saying. But even though he has stopped talking, he might still be thinking over the remainder of the communication, and if so, you'll be getting some needle and tone arm reaction. You don't even have to learn to look at the pc and tell whether he was introverted or extroverted, you can tell it off a meter. And he goes on and pretty soon – and he looks at you, and he looks blankly into thin space for maybe a minute, two minutes, three minutes, four minutes, five minutes (it doesn't matter how long), and you're still getting the tone arm action and so forth, and he finally turns around and he says, "Yeah, I – I guess that's all, I guess that's how I feel this morning."

And you say, "Good."

Well, where's the technique, see? Unless interrupted, and blasted with bazookas, with his chair pulled out from underneath him and the auditor eating a crunchy brand of candy – see, additive, additive, additive, additive – why, basic auditing runs off nicely.

Now, you've got to know what to ask the pc. Now you're getting slightly into techniques. Now, what do you ask the pc to produce tone arm action? Well, you're getting into the technique sector, and I started out by calling it R4 because we're mainly talking about Routine 4 and I'm trying to coordinate it with you, but at lower levels, the techniques still belong up there in that sector.

What technique do you use? Well, whatever technique you use you run it the way it is supposed to be run. If it's run with a little bit of assessment and a little bit of this and a little bit of that and so forth, it's still run first with basic auditing, then with technique, and if anything goes wrong you finish the cycle of the thing with case analysis. It's always a one-two-three proposition.

The one hat you wear all the time is the basic auditing hat. Now, as long as you've got this basic auditing hat terrifically tangled up with techniques, as long as you've got it terrifically tangled up with case analysis, as long as you've got case analysis terrifically tangled up over here with techniques, you're going to be in a mess, man. I feel for you!

I can see you now, supposed to be asleep, lying there upon your pillow, a bit of salt water dripping upon the cambric, quietly in the dark. And if I was to appear at that moment and you were to ask me, "What am I doing wrong?" why, I'd almost hit it right on the groove if I said, "Well, you've got basic auditing mixed up with technique. You've got technique mixed up with case analysis. You've got case analysis mixed up instead of basic auditing. And your basic

auditing is probably absent while you're doing other things and so forth and if you'd just straighten these things out into its three ponds, then learn to do each one of these things... First, basic auditing without injecting what *you are doing* in it very much, but just do the actions of basic auditing. And the technique – well, learn what the technique is and then adapt and fit that into – so your basic auditing can go on and run it. And when you run into trouble or finish the technique, go into case analysis and so forth." Why, you probably would take a look at that and be able to figure out exactly what you did had crossed up. You probably would close your eyes and go soundly to sleep. If you heard me! I can't talk loud yet.

Anyhow, the situation, then, is that a compartmentation of action brings about a comprehension of action. You go down in the engine room of a ship, and you see the big whizzles going around the scrubbles, and the ruddybars pounding out against the flogwheels – looks awful complicated to you till somebody points out that those bars belong to the generator and these bars belong to the main engine. And those up there, they're steam pipes and they simply have to do with the fire room and they have nothing to do with all this moving machinery. You take it apart and you can understand it.

You realize that all those bars up there can s... when they stop, well, the lights go out in the ship. And when these bars down here – these great big ones – when they go out, why, the ship stops moving through the water. And when the fire goes out in there, why, neither one of them moves. See? And right away you understand this a little bit better, see. Actually, you could teach a woolly fuzz-wuzz that much compartmentation about steam engineering, don't you see? So it's not too much hill to climb. And basic auditing is the firebox, see. You're putting something into this session or you're not, don't you see? And as long – when that's absent, why, nothing moves. Just nothing, see. And – not a good analogy, but the generating equipment and that sort of thing – that's the technique. And the big drives going around – that's the pc's bank, man! And as long as that bank is moving, you've got tone arm action and you've got things happening, the pc's getting better and everything is going along beautifully.

All of a sudden, why, you come to session one day and you got a headache and your basic auditing goes out and everything goes to hell, so you remedy your handling of technique. You go study a bulletin on R2H, you see, to get this new technique because you didn't have a good session with the pc.

So you get down R2H perfectly, *perfectly*, you get it down so it – just to the exact point and you listen to a tape on it, and you get it absolutely squared. And you go into the next session (your basic auditing out the window), do perfect R2H, and you lay a beautiful – *wshhh-boom!*

Well, the main drives weren't running, you see, so you repaired the generating set which was running. Wasn't anything wrong with your technique, you just didn't happen to be applying it. Small oversight, don't you see? All the valves were open but there was nothing generating steam (to make a better analogy). Simple.

You actually think you are being trained as auditors. In actuality, you are simply being untrained over all of the complications which, during the vast vistas of time, you have accumulated with regard to human relationships and minds. And I'm simply trying to lead you through this maze, these barbwire fences, these down forests, these windfalls, this snow, wind, storm

and ice and sleet that you imagine is there, and finally point out to you that it doesn't matter whether it's there or not, this is what you *do*. And you get a marvelously simplified look at the situation, see.

I imagine – you know, in the writing professions they always have writers who cannot write unless they have their blue slippers on. They have musicians who cannot play unless they have the purple handkerchief in the swallow-tail coat pocket, you see. You have the fellow who always has to have a china cat on the piano, you see, before he can give a concert, you know? You have the prima donna who must always have received green and purple chrysanthemums, just before, in order to have good luck, you know. You've got all this nonsense. Well, actually, that's just a big substitute for knowing what they're doing. It's a big substitute for confidence. It's – they put it off into something else. They've got it fitted into some other thing. Because you're actually wearing all these three sectors very solidly, with high level of responsibility asked. But you'll find out that a person believes that if he takes too much responsibility in one of these sectors or something like that, it's liable to go wrong. Well, that's just because he's unconfident.

"It's best, sort of, to let the pc run the session" – this is one frame of mind, see. See, this has nothing to do with basic auditing or anything else. This is a – this is a new datum that is interjected. This is one of the additives: "It is really best to let the pc pretty well run the session," and the hidden datum is "because if anything goes wrong, then it really isn't my fault." And we call this "making the pc self-determined." See, that's the way we excuse this frame of mind. So we're into a complication now that has to be battered down with clubs if you're going to get at anything, see.

All right. Now let's go in the other way. "The pc doesn't know what he's talking about and is going to get himself into severe trouble and I will be to blame. So therefore, I had better do everything in the session and not permit the pc to do anything in the session, because if you depend on the pc, that will make him guilty and that's like blaming the pc, and you really shouldn't do that. So we must relieve all responsibility from the pc, and therefore it's only on the meter." You get this frame of mind? Well, this is this reverse vector of responsibility on the thing. "Let's take full responsibility for the thing, you see, and then it won't go wrong."

Well, what's all this worry about it going wrong? I don't know why you worry about it going wrong. And yet an auditor audits more poorly if he himself has had some bad sessions. Then he has the example of how wrong it can go. If as a pc he's had some very bad sessions or as an auditor he's conducted some bad sessions, now he's got a reality on the fact that it can go wrong. And he actually starts fighting back against it going that wrong. And he'll start fighting back against its going that wrong up to a point of where he does nothing in a session but keep it from going wrong. So there's, of course, no session; there's just an effort to not have wrongnesses. That's not a session.

There are many ways that you could analyze this; there are many ways you could understand it. But this is all in the matter of being conducted across the storm, sleet, rain, night, barbed wire fences and howling-wolf type forests to a safe plateau of confidence, don't you see? It's all liabilities. As long as you recognize that additives are the main thing. And frankly, you – in the field of basic auditing, there's very little to teach you. Very, very little to teach you in

basic auditing. All you have to do is observe that a pc has an attention line on his own bank and that when you ask a question, his line goes on his bank and you should let it go on his bank until he's – until it's through going on his bank and then you should tell him, "Well, that's now off of your bank," when it comes off the bank, and keep an agreement on the situation, and just gets these things running.

Find out what the mind is doing. This fellow's worried about squirrels, so all right, you just say, "Well, when did you start worrying about squirrels?" Now you're in the technical department over here, you see. That's the technique department. So you know that there's something to do if you – you got the times he's worried about squirrels; all right, that's fine. But now you fit that into basic auditing and you're back on the same old stand now. You're no place else. You're asking a question and he's going to play the – play the attention line on the stuff in the bank and your tone arm's going to move and when he's finished talking, why, you're going to tell him he's finished talking, and what the hell? I mean, how can you make anything complicated out of this, see? It's not possible, really.

Most auditors' genius is – when they're having a hard time – is best demonstrated in finding a difficult way to do it. Because in actual fact it can't be complicated.

Techniques are taken care of over here in this second department, See? There are ways to run these techniques and they run off in a train maneuver. Actually, it requires quite a little grooving and training to run a technique. It's all sort of *da-da-da-da-da*, wound-up doll. And this wound-up doll stuff goes on, but back of that wound-up doll stuff – that's not auditing. See? There's no auditing connected with "All right, when was that ARC break?" See? *Da-da-da-da* and so forth, and "All right, now, was it caused by affinity, communication or reality? Is it so-and-so, *waff-waff-wa...*?" Well, this is all a sort of a phonograph-record stuff, you see.

At any moment – at any moment, the auditor's basic auditing hat is liable to go on. He says, "Was it affinity?" And the pc says, "Well..." (There's your basic auditing hat, see?) The pc says, "Oh, well. You know, it could have been. A long time, about 19-*d-d-d...* and there was this girl and so forth. Could have been affinity. You know, it's a funny thing, but every time I thought of that in connection with that particular incident, I *waff-waff-waff-waff-waff-waff-waff*, *waff-waff-waff-waff*, *waff-waff-waff-waff-waff-waff...*" Well, how long is he going to *waff-waff-waff*? Well, it doesn't matter how long he *waff-waff-waffs*, because you're auditing the whole time. There is no speeding it up or slowing it down, except as it produces or fails to produce tone arm action.

Now, if you let him go "*waff-waff-waff-waff-waff*," on "Was it affinity?" when actually it was communication, and you didn't get down to a point of being able to assess that yet, you know, and he's going, "*waff-waff-waff*" on this particular subject and the tone arm is sitting here at 4.7 *period*. And it isn't going anyplace else and you let him "*waff-waff-waff*" for half an hour, you've got rocks in your head! See? That's basic auditing hat – where is it? Where is it? Look through the drawers, man. You must have parked it down there – the last time you took off your case analysis hat, you must have removed your basic auditing hat, too.

This guy has finished talking, but because you are being silent, you are inviting it in some peculiar way. Oh, yes, you could explain it, but the truth of the matter is, time is going by without tone arm action! So what hat is out? The basic auditing hat is out. Not the technique

hat. Not the case analysis hat. It's the basic auditing hat that's out. You're letting the guy run on and on and on and be in-session without getting tone arm action, so, obviously, he has said all there is to say and he's as-is-ed everything there is to as-is and he has done everything you have required of him and you are now from here on, in some weird way, cleaning a clean from now on out. So you, of course, aren't auditing.

You just haven't perceived. You ask him a whatsit, and you said, "Was this affinity? Was this caused by affinity?" And then you looked at him expectantly, you see. In other words, you threw your basic auditing hat into the middle of your technique hat, see? You just didn't go wound-up doll, say, "Was it affinity? Was it *da-da-da-da, wa-da-da-da-da-da?*" Tick, tock, bing, bang; "That was a *d-bow-bow-bow-bow-bow...*" down the line. But you pause somewhere. You invited this. You caused something to be corrected, you know? You're somehow or another inviting an itsa. You're not in control of the session. You got your basic auditing hat of getting him to answer a question. You don't want a question answered, you want a tick on a meter. You understand?

Now, if you're getting TA action on slow assessment, that's another thing. That's the technique, don't you see? But this, you're just simply trying to find the source of the ARC break – *pow-pow-pow-pow-pow-pow-pow-pow-pow*, oh, bing bang! See? All right. There it is – bang. You've done it; back to the basic auditing hat. "It says here that this is a false communication that caused the ARC break. Is that so?" Oh, now you get "*waffle-waffle-waffle, yip-yip-yip, yop-yop-yop-yop, yiffle-yop-yop, waffle-waffle-waffle-waffle,*" down comes the tone arm, up goes the tone arm, down goes the tone arm, "*waffle-waffle-waffle-waffle.*" There we go. There we go. That's it. That's a *wrow*. It's so *wrow*, and so on, so on, and it was so on and so on. And I – I – it was Aunt Sadie. It was dear old..." Tone arm action, tone arm action, tone arm action, and so forth. What are you doing? You're getting tone arm action; what are you doing auditing? See?

All basic auditing is, is coordinating your question and the pc's itsa with the tone arm and when there's nothing happening in the session, make sure that you grab the technique or the other hat and get something – and the case analysis hat – and get something to happen, see. And when it isn't happening – "Well, the tone arm's rolling now, that's fine, and so forth" – just keep kicking the ball along, man, keep pouring the coal into the firebox and letting the flames roar. You're just sitting back there, and you say – pc says – your pc says, "Oh, *scraffle, scraffle.*" And you notice, "Well, he said '*scraffle, scraffle,*' and it's been kind of a little while and we don't seem to be getting any tone arm action here. And he seems to be getting sort of dark in his statements of '*scraffle, scraffle.*' Maybe I'm overrunning this particular thing." Recognize an error in basic auditing – you've invited an itsa on something without having any coal on the fire, see? You just went for a vacation or something when you shouldn't have as far as the basic auditing hat.

You'll get all this stuff coordinated. There's really nothing to it. There's three hats. Now, you're taking the basic auditing action; in the basic auditing action – you can do all kinds of wild things with basic auditing and produce tone arm action. You can produce tone arm action with "Do birds fly?" perfectly done as a basic auditing action. Now, you think I'm kidding. Try it some time. "Do birds fly?" That's as close as you can get to no technique. See? Go through Model Session and run "Do birds fly?" You'd be surprised. You'd get some tone arm action.

The pc says this is a boring and tiring process to have nothing whatsoever to do with that. And you say, "Okay," and if you do it all right, he'll then explain to you why it's a basic and boring process, and you'll get quite a bit of tone arm action.

You've got to have the pc willing to talk to you and got to have the pc's attention on his own case and you shouldn't go yanking his attention off his case and putting it on you, because you're not putting on a show; you're just the auditor. It's not a matter of merely the auditor, but the best auditor is totally unperceived in a session. He's not visible, man. His presence is felt, not seen. He's just about as close as you can get to an invisible man.

Now, of course, it's the technique and it's the state of the case as arrived at in case analysis which gives you the technique, and the application of the technique, and the wound-up-doll characteristics with which you can deliver that particular technique and when to stop delivering the technique and so forth. These are all questions which are really independent of basic auditing. They have to do with the understanding of what's technique and what's basic auditing and what's case analysis. But basic auditing: It's your ability to just sit there and be uncomplicated and keep the ball rolling.

Actually, the divisions do not at first appear sharp to you. They would not appear sharp to you. Because at the present moment I imagine you've got them pretty well intertwined. You say, "What is auditing? Auditing is running the process." Go to the foot of the class. Auditing is not running the process. Auditing is doing basic auditing, running the process, and having an analysis of the case that *justified* your running the process and tells you when the process is flat. See? So there's three different departments involved here. Auditing is three different departments.

You say, "Well, an auditor, actually – in a session, an auditor should sit there – should sit there and answer politely." Well, I don't know. I don't know if that's a statement of auditing or not, don't you see? Why? It's only one section of the session. One section of the session – that's the auditor.

See, there's three other sections of the session and the two most important parts of the session are completely omitted. That's the pc and his ability to it'sa, which you're trying to improve, and that is the bank, which is knocking the pc's head off and via the pc can knock yours off, too, if you mishandle it.

All right, there's two big – great, big, important pieces of the session, and they're the most important pieces of the session. The most important, of course, is the pc. And the next most important is the pc's bank. And the next most important thing is the E-Meter, and the verification – indication/verification process of what the pc said. And we get down to, not the most unimportant part of a session, you understand, because he's actually the most important as far as the beingness of the session is concerned, but the most invisible or unexamined or not germane – conduct not germane, is the auditor. See, these – you don't concentrate on the auditor.

A fellow says, "I listened to this report of my case analysis, and *I* found out that *I* cut the pc's... and *I* found... and *I* did this and then in the session *I* said..." Oh, man, they're not answering the auditing question. The auditing question, on a criticism of your auditing thing –

hell, it has nothing to do with what you did! Who cares what you did? Nobody – unless it got in the road of the session or failed to make the session run. Now, that's important.

What is important is *what happened* in the session. See, it's not a case of "I cut the pc's itsa." Oh, no! It's the fact the pc was itsaing and was apparently as-ising some portion of the bank and was prevented from doing so by dropping the E-Meter off the table on his foot. That's what happened. So now you see, you have all elements expressed. But "I cut the pc's itsa" – I don't think you have the power to cut the pc's itsa. What kind of thetan shears do you use? See?

The pc also can cut his own itsa. Don't be so self-conscious. You don't always cut the pc's itsa to make the ARC break, you see? You do it frequently enough, but once in a while you just didn't pick up the ball at that particular minute, or steer in that particular direction, and with perfect aplomb you were steering to the right and you should have been steering to the left and everything exploded in your face and there was frankly no possible way – you shouldn't be so self-critical – there is no possible way it could have been prevented.

Svengali, Charcot, the best mind readers of all time, inhabiting his bank with him, could not have foretold that when you ziggged, he would zag. Don't you see? The important thing is that a zig occurred when a zag should have occurred. That's important. Why it occurred is of secondary importance. But it did occur. Now you can go ahead and say, "Well, why did it occur?" and so forth, and promise never to do it again and throw half crowns out here in the wishing well in penance and make the Instructors do infraction sheets...

But anyhow, the thing about it is that it did occur. That is primary. Not *why* it occurred; that is not even secondary. That is tertiary, or something. I have to learn what some of those upper figures are. I wonder what "fiftieth" is? "Fiftyertiary," I guess. See what I mean?

You see, a session – a session is something. If we've got a piece of cake and it's sitting on the table and somebody comes along and picks up the cake and throws it on the floor, only a damn fool stands around and asks why he threw the cake on the floor. But people, I will assure you, always do ask that.

The only important – really important element present is that a cake has been thrown on the floor which you were about to get a piece of. And yet you'll inevitably stand around and ask *why* did he do it and so forth. That's completely unimportant; there's no cake, it's on the floor. See, that's important. First things first.

Now, a session is an irreplaceable section in time. It will never happen again, there will never be an opportunity for it to occur again. There will be more sessions, but there will never be that session. See, that session is itself. So we look straight at it and look straight in the teeth of this thing and we see that *what happened* in the session is of primary importance. First, did you get TA action? Second, was the pc's ability to itsa and confront improved? Third, was his bank straightened out? Now, those are the important things in a session. That you cut the pc's itsa has nothing to do with it whatsoever. If, at the same time, you got TA action, you actually did eventually improve the pc's ability to itsa and you got his bank straightened up. You understand? Those are the important things.

It doesn't matter what expression you have on your face, so long as that expression does not impede getting something done. See, that's all that's important. It does not matter whether

you appear in a session in a boiler suit or pin-striped morning trousers or an afternoon cocktail dress. It just doesn't matter how you appear in the session so long as, *when* you appear in the session, is your dress impeding or pushing forward the session?

Now, you can wear a glaringly yellow sweater or a dazzle rhinestone-studded sweater and cut the session to ribbons. So therefore, your dress influenced the session because it ruddy well blinded the preclear! [laughter] The boiler suit, being stained with diesel oil and quite odiferous, impeded the session's progress. So if you adjudicate everything from what – what happened in the session, what is happening in the session and whether or not the session did get tone arm action, whether or not it improved the pc's ability to itsa, confront, his reality on his bank, and whether or not it straightened out the bank any – if you adjudicate those things, you've got it made.

And you go around holding your head in your hands and saying, "Well, let's see, did I give the auditing command in the proper tone of voice?" It frankly doesn't matter a damn whether you gave it in any tone of voice, by telepathy, or by short-wave radio. All that matters is was you – did you produce these results in the session?

Now, what you call basic auditing training is simply the mean refinement – the average action – best calculated to produce a result in the session, with minimal impedance of the session gains. There is no completely proper auditing action except as measured against these elements.

Now, if you understand auditing from that particular viewpoint, when you walk outside after this lecture, you can lift up a flap of your skull and skid out the 568,000 data which you've got there now completely impeding your ability to sit there and get the job done, see. Because in the final run is "Did you do your job as an auditor?" And if you did your job as an auditor, that irreplaceable, terribly precious session was very far from being in vain. It promoted the thing and went on forward and you continued to do your job, adding up one of these sessions to the next session, to the next session. At the far end of it, somewhere up along the line, you've got yourself completely rehabilitated being. And that can mean a great deal.

So all of your rightnesses and wrongnesses with regard to *your* actions particularly, see, are just waste of breath. Your self-criticism has – is badly spent. It's whether or not you produced a result. If you're doing things in session which impede gains in session, well, they're probably wrong, but who cares? Let's do the things that get results in session, not the things that don't. And if we never get results in session by reason of never doing anything in session, well, decide to be brave and do something in session. And that is – about there is where all analysis ends. It doesn't go really much further than that.

Well, I thought I could give you these three sections and subdivisions of auditing, and you could see them clearly each one in their own light and it might make it much easier for you to view what is going on and carry forward a session to a better and happier conclusion.

Thank you.

RELATIONSHIP OF TRAINING TO OT

A lecture given on 7 November 1963

What's the date?

Audience: Seven November.

Seven Nov. AD 13, Saint Hill Special Briefing Course.

You are very fortunate people. You are very, very lucky people. Come down all the way down the track, lived all of those years, did all these stupid things, and you wind up here with a chance out.

The chance is as good as you can audit, and it's not a bit better.

The number of raw meat that's going to go out through the roof will be numbered on a nonexistent Chinese abacus from the Ming dynasty, which has long been lost. They won't make it.

You can patch them up, you make them feel better, but that's about it. Unless you train them, unless they become actually a fully trained auditor, they really don't have a prayer. This, at this stage of the game, is not, "It is a good thing, if anybody is to be fully cleared or go OT, for them to be trained" organization policy. Moves out of that zone and area into an entirely different zone and area. "If dey gonna make it, dey gonna have to have been trained well."

So I can see you now with your sleeves rolled up, sweating dubiously, with three or four people that you're auditing, something like this, over a "Hubbard mind trainer" – putty on the end of your nose, little pointer in your hand – saying, "This is a GPM."

And the fellow's saying, "Huh?"

And you about that time saying, "I wish to God Herbie was here!" [laughter]

Yes. "No matter what I thought of Fred last year, if he were only here now." [laughs] You know, this type of state of mind. And then you'll sock ahead with this, see – sock ahead, and you decide, "Well, why don't you go – why don't you go to Los Angeles or Cape Town or something and take an HCA Course?"

And you keep asking – they keep asking you these silly questions, you see, about "Well, you say something about – what is this thing called a Tone Scale? I didn't know I had to study music in order to..."

You say, "Well, why don't you go to – down to Cape Town or Los Angeles or someplace and take an HCA Course? And when you come back, I'll give you the hot dope here, don't you see?"

Because in the first place, they're not really worried about becoming OT, they want to cure their lumbosis. And of course – lumbosis, slumbosis – who cares about that, see? It's nothing; no importance. And they're all worried about their present time problems. They come into session, you see, and they want to tell you about the fight they had with their wife, you see? And they want this all cleared up as a present time problem. But actually it's their son they're really worried about. And then there's – there's Aunt Agnes and so forth. She has committed a terrible overt act against... They got a motivator: she didn't die and leave them her money. And so forth, and on and on.

And I can just hear you now straightening all this up, saying, "Fine."

And the guy says, "Well, what's all this wonderful power I was supposed to have?" and that sort of thing.

"Well, I tell you, *ahem*. It's like this: You have to be very learned indeed in order to put your little feet upon this road to glory. And you have to have attained certain philosophic poise." Something like this.

And they'll come around, "Well, all right, I've read some textbooks. Now have I attained philosophic poise? Am I now capable of right conduct?" and so forth.

And I can see you now: "By the way, why don't you go down to Los Angeles or to anywhere, take the HCA Course? When you come back, why..." and so on and so forth, and there it will go. You – you wait. You'll do just that.

Why? Because your raw-meat case is very easy to audit – very, very easy to audit. They're marvelous. I mean, of course, you're sitting there with so much knowledge of cases and that sort of thing, you could hardly fail to get some kind of a result no matter what the fellow did. But the facts of the case are – is you can audit the fat off the top RIs. These cases are fat; they're fat with charge. The charge is leaking out of their ears. They remind you of a boiler which was designed to contain two hundred pounds and has been pumped up to fifteen hundred pounds per square inch. In other words, you've got charge here, man! There's voltage coming out of their ears! You just touch them with a glance at the E-Meter and they bleed charge, don't you see? Because the top of the bank is fat.

Present lifetime – got lots of reality on their difficulties; the case is fat. See? Good and fat. And all you have to do is take a little bat at either one of these two top RIs, the terminal or oppterm, and it bleeds charge. So you can just sit there and bleed charge and get good tone arm action, and straighten out how Aunt Agatha didn't die and leave them their money. And you can – charge, charge – you can – just-service facsimiles and *aahh!* and so forth. And the tone arm fl... Very easy auditing, because you're auditing fat.

And the reason why a Scientologist appears to be a tougher case, which he isn't, is because the fat has been taken off of him. No more fat left on those two top RIs. How are you

going to bleed any charge off of them? The only way you can bleed charge off them is find the two top RIs and go on down the bank. That make sense to you?

So how you're finding – in the lower units here at Saint Hill – how you were finding any charge or tone arm action on the pc at all, I don't know, because it's probably the totality of it was removed several years ago. I've made some kind of a side remark on this in an earlier lecture, but I think you must be a flock of geniuses to get charge at all. See?

That doesn't – that doesn't restrain me from insisting that you *get* tone arm action! [laughter] But realize that in all honesty I'm totally aware of the fact that you're attempting the near impossible. You get a case parked into its first or second bank, you get that goal in full bloom, you've got this case all ready to find that goal, and the longer you don't find that goal, the harder and tougher that TA is going to get stuck.

I've seen a case well straightened out – nothing really wrong with the case at all, just lined up beautifully – in the second GPM ready to list for the third GPM, and that tone arm at 5.5, man, and going higher. And there were errors to be straightened out in the case – there were some errors there in the first and second GPM that could have been straightened out beautifully. But even straightening out *those* errors made no slightest difference to the tone arm. That case was ready to roll on the third GPM. And that case had already – *huh!* as one found later – had thought of the next goal. And that was it! No tone arm. I mean, the case could have gotten wound up in legal actions and every other kind of human difficulty you could name and been charged up with it, and you could have put in the Prepcheck buttons on their PTPs, and you could have just done everything you could have thought of, because – I know, because I did it! And there it sat – 5.5, 5.6. Next session – 5.7. Next session – 5.75 and so forth.

And finally got around in the department of case analysis to find out what's wrong with this case: well, the case had *thought* of the next goal. And the full charge of the next GPM was sitting there just *pong!* all ready to go. It was the next charge up; nobody was touching it, nobody was doing anything with it at all. And until that goals list was completed, that tone arm stayed at 5.5. Not even case analysis would put it down.

Why? Because the case was rolling. The case was running. Do you understand that? I was solving just this one mystery, is how did this case come back into session with a tone arm at 5.5 when they'd left the session at 3? After two sessions or something of that order, I found out. They'd thought of, and actually had written down, four goals – and one of them was it. It brought the whole GPM right back up there and it *wasn't* any between-sessions charge, it was the next goal.

All one really had to have done at that spot, of course, was just to continue the R4 and you had tone arm action. And immediately R4 was resumed and tone arm action went back to forty-five divisions per session.

Well, what's – what's the matter here? Well, the auditor wasn't running the next thing to be run on the case. Do you see that? Well, the auditor wasn't running the next thing to be run on the case. This next thing was so germane to the resolution of this case that there wasn't anything that would have alleviated it except doing it.

So Scientologists are sitting there ready to roll. You want to know the truth of it: You can do case analysis and patch up the bank and get some tone arm action, and get goals that have been found, analyze these things – these things you've got to do anyway. And you get some tone arm action and square it up. But think about somebody that *has* his present time GPM. Has it. It is it. Unfortunately, the only real tone arm action you're going to get on that case is finding the top terminal and opposing the next RI.

So, your lower-level case runs on fat. They're fat with charge. When this is blown out and straightened up, their life looks much simpler to them, looks much better and so forth. Well, what's wrong with them now is the whole stretched-out bank. And that is sitting there ready to be run. You're not going to get anyplace if you don't run it. And you can't run it on somebody who doesn't know his mind – the mind – and so forth, backwards and upside down and also right way to.

So what kind of a situation does this put us into? This is a series of data which are forced upon us by technical facts – not by my hopes, not by what we would like to believe, not by optimism. And they're very, very cold, harsh facts. The tone arm action which you're going to get at case levels I, II and III are the fat that exist on the two top RIs and incidental fat that may be on the rest of the bank disarranged. And that's the tone arm action you're going to get. And those RIs are going to be cut down, they're going to feel easier, life is going to be easier, those things are going to have less punch. When you find them, however – when you finally find them – they're going to have bang, they're going to have punch in them still. You can't take I-, II- and III-level auditing and do anything, really, to an RI. When it's put back in position ready to be found, and so forth, it still fires and blows down and opposes everything and so on. These things are practically indestructible. So don't get too worried about "the case was messed up and so some of its RIs are missing." That's never going to happen. You can even find them in the wrong banks. And when you put them in the right bank they fire and blow down as usual.

They only disintegrate when exactly and properly located, and when they are opposed or up against the item which they oppose. When the companion items around them are released and so forth, then they disintegrate and you haven't got any more RI. That's the end of that. Now trying to find it again, now, can actually cause a fantastic ARC break on the part of the pc. You found it properly with R4, it is gone, you now tell the pc, "We are now going to find it." You want an ARC break? Take a pc who's had the first, second, third bank run out and say, "We are now going to run out the second bank." He can't! See? You've told him to take stock out of the shop that isn't there.

You say, "Now, see that empty warehouse? Good. Move everything out of it."

That, in actual fact, is the only way you can get rid of goals, GPMs and RIs, is run them properly by R4. All right. Somebody that's had his bank chopped up, fifth GPM from the top found sometime in the past by R3, bunch of items run out of the thing and that sort of thing, that fellow – that bank, if it was at all well run, is going to cause you trouble when you finally connect with it, because the next goal isn't now going to fire. You're trying to empty the warehouse that is empty. And the way to get around that, if you ever run into that situa-

tion, is to make sure that you have every goal that's ever been run on the pc, and do it by dating. You can confirm by dating.

Because you can date an RI even though it has been discharged. It's the only thing you can do that is left to do with an RI. You can date it. Even though it's gone and the bank is gone, you can still get reactions on where it has been on the track, because of course it was pulled slightly out of position to be run. So the reorientation of it still has the bang left in it necessary to locate it on the track. Interesting, isn't it? It's just the idea is left, and you're really dating the idea; it has no mass with it or anything like that anymore.

So if you ran up against that proposition, why, you can solve the thing by dating. Let's say the bank "to know nothing" has been run out of the pc, and you've got – for some reason or other you've come across the goal "to know" and you've just run it out and you're doing an oppose, and it doesn't conclude with anything; you don't wind up with anything. Well, you finally have to assume that if the pc had been run on R3 earlier and some GPMs run out, look them over. You'll find in that list a GPM that will oppose it. You'll probably find, see, "to know nothing." And you get some kind of a situation here; you can confirm it by dating. You can date the bottom of the GPM – the RI end of the GPM that you just left – and you can date the top of the one that has been run out. The two dates should coincide – should be within a short distance of each other. Trick. Well, but it's a necessary trick to know.

Now let's look over this general situation. I'm sure that somebody sooner or later is going to get around this, going to take one of these big tables and a bunch of clay and he's going to train somebody up who's unusually smart and get them to know all the parts and definitions of the mind and that sort of thing, and get them groomed up to a point where they can call them all off and know what he's talking about and so forth, and find the present time GPM and go on down the line. Somebody is going to do that sooner or later; and that will be the exception, however, to the rule.

You have not realized how much aplomb you have acquired with regard to the mind. You have no concept of how much aplomb you have. Pavlov, his approach to the mind – nervous old-maid aunt. You know, just "Uhhhh!" Nervy, man. If you'd talked about the mind to him while he was on an E-Meter, why, it would have banged across both pins. Why, of course, nearly everything theoretical was a lie on the thing, but he was still nervous. He had no aplomb about this subject at all.

When you start training somebody in an HCA Course and so forth – you've had that activity; that's been part of your activities – you remember how nervous these people were, amongst them, how nervy they get? You tell them to sit down and say something to the person across from them. Well, they will do this very happily maybe in a co-audit, because they haven't even looked at what they're doing yet. It's all unreal to them so it's perfectly all right to do this, you see? And you'll see this in PEs all the time. Well, that – they're not saddled with any responsibility; they're just doing something there because the Instructor told them to do and they're not taking any responsibility for anybody's mind. All right, you get them into the lower levels of HCA Course, and the D of T or Instructor starts chewing them out for the subject of having gotten somebody into an ARC break because they didn't complete the auditing

question or something like this, and all of a sudden they're saying, "What? Somebody is actually requiring me to be responsible for the conduct of a session? *Ohhhhh!*"

Actually, there's little gradients many Instructors have dreamed up, trying to get people to actually sit there and take some responsibility for a session. They give them *Self Analysis* or something like that and have them read questions out of *Self Analysis* to the pc or something like this, just to get the idea of it. The approach there is quite interesting.

Well, actually, these people are all preselected out of the races of Earth today. They're preselected: They arrived and enrolled. That's interesting, isn't it? They arrived and enrolled. Well, they're preselected people to begin with – that they're there tells you that. So it's not any cross section of the population at all. This is a very great minority of the population, certainly composed of the upper tenth of the intellects of the world today. So this is a preselection. And if those people coming into an HCA Course are showing any degree of nervousness, they're already people who have a potential of aplomb on this particular subject. And they get nervous.

Now you start running them up along the line a little bit further, and you start getting them into the zones and areas of running the pc's goals and itsaing the pc's goals, you'll see them a little bit nervous, because they're – they've now got a further zone or area. Getting the read on the meter is a source of nervousness. Not getting TA action, they get nervy. Any of us do – me, you, all of us. And we sit there over a session and we see that TA isn't moving, man, and "*Hoo-ah!* Wha-what's-what's going on? Wha-wha-what's-what's the matter here? What's the matter here? Wh-why-why didn't that run?" Lie awake half the night: "Why didn't I do that? I wonder if *ss-mmm* has got something to do with it. *Wa-wa-wa* and did I *so-wab-ba-ba*," and this sort of thing.

Well, you're smart enough and bright enough and got enough aplomb to get up to that level to get nervous. I think Pavlov himself, he probably would have gone into a complete nervous breakdown. He probably would have been howling, [laughter] if not slavering! But there's your level: You're dealing with preselected people, and these people have a tremendous amount of training. Even people – non-certified people who hang around an organization have a tremendous lot of training and aplomb on this particular subject. It's quite amazing.

So you're dealing with a specialized group, specially selected, and then these people are moved on up with further selection by advanced levels of training. And they're moved on up – their confront, their persistence. Look at the things that are required of one of these people, you see – the things that have been required of you, in actual fact. And sticking with it and the disappointments and the upsets and the reasons why you shouldn't have and all this, and the lack of success you've had with this one and that one and the trouble you've had someplace else and so forth. Boy, if you don't think that isn't a process of preselection, you should take a look at it someday. Just going on being in Scientology, see? It has its rewards, but it also has its liabilities. And the liabilities, particularly the last few years, have been very great. Rolling along on a research line, mostly living on hope and the next and latest technique – this sort of thing, has taken its toll. Don't think otherwise.

And those that have survived this particular process and so forth, are not to be congratulated; that has nothing to do with it. They have simply demonstrated the fact that they will obviously someday make OT. It's as simple as that, don't you see?

All right. Now we walk along this line a little bit further and we're suddenly confronted with brand-new demands of auditing. A new style of basic auditing. Not too different, but requires some neat adjustment of sitting in there as an auditor, not taking the pc's itsa away from him and yet not abandoning the pc to his own itsa. Man, you make that adjudication! That's a rough one to make; you have to make it yourself. At what point – at what point do you take over too much of the pc's itsa, and at what point do you take over too little? Where is the exact middle ground of these two points? Discover it for yourself. You will, sooner or later.

The reason you have to discover it for yourself is it varies from pc to pc. There's a variation here. It's not – doesn't vary from auditor to auditor; it varies from pc to pc. Some pcs are quite bright, their perception of their bank is quite good and so on, and you mess up *their* itsa, you've really done something, don't you see? They know what they're talking about. They say, "There is a cat sitting over there," see? And the auditor that doesn't pay any attention to this at all and doesn't weigh the fact with that particular pc is going to be in trouble.

Similarly, you'll have a pc, he says, "There is a cat over there," and you can be absolutely sure that if the – he said so, that proves it isn't the case. See, pcs are different. He's maybe trying to make a good show for the auditor, he's not trying to look at the bank or itsa. He's trying to put on an act, or – or there's a lot of other wild factors enter in here. Well, how much responsibility do you have to take for him?

And the reason you should learn to adjust this, is as your pc moves on up the line to higher and higher case levels, his perception gets better and better, his ability to itsa gets better and better – dependent on whether or not you yourself have engaged in a promotion of his ability to perceive. Have you increased his reality on his own bank? And if you have, and the case is rolling along the line nicely, why, he will wind up with higher and higher levels of responsibility for his own bank. And finally, running on to OT and going actually on down the track and knocking out GPMs, you'll get to a point where it would be very perilous to challenge the pc's perception of the matter. I mean, it would be just foolhardy. Not that the pc would do anything to you, but it's just foolhardy. You're just making trouble.

Pc says the next goal is "to scat." It rocket reads, blows down – that's the next goal. That's your goals list, see?

Now, if at this point you said, "Well, let's take a list here, and we're going to list this thing out," and so forth.

And he'd say – he'll keep saying, "Why? What do you want to list it for? It's sitting right there. That's it; that's 'to scat'."

And he says, "The top terminal-the top terminal is 'those who scut,' and 'somebody who can't stand scutting,' a 'non-scatter'." And your meter's going wild – what are you going to do at this point? Say, "No, no, we've got to go back, and we've got to trace all this back, and really, we'll go back, and we'll first do the goals list, you see, and we want fifty past the

last RR," and so forth, and so on. Three sessions later your pc's going into a decline. You say, "What's the top oppterm?"

He says, "Oh, to hell with you!" [laughter]

The horrible part of it is, the same condition can exist, apparently, on somebody who doesn't have any GPMs run out. He says, "My next goal is 'to scat,' and there it is right there, and the top oppterm is 'to play on a piccolo,' and the terminal is 'to eat meat.'" You buy this, the pc's wrapped around not one telegraph pole, it was something like sticking him out through a train window as you were going by the telegraph poles, you see? [laughter, laughs] So there is your – there is this adjustment. How much responsibility do you take? How much of the pc's itsa you take, and so forth.

Well, it changes, not only from pc to pc, but it changes in the same pc. Furthermore, you can go reversewise: The pc has had some bad loses, his itsa can deteriorate for a little while. Had some real bad loses, you know, some kind like this: You ran out the present time GPM, only it wasn't it and it shut off the RR. You got him stuck you don't know where, in what. Incomplete list; this, that, the other thing – something is wrong here. Case analysis is coming to the fore, and the pc is all snogged up.

Well, maybe a short time before you did that he could have itsaed it well, but now that this has happened he cannot itsa for a little while very well. He can't spot these things. He really doesn't know, and he gets frantic, and he gets wild, and he starts giving you various ideas and hints and so forth of what you ought to do; he starts giving you auditing directions which are based on unreality and you wrap him around a half a dozen telegraph poles, too – having wrapped him around a telegraph pole, don't you see?

Wrap a pc around a telegraph pole and his ability to itsa will deteriorate. That doesn't mean it won't improve immediately that you straighten it all out again, but you have to make these allowances.

So, not only different from pc to pc, but plus and minus in the same pc. And can not only improve but also deteriorate in the same pc. So these are things that when you say, "This is exactly how much responsibility you take for the pc at any given instant" – well, how many – this is the much – the degree of responsibility you take for itsaing for the pc, you see, finding out and showing him what it is – is not a constant. It's highly inconstant. Varies session to session.

Pc comes in with a big present time problem. He's been reliable – he's been reliable as a grandfather clock – tick-tock. He'll call his shots all the time. And he comes in this session, he's got a present time problem. He's a bit overwhelmed, he's a bit bothered by various things. And in a gesture of impatience or something like that, why, he gives you a wrong datum. You're very accustomed to – well, you haven't estimated your pc for that session. This is not something that takes a great deal of study, but it takes some experience. It's something you want to watch. Pcs run good and they run bad. Pcs run well in the morning session, bad in the evening session, see? Some pcs run well in the evening session and badly in the morning session. See, that's – it varies. One day your pc who always runs badly in the evening session comes in and runs wonderfully in the evening session, runs horribly the next morning.

So, the final solution to it is you do what you have to do to get the case done right, at any given instant of auditing. And every moment of auditing is a different moment of auditing than any other moment of auditing – particularly in this business.

Where you can produce change in a pc, you of course are changing the values by which you audit. You ever look at that? Now, some auditors back in the old days solved this by simply not changing the pc. [laughs] And they'd express it this way: They'd say such and such a process ran well on the pc, so we will now run it, and this is the only process we are ever going to run on this pc. And, of course, the thing – long since flat, you see?

I remember one time somebody a long time ago ran on Mary Sue – one of her auditors – ran her for forty hours or more on, I think, "failed to endure." At the end of that period of time she sure was failing to endure! Very successful series! That's because she happened to be running well on it at the beginning, you see, and then they didn't know how to shift their gears. It's happened to all of us at one time or another. And also the reverse has happened, is before a process could bite, the auditor had changed it, see? All these various casualties occur.

Well, these casualties occur by a failure to estimate the state of the case at the moment the case is being audited. The case is always different one moment to the next; they are never the same case. They are always different. For one reason, they're in a different period of time, don't you see? Time has changed.

All right. Well, let's get back to this problem of you audit the fat off the top RIs and you've got a R4 type case. Now it requires a real genius to get any TA action off the case at all, you see? He's taken something that has no fat left on it and is trying to find some fat. And of course he has to be more and more adroit about the kind of fat he finds, and he can get quite remarkably adroit at this. It makes a good basic auditor because at this particular time he, of course, is running into a case that has no fat to be run to amount to anything, and he is yet running some, so therefore the case is more liable to ARC break and becoming critical of auditing. So it works two ways, and it makes a fantastic auditor.

Not only is there no – nothing there to get TA action on, but there's a greater liability to the whole zone of auditing, because he's more likely to get ARC breaks and upsets in the session. Pc is more likely to develop present time upsets by reason of auditing. So by the time you get through that preselection, why, you're practically a screaming genius, man.

Now let's move into the field of – let's move into the field of what happens after somebody has gotten up the track. What happens? They're in a position of doing R4. Well, at this stage of the game they're probably trained. They're probably trained somewhat. They'd certainly have to be trained further, in spite of the preselections and other things that brought them up along the line. They'd have to be pretty well grooved.

It's almost grimly factual that Saint Hill will undoubtedly make more OTs in the final run, for various reasons. Data first on the firing pin, and it's being sorted out all the time; there's terrific evaluation of this data, reassessment, re-sorting the data continuously occurring and so forth, cases being very carefully adjusted. And right here, of course, we have more people that know more Scientology than any other place in the world, naturally. And – on the staff. And you get into a preselected situation, already, by reason of technical knowledge. And this is expressed right now, that there's only about – I think there are four or five cases at

this moment in the whole world that are headed directly, immediately and straightly to OT without another quiver on the line. I mean, they couldn't be stopped, just give them auditing and they will arrive, see? There are only that many cases in the world right now that are in that particular state, and they are all at Saint Hill. That's interesting, isn't it? So we can suppose that this area of dominance and forward progress will continue.

The best way and the most sure-fire way to get to be OT, then, is to be a top-rank auditor, and that for various reasons, you see, including the aplomb it takes to confront the bank. You have no idea how mu... We had somebody here (I would – I won't mention any names) but we had one case that was running very badly...

I call a case on the way to OT, by the way, who has had the first bank run out. This proves it. This proves the top GPM; this squares it up. First bank run out, second bank coming up, and that case is surely in the channel and on the road.

It isn't just that we've found somebody's goal and we're fishing for the PT goal and that sort of thing; I don't consider that case en route yet. It will take that case anything up to two years to get into this other situation. Anything up to that. Might only be a month. Might only be two months. Just because somebody has found a goal on this person is no guarantee of anything. But I might add this snide, cynical and horrible comment: There is one thing it *is* a guarantee of, that the case who has had a goal found on him – between that point and the first actual GPM run out, finished and the next goal found, between those two points, is more hell, upset and uproar than any being ever thought he would have to endure. That is absolutely ghastly.

I'm talking now about actual empirical experience. I've seen these cases. Now, these are – lack of technology is some of the explanation for the length of time in this.

One of these cases at Saint Hill had the top GPM found – imagine it, it was the top GPM – and its top RIs listed for, over the better part of two years. I think more than that. Horrible! The reason it could never make any progress is there weren't any top items – it was a truncated bank. And it never occurred to anybody to go down into the bank and run it as a truncated bank. Technical, of course, has caught up with this type of thing, but nobody ever suspected this was the PT GPM. GPMs have been listed for, above it and below it and around it, and discarded, and I've seen goal after goal presented as something closer to present time on this case in the last few months. And misery and *bow* and upset and so on, and – oh, me! Misery. Agony.

Even when you've found the PT GPM, that agony isn't over and so forth, because one might miss a couple of items in it, and one might shoot that sideways. Now, now the real trouble begins! This is the toughest period of the case. Top GPM found: Will it run? Is it the top GPM? And I myself have been knocked around for thirty days on just answering that question, session after session, misery after misery and so forth. Other things being found for it, being found above it, being found below it and so forth. And then we found out that it had been run out. How can you make mistakes like this? Well, it's very easy to make mistakes like this, because the present time GPM is the one in which all a person's present time problems sit. And he has practically no perception on it.

You go back-you go back ten GPMs, you can probably run one of those out. Pc won't run it with any reality and it won't do him any good and for God's sakes don't do it! That would probably run with nice perception and everything going along swimmingly. And you move up into the present time GPM, all of his present time problems are sitting on this present time GPM.

Now, do you see what I mean about preselection? Because at any time during that period of finding a goal and finding and running out the perst... – PT – the first GPM on the case, life can become so horrible, so unbearable, so unlivable, so many creaks occurring of various kinds whatsoever, the fellow's just liable to pack it up, man. Raw meat won't stand there and – they won't understand anything about it. They won't have any hope; they won't have enough confront to go through it. A little creak turns on, "Well, I've been audited and I don't feel so good, so I don't think I'll be audited anymore." Well, let them go creak till the end of time. Who cares? Preselection didn't operate.

"Dere was many called, and few was put into de first bank!" [laughter]

Now, these are the facts. These are the facts I'm giving you. These aren't any gilded thoughts of any kind; these are just the grim, horrible facts.

Now, once you've got the person into that first GPM – you know it's the first GPM, there's no doubt about it whatsoever – you can maybe for the next two GPMs worry about whether or not it was the first GPM and be prepared to find two more above it at any given moment, because the bank is liable to straighten out suddenly and so forth, and you find yours... But this is much more – less likely to occur than has been believed in the past. And a lot of case time and auditing time has been lost in taking the first GPM and then knowing it is the GPM, checking it out, and then for some reason or other not running it or not really handling it, and even after running it, not knowing whether or not it was *it*, and therefore do something else to prove something else was *it*.

Because this horrible datum has just emerged as a very important datum. And that is, an *actual goal invalidated will then behave like a wrong goal*. It's terrible! I mean, a datum like that – that's terrible, man. Think it over for a moment. An actual goal invalidated will then behave like a wrong goal. Well, you probably haven't measured in everything there is to be measured into that simple statement. Because it means this: that that invalidated actual GPM will now turn on the creaks and ARC break the pc just as though it were a wrong goal, and just the way a wrong goal would ARC break the pc.

And when you say to the pc, on the meter, "That's a wrong goal," because it reads that way, "we've found a wrong goal, that's a wrong goal – 'to spit' that's a wrong goal," the pc will say, "Oh, well, what a relief."

Proves it, doesn't it? He will feel relieved, because you've just added more not-is. This is not-is coming in. See? But he won't feel very happy. He'll go on being ARC breaky around the perimeter here someplace, but not on that one. That one's all taken care of, isn't it? We knew that was a wrong goal, didn't we? Because every time we say it's a wrong goal it turns off the creaks and the pc's happy and cheerful and doesn't ARC break now. And every time it comes up and gets restimulated, why, the pc ARC breaks, so that's a wrong goal, so we just

say it's a wrong goal. And the pc doesn't ARC break now, and it straightens up beautifully. So we obviously know what it is.

Isn't that terrible?

That's why, now, you've got it contained in your lines, where I gave you that program: after you got through checking everything – after you got through checking everything, you know, all the case analysis on the thing, then you prepcheck everything you found.

That's why that's there. That's – probably you've been wondering. Well, it was there just as an elementary caution to begin with, but it was just my instinct that it ought to be there.

Now I've found out *why* it ought to be there. Because you could have carefully, with great relief to the pc, laid aside an actual GPM as a wrong goal in the case analysis, simply because it was so heavily invalidated that it behaved like a wrong goal.

Now, I don't know that the reverse is true, but I would be – I would expect now, just by extrapolation – I don't know that this is true or will hold true, but this horrible specter might rise, too: that a wrong goal is sufficiently validated to behave like a right goal on the meter on a case analysis. Pc has asserted, asserted, asserted and everybody's asserted, and everybody knows that's the right goal and so forth. And somehow or another it's got now the value of being a right goal while being a wrong goal. I don't know that that particularly will obtain, but I would expect that sooner or later we might run into instances of this. Because if one side of it is true – if you can say that a right goal is a wrong goal and it will then thereafter behave like a wrong goal, you should be able to say that a wrong goal is a right goal and it will then behave thereafter.

There's only one thing wrong, however, with that second statement, is any actually wrong goal – it's no GPM – or an actual goal run as an implant goal will turn off the RR just like that. Two items, three items – no RR, no falls, nothing on the meter. Gone, see? This is the guy who won't get any tone arm action, he won't get any meter action, he won't go – *lah, lah, lah*. You try to – so you're saved, you see, from making this second guessed-at mistake, because it shows up almost at once. You won't ever run, then, a – you won't ever run a wrong goal. That I can absolutely guarantee. You won't have any RR to run it with. That simple!

You'd have to sit there and just lie to the pc. Say, "Oh, well, we found an item, yeah. We found another item" – the meter is absolutely frozen, see? It won't run. So you never really will.

Even though a goal is an incorrect goal, it could only be incorrect for its position, it could never be incorrect for its wording.

You can sometimes – you can get items for an implant GPM, you can get a wrong line plot for an implant GPM, without turning off the RR. But you can take an actual GPM and try to run it on an implant pattern and it turns off the RR right now. Off goes the RR. Off goes the falls. Off goes the tone arm action. That thing will just stick – not necessarily a high tone arm or low tone arm – it just won't – nothing happens now. And the longer you try to run it and find items and so forth...

So the surest sign in the world – this is sure, you know, like it is daylight when the sun comes up: If you run a wrong goal, the RR or falls or any other meter action will turn off, completely aside from the ARC breaks of the pc. So that one isn't dangerous.

What is dangerous, however, is that the pc's actu... an actual GPM of the pc is so thoroughly invalidated, you know, by various things – it's so thoroughly invalidated that it now reads as a wrong goal and so will be consistently discarded by the auditor. He and the pc both know and agree by actual test that "to spit" is a wrong goal. And they're going on looking for the next GPM in the line, or the PT GPM, or something like this, and they can just go on looking forever. Because, you see, you can't find something in a place where something you know isn't there, is.

It's these errors which take up time in R4. They are not, in the broad analysis, destructive. They're merely hell to live through. Hell for the auditor, hell for the pc. The pc's got nothing but screaming ARC breaky sessions, he's not getting any improvement, his tone arm action is minimal, he doesn't know where he's going, he doesn't know what he's doing. He's starting to itsa all in the wrong directions and dish up wrong data at every hand, invalidate everything that's been found on him and knock everything out left and right and rearrange his data, and he's getting into a worse and worse condition. The auditor's sitting there tearing his hair out by the roots. Tone arm isn't moving, is – he isn't getting falls. His goals lists aren't listing properly. He can't find anything. Anything he does find today checks out perfectly and tomorrow is invalidated and won't check out and it's all different, and *thuh-thuh-bua-uah*, my God! – that it should happen, you see?

And there's absolutely nothing will ever be done to make it any other way. That's horrible. Because that is the condition of auditing with the very best auditors and the very best trained pcs there are. That's something to think about, isn't it?

Now, you get a square look at this. Many are called and few ever hit the top of the bank. See that?

See, given all the training, given all the data, given everything else, it has great and wide liability. It can be worked out. Somebody who's started in this line, if he's had that much preselection all up along the line, and enough training and so forth himself, and so forth, is not going to bail out until it is done. But remember, two years have elapsed. Of course, the technology was not up to it in many instances and so forth, but two years have actually elapsed between the actual finding of a PT GPM and running that same GPM. And the interim covered with trying to find the pc's goal, trying to run the pc's goal, trying to audit the pc and so forth. That has actually happened.

And even with all the technology you're sitting there right this minute with, it has been many months of a very skilled auditor and a very well educated pc – many months to finally sort the thing out, finally, and get it running.

We got better technology. We can shorten the time. But don't go around in the happy dream that it can't happen. All the best training in the world makes it possible for it to occur at all, see? The best training makes it possible for it to occur. This is exactly the state that it's in, see? And even with the best training, it occurs sometimes very smoothly and very luckily and very slippily. Just that morning you got up and you were wearing the right halo. And you

sailed in and for some cockeyed reason were actually able to bust through the line and really run it and it started running. Just figure it for what it is. It's a high degree of skill compounded with a phenomenal bit of luck. That's what it is. It's – you just got up that morning, and you – your shoes were in the exact correct position alongside of your bed. And that was it. You're just lucky.

Now, this is a sober look at all these things, and I perhaps might sound to you as though I'm depressing your morale. I'm not trying to depress your morale. I'm trying to keep your morale from departing from a reality. And the reality of the situation is that if you're very good and if you're very well trained, and if you know your business very well as an auditor, and when as a pc you are audited by a very skilled, very capable and very able auditor, and you have a great deal of luck, you won't suffer many catastrophes (get the level of action there: you won't suffer *many* catastrophes) up to the point of having the first bank found and run out. And that's exactly your level of expectancy.

Now, the actual running out of the bank can furnish difficulty. You can get into the fourth bank or something like that and all of a sudden the pc invalidates the goal. It's out of session, see? The goal is, for instance, "to be a snob." See? And the pc says, "Hey, I don't like that goal. I've never – no, I've never been snobbish," and so on. They're caught up somewhere up around the top terminal, don't you see, and they start dramatizing the top terminal, which is "an humble person," see? They say, "Well, us humble persons, you know" (they don't know what it is yet), "us humble per... We hate snobs, you know. They're no good, and uh – and so on and so on and so on."

Or unfortunately – unfortunately, they see a great big limousine going down the street with a guy in a top hat or something in it, you see? Something keys them in suddenly. "That goal couldn't be my goal. That – it couldn't be my goal." And they come back in – you've got some items in this thing, see, already. Put them on the meter, so forth, check it out. The pc nattering, ARC broke, see, "*Nyah, nyah, nyah, nyah.*"

You figure something's wrong here – something's wrong, something's wrong. You check this thing out: "'To be a snob.' All right, is that an actual GPM? And is it in proper sequence?" And – no read, see? "Is it an incorrectly worded GPM?" Tick, you see? "Is it a wrong goal?" you see? *Clang!* you know? It goes practically – rocket reads, you know? "All right, is it out of sequence?" and so forth – there's no read. It's just a wrong goal, that's all there is to that, see?

So you say, "All right, now let's try to do and extend our little goals list that we were doing from the upper GPM." At this moment you have sealed your doom for maybe the next two weeks of auditing. It'll look so reasonable to you and the combinations are so varied, you'll fall for it. It's inevitable.

You try to clean this thing up: "Well, did you think anything" – knowing this, we might shorten it down, don't you see – "Did you think any invalidative thoughts about the goal? Let's get in the mid ruds on the subject of the goal: On this goal, has anything been suppressed?" *Blah-blah-blah-blah-blah-blah.* And all straightened out and...

Pc spends the whole time you're getting the mid ruds on it saying, "Yeah, but I've never been a snob. I never had a goal like this. I never had a – so on and so on. I'm a – I – not

me! I couldn't possibly have had a goal – and so on and so on." So even the mid ruds are converted into a total invalidation of the goal, see? So this thing – this thing still reads "wrong GPM" – must be, the pc's ARC broke.

And you say, "Well, let's get the pc out of the ARC break." "All right," you say, "that is a wrong goal."

And the pc will say, "*Whew!* Boy, that's a relief!" See, you add to the not-is that they're trying to pull off, of course it complements it and so on.

Now begins the silly rat race of trying to find the right goal which occurs in that place. One after another, we get *three* goals to read – actually fire, actually check out as an actual GPM. See, everything's awry now. And we get one after the other. And we start – and we find their top oppterm and we find their top terminal and we lose the RR. That's the end of that RR. Well, it must have been a wrong goal, *hu-hum!* So we throw that one away, and we get another one. We take the same goals list and we work and sweat over this goals list.

And the reason, of course, a goals list will read if you work it over hard enough, unbelievably hard, under a circumstance like this where you've already invalidated the correct goal on it, you'll find other items will start reading on the same list, whether you extend it or not.

So, you find another goal, and you put it in the same place. Pc has eventually sold you "to be humble," see, something like that, motivated by the RI they're sitting in. Only you don't know that and neither do they, see? Top oppterm, top terminal, everything's going along – well, we're really rolling now, got beautiful blowdowns, you see? We get the third item up – *erk!* [knocks against the meter like one would do with a broken device to make it work again] "People who hate humble people. (I don't know what it says. No read.) Let's conti... extend the list a little bit more." That needle is just freezing. It's getting tighter and tighter. There's less and less read, there's less and less fall, there's less and less tone arm motion.

"Well, that's a wrong goal." All right, we *throw* that one out, see? "All right, now let's find another goal that goes in this immediate area and so forth." You're groggy, the pc's bank is all messed up. He couldn't – he actually couldn't it'sa, bright red paint in front of his face by this time, see? You've got his bank looking like a GPM pretzel! [laughter, laughs] And then sometime down along the line – we hope it will be in the next few months – somebody's looking over this folder – you're looking over this folder or somebody's looking over it or you notice it and so forth: The goal you were running ran seven items without turning off the RR. Must be a right goal from someplace. Well, we better orient the thing.

So we put in the ruds on it and we get it sorted out and we eventually straighten it out, and all of a sudden, bang! it *was* the right goal in the first place. And the RR is beautiful, and it's on, and everything is going along gorgeously. And here we go now, and we go on down and finish off and we find we were only two items from the bottom or something stupid, see? It isn't that that was that short a GPM, but let us say we'd found eighteen items in it, and maybe stopped on the last RIs – something like this. This sort of thing happens. See? The one thing you'd never imagine, because it all checked out. Everything checked; everything checked. But it read as a wrong goal because it had been invalidated.

All right, let's take the exact same situation. Remember, we're walking in the dark, here. These six-foot rear-view mirrors: When we've got it all done we say, "Of course!" But at the time we're walking into it, man, that peephole in front is about one-thousandth of a millimeter in diameter. And we are going up the line, one way or the other here, and we say, "Who or what would 'to dance' oppose?" And we get – and it reads, and everything is fine – "to not dance." Obvious! The exact goal! Everything is fine. So we take this goal and we run it and it doesn't turn off the RR. Pc is beginning to look mighty pale and the tone arm's pretty high. We're not getting much in the way of blowdowns and the falls aren't very pronounced, but it's running.

So we say, well, we won't make trouble for the pc; we will go on and run this a little bit further. It's all checked out, everything is gorgeous, you see, and so forth. And it gets worse, and it gets worse, and it gets worse, and we're not quite sure what this is. And the items start to look rather odd to us, so we challenge the pc. We say, "You aren't listing the auditing question. Now, you must list it." Yes, he is; he swears he is.

And he's getting the goal, you see, "to not dance" and... 'Tain't running right, though; nothing's running right. It's going to pieces. Tone arm action's degenerated, tone arm high or low and pc's morale kind of bad, they're dragging around, and they shouldn't be operating like this. Hard to find items, hard to get them to blow down, and have to prepcheck every item to get it to blow down, and all kinds of stuff like this is occurring, you see?

Finally you get bright and you say – you start looking at those items and, "Gee, you know, those look like an implant line plot." And hurrah, hurrah, it is! It is. And you check it over on an ARC break and you get this – you get a tick. Your first clue, maybe by just inspection, which it probably should be, but if you didn't get that, you'd get something like an incomplete goals list is the reason for the ARC break. Well, you've completed every goals list you can think of, so why should it possibly be an incomplete goals list, you see? And so on.

We find out that there *is* a GPM, an implant GPM, "to not dance," and the reason the RR didn't turn off is we were running an implant GPM, and of course an implant GPM doesn't turn off the RR if you're running it. So why should it? If an im... if you're running an implant GPM with the wording of an actual GPM your RR will go off. You know, you think you're running an implant GPM, you're running it by pattern and you're trying to run the actual GPM by an implant pattern, you won't have any more RR than a rabbit. But the other isn't – the otherwise isn't true. You found an implant GPM, the only thing that's wrong with it is, is you're just finding some misworded items in it, and the RR isn't going off, nothing's going off, thing is apparently running, everything's going along all right – except it isn't running well at all. The pc's pretty upset and so forth. You got an incomplete goals list.

You go ahead, and you did your – you finish up your goals list, and so forth, and you'll find out that it was "to be sad" or something, see? And that was the right goal and you're back up at the top and you're on your way again.

How many auditing sessions did it take you to find this? That is the question. How many auditing sessions? It's actually as many auditing sessions as it took you. That is the exact precise statement of time. Because it could take you anything up to thirty auditing sessions to get a blunder. What takes time in R4 is the mistakes. You'll find this time and time again.

The time consumer is the mistake. You make the mistake, you're in for it. Well, that doesn't mean you should go on trying to be perfect all the time, just be as good as you can. And you'll make as few mistakes as possible and lose the minimal amount of auditing time if you repair them as quickly as possible. But this statement will still hold true, that the time that is consumed in R4 is as a result of a mistake. Mistakes consume the time. You make one blunder, you buy the wrong goal, there you go! You've had it!

Now, actually if you'd found the right goal you would have had the whole thing run out in the next session or two. See? Would have been all gone, and you'd have been on your next list. Instead of that, here you'll be, idling around, fooling around – not for just this session, but the next session, and maybe the next session, and maybe the next session, with your pc getting less and less capable of straightening it out, and you getting more and more confused. And everything you're trying on as the error here, you see, is not working out, don't you see? And then you're invalidating things that are true, you see, and validating things that aren't, so that your analysis of the situation is getting poorer and poorer, don't you see?

Well of course, you could say, quite handily, and possibly some day in future ages some Instructor will say it, "Well, of course, the thing to do, obviously, is not to make mistakes in the first place." That's not possible. That's merely a snide, not an obtainable perfection. Where absolutes are unobtainable, that one is peculiarly so, because it depends exclusively upon the pc's ability to itsa. And the auditor auditing with the best possible talent, technique, attention to duty and so forth, is sooner or later going to run into a zone or area where the sub-itsa, as represented by the pc's ability to itsa, is very peculiarly shallow. And he's going to hit that point, and he's going to say, "Well, it's this way and this way and this way." And what makes this... and he's going to be wrong.

But what makes this peculiarly true that you – nobody should go around saying, "Well, you shouldn't make mistakes in it" – what makes it peculiarly true about the matter is that the mistakes that you make are consistently trying not to make mistakes.

Pc's running like a well-oiled dream – I've done it myself – so you decide, just to be sure we haven't made a mistake, we will go back up and patch up... And then find that the next four items I found in the patch-up of the goal above it actually belong in the goal below it. And we got a pc wrapped around the telegraph pole and the tone arm's sitting over here at five point f... if I'd just kept my mouth shut and just gone on the way we were going, all would have been well!

So, you see, you can strain so hard to not make mistakes that you wrap a pc around a telegraph pole. I'll give you an idea how you do this. This is one of the reasons mistakes are impossible to avoid. They are impossible to avoid in R4, because you have to do this but you mustn't do this, see? It runs like this, you see: "All right, is that an actual GPM? All right, that reads. I'll check it out the rest of the way. Is that an implant GPM? Is that no GPM? Well, those don't read. It's an actual GPM. All right. Good."

Pc is sitting there, smiling, happy, everything's all ready to go, you see? You got it made now, see? You're all set. All you got to do is say the last RI down to the next oppterm and get that list, and you're away like the hounds, you see, after the red fox, you see? But you don't do that. You've just got through wasting two weeks on this pc through having wrapped a

couple of telegraph poles around the pc, and then the pc around the telegraph poles for good measure. You're all set now, so you're not going to – you're not going to get caught this time. We know this now.

All right. "You mind if I check that again? This – is this an actual GPM? Is this an implant GPM? That – that reads. Did you protest that?"

"Well, no."

"Is this an implant GP...? (Gee, tha – that reads, you know.) All right, do you – you – you mind if I get the – get the mid ruds-mid ruds in on this goal?" And we come back and we check it again: "Is this an actual GPM? Is this an implant GPM? Is this no GPM? Is this only a goal? That reads. All right. Let's get in the session mid ruds here just to make sure that everything is straightened up all right, because we've got to be sure. Just – *uuuh!* – wasted two weeks on this other GPM. All right, good enough now. Is this is a – is – is this a – only – only a goal? All right, that – that's fine. Now, let's get in – let's get in these – only a goal, yeah. Well, let's get in – let's get in a couple of buttons on the session mid ruds anyway and get these in. In this session, has anything been protested? So forth, so on, so on, so on, so on, so on. All right, thank you. In this session has anything been decided? All right, all right, all right, good, good, all right. Now let's continue this goals list. All right, let's continue this goals list. Is that okay?"

Pc sitting there, "Huh? Find it very hard to list," and so on.

"Well, just – just go ahead. On this list, has anything been suppressed?"

"Well, you sort of suppressed the idea that we already found the goal. I thought the list was complete."

"Well, all right, fine. Got that, thank you. Now, all right, who or what would 'to dance' oppose? All right."

Pc obligingly gives you a whole bunch of new goals. Meantime the actual GPM is all being beautifully suppressed. Then two weeks after that, you suddenly remember that there was a point where the pc was running well and you went back to it to see what was happening at that point, and find out that you had the goal in the first place. And the reason the thing changed from the read of actual GPM over to the read of an implant GPM – the reason that changed – is because the pc was saying to himself and didn't bother to tell you, "Why the hell aren't we running it? Why aren't we running this?"

And he thought that at the time you asked the question, "Is that an implant GPM?" This factually you'll never recover. You understand? You don't get that datum back, but that's actually what happened.

You were going to be *very careful* and you were going to *double-check*. So the second time you checked it, the pc's objections give you an incorrect analysis. That's many complications.

In another case, the reason why you're going to make mistakes, and that's for sure, is the pc is not ready to have an analysis done. The tone arm is still moving. The needle is still blowing down. The pc is still cognizing on this goal, see, "to be a snob." There it still goes,

pshewww! Every once in a while you'll see it go out from under. You think it has now quieted down.

Now, actually the impingement of your voice on the bank, of *your* voice on the pc's bank, is enough to cause – during a particularly blowdown period when waves of heat and that sort of thing are coming off the pc – your voice against the pc's bank is sufficient to produce a rocket read.

Well, look – look. The charge is blowing off, see, and every time it blows off you get a long surge, and you're watching that tone arm come down by long surges – sporadic, occasional surges. Well, look, it got down here to 3.25 and it's all ready to blow down to 3, and all it does is need the slightest zephyr breathing upon it, you see, to trigger it. You get the idea? I mean, it's all set to be triggered, if you'd sat there just a little bit longer and let it blow down all the way. But you thought you estimated it properly. It's still got a way to blow down, don't you see?

Pc's a little bit introverted thinking about this thing of he's – how he's *zuh, zuh, zuh* – this – this accounts for the fact that he can only have Daimlers, you see, or something like this, but he can never afford them and that sort of thing, and really doesn't like them, and so on. He'll say, "That's *zuh, zuh* Daimlers," and so on and so on and so on "and that's why I always went round with tall, blond girls, you see," and so on, so on, and on and on and you know, like this. Still very introverted.

You think the blowdown has stopped. So you say, "All right, we're going to check this now. Is that all right with you?"

And he wakes up, "Oh, yes, perfectly fine, life is wonderful," you see, in a sort of a foggy, dope-eater's daze, you see? Life is wonderful. "Oh, yes, it's all right," and so on. "You – oh, you know best, you know. Good old little auditor. That's fine, we got this – we got this nice goal here, 'to be a snob.' All right."

"Now, now, good enough, good enough, now. Okay. Now is this an actual GPM? Hm?" There's no read there, you see? "All right. Is this an implant GPM?"

"*What! My goal an implant GPM?*" See? "*No!*" See? Rocket read on the protest and the triggered charge. That goal will now continue to read as a wrong goal. And with all of the cares of observation and everything else that you can do, you still can't avoid, once in a while, making one of those wild everything-was-just-exactly-wrong-at-that-moment-for-you-to-have-said-what-you-said-in-order-to-get-that-read. See?

So anything that can make a meter go out, or any condition which will give you an erroneous read on a meter, is then susceptible to throwing out a case analysis. And your own efforts to straighten out a case analysis are susceptible to throwing out a case analysis. And a case analysis can be wrong in the first place.

All right. Those are the nerves with which you live. At least know you live with them. Something like the Gentleman who was going to teach his young boy his first lesson in business, and sent him up to the top of a stepladder and told him to jump, that Papa would catch him. And so the little boy jumped and Papa stepped aside, and there was a tremendous upset

at this particular point, and "Why didn't you catch me?" He said, "That was your first lesson in business: Don't trust anybody – not even your papa." [laughter, laughs]

All right, now, that's the way it is – that's the way it is with your E-Meter, see? That's the way it is with your E-Meter. And yet if you don't trust it you'll never get anyplace either.

These, in actual fact, are really the exact conditions under which R4 is performed.

So you see very clearly that if there are three zones of auditing – basic auditing, the technique or process as your second zone, and case analysis is your third zone – you see that with all these conditions occurring, you haven't got any time to be worrying about how you perform the technique or your basic auditing. You haven't got any time to be worrying about those things, because all of that is going to be subtractive of the real and terrible liabilities of case analysis. And the liabilities I've just been giving you are simply the liabilities of case analysis.

No matter how carefully your basic auditing was performed, no matter how well you knew the technique, no matter for all of these things, your case analysis is still liable to error. And will *always* be liable to error, because you're getting your case analysis from a blind man who is lost in the dark and doesn't even know who he is, where he is or what he's looking at, even though he's perfectly well trained and beautifully educated in the subject to know. The best blind man caught in the dark isn't going to be able to tell you. The only thing that's going to be able to tell you is a meter, and that meter, while when it reads is perfectly accurate, what is it reading on? We're not quite sure of that, and so from that point on we have no time at all to be worrying about our basic auditing.

That's something you should be able to do. You got a headache, you got a backache, you haven't had anything to eat, you feel dizzy, you feel confused, you are very faint, you have just had a terrible session yourself, you are halfway through a wrong goal, and life is looking awfully grim – you should be able in the basic auditing division to turn in a flawless session. That's part of the preselection: to be able to turn in a flawless session. There's no excuse for not doing so. Why? It's very easy to do. Providing you can do it. So there you are.

Technique? Man, this bank and this pc that you're facing – to keep seven Indian clubs in the air is a simple action compared to getting them to sit there all assembled and not ARC breaking and running down the wrong corridors and getting everything upset, even though they're trained and they know what they're looking at and they're well grooved in and their case is not in bad condition and they've still got the ability to confront their bank to some degree and they're not scared to be a pc and horrified at what might happen to them. That's still like keeping seven Indian clubs in the air simultaneously. See?

So your technique: You've got to be able to sit there and dish off a list, a goals list – *plaff-plroof*, who cares? Goals list, fifty-odd down the line, well write it upside down, it doesn't matter, see? Basic auditing going off perfectly; goals list, *blah-blah-blah*, it doesn't matter and so on, down the line, all flawless, perfectly, every read recorded over here and everything's fine, perfect.

But you haven't got any time to worry about being able to do that. You've got no time at all to worry about any: "Let's see, how do I head a goals list? Let's see, how do I head a

goals list? I was supposed to write the question up here, I think. Yes, let's see. And how do I write this first goal down? Let's see. I'm having an awful time keeping this. Where do you keep a meter here? Write a goals list. You – you keep a meter from out here, so on and so on. That's – can't really see the meter. It's – it's this... Can't really see the front of the meter while I write the goals list, and so forth – I'm not – excuse me, I'm having an awfully hard time trying to get this meter oriented..."

It's perfectly all right to have problems like that, but let's have them all smoothed out before we get into the raw meat of running a case, see? There's all kinds of interesting solutions that auditors make with regard to it. The paper slides up this way and that way, and they work these things out, and they start subtracting things from the things they can record and keep track of. For instance, how much tone arm can you keep track of while doing a goals list? Well, I frankly can't keep track of much more than doing a fall and a blowdown while doing a hot goals list on a pc. I'm doing very well to keep track of the falls and blowdowns and the amount of the blowdown. And that's why you need a counter. And a counter which won't subtract [distract] you. The first counter that was developed, by the way, I rejected categorically because it distracted the auditor too much.

So you see, at this point you have no reason for the technique to be posing you any difficulties at all, because you've got no room for it, that's all. You can't be having trouble with technique. How do you do a goals list? See? How do you do an items list? These things should not be an enormous puzzle to you. Otherwise they just take that much out of the session; they cause you to make a lot of mistakes, in other words. You got to have those things licked. And this leaves this tremendous zone of case analysis.

And you should be able to think bank. That certainly sounds funny, doesn't it? Because a bank is for thinking. A bank thinks. A bank pushes thoughts off on people, so forth. Well, there's another point of preselection. You should be able to think perfectly and accurately about a pc's bank which you're not looking at except through an E-Meter, and by signs and data, and you're thinking perfectly about a bank, and the bank is something that thinks. And your bank also kicks around a little bit while you're thinking about the pc's bank, inevitably, a little bit. And so the final analysis is, that's enough trouble. Because that is a big point of randomness. And in auditing R4, that should be the only point of randomness – is, "Exactly what is happening with this – with this bank I am handling? Exactly how is it going together? What are the contributive data I have to make up my mind about the situations in this bank?" And that is plenty for you to handle.

I know, it got plenty for me to handle. I don't – I don't want to handle anything else but that, see? Because that's plenty. Because that's the one that gets you mistakes. And with a perfectly free mind and with perfect education on the subject, you're still going to make errors. But if errors are the things that cause you to stretch the case out endlessly, then we want to minimize these errors. Well, the way to minimize these errors is with perfect training in the zones, oddly enough, of basic auditing and technique, and then the elements of case analysis. And with that three-way triangle there of training, you can make OTs and you can be OT, because you only really get auditing of the level which you yourself give, in the final analysis.

If you don't give good auditing, why, you actually don't tend to receive good auditing. It isn't for the reason of the overt-motivator sequence, it's just the people who will co-audit with you. I mean, there's one point, you see? You can always get worse auditing than you give, to some slight degree, so if your auditing is pretty poor, and the auditing you're going to get is worse than your auditing, think what happens. And that gets to be a grim scene, doesn't it? In fact, I can almost guarantee it. You'll always get slightly poorer auditing, ordinarily – you can view it safely from this viewpoint – than you yourself give. Therefore, if you're a real whiz-bang, your auditing you get won't be so bad.

Now, the training levels and so forth, then, and training, is *definitely, definitely, definitely* a part of the route to OT. *Definitely*. Degrees, levels, training. This is something that it's not nice to be a part of, this is something that is a vital part of becoming OT. And I would say that we have gone and – we've gone up to a new plateau here. Because you've noticed here, in the last few lectures I have given you particularly, I've been talking to you pretty straight from the shoulder about this sort of thing; I've been giving you exactly what the score was and so on.

Now, the best reason for that is, is there are several people rolling up thing right here at this moment on the goals channel, going right straight to OT. And there isn't any quiver on that line; there's just the incidental mistakes of straightening out the goal and that sort of thing. In other words, we are on our way, definitely. And it's from this factual data that one can view this other with aplomb. Our interest in the state of Clear is so microscopic as to be a yawn, see; it's of no importance at all. The state makes somebody more comfortable – so what? You can make a sick man more comfortable by putting a pillow under his head, see?

Raw meat – very nice. You can make them well. Good. Fine. Well worth doing. There's nothing wrong with that at all. You can make a marriage run better and a kid be happier, and you can make life tenable and so forth. But actually you have to know to audit well in that direction just to make life tenable enough for you to be able to go on through to OT. That's a necessary zone, too. Actually a non-Scientologist is so surrounded by confusion that their present time is insufficiently calm for them to have any progress in the direction of OT.

These are other preselections and so forth. Many are called, few are chosen. There are many reasons why this track and path is a limited track and path. Now, it isn't going to say that eventually everybody won't make OT. But certainly, certainly and definitely and positively, it'll be a very, very long route for others, and you'll still be getting around to some hundreds of years, thousands of years from now. There'll be somebody picking it up, saying, "Well, let's see, what's this thing called tone arm action?"

Now, when you look up the line on that and get a real view of the situation, you realize where you are and where you sit. You're right up in the front seat of the first breakthrough that's ever been made in this universe on the subject of the road out, the way through – that sort of thing. You're right there. You're fortunate to have moved up into the situation that you're in. And the only thing I can ask you and point out to you is that you're in a position where you shouldn't waste any of the potential which you have immediately at your fingertips. You shouldn't waste any part of that. The only thing I ask you to do is to make the most of what you've got.

I've tried to give you an outline of training, its use and application, and its relationship to state of case and future of case, and I hope it has been of some assistance.

Thank you.

R4 Auditing

A lecture given on 26 November 1963

Thank you. [continuing applause] Well ... Thank you.

Is that because I haven't seen you in so long? [laughter]

All right. This is the what of what?

Audience: Twenty-sixth November.

Twenty-sixth of November. How did it get to be that? Well, Saint Hill Special Briefing Course.

[part missing]

Well, we're very glad you're here. You're just in time to be launched for Saturn. Some people are very clever. Some people are very clever and arrive right on the spot at the exact moment necessary to resolve the case. And the new students have been.

Of course, they don't have the old-timers' claw-and-paw-through-it-all uncertainty. "Will we ever make it? Will Ron make it? Is it possible? Well, I see we've shifted again to... Well, I guess that wasn't so good, you know." Scientology, Dianetics in the last thirteen years.

Now we got it pretty well taped these days. Too well. So the romance has now gone out of it. [laughter] We can take somebody now by the nape of the neck off the street and bit by bit and edge by edge and level by level, push him right straight through out the top beyond any target man ever dreamed of.

The techniques are all there. It doesn't mean that as you hit the top level that it isn't a... we used to have a tightwire walk across the Grand Canyon that we used to use as an example, you know?

Well, actually, the tightwire is a little bit of an overstatement in the matter. That's – that's putting it up too high. Actually, it's a busted spider thread across the top of the Grand Canyon. There are going to be some people, even good auditors, who get up there and walk around for quite a while trying to get their big toe on the edge of it, see?

The levels that you see as they come up the line all look very confident and they're all very fine till you get to the highest level. And there the best trained pc – the best trained pc reaches with his ballet slipper for the near edge of that spider thread, you see, and goes over and grabs hold of the small cedar tree five hundred feet down and climbs back up again laboriously, gets to the edge; at that moment the auditor inadvertently steps on his fingers. [laughter] This sequence of dramatic events continue for some time until he is safely out over the middle of the canyon with nothing below him and the roaring water thousands of feet down. And at that point – at that point, he gets a wrong goal. The umbrella collapses on him, don't you see, and he's lefted there in suspended animation.

The only way he can possibly make it is his case shape is now sufficiently good that he can maintain suspended animation in empty space.

It isn't that it – it isn't that it isn't frightening and it isn't that it isn't spectacular. He just happens to be able to do it at this particular point.

I know. I've seen them now until you get a bank "to spit," you see? And "to spit" has – this is an alleged GPM for "to spit" – has thirty-two items in it, you see, without any of them having reached up to the crossover, see? None of these – all the items on the terminal side are still in favor of the goal – this is quite remarkable – if they are in favor of anything. And they have certain things like "blacksmith's forges," you see, and so on. Well, you maybe could tie that in to "spit" and that sort of thing. That's fine. And they have "World War II" and "catastrophe," and "my mother's handkerchief," and well, that's probably connected with it in some particular fashion. [laughter] And "barrel organs."

Well, "a steam calliope," you might be able to see it, you see, but "a barrel organ." After a while – after all and so on. And the opptermis that these things solve are such things as "the Constitution," "clouds." Clouds? That might possibly make it, you see. "The ocean." That might possibly make it, too, and so forth. "Library books," we can't quite see how that connects. [laughter] And we look at these things and we'll say, "Well, there's something you can conclude about this. That something has either been overlisted or underlisted or it's an implant GPM or it's only an actual goal, or, or, or, or, or." In other words, there are about eight things you can conclude that would be wrong, and you have to conclude that it's at least one of those eight.

Or it's simply that the auditor is finding far too many items for that bank. You know, a bank usually runs from twenty to twenty-four items. And somewhere in the vicinity of ten to twelve items from the bottom, you've reached the crossover and the items – terminals above that point are no longer for the goal. They are against it on a gradient.

So we see all kinds of wild things and if we don't know our business, why, there it is.

Well, we got an impression from this that it is a long road and that it is a complex road and that it's very difficult. The most difficult end of it, however, is finding the present time GPM. That's the most difficult end of it and of course at that point we find the auditor the least experienced, the pc the least experienced and the hardest part of that to find is the existing, latest terminal of the present time GPM, which of course is not the top terminal. It's just how far up this bank has gotten, don't you see.

And to find that terminal then becomes the touchiest, trickiest piece of auditing ever done. And this is being done by a wholly inexperienced pc and it is being done by an auditor who is just getting his feet wet, particularly with this pc.

The hardest part of it is practically the beginning of it, and this operates as quite an effective bar-out. However, it is resolvable. The funny part of it is that you can't mess up a right item or a right sequence. Now, by that I don't mean that you can't get items in wrong places or GPMs in juxtapositions which you can. But even though you list and list and cross list and suppress and get wrong items and everything else, the funny part of it is the actual bank is still there ready to be run out when somebody hits the happy combination. You cannot wreck a case. You can only kill a pc. That's something for you to console yourself with.

After he gets back from the between lives area – they aren't able to wreck the case either, don't you see – and he picks up another body, why, somebody will be able to audit him just as before. They will find the bank a little scrambled, but they can go through it and get what it is. This is very remarkable.

The only thing that doesn't disappear is the incorrect item, the improperly worded goal, the wrong goal. These things – these things don't disappear. As a matter of fact, they tend to appear, which is another thing that adds some misery to the passage. They tend to appear.

If you find a goal on somebody "to have big ears," I swear his ears would start growing, if it's a wrong goal. If you see somebody dramatizing an item that was found yesterday, that's a very sure proof that it was a wrong item.

The validation of a wrong item tends more than anything else to throw it into the behavior pattern of the pc, which is quite interesting. Somebody has an item "to be mean" or a GPM, let us say, "to be mean." It happens to be a wrong goal, but it's been validated like mad and he believes implicitly and the auditor believes implicitly that this happens to be a correct rendition. And by George, that pc will get mean. That's a way of testing it out because, you see, when you've found a right one, it ceases to have power of making the pc dramatize and when you find a wrong one and say it's right, it is now possessed of power to make the pc dramatize. An unimportant point but a little side commentary; it's just something that makes the way a little more arduous.

We find a goal "to be tired," and it happens to be just – just a goal. It's only a goal. It's not an actual GPM at all. And we find this thing "to be tired."

And it's found just at the end of the pc's intensive. And he goes for a week now before he gets audited again and during that entire week he will be completely exhausted. And he'll know what it is. It's that goal that is making him this way.

And this consoles him and so on. However, in the first few minutes of play of the following intensive, the goal is discovered not to list. The RR turns off, something catastrophic occurs and somebody finds that this is not a right goal. And they go ahead and continue the list and null it down and find the right goal for the list, and "to be tired" has nothing whatsoever to do with it. At that point the pc tends to cease to be tired.

Now, if we had found the GPM – the correct GPM, "to be tired," and it was the right GPM, then some of the pc's feelings of tiredness would vanish. He wouldn't get more tired. He'd get less tired. This is just side commentary and chitchat that I'm giving you here. It's just, the way is arduous.

You can believe the most horrible things about yourself for a while, you know. You do this list and you get this goal, and it's supposed to be the PT GPM, you see. "To be a thief." And this is ladled out to you as the real McCoy, you see. And you look at that and you say, "Well I know it's degrading, but I should accept it and I shouldn't keep insisting on high-tone GPM and it probably is my GPM and I realize that and I – I did steal some sugar once and..." Just explain it, you see, and go around feeling very degraded and so forth and sort of restraining stealing things, you know?

And then, all of a sudden, it turns out that that happens to be a wrong GPM, you see? Actually, the right one was "to be a saint." Something like this, you see? And maybe that was

wrong, too, but if that was wrong, then you'd go around for the next week or two, you see, with growing a halo. But if it was right, you would cease to be so saintly.

In other words, you get the reduction of aberration with correctness and you get an additive aberration with uncorrectness.

Now, that doesn't mean that this is very disturbing or aberrative, but it does tend to upset somebody. And you'll see this happening and that simply adds some more danger to the line. The killing power of a GPM is not to be questioned. You get a GPM wrapped too thoroughly around somebody's neck and you can kill him deader than a mackerel. I might as well tell that here between us girls and boys it takes some real doing. It would be awful lousy auditing. It would have to be absolutely incredible. You would have had to audit the fellow with his RR off for a whole intensive. You'd had to shove the items down his throat with a thud and disarrange all the GPMs in the bank practically and drop them in front of him when they should have been behind him on the track. You'd have to make some colossal blunders that one – one would really have to work at to accomplish this, but the end product is you could knock off a body with it.

That merely adds to the difficulties. I'm just cheering you up. Long ago you got audited beautifully through your lumbosis. Now, you haven't had lumbosis for just years until you get into the second GPM and an item which is an incorrect item – the auditor didn't take the first one on the list that fell but made something else read and goes five items beyond it, pain suddenly turns on. Boy, have you got lumbosis. You got lumbosis you never heard of before.

This is more lumbosis than you ever dreamed of, because anything you got rid of in early auditing is going to be found again. Just to cheer you up.

Now, actually, it's only a wrong RI that gives you somatics. Only a wrong GPM that gives you the somatics and the creaks. This is quite interesting.

A right GPM, or a correct GPM – of course, with this one proviso, that on a GPM you can get sufficient invalidation of it, it will act like a wrong goal and give somebody the creaks or somatics. You understand that? You could actually make a right one act like a wrong one.

Well, with that slight proviso, no GPM which is a correct GPM and no item ever turns on any pain of any kind whatsoever if found in proper sequence. They only turn on heat. They do not turn on sen. They do not turn on pain. They only turn on heat. Great, swelling waves of heat. Globular, radiant waves of heat. And that's a properly found item in proper sequence. Nothing but heat. No pain.

This is so much true that if you find pain on an item, you unload. You hit the silk gracefully and with a swan dive. That is the end of that. You go back and find out where you erred. You will normally find that the item two or three back of you on the line plot – two or three items back – still reads. If it still reads, the list it came off of was improperly done. That is to say, there's a higher item, usually, on that list that was the right item. The auditor overshoot the right item, found the wrong item. Naturally, as you try to oppose that item, it will continue to read. You will thereafter usually get nothing but wrong items for the remainder of the bank. That's cheerful, isn't it?

One of your awarenesses will turn up on the fact the pc turns on pain. That means you've got a wrong item right there, which is unlikely, or an item which you have had just

before was wrong. Probably it was an earlier item on the list from which the wrong item came that was the right item. It's already been listed. It's sitting right there. Don't continue lists these days, for heaven's sakes. Try to make the earlier item read.

If these rules don't follow, you are not auditing a right GPM. That is all. You are just doing only a goal or you're getting locks on an implant GPM. There's something wrong with the GPM if these rules don't apply.

This is very precise material. There are only a few elements to handle. These elements we are getting together to show you in terms of actual model form. The new students are very, very lucky. They'll be trained from scratch in this particular technology.

There are only certain objects in the mind and they can only get disarranged in certain ways and only certain things can go wrong with the mind and actually those things are not significances but masses.

Significance, *poof, poof*. Who cares? It's the mass. It's the mass that counts. And these masses are in different shapes, sizes, with different names, behaviors and sequences. And it's all very simple. There's not very much to it, but you'd be surprised how much complexity can come out of four or five different kinds of items. I mean, different kinds of objects in the mind. And you just get variety, endless variety out of the thing. And every once in a while why, you slip from grace as an auditor and omit something from your patter. You forget to ask about implant GPMs.

You know, you'll start saying, "Is this the – this the GPM?" you know, and *wraabow* - and it reads, and you run it and nothing works right, and ooooh my, and you get about ten items later and you – suddenly it dawns on you that this thing isn't following any sequence anybody ever heard of. There's pains turning on in the pc. The thing is going all wrong, your needle's kind of getting stuck up. It isn't too bad, but it just seems to be sour. And nothing seems to be able to get into proper sequence, and that sort of thing. And you brightly do an examination of it again, and you remember that you didn't ask if that was an implant GPM. *Uuuuuuh*.

And you ask it now, and you get a beautiful blowdown, and that is the end of that.

Then, of course, you can have an implant GPM and an actual GPM which have the same name. Have the same goal. There are several like this. Any pc is common enough to pick up one of these because, of course, implant GPMs are designed on the actual bank, except they – this might be of historical interest to you – they really didn't know what an actual bank was composed of.

They knew it had goals and they knew it had RIs, but that's all they knew about it. So obviously they never cleared anybody because those items oppose, and actual GPM items solve. Quite remarkable.

They knew the goals opposed and so they – then they presupposed that the items opposed, and they don't. And so they could just have messed everybody up like fire drill if they had known that other little piece of technology. They didn't know it, so now we have these beautiful implant GPMs that student auditors can practice on. And I think it was very nice of them to provide us with practice material so that people can see what rocket reads look like and see what patterns look like and that sort of thing.

The difference is, of course, that in an implant GPM you always have to use oppose. And in an actual GPM it is solved. Only goals oppose each other in actual GPMS.

Goals always oppose. Items always solve.

So item lists always contain the word *solve*. Goals lists always contain the word *oppose*. And *never any other way*. I won't look at anybody just now so as to be accusative, but I've seen this violated lately.

Items oppose – implant GPM. Distinguishes an implant GPM from an actual GPM. I think it is quite amusing. They didn't know.

No, in an actual GPM, the items always solve. Always solve. "Who or what would solve a caterwump?" It's very seldom a statement of a goal, but sometimes a "too" might occur in the item wording, like well, of course, as silly as, "going too far," but you can actually have "wanting to get out," see? And it might occur in a GPM, you see, that has nothing about "to get out" in it, you know.

A GPM "to not be bothered," see. And it contains this item "wanting to get out." Somewhere on your goals list this pc is going to write down "to get out." Difficult, don't you see?

He's going to put on this list and it's liable to get a read when the whole thing is all charged up because items read on the burden of the whole charge of everything, don't you see? So you get "wanting to get out," which tends to give you something that looks like a goal "to get out."

Well, it's worse than that. Sometimes a lock item will have a goal wording as part of it. I had one myself "Wanting – not wanting to find fault." And the goal read is "to find fault." Three telegraph poles and what was left of Ronnie later, we found out it was an RI, not a goal. "To find fault."

See, I was perfectly willing to say, "Well, all I do is find fault and that's me. I mean, that fits my personality." You know, trying to degrade, degrade to fit myself into this thing. And I got more and more natterly and more and more naggy, you see. And then we finally find out it was just an RI and that was the end of that. Interesting.

But – so there is the source of a goal and the source of trouble. Sometimes you have the tag end of an item that will give you a read like it's a goal. That's rare, but it does occur. The most trouble you'll get into and the most horrible thing that can occur to anybody is this implant GPM and actual GPM which are the same goal, and you pick up an RI out of the implant GPM and you use it to solve, don't you see, and you get the pc running the implant on the track of the implant GPM, thinking you are running the actual GPM while you were doing it.

And you'll get items like "somebody or something with a goal 'to spit'," see? Well, of course, there are no such-you don't have items like that in an actual GPM. You don't have these "somebodys" and "the goal 'to...'" and all of that. That's just implant stuff, see?

They didn't know what they were doing, fortunately. Because if they had really known what they were doing, they would have put those banks together so they did exactly what banks do. And brother, you couldn't have pried a pc apart with a crowbar. That would have made it ten times as hard.

But it's rough enough. You sometimes will take an actual GPM, RI or something like this, get over into the implant GPM, and the RR shuts off. Oh, marvelous.

Now you've got no RR, so it couldn't have been an implant... actual GPM. The RR shuts off because that isn't the wording of the implant GPM exactly, see. Something like that.

Let's say you have an actual GPM "to be a big man," see, actual GPM. And you've got an implant GPM, well, "to be mean" or something, but there's something about a couple of these words, you see, that hang up on each other, don't you know?

And you find the pc over here running on the implant track, and the RR shuts off, so you say, "Well, there is no actual GPM 'to be a big man' because the guy's implant... the guy's RR shut off, so that proves there was no actual GPM here, so we'll abandon it."

I don't know how many sessions later somebody gets bright enough to realize the pc was simply misplaced on the track. That leave you a little bit adrift? Well, it's very simple. You're supposed to be running down this aisle, you see, with the pc, and actually you've gotten an item for which you don't have a goal accidentally from some implant.

So you then follow this item listing that. So you overlist, go around a corner, jump out of the actual GPM, see, and go over into this implant GPM. You're now running in the zone and area of that implant GPM. Guy's RR shuts off, so you say, "To be a big man" – there can't be an actual goal there because the – the RR shut off. Sure test that there's no goal, isn't it?

Well, it's a sure test up to that point. Then you throw it all away, you see. That's the usual thing. Throw it all away. Dump it all overboard. Get rid of it and start anew. And eighty-nine page goals list later, you still haven't found the guy's goal. Naturally, it was the right goal. Pc was just being run in the wrong place.

Oh, you got a lot of fun ahead of you. I'm just trying to paint a bright, sunny, cheerful picture here.

This is rough stuff. I'm not kidding you. But there are rules. There are rules. And those rules take you through. And the thing is all figured out and the only thing that wrecks you on these rules – well, it's like, it's the first fall on the list. Almost invariable. Almost never otherwise than the first fall on the list.

And this, if your pc is in session at all, is usually the first and last item of the list. But it's certainly the first nice fall on the list. The first fall on the list. Actually and factually that. If the pc's running any kind of shape at all, why, that's the way these things start to fall into place. First fall on the list.

You call it back to the pc and it doesn't read, you maybe list a little bit further, you get some charge off or something like this. Go back and try to make that first fall read again. Just because it didn't read is no reason it won't.

Go back there and chew away at it. Unburden it a little bit. Try and list a little bit further, and so forth, and all of a sudden you're staring at this first... you got another read. Oh, boy, something reads beautifully and you try to give it to the pc, and there's something wrong about this thing.

And you go backtracking and read that first fall again. And work it over real good. Nine times out of ten, it all of a sudden caves in. Great, big surge. Great, big, disintegrating rocket read. Blow on down and so forth. And you say brightly, "Is that your item?"

"Yeah. Why didn't you give it to me in the first place?"

"On this item has anything been suppressed? All right. Thank you. That's your item." Crash! Another great, big read.

You know, you can't be convinced that it all doesn't run off easily. You think the auditor shouldn't have to work for a living, see.

You say, "All right, let's just list and list until we see a great big blowdown and a big fall, and then let's take that item and give it to the pc." And then he's in Illinois and then he's in another bank and then he's doing an implant GPM item, and then he's – he's – and so on. And he's getting kind of weird looking and the creaks are turning on in all directions and somebody gets hold of it and they see this big beautiful item that you got, it went just like that on him. Bang! You just had him put down one, two, three items. Just like that. And that third item just went *boom!* And you know, thorough, full loads, wonderful, you know. Just gorgeous. Except you just got through missing three RIs.

Of course, when you oppose that, because you've skipped some RIs, instantly you will skip into another GPM. It's just like sending somebody off with a rocket.

Miss an RI, the item that you get after that might be in the bank you're listing in, but it goes *phheeeuuuu!*

Your next list? Ha, Chicago. Get the idea? That's how you jump from bank to bank. That's how pc's are made to jump from bank to bank. Missing an RI.

Well, it was pretty hard at first to find out where this RR really lived on this list. And that was difficult because we were using "oppose," thinking it was on the same pattern as an implant GPM, when it isn't. Soon as we got to using "solve..." The dangerous item is the first one on the list because sometimes the pc is saying, "Oh..." pc's saying, "Well, I had – I had some good cognitions on that," and so forth. And the auditor's sitting here and he's getting his paper ready, don't you see, and the pc all of a sudden, without any pause of breath or anything like this or any word of warning, says, "guttersnipes."

"...oh, guttersnipes. Yes, Yes. Here's your question, 'Who or what...' and so on.

And you go ahead and list it. You didn't see guttersnipes on the meter. When he said it you didn't see it.

So you go on down, you get a ten- or twelve-item list and nothing's falling and you try to get it into shape and you know ... So you null the whole list. And you go down, "Gutter-snipe, *fluh-uh-uh-uh-uh-huh*" – go down to the end of the thing and you get this big blowing item down here at the end, you say, "That's obviously the pc's item. Ha, ha, ha. First fall on the list. Number ten. First fall on the list. Obvious. There it is. Fell easily and it read right away and the pc apparently happy."

"All right. Who or what would..." – and this thing is crab apples, you see – all right, "Who or what would solve crab apples?" You see?

"Oh? Somebody or something with a goal 'to eat'." *Sabah-bah-ba-bahbah-ba-ba-uh-huh-bah-bah-bah-bah-bah-and* oh, let's hit a couple of more actual GPMS, carom off a couple of engrams, you see, and do a corner billiard, you see, off the Helatrobust.

And we come up with the item "scavengers." Mm. Sounds good. PC says, "All right." So all right, let's oppose "scavengers" now, see?

All right. "Who or what would scavengers solve?" would be your next question. "Well, it's the absence of eating." (Good implant item.) "The starvation, starving people. Those who are starving." (Nice implant item.) That reads. Good, see. Nice. Oh, that's – that's a honey, that's a honey. That's good. Big, beautiful read. Blowdown. Oh, yeah. Yeah. Show the Instructor, you know, it blew down. I mean, there it is. We're all set, you see?

We got this starvation, starvation. All right.

"Who or what would solve starvation?"

"To run away. Running away. Beings who run away. Those who run away. Somebody or something that runs away."

"Oh, that reads. That reads. No, it doesn't read. Somebody or something that runs away. I'm sorry, it didn't read. The upper one, the first fall, that read. It doesn't read. Well, let's see now. Somebody or something that... Okay, give me some more items. Now, who or what would solve starvation?"

"Oh, cooks, restaurants, somebody or something with the goal to eat."

"Somebody or something with a goal to eat. Here, I'll null this."

We got an item – we got an item list here, you know. It's now got twenty items on it. Now I got twenty-five items on it. When we go back nothing reads. You're trying to get this thing to read, and it won't read. Where are we? We're nowhere, man. What happened? Who pulled the rug out?

Pc's starting to say, "Where did you learn how to audit?" You know, starting to pull this line.

"Well, I told you a little while ago that the item was actually 'eating well' and so forth and you didn't listen to me and so forth" and *oooooooooh*.

Well, of course, the actual action that you undertake is traceable back to that list on which "guttersnipes" occurred.

Now, you go back to that. You go back to that list and you read the item that you took off of it. Ten down, see. You read that item and it's got a read on it. It goes *cltsk-cltsk*. You read it and it goes *cltsk*. What does that mean?

That doesn't mean it hasn't been opposed. That is never what it means. That "never" is underscored, as in implants. Never means it is unopposed. I don't care if it rocket reads and stands up on its tail and barks. See, it has nothing to do with it hasn't been listed against, see.

You say, "Well, I found the right item. I found the right item is ticking, but I haven't then properly opposed it. So that's why it's still ticking."

And that's wrong. Cut your throat, because that's never right. Ha-ha – never. Don't ever go daydreaming on this, man.

If after you've done down the list, what would now be on the line plot, even though it's still on your list, I don't care if it ticks, if it rocket reads or if it blows smoke out of the meter, we don't care what is the quality of read, it only means one thing. The item list it came off of is incorrect in that you took the wrong item off the list. You understand?

It's an incorrect action. And that item that ticks is always improper for that location. It's not the next item to it. It's not the item it came from that's improper. It's *it*. It's a very simple one to remember. It sends up a little red flag and waves it, and it ticks. Or it rocket reads or it blows up the meter. We don't care what. That item is wrong.

Now the proper thing to do, you see, would have been just scrub all the rest of this stuff and get back there on that line plot and read the items you found and you get back here – you get back here to crab apples. And it goes clank! Well, you took the list off – take the list off which you got crab apples. The list off which you got crab apples. Understand? Go *earlier* on that list and roll up your sleeves and go to work. Because almost invariable there's an earlier item on that list. It's almost invariable that an earlier item on that list went undetected by you. And in this particular example I'm giving you, it's guttersnipes which was written down when the auditor wasn't watching, and so forth, and there it is. And you read guttersnipes and it doesn't say a thing. Now it's real good and stuck.

You see, you've put a wrong item in its place. So it's got it good and scrunched. Now, it would have been tough enough to make this thing read in the first place. But you've now unloaded an item where it belongs. Now this could be true of any of the ten it – any of the nine items which preceded crab apples. It could be true of any one of those items.

How you going to make that read? It requires nothing but genius, so wrap it up and just do it. You've got to make one of them read.

Only after you have totally convinced that none of them can be made to read in any way, shape or form do you ever extend that list any at all. And that, man, extension of a list is a last resort in modern OT auditing. That's the last resort. That is just, I don't know, it's sort of like throwing in the sponge. You'll usually find out that the item was so burdened that it didn't read well, but now that you've gotten the other item off of it and so forth, you go back and read it and it now will read and blow down. Almost always earlier than the wrong item was located on the list.

You've got ten items on the list, the wrong item was number ten, it's almost invariably – so I never pay any attention to any other circumstances – it's items one to nine on that list. It's one of those items.

Of course, if you're a smart cookie, you never miss a fall. You've got a built-in periscope into your eyeball by which you can see the fall of the meter even while you're arranging the papers. And the pc said something and the meter falls.

I carry this to considerable extent. I'll hear the pc talking about something and I will keep one eye slanted slightly on the meter. And when I get that, and the pc says things – why, I saw one the other day. "Walking fast," the pc said. "I was walking fast." And I noticed that "walking fast" gave an instant rocket read. And I used it as a cross-verification of the bank we were walking into. That's right. The goal was "to be fast."

The pc had offered it up as something else, so I was able to correct the bank through my inspection of what the pc was chattering about.

You can also go far astray on this. The pc suddenly conceives something or other is his next goal or the next oppterm or something of this character and he says something with regard to it and it tends to rocket read and if you bought it right there at that moment without further inspection, you'd probably get yourself into a lot of trouble. And some – because you'll get yourself in enough trouble, you see, by when – sometimes you buy them after inspection and they're still haywire.

See, you've got – you get it into enough trouble with the ordinary methods without being extraordinary. You don't have to work to get into trouble at auditing to OT at all. It's just sitting there at every bend of the trail. It's all over the place, see?

As you're crossing Grand Canyon, if it isn't meteors, why, it's boiling water splashing from below, don't you see? And if it isn't that, it's hurricane winds suddenly springing up. And if the hurricane wind isn't bad enough, it happens to be blowing anvils that day, you see.

You always look for these things. So actually you don't have to be original to make trouble because you see, there's plenty of trouble there with the most ordinary, textbook methods.

All right. Well, there, you see – now you're four items later, pc's got two more, three more banks chewed in, of course, you're just going to go back and continue the list. That's going to solve the whole thing. But the pc's sort of nattery and ARC broke and you've had some session ARC breaks and he's got some overts now on the session and he isn't running so well and he isn't cogniting now nicely and so forth. And he won't start cogniting again until you get out of the little disturbed area that you had him in. Then he starts cogniting again.

Heat is harder to get off and so forth. But these goofs occur. I got halfway down a bank the other night in a pc. Imagine it. Ten items deep. Gorgeous. Ten items running like a startled gazelle and all of a sudden, *guuh* – here was a list. And it was getting longer. I couldn't get anything to read. And that list was getting longer.

Well, I don't exactly subscribe to the school that pcs are better off for having suffered. I don't subscribe to that school. That's an old school of opera, you know. You couldn't sing unless you had suffered, you know, and I don't think that's true of pcs. So as soon as I noticed that list getting a bit overlong, I became cynical concerning the line plot that we already had and went chasing back up that line plot again, just reading each item in sequence, not reading them backwards but reading them in the sequence that they were found.

Always try to read items in the sequence they were found. Always try to read goals in the sequence they were listed. Do it in the sequence they were put down or found. And you'll find out there was much less disturbance.

Sometimes you can make somebody's bank go creaky by reading backwards or suddenly jumping back from a late item to an early item, you know, and the pc – guy goes creak because they still have location in space.

Anyway, so I went chasing back up the bank and I'll be a son of a gun if it wasn't the third oppterm. I just absolutely was willing to spit ballpoints. *Yaaaaaaaooow*. There it sat. The third oppterm. The third one. And here I was at ten. I'll be a son of a monkey. It was sitting there, I call it. *Tick!*, It was saying very nicely. Tick. "Oh, you drunk skunk," I said. *Uuuh huuuuuh*.

So I fished the list out. Former session list. And I fished the list out and went earlier on the list and sure enough it was earlier on the list.

It was up at the top. The danger point of the list is always the first item on, whether that's a goals list or an items list. It's always the danger point.

It had been missed. I had read it, but it couldn't be made to read. I think there was some other little conditions concerning the thing. Been an upset or some – some little minor, additional thing.

Oh, I remember what it was. It was – it had been left that way between intensives and so the item had been sort of gummed up with the period of waiting in between, so it *didn't* list very nicely. It wasn't actually falling nicely as the pc listed and it didn't start falling nicely until it got down to about the fourth item.

Well, you're not very critical when you see that the fourth item fell when called to the pc, blew down very nicely, pc was happy with it, everything solved in all directions and it listed very well and apparently stayed in the bank and everything was happy and cheerful from there on out. You're not very critical of it, you see? You go and buy the thing. But it was ticking, and I found the earlier item was, I think, number one on that list. *Aaaah*. I beg your pardon. I beg your pardon. I've just given you a piece of misinformation. I just remembered it utterly. It was the item just above it and the pc had *added* the item that I found. And that was when I learned that items with pain on them – I had been noticing this before – the item had a momentary pain on it when given to the pc. It wasn't the third item. It was the fourth. It was the list from the third item that was in error.

All right. That's beside the point. It was simply earlier on the list by one item. Heart-breaking. Of course, that took the line plot and that was it.

He now only had three items on the line plot. I put the fourth item on the line plot that I had gotten in and just proceeded straight from there. I didn't try to sell the pc any of these other items. You never give the pc anything. Don't give the pc a thing that they've had before. Just scrap it from there on, man. That's it. Finish.

You sit there, you think you've got ten items in the bank and suddenly you have three items in the bank. The fall – roof falls in just like that. Now you don't have ten items in the bank. You don't have. Maybe some of those items will come up later and the pc will put them on the list and maybe they will all line up later, but only if the pc put them back on the list again.

Sometimes an auditor probably will be seen kind of shoving the line plot at the pc saying, "Don't you want some of these items there? There's some nice items there. You have nice items there?" and so forth. *Mmmm-mm*. You want to ARC break a pc, try it, because they're probably all out of – scramble in sequence and anything else. And usually they're mostly locks. The pc just launches off at that long – that wrong item. He just launches off into locks and he gets nothing but locks and other bank items after that and so forth.

And then he may freakily, through another double mistake, double back into the bank and actually get an actual RI and then for two or three items it runs straight, you see. But then it goes out of the bank again because you got the bypassed charge, and so you can't – you don't know which ones of those things are straight, so you can do nothing with any of them.

So you just take off where you corrected and proceed from there. And if you're very, very lucky and if you said your Sunday school lessons very well and stayed out of Dallas*, you'll get – you'll get yourself a situation there where the pc will suddenly put a pair back on the list. Say, "Oh, yes. That's railroad locomotives and drunk engineers. They belong there. Oh, that's where they belong. Yeah oh, that's where they belong. Yeah, that's right."

But it's only in the course of listing, and you write them down on the new list. There are – just – just go on writing on your new list, just as though he never heard of them before. That's what a mistake on an item means. And that's how you correct. And that's where you straighten them out. And that's how you hold it in line.

It is adroit. An item list of two items should be regarded as moving into the zone of overlisted. Items are usually overlisted. Goals lists are almost always underlisted. Goals lists are almost never complete – almost never. They're so arduous. You take such pity on the pc. You break it off one way or the other and they just never get a complete list. And the pc will add a few goals and you null those. And the pc adds a few goals and you null those. And you just can't find the pc's goal. And you add a few goals and you null those and you add a few goals and finally you get down one for one. The pc will add a goal, you read the goal back and you say, "That doesn't read." And the pc adds a goal, you read the goal back, you say, "It doesn't read." Echo metering. Whatever the pc says, you say it and look at it on the meter.

Actually, that's about the grimmest thing that can happen. And you know why it's grim? Because the goal, with a complete list, may have been five or six. Number five or six on the list. Way up at the beginning.

The moral of this story – the moral of this story is to do a complete list before you null it. That is the moral. And in view of the fact that's almost impossible to guarantee, when you don't find it on your extended list, at once renull the whole cotton-picking early list.

You should always be *terribly* thorough on goals lists. A goals list is an arduous, mean, vicious, mechanical, clanking proposition. It is done: What goal went up *ha-ha-ha*, oh that goal went up *ha-ha*. *Wawawawawa*. *Wawawawawawa*. *Wawawawawawa*. That's with fall, with the RR, with the tick, with the fall, with the blowdown, watching the tone arm, watching the tone arm over here. Does the tone arm have motion left in it? Finally, we get down to no tone arm motion.

Now we begin to watch for the last fall on the list. And we finally find the last fall on the list. And then we go fifty beyond it. We go, not forty-nine, not thirty-eight, not fifty-seven. We go fifty. Five-0.

How big is a fall? A fall is a distinguishable read that might be the fall of a goal.

You will find that if you continue a list beyond that fifty flat point with no TA, that you start roughing up the pc's needle. The pc starts listing himself off that section or area of the time track and starts listing himself into other areas and you start crimping up the bank. And other evils set in.

So a goals list is complete when you have totally run out of TA – no TA action and fifty beyond the last decent-looking fall on the list.

* Editor's note: LRH alludes to the fact that President J.F.Kennedy was assassinated on a visit to Dallas four days before this lecture.

A finished goals list has a very smooth, beautiful, complete-looking needle. Nothing goes off on it. Nothing, man. I mean that thing is just flowing, just dry, smooth as a little river of butter.

And when you null it, a complete list just goes smooth as a river of butter. There's nothing in at all but the pc's goal. And that rocket reads like a startled gazelle. *Pow!* And when you get to it, you just check a couple of more falls on the list to make sure you haven't got two rocket reads on that list and you give the pc the goal.

It is a bad policy to continue nulling the goals list for the next three or four sessions after you have found the pc's goal. That is not good policy. It puts a certain amount of strain on things. Actually, it invalidates the pc's goal.

You can always tell if the pc's goal is on the list. Not by standing and chanting at the meter, "Is this goal on the list? Is this a complete list? Is this an inc..." I wouldn't give you two nickels – man, I wouldn't give you any communist money for the value of a question like "Is this list complete?" I've just never seen the question correct.

See, I don't care whether it reads or it doesn't read. I've just gotten to a point now where I know what questions will Ouija-board and what questions won't. And that one won't Ouija-board. "Is the goal on the list? Is the goal not on the list? *Heh-bah-heh-beh-thaa?*" I don't know.

Will the United States be here long? Will the United States not be here long? Silly questions, see? Everybody knows what's going to happen to it. It won't be here long. Obviously.

Now, there is a way of telling. (Not unless they get some cops.) There is a way of telling. There is a way of telling. Is this pc in a relaxed, un-ARC broken frame of mind? That's about the first test. Seem happy when you finished the goals list? When a pc refuses to list, you usually only have to put in Suppress and the pc goes on listing. You don't even have to tell him to go on listing, you see? His stopping listing and his nattering have nothing to do with that. But when you finally finish this list, the pc seem calm? Seem happy? Relaxed? Is that needle flowing nicely? The last few goals that went on the list, did they disturb the needle in the slightest? Or did they just leave that needle completely smooth? When he said them, nothing happened.

These are all tests. And a very, very important one: Has pc got heat? Did some heat come off? Start coming off? Is this list kind of blowy?. Is the pc getting heat now? Somewhere did heat turn on on this list? Not pain – heat. Some heat turn on? Man, if some heat turned on, that goal is on that list. That right there. You can go to it at once. Bark, bark, bark. And there it'll be. Reading beautifully.

Now, that's what a complete goals list actually looks like. Those questions were all answered one way or the other.

But if he didn't turn on heat, it still doesn't invalidate the list.

Now, what you'll run into sometimes on nulling a goals list, I should remark on. Because it's quite amazing and mad.

Violate audit with a moving tone arm, you know. Saying things to the pc while the tone arm is moving, you see. Do things while the tone arm is moving, you see. That's a viola-

tion of basic auditing. And of course, a lot of violations of basic auditing gets you into trouble in doing these upper-level processes. In fact, it all requires basic auditing which is a long, smooth – you know, you don't even notice it. The auditor and the pc don't even notice the basic auditing that's in progress. That's the best kind of basic auditing to occur.

And when you get this long, smooth list and the pc's had heat, you've got another little hurdle that just makes life just a little bit interesting. And I'd better tell you about this because you're going to run into it sometime. You're going to be totally baffled. It isn't seldom that you run into it. You run into it quite frequently as you start the pc. The pc's getting more and more OT, don't you see? And his meter's reading easier and easier and easier. And this phenomenon turns on better and better and better.

You're auditing while the tone arm is moving. In other words, you've started nulling the list, see. Bark, bark, bark; and all of a sudden you see big surges start off of this thing, you see. And surges go off of this thing. Tone arm's blowing around here and so forth.

Well, I don't particularly stop and twiddle my thumbs just because this – I go on and null the list because you could waste an awful lot of time doing something like that, don't you see?

Nevertheless, it's a violation of basic auditing to be – for the auditor to be acting while the tone arm is moving; and this is the kind of silliness which now occurs if you violate that, if you're not awfully slippery. And you're for sure going to violate it because you're not going to sit there when you get to this level of auditing for a half an hour waiting for some tone arm action to disappear before you give the pc his goal, see. He will finally ARC break on you.

Any vocal impingement on the pc causes a rocket read. And, man, if you don't know that, you're going to be in more trouble.

Now let me give you the exact statement. Any vocal impingement on the pc may give you a rocket read. That's very accurate. And most of them do.

So you say anything to the pc, like you read him the next goal, and of course it appears to rocket read. And you read him the next goal and it appears to rocket read; and you read him the next goal and it appears to rocket read. Or you've got a goal and it appears to rocket read and you go down the line five more and it appears to rocket read. So you say you've got two rocket reading items on this list, so therefore... This is only true, you know, when you're getting this blowdown. You've already seen this meter blowing around and the pc has had heat. Those things are vitally necessary before this other phenomena that I am telling you about takes place. This doesn't take place unless you've had heat, see, on the thing. And you say, "Well, there's two rocket reading goals on the list. Let's extend the list."

Two rocket reading items on the list, the rules say extend the list. But you didn't have two rocket reading items on the list. You had two rocket reading vocal impingements on the pc. Actually his bank is simply sitting there right in front of you and you're not actually hitting the pc with anything, but your voice can actually impact a bit of the bank. And every time it impacts a bit of the bank, of course, it blows a huge surge into this meter. And you say, "cats," and you'd get a surge on the meter.

You get – your vocal impingement is what's kicking your meter. And you can read this actually very directly after heat is turned on in a goals list. This is something to know because

sooner or later, before you get to be an old veteran at this, you're going to ARC break a pc by refusing to give him his goal because everything on the list is reading.

At this particular time the pc can unfortunately get upset while this blowdown is going on, and a pc can get sufficiently upset that you're going to get the Protest rocket reading. So now anything you say rocket reads and any protest the pc has rocket reads, and then there are occasional surges going on anyhow.

Now, you try to walk yourself through that much rocket reading and that much contradictory information. Now we try to do a case analysis, see. Got a nice, blowing-down goal, see. Going to do a case analysis, see?

"Is this an implant GPM?" Rocket read.

"Is it an actual GPM?" Rocket read.

"Is this only a goal?" Rocket read.

"Is this just an item?" Rocket read.

Now, sometimes it isn't that consistent, so you don't notice it. You say, "Is this only a goal?" Rocket read.

"Is this an implant GPM?" No read.

"Is this an actual GPM?" No read.

Ah, well, it's only a goal. All right. Well, let's check this out again.

"Is this an implant GPM?" Rocket read.

"Is this an actual GPM?" Rocket read.

"Is this only a goal?" No read.

What's going on here? What's going on here, see?

Well, what you're actually doing, you're just bucking away at a blowingdown meter. And this – this pc is throwing off charge and heat and everything else and you really shouldn't be doing anything, by the basic rules of auditing.

Your voice is then causing your own rocket read, you see. Your voice hits his bank, and if it's this way and that way, it either always or occasionally causes the meter to go bang.

And you will notice this once in a while. I've seen an item list – failure to give a pc an item on an item list – and I've seen a pc – an item list with six items on it, with the pc blowing down on the right item, but the right item not spotted by the auditor. With six items then, reading, and a blowdown in progress, no matter what was read to the pc; the pc ARC broke at the same time and so not being informative. Pc ARC broke, of course, because you haven't given him the item. How can you give the pc the item? You've got six items on the list. You've got six rocket reads. Any one of them will rocket read. You can't tell which one of them is and which one of them isn't. Well, that whole trouble and upset causes from flying into the teeth of a moving tone arm, trying to do case analysis, locate items and that sort of thing.

Your proper action, of course, is to sit quietly back and let the tone arm stop moving. Now you'll have to do that on item finding. You can't possibly afford to do it on goals lists.

But you have to do it on item finding. You say to the pc – you've got this thing reading, you see. *Pow!* You say – all right, you say – and you've seen that the blowdown starts, and so you say, "Is that your item?" Now you really see it read. Big surge, see, and the pc's got more confidence in it, you see. Big surge and you got more confidence, and you'll see this thing blowing down. You're just a fool if you say a thing. You're just being a fool. You're just making trouble for yourself. I mean you just must be silent at that point. Just be silent. Just keep your big yap shut. Don't say a word. And let that thing blow down.

Now, it frankly is only going to take it about thirty seconds to blow down. Where you're going to take your big error is waiting for ten minutes for it to finish off all of its tone arm action and of course you're just going to waste a lot of auditing time doing that.

No, you want to get the major read off of that. And it's come down here now to let's say – this is not the – you just don't pay any attention to this numeral – but let us say it has come down to 3.2. See, this is just an example.

It's blown down to 3.2. It doesn't seem to be moving now. You say, "All right. That's your item."

Now shut up. Because first you said, "Is that your item," don't you see? See? You say, "That reads. Is that your item?"

Let me show you a sequence here.

"That reads," you're saying, "Grapevine, grapevine. Anything on that been suppressed? Grapevine. That reads. Is that your item?"

You're going to see *pssseeeeeew*. More confidence, because you're asking him if it's his item, you see.

"Oh, yeah," he says. "Oh, yeah, that's fine. I mean that's my item. That's my item. That's my item. " *Zooooooooo*.

This thing comes down here about 3.2, see. You didn't say a word while it was doing it. He's terribly introverted. He won't notice that you're being silent. He isn't expecting anything to happen.

He's looking at this. What do you know, you know?

Now it's at 3.2, and it appears to be momentarily stable at 3.2.

Don't sit there and wait for the next half-hour to see if it's going to move again or you're going to get into a mess.

You now say to the pc – you now say to the pc, "That's your item."

"Good. Whoa. Good. I thought that was my item, see." *Bsssoooooooooosh* – 2.8. Comes down to 2.8, apparently stable.

Now the pc says, "Yeah, you know, all of a sudden, every time I get in the car and I see a girl and so forth and so on, I get this great – and she tells me a rumor or something like that, I almost go mad, you know. And it's so on. But I'm always wanting to find out what it is and I never want to hear it. And this is a terrible situation I've been in, and so forth." And this thing is going *pocketa-pocketa-pocketa-pocketa*. And you're getting tone arm motion, tone arm motion here and so on. And he finally shuts up.

You'll find that by the time he shuts up, your meter's probably recovered this – don't pay any attention to these figures, they're just relative, you see – maybe recovered to 3.5.

Now if you hang around that corner drugstore, and you wait around leaning against that telegraph pole, you going to wrap somebody around it. There's a nice piece of timing. It's now regained the height it's going to regain. And you'll see that meters do this. They regain this higher level. The tone arm action's gone out of them. You've just seen the new item move into place and the old item go away – because the meter's regained it slightly.

And you say, "All right, see. Now we're all set here. That was *yackety-yackety-yackety-yackety-yacketa*." Now let's blow some more charge out of this thing, see. You don't – it doesn't have to have regained anything for you to blow this charge out, but I'm just giving you an example.

You say, "All right. Would caterwumps solve a grapevine?"

Watch your meter at this point, man. Watch your meter. Turn on those big, beautiful eyes of yours and put them right straight on that dial because you want about a two-inch *peeeeeew* when those two items collide. I don't care if he's already said it! You always say it.

He'll sometimes say, "Well, I already told you and so on. Weren't you listening to me? You cut my itsa and so forth; I already told you that caterwumps solve *wra-wra-wra-wra-wra-wra*." I don't care what he said. You always put it in. We don't care if he's said it. We don't care if he put in all the courtesy steps himself. There is still tone arm action left on those courtesy steps put in by the auditor. The auditor is still the auditor and auditing works still because of an auditor.

So we say, "All right." We found this new item. You say, "Would grapevines be solved by caterwumps?" or "Would caterwumps solve a grapevine?" Which is the better wording when you've got an oppterm. Whichever it was. Or both. It doesn't matter. And you watch. You watch and you will see those two items come together and they go *pssssst*. And you'll see about the nicest two-inch *bang* as they hit that you ever wanted to see. Not because you say one or the other of the items, but because you've spoken about them coming together. Would it solve a *blah*? See? And you'll see it go boom. And that's one of your basic proofs that you've got the right item.

When it do not do it, get Suppress in. Do a little something here. Monkey around a little bit. Test this over. Get suspicious. When you've gotten Suppress in, ask him again just as though you haven't asked him before.

Would a caterwump solve grapevines? Pc says, "Oh, yes." And this time you see the two-inch bang. You say, "That's fine." And get off of that, see?

"Now, how does grapevine" – your next step which follows immediately afterwards. You don't have to worry much about the tone arm action. You say – you say, in no uncertain terms, you say, "How would grapevines ... ?" or "How does grapevines relate to ... ?" Now, be careful now. Don't you use that goal wording. Don't you use the goal as an RI. Get off of that.

Don't say, "How would it (grapevines) relate to 'to eat'." Flunk, flunk, flunk. See. Because you're going to pull the goal as an RI up the bank and keep it restimulated. He knows what GPM he's running. Let him worry about that.

So you say, "How would it relate to this GPM?"

Now, he sometimes has to say to himself, "Now, let's see. GPM, it was to eat." Something like that.

There seems to be a question in his mind it'll always come true. Now that's not as reliable a test as saying the goal that you're trying to relate it to. It's not as reliable, but it is less kick-the-pc-in-the-head. See? It's much easier on the pc and it restimulates the bank less.

And you will get another bang and another blowdown. And as soon as you say, "How does grapevines relate to this GPM?" – the proper wording, see – he says, "Oh, well, it's so and so on and so on, and it's up in the bank and so forth. I guess it's so on and so on, and so on. It's about – it's about the third or fourth oppterm, I guess, and so forth. Yeah, yeah, that's what it is."

You all of a sudden see another blowdown and you'll see your needle. And your needle will go *peeeewsst* again. We blow it out with relationship then to the actual GPM mass. That is your proper step at that particular point.

Now, he may have something to say and he might not have something to say. There might be a little more tone arm action. If so, you could wait it out, but it would just be a matter until it regained a certain level.

Soon as it regains a certain level, your tone arm – you see your tone arm's coming back up and so forth. You might let it come back up a bit. Or let it come back up. Have at him again with the next question, see. Which of course is, "Who or what would solve grapevines?" or something of the sort. Just have him, with the next question, list it down and you're away with the same repeat action.

In actual fact, it takes from four to twelve minutes to ask the question, list the RI, get it to read back, get the tone arm action off, get the courtesy steps in, get their tone arm action off and be ready for the next question. Between four and twelve minutes – somewhere in that vicinity. Sometimes you're rolling hotter than a pistol, the pc's working very, very good and you make up your average in the session by getting one in two minutes or something like that, you see?

But usually your average is a bit more than this. And you'll find your – a session average of once every twelve minutes is perfectly acceptable. A session average of one every hour, I don't know. What are you doing? You must be going on vacations between RIs. Something else going on here. It's not – not the – not what is expected.

Just give you an idea of the expectancy. If you can add up a hundred-and-twenty-minute session of actual auditing in the session, don't you see – a hundred and twenty minutes of actual auditing in the session – and find that you have found ten RIs in that session, the pc is running well, you're going very smoothly, everything is moving fine and so forth.

Don't expect this to happen when you've run into trouble, you've accidentally overshot an item, found a wrong item, you're going back up and have to repatch the bank. You found yourself running a wrong goal and now you've got to have a right goal and the bank is all gummed up and that sort of thing.

This sort of thing is not expected. Now, you're going to have to hunt and punch and grope in the dark and fall over old, odd bits that you've left in the middle of the room, don't

you see. So you won't come up to your average so good and maybe you'll do very well to get one in fifteen or twenty minutes. You're having a rougher time of it and so forth.

But as soon as you get things straightened out and get out of the affected zone that had got kicked around and so forth, it should fall right back to about one every twelve minutes. The thing to do is to get the tone arm action off of those things.

You don't want those things to read anymore. Tone arm action is mainly caused by the discharge of energy in the form of heat on the pc. Those surges, you don't want to get a new item going before the old surges are off, don't you see?

There's a limit at which this takes place. You could, of course, stretch this and take a half an hour to let the surges all come off of the item you found.

I'll tell you a joke. For the last twenty minutes of those, they're coming slowly off the new item you haven't found. You're not finding the surges off the old item.

The pc has moved into the new position in the bank and without even knowing what the RI is, but having some half-dim idea and so forth of it, he will continue to get surges. So the surges off an item actually are those that come off in the first part of the run and down to the last courtesy step of it. Do you got the routine to take? Those are exactly the way you find those things.

I suppose you understand such things as crude as this – that after you've opposed you – "What would the goal – what would 'to eat' oppose? What goal would 'to eat' oppose?" and you've got the new goal "to starve to death," you realize, of course, that you've got to oppose the RI "to eat" – the goal as an RI "to eat" – against the top oppterm of the new GPM you just found.

Well, that is usually fairly easy and it follows the same rules. It's a "solve" question. It is not an "oppose" question. You've found the two goals on "oppose," see, but this is now "solve."

And you say, "Who or what would 'to eat' solve?" is your right question to get that oppterm.

And you normally get them in exactly the same way. It actually doesn't take any more trouble and so forth.

But a wise auditor does a nice little piece of case analysis. He does a nice little dance around the top of that thing after he's got that all taped. He's got the next goal, he's checked it out and so forth, he's found the two top RIs. He's found the top oppterm and he has found the top terminal and so forth. He does not now go like a fast rabbit around the track. He holds hard because the top of the list is the dangerous item, the most likely to be overlooked and the one you're likely to make the most mistakes on are the four top items of which the most dangerous are the top two.

You'll find that most of your mistakes are made in the four top items of the bank, but that the majority of those are made in the first two items of the bank.

And you want to check those out. You want to run a case analysis. After you've found the top oppterm, you found the new GPM, you got that and you got its top oppterm, you now

got its top terminal and so forth and you're all square, you want to run yourself a case analysis.

Is there anything above these things, see? Is there any other item? Are these things correct, see? Are they incorrect? And you're getting some kind of equivocal reads and you can't make out what they are, you should proceed cautiously. Because if you've got a wrong goal – you could have just an actual goal or something like that, but if you've got a wrong goal or something like this, you can get the two top ones – the top oppterm and the top terminal – you can get those. Usually your RR doesn't start shutting down – the length of the fall doesn't start shutting down – until you get the third item.

Now, you don't mess up a pc very much by finding a wrong top item and then having to find a right one. Or find a wrong goal and find its top oppterm and then discard it, and then find a right goal and find its top oppterm. This is not going to mess up the pc to amount to anything.

But if you actually go so far as to find the two – the next goal, the two top RIs and the third and fourth RIs in that new bank – if it is a wrong goal, that's it. The RR is going to go off. And that needle is going to freeze. That needle is just going to freeze absolutely still. And nothing will fall until you start listing for goals. It doesn't matter what you list now, the pc's had it. He has no RR, he has no fall, he has no tone arm action, he has nothing. It just sits there with a frozen *zzzzz-bzzzz* and he gives you something. *Brrrrr*. You can get nothing to fall. You can't get anything to move. That meter just freezes right up. And believe me, this is hell on a pc.

It won't kill him. It won't do anything to him particularly. But it sure – it sure – something like taking several tablespoons full of sand, raw, without salt. No good.

So if you're going to find anything wrong with a GPM, why, find it before you depart from the two top RIs. Now, that you have found those is no – and that the RR has stayed on – is not a guarantee. You can get sometimes as far as four items or even five items deep into a GPM without turning off the RR if it's a wrong goal. You can get that deep and the thing will still be reading.

But a real sharp auditor will have seen his falls getting shorter. From three inches, they have become two inches. From two inches, they have become one inch. From one inch, they have become a quarter of an inch. And he would have to be dead asleep not to have noticed something was wrong by this time. The meter locks up.

He's in a wrong goal, the RIs he's finding are, of course, wrong. They're being dragged from some other GPMs. You're getting GPMs dragged all over the place, and all hell is breaking loose in your auditing. And it is a big, pluperfect mess.

Actually, the number of things you can do wrong are few. The elements you are handling are few. The precision of the technique is great. There are no – there are very few variables in this technique. I don't know of any, as a matter of fact. It's something like, if you have a white salt shaker on the table, why, that means there is a salt shaker on the table. And if there is none on the table, then there is none on the table. I mean it's that type of testing stuff.

Certain things occur. You could even audit this stuff by ARC breaks. Every time you tried to do something, the pc ARC breaks. You should – even you decide after a while that there's something wrong with that direction. You know, you could even – you could herd

yourself down through this stuff with pc ARC breaks. A little bit hard on the pc, but you can do it.

You'll notice that when you undertake such and so an action the pc is not ARC broken. But when you undertake any other action than that, he is ARC broken. Then you can figure out from that what is correct or incorrect about the bank.

Every time you tell him to list more goals, his ARC break ceases. Every time – he's selling you all the time that you have found his goal, don't you see? But he's selling you at a high-pitched scream, see.

"What? You've already got this goal 'to eat.' You've already got this goal. And there it is. And I don't want you invalidating my goals all the time and everything. You know the horrible things that happen with regard to this sort of thing. You already got this goal and so forth."

And you say, "Well, we're going to list a few more goals."

And he sits there and he says, "Uh – to jump, to run, to ride a bicycle, to manicure my fingernails, and so forth, and so forth."

And you say, "Well, that's all right. We don't seem to be getting any reads on this particular list. Let's go back and take this goal, 'to eat.'"

"Well, I told you all the time that the thing was the goal. It's the right goal. I mean, for Christ's sakes – could have told you a long time ago it's the right goal. What's..."

And you say, "Well, when he lists goals, he isn't ARC broken. Therefore, we have found a wrong goal." Slippy, see. You can use an ARC break to adjudicate it.

There are many ways of steering through it. Case analysis – here's another tip I better give you – is always done by blowdown and even then is about 50 percent reliable.

Case's analysis is always done by blowdown. Don't ever believe only the needle. Believe the blowdown. "Is this an actual GPM?" Tick. So what? You can buy ticks anyplace. Any watch company has lots of ticks, see? They're cheap. You can get them by the barrel-load. It means absolutely nothing.

And you say, "Is this an actual GPM?"

Pseeeew. Little blowdown on the tone arm. Ah, yes. Yeah. That's an actual GPM. That's... we got some little confidence. There's a 50 percent chance that it's an actual GPM. Maybe – maybe better. Maybe 64 percent chance it's an actual GPM. Not 100 percent, but the blowdown gives you that chance. Tick gives you no chance at all. Forget it.

The case analysis you should really depend on in your analyses – results that you should really depend on – should be accompanied by a blowdown, particularly after an ARC breaky, upset period. You finally found something wrong and then you finally found what was right about this and you find out what was right and it goes *pseeeew*.

Well, you've got a 64 percent chance that that was what it was, see? And you got a 36 percent chance that it wasn't. And that, having accepted this, you will now be in just as much soup as before, if not more so.

But the blowdown – the blowdown is what you want to put your paws on. That's what you want to have count. A little bit of a blowdown. Doesn't matter whether it's a big blowdown or a little blowdown, you know. But let's make sure the tone arm moves when you ask that signal question, see? Move that tone arm with the question.

If you don't move the tone arm with a question, regard it with a very jaundiced eye. Stuff like, "Is this list complete?" I might believe it if I had a half-a-division tone arm action.

See, I say, "Is this list complete?" Get a half a division tone arm action. Well, that particular question, I think there's a 30 percent chance in favor of the list being complete.

Cynicism is the rule of the day on case analysis.

You do everything possible to overrule the tremendous opportunity for error in case analysis because it's only as good as the pc can do. It's only as good as the pc can itsa and it's just a little bit sub-itsa below where the pc is actually itsaing, don't you see?

And this also is attended by pc's skill. It's horrifying to realize that the only people who will ever get to be OT are Class IVs. That's horrifying. Nobody else will. Nobody will make it. I know that sounds horrible. It sounds absolutely – I saw an old-timer look up back of here and say "What? What??" It's true, though. You'd have to practically educate a guy into the whole skills of auditing before he knew where he was going.

His case would have to be as cleaned up as that level of case would clean up a case, and so forth, before he could head in that direction with any reliability. Because let me tell you, you took some guy who isn't educated and doesn't know what's happened to him about it, you wrap him around a telegraph pole, you have wrapped him around it with adequate mystery to spin him.

He doesn't know what the hell's happened to him now. He has no confidence in anything and so forth.

Now, I'm afraid you're not going to make OTs out of non-Scientologists.

So it takes a lot of education to bring them up to that level. So your case analysis is actually as reliable as the pc's educational standards.

Does he really know what an actual GPM is? Well, that's the only read you're going to get. "Is this an actual GPM?" *Clank!*

Supposing he thinks actual GPMs are actually something that you implant people with.

So your case analysis is as reliable as the education of the pc, and it is reliable as the pc's itsa.

Now the – you – it goes a little bit lower than the pc's itsa, but it's actual fact depends on the pc's itsa because the distance between the pc's itsa and the sub-itsa is a constant distance.

Well, that's why case analysis has to be regarded with a jaundiced eye. Every once in a while, you're going to make a mistake and you're going to blame case analysis and its frailties for your own errors. You'll forget to ask some salient question. You will become so expert – become so expert a cook you see, that you don't bother to light the fire or something in order to cook the beans, you know? Some little mistake like this. You forget to ask if it's an actual

GPM, you see. You just slip somewhere and then you'll say, "See, case analysis let me down." Well, case analysis will let you down often enough without assistance. You don't have to help it out any.

All right. Well, I've tried to give you some very factual data about the running and handling of these OT processes and you noticed today I have not been using the designation which we've been using because the designations that we have been using have become antiquated.

And we're grouping up all auditing skills, techniques, technologies and levels of auditing into new groups. And I found out we didn't have enough groups and so your classifications are about to go up. Isn't that nice?

Now you can really swank it over people.

Thank you.

TV DEMO: AUDITING DEMO WITH COMMENTS BY LRH

An auditing demonstration given on 28 November 1963

Okay, we've got a demonstration coming up here – three twenty-minute demonstrations and what I want cleared is: "Today, has anybody missed a withhold on you?" And that's supposed to be cleared up in Model Session and the session wound up and so forth and so on. We plan these sessions for about twenty minutes each and we'll actually cut into the session if it starts overrunning. Okay? Carry on.

Auditor: Valerie, we are going to run a session here – twenty-minute session – and the body of the session will consist only of this question: "Today, has anybody missed a withhold on you?"

PC: Mm-hm.

Auditor: Okay. Now, is it all right to audit in this room?

PC: Yeah.

Auditor: Good. Please squeeze the cans. Thank you. You're getting half a dial, 3.5, sensitivity 1.

PC: They're large cans for me. I don't like the cans as large as this.

Auditor: Yes. Well I'm sorry, they can be no less at this stage. Can you put up with them?

PC: Yes, oh yeah!

Auditor: All right. Thank you. Okay, is it all right with you if I begin the session now.

PC: Mm-hm.

Auditor: Good. Start of session. Has this

session started for you?

PC: Yeah.

Auditor: Good. What goals do you like to set for this session?

PC: To survive it!

Auditor: All right. Thank you.

PC: Um – oh, yeah, to feel a bit less hopeless at the end of it than I do now. Nice high-toned goals for you!

Auditor: All right.

PC: That'll do.

Auditor: Thank you.

PC: Where am I sitting on the meter?

Auditor: 3 3/8 right now.

PC: Mm-hm.

Auditor: And put the sensitivity up. All right. What – do you feel upset right now?

PC: Yes, I was – I was very surprised. Jenny came and yanked me out of the lavatory. Uh – last thing I was expecting was to be

a pc. It took me rather by surprise. I was feeling a bit lost and there I was when all of a sudden someone banged on the door and says, "Valerie, come be a pc." So I – I haven't quite arrived yet.

Auditor: Okay. All right. Anything that's holding your attention?

PC: Well, yes, my stomach. I wasn't feeling all that well. It's slightly got my attention. Mm – that's all. It feels peculiar.

Auditor: All right. Thank you very much. And I'd like now to go over to this question, which I will first start asking of you, then I will check on the meter.

PC: Mm-hm.

Auditor: All right. Good. Today, has anyone missed a withhold on you?

PC: Um... well, yes. Um – you've caught me on a bad day, I'm sorry, Constantine. Um – not so much a bad day as a bad week, I suppose, or a bad fortnight. Well, it's a bit – I think everyone misses on me – um – how hopeless I feel at the moment, you know, and that makes me feel terribly grieved. I think the one thing that I never communicate to anyone is – um – how hopeless I feel at the moment... I feel a bit as if I've been walking around – um – in the most almighty bypassed charge for such a long time, I've got used to it. I think – well, what I sort of... I sometimes look at myself in the mirror, and – and I think, by Christ, how ghastly I look, you know, and I think probably no

one here realizes how I look when I feel all right. And I thought – it struck me today that probably no one realizes how lousy I feel. You know, if someone walks around looking lousy for a month, it sort of doesn't strike you as anything different about it when you happen to look at them one day and see them looking lousy, you know. If you usually look all right for most of the time then you suddenly looked bad, people sort of ask you what's happening. And I sort of felt, I've looked so lousy for such a long time that [starts to sob] probably no – no one realizes just how lousy I am feeling at the moment. I sort of feel – I don't know – I should – I suppose I should sort of communicate it to someone, otherwise how can they help me? I think probably the biggest thing I suppress is I'll – I'll never let anyone know when – when things are really going badly with me. It's – it's as if the worse I feel, the more I'll – the more I never communicate it to people. Or at least, probably to – never communicate it to someone if it can help me.

I thought – I was – I was walking over to Practical today and Joe then stopped me and said, ""How are you doing?" And I said, "Oh, pretty lousy." And then I said, "The one thing that I do is I never blow because I – I'm too far below it. I just hang around here in apathy, you know." And I was thinking

about this. I walked off, I thought – I don't know. I think this is what everyone misses on me. The fact that I just sort of – I'm actually below blowing. I just sort of feel I'm stuck here forever and I haven't really got... And I suppose I never really take it upon myself to tell someone what's happening to me. I expect them to know and then I suppose they miss it on me.

Um – perhaps I even make them guilty. I suppose I do, I just sort of make guilty. I expect people to come along and help me, you know, when I'm like this. Yeah. I think I actually make people guilty for not coming along and helping me, you know, I sort of - I'll never tell them, I expect them to come along and do something for me. Well, that's one.

Auditor: Thank you.

PC: Would you mind if I blow my nose?

Auditor: Okay, put the cans down, do so.

PC: It seems a funny place to sit and cry about all this when you sit in the middle of a demonstration. I'm sorry, it was just the way I was feeling at the time...

My hands keep on shaking.

Auditor: Okay. We have completed this, all right?

PC: Mm-hm.

Auditor: Okay. Well, thank you very much.

PC: What – what have we done? I'm

sorry. We've completed what?

Auditor: Well, you have completed your answer...

PC: Oh, yeah.

Auditor: ...what you were saying. All right. All righto. We are running short of time.

PC: Mm-hm.

Auditor: So...

PC: I must say, I've got it off to most people now, what do I say? If I wanted to get it off, my God, I've certainly – I've certainly had the opportunity to get it off.

Auditor: All right, well how does that feel?

PC: Yeah, that's – that makes me laugh. I've been a proper victim.

Auditor: Good. Okay. Thank you. Now, is it all right if we end off the body of the session here?

PC: Yeah.

Auditor: All right. Is there anything you would care to ask or say before I do so?

PC: No, I think it's the funniest session that I've ever had, though. Well, fair enough.

Auditor: All right. End of body of the session.

PC: Thank you.

Auditor: Okay. Now, let's see. Have you made any of the goals you have set for the session? One is "to survive it."

PC: Yeah, I've done that!

Auditor: Thank you.

PC: I'm even laughing. I was very – Murray's the one that said that when he was being audited opposite me, he could never tell – one minute I was laughing, the next minute I was crying. I seem to go up and down. That's all.

Auditor: Okay. Number two, "to feel a bit less hopeless by the end of it than I feel now."

PC: Yes, I've achieved that.

Auditor: Thank you for making these goals.

PC: Yeah. I've – I've certainly got off my missed withhold to everyone now.

Auditor: Okay. Have you made any other gains in this session that you would care to mention?

PC: Um – sorry, I keep shaking. Um – my tummy feels a bit more settled. Sorry, the cans keep shaking, sorry.

Auditor: Okay. All right, well thank you for making this gain.

PC: Mm-hm.

Auditor: Please squeeze the cans. Your havingness is pretty good.

PC: Mm-hm.

Auditor: All right.

PC: Christ! I've...

Auditor: All right. Now, what are you going to do when you finish this session?

PC: Um – stop shaking, I hope! I'm going to go back and pick up my handbag. I can't remember where I left it, I think in Practical, and then go and sit down

and watch the TV demo. Some oth... some other poor soul, I guess.

Auditor: Okay. All right. Is there anything you care to ask or say before I end this session?

PC: No, thank you, Constantine!

Auditor: Okay, you're most welcome. Is it all right with you if I end this session now?

PC: Yeah.

Auditor: All right. End of session.

PC: Thank you.

Auditor: Has the session ended for you?

PC: Yeah.

Auditor: Okay. Taking you off the meter.

PC: Thank you.

Auditor: Your chair all right?

PC: Yeah, more or less.

Auditor: Okay.

LRH: Go ahead.

Auditor: All right. Take the cans, please – get this thing adjusted.

PC: There are spider's webs in this can.

Auditor: Oh. Okay. All right. Now, look around the room and tell me is it all right to audit in this room?

PC: Well – um – if I can see through that – uh – that thing over there, I might be able to say no, you know... I guess so.

Auditor: All right. All right, give me a can squeeze please. Okay, that's fine. All right, now what we are

going to be doing in this session is to clean up the missed withholds, and it's for today.

PC: All right.

Auditor: Okay. Good. Now, is it all right with you if I begin this session now?

PC: Yeah.

Auditor: All right. Start of session.

PC: Hm.

Auditor: Has the session started for you?

PC: Yeah.

Auditor: Good. What goals would you like to set for this session?

PC: Oh, to – uh – to survive it.

Auditor: All right.

PC: And well, not to incriminate anyone.

Auditor: Okay.

PC: Well, just to answer the question – the actual question – you know, without uh – pulling in anything else.

Auditor: Very good. Okay. Is that it?

PC: Um, let me think, should be some more I think. Uh – well, to get on all right with you as an auditor.

Auditor: All right.

PC: Peculiar humming noises and squeals and things going on in this room. It's rather – it's like a – rather like a gas chamber, something of that nature. Um, well, to feel comfortable at the end of session.

Auditor: All right.

PC: Uh – I think that's about – that's about it. I don't think I can stretch that out much longer.

Auditor: All right. Very good. All right. Just one moment. I'm going to adjust the earphones – they're slipping out of my ears.

PC: Oh, right, right.

Auditor: And my chair. I hope that moving didn't shift the meter.

PC: All right.

Auditor: Okay.

PC: You look very medical.

Auditor: Very good. All right, is it all right with you if we go on with the body of the session?

PC: Yeah. Yeah.

Auditor: Okay.

PC: We're not doing mid ruds as well, are we? No.

Auditor: All right, the auditing question is going to be "Today, has anyone missed a withhold on you?"

PC: Hm.

Auditor: All right, do you understand the question?

PC: Yes, yes. I – I – I – it means to me: today, has anyone done anything that restimulated me, and what have they done, sort of thing, you know. Uh – rather than what I've done. Being someone else's action.

LRH: Man, don't buy that definition of missed withholds.

PC: [laughs]

Auditor: All right. Did you happen to hear that?

PC: I heard someth... yes, I heard something. I didn't hear actually what he said.

Auditor: Fine. Okay. Good. All right, what is a withhold?

PC: A withhold is – uh – something I've done.

Auditor: All right.

PC: Right. Uh – so a missed withhold is something I've done that's been restimulated by someone else.

Auditor: I don't get that.

PC: Well, something...

Auditor: Oh, I...

PC: You know what I mean?

Auditor: Yeah.

LRH: You keep working on that until we get it straight.

Auditor: Okay. All right.

PC: I'm in – I'm in sort of mystery as to what's going on.

Auditor: Fair enough. Okay. Now, would you give me what you gave me again, please?

PC: Yeah, it's a some – it's something – that – a contrasurvival act that has been – uh – been restimulated by so – by another and not disclosed. That's the definition.

Auditor: All right, that's the definition.

PC: Hm.

Auditor: All right, let's – let's begin in the beginning. Again, what's a withhold?

PC: A withhold is something that I

have done, which is contrasurvival. Yeah.

Auditor: All right.

PC: Uh – which I haven't – which I have withheld.

Auditor: Fair enough.

PC: Right.

Auditor: All right, and a missed withhold?

PC: It's something like that that's been restimulated by someone else. By someone else's action.

Auditor: Oh, I see. Okay. All right. Your doingness, though?

PC: Yeah. An original doingness of mine which someone else has restimulated again, sort of thing. See what I mean? Something that I have done one som... at some time or other, that's been restimulated today by someone else. That's what I understand as what you want.

Auditor: All right. Once again, give me what a missed withhold is.

PC: Uh – it's something that's – that I have done, that has been restimulated by somebody else.

Auditor: I don't get how it's been restimulated by someone else.

PC: Well, say I've – uh – uh – let me see – I have – uh – I have blown the course, say – right? – at some time which is to say an overt. All right. And say I was withholding it from someone and then someone said – started then – that was a long time ago, say, and then somebody says to me – um – suddenly looks at me

and says, "What do you feel about – how do you feel about blowing courses," and I might remember that I have a withhold that I blew the course. And that would be a missed withhold. The act – the incident of him saying this to me would be the missed withhold. That's – that's my understanding of a missed withhold.

Auditor: Let me see if I get it straight.

PC: All right.

Auditor: The incident of someone saying this...

PC: Yes. Well, the withhold is not the miss – uh – the withhold is that I blew the course. The missed withhold is someone saying to me it – it – that – well, the incident where it's missed is when someone said to me – uh – you – what about blowing courses, something of this nature.

Auditor: Fair enough. And they missed that you had, all right?

PC: Hm. Yeah.

Auditor: All right. That's fine. Are you ready to go on.

PC: Yeah! Sure!

Auditor: All right, then here's the auditing question. Today, has anyone missed a withhold on you?

PC: Um – let me think. I'll have to have a look over today and see. Well, I had an auditing session this morning. Um – I don't remember if there was anything missed in the auditing session.

Uh – I remember you banging on the table! Uh – I don't think that was a missed withhold. I can't remember ever having banged on the table. Yes, I – last week I banged on the table, I think. And your banging on the table may have restimulated that. Um – what else now? There may have been some missed withholds in the session, because I was nattering a lot. Well, no, I've been nattering a long time – uh – and I don't think there's – I don't think tha... if there's a with... missed withhold in relationship my – to my nattering this morning, it wasn't missed today. Must have been missed quite a long time ago. Um...

I think Dick may have missed a withhold. He was making remarks about um – a book that I had lent him and um – and he was – he had the session next door to me. And uh – he was making a lot of remarks about some book and it sort of cut my itsa line a bit. And uh – it couldn't really be a missed withhold, that. It's uh – maybe I had probably – I'm a – have lent him – or lent him the book to – I mean, it was perhaps an overt to lend him the book because it – uh – it was nothing to do with Scientology and would take his attention off his studies. Um – you'll probably get a good laugh out of this now. Uh – he referred to – it was a book by Ouspensky, actually, about Gurdjieff's work and he referred to uh – Gurdjieff as a "little Hubbard,"

and I thought, well, I don't know about that. It's difficult to evaluate certainly, you know, one from the other. Hm. That was the session, I don't think there was anything else, I – I – I didn't feel that my auditor had missed any withholds in the session. You know, I didn't feel nattery about him or um – and then I went on the bus into town and uh – well, no, I didn't go into the bus, because the bus broken down. And uh – I'd – therefore I'd – I went in with Edgar. But in the bus, before it – before we decided the bus had broken down, uh – something about blowing – something – some remark about – I made some remark about blowing. I wasn't seriously thinking of blowing or anything. I just – and I said something – and I said something about blowing and the – and someone said, "Oh, I'll keep an eye on me over the lunch," and I said, "Well, if I – if I was going to blow, I wouldn't be saying remarks about blowing." And uh – and then I thought, well, perhaps it would be a good idea. Say I wanted to blow. Then if I said I'm blowing like that, no one would believe me. You see. And I'd get a – make a clean getaway.

Well, I know some missed withhold, yes. I don't think it was a missed withhold in the lunch hour particularly. Perhaps the National Insurance people missed it, perhaps the post office people – no, I don't think they

did. Uh – Herbie! I think Herbie, yes! Herbie must have missed a withhold on me. Um – Herbie was ranting about something in the practical period and he was giving his – his random rote procedure lecture, you know, the one that he often gives – uh – about it being a rando... not a – not a random rote procedure, uh – a wound – a wound-up doll – uh – what was it? How does it go now? It's got to be a rote – a routine rote procedure! You know. And all that sort of stuff and I was – he – he – I had the feeling that every now and then he looked at me because I was – I was finding it hard not to laugh, at this point, you see, and every now and then he would seem to be looking my direction – that – probably my imagination. And I had sort of committed an overt against Herbie the day before, because he see – he had given an example of some experiment he'd done, to prove something, you know. And I didn't think that – um – I criticized this and I said – well, I – more than criticized, I tried to make nothing of his experiment. You see? By saying that it didn't prove anything because there were a lot of things that were different from one situation to another, so I mean it doesn't – it didn't – it didn't actually – I mean, I was right, in the sense that one of his experiments didn't – the other two were reasonably all right and he went on to that. But I – uh – the overt was

that I was trying to make nothing of Herbie – Herbie's experiment, which was no useful thing to do, you know?

And – uh – he looking at me sort of made me think of that, you know. And I thought – felt that I'd done the wrong thing another – in another way by – by saying – uh – by saying that, you know? Because – uh – it didn't do me any good, you know, to go around nattering of this – you know, this was an overt against me as well as against him, you know. Because if one feels nattery, the best thing to do is to keep one's bloody mouth shut, you know, and – uh – so one only knows oneself when one's nattering.

Auditor: Well, all right. Okay. How you doing now?

PC: All right.

Auditor: Okay that's...

PC: Probably got plenty more, you know.

Auditor: Okay. Thank you very, very much. All right, we're going to have to end it off here.

PC: Oh! All right. Okay.

Auditor: All right. Okay, is it all right if we just end it there?

PC: Yeah! Sure! Sure! Yeah! I can tell my auditor the rest of it.

Auditor: Very good. Thank you very much. Okay, I want to check to see if you made any part of your goals for this session.

PC: Hm.

Auditor: Okay. One is to survive it.

PC: Yes, I survived all right! Pretty well, I felt, too.

Auditor: Good. All right. To incrim... not to incriminate anyone.

PC: No, I didn't incriminate anyone. Hm?

Auditor: Okay. To answer the actual question, without pulling in anything.

PC: Yeah, I stuck pretty well to the actual question, yes.

Auditor: All right. I'm sorry. Oh! To get on all right with you as an auditor.

PC: Oh, yes! Yes, yes! I did all right with that.

Auditor: All right. To feel comfortable at the end of session.

PC: Yeah, I feel all right. Yeah.

Auditor: All right. Thank you for making these goals.

PC: Hm.

Auditor: Have you made any other gains in this session that you'd care to mention?

PC: Um – well, let me think. Well, I feel all right about these demonstrations, you know. I think – uh – I don't think I'd like to have a long demonstration, you know. I don't – I wouldn't like to be a demonstration pc on a – for a full session, you know, particularly, but on a short one I don't mind. I thought I would dislike it, you know, but I – I find I don't mind, that's fine. It's rather long wi... long winded to write

down, but...

Auditor: Okay. I got it though.

PC: Yeah.

Auditor: And thank you. All right, now let's have a can squeeze.

PC: Up?

Auditor: No. All right. What is your Havingness Process?

PC: "Feel that."

Auditor: All right. Put the cans down, please. Okay. All right, feel that table top.

PC: Mm-hm.

Auditor: Thank you. All right. Feel the arms of the chair.

PC: Yeah.

Auditor: Thank you. Feel your shoulders.

PC: Yeah.

Auditor: Good. Feel the cans.

PC: Yeah.

Auditor: All right, and feel the back of the meter. Thank you. Take the cans. All right, and squeeze them. Very good, that's better. All right, we're going to leave it right there.

PC: Mm-hm.

Auditor: Okay. Is it all right with you if I end this session now?

PC: Yeah.

Auditor: Okay. End of session.

PC: Right.

Auditor: Okay. Is the session ended for you?

PC: Yeah.

Auditor: Good. Tell me I am no longer auditing you.

PC: You are no longer auditing me.

Auditor: Thank you.

Auditor: All right, how's it seem to you to be audited here today?

PC: Seems all right, actually. Doesn't seem as though the TV camera's watching me or anything.

Auditor: Okay. All right. Is it all right to audit in this room?

PC: Hm – well, um – I don't like all these electronic things, you know? You know, electricity and wires and things, but otherwise okay.

Auditor: Very good. Okay. Well, now in this session I'm going to ask you: "Today, has anyone missed a withhold on you."

PC: Hm.

Auditor: Okay. Is it all right with you if I begin this session now?

PC: Mm-hm.

Auditor: Very good. Start of session.

PC: Hm.

Auditor: Has this session started for you?

PC: Mm-hm.

Auditor: Very good. What goals would you like to set for this session?

PC: Mm. To feel calm at the end of this ... Hm – that's all.

Auditor: Very good, thank you. All right. Well, I've omitted to get a can squeeze at the beginning of session, I'm very sorry about that.

So I'll do it now. All right. Squeeze the cans, please. Very good. Okay, the tone arm there is at 2.0 and there was an eighth of a dial.

PC: Hm! I don't know if I squeezed very hard or not. Very softly actually.

Auditor: Very good.

PC: Want me to do it again?

Auditor: Okay, well, I'll just check. All right, that's fine. All right. Squeeze the cans please. Thank you. All right, that's half a dial now. Okay. All right, well now, if it's all right with you we'll carry on here.

PC: Mm-hm.

Auditor: All right, I'll give you the question. Today, has anyone missed a withhold on you?

PC: Hm – um – appears as though lots of people have, you know. You know, that's funny, Liz! Do you know, in – in Theory – in – in Practical this afternoon, I was longing for someone to pull missed withholds on Jenny, because I had a feeling that Jenny missed something on me this afternoon, and it's just happened. There is something and I just didn't know what it was and I knew I wouldn't be able to find it, unless I sat with an auditor and looked for it. I know what happened, I was in the basement in the – you know, the office here.

Auditor: Uh-huh.

PC: And she said something about

my voice being very – um – kind of- very sort of hard and harsh with the pc. And then I find – found myself defending myself. Oh God, let me see if I can get this right. Sort of saying – um – sort of – uh – I don't know if I said it, I felt like saying, no, no, that wasn't, you know, or the pc didn't get it that way, or something like that. Um – I just thought Sophie's just missed a withhold on me, because I was going to say – I mean she asked me how much TA there was and I was going to say, "Now, I told Sophie I wouldn't tell her how much TA she got until the end of the intensive." But Jenny asked me and then she thought it was quite good. And then she sort of, you know, wasn't critical of – of my speaking that way. But there was something and I felt very funny. I walked out of there and you know how you sort of feel sometimes, you're sort of running away from something, where you sort of – um – what's the feeling, the feeling of – um – wanting to get away. Hm.

Auditor: Mm-hm – Okay.

PC: Let's see if I can get this damn thing. Hm! There's one thing. Um – Jenny was watching the session this morning and um – Sophie got a fright. And um – afterwards she whispered in my ear, "Ask Sophie what happened just before this..." – and Sophie got a fright and the TA blew down about a whole division. And then she said, "Well, when

Sophie feels a bit better, ask her what happened just before that." And as far as I know – I said – I think I said, "What happened?" and then – then I said to her – I didn't wait for an answer, and then I said, "What happened just before you got that fright?"

Now, that ties up with this afternoon. Jenny was talking to me and she said, "But you didn't – you didn't ask her what happened just before she got the fright." So I said, "Yes, I did." No, no. Jenny said, "Ask what we – what was she – ask her what she was thinking about just before that." And I said yes I did – I did ask her, and then I thought, no, I didn't, I asked her what happened just before that, and I got confused, but I knew I'd asked something like that. And there was some confusion there. I think Jenny missed on me that I felt that although my voice may sound very abrupt and sort of – um – kind of careless and sort of hard to the pc – or it may sound like it to someone listening to the session. I feel that my pc feels the affinity flow. And I sort of don't bother with how I say it or something. I always sort of feel my pc knows. And I can – I feel I can sort of say, um – "What happened," in a very sort of abrupt and sort of uncaring way, you know, and tone of voice. But I feel my pc knows that that isn't so and my pc doesn't un... no pc's sort of critical of that or – sorry – and um – worries about that, you

know? That was one thing.

I don't think – and I don't think Jenny got this. And then I said, "But look, Sophie hasn't ARC broken about my tone of voice there." Then she said, "No, well the TA went up to 4, and got – got sticky. " And um – I don't like talking about cases, you know.

Auditor: Carry on. Tell me more, what was missed here?

PC: Um – I don't know – now I feel I shouldn't be talking about cases. You know, about my own pc, and about what happens with my own pc.

Auditor: Mm-hm. Okay. All right, well now – um – just when did Jenny miss this withhold?

PC: That was this afternoon in the basement.

Auditor: Very good.

PC: Definitely.

Auditor: Very good. What did she do to miss it?

PC: I'm not quite sure what the withhold is that she missed.

Auditor: Okay! All right.

PC: I think it was the tone of voice. I was trying to get across to her that this tone of voice may apparently be like that and I may apparently be very abrupt. But – but to me, it doesn't seem like that. You know? And she missed my kind of disagreement and wanting to – wanting to assert something and then feeling foolish and feeling um – degraded

- for wanting to assert something. You know, I feel bad when I have to assert something – you know, defend myself again like that. That was what she missed.
- Auditor: Very good. Okay. All right, now, did anyone else miss that?
- PC: Mm. I told somebody about it, I think. Yeah. I told Don. Um – oh well – ties up into a little story. I told Don about it and he was listening to a tape and he told me afterwards in tea – at tea time that – I'd just said that Jenny said that I spoke in a very hard way to the pc, you know, and he said the funny thing was just as he put the tapes back on, you know, over his ears – the earphones, he heard Ron saying it doesn't matter what tone of voice you use with your pc. Um – hang on a sec.
- Yeah, there's something gets missed with me. It's a kind of attitude. I feel that I can – um – hmm! It's a bit like that thing with Val – she expects people to know how she is. You know? Even though she sort of doesn't say it. Well I expect people to know – let's take a look – hmm! I – I expect people to not be taken in by a tone of voice. Hmm. That's what it is.
- Auditor: Very good. Okay. Is that all there is on that one?
- LRH: Don't repeat your question and end off the session.
- PC: What's that?
- Auditor: I got an instruction from Ron then.
- PC: Do you want me to answer that question?
- Auditor: All right, um – have you got an answer there?
- PC: I'm just a bit worried about that instruction.
- Auditor: Okay. He said not to repeat my question and to wind up the session.
- PC: Mm. All right. If it's all there is to that missed withhold, do you want to know?
- Auditor: Yeah.
- PC: Hm. No, it isn't actually! Uh – it's happened once before. Yes, Jenny said the same thing before about this hard tone of voice. And I know what – I know what she means, because I know my voice sounds like that, you see. And there's a kind of agreement. But the disagreement is that the pc could care two hoots about it and that it affects the pc.
- Auditor: Hm. Very good. Okay. Well, although there may be some more on this, if it's all right with you I'd like to end this subject here.
- PC: Mm.
- Auditor: All right?
- PC: Mm-hm.
- Auditor: Okay. Is it all right with you if we end the body of the session now?
- PC: Mm. I'd just like to check something with you.
- Auditor: Sure.
- PC: Is my needle flying around?

Auditor: No.

PC: Not?

Auditor: Not at the moment.

PC: All right. All right.

Auditor: All right. Okay, well, is it all right with you if I end the body of the session now?

PC: Mm.

Auditor: Okay. Is there anything you'd care to ask or say before I do so?

PC: Mm-mm.

Auditor: All right. End of the body of the session.

PC: Mm-hm.

Auditor: All right. Have you made any part of your goals for this session? Shall I give it to you?

PC: Mm.

Auditor: All right. To feel calm at the end of it.

PC: Um – as a matter of fact I haven't made that goal, no. But I made some gains.

Auditor: Okay. I'm sorry you didn't make that goal.

PC: No, that's fine.

Auditor: All right. Have you made any gains in this session you'd care to mention?

PC: Mm. Mm. I found I was able to look. Didn't expect to be able to, you know? Um, yeah. And I feel I've pinpointed that missed withhold. There – there may be some earlier ones similar, but that particular one this afternoon today, I pinpointed. And I feel good about that.

Auditor: Very good. Thank you for making that gain.

PC: Mm.

Auditor: All right, well, I'd just like to take a can squeeze here.

PC: Mm. My hands are all sticky.

Auditor: All right. All right. Well, I'm just going to check how you've got those cans held. All right, just take hold of them. Very good. Okay, please squeeze the cans. Very good. All right, that's half a dial there. How are you doing?

PC: Fine.

Auditor: Very good. Okay, well it's – we'll leave that there like it is.

PC: All right, good.

Auditor: All right. Is there anything you'd care to ask or say before I end this session?

PC: Um – no, except that you look a bit funny with those things around your ears. Uh – like a strung-up – you know those people – these typists from dictaphones.

Auditor: Mm-hm.

PC: And that's all.

Auditor: Very good. All right. Is it all right with you if I end this session now?

PC: Mm.

Auditor: Okay. End of session! Has the session ended for you?

PC: Mm.

Auditor: Very good. Tell me I'm no longer auditing you.

PC: I'm no longer auditing you.

All right. Here we are with the comments on these sessions. And we have sessions one, two and three and I would have been happy to have commented on these things as they were done, while they were fresh in your memory. The only difficulty with that, of course, is the auditor and pc have not removed themselves back over to the chapel and can't hear the comments being made on their session.

The essence of this problem here is that you just have to remember what's going on in these sessions. These were the sessions of the twenty-eighth of November and there are three student sessions here. We'll comment on them rapidly, one after the other.

But first, before we get into the gruesome aspects of it, thank you very much. Very brave of you people to be on TV. It's too much for me, it frightens me to death being on TV. I get stage fright, you know?

All right. Now, here's the first session. Constantine auditing Valerie. Now, there's no reason for you to go out and blow your brains out or anything like that, Constantine, over this. But we need a bit of brush-up in some departments and let's go into these things. Now, I didn't get the sound the first half of it, you're lucky there. I can't call anything wrong on the first half of it because I didn't get the sound – the sound was off up here. The first half of that. Too faint. When I finally – it was a broken ear plug, something. And when I did tune in, however, I could not help but notice a certain stony silence. A certain stony silence that – if I were being audited that way, I would think I had done something wrong, as a pc.

Now, stony silence is not a proper presence. There's no encouragement there, there's no auditor action. And so forth. There's room there for a little half-acknowledgments and so forth. Let the pc know he's talking. Just don't sit there glumly looking at the pc, because the pc after a while will just start compulsively itsa-ing. And that's in essence what this pc did. That's inviting itsa by silence. Also reproving itsa by silence, in this particular case, because when the pc said something, nothing was ever given back to the pc at all, no "Mm-hm." Now you can go "Mm-hm," a long – a lot too many times. But a nod now and then and some attention to the pc and so on, is very much an action, very much called for.

Now, at the end of the body of the session, there was no action and then sudden lowering the boom by just ending the body of the session. Actually, the pc was not acknowledged at all at the end of the body of the session. In other words there's no, no comm cycle in progress there at all. And you've got to study comm cycle, Constantine, you've got to study comm cycle. You're going to find out what an auditing cycle is. I don't care if we've introduced itsa and so forth, you've got to study this. And you've got to get this down. And you can be grooved in quite a bit.

And now, you knew how to do it once, now you've gone over the other side of it and you stopped doing it at all. Now, let me assure you that there is a middle ground of the correct action. It doesn't run from total talk by the auditor to no talk by the auditor, you see. There's a middle ground. There's a certain amount of talk here and acknowledgment and so forth.

The old TR 1, TR 2 – that sort of thing is what's out there. And did no acknowledgment of the pc, but only ended the session and that's a lousy comm cycle. Get some more warmth, and so forth, in actual fact ending a body of a session that way is using the tools of auditing to cut itsa. And under that heading, using the tools of auditing to cut itsa, there are a great, great, great many crimes. You can suddenly wave your pencil around in the air and be writing, and so forth, so that the pc doesn't think you're paying a bit of attention to him. All right, cuts the pc's itsa. You can misuse Model Session to cut the pc's itsa, but all this comes under the heading of this large classification: using the tools of auditing to cut the pc's itsa. And it's very, very poor, doing it that way.

Now, there's an actual auditor comm lag going on here, Constantine. There's not picking it up, see? Picking it up, picking it up. There's an actual auditor comm lag. When the pc says something or something is supposed to be done, the auditor should not remain silent at that time. An auditor should not pick up his comm lag. It's bad enough to have pcs that comm lag, without having auditors that comm lag, too, you understand? Pc says, "That's all," and the auditor says, "... oh, thank you."

"What's this?" the pc says, see? When the pc says, "That's all," see, pc says, "Well, that – that's all," the auditor says, "All right." In other words, there shouldn't be comm lags in there, before the auditor does what he's supposed to do. Don't stand around waiting.

You see, the introduction of itsa has encouraged auditors to stand around and wait, to do nothing, to invite itsa by silence and brought in a whole bunch of new crimes that nobody had ever dreamed of before. And so forth. Well, itsa is gotten with – in the absence of these crimes, and so forth.

Now, you need to study your Model Session. Your Model Session wording is way out. And that needs to be studied and re-passed and you want to get some hope factor and some confidence instilled into the session, some warmth, and so forth. We don't need any sphinx-like attitude on an auditor. And just to summarize this, why, you're to study the Model Session, the auditing comm cycles and actually restudy itsa.

Now, this crazy comment, "What are you going to do when we end the session?" has never been heard of again. It was said by Constantine on the twenty-eighth of November and then nobody else ever said it from there on, for the next two thousand years. You hear me? I don't know where that wild one come from, but I can see these things develop. Oh, I can see why, you want a trick there, to get the pc to think about another time, but actually is a continuation of the session.

All right. Other than that, Constantine, you did fine and the pc did fine – and don't think I'm being – bearing hard on you; I want a good auditor and you're very capable of being a good auditor, so thank you for giving that session, giving me an opportunity to look over what you're doing and be able to give you a hand on it, okay? All right.

And now, we get to session number two. The placement of chair. The auditor didn't notice the pc then changed the chair. After the auditor places the chair and the pc moves the chair, the auditor should place the chair. It's simple as that. Of course, it operates as a criticism of the pc, but that's the point of control of the session, is right there with the placement of the chair. Pc moved the chair. Was not in control in the session thereafter.

That start was far too slow. Didn't have the pc's attention in order to start the session. Pc was going, "Rah, rah," and so forth, and you just started the session. You got to get the pc's attention before you start the session. You want to get the pc's eyes right on you to start that session.

Also, incidentally, having nothing really to do with auditing skill, and so forth, I noticed that you really need to practice writing faster. With all the writing an auditor has to do, don't take that length of time to audit. Learn to write a little bit faster and you'll have an easier time of it. That's almost extraneous to auditing, but it would help you out and I noticed that in passing.

Now, you did something I told people not to do in the last demonstration that I commented on. Which is, you bled goals. After the pc has given a goal or two, then you asked for another goal. Never ask for additional goals. It's – if you want to know what goals he'd like to set for this session – and that's it, you never ask him again, are there any more goals and so forth. Do you know, you can spend the whole session getting pcs to list goals. Never bleed goals off the pc. Just once – bang! And that's – you take it and that's it and you're away.

You noticed the pc, in this particular instance, was actually flabbergasted. He didn't quite know what he was expected to do or why and you put a huge comm lag into the session there, when you bled goals. Never bleed goals. Any of you. I thought you would have learned that last week.

Now, the auditor in this particular instance, also, inactive under the guise of not cutting itsa. Any time an auditor doesn't want to do anything, he says, "Well, I didn't want to cut the pc's itsa." Actually, we have to get a moderate look at this.

Now, you didn't ever have to call – don't ever call the pc's attention to the auditor. If you got to adjust the earphones, why, just adjust earphones. Don't say, "Is it all right with you if I adjust earphones?" and so forth. Don't keep calling pc's attention to auditor. Don't ever call the pc's attention to the meter, don't ever call the pc's attention to the auditor. If you got to do something, just do it. Put in an R-factor, if you want to, if you think it'll startle the pc, but in this particular case there was nothing of that. That's perfectly all right, but in actual fact, avoid calling the pc's attention to the auditor, always. Now, the definition of missed withhold! I think that's very remarkable, because, you see, the pc never did define a withhold, or a missed withhold. And therefore, this pc couldn't answer the auditing question because he didn't know what it is. And actually, this pc needs to be audited in that direction, needs to be trained in that direction. And the pc's case, any case advance this pc has is hung up, right on that point. And you had an opportunity to cut this wide open and actually, you fell back from doing so. Now, I would have lowered the boom, until the pc really knew what I was talking about. Because of course, a missed withhold is the – a withhold, basically – is just not talking. And the pc never did bring this up. See, it's just not saying. I mean, the basis of it.

And missed withhold: what did somebody else do that made him think that this had been keyed in? This pc had that defined as a motivator. And that needs to be straightened out. Because the pc's advance and so forth, in processing, is actually held up at this point. Right there. Bang! Noplace else. And I've just written some direction for the pc's auditor, we can straighten that out, *bingity-bang!* But you had an opportunity to straighten that out, and I

want to call to your attention – if the pc cannot tell you what the part of the session is, or what the part of the mind is, or what the – what the auditing definition of something is, the pc then can't answer the question in relationship to it, because the pc doesn't know what it is.

All right. Now, that was clearing the auditing question. Now, the pc once gave himself the auditing question. And a smart auditor is always in there repeating the auditing question. The pc says, "Let's see – all right – let's see – what's the question – ah – let's see – in this session has anything been suppressed?" I'm always in there and I say, "Today has anything been suppressed?" or whatever it is. "Since the last time I audited you, has anything been suppressed?" I say, "The question is..." you know? Keep control of it to that degree. Don't let pcs go giving themselves the question. Because they, at that moment, go on to self-audit and you have to bring them back on to a session-audit.

Then we already commented on auditor silence. Then there are quite a few Model Session errors and the auditor here should study Model Session, get the comm cycle in and get command clarification and review missed withholds HCOBs. And that's what this auditor should do.

Thank you very much, Stan, I hope you don't think I'm being too cruel. Actually, you are one of the better auditors. Let's just make sure you stay that way and not go stepping on banana peels and going out into the blue, just because an auditing style has changed. So, thank you Stan.

Now, we have session number three. Model Session errors, Model Session errors, Model Session errors and so on. Study Model Session until it could be done in a hurricane. In other words, hurricane blowing, still be able to do Model Session. Roof falling in, still be able to do Model Session, you understand? That Model Session, pooph! See, I mean forgetting things like the can squeeze test and that sort of thing, tha-that's corny!

Now, side comment, having nothing to do with the auditor – having nothing to do with the auditor at all, but that pc's havingness is awful low for a Saint Hill student and that has a lot to do with this pc's regular auditors. What do you mean, letting somebody sit around with that low a can squeeze? I think it's phenomenal! I think it's fantastic! How can you possibly have a student sit around with that much can squeeze, that tiny amount of can squeeze test? That just isn't enough to bother with! On a Mark V – on a Mark V, a normal can squeeze is across the dial and two bounces off the pin! You've got it? Not a half a dial! That's set at 1. That's set at 1, on a Mark V.

That just isn't enough can squeeze. Why hadn't somebody noticed this and run this pc up the line, till this pc's havingness was in pretty good condition or find out what there is in the environment that's cutting the pc's havingness down. That's pretty low for a Saint Hill student. And if any of you – others of you have been putting up with that kind of can squeeze, and so forth, realize that that little half-a-dial *raw!-raw* – that is not havingness, man!

Put it on the Set mark, pc squeezes the cans, it bounces twice – twice off of that pin. Hits – goes down and hits that pin! From Set to pin – *pshwww-pang!* – twice! Bang, bang, boom! That's the way it ought to look.

If it doesn't look that way, your pc's havingness is too low to be audited. How do you

like that? Now, all of you are sitting there, saying, "What!" you know, "My pc's havingness is only a quarter of an inch and I've been auditing the pc." Yeah, you should hold your head in your hands, because that isn't enough havingness for a pc to be audited on. That pc either hasn't eaten or the pc is not sufficiently rested or the pc is this or the pc is that or the pc is bothered by his environment or has PTPs – but basically has withholds, my God! You understand? Withholds! That sort of thing. That's what really cuts down havingness.

So, your pc's havingness is that low, get the pc's havingness up by normal Havingness Processes and see if you can't pull the missed withholds – run some O/W. Let's get some auditing done around here. If any of you have pcs who have can squeeze tests that are that small, you are then looking at a critical case. So let's do the necessary to make the case audit-able! A bunch of you are going – *hggh!* – like that, right now, I imagine.

Now, this auditor is very indirective of the pc's attention but also the auditor is in W so it's not too serious. But there isn't really enough direction of the pc's attention going on in that session. Failure to direct a pc's attention is never excused by, "I don't want to cut the pc's itsa." You can direct the pc's attention without cutting the pc's itsa.

The auditor actually could have delineated the question there at one particular point and gotten the pc to find out what was the missed withhold. Actually the auditor did not pull a missed withhold in that session. It required this question from the auditor: "What did Jenny do that made you think she had almost found out something?" See? That applied at the right moment. "What did Jenny do that made you think she had almost found out something?" Hm? That's the question to get the missed withhold and it would have peeled off just like that, you see?

Pc was floundering, was trying to straighten it out, and so forth. It's all right, let the pc talk. This isn't too serious because you as an auditor are still in W Unit. But it would be serious in X.

Now, there was an MS – Model Session – error on the goals question and the auditor's voice tone was a bit bored at session end. Little brighter voice tone. And by the way, for the last can squeeze test the auditor did herself – may have done herself out of some can squeeze because the needle was left on the pin over on – as you face the meter – the left-hand side. I think the needle was lying right down against the pin when the can squeeze test was given. Which, of course, you don't want it there; you want can squeeze test given from the needle at Set. And of course, if it's down against the pin, you don't know how far it rose before it's visibly moved. That's all there is to that.

Now, this sounds very, very vicious and your auditing actually is pretty good and you have a very good reputation amongst the Instructors as an auditor. Now, let's not let that down. Let's get to be better even than that. So thank you very much for giving that session.

All right, on auditing in general – on auditing in general, why, I think our modern fault in auditing is – I can sort the thing out – simply falls under these headings: You don't know your Model Session. Just don't know it! See? I mean, you're not good enough – sharp enough on Model Session. You ought to be able to purr Model Session off, *brrrrrrt*, without any difficulties whatsoever and we're going to reassign you to saying Model Session to the walls, the whole lot of you, and get your Model Session straightened up. Got that Instructors?

All right. And the next thing I want to say is, there is letting the pc itsa and there is sitting silent and inviting pc's itsa when there is no auditing question. And I think a lot of you may be doing that. Pc really doesn't have a question, is just talking – if you just sit silent and look at a pc, you are inviting itsa and the pc will talk. Learn that! Make a test of it. Just sit silent in front of a pc and you'll see the pc will start talking. Well, that's all very fine. But don't do it in a session! Pc hasn't got a question. So you sit silent and look at the pc, now the pc's got to talk. But the pc actually doesn't have a question. And so forth. Auditing is auditing, itsa is itsa. There's a happy medium between cutting a pc's actual itsa and being afraid to cut the pc's itsa, so not doing anything. And you've just got to find the happy middle ground and stop caroming off both extremes of this thing. It's either: cut the pc's itsa to ribbons – you say to the question. Here's really cutting a pc's itsa: "In this session, has anything been suppressed?" The pc says, "Oh, well, I uh..."

"Thank you! Well, all right, well, I didn't get any read on that," and so forth, "All right, in this session has anything been invalidated?"

"Uh, well, yes, you sort of invalidated my cognition..."

"Well, I didn't have any read on the meter. Let's see now. In this session, has anything been suggested?" and so forth. Well, by this time, of course, you've got a roaring ARC break. See, that's cutting a pc's itsa.

Now, here's another way to mess up a pc:

"In this session, has anything been suppressed?"

Pc says, "Hm, don't – don't think so."

Auditor: ...

Well, you're going to get an ARC break. Do you realize that you've cleaned a clean, by sitting and looking fixedly at a pc who hasn't got anything to say. When you sit silent and look at a pc, you clean a clean. Pc has got nothing to say, you understand?

You said, "Has anything been suppressed?" and he said, "Yeah, I suppressed – I suppressed all the Instructors, you know?" Whatever. And then he sits there – he's answered the question, you understand? And you sit there and you look at him silently, you say nothing, so forth.

He after a while all of a sudden gets the idea, "Maybe he still expects me to talk. So I'll look for another suppress. Let me see, what suppress, and so forth? Well, I guess not, I don't know, hm, *whao-whao*. What's this guy doing to me? I don't like this place. I don't even wanna answer his question!" Well, he's in a horrible position because he doesn't really have a question and yet the auditor, by sitting silent, implies that he's got to answer something.

Do you understand? And that is not cutting itsa, that is cleaning cleans. And when you start practicing this "sit still and look at the pc and not make sure the pc's got a question, the pc's answering the question," you're not doing anything for the pc – well, what are you doing? You're cleaning cleans.

Supposing you said on a meter, "In this session, has anything been suggested?" You didn't get any read, that needle was *smoooooth* as glass.

And then you said to the pc, "Hey! You heard the question! Had a read here."

Well, the pc's going to try to answer that. Only, of course, he hasn't got anything to answer. And then you just sit there and look at the pc. Well, you can watch a pc ARC break on a cleaned clean.

Well, you can also, also clean a clean, and make a pc ARC break, just by sitting there and looking at the pc! Look, develop a sensitivity. Develop a sensitivity. *Know* when the pc's got something to say and *know* when the pc hasn't got anything to say and act accordingly as an auditor. How do you develop that sensitivity.? That's up to you. I'm just the critic around here. Okay.

All right. Well, that's the end of those demonstrations. I'm very happy to have those demonstrations. I see what weak points are showing up in the last two demonstrations I've looked over here. I see about where we've gone. I see about what the score is with regard to this and I'm very happy to be able to give a hand and straighten this out.

Basic auditing is usually the cause of no progress. Basic auditing is corny – no progress. Yet, you look at techniques and that sort of thing to give you progress. You look at case analysis to give you progress. Well, actually, case analysis and techniques can get nowhere when basic auditing is out. If you want to see results in your pc get your basic auditing in flawlessly, perfectly, right straight down the groove. Basic auditing: Able to handle Model Session. Able to handle the meter. Able to handle the comm cycle. Snap, snap, snap. Able to handle these various things. And you will see, then, that you can apply a technique. But in the absence of basic auditing, you cannot apply a technique. So therefore, the technique appears not to work. So you ask for a new technique for this pc. Doesn't need a new technique – needs a technique applied with good basic auditing.

That's why I have these demonstrations and that's why I tie into you the way I have. I still love you.

Thank you very much.

Good night.

SEVEN CLASSIFICATIONS

A lecture given on 28 November 1963

Your applause is well received. Thank you. All right, what is the date?

Audience: November 28th.

Twenty-eight Nov. We're still in the month of the Russians. Your Saint Hill Special Briefing Course, AD 13. You notice that the daylight is fading and so forth. Daylight's fading, and that has nothing to do with the communist plot. They – purely coincidental that they never have any sunshine in Russia and so forth. I just wanted to reassure you. And the missiles – the missile situation is very good just now – very, very good just now. They used them all up on Guy Fawkes Day, so they have... [laughter, laughs]

I want to talk to you for a moment – this lecture's going to concern most anything. It's one of these potpourri type lectures of all ingredients that you can never realign in your notebooks; that you can never assign on a checksheet. [laughs, laughter]

I wanted to – I ended your last lecture with a remark on classes – new classifications. And this might – you might find very, very interesting. And I'd better give you some rundown on this and so forth, because we're off for the long shoot now, you see? And I said that Scientology would go as far as it worked and not as far as it was administered and that I could have gotten very busy on administration many, many years ago and administered it out to some considerable distance and so forth. So administration, actually, while getting a great deal of attention, and many instances very ably done in general, has suffered for a concentration.

Because until you had the full technical picture, I suspected, all the way – we're not now talking about clearing; we're talking about all the way – until you had the full technical picture, you could not lay out the administrative picture, you see? And I just had a hunch without even thinking about it or articulating it, that it would be impossible to lay out the administrative pattern of Scientology, and all of its administrative angles and designations, without having clear-cut and across the boards, the technical data. And this is very fortunate that this came about and was done this way because the technical data turned out to be no pill that you took after breakfast or a sudden shot in the gluteus maximus to make you Clear or something or grow wings. It turned out to be a highly precise, fantastically coordinated activity at the highest levels. And it also turned out that individuals could not actually be audited at these levels unless they had been brought up to that point in gradients. And it turned out that this was the case.

I'll give you what I'm – what I'm talking about here, now. I think you will agree that this is it, because it's not only just at the highest levels; it also falls in at the lower levels.

Let's try to pull some missed withholds on somebody who doesn't know what one is. You say, "Has anybody missed a withhold on you?" Well, you know what a missed withhold is. So you say, "Well, a missed withhold is a so-and-so and a so-and-so and it's a such-and-such and it's when you did this and when you did that, and so forth, and that is because of this and that. And then there's a double stimulus-response cycle in Scientology. It goes like this: The psychologist, you see, he thought that there was stimulus and response. And he thought there was one cycle: When you stimulated you got one response. That was the limit of his thinkingness. If you pushed a button the button got pushed, and that was all he thought ever happened. And that's why psychology was limited, you see.

"But there is actually a second curve. You can't have in this universe a stimulus-response without getting a stimulus-response. So it's a double cycle, you see, and this is all very simple, but actually when you push the button – when you push that button – even though it only said 'click,' remember, when it clicked, it was a stimuli, and your ears or hearingness responded to the click of the button, didn't it? So when you pushed a button, you got one stimuli response, you pushed button, and then it clicked. Well, that was a stimuli to which of course you get a response yourself. So there are always, no matter how slight the situation is, you always have a second stimulus-response cycle going on for every stimulus-response."

And the pc will sit there looking at you wondering... Well let me assure you, the middle of an intensive is not a time to take up this information. You've thrown him a philosophic conundrum which has never before been propounded in the literature and philosophy of this planet – which is to say, you cannot act without consequences. That's a philosophic, see? There must be consequences for every action. The Buddhist ran up against this same thing and he answered it in an entirely different way. He said, the Buddhist said, "Well, in view of the fact that you get a consequence for everything you do," he dimly understood this was the case, you see, he didn't articulate it, "why, you better not cause anything." And his answer to it is don't cause. In other words, the only way to avoid stimulus-response consequences of another stimulus-response occurring, is of course, start no stimulus-response mechanisms. Push no buttons. Do nothing. Cause nothing. And that was his answer to the situation.

Well, the world – and believe me, the chaps who are walking up and down the highways and byways and sitting in the palaces and at the – in the day of Gautama Siddhartha – were as reasonable, if not more so, at the raw-meat level, you see, than they are today. I mean, you've got the same breed of cat. There's no reason to downgrade the people he was talking to, you see. And he came to this conclusion and from that day to this the Buddhist, you see, tries not to cause anything. That was his solution to a problem.

Well, we have another solution to the problem, is you can audit it out. That's a much more forward method of doing so. But at what level is all this taking place? I'm afraid that you're really not talking to the man in the street. You must be talking to a trained Scientologist. And I don't think you'll even put this across at Level II. I think this is a Level III proposition, according to my new levels here. You get the – you get the idea? This is pretty profound, actually. It's the question of right conduct. Is it right to cause things? Can you really cause anything? If somebody gets into total chaos, he says – he gets this proposition, "Can you cause anything? Do you ever really cause anything?" You find some birds wandering around, and they will tell you, well, by association, you never really caused anything. Because where

do you find the start of the cause cycle? Of course the start of the cause cycle's very easily answered. The start of the cause cycle is where you say the cause cycle started. You just nominate it.

But you'll get this: And if you want to really throw somebody, say, "All right, take a rifle. All right, now, somebody gets killed. Now, if we examine this very carefully from a stimulus-response mechanism we find out that the trigger of the rifle – well, we say the rifle really killed somebody because that actually, you see, had the bullet and the powder and had the barrel to direct the thing, you see, and so it actually was the cause-point, wasn't it? It's obviously because it's the start of the cause-point, so your comm cycle there is cause-distance-effect; it naturally starts with a rifle."

All right, the fellow comes along, and he says, "Well, this couldn't possibly be true because somebody squeezed the trigger. And therefore it was the impulse that squeezed the trigger that caused the rifle to fire, and therefore the finger was the start of the stimulus-response cycle." Somebody else comes along and he says, "No, that isn't so. It was the thought, 'pull the trigger,' which caused the finger to pull and which caused the rifle to fire, so therefore the stimulus-response cycle takes place at the thought 'pull the trigger'." And then somebody comes along and he says, "It couldn't be that at all, because obviously there was some motivation for this. It must have been the motive. The person thought that he had reason to do this. So therefore the reason he had to do this was actually the start of the stimulus-response cycle."

Somebody – behaviorist comes along, and he says, "No, that couldn't be the case – couldn't be the case at all because the fellow got that reason from his early childhood, and so forth. So actually what started the whole cycle was the person's early childhood, you see. People were mean to him or something of this sort, and they complained when he threw spitballs at them, you know. And so therefore, it was really his early childhood that caused this whole thing."

And the child psychologist comes along and he explains to you very rapidly that of course you can't just say something nebulous like "early childhood," you see, you must assign it to something. So therefore, whose influence was the greatest over him: was it his mother, or his father? All right, and they finally figure it out that his mother pulled the trigger with... [laughs] You see the nonsense we get into as soon as we start – well, actually, you just take any – anything in this universe, of course, is so tied in with the rest of the universe that you can just keep tracking back endlessly, and so on.

Fortunately for us there is a prime thought. And it's way back there on the track at the beginning of the actual GPMs and you could track all cause for the individual back to prime thought. Well, that's great. There is a stopping point somewhere. But without knowing that particular data the rest of this data gets very esoteric. And the philosophical conundrums which it gives and the number of humanitarian (quote) "sciences" which it gives birth to – genetics, behaviorist philosophies and so on. You can just start counting these things on the fingers of a five-armed wonder, see, and there's just lots of them. And you've got yourself a – you've got yourself a "Where did anything start?" And then you must then conceive that it

must have started nowhere. See? Must have started nowhere and it was all out of everybody's control to begin with so you better not do anything about it.

Well, the people get so intrigued, you see, trying to trace this cause, this initial impulse for the stimuli back, that they never realize that that stimuli actually causes another stimuli cycle right in front of it. You squeeze the finger around the trigger of a rifle which then fires and there's going to be some repercussions. It might only be the recoil of the rifle, don't you see. But in actual fact the puller of the trigger is going to receive something from the act. It might only be the recoil of the rifle. It might only be the responses which – or pardon me, the stimuli which then start at the other end, which come back and hit the individual, don't you see? We've recently had a very gruesome example of this. I think in twenty-four hours the guy was dead. See? He fired a rifle and twenty-four hours later, boom, he's dead, you see – stimulus-response.* Well, if he hadn't fired the rifle he wouldn't be dead. See, that's very interesting to examine from a philosophical standpoint.

All right. Now you get your overt act-motivator sequence. And now we can go into a whole bunch of other think-think on this thing. Did he get shot because he shot? Was it very involved? Wasn't it just that he delivered an overt of shooting and received a motivator of shooting? Wasn't that just about what that amounted to? Or was it wider than this? Would the word "consequence" have to do with the moral values of his act? See, we can go into another big, wide perimeter of think, here, see. Moral values of his act, *dluhh*, so on and so on and so on. We can get awfully spread out.

Truth of the matter is you can't pull the finger of the rifle without receiving another stimulus-response cycle. It can't be done. In this universe it's impossible. Simply that. It doesn't matter if I... Now, I'll give you an example.

We haven't said how much stimuli and how much response, don't you see; how much cause and how much effect, we put it into Scientology language. Now we take this E-Meter and now I am going to turn on the sensitivity – I mean, the on-off switch of this E-Meter, see? Now, listen. All right, that's fine. [switches the meter on] I turned it on, and then that click occurred at this particular point and it itself was a new cycle of stimuli which then I heard and impinged on my eardrum, see? I'm not talking about the seriousness of things. We're not even really talking about the comparable magnitude. We're certainly talking, however, about stimulus-response mechanisms are met with stimulus-response mechanisms.

A cause and effect cycle is always met with a cause and effect cycle. You can't have a cause and effect cycle without receiving a cause and effect cycle. Then it gets to be a contest of how tough are you and how much can you confront.

Therefore, what you cause is monitored only by how much you can confront. If you can confront getting shot, shoot. You see? If you can't confront getting shot, don't shoot. And actually, moral conduct would simply be only causing those things which can be confronted by those they're caused to. And there in Scientology is an actual route around the overt act-

* Editor's note: LRH alludes to the fact that the alleged murderer of J.F.Kennedy, Lee Harvey Oswald, was himself shot shortly after he had been arrested by the police.

motivator sequence. There is an answer to this. Don't cause things others can't confront. This way you certainly minimize the stimulus-response stimulus-response curves.

You go around shooting people, you're liable to get shot. All right. Maybe this would be all right if you can confront getting shot yourself; maybe or maybe not, but that's a very first dynamicity proposition, let me assure you. Exclusively on the first.

The trouble is we do not live alone. You can go out and sit on a satellite for umpteen trillion years. Sooner or later you're going to – you're going to meet somebody else. Sooner or later. I can guarantee it. I've sat on some satellites and things for quite a few years. And sure enough, somebody always turned up. You wait long enough, somebody always turns up. That you've got a guarantee of, see?

Now, if we look over the proposition which is put before us here, we find out then that if you cause things which others can confront, or which others wish to confront and so forth, why, you lead a rather unstimulated existence. But if by your acts of omission and acts of commission are causing things others can't confront – that is to say it'd be greatly to their detriment if they even tried to confront them, such as of course, starting a war or something like this with its fantastic ramifications – if you set yourself up to be directly responsible for this particular type of cycle, why you can expect to get your head knocked off, that's for sure – eventually – even though you think you could confront it, you see?

You could say, "Well, I can confront all the effects of a war so therefore it's all right if I start a war." No, it's going to generate some effects you can't confront. Because you generated some effects they couldn't confront. The overt is generating effects which are unconfrontable. And the motivator is inevitably going to be the generation of effects which are unconfrontable.

So you see, the limited first dynamicity view of, "Well, I can shoot somebody because I don't mind getting shot. Therefore it makes it all right if I shoot somebody." That doesn't hold good. Because actually the overt isn't shooting somebody, the overt is causing an effect somebody else couldn't confront. And the motivator of it is going to be the cause of an effect that you can't confront. I don't care, it might be some entirely different type of effect. But it'll be something you can't confront.

Well, that's the story of this universe. What's omitted from all this – that any given instant the thetan can get an idea totally independent of all other ideas. And that's what puts in randomness into the whole situation. And any given idea, any given moment, any given thetan can "think" one, independent of everything else that's going on. Now the psychologist didn't believe this, so his work was limited. Other earlier philosophers didn't believe this. The idea was never really envisioned, which was independent postulation. He always thought you had to do it on association and they set you up a trap.

The old idea of you will always make gold – the alchemist joke – you will always make gold if you go to the top of a mountain at midnight, and you get on the top of this mountain and you take an old stump. And you put three pieces of lead in the stump and you say this charm over those pieces of lead, providing the phase of the moon is full. If you do not think of the word "hippopotamus" the lead will turn to gold. You can see it now!

All right, somebody will always think of the word "hippopotamus" because he's not supposed to. All right.

Similarly, they'll set up a proposition like this – they'll prove it to you conclusively. You cannot think of an independent thought. The reason you can't think of an independent thought, you see, is every time you try to think of an independent thought you will see that it is associated with some thought that has already been thought. Then they'll look at you smilingly like Cheshire cats, having set up the "hippopotamus" mechanism, you see. And just leave you, in vain, struggling through trying to think of an independent thought that is not associated with any independent thought. Well of course, that's silly, because you are already in association by having the idea that you should think of an independent thought without associating it with any other independent thought, so that is the independent thought. You get the trickery and trappery involved in this kind of stuff?

Well, just because you could always do weird tricks with association is no reason association is a total all of everything. And association, the idea of association, you think of ice cream, you think of a hot day, you think of a child, see? Stream of consciousness, writers call it. And you think of a this and then you – cause that, you thought of a that, and everybody's got his life all dreamed up as all thoughts were consecutive to an associative base someplace or another which in itself didn't exist. So they don't ever look for a primary or independent base, therefore they start to predict human behavior in a very interesting and peculiar way. They predict human behavior along this particular line and say that it is predictable.

See, they want to predict human behavior so they never recognize that human behavior can be unpredictable as part of its prediction. Part of the prediction of human behavior is the fact that it is unpredictable. And the reason for that is any thetan, at any given time, in any given place, can get a totally independent idea all off his own bat, without any assistance from anything.

Now that's a rather weird and wild proposition which exists exclusively in the area of Scientology: that somebody can think an independent thought. Well, of course, you can prove to everybody conclusively that people can't think independent thoughts by telling them that any thought they think is associated so try to think of a thought now that is not associated with any indepen... with a – with a... A guy will go, "Let's see, I can – all right, I'll think of that door. No, I couldn't think of that door because it's there and of course the fact that it's there made me think of to think of the door." You eventually go down scale. You say, "Well, I can't think of an independent thought."

In other words, self-determinism of think is taken away from a person in this particular universe. And then we get up to the proposition, then, of how much think can a person tolerate. How much think can a person think he has "think"? We see that all the time in the overt-motivator sequence. We start running somebody on, "What have you done? What have you withheld? What have you done? What have you withheld?" and that sort of thing, and they give you motivator, motivator, motivator, movitator, motivator. Motivator, motivator, motivator. You say, "What have you done?" And they will say, "Well, I sat down here so you could ask me – I've done something to myself by sitting down here and letting you ask me these horrible questions." That's the overt, see? You'd be surprised. We've got quite a catalog

around here of "overts" that are motivators. We used to keep lists on them. Some kinds of questions that students would answer in a motivatorish fashion, see?

"Now, what have you done since you came to Saint Hill?" don't you see?

"Well, I made myself come to Saint Hill and I've done something to myself so therefore that is an overt, you see."

They go on this way by the hour. And of course they're giving nothing but motivators, motivators, and not really answering the question. They're making it very reasonable, but they're really not answering the question. It gets worse and worse and worse and their tone arm will get stickier and stickier and they'll plow in harder and harder, see? Until all of a sudden they say, "Well, I did this and I did that and I pinched another student's biscuits and so forth," and all of a sudden they'll start coming up the line again, don't you see?

Well, this is concept of responsibility. So what is the relative concept amongst beings? Well, you find the fellow out there in the street, and man, it's all been done to him. This was the great appeal of Dianetics. See, it's all been done to you. Somebody tries to tell you Dianetics and Scientology are the same thing you might bring up this fact of responsibility. In Dianetics it was all done to you, and responsibility level of Scientology is "you done it." Makes Scientology relatively, not unpopular, but makes it higher toned. Somewhat different. But there is a difference between these two subjects. One concerns the mind and the interrelationships of mental image pictures and the other concerns the adventures of the human spirit. But man is a spirit; he is not an animal. These are entirely different subjects, if you want to look at it bluntly.

All right, so we are faced with a problem, then, of the tremendous popularity of irresponsibility: "It was all done to me." The individual then can conceive so easily in this universe that it was all done to him, that he never had an independent thought, that he never thought of anything that ever had anything to do with anything, that he himself never started an action. You'd be surprised. Kleptomaniacs are always pulling this as a defense: that the garment just moved off the counter and into their bag. And they actually say this, and people think they are joking. See, they don't realize that the kleptomaniac thinks that's what happened. He'll see his arm – he'll see this independent arm go up, and pick the article off the counter and put it in the shopping bag, you see? He sees this happen, very detachedly, see, he had nothing to do with it, you know? Arm comes up, arm comes up...

The common criminal, the common criminal, knows at levels of responsibility which are quite interesting. They watch themselves do things. And they see these things have happened, but they know they didn't do it, that it's due and owing to some other factor or force that it occurred. They have all sorts of ideas. For instance, they think that everybody pretends that people own things. See, they know this – they know this is a lie, that everybody else knows is a lie, and that has been dreamed up everywhere, and that everybody has agreed on for one reason only: to get them.

To give you a slighter amplification of this, the fellow knows that nobody owns anything, you see, he knows that nobody really owns anything anywhere, but they have entered into a conspiracy which they pretend, see, they pretend that people think people own things.

And this is done for only one reason: These other people pretend this to get them personally in trouble.

That is actually the thinkingness level of a criminal. That accounts for the little sly sneer you see on their faces sometimes. They know everybody else is just pretending that it was a crime. They can be gotten to just because everybody else pretends it's a crime, see? Everybody else is being very nasty to them. They say certain things exist, you see? And that's just to get them in trouble. These things don't really exist. And people believe these things just to get them in trouble. Courts and that sort of thing only exist – not because there is such a thing as crime – they just exist so that they can pretend outrageous and unreasonable things so that they can get this poor guy, you see, and they know that's the way things are. And of course, operating in that frame of work, why, they then have the total reality of the uncriminalness of all criminal acts.

Now, the police are going up against a mechanism of this particular kind and character in order to stamp out crime. Now that's one of the most remarkable situations in the world. The cop actually, they have rather widely, particularly in the US, borrowed a lot of our definitions with regard to crime. "Criminal can't work," criminal *rah-rah-rah*, that I wrote some little essays on at one time or another, and they've gotten about. I've heard them echoed back.

But they don't realize this horrible fact: That anybody they're arresting for stealing the car – the guy just overtly stole this car – the person that they are arresting would horrify them if they could look into his head and find out what he was really thinking. He knows, he knows, this fellow who stole the car, that the police are just a bunch of frauds. That the car really never belonged to anybody and that the police are fraudulently pretending that cars are owned in order to get the fellow who drove this one off in trouble. And that somebody else who owned the car is just pretending that he owned the car.

This is one of the reason MEST goes to pieces amongst criminals and so forth. They know nobody owns it. Doesn't belong to them; doesn't belong to anybody. This is a very fantastic frame of mind. Of course that's a total unreality; total this and that. Maybe at the highest levels and so forth, maybe it is kind of a joke that everybody owns everything... no – that anybody owns anything, and so forth. Nevertheless, these are the agreements upon which this society is built. And failure to recognize the rights of other individuals with regard to their zones and spheres of ownership is bound to bring about chaos of magnitude. And to not respect those spheres of ownership, of course, is to sow overt acts that are just madness themselves. Nothing can operate.

Actually, communism gets a very accurate designation because it really believes, nationally, that nobody really ever owns anything. And of course they enforce it as a state. That's why it tends to attract so many hot rod criminals into its commissar ranks. And they got plenty. This idea is basically a criminal idea.

All right. Now let's go a little bit further than this. There, of course, is a very subnormal – subusual I should say – idea that is much below the social level. You're getting into ideas which are down into the bottom of the sewer, you see. They're way below what you would consider a normal. Now you're dealing, however, with what is basically a neurosis. And at some levels this becomes – it becomes worse, it becomes, of course, some kind of a

psychosis. "It's perfectly all right to kill people because they don't exist," is one of the homicidal characteristics of thought. "I didn't shoot him. I didn't shoot him." And one of the reasons he's basing this – "I didn't shoot anybody," he's more likely to say because, of course, the other person didn't exist, so therefore, you know, how could he have shot him? His reasonability – person will be lying there in a mass of blood and he'd say, "Well I – I didn't – I didn't do anything to anybody," see. Why? Because there was nobody there.

Everyone around that person is a figment of his own imagination and he recognizes the delusory nature of his own imagination which gives him a universe, which is quite interesting. But we are not talking, actually, now, in classification about such subnormal levels of thought, we're not talking about psychosis, we're not talking about neurosis. We're just talking about this guy out here in the street. And this boy out here, he's walking around, he has his own difficulties. The most common difficulty at this particular time and space common to most nations of the planet is that "it was done to them." This is pretty much the common denominator of their think. "It was done to them."

The way they are – as they are right now – is the way they are because something was done to them that made them that way. That is their big think about it. The responsibility for their state of beingness is exterior to their own control. They cannot control their own state of beingness; it's always exterior to them. I've – as a writer I used – my hair used to stand on end on one peculiar little phobia I used to have. I have just published a story or something like that and it'd be all over the newsstands and I'd be all swelled up on myself, something like this, and – never seem to wear off, no matter how many stories you publish, you're always glad to see them, and – I don't know, it's probably a second dynamic manifestation – thetan's always happy to see his creations around, you know, for some reason or other.

And some fellow, you know, one of these lip-moving writers, you know, tongue in – held between his teeth, you know, and little stub of a pencil, and you know, fellow's – to sign his name, you see, or make out a bill or something like that, he'll say "Oh," he says, "I always wanted to be a writer. I always wanted to be a writer but the trouble was I didn't have the education." It always used to strike me as peculiar because not one fellow said it to me; this is a totally generalized remark. I heard it everywhere. It was inevitable that this remark would be made in the course of any conversation. "Oh yes, you're Hubbard. I saw one of your pictures recently," or something like this, see, or "I saw something or other" and so forth. And you just wait for a moment, because here it came, you see. "I always wanted to write, but I didn't do so because I didn't have the education." You know, I never really figured out the pat response for that stimuli. I could be counted on to change the subject or to ask them how the weather was going to be or how their wives were or something of the sort. But it was almost inevitable.

This was, of course, from one point of view on one profession. But the generalization of this particular activity – it didn't mean that some of them wouldn't have written, don't you see? It didn't mean that they were being in contest with anything, it didn't mean they were probably doing anything but agree. But what I'm calling to your attention is it – the reason they didn't write had to do with their education. And this made to me, in the first couple of years as a pro writer, particularly stood my hair on end because all during that period of time I was hectically, fiendishly, frantically trying to jettison and throw overboard all of the education I had gratuitously and horrifyingly been given on the subject of writing.

I was writing in *spite* of very good training in this particular field. Almost killed me. By the time you get over all these instilled phobias from somebody else, you have a hard time.

Now, what's this mean? It means that in a little banal, ordinary type of conversation that didn't have anything to do with anything, somebody else had the responsibility. That person – person wasn't writing because they weren't writing or because they were too lazy to write or they didn't have time to write or they just weren't writing. They couldn't say this. It had to be an exterior stimuli of which they were the response. It had to be an exterior cause of which they were the effect. You bring up almost anything with the average being and he will always handle it in this fashion – ordinarily handle it in this fashion. And then he will say, "There's an exterior cause that – which I am the effect." His conversation.

If you want to – ever want to read letters exchanged by members of the American Middle West – those are the most educative letters on the subject of health I think I have ever really read. I've read lots of them at one time or another. I've seen lots of them around. For awhile I was so horrified that I had the fixation of the "you couldn't stand to look at it so you went and looked at it," you know, this kind of a fixation on the subject. And I'd see letters from Mrs. Johnson, you see, to Mrs. Brown – and Mrs. Brown in Sioux City was being told by somebody in Kansas City just the common news of the day, you see. And "Uncle – Uncle Ralph, you see, has his lumbago and so forth and so forth, and they had to take poor Irma's *blah-blah* out the other day, and so forth," and it runs off this horrible medical catalog – the letter, you think of holding it up, you know, and the blood just drips off of one corner of it, you see, and the rest of it is unreadable because of the disease germs. [laughter]

Effect-they're just fixated on the idea of effect. Causative, cause is just lost to this wide, greatest majority of people – anything causative. Now, one of the things which you err in when you try to disseminate Scientology is not estimating this exact aspect where it comes about on the – this mythical character – the man in the street. You don't estimate how much cause he is willing to be responsible for, see? You hit him at where you live, which is you're willing to be responsible for some cause, don't you see? Well, he's not willing to be responsible for any cause; he's effect. Life has done it to him. If he had just been left a million dollars then he would be able to go down and look at the ocean once in a while himself. If he had – if he had – you see. If it hadn't happened to him that... If his Uncle Snodgrass had not died then... If... You see, he's effect, effect. He's telling you all the time, "I'm the effect of this horrible thing called life. I'm effect of all this trickery. I'm the effect of all this nonsense. I'm the effect of all these other things."

Well, he gets into that mood quite honestly because, believe me, he *is* the effect of an awful lot of interesting things, you see? There's not some lack of truth in this, see? At any given instant, why, his boss can take a sudden dislike to him or something like that and he's out in the rain, don't you see? At any given instant, why, some bug comes walking down the boulevard, you know, and gives him a nip, and he's up there in the hospital with a four thousand dollar bill facing him, you see? Wild and horrible things can happen to this individual. He can be the effect of so many things that he actually can't think of himself as ever being cause of anything at all.

So you have some mother whose boy has gone zig-zag down the bad road, or something like this, and she can't think of herself as ever having any part of any of that, you know. Can't think of herself as having caused any part of it. Can't take responsibility for anything that ever happened to this fellow, you see? She'd take refuge in such things – all famous criminals' mothers, incidentally, almost uniformly say at the time the criminal is executed, "He was a good boy." It's just happened again in America. "He was a good boy." That's right. Oswald was a good boy. That was the adjudication of his mother.

See, they don't think any further than that, but they can actually go into an inversion of this and just try to deny all reality with regard to any of the existing situation. One doesn't say that she should take full responsibility for the matter, but why is she interested in being an effect of it if she couldn't cause it? And one of the errors which you make on dissemination, of course, is try to make the fellow take hold of any cause at all.

Dear old Peggy Conway told me one time or another, "I was going along in life," she says, "I was going along in life and I was doing all right and I was doing okay. I just knew that everybody else was the reason for all of my troubles and difficulties, and that I had nothing to do with it whatsoever at all, and I knew that if I believed in certain things and I acted in certain ways and so forth, then somehow or another I would get through somehow, not very well. And all of a sudden you come along and you tell me just, 'All right, stand out there in the open. Now stand on your own two feet. Now be responsible for what's going on in your life!'" She says, "It was a horrible shock!"

'Tis, too! You just – but look. Look at how low this level is. Look at how low this level is. If you just intimated – this would be a gradient on it – if you'd just intimated, "There may be certain zones and sections in your existence which, if you think them over very carefully, you may find you have had a causative action in. If you think them over very carefully and sort them out, you may find that some zone of your life you have actually caused something." We don't say it very much. We say, "At one time or another you decided to read a book and you decided to read the book and your cause there was deciding to read the book, see."

Well, perhaps they'd buy it on that. But ordinarily, if you just dump it on their heads, say, "Look you're responsible for everything that ever happened to you, what's really wrong with you is you've been doing so many weird things with your bank, and coming along and thinking of postulating this sort of thing and so forth, and moving on up to present time, and so forth, no wonder you're in a horrible condition, see?" And they go "Uhhhhh." Well, they want to be an effect. That's the comfortable agony to be in. That's the most comfortable conceivable agony, is to be at the total effect point of all of existence.

Now, you take this fellow and you show him, or her, you show them this little, little bit, that – you show them there are a couple of rules in life. And you show them something or other, and they get a bit wiser suddenly. They look at these things. And then they apply a rule or two of this. Well, you tell them about communication, ARC triangle, or something like this, if you've got them up that high, and they apply this. Or you show them how to do a Touch Assist, and train them up just like you were training a pro auditor, you see, until they

could really stick there, and you know, "Feel my finger." You know? Do that Touch Assist real good. Give them a very disciplined run of a Touch Assist and so on.

And they all of a sudden are working on somebody one day and horrible shooting pain goes through the guy's skull and he suddenly snaps out of it and he's okay, see? Fantastic. He's caused something. The person who did that Touch Assist has caused something. Entering it philosophically, saying, "Look old fellow, you, in actual fact, are the cause of certain things in your life. Just to think it over." He might be able to pick this up on a think-think basis. But in actual fact he won't believe it. If you show him – if you show him that he can talk to his wife or he can do a Touch Assist on his friend, or something like this, it gradually starts dawning on him that he can cause something. He doesn't really wish particularly to look back that you're the one who taught him to do it because he is doing the action. And at that entrance – and he can cause an effect. And he realizes that he is causing the effect.

Now, people who are the most saddled with religious superstition are the hardest to bring out of this rut. Ireland was a terrible example to us in that particular line. Because the one lecture that laid a complete egg every week was the lecture which was devoted to creation. And of course this ran straight into the eighth dynamic and went up beautifully, exploded and fell to the ground in little bits and pieces because nobody could create anything. And finally, the Instructors over there got very clever, and they got up to a point of saying, "You could make a chair. Could you make a chair? Therefore, you have created a chair." And eventually it'd get around, it was heresy, don't you see? Utter heresy. God had created everything and therefore they could not have created anything without actually running into heresy.

It's the first time I noticed this principle at work. Actually, create is the wrong word to use. It's "cause." "Cause." Did they cause anything? And we wouldn't have had that much difficulty. But you can argue with the man for a long time as to what he can cause. You can process him in this direction and so forth, you might get someplace – would get someplace.

But you could be very philosophic and you could be very involved without making very much progress.

Can you cause anything? Do you cause anything? Ah. But the areas where he knows everybody fails are the areas of human relationship, communication, health, well-beingness – these particular areas. These are very desirable effects. These are effects that somebody else wants: good communication, feel better and so forth. All right. Well, he's then obeying this original rule that I gave you: "Cause only those effects which others can confront, or that want," see?

Now, you've given him that and then you give him some tools and train him up well in the use of these tools and let him find out that he can cause an effect. And you have snapped him out of this endless cycle of stimulus-response stimulus-response; everything has a consequence; anything you do you'd better not do anything because if you do do it then you'll get your teeth kicked in, therefore you better be very idle, therefore you'd better be nothing but an effect because your teeth have been kicked in already. Think-think-think, figure-figure-figure, does anybody ever really start an original action? See, all of these – all of these questions.

You see, the point is, it isn't these people are ignorant of philosophy, these people have failed in the field of philosophy. It's not that anybody doesn't want philosophy, they just don't

believe it could exist anymore. You see, these men, out here on the street, we don't care what the savants up in the university are saying about matters of life and death, "...and is it true or isn't it true that eight needles can stand on the head of an angel." We're not interested about any of their philosophic conundrums, we're not the least bit interested. Nor in their opinions, because they are not the living world. They're a pretty dead one, if you want to know the truth of the matter. I went into a university one time, dusted off a professor and talked to him for a few minutes. Put him back in his chair and left. I suppose he's there yet.

That's very, very cruel of me, actually. That particular university, they were very, very anxious to see me – they were very, very happy to see me because they'd been trying to write science fiction stories around there, too, and they'd never made the grade. That's far from the totality of my writing, but that was why they were interested.

Anyway, these savants and their definitions and so forth seem to upgrade the field of philosophy to a point where it is an untouchable area. It's a plateau that nobody could ever ascend to. One must know propounding words and propound words like "telekinesis," and must be able to have an insight into the writings of Hume as locked into the writings of Locke, as modified by "he-couldn't" Mr. Kant, see? And one must be able to give forth verbatim a whole page, *pocketa-pocketa-pocketa-pocketa* of Lucretius, you see, without even pausing for colons, in order to be a philosopher. And actually this is their zone and area of philosophy and that isn't the zone or area that philosophy was ever designed for, that isn't the zone or area where it's ever bought, and it must be that they're studying some kind of dead philosophy that nobody wants for it to reach a plateau of this particular kind.

So it leaves the whole world open to this very, very marketable commodity called "philosophy." I say marketably, not for financial reasons, but everybody wants this thing. Because the philosopher, the fellow, is that little guy out in the street. Except he's failed in this particular field. He wants to know, vaguely, dimly, almost forgotten wanting to know it, "Who am I? What am I? What am I doing here? What are people? Where did this universe come from? What happens to me when I die? Where am I going? Why is it that you really can't succeed in life here? What is tha... what happens to people? Why don't they like me? What is the truth about *raow*..." And actually, some circuitry in the head of every skull on this planet, and the guy himself, is going around at some low level, saying those exact questions. And those are the basic questions of philosophy. And that philosophy hasn't answered them has put it on a plateau so that everybody can pretend that philosophy has answered it, but can't ascend to the plateau to find out.

The greatest defeat philosophy ever had was Immanuel Kant saying, "Oh, well, there's the knowable and the unknowable and some things are so unknowable that nobody ever knows – is going to know them and so forth. The unknowable is just unknowable and that's all." That's insanity, man! Will you please explain to me *how* he would ever find out there was an unknowable if nobody could ever know about it? And as far as religion is concerned, and its answers, are very unsatisfactory, because "God made everybody." That's a wonderful thing. I mean, it doesn't take any time at all to say it, "God made everybody," see. And people go running around with this one, "God made everybody, God made everybody," you know, that's wonderful. Glib. Prime cause is announced right there, bang. Ecclesiastical councils can sit around and propound this for thousands of years, don't you see? "Boy, are we learned!

Marvelous!" Learnedness here goes out by the ream and they say it in Latin with organ music. Awful waste of good organ music. Anyhow, what this all adds up to here – what all this adds up to – is one question from a little child can puncture the whole thing. Little child says, "Who made God?"

So, we go on this stimulus-response track looking for answers, forever, you see, and we're just on an endless treadmill. Of course we come to no full stop until we realize that every being is an independent being who is himself capable of expressing a thought or intention independent of all other thoughts and intentions at any given instant. As soon as we recognize that every individual is capable of himself being causative, we have no, no slightest approach to answers. We can't answer anything. But as soon as we accept that as a basis for action, a basis for thought; as soon as we realize that it's the degree that an individual can accept or execute causation independent of other influences that brings about his state of case, we then have cracked the whole riddle of philosophy. There's nothing left to philosophy to be stupid about.

Now, if we introduce physics into it and say all things are relative to all things in a time stream, and the time stream is invariable and uneradicable, and so forth, we've already accepted our distance into a prime thought. We're that far from prime thought. We've already postulated time. Now, of course, you're on the treadmill of "you must never be able to escape this time." So all things happening in the past must influence all things that happen in the future and then everything is inevitable and let's all go down and die quietly in the barn together. See, I mean, that becomes utter nonsense.

As soon as we got a time stream, don't you see, then all before influence all afters, and then we can prove, because the time stream exists, that nobody can be cause. Until we realize that the time stream is capable of postulation. A time stream can both be caused and escaped from. And if this is possible, then of course, we get another higher level of cause.

So, I tell you – listen to me now – the only thing I'm giving you all this about – you might find it useful, you might find it entertaining. In the field of dissemination it might give you some answers – you say to somebody, "All right, now you realize that you're the cause of this bad marriage. Now just be more causative and straighten out the bad marriage," see? *Bloom!* [laughter] That isn't just an error; that's an ARC break. That is so far from this individual's reality on the subject, you see? So you might have some answers to dissemination along in this particular line, but what I'm trying to tell you here, what I'm trying to tell you here, is the basis of classification.

Now, we've had gotten a lot of technology, and technology is very valuable, and anybody tried to swallow it all off one spoon he'd get an awful bellyache. There's one rule about it, by the way, there's one rule in dissemination – before I leave the subject of dissemination, I will give you one little tip on the thing: If you only tell people things about Scientology that you yourself have an excellent reality on and have experienced, you'll find you'll just communicate like a shot to almost anybody because your R-factor in you is so high that you cannot help but put it across to others. It's an interesting rule in dissemination. You'll hear more of this later. And it probably could be stated much more aptly than I have just stated it because I haven't worked it over at all for a good statement, but it's just more or less that. If you talk to

people about things that you yourself have an excellent reality on – and the best way to have a reality on it is of course to experience something – well, you'll find out you'll communicate like a bomb, and nobody ever doubts you then. They say, "This Scientology's wonderful, wonderful stuff. I mean the fellow and so forth just look at him, you know, and there he is," and so on.

I was very interested at a level of reality that Charles in here, my man there, he's an old sailor, and he'd been everywhere and done everything, you know, and so on. He met somebody up in a pub and some student or other had not really acquainted this fellow with the facts of Scientology. And he was able to communicate to this person and he had this person swinging over from "their bunch of bums and rats" over in no time. He actually was unconsciously applying this rule. He said, "Well, I've been down at Saint Hill," he said, "for several months, and I feel much better." That was his total argument in selling Scientology. "Been down at Saint Hill for several months and I feel much better."

I think that you – I think that you will consider this an interestingly mild little piece of dissemination. But in actual fact that was his reality. See? He does feel better for having been down here for several months, see? But that, of course, carried fantastic conviction. It was just like a bullet. That was his total reality on the subject and he just delivered it across and that was all there was to it. It arrived with complete truth because it was complete truth from its point of origin. Don't you see?

It isn't the startling thing you say; it's the real thing you say. And it isn't whether or not it's real to the fellow you're talking to but whether or not it's real to you. You'd be surprised how well you could communicate if you had a wart in your left ear at one time and you had some processing and it disappeared. Tell this person all about this wart disappearing, you know, and they say, "Scientology's a good thing, you know, and you're a good communicator, you know, you're really talking." Sounds wild, see.

Or maybe, "I had a – I had a – I used to worry all the time, I used to worry all the time about whether it was a good or bad thing, or I'd been a bad boy for not going to church. And I don't worry about that now." The guy's – a benefit he's had, see. And the fellow hearing it at the other end will. "What do you know!" You'll find out it'll arrive in every case with terrific impact.

By the way, this was called to my attention by people talking about things on which they had no reality, and I suddenly got a codification of exactly how you could talk to somebody with a total reality. I thought that was helpful. People don't often tell me things that are helpful, but that one did.

All right, in this other particular – that's enough of that. I want to tell you about this classification scale. Because it does – I've had to work it out one way or the other and I've seen the necessities for it and so forth. But all a classification scale is, is willingness to accept cause over one's destiny and that of others. That's all a classification scale is. It's a scale of willingness to accept... take cause over the – one's own destiny and that of others. Be at cause, in other words; degree of being at cause.

Now, of course, down scale, madmen get into an obsessive "cause," you know. And every once in a while somebody will come along and consult me on the fact that he has to

have processing because he's got to take over control of England, or something of this sort, and wipe out Europe, you know? It doesn't seem to me to be very real. Then we try to find out if the guy can remember what he ate for breakfast and we find out he can't. So this, of course, is susceptible to various reinterpretations. But in actual fact, you could get it every time just by a test of O/W. What is the fellow – what has he done and what has he withheld?

Now, of course, this of course is also susceptible to misinterpretation, because some fellows have done horrible things and they tell you these things without any responsibility whatsoever. But there you are merely looking at a lack of social sense. We are not discussing, however, how you measure this. We are not discussing how you measure this. We're just giving it to you as the basic formula on which classification is founded.

And cause is not expressed in actions in life but in case responses. You understand? It's cause over, or in, one's own case, that we are discussing. We're not ask – talking about the person being causative in various zones and dynamics and areas. We're just talking about his level of responsibility in his own case level. Now a lot of these factors can shake out, and they can actually be plotted. A person of very high levels of responsibility has certain abilities and perceptions, mentally, which are very evident. They're quite evident. They're processing of one kind or another. These – you only get fooled with these for lack of experience.

Some fellow who apparently never ARC breaks may be totally incapable of assuming cause. See, he never ARC breaks. He's a very quiet, good pc, but never makes any case gains, see, unless they're very carefully processed. And you don't realize this until after a while you see that this case is not making any progress whatsoever; his level of cause is not increasing or improving. And he eventually may come up to a point where he will ARC break. This is your propitiation case, of which you are well acquainted. Always tell the auditor in a sort of a sad-looking – from a sad-looking eye about his case, "Oh, yes, I made some good results in-session, thank you," so on. You hear him afterwards saying, "Well, yes, he isn't so good, but I have to be nice, you see." It's all sort of washed out. I've even seen a propitiative manic the like of which you never saw, you know. Process the person, gets no better, gets no tone arm action, nothing of the sort, and at the end of the session, you know, tell you brightly, "Oh, it was a wonderful session! A wonderful session!" and so forth. But these are just variations of lower harmonics of the same thing. People make progress in processing or they don't. And you quickly get so that you can plot up a case as to whether or not that case is doing well under processing or isn't doing well under processing.

Let's take one level of case that can't sit still and answer an auditing question. That's a pc manifestation in processing. You say, "Do fish swim?" and they say, "*Whooo*" wiggle, wiggle off and so forth, cans *raow* and so forth. "Yes." And you explore it afterwards, they answered the auditing question, and they were answering the question, "Is any sun coming in the window," you see. I mean, this thing is all disconnected and they really never answer the auditing question and they never seem to get any this; they never seem to get any that.

And they don't get over this. They don't get over this manifestation. In other words there's no change. One of the ways you tell this is they always set the same goals. You can look over goals lists, and when an individual starts setting the same goals session after session after session after session after session, this individual is not making any progress in process-

ing. It's one of the ways you tell. You want to look for the ARC break session and so forth. You look at the goals set in that session and set in the next session. And violent changes between these two things – not a gradient change, but a violent change – will denote that that was the session in which you should look for the ARC break. And then you see what was done in that session and you can straighten the case out accordingly by inspecting the goals for the session.

All of this is very interesting, but it means that a case under processing follows up a rather smooth, steady gradient. Cases do not leap up suddenly. What the case is doing is becoming more at cause over matter, energy, space, time, forms and other beings. And the individual is assuming greater and greater cause. He isn't being necessarily more causative, he is simply assuming greater cause and he's more capable of cause. We aren't asking him to throw bricks around and keep them hoisted up in midair at a glance. We're asking him whether or not he would be *willing* to do this, don't you see? Would he – willing to cause that?

But it actually is not even the – not even the single act that we're interested in. It's just he is more causative. He can handle his mind better. As he handles his mind better, he is more capable of handling other things around him better, and so forth. And his responses in processing are your very best possible indicator. This is not, then, a quick test so it tends to be neglected. And you actually have to process somebody for a while to find out if they're making some progress in processing. You can't take some fellow, and in the absence of his case folders and in the absence of everything else and so forth, just suddenly test whether or not he can do this, do that, and the other thing. It would be nice and maybe we could devise a set of tests of this character that would give you a good index.

However, they don't exist. You can, however, take somebody's case folder and find out how he was last year and how he is this year. That would make a marked jump, or somebody has had two or three hundred hours of processing and how was he before these two or three hundred hours of processing, how is he now? Well, that jump is big enough so that he knows and so forth, and you actually have to plow around for a little while to find out how he was two or three hundred hours ago because it's all negative gain.

The things that were wrong with him, two or three hundred hours ago, are not wrong with him now and so are not occupying any attention as far as he's concerned. And sometimes a fellow would have to sit there and think it over for quite a while to tell you if he's made any progress or not. But he has.

Case progress. Case progress. That is a direct index of cause. Take this fellow out here in the street, this common fellow, he's totally going to be an effect of everything. He wants to be told he's an effect of everything and so forth. Wrong thing to do is tell him to get causative. The right thing to do is to give him a little training and give him some tools, which when he applies them will demonstrate to him that he is now a little bit more at cause. Now he finds this out, and in the course of being processed and processing, he becomes more and more causative. He comes up higher and higher. He can accept more responsibility. Life in its zones and areas does not find him as a puppet or a marionette dancing at a set of strings, he's likely to have snapped a few of the strings, you see, or he's likely to stand still when somebody shakes the crossbar.

In other words, he's moved up to that degree. He's become more causative, therefore he's less of an effect of life. And these things are the things on which this class scale is drawn. That's all. That is the index, one to the next, within the ramifications of the things I've given you here as indexes as to how to measure it and that sort of thing.

You don't realize how far you've come, you see, until you get ahold of Joe Blow out here someplace working in a garage, and try to ask him if fish swim. Now that's not a particularly educated process or another. Let's not ask him a process. Let's just ask him if he has any problems, and listen to some of his answers. This is quite interesting. Fascinating, what he considers a problem. What is bedeviling his days and so forth. It's horrible. I mean, the fellow is living in a madhouse, from his viewpoint, don't you see?

All right, you just tell that fellow, be more causative, and that sort of thing, and he's not likely to love you for it. But if you can bring him up the line and you can teach him a little bit about processing, you can teach him a little bit, and you can get him processed and work back and forth at a very, very low level of processing, you see, why, he will assume more cause. And at that time he's quite capable of assuming enough cause to assume a new level of processing others and being processed. And when he's completed that he would be at another level where he was quite capable of assuming a new level of causativeness and being able to handle processes at that particular level. And so on up the line, all the way to OT.

This gives us, essentially, seven classes. And these seven classes are in actual fact eight. Now, you think we went up to the eighth dynamic, but we didn't – we went down to zero. There is a zero classification and that's the person who isn't classed. So you see, you have an unclassified class that you can refer to as Class 0, and seven classes, which makes the statement I gave you in the first place quite accurate. But in actual fact there's another class. That is the unclassified.

Now, if you wanted to be very precise about this thing you would say that a person who was a Class 0 was higher than an unclassified person, if you wanted a person who had never heard of Scientology at all, and wasn't in any direction whatsoever, you could maybe call that "unclassified," or something, to differentiate. Actually, we haven't really got any word for that but "raw meat."

But an unclassified person, a Class 0 – however that gets divided up – finds the person putting his rung on the ladder when he leaves Class 0 and becomes a Class I, HAS. This certificate is restored for good and adequate reasons that it's a different route now than a Book Auditor route.

Class 0: A person could be a Class 0 and have a certificate which had not yet been classed, don't you see, because he's only classed by the classification, not by the certificate. He can have a certificate without being of that class. That's important because in training activities, you will have a certain number of people who absolutely get their hearts utterly broken if they do not get a certificate or something to show they have been there and worked at it, and they've tried and they've passed their checksheets and they've done what they could. And all of a sudden you turn around and say, "We're going to give you no recognition for all the work you've done." Well maybe it was ten times as much work as somebody who did pass it all, don't you see. But we've done nothing for this chap.

So therefore, we make the certificate – the piece of paper – the certificate is inevitable for the completion of a certain course of study. But it doesn't make it inevitable that the person would be of that class. They would remain in the class they were in until they have their classification requirements met. Classification requirements, absolutely cut and bang, right on. No monkeying with it. No fooling about with it. You'll find out then that you can hold your classification requirements much more tightly if you do not try to hold your piece of paper certificate requirements so tightly. You understand?

Nobody will argue with you, particularly, you're training some people – you're training some people up through Class 0 and I. All right, you're going to give them a certificate when they're Class 0. They're Class 0 and they completed a certain course of study and that sort of thing, and there they are with a Class 0 certificate which is HAS, but it hasn't got any class on it. They can still run those processes that they were permitted to run at Class 0, which is practically everybody processes, and the Class 0 level of processing is a Touch Assist. See, he can do a Touch Assist. He can do something of that level of process at Class 0. Nobody really requires anything very desperate of them to do so, don't you see?

Now Class I becomes itsa. Now we've got itsa for Class I. That's the process of the class. Just to give you – just as a – not necessarily total final processes that belong to these classes, but it'll give you an idea of this gradient. Itsa is processes; they're Class I.

Repetitive processes: "Recall a communication," that sort of thing, normally the first processes taught in an Academy course. But this tremendous panorama of repetitive processes, they're not complicated beyond repetitive. They're not even complicated with a meter, don't you see? They'll have a meter at this stage, but mostly for reading the tone arm action. The meter is not significant at this level. And that is a Class II, with the repetitive process. And they get all of those old-time repetitive processes that are way back. They're strung out across the years and they're so valuable and that have done so fantastically workhorse a job, don't you see? They all belong in that particular class.

And we relegate missed withholds and overt/withhold processes and all Prepchecking, to Class III. That's missed withholds, O/Ws, Prepchecking, that would be Class III. I have learned by experience that it's pretty hard to teach a meter with great accuracy in an Academy and so forth. It leaves a lot to be desired. So it had better be grooved up into its own class, and that sort of thing. Well, they're taught about a meter in the Academy in a cursory fashion. This is the tone arm, this is how you switch it on and off. But the real hammer and pound on meters comes in here at Class III. They really start using meters at this level. And they can prepcheck. And at Prepcheck levels of course you've got tremendous numbers of processes again. This carries with it a little bit of an assessment. Not much of an assessment, but enough assessment to carry through in these things. You can find out what was the principal problem of this guy's existence, and then prepcheck the old HGC twenty-five-hour intensive. All of those processes belong in this thing.

See, here's what's funny, it's this whole thirteen years of research is suddenly coming alive before your eyes. It is not just deserted and neglected and lying there never to be seen again and your skills will never again be used. As a matter of fact, that stuff had value, value, value. What's happened to everybody is they followed the research line up, you see. And they

moved on up, and tried to move up to the top of the research line doggedly with their tongues hanging out, and that sort of thing. And in many instances have actually never gone through thoroughly any one of these levels as they came on up.

Therefore they get to the higher grade and they find the door barred. They actually never completed one of these lower steps. And they get up to the upper level and they're moving like the dickens with the research line and it has unsettled them to that degree. That doesn't mean we're just throwing everybody into Class 0 either, I'll take that up in a moment. But this is essentially what happened. But there's tremendously valuable processes lying back along those lines. There's fantastic things have been done, in times. Well, the old "Hello Mama," for heaven's sakes. You take a guy with a toothache and have him say hello and okay to it, have the tooth say hello and okay to him for awhile, and the most remarkable things can happen.

In other words, there's all kinds of processes – tons of them lying back along the line – and they fit into these various slots just as they were, you see, and grouped up and made neat. But just as they were. There's no vast reformation or change what the process was. You'll find, for instance, Class II will be studying a comm lag – on comm lags of equal length, as to when to end the process. Remember those old ones, you see? All that stuff is all back in action, see.

Anyhow, here's Prepcheck at Class III, and service facsimiles and assessments, and doing assessments and supervising the doing assessments and all that sort of thing, service facsimiles, all of that kind of work, you know, assessment – real heavy assessment work – and so forth, belongs at Class IV. In anything we've ever assessed or done, except 2. I don't think I'll ever let anybody run 2-12. 2-12 was interesting training ground, it taught people a lot of things and so forth, but in running a case I have found out that 2-12, of all the processes we had, was itself about the only one capable of pulling an RI out of place in a GPM. Process just has just a little bit too much smoke to it. It's just a little bit too hot. Because I've refound misworded 2-12 RIs in running a case to OT. And I found them, man. They were sitting right there and they had an RI pulled out of line. The case jammy at that particular point. In other words, it's just too powerful a process, it just reaches a little bit too deep into the case. So just skip your 2-12, and 2-12A and so forth, they don't fit in this hierarchy at all.

But there are tremendous numbers of assessment processes even so. And they were the old processes of the Prehav Scales, and you assess people on the Prehav Scales and ran brackets and all this kind of thing and so forth. Well, they belong – they're terrific, you know – and they belong at this level of IV – Class IV.

Now, Class V: implants, the whole track, case analysis – all that sort of thing – running implants for practice and so forth. Class V. You don't just run implants for practice. You can make considerable case gains from running implants. What we now call R3R and so forth can swing in at that particular level. But R3R might as easily go into service facs so I haven't made up my mind about that, don't you see? Might crowd the level too much. We might be able to put engram running as an old process, you see – it was a wrapped up process; we ought to preserve it. So it goes at one or the other of those two classes, and I won't tell you at this time which one it goes in.

But implant running, definitely, definitely. Implant GPMs, that sort of thing, at V. And your present, what you're calling now, R4 material – and it was R3 material, now R4 material – goes to Class VI. That is the actual running of actual GPMs for OT goes to Class VI. And then at VII we have old Route One with frills – thetan drills, so forth.

Now these, by the way – just in rapid summary and review – these, by the way, will have certain designations for classes. For instance, there are three types of pin that give this type of thing. There's the small "S" and double triangle, which is your normal thing and that serves in your earliest classes, the first two or three classes, you see, just have that plain "S" and double triangle, don't you see? But it has a little enameled plate in the middle of it. I don't know if you've seen the release pins that were issued at one time or another. But a little disc there, which is a colored disc in the middle of the "S" and double triangle with a Roman numeral on it. Of course with Class 0, they can wear that, but it's – the circle itself makes a zero. But your Class I of course has a Roman numeral I on it.

Now there's a color scheme brought up the line for each one of these classes, for designation, and it has in addition to that – your second type of pin covers the next two or three classes, got a small circle around the "S" and double triangle with the colored plate in front of it and the class number on it. And then the large circle – a great big circle around the "S" and double triangle – for the very upper classes on the thing. Just to get everything neatly in line. I'm just reading that, not to sell you some pins, because they'll probably be given to you. But just to give you an idea of how far the planning goes and this sort of thing.

Your – certain certificates will move on up the line. We'll probably reactivate every certificate we've ever had. You know, there's certain designations were dropped out. There was an Hubbard Advanced Auditor at one time or another, and so forth. Exactly how we pattern these certificates against these various classes, we're going to have some certificates, that's all. Going to try to follow this.

Now, exactly what is happening? Exactly what is happening here? Of course, your key main certificates of Hubbard Professional Auditor and HGA and so forth, those things are definitely preserved. But we may have to fill in some slots here in order to keep this thing neat.

Now, we've got the – the whole situation here, what we're trying to do, is we're trying to open a bridge. If anybody says to you, "You see, they're getting class-conscious" yeah, you bet we're class-conscious. It's a limitation and scope of processes. And an auditor should be audited inside his class only. And he should be audited by auditors of his class only. An auditor should not be audited outside of his class. Perfectly all right for somebody in practice – we're not trying to knock people in the head for processing for fees or something like that, and we're not particularly interested in whether or not some Class IV or something audits some people of lower classes and so on. But if he audits them outside their class levels, he will be hearing from me. Because he's not going to make a case gain with them.

This is an effort to graduate cases up the line and I have found out that they do not advance further than they are trained. And it's an effort to advance cases up the line to... and a preparatory step level with information and skill and auditing availability, right straight on up the line. And the way we've got it rigged right now, people don't know where they are, they

don't know where they're going, they don't know what's expected of them. We've got professional preclears from 1950 standing around waiting for somebody to process them to OT, don't you see? And bless these people, they have been of benefit to many of us in many ways. But at the same time I notice their cases aren't running much better than they were running. I consider this quite interesting. It's because they've never really learned anything. They've hit a certain ceiling, and the door is barred.

Well, this is an effort to bring people all the way through all the way up the line. So that makes it easy then. You take an HCA, HPA level process, this fellow then, yes, what's he going to do? Is he going to process people? Well, he wants to process people, that's all right, and we're not going to raise any devil with him about processing people. But we're going to expect him to train Class 0 and we're going to expect him to be able to award Class I. And we expect him to do just those things and we expect him to do that to people and expect him to get them to co-auditing with one another, at those levels of process, and teaching them to do the things necessary for those particular levels.

And then we expect those people to go and get themselves a real fast training course, and be able to answer up. We're not asking for vast lengths of time in training, because you notice there are more courses involved here, so they can afford to be shorter courses. And so the fellow can get himself a piece of training of some kind or another and make sure there's someone in his neighborhood and so forth that's also trained and he winds up with somebody to audit with. In other words, we're not trying to cost somebody a fortune to get up to OT, because if he's laying out the money to buy all the processing necessary to get to OT, he'll never get there on educational basis alone and it's going to cost him a fortune in order to get there. Whereas by audit inside your class, the guy will inevitably eventually get there.

Why? Because his auditing isn't limited. He can have unlimited quantities of auditing. He normally will get auditing as good as he gives. So therefore it's of very, very great interest to him to be as good an auditor as he possibly can be. Otherwise nobody will audit with him. I mean, it isn't whether or not I say so! You see what I mean?

All right. Well this opens the door, and this opens the channel all the way up and by giving these classes, we're not interested in whether or not we're class-conscious, we are extremely interested, however, in people knowing where they should go and what they should do next.

We're going to give you a chart very, very soon which carries all of these classes and all of the processes and training skills of each class. And sometime after that, much, much more distant than that, we will have a textbook for a class, and a question-and-answer book for the class, and so forth, all the way up. And that will be a very, very neat package indeed.

In other words, there's the whole road, it's all laid out, and the person can go from this level to this level to that level to that level to that level, that level, and they can move on up the line. Well, it'll take some of them ten, twelve, fifteen, twenty years. What's their hurry? They've been in this universe this long, we got the gate open, why should we expect them – why should they expect to kill everybody in the rush, don't you see? Well, it's no leisurely, leisurely proposition whereby we're simply saying time isn't valuable or something like that, it's just what can they do within the framework of this? Well, possibly somebody could go all

the way through this. There's a possibility that somebody could go all the way through this in about eighteen months or two years, you know, just flat out, all the way. Somebody could go through this. But in any event it would take him that long.

Look at us. It's taken you years, it's taken me years, and so forth. You suppose somebody's going to better that? No, I don't think so. The stuff that got bred in the bone in you as a Scientologist on your way along the line, you've still got at your fingertips and that sort of thing. And you're rather surprised – some Johnny-come-lately and you say, "Well, what he needs is some Op Pro by Dup. That – I think that..." And the fellow says, "Huh?"

"Oh, yeah, well, that's a process – you know, Book and Bottle."

"Huh?"

No latch. He missed it someplace along the line. And you'll find big gaps and holes and stuff like this and actually his duplication is terrible and it's just a hole in the fence. And his case will leak out through that hole; he won't go on up.

Now, this gives us, this gives us in essence then, a ladder that can be climbed, a line that can be followed and it tells people where they can go to the next step. It puts auditors in the picture all the way on up the line. And rather than knock everybody in the head, we're toying with exactly what we are going to do with the pre-1963 Scientologist. And we've had under discussion a title or designation, a type of class for this particular individual. Having lived through the period, this us – see – why, he's permitted a certain amount of liberty and scope in that zone and benefit of the information which has been developed while he's been coming along the line. In other words, we aren't leaving these people out in the dark or throwing everybody back to 0. That's not the point.

But we are pulling this foul and terrible trick – this horrible trick. I say "we." That's because I don't want to be that causative just now. I'm halfway through a bank and I'm not being causative at the moment. It's I don't want individuals to get pitched out on their ear, but I do think in all fairness that people whose classifications exist as of now should not particularly be changed until they've earned them. Now that's a horrible blow to some people, but I – my candid opinion is, is they're not doing too well with the material which lying right under their hands and it gives them a chance to catch their breath, and level out at their particular level that they are in, catch up a little bit, get themselves oriented and move on up the line. I think it would be unfair to them.

I think anybody right now, out in the field, running what we have been calling R4, is going to fall on his silly head. I just don't think he can do it. I just don't think he can do it. It's – I don't care if he was even trained some on it here, he just isn't going to do it, that's all, he isn't going to make it. It's a very, very precise piece of technology. This is awe-inspiring, man, I'm not trying to tell you how horrible or how hard it is. I'm just saying it's horrible and it's hard. This is a rough piece of cake to try to get down. And the Instructors around here right now are just getting their hands in on the line on this, and trying to pin this down. Oh man, if a Saint Hill Instructor's having trouble with this one right now, I don't expect anybody out in north Poughkeepsie is going to be having a good time of it. Do you?

So I think it'd be unfair to throw the class level up on everybody around the thing, but there'll be a certain latitude in this particular lineup. Some of the HCAs, HPAs, perforce will have to be classed to Class II, and so forth. Well, that means that you're pretty lucky right here and right now. You will get, of course, the class that you have earned.

[Please note: This tape ends abruptly as did the original master recording.]

CERTIFICATIONS AND CLASSIFICATIONS

A lecture given on 3 December 1963

Well, I'm glad you're still alive. Report I've gotten on your auditing lately, I wonder but that's... [laughs] I wonder. You must have done something terrible to look that guilty when I said that. [laughs]

All right. What's the date here?

Audience: December 3rd.

What's the date?

Audience: 3rd December.

Three December AD 13, Saint Hill Special Briefing Course. We have a lecture here on these new certificate and classification changes and so on – give you the rundown on this. You might be quite interested in this. Tomorrow we will get a demonstration of a session that I taped of finding a PT GPM and I will go over that with you, over TV. But today, I want to talk to you about some administrative matters which also have bearing on technical.

All right. Now, you have received or are about to see HCO Policy Letter of November 26, 1963 which is – probably be the first of many policy letters on this particular subject but which lays out the basic format of classification and auditing requirements for individuals.

First I'd like to give you the TR – pardon me, the Scientology Zero on this of why is this done. Why is this done? We have to go back in actual fact here more than thirteen years, to the original activity which sent Dianetics forward in the community and in the society. And the original method of dissemination, which was intensely and extremely successful, was simply getting some chaps around who (quote) "wanted to be audited," who (quote) "had troubles," and so forth, and giving them some training, supervised their co-audit and took money from them only for those sessions which were patch-up sessions and a nominal amount of money for supervising their co-audit.

That was actually the first method of dissemination. Along with this went a hectographed edition of *The Original Thesis*, which was the only textbook at that particular time, 1949, and the textbook was actually not sold but was distributed by somebody making a mimeograph copy of it and giving it to his friends. And I don't know how far that book went and I don't know but what it isn't still going today. Of course, we would never hear of it because all the addresses are closed on the lines, and so forth. That was *The Original Thesis*.

Now, the system there, and this is – this was me operating, you understand – the system there was simply to get Joe and Bill and Pete who wanted processing – had heard of this new thing and were interested in it and my statement, "Well, if you want some then you had better put the nose to the grindstone and study this over a little bit and I'll show you how to do this and then you three can form up a co-audit of various lines, and so forth. And you make sure that you're here every weekend and we straighten all this out for you." And then their complaints that – their complaints about Pete, you see, who at this time was flubbing a little bit, he wasn't giving as much auditing as he was getting, you see, and that sort of thing. And somebody's effort then to get somebody else into this unit and the unit was up to six or eight before you could sneeze, don't you see. And finally somebody came along who was as clumsy as Pete that could get paired off with Pete, don't you see. And this sort of thing was carried forward.

In actual fact, although the auditing was terribly clumsy and we didn't have the technology which we have today, no shadow of it practically, although the auditing was terribly clumsy, some rather fantastic things occurred with cases.

Now, when they'd get too bogged down, one of these teams would get too bogged down or something like that, well, of course, they'd call on me to give them a session. So, I'd sell them a session. And actually, I don't think I ever really took any money off of them but they used to push money at me, and so forth, because I was not at that particular time interested in any income. But I know there was money there and on several different occasions I had to turn down \$800 and \$1,500 and, "If you will just audit me straight through to Clear now and do nothing else so I don't have to co-audit, I will give you \$3,000." And I'm – my saying, "Well, you can just put it back in your pocket because you're just getting along fine with Joe and you just make up your mind to keep going." You get this kind of an approach – very successful, extremely successful.

Well, when the Foundations were formed, they were formed not at my instigation but it all seemed like a good idea, good roads and good weathers, and they got into a big organizational this, that and the other thing, and there were an awful lot of people in charge.

And I guess there were more bosses around there than you could easily count. And there were many different schools of technology operating. And I remember old Joe Winter going around telling everybody that you had to *believe* in it for it to work. Auditing – there was nothing scientific about auditing, actually it was merely an art, you know. This is all fine; that was dear old Joe. Ah, this kind of thing, don't you see?

You'd give a lecture and then you would find out that that didn't apply to what – the session was going on immediately afterwards.

Well, they started training on the basis of just letting somebody hang around for a month to see what was going on. That was the first training course. And Parker I think dreamed that up and old Parker said – I remember coming down one morning and Parker said to me, "Well, I've – these people keep walking up to the front door. They want to be trained, so I've finally arranged for this to happen. And I charge them \$500 to hang around." Pretty wild.

But the Academy developed out of that particular activity. That first group, by the way, was a group of ten auditors. They were pretty well trained, but they were trained to audit others and they were not trained particularly to co-audit.

I remember teaching them old Straightwire, how to pick up psychosomatics and so forth, off people, and most of those fellows could do it. Their auditing was clever rather than otherwise. Auditors of that day were not badly trained.

But along with this came the same fault that the individual auditor runs into; and that is, people wanted processing and they wanted processing exclusively and only. They didn't want to audit anybody, they wanted to be processed.

Now, let me call this to your attention as a very terrible and destructive action. Let me call this to your attention in that wise now. We've always thought of this as "that's a good thing, he wants processing," and I suddenly tell you that that's a destructive action. Ha-ha. I'm... let me make my point.

Now supposing, I'd taken this fellow's \$3,000 and I'd neglected the rest of the group and I'd just sat down and audited this fellow day and night. Supposing I had done that. Well, what would have happened to the rest of the group? Hmm? I can see an individual now, an HCA, something like that, and he's developed himself a group of ten or twelve and he's got these people going forward very nicely. And all of a sudden Mrs. Gotbucks from Poughkeepsie shows up and flashes a lot of green under his nose, and he sits down to grind it out, and so forth, and earn this money. He's going along all right. But then her husband gets orders to Saigon or something of the sort and she disappears out of his perimeter. What is he immediately and instantly, at that moment, confronting?

He has dropped all of his dissemination, he's dropped this group, he's not paying attention to the eager beavers that wanted to outflow this stuff. He's paying attention just to somebody that wanted to inflow it and nothing else. He didn't get any dissemination in the area then, did he? He neglected the fellows who were keeping it whizzing, and the net result is when her husband gets orders to Saigon there goes his (quote) practice (unquote) and that is the end of that. See?

So, he says then, "Well, I've got a failure on my hands. I'm not doing well as an auditor." Actually, it was not a failure as an auditor, it was a failure in dissemination because he didn't use his best dissemination activities in order to keep himself going. That is to say, he wasn't taking people and making them co-audit and making them help each other and supervising it, and making income off of this action, and making income also on the inevitable patch-up sessions.

Now, let me assure you that if you want lots of processing to do, you'll get lots of co-auditing going. Let me make that point with an exclamation point. You actually don't get any auditing to amount to anything, if a co-auditing activity isn't going. As soon as a co-auditing activity ceases and as soon as the individual swings in on just auditing one person, everything he's doing goes up in smoke. Ah-ha, but the Central Organizations of 1950 made that mistake. Although they had lots of students, and so forth, they went into the processing business. And everybody they processed, who wanted only processing and who didn't want to give anything

for it, introverted. And you get this, the preclear doesn't disseminate. The purely preclear person doesn't disseminate, ever.

You take this old boy's long arduous experience in this particular field. Man, you cured this guy's migraine spooziks you know, and he can actually now do fifteen chin-ups, you see, and everything is marvelous, you see. And you say, "Well, isn't that interesting. Therefore, one of his family members or somebody like that ought to come over and get some processing." That is the fond hope that you might have in this particular direction. But his family members rarely appear. Oh, sometimes. Why? That person never mentions it.

That is about the wildest thing. If you've done something wrong to them, though, they mention it! [laughter]

But that is the phenomenon – this is forced on us in a technical capacity – that's the phenomenon of negative gain. That he has had lumbosis has no bearing on the situation. It's now gone so it doesn't worry him, and if you've done a thorough job of erasing it, he never mentions it. Because it's gone. Negative gain. Everything you do with a case is negative gain. It's the eradication of something wrong. And if it's eradicated properly of course the fellow then never has anything to say about it. He just feels better and everything is going along.

So that, purely processing activities over the vast span of years have produced – they of course have produced some, but they have produced minimal dissemination. And just as the individual auditor – just as the individual auditor who formed up a few people and he had them co-auditing-you see, you don't have to have a big dress parade situation. There's this fellow down at the garage and then there's a librarian and then there's somebody who teaches in the kindergarten, and that's a perfectly representative group. Because if they start co-auditing you're going to have two or three more drift in and then some of those fellows are going to drift out and you're going to get some more in. Your group has a gradual even growth and tends to maintain itself, unless you suddenly withdraw all your attention from that group, and put it on one preclear or two preclears, do you see?

All right, just as a fellow breaks his practice to pieces by knocking down his dissemination activities in that fashion, see – concentrating it on a preclear who rarely disseminates; people who co-audit disseminate, see?

A Central Organization can do the same thing. They get so interested in their HGC income they never bother to make any Scientologists. Now, I shouldn't do this because this has nothing whatsoever to do with what I'm – it's on a line that was a privileged line and it's all very secret, but an Assoc Sec very recently, reading the first info letter which inferred that HGCs would be cut out – it just inferred this, don't you see – was holding his head in his hands. How was he going to keep his organization running, if he didn't have an HGC because his HGC was his mainstay, his HGC was his main income. And he was suddenly confronting the problem of how was he going to keep his finances up, how was he going to keep anything going at all? Because it seemed to be so terrible because his student income was so low. You see, a Central Organization can do the exact same thing that a private auditor can do.

Now look, if you had – if a Central Organization really crowded them out – we tried to do this down in Los Angeles and they never got the word. That's a city over on the Pacific

coast of a country on the other side of the Atlantic. [laughter] They never got the word. I've tried to give them outside private processing activities, you see?

Well, let me assure you that in the absence of these things you get minimal pcs, too. There is just nothing like a good, broad brawling co-audit activities going on all over the place regardless of how hard it was to promote them or how hard to keep them in line or how many ten – phone calls – these are quite wild to handle. They sort of discourage you from handling them because you've got a phone call at two o'clock in the morning. The guy can't end his session, don't you see. And so forth. "What do I do?" And – various processes in the old days. I've had some remarkable phone calls at some remarkable hours of the night. [laughter]

One of the most remarkable is, one time they couldn't get a preclear down off the ceiling of the room and there were four pro auditors present, and she had exteriorized and splatted up against the ceiling. And they couldn't get her off the ceiling and so they held the telephone to her ear and I talked her off the ceiling back into her body. [laughter]

So, I well agree, that the randomness of this type of activity is considerable. You can't sit back in an ivory tower with a lot of co-auditing going on. And some of the most remarkable goofs occur. They're incredible, they're unbelievable. But, you do a sort of a D of P action on these things, you keep them going one way or the other, you try to hold it down.

But those people – those people will get themselves wrapped around telegraph poles if you're speaking in terms of purely commercial auditing, see? And a Central Organization would have three times the pcs. If they had a thousand co-audit teams running in that part of the state, they'd have three times the pcs – just casualty rate. [laughter] Have to straighten them up, you know? I know that's awfully coldblooded, but it happens to be if – the people are going to say, "Well, we mustn't disseminate or co-audit because it's going to hurt the income of the organization," see? Well, let's counter with this coldblooded an activity. What do you mean the income of the organization? You got to have co-audit teams going to create enough casualties to keep you solvent. You'll find as a private auditor that you're always being called on for emergency and people forget to pay you for this sort of thing and that sort of thing. But you give them a good understanding if you have to give an assist or put somebody together and give them special sessions, and so forth, the rate is so-and-so. You'll still come out all right with it as long as you've got co-auditing going.

Unless a man... You see, there are tremendous technical – technical data associated with this. We're now speaking from the security of – and this whole policy letter by the way is erected from the security of technical information. It's the technology rounded out, completed to OT, that is making it possible now to lay down these various lines and say about what the score is. Because it's forced off on us like this.

You'll find, that the individual who is engaged in helping somebody else while he is being helped gets extroverted and introverted with regard to his case. He extroverts and introverts. You'll get somebody being audited during the week. All week long this person is being audited. And you'll find out they're very introverted during that week. You see, it's all what they're doing, and so forth. It's very hard on the auditor meeting them at lunch, you know. They sit there and continue the session, you know, that sort of thing.

Next week, first day or so, they don't really see how they can make it. See, they've got to put their attention now on somebody else, they got to pay for it, they got to help somebody else. An awareness of another being takes place at this particular line and they start extroverting. And along about Wednesday, Thursday, Friday and so forth, they're so extroverted that it's not terribly vital, they're not going to die in the next five minutes if they don't get audited, you see. Of course, it can occur that something has gone wrong in the session, that they've been wrapped around a telegraph pole and nobody patched it up, left them in an ARC break. But a normal course of existence is that they're – by Wednesday of their processing activity – are in a rather extroverted frame of mind with regard to their case, don't you see? You've got an extroversion taking place here, they're looking outward. When they get audited they look inward. When they audit they look outward. And you've got out and in with regard to cases, and you've got an understanding of life going forward. And for the first time it gets off the first dynamic and starts moving up onto the higher dynamics. And life is an activity of multiple dynamics, not an activity of a first dynamic.

So, technically – technically, the individual is in a far better frame of mind with regard to life when he is doing some auditing and getting audited as an activity. This is by actual experience on the thing. I think it agrees with your own experience along this line. Even though it's very tough sometimes to bail out when you're in the middle of something, and then audit somebody else.

Now, the next – the next point here, however, is that an individual can only progress so far without an increase of understanding. Now, previously we said it was a good thing if somebody was Clear, to become OT, that he should be trained. Well, that's totally reversed now. "Should." "Be a good thing." No, no, no, no – it's nothing like that. Hell never make it unless he's trained.

Now, you can talk all you want to about the Scientologist being a rough case, and so forth. No, he's just being run on rougher things, that's about all. You couldn't get anybody else to run on this thing. Of course, the fat, the amount of charge that exists on the case that can be bled off easily, starts getting bled off by the very easy processes.

Now, let's take a look at the schedule of processing here. Very easy processes, this is Listen-style: A guy discusses his PTP and he feels better about it, see? See, lots of fat there and you can bleed charge off like mad. But you have to do it more expertly after a while, and it requires a repetitive process or the CCHs or a Straightwire or Overt/Withholds or something like that to pick him up. Why? You're coming to the bones of the case. Now, of course, this fellow in his original state – to the amount of better off he is, is in comparison to how bad off he is. And of course, he's just a walking lightning bolt as far as charge is concerned. He's just fat with charge, and he is so bad off that bleeding any charge on the case at all makes him better. But what is better, see? He doesn't scream with his headache, you see? It's a betterment in relationship to the worsement that the case is in, don't you see?

All right. We have this fellow feeling pretty good here at Level II and it takes repetitive processes, of which there were innumerable wordings and processes. It takes something like that to bite. But it takes a different kind of auditing. This guy can no longer wind up... and I notice some of you characters doing that this day. You think this character's going to go

forever on a self-audit called itsa, and so forth. *Nah*, ain't going to do it. That is not going to happen, see? Now it takes formal auditing. "Do birds fly?" see? "Recall – recall a wreck." "Thank you." It takes the impingement, the pound, don't you see? It takes the auditing cycle completely completed without cutting the pc's itsa line when he is talking, but then not sitting back and making him make up things to talk about. You get the idea? You differentiate between a pc who hasn't anything to talk about, and a pc who is answering your question. You see?

He's completed answering your question. All right, that's the time to give him a cheery thank you and bear along. Well, that requires a little greater sensitivity. Well, that's a hammer pound of auditing cycle that's going forward here, and hell make frankly as much progress as he gets commands per unit of auditing time. That's old. He makes as much progress as he gets commands per unit of auditing time. He gets a command every three minutes, he will make a command every three minute's worth of TA. See? He gets a command every minute, he will make a command every minute worth of TA.

Now, this carries out at the highest OT processes. I'll tell you this, because this is actually a piece of fantastic amounts of TA and action, and so forth. But the session I ran last night got the PT GPM which had sixteen items in it; found the goal of it and got all sixteen items and got it joined into the rest of the bank. The thing was found to exist after several banks had been run below it, don't you see, which is quite an ordinary circumstance. Did that in three hours. Found the goal, PT GPM, it's top terminal, ran the rest of the items out of it, got it all flat, completely bled of charge, with complete accuracy and so forth, in three hours, with 175 divisions of TA. Now, there's a lot of TA.

Now how? You're going to hear some of this tape tomorrow by the way, not for any particular – not for the technology in this particular instance but for the itsa, the handling of itsa, because itsa has to be perfectly handled in order to handle those levels of TA. See, you have to handle itsa perfectly to do these OT processes. You have to handle – your basic auditing has to be absolutely, well, practically flawless, if you're really going to fly. But it's actually the number of items that you find per unit of auditing time that gives you the TA. You know, if you just sit there – if you just sit there and let that TA drift about, and it sits there awhile motionless and you think, well, maybe the pc will cognite or say something now that'll give you a little more TA and you'd better not talk because the TA might move again and all of this sort of stuff that's preying on your mind, you're going to get – the next item you haven't found yet starts to blow. And your TA is coming from the next unfound item and your pc's going to get very unhappy.

In other words, you just come right up on top of this thing and start driving your auditing session, and it's a hard drive, don't you see? You're not talking when the TA is actually moving a lot, see? That first blowdown that you get. Yeah, you're not saying a word during that blowdown, see. The moment that thing seems to steady down, you're right in there with the next question that is going to kick the TA again, you see. The courtesy steps, you know. And then as soon as you say – get the answer to how does that relate to this GPM – the moment that you get the answer to this which gives you a *brrrrrrrrr* surge, you don't care whether the TA is moving or not because you know right now that any further motion of that TA is going to come from the next item. You just get your question in there, quick.

Well now, that's very refined, very fantastically, closely timed auditing. The way you achieve that sort of thing is just work real hard at basic auditing on lower levels. Make your basic auditing practically flawless. Promote the itsa of the TA, never sit around and get itsa that you didn't promote, don't you see? And handle that. It's like driving a 16-horse team at a dead run when you get up to OT, but it's fairly easy to do it at this level, too, because the repetitive process is very simple. The pc has answered it. Pc has answered it. Give him the next question, see. Bang. You're not waiting around there for something else. You don't sit there for three minutes hoping, then, the pc is finished talking, and afraid that the pc is going to... Because the fact that you're sitting there motionless is inviting the pc's itsa, don't you see? So the pc always will say something else but it won't be germane, and the pc has no auditing question to answer so therefore the pc goes on to self-audit and you no longer have an auditing session. That's how you destroy it with these silences. And you can drive – drive your pc mad and your session down the drain. They can throw your TA completely away.

So, it takes, when we get to Level II... the guy, by wandering around bleeding charge, is no longer able to produce TA. So we've got to pound it out of him now.

So we say, "All right, repetitive process." However many old repetitive processes there were, don't you know? *Bang!* goes your question, good impingement you know. And the pc says, "*Whoa*, that was long." Well, we don't care how long it took to answer. We're going to wait till he answers the question, saying, "*Whoa, mm-mmm-mmm-mm*," and we're going to make sure that we knew what he answered, too; we're not going to be interested in "Yes, I've recalled one. Well, yes, I've recalled one." If you – he answers that way you also want to know what he recalled, don't you see?

So you get your questions answered. But as soon as you got that question answered and he has answered it and you know he's answered it, you feed him the next question you see, *bang!* There you are again, you know? You keep ending off that cycle, starting a new cycle. Ending off that cycle, starting a new cycle without actually cutting his itsa. This is very smooth auditing indeed but it requires very professional training. A guy has to get very good to handle this sort of thing. But it's enough at – an auditor at Level II to handle that sort of thing.

All right, well, we've got this guy now, he's bled lots of charge. He's gotten to a point where he doesn't think a lion is going to spring at him when he goes down to the postbox. He's had a lot of wins one way or the other. He finds he doesn't have to scream at his wife. He finds out the kids make him just as nervous as they always did, but he doesn't have to comment on it now, you see? He can suppress it. See, he's had a lot of wins of one kind or another. But life is livable. He doesn't find he's living at that same level of anxiety that he was before. He's still got a lot of that sort of thing.

Well, that's fine. Is he going to get any better? Is he going to get any better? Well, yeah, he's going to get better when he's on prepchecking and metered processes in the session and assessing and running ARC breaks, and that sort of thing. That's his next logical step forward. And you'll be surprised what you can do for somebody if you can really gun them up into running ARC break. But look at the – look at the level of technology. This guy has to be sharper than a tack. He has to be actually trained to do R2H. He has to be able to spot this and

that. He recognizes that it's bypassed charge. He recognizes he spots the earlier bypassed charge.

Well, you would try to run that on somebody down here at Level I, the guy would just drift. You've heard them. You've audited people at this level and you've been surprised at how much they drifted, and so on. Well, actually, what you were asking them wasn't real to them. You weren't then making the case progress you thought you were making. See, you've had the idea perhaps, that the higher the process, the more it would do for the case, see? Well the process that does the most for the case is the process that is realest to the case at his state of case. It's merely what's real to him, that's all. That's quite a remarkable revision of look, don't you see? That's a technical revision of look. He'll get the most gains on the process that is most real. And the further his case is away from optimum, why, the more insignificant, tiny little things are real, and the more rough and tough things are unreal.

Why, you say to this fellow – well, we were actually running people over their heads in 1950. We were saying, "Well, it's this engram. If we just run out this engram, why you'll be all right." People understand that pretty well, by the way. They respond pretty well. But there was person after person couldn't run an engram, couldn't even come close to an engram, couldn't confront anything about engrams. And yet those people responded beautifully to a little Straightwire processes, and so forth.

I've seen a guy run from total insanity straight on up to a mild neurosis, just asking him for times he'd communicated. Interesting. There was no other auditing command used. There was just a repetitive process. It was real to him that he had communicated, see? As simple as that.

Now, this guy doesn't have to be insane to get a win on such a process. But when he was first doing that process it was already over his head. Communicated. And the amount of comm lag and upset of trying to figure out if he had communicated or if he'd – never had communicated or what was communicating, was quite pathetic to observe. Process was already over his head. Should have taken the CCHs, don't you see? That would have undercut that beautifully and it could have cut up into these upper processes.

But nevertheless, the person couldn't run an engram yet he could make a marvelous case gain on just recalling times he'd communicated, don't you see? Now, any case profits to some degree from this, but these cases back here on these lower levels only profit from that, don't you see? They're hung up at this state of beingness. They're hung up at this level of action. They don't know enough about the mind. Now, you're going to take this person here at Level III and you're doing Prepchecking. You're going to say, "What is – biggest changes that you have made in your life, you know, decisions you have made to change?"

We're going to assess all those and so forth. Oh, the person will come quite along well, and so forth. You'll be surprised. Every once in a while you're going to get a pc who shouldn't be running at that level but running at a lower level. Decisions he's made in his lifetime, heh? "Ehhh. Whoa, decisions? Me make a decis... *whoa, ooh-mm-mm* – I don't think I ever made a decision," see? Well, you're not getting your assessment list. Well, why aren't you getting your assessment list? You're just running the pc over his head, don't you see? Pc is not capa-

ble of deciding, taking responsibility for ever having made a decision to change, don't you see?

Well, that's – back down the repetitive processes you might get something like that. You might get a concept – a concept run. "Get the idea of deciding to change. Get the idea of not – of deciding not to change," see? "Get the idea of deciding. Get the idea of not deciding." You know those old Concept Processes. And all of a sudden he has this red lightning bolt of cognition on the thing and says, "You know, I've made a decision in my lifetime. Oh. Gee, no wonder. I don't trust myself to make decisions but, you know, I really have made a decision." Well, then you might be able to run a Prepcheck process on it, see?

All right. Well, now we take somebody who can get off his ARC breaks. It's a very educated level of process. He has to understand a lot of factors of life before he gets into this, otherwise he's looking at so many ramifications of what you're asking him that his mind can't settle on any one of them. There's just too much charge in his road.

All right. Now, let's get into such a fantastically esoteric thing as a service facsimile. Have you actually any idea of what that requires of a pc? What does that really require of him? It requires that he take enough responsibility so that he actually is keeping himself sick so as to make somebody else wrong. He has to take over the responsibility of his own illness. Now, let me tell you, that is asking the impossible for lower-level cases. You say to this fellow, "Well now, what did you do to make your mother wrong? What sickness did you give yourself in order to make your mother wrong?" We don't care what question it was but this concept is given to this person. This person's liable to fly off in a mad state and tell you, "Ah, that wasn't the case. That wasn't the case. Actually, she was very mean to me. Oh, very mean. Very, very bad to me. She used to tell all kinds of lies to my father so he would beat me. And my father, you know, he'd beat me incessantly." This is your approach in an effort to take – get responsibility for a service facsimile, see.

Look at your level of jump. I was horrified in 1954 when I asked around about full responsibility, the idea of a person taking full responsibility. You know, I saw people around who actually had had some case wins and that sort of thing, who were in a state of collapse, if you please, on the subject. "Take full responsibility for my – oh, no." Actually it's old *Advanced Procedure and Axioms* I think that's in or it's the *Handbook for Preclears*, one or the other. *Advanced Procedure and Axioms*. And when that book was published, why, we made lots of people who knew we were wrong. Yeah, we were wrong. You couldn't take respon... not only could you not take full responsibility but, of course, it was impossible to take any responsibility in any direction, see?

Now, what had happened there is that research had progressed forward on the subject of levels of case, and the dominant level of case at that particular time – 1954, 55 – were getting up a little bit to a point where they could take some responsibility. So people close in who had had a lot of fairly good processing up to that time were perfectly willing to accept this as a concept and an idea. But people who had not been processed in that particular direction or up that high, weren't. You get the make and break point then of how far you can advance with a statement or a technology or a thought or an idea.

And you get things like ARC break assessments – getting somebody to sit still even though he's ARC broken, and so forth, and go into it. You can't do auditing on somebody who's too badly ARC broke who has no understanding of it at all. You're running a high-level process here anyway. You got programing cases and you got missed withholds. Well, it's very rough pulling missed withholds as different than O/W. This again, requires an enormously high-level of responsibility in order to respond to it. O/W – you'd be surprised at what you normally get on the man in the street running O/W. "What have you done?" "Well, I sat for a while," see, level of responsibility. Makes you want to saw in and say, "Well, what have you *done*, man, done, you know, done?" There's no sense pushing it, that's what he has done. And what has he withheld? Well, he withheld getting up. That would be your level of responsibility. No idea of interpersonal relationships at all.

Let's move up on a little bit higher here and we get implants, engrams, whole track, whole track case analysis. Well, very few people walking out on the street right now have any idea of themselves as a spiritual being – very few. As a matter of fact, they buy meat-body philosophies very easily. Treatment – "Saw off my arm, it is sick," you know?

Well, this kind of nonsense that goes on is – this guy doesn't have any idea of himself as a spirit, much less as a spirit who has an eternity to live through, you see? Has no such concepts.

Who has he been? Where has he been, and so forth. You'll find out in that level itself they normally take off into past lives since Roman days. They may get back into Greece, don't you see? If they work real hard, why they'll push it back maybe to Egypt. And they're sticking up at the early part of this run, they're up here in the last 2,500 years, quite ordinarily. They talk quite happily, ordinarily, of having had a bad time in a castle that burned down over in France two hundred years ago, you see. This is whole track. Hah! But that is nevertheless the approach to the situation.

I know these things. I've been through them myself. But that suddenly starts to get real. And after a while you say, "You know, I – I might – might possibly have... I might possibly – you know, I've been somebody else," and it gets to be a fairly good level of reality on this particular basis.

Well, that's a far cry from actual whole track, and yet that is a gradient entrance into it. Guy gets some kind of reality, has pictures on these things so they must have happened to him. You know, that kind of thing. He gets a little feeling of reality on it. It moves up just a little bit further to a point where he might possibly have had a higher longevity. He might possibly have had a higher state of beingness at one time or another, not a meat-body state. He moves up into higher levels of things that have happened to him at one way or the other. These things all increase in reality to the degree that he sheds charge off his case.

Well, in the final run of it, he gets up to a fairly comprehensive idea of what he's been and done. This ebbs and flows, the reality on it gets great and falls away, and so forth, because he's falling all over his actual GPMs as he passes down the track, and so on. He nevertheless, gets himself one god-awful amount of time blocked out. Oh, some terrific amount of time blocked out. He gets up to trillions to the eighth power. *Time*, you know. Oh man, time, you see.

First he gets horrified, you see, at the idea of twelve trillion years ago or something like that. He gets finally, up to a point where trillions to the eighth power take him back to some of the earliest implants. And he's perfectly happy at this level that there's an *awful lot of track*.

Well, when he moves up into Level VII he finds out that one GPM will cover from trillions twenty-nine forward to trillions twenty-one – one GPM. Of course, that span of time is almost fantastic. Because that's much more span of time than the whole span of time back to the earliest implants you can dig up on this guy, and that's just one GPM.

Now, his track goes sizzling back to trillions to the 200th power. Well that's, of course, one of these ridiculous figures. That's trillion written two hundred times. Or one with two hundred times you write all the ciphers of a trillion. That gets to be quite a few ciphers and every one of those things is a year. You're getting into the sweep of time by this time.

Well, I myself have had – I just thought I was doing fine when I was doing some research this last summer. I said, "Gee, you know we're getting clear back here. Trillions four, you know. *Whew*, you know? Dizzying. Concepts of time. Trying to date one of these confounded things, you know. Trying to handle these fantastic periods of time with arithmetic, and trying to dream up other methods of going into all this. Rough! Because it just took the auditor too tall – too long to say anything so you got crude rough approximations like, trillions 4.5, see? Some comprehension of this. Gradually making it one way or the other.

Now, in GPMs you don't have to worry about the time of an actual GPM. It just is. And you don't have to date the thing up fortunately, and so on, because you're into such vast spans of time that it's fantastic.

Now, we've carried this guy from his PTP that went back to yesterday when his boss didn't look kindly at him, who really can't remember what he had for breakfast, who is asked for a tolerance of this and that and whose life cuts in at about at the age of twelve or thirteen – if you pushed him real hard, if a psychoanalyst had pushed him real hard and worked for four or five years, he would have gotten him to remember when he was ten. See? This boy, we pushed him up by gradients to greater spans of time, greater concepts of thought, greater concepts about life and the universe around him, until his tolerance as far as processing him is concerned in time alone just - well today, say well, trillions two hundred, that GPM's back there trillions two hundred. All right, so it's back there trillions two hundred, see? There's no gawp about that.

See, reality, familiarity. Why you'd take – you'd tie a whole session around a telegraph pole if you said to this fellow, "All right, now what we're going to run on you, Joe, going to run on you..." This fellow is kind of a fellow who is – it worries him that he can't remember what he had for breakfast, you see. If you can't remember what you had for breakfast, that's one thing. If you worry about it, that's something else. [laughter] And this guy, and we say, "Well, what were you doing in the 14th century?" You're just going to spend the rest of the session, you see, trying to get around this unreality and his grappling with it. You're not going to get any auditing done. See, you've hit him with too much unreality. He can't meet with that whatsoever. So he goes out of A with you because the R is out, don't you see? He'll go out of C with you, and so on.

Well, that's true of this whole scale. So this is a technical scale. And this takes those gradients of processes which I have learned by experience over the past thirteen years that a case normally follows through. They'll be willing to talk to somebody about their troubles, and then with assists they're willing to have somebody touch them or something like this in order to square up some minor illness. They'll talk on specific questions, RIC, they'll answer specific subject matter. You're not giving a repetitive question there. You're just telling them "Tell me all you can about marriage," or something, you know. "What solutions do you have?" Something like that.

Comes up to a point where they can actually be disciplined and follow through and be alert enough to follow through repetitive processes, CCHs, Straightwire, do these various things, will actually be able to answer up to Prepchecking, an E-Meter, decisions of change, can get up to a point of recognizing when ARC breaks are ARC breaks and what they come from, and what missed withholds are all about and what all these various concepts, responsibility are. And particularly that they are doing things to make people wrong, and there's difference of case responses that they themselves are doing, then we give them the idea of whole track and that they've been here for a long time and then we move them up to the fact that, doggone it, they did it all themselves. Just let them get their bellyful of motivators.

Five, see. You'll find a guy can only be run on implant GPMs for two or three months and he just gets his bellyful. He finally begins to figure out, "Well, how – how could this really have aberrated me? I know it was uncomfortable, but what's this all about?" and so forth. And we had students around here protesting about it and so on. "So it was all done to us. No, it couldn't have been," see? Here were violent protests, and so forth. Well, that was plenty of time to move out on to actual GPMs.

Now, of course, we have an additional level there. What's this old Route 1 and other drills? Well, that's proper and right conduct for an Operating Thetan. And we've had lots of drills of this particular character. They'd probably be different drills today, they'd be a little smarter and avoid – and avoid some of the rocks and shoals of the drills of yesterday.

I remember we used to have change of space drills, and we had at one time two skulls. I think those two skulls are still stored in Washington. And they'd just get the guy used to it, and he'd be in skull A, skull B, you see? Be in skull A, skull B and so forth. Back and forth, back and forth, back and forth. Well, if a guy – a guy was pulled down, really, because of his actual GPMs and all this case load that could key in. You really can't do those things until you got the guy's case practically gone. But whether any of those are really necessary or not is a point in question. I know that if I'm outside, and an auditor will just let me it'sa for a while, that's just about the only thing I require on the thing. Let me find my feet (quote) (unquote) "feet." Let me orient myself, let me get over a queasy idea that I might not be able to hold this position in space.

All right, now the whole – the whole problem as far as we're concerned is that of dissemination, practice, smooth processing, forward progress, and keeping the road open and keeping the Bridge up behind us, don't you see? How does anybody else ever travel this road? That's one of the problems. And how does one travel this road best? And what is the easiest procedure of dissemination? What's the easiest way to take this on, and so forth.

Well obviously, it would be to insist that somebody didn't outstrip his training level with his processing level, because he's sooner or later going to come a cropper. He goes up above his training level too high and the further he goes – although it isn't noticeable at one grade, very – by the time it's gotten two grades it starts to be noticeable and then he all of a sudden gets up somewhere around V or VI, and he practically spins in. It's just not anything that he can consistently make.

A lot of auditors by being very clever, I'm sure here or there, can get a person at higher levels – pardon me, a person at lower levels to sit still for processes at higher levels, and by carefully holding the breath for the pc and so forth, get the pc over certain hurdles in order to get them up to a case gain and then I'm sure that here and there it'll be done successfully. But in many cases after they've gone to all this trouble, they found out that the guy just stepped over to the – on the backtrack and went *below* where they had been. They were running at a level that was too high for them to attain – way beyond their reality. And they were just being propitiative.

So, there's a lot of questions like that. But what interests us is, is how do you keep the road open? How do you keep people coming up the line? And how do you guarantee that a person can make it, see? Now, that's another problem, see? We're not talking now about the *possibility* of somebody making it. We're talking about *guaranteeing* that somebody can make it. Let's take the economics of the situation. They're very much pertinent on this particular planet at this particular time.

The number of hours of processing between Level 0 and Level VII are very hard to estimate – very, very hard to estimate. But the number of hours of processing, I don't know. Two thousand? You make a guess. Fifteen hundred? I don't know. I wouldn't know. That's a lot of hours of processing. Now multiply it by ten dollars. However many it is, multiply it by the very cheap rate of ten dollars. Completely aside from the fact that the guy couldn't buy his way all the way through without being trained – he would never make it, don't you see. The economics that he is being presented with here – the economic picture is inequitable.

How many hours of processing could he buy for the training fees involved? Well, if all the training fees – this is – this is just wild guesswork, I'm not – haven't added anything up, and so forth. Supposing all the training fees and processing, odd bits and other things added up in the line – supposing these things all came together and added up to five or six thousand dollars. Supposing you could get all that? Why, I don't say that it's a correct figure; might be more, might be less, see? That's five or six thousand dollars – I'm trying to give you comparative figures, you see, compared to perhaps twenty thousand dollars. Well, immediately that you decrease the economic – the cost of the thing, of course, you make it more possible to make this line.

All right, now let's see if we couldn't decrease this further in various ways. And I think this could be done on the basis of bringing this schedule of courses up along the line, and each course requiring that the earlier course had been well done, then of course these courses would be briefer and you would have a less costly situation. You see how that would work out? But he would get an unlimited amount of processing and he would also make it. He would get as much processing as he himself was expert enough to keep his co-auditor. That's

practically the technical definition of how much processing somebody gets. Processing – his own processing has got to be good enough to keep his co-auditor.

And then your processing's always got to be good enough to run your own sessions out of your co-auditor, just straight co-audit. A certain amount of skill. That is to say his auditing you – you've got to be able to audit what his auditing of you did to him, you see, or what he said it did. And you've got to – it's in your – in your vast interest to keep picking up his overts against you as an auditor, you see, and your sessions will get very smooth.

Various lines completely aside from that do show us then that it is more economic – the figures I gave you are just so that you can see the point, you see. It's more economical to co-audit along the line. It is also only possible if it is co-audited up along the line because the levels of training are necessary to attain the levels of case. So the only possibility of getting up the line; it's more economical to do so.

Furthermore now, the reality level of advance is cared for, which cares for dissemination. Now, if any HCA/HPA could train and issue the HAS certificate by application to the Central Organization, to the person he trained and actually issue a Classification I to that person, and so forth, this would give him a co-audit area that he could cope with – that he could cope with one way or the other.

Now we've never been very successful in individual auditors training up cases at what is now given as Level II. We've never been too successful at that. It's very spotty. The results have really not been able to because the individual auditor really does not have the facilities to enforce a tight schedule and handle the situation. So that has not been too good.

So therefore, that course would have to be given in some district or area and would have to be short and to the point, but very effective as a course and shouldn't be too terribly expensive in order to get that course. It should be within the finite limits of thirty days because almost anybody can get thirty days off, but you ask them to get off much more – well, that's an awful lot to ask somebody to get in thirty days. Well, it would all actually depend on how well they were trained at Level I, how fast they could go through the upper course.

Now, you see, we are away, because any auditor who had sent somebody out to get something like that could expand a little bit further. It wouldn't be that they would necessarily come back and do it all themselves, but it would come back into a zone or area and then you'd have a broader level of co-audit in progress. That's what it would in actual fact amount to. You'd be co-auditing at higher levels. And it could move on up that way in a whole district or zone, could move on up in that particular wise.

Now, if every one of these levels had its own textbook or textbook with its question and answer sheets so that everybody knew exactly what was required of him at that particular level, and all the data was there for that particular level, and the examinations were all there and the examinations were particularized enough so that they were – you had to really know the stuff in order to pass them, this would make very little randomness in moving up the line. That's another point that has to be taken care of.

That job falling mostly on the back of my neck I absolutely shudder at because it means, my God, I've got to rewrite about thirteen years of work into simple textbook form,

cost us a lot of our Scientologese, but it is actually not to our interest to cut down too much on the esoterics of Scientologese into the upper levels. It's only in our interest to cut them out in the lower levels. The... because there are many things we've discovered in the mind that nobody has any word for except us.

We can simplify, then, on the broad public front the wording and usages of Scientologese, as a language, you see, but in preserving the necessary points, still get a simplification as we go up along the line. But there are certain things you can't simplify. You start calling an actual GPM – you start calling that in too much English and you use an English word of some kind or another for a GPM and you've just about had it. What you want is a symbol that is not restimulative of the wording of goals or items. See, has a lot to do with it.

Anyway, however that is, somebody now is in this position. He's out here on the street, he hears about Scientology. So he goes around and he understands there's an auditor there and he has some meetings on Friday night or something like that. And he decides he'll go along. He's heard from Bill or something. And he goes along there. He sees a chart up on the wall of where he's supposed to go. This tells him at once that there is someplace to go, that there is a way to get there, and if various states of arrived beingness are described with great reality on this chart, and so on...

He frankly won't look at the upper levels of the chart. They won't interest him. He will be mostly looking at the immediately adjacent interests of the chart, you see. And he'll say, those are a good thing to have and this is all he has to do. And this is all he has to study. And this is his practice of activity and it's on this schedule and that sort of thing. And that shows him that he can move from that point on forward. The road then is not blocked out because he sees that every time he gets at one of these points, he can then take off to the next point similarly informed and equipped.

Furthermore, he's not being limited by fantastic sums of money being required of him for processing. He's being asked for enough money to finance training but he is not – and he's usually perfectly willing to give that, by the way. He then realizes he's buying an unlimited amount of training to get through the processes of these particular levels and move on forward.

Well, by restimulating a lot of co-audit – getting a lot of co-audit going in areas and making Central Organizations concentrate on this and show auditors where they fail by not getting co-audit groups going, then the Central Organization itself comes over on to training mainly for its income line. It actually runs more courses than it did previously, more levels of course, and any HGC activity is basically patch-up activity resulting from co-audit areas.

Now, there hasn't been any success whatsoever – any fast success of dissemination or broad knowledge – in the idea of a private professional practitioner who grabbed guys off the street, laid them on the couch and ejected them out the front door. I want to call this to your attention, that this is not – in spite of the fact we have one or two guys, a few guys in Scientology that have been absolute geniuses at this and have made very good forward progress – but this has not been the picture of the whole at all.

This bloke who does this is following a pattern laid down by earlier healing professions. And we don't happen to be a healing profession so we're out of order to accept this par-

ticular zone. Now what's the score here? What's the score? Your... immediately, you have figures – you immediately have figures here before you. It took the medical profession over a hundred years to get anywhere with that system. It's taken the chiropractor, naturopaths, homeopaths, the osteopaths almost equivalent lengths of time and they're not really making it.

Look at this as a healing profession activity. You look at the amount of time it's taken them to get off a launching pad and, why just now the American Medical Association is getting up to a point where they have something to do with public opinion in the United States. And they're doing it for the rather unworthy reason of just getting a few more quick bucks into their pocket. These boys took a long time; these fellows were a long way on the road. So that is obviously not a fast system. Just looking at the comparative statistics we say then there is something wrong with this picture.

We have this Freudian analyst who has an office in the Ritz Building, and who gets a couple of patients in every day and listens to them, and so forth. This picture is not a successful dissemination picture. It happens to be the only picture in the society that anybody is complaining about. The medicos – it took them a hundred years to make it and they're not going to let anybody else make it, if they can possibly help it. They know how tough it is. They're going to – they're going to scuff the track up in front of us. They're going to push us around in order to get that quick buck and the monopoly, don't you see?

Well, we don't belong in their field. We have nothing to do with them at all. And so I don't think that pattern which is so well adapted to... What is – what is their highest level of prac... oh, letting blood, yes. They bleed people these days. They're the fellows that have those barber poles that go up – no, that's some other profession.

Anyway, all joking aside, they have not been successful because they are all poised for the final kickover. They were seized 100 percent in England by the government. In the United States, they will be in the near future. Socialized medicine is certainly going to be there. The big insurance companies of Canada and so on are – have all of their chips down on the fact that all medical healing in the United States will become socialized within the next five years.

Well, that'll be an adequate stop to any forward movement that – no matter what their forward movement might have been. And it looks to me – it looks to me and has for some time that that is not a successful pattern. Furthermore, the society only complains about Central Organizations when they engage in public processing: getting the guy off the street and straightening up something with him. Then they have an objection to this because it's in the line of that. They have also an objection to a private practitioner.

Let me show you here that if this system is followed – if this system is followed – you realize that anybody who becomes a preclear has to become a member of the club. Therefore, anything that's happening to him, he has a right to try to help do something about, if he doesn't like it. He isn't just at the total effect-point. And he's moving on forward and he has some responsibility for the general forward progress of the Scientology movement. Makes a different picture.

Now, the Senate anti-American activity – I mean the Senate Anti-American Committee, (I think that's one of their principal functions) American organizations, and so forth, have to be stamped out now, you see. We mustn't have the – organization never hired a communist

in his life – blacklisted, you know. They're going crazier and crazier. You're seeing government go goofier and goofier.

Now, these boys – these boys come up on an investigatory level, see, and they want to know about this terrible movement Scientology, *oh-wooooh-wooooh!* "They're doing these poor little poverty-stricken doctors out of their honorable duty." You knock them over in a minute – you knock them over in a minute with another plan of dissemination, don't you see. You'd say, "Well, as far as I know, the only thing that's ever gotten us into trouble with the press or with governments or anything is because part of our plan of dissemination – which fortunately for us was our most unsuccessful part of our dissemination activities – paralleled that of the poor, downtrodden medical doctor, who must be protected," you see.

Now, the government itself – the government itself – gets the idea of somebody trying to influence the public at large. They have another entirely different angle on this. They get some idea of somebody treating members of the public. This makes them a sort of a public activity. But look, I'll call to your attention that in every area and state in the world there is this idea of the private club. They have many privileges. The idea of the private club, the idea of the private activity. This fellow is a member of the club so he can buy drinks at hours which are not legal in any public pub, you see? All kinds of – there's all kinds of privileges associated here with the privacy of an activity.

Well, of course, it doesn't seem to occur to them that the member of the public becoming a Scientologist – the member of the public becoming only a preclear – is pretty hard to draw in our particular instance. But it does tend to wipe out forward randomness. We're now running into randomness. We've got such things as the Victorian Parliament. They got the – they got the straw out of their teeth long enough to utter asinities on the subject of "What is this Scientology?" And they're now having some kind of investigation on the subject down there in Victoria State – that's a State Parliament down there, they don't amount to anything.

I was fascinated by their summons to the inquiry. It's inquiring after the corporation which has never done any business in Australia. It wants all the papers of this corporation which has never done any business in Australia. Just happens to be one of the Scientology corporations. They haven't even got the right corporation in other words. They're adrift, man.

Of course, I have no objection to these attacks, so long as they continue to attack along lines in which they will inevitably lose. [laughter] See, the FDA attacking us for healing people with an E-Meter, hooking it up to people and saying their cancer will now be cured because we have turned the meter on, see? That's what they actually were charging us with. So long as they bring attacks along that line, it's perfectly all right with me because we win them. We'll win all these attacks one way or the other. God help the Victorian State Parliament. I used to look at the HCO Exec Sec down there occasionally. She got an interested look across the street, you see – it's right across the street from HASI. And she'd say, "Well, we'll own that place one of these days," and it's already begun. They're the people who did enough overts now and of course they'll run for cover like a bunch of startled quail.

But if their investigation starts by investigating a corporation which has never done any business in Australia, as the corporation they should investigate, well, it gives you an idea of it, see? And they're investigating things that don't exist, and so on.

We don't care much about this type of activity except as it takes it out of me and muddies up the lines and takes it out of Assoc Secs and HCO Secs around the world. They manage to hold the fort. They really don't do us a lot of harm. But if it's stepped up to this particular point at this particular time... We have just now gotten a complete cycle of research here, what's going to happen because of this is, of course, gruesome because this will make a vast difference in its own right.

But everybody's gotten terribly interested in Scientology. Newspapers are saying to us now, "Oh, of course, anything that happens in Scientology is news." Well, of course, what they consider news these days is bad news. And we're not terribly fascinated with being treated this way. But we'd better... not – this isn't necessarily why we would put out this policy letter. I'm just showing you that it does happen to have an advantage in that direction, too.

Now, I've examined this from all fronts. The only criticisms I have with it – it sure does make an awful lot of certificates, has lots of certificates. But I call to your attention that these certificates are most of them extant. They have at one time or another actually been issued or used. And these certificates are an effort to handle the situation of somebody completes a course but doesn't get his classification, at least give him something for the course. You'll find this continuously operates as a problem in handling courses and so forth. You'd be surprised how much upset you get if you don't do this.

And therefore, the certificate does not carry the rights of the class. At no time here does the certificate designate or carry the right of the class. These are just an afterthought. The classification is carried by the Roman numeral and only the Roman numeral regardless on what certificate it occurs.

So someday you may see the oddity – because HGA was given away years and years ago – you may see an HGA with a Class II on it. Sounds wild but – and a lot of administrative randomness can be kicked up along this way. But it's actually the class they have made. And if they are studying for the next class, they may do the processes of that class if they already have in their hands – you couldn't train anything unless you did this – unless they already have in their hands the level of their last class, see? They must have the level of their last class. May therefore do the processes of the next class while actually being trained for that class – while actually being trained for that class, see? Because this breakdown will stand that much – that much strain but may not do the next class.

See, it can only move one above. If they haven't gotten the classification let us say – they've got a Class III and they haven't gotten their IV classification but have been trained for IV, and then they go on to try to take a course for V. Can't do it. Because in the first place, there's something must be wrong back here with their case or something like that. Something must be wrong with the basic understanding not to be able to get a class. Something must be missing here someplace, you see? And you'd throw the whole thing askew again if you permitted a guy to just go on up training for each class up and doing the processes of that class because he was training for it. It would become idiocy.

But you have to allow the next class to be trained from the class award actually given.

Now, the question came up, what about Class 0 and Class I? Well, of course, that's the only one where you have this condition. And that's because it is Class 0, because you haven't

got a Scientologist yet. And therefore, you say, Class 0, you're actually not saying very much. This class has to be double if you take a good bold look at it. You've got the person who is being trained for an HAS certificate. You have to consider him a class of some kind or another. Consider him Class 0 striking for an HAS certificate. And then there's your HAS certificate classed, because there had to be a certificate before he could get a class.

Now that condition doesn't ever occur again. The person from that time on has always got some kind of a certificate to put a class on. I mean it's as elementary and as stupid as this particular thing. There is no other ramification about Class 0 and Class I both coming under HAS. It has no other meaning than that. Of course you call this person a Class 0 because he's taking a course for an HAS, don't you see?

Now, this permits however a basic public release textbook to be issued at the level of Class 0 which doesn't really contain the classification materials for HAS and Class I. It's just public stuff one way or the other – dissemination material.

All right. Not to labor the point too much, I can tell you right now that there are cases all over Scientology who are parked because they skipped some of these levels or haven't got things squared away at one or another of these levels of processing. And they tried to leap with seven-league boots into the rare and stratified air of upper-level processes when they are still desperately worried about the fact that water, every now and then, looks awfully green when it comes out of a faucet but they really can't ever see that it is green, don't you see? And they're worried about such things as visual perception, or what is the environment all about. Something that would be solved all at once with the CCHs, don't you see?

And yet, somebody's trying to run them on implant GPMs or something like this, see? Oh, brother. Now that stretch of unreality accounts for lack of forward advance, and if an individual in Scientology doesn't feel that his case is advancing, that he is advancing, then somewhere along this line – and this schedule is laid out fairly precisely – he has dropped the ball at one of these levels. That level has never been flattened on him as a case. That contains things that he is still desperately worried about.

Now, it's all very well to say that only in the upper levels do you get a real resolution of the case. That's true. But how do you get past the camouflage and the nonsense of the PTPs and upsets of present time in order to get through the case in order to relieve the things which are the real trouble with the case? It is very true that the real trouble with the case lie at Level VI. These all lie at Level VI. And it's also very true that you've got no chance whatsoever to get to them because there are too many other things wrong already that lie on the top of them. The unreality of the situation is such that no one can ever get to these.

So, the anxiety of some auditor to get the most, see, get the *biggest effect* on the pc, you know; do – *do the most* for the pc, you see – takes this little kid who is awfully worried every time his mother leaves the room, and tries to run an actual GPM on him, see? He isn't going to make it.

And the other point – the only other point I'd like to make is I think this reduces the amount of danger, the amount of upset, the amount of randomness connected with processing results. And I'm terribly interested in that.

Well, I've given you a lot of data here one way or the other. I've tried to give you my viewpoints with regard to this, and I hope they've been of some assistance in this matter.

Thank you.

TV DEMO: BASIC AUDITING

LECTURE AND DEMO

A lecture and demonstration
given on 4 December 1963

How are you today? Thank you. Now this is the 4th of December, isn't it? Fourth of December 1963, Saint Hill Special Briefing Course. What you're going to see here today, and what you're going to hear is an extremely novel demonstration. And we're going to combine a lecture with a demonstration.

I'm going to try to give you some idea of the presence of auditing – the use in handling of basic auditing. Now recently, recently, you had something called itsa. And itsa has always been present and actually there's no difference between auditing in 1952 and auditing today. Really there's no difference. I'd say probably 1954 was more like it or 1955. There's no real difference. And everybody seems to have interpreted itsa as some new strange commodity that doesn't have anything to do with what we were doing. Well, I have more or less always handled itsa, and I found out that auditors weren't handling it, and, that they needed a different viewpoint and a different perspective from which to view an auditing session, so as to make their auditing better.

Now, all this is very interesting. But auditors in actual fact – and this goes for, I'm sure, Central Organizations, field auditors and so forth, as well as this course – have all of a sudden dropped into some kind of a category of itsa that nobody ever heard of and that was never intended. And this is pretty awful bad. I couldn't say how much. I mean I – this tape's going out in public so I can't swear, don't you see? But it's pretty grim.

Do you – do you know that auditors are permitting their pcs to draw pictures? Not to illustrate anything, just sit there and draw pictures and pc is humming and the auditor marks down the TA action while the pc is humming and... *What is this?* I mean, what on earth's going on here? This is madness! Auditor sitting back giving the pc nothing to do, not handling any control of session, not doing anything in the session. Of course, your TA is going to pieces. Well, now look, the place to get your basic auditing together is at Class II and Class III. The – your basic auditing ought to be very nearly perfect at these levels. Because you're never going to be able to do an OT process unless your basic auditing is nearly perfect. There frankly is no difference between Class II auditing and Class VI auditing. No difference, really, as far as basic auditing is concerned. Now, the basic auditing is that fundamental

which handles the pc, handles the session, handles the auditing comm cycle and handles the meter. Regardless of what else is occurring.

Now, the situation that you face here is that there is a thing called perfect basic auditing. There is a thing called perfect basic auditing. And at Class III it – now as we know it, it now handles the meter. It adds that into it. But at Class II all basic auditing is doing is simply handling the pc, the session and keeping the auditing comm cycle going and intact.

Now, there is room for improvement in this. Nearly everybody's auditing had room for improvement. Frankly the demand of an OT process on basic auditing is so great that you cannot have frail basic auditing and run anything, really, at Class V or Class VI and expect any result to occur. But for an auditor to be sitting there, letting the pc doodle, for an auditor to be sitting there, with the pc humming, with an auditor to be sitting there silent while the pc had nothing to say; these things are fantastic violations of basic auditing.

Your basic auditing has got to be good. Now, I'm laying it on the line to you here, and it may be very cheeky of me perhaps to play one of my own sessions on this sort of thing. But for the last three months I knew that auditing could be improved. I knew my own auditing could be improved. How about yours? So I've been working for about three months to get my own auditing improved as far as I could improve it. And I've been very careful of various things. And I've been grooving myself in along this particular line.

The trick is to do all these things and keep the session rolling. Now of course, at Class VI you're right on top of the session, you're kicking it all the way along the line, you're speeding it up, you're rolling it very quickly and so forth. But frankly it's no different that it should be at Class II or Class III. All of these auditing lessons, then, apply to all classes above I. Basic auditing is something that should be very smoothly done indeed.

Now, what I have been able to improve in my own auditing are these particular points: handling the pc's itsa, receiving it, knowing when the pc has spoken, acknowledging what the pc has said and not cutting off the pc's itsa. Now of course, one of the ways to (quote) "play this safe," is just not to say anything to the pc at all, and then of course you never cut his itsa. Well, how about cleaning cleans? The pc will just go on a self-audit if you sit there silently. So this is a beautifully balanced situation. You've got to be able to answer the pc without cutting the pc's itsa, and without putting in a big silence there which will also really not handle his itsa. So it's a case of knowing when – for the auditor, when to talk, the auditor should know when to talk and when not to talk. And it's a quick proposition. It is not slow.

Now, there's a lot of ways by which auditors comm lag. And I've noticed auditors comm lag down through the years. But the pc said – you're asking the question, "Do fish swim?" And the pc says, "Yes, they do."

Auditor: "...Oh! Oh, yeah! Okay." And the auditor says, "Do fish swim?" "No."

And the auditor: "Hm. Oh, very good. Yeah, ver... yeah, all right, excellent. Excellent. Yes-hm-hm, yes, *jush-jush*. Mm-hm, well of course. Yes. Thank you. Thank you very much for..."

What the hell is that but auditor comm lag, see? The comm lag of silence, the comm lag of stringing out a whole bunch of acknowledgments so – hoping that something will hap-

pen. These two things are auditor comm lag, nothing else. What's the auditor doing comm lagging? Well, maybe he's comm lagging because he doesn't know the technique. Well, all right, he can learn the technique. But if he is comm lagging his basic auditing just doesn't happen to be good. It happens to be bad. His basic auditing is very, very, very poor.

Now most everybody in auditing believes that if they just knew the technique they would be all set. Well now, auditing is now divided into basic auditing, technique and case analysis. Three sections. The truth of the matter is that basic auditing is basic auditing, and it doesn't matter what technique you are running. Your basic auditing must be adequate.

Now, do you know that it doesn't even change from technique to technique? It's just basic auditing. It's the pc says something, you answer it. Pc isn't saying anything, you get the pc to say something, you know? Pc hasn't got anything to think about or say, give him something to think about or say.

You keep this thing rolling. You keep it going. You keep your action up in the session. You're right on top of the session. That's what gives you tone arm action. Tone arm action totally stems from keeping the session rolling. There's all kinds of ways of mishandling pc's itsa. But the secret of good handling the pc's itsa, when the pc has answered it or said what he's going to say, the auditor then and there at that moment knows the pc is finished talking and answers it. Once in a while he makes a mistake. The pc had something else to say. Fine, let the pc say the something else, and acknowledge it again.

When the pc has got nothing to say, *give* the pc something to say. Give him something to think about. Give him something to work on. In other words, it's the auditor who injects the busyness into the session. Now, I've given you itsa, and the response to itsa is to fall away and do nothing. The auditor does nothing now in the session except record and hope the pc by self-audit will get somewhere. Well, believe me, that is not auditing and it never will be auditing, below – above rather – it won't be auditing above Level I11.

Yes we expect a Level I person to sit there and let the – let the individual talk. We expect this to happen. That's what we expect to happen. But that's Level I. Well, none of you characters have been in Level I for a long time. You've always been doing formal auditing. Well, who stopped you from doing formal auditing? I didn't. But at Level W I thought you could get some idea of measuring communication. And letting the pc talk and learning to listen to what the pc was saying. And I thought that would be beneficial. But you, you've carried it all the way through, and you are going to audit somebody up along the line clear to VII, I suppose, sitting there, comm lagging, saying nothing, while the pc doodles. That's not auditing! You hear me now. I mean, I'm strenuous on this and I'm being rough on this because I was plainly shocked. I conducted a survey of this and, well, you've just simply misinterpreted what is itsa.

Now, the points I've had to improve in my own auditing were handling the pc's itsa. Be right up on top of it. I found out that it was I who was causing the dirty needle, it was I, in my auditing, handling basic auditing, who occasioned the occasional ARC break the pc had.

11 Editor's note: This follows another system of classification as the modern one (for details HCO PL 26 Nov 63). The auditing style referred to here today would belong to Level 0.

Next thing I had to concentrate on was promoting and increasing the pc's itsa. In other words, I never pulled information off of a meter or grabbed information from anyplace unless I couldn't get the pc to give me the information independently. You got it? I didn't ever assess – I stopped assessing, solely and totally by meter. I gave the pc a chance to tell me what it was. The pc couldn't tell me, then I got it by meter. Promoting and increasing the pc's itsa, giving the pc every opportunity to increase his ability to itsa. Because that is the road out. The pc's ability to itsa must be improved or the pc isn't getting any better.

Number three: Not talking while the TA is in fast motion. You've got a TA over here, and it's going – it's going like this. Well, during that period of time you're silent like this, see? Pc says something and you see your TA...[demonstrates something on the meter]

All right, at that moment, you say, "Thank you." You didn't say anything while that TA was in violent motion. But also not waiting to see if the TA was going to move again. I'll give you the idea what this is, see. We get – the pc says "caterwump" was the item. All right, and we see the TA go.

We're silent during that period. Now, if we kept silent here hoping the TA was going to move again, we get this kind of a picture. [demonstrates something on the meter]

That doesn't count.

Now, I'll show you the right way to do this: And you can see this TA moving, and here's a big broad sweep of the TA. Pc says, "Caterwump!" Auditor's silent, you see.

"...Thank you." All right. Just as long as that was on a smooth even sweep, why, the auditor was silent. Because he would have upset the pc if he had talked during that period because the pc's very badly introverted.

Now this is wrong: Pc says, "Caterwump!" And we've got this smooth downward sweep of the TA here. Auditor silent. Auditor remains silent.

See, that TA pumping around, working. That's wrong. That's wrong. In other words, that TA is pumping around. Of course, if the pc is itsaing at the same time and talking, well, it would be because the pc was talking that you kept silent. But ordinarily for reason of tone arm alone, you just take those big, broad sweeps and you shut up during those sweeps and then you don't sit there and wait endlessly for the – to see if the meter is going to move again. Because actually that's in violation. The meter has stopped moving, hasn't it? So at that point of stopped motion, why, it's perfectly all right for the auditor to start talking.

See, you can push this so painfully far that a pc never gets an opportunity to actually – well, he's just left without an auditor, that's all.

Now, actually at Level VI you'll get this situation, that after the thing has blown down and come back up, this pumping motion that you now see, here, this little pumping motion of – regardless of what he's saying, and so forth, is in actual fact coming from the next item, not yet found. You've got all of your TA action out of the item you've found, with that long broad sweeps. And now you're just bleeding TA out of the bank someplace.

But that's a particular thing about TR 6 [level VI]. It works with any process, then, that the auditor should not be talking while the TA is in fast motion. But not waiting to see if it

moves again. See, once it stopped moving the auditor has no business now sitting and waiting to see if it's going to move again. He just simply now says, "Good!" You got the idea?

It isn't a case, then, of sitting there haunting the meter; it's sitting here at 3.5, and you're haunting the meter, wondering if the meter is going to drop. Well, it drops to 3.25. And then sitting there and waiting to see if the meter's going to move again, and finally after four or five seconds the meter does shift up to 3.3. See, that's wrong, that's wrong. What we're talking about when the meter is not moving, we don't want the auditor talking on these war... large sweeps. That's what we're interested in.

So that's another point involved here, on basic auditing. It's a basic auditing point. No technique point. Now, taking up and handling the pc's problems, either at session start or as they arise or at session end. Now, that's all a part of basic auditing. You can't audit and get auditing gains with a pc with a PTP. The pc says he has a PTP, whether that occurs in setting his goals, he apparently has a PTP, or in mid ruds, he apparently has a PTP, or in – during the running of the thing. As he discusses things he suddenly brings up a present time problem. Or at session end he now has a present time problem. Keep the pc's present time problems handled with regard to the session.

Now, you think of a present time problem as something that happens outside sessions, no, a great many present time problems happen because of auditing. Now we have – for instance I'm – will even go to this point now, is just before I give the end of the body of the session, note that there's a goal up here that the pc has set, and this goal that the pc has set up here is very definitely a – hasn't been touched in the session. See, it's sort of a PTP kind of goal, you see. "To find out if I really am bright." Or "If I find out if I really am stupid." We haven't had any of this in the session at all. And take it up before the end of Model Session.

Now, this goal up here – don't wait for goals and gains, see. You can all take this up right after the session – right after the end of the body of the session – but you notice there's an outstanding problem there. You hoped it might turn up and solve during the session, it didn't. You say, "Well, how do you feel about that? Is that really a problem to you?" The pc says, "Something or other *sother sother sother* and so-on and so-on," and "What considerations have you had about that?"

"Well, so-and-so and so-and-so."

"How do you feel about that now?"

"Oh, I feel all right."

"Okay, thank you very much. End of the body of the session."

And then just go into his goals and gains as though you hadn't paid any attention to it. You get the idea?

Pc says in a – now here's a middle session thing. Pc suddenly says, "Well, I don't know whether I really answered the question or I didn't answer the question, you know. See, it's very, very difficult to tell whether I answered the ques..." Know you're looking at a PTP. All right, so you handle it as a PTP. And you say to the pc, "All right, well, what considerations

have you had about it?" You're of course going to wear this one out because it appears to be a pat thing. There are a thousand ways to handle this thing.

But you're going at it on this basis: PTP.

"Well, I don't know I..."

"Well, what was the answer to it?"

"Well, it was so-and-so and so-and-so. Well, I don't really know. I didn't really know at the time."

"Well all right. Well good. Well, what was the question that was asked at that particular time?"

"Oh, so-and-so. Oh, oh, yes! So-and-so! Oh, well, yes! The answer was so-and-so."

"Oh, all right!" And I come right off of it. Because we handled the PTP. Get the idea? Don't let the pc pack up a bunch of PTPs in the session.

Now I'll give you these four points again. Handling the pc's itsa. That's number one. That's not talking and cutting off his itsa, and not being silent and giving him nothing to itsa. That has two sides.

Two, promoting and increasing the pc's itsa. In other words, you give possible opportunity. So that you don't tell him or the process doesn't let him find it out or a meter rather, the – he does – you don't going to find it on the meter, when the pc can tell you. In other words, get pc first on this sort of thing. Get him to itsa. Get him to look at it. Get him to find the answer himself. Do all you can to get the pc to find out the answer himself without barging him down, and making him feel like he's getting no help. You can also do this to a point where he feels he's getting no help at all.

Number three, not talking while the TA's in fast motion, but not waiting to see if it moves again. That's all part of it.

Number four, taking up and handling the pc's problems, either at session start or as they arise or at session end. Don't let a pc have PTPs.

Now, there's basic auditing. Basic auditing is something that an auditor is. This is something he does. And when I get the idea that all the auditors in Scientology are going to sit around and handle a session this way: "Well, what consideration have you had about problems?" For the next hour pc saying nothing, doing nothing, the auditor sits there and looks at the pc.

Look. If all auditing, if all auditing I thought was going to degenerate into that, if it was going to degenerate into that, I'd go on a vacation and I wouldn't come back. Now, you just – mind you now, I've given you the threat.

Here's your – here is something interesting here, from a standpoint of Model Session. Now, you're going to hear on this tape – I'm going to play you little bits of this, you're not going to hear a complete session, you're going to hear little bits of this. And I'm going to give you this tape in chunks. And although this tape is very valuable, this happens to be a present time truncated GPM found on a pc, the goal found and the – all sixteen items in that GPM run

in three hours, with a total TA division of one hundred and seventy-five. That's in three hours. And this is very valuable because it's probably the only tape that gives us the full complete rundown on finding items or anything else. Completely aside from the fact that it is a tape on technology and gives technique and its patten, it is a study in basic auditing.

Now let's see if you're good enough to hear the basic auditing that is going on in this particular tape.

LRH: This is what, 3 December?

PC: Yes.

LRH: The tone arm's rather high here.

PC: Is it really? Where?

LRH: 4.75

PC: Oh.

LRH: All right. Cans in your lap, squeeze your cans. All right, that's fine. Your havingness is in good shape. We're going to continue with actual goal processes, okay?

PC: All right.

LRH: And I think I'll start out this PT situation.

PC: Mm-hm.

LRH: And if not we'll go on with what we were doing, okay?

PC: Mm-hm.

LRH: All right, is it all right with you if I begin this session now?

PC: Yes.

LRH: All right. Start of session. Has the session started for you?

PC: Mm-hm.

LRH: Anything worrying you?

PC: No.

LRH: All right, very good. What goals would you like to set for this session?

PC: If we work on it, find the ninth – ninth GPM.

LRH: Hm?

PC: If we work on it, find the ninth GPM.

LRH: All right.

PC: Clear up any doubts about the present time GPM. That's it.

LRH: All right. Very good. Now we'll get our since mid ruds in here.

PC: Mm-hm.

LRH: All right, since the last time I audited you, when was that?

PC: Last night.

LRH: Very good. Since the last time I audited you has anything been suppressed?

PC: I suppressed um – myself to go to sleep last night, so I would go to sleep.

LRH: Oh, yeah?

PC: Yeah! Because I'd been staying up late and...

LRH: All right.

PC: Um – I suppressed annoyance today at not being able to locate the um – your old passport. I suppressed an-

noyance at Arthur because he wouldn't let me read – didn't want me to read Christmas – the way Christmas is celebrated in different countries. He figured that was too grown-up for him. That's all.

LRH: All right, I'll check that on the meter. Since the last time I audited you, has anything been suppressed? Well, that tends to rough it up just a little bit.

PC: I suppressed concern about getting this affidavit out and done. I suppressed concern, well, what if we don't find your passport, you see. I suppose your police book would do. Um – also, you know, had the American Embassy call again and found out that we didn't have to go down there, do you see what I mean? Always – you know, like can we have it notarized here and then send it there, and then they handle it, you see. Of course, you see, yes!

So um – you see, but Mary called up and she asked about it, "Well, they'd have to come down here to the American Embassy and bring their passports and..." You see what I mean? So it's all right now, and we have a notary coming down, to notarize it here, and we don't have to go to the Embassy in London. Well – well, I suppressed um – I suppressed that um – as usual, with governmental type things I found out that uh – my passport has been out of date since, you know, February 63. And um – I thought, well, that's to be – that's certainly true. Anytime I come into contact with governments I suppress – I don't want to have to do it, see. And uh – so I suppress – I suppress doing all their little actions that one's supposed to do. And forget all about 'em. That's all.

LRH: All right, very good. Check that on the meter again. Since the last time I audited you, has anything been suppressed? That a protest?

PC: I'm protesting the question, yeah.

LRH: I didn't leave anything...

PC: Oh, I suppressed my legs are tired tonight. Standing out there on the cement, cold cement, and watching students, you see, audit. Well, it's like um – like jumping up and down on a steel deck, you know?

LRH: Hm!

PC: Cold floor, hard cement.

LRH: All right.

PC: That's all.

LRH: All right. Since the last time I audited you, has anything been suppressed? Well, that didn't read.

PC: Mm-hm.

LRH: All right, since the last time I audited you, is there anything you've been careful of?

PC: Oh, to write up this affidavit with Plenty of "therefores," and "thereofs," and "wherebys," and "whereofs," and "witness all ye men," and, you know, legal jargon. And um – I was careful to make a complete search for your passport. I've looked all around. That's all.

LRH: All right. Sin – I'll check that on the meter. Since the last time I audited you, is there anything you've been careful of? All right, that apparently didn't read. Since the last time I audited you, is there anything you failed to reveal?

All right, now you've – you've seen this going on to this degree. I'm sorry for the slow start there. Actually the machine had to be considerably adjusted there at the beginning. Now, you heard a blank. You heard a blank. Right after she did the last Careful of, you heard a blank. That was a tone arm blowdown. And as an auditor I just simply made notes on what she was doing, and watched the tone arm blow down and when it hit bottom and so forth, was in there and acknowledged it. Now, do you get that? That isn't just a blank hoping something will happen, it is in actual fact this.

Now, do you see any difference so far, in what you are doing with Model Session and what you are hearing on this record? I'm going to play you the rest of these mid ruds and let you listen to that.

PC: The passports. I kept thinking there was something. I didn't – I never found it.

LRH: All right. Okay. Since the last time I audited you, is there anything you failed to reveal?

PC: No.

LRH: All right. I'll check that on the meter. Since the last time I audited you, is there anything you failed to reveal? Is there anything you failed to reveal? Well, that didn't read. Do you agree that's it?

PC: Mm-hm.

LRH: All right. Since the last time I audited you, has anything been invalidated? The last time I audited you, has anything been suggested? There's some read on Suggest.

Now, I want to call to your attention the fact that the pc is actually given time to answer the auditing question. The auditor doesn't go on talking, you see, because the pc is taking time answering the auditing question. Those are the pc's comm lags. The pc's blanks. They are not the auditor's blanks. The question is asked or implied to the pc, and the pc is then given time to answer the question. So there is your – those silences that you hear there is the auditor giving the pc a chance to answer the auditing question. And the pc is floundering around trying to find if there is any answer to it.

PC: I can't think of any mistake.

PC: No, I don't think so.

LRH: You don't think so?

PC: No.

LRH: All right. Since the last time I audited you, has a mistake been made? Yes?

PC: ... No. Haven't done any mistake. I don't know of any mistake.

LRH: Mm-hm.

PC: Oh, just – just students, making mistakes in their auditing.

LRH: All right, very good. Since the last time I audited you, has a mistake been made? Yes? Another one?

LRH: A protest? Seems to be a latent protest. I'll check the question again.

Since the last time I audited you, has a mistake been made?

PC: Well, I don't know what mistake has been made!

LRH: All right. Was there a mistake about case analysis? That read. What mistake in case analysis?

PC: Well, that was just one of the students not getting the charge off before doing a – a case analysis.

LRH: All right. Does that answer it?

PC: Yeah! Well, I covered that on the – on student auditing mistakes.

LRH: All right, very good. Since the last time I audited you, has a mistake been made? All right, that seemed clean. Since the last time I audited you, has anything been protested? Since the last time I audited you, has anything – is there anything you've been anxious about? Last time I audited you, has anything been decided? Yes, what's been decided?

PC: I've decided to get these uh – get these uh – wigs, and – and uh – false noses and – and makeup grease paint and false beards and so forth, for Diana, and make her up a disguise kit, you see.

LRH: Oh, all right.

PC: These noses, these false noses or rubber noses, you see, and you can put them on and then n... makeup putty, you see. You can put the putty around and then cover the putty up with grease paint, and so on. And they also have a little book about how to make up, you know, how to make yourself look old, and how to make yourself look this or that, or sad or, you know. So um – should be interesting.

LRH: All right.

PC: I also got her some beard, some crepe hair to make uh – make beards or mustaches or sideburns or what have you. Two um – two womens' or ladies' wigs and one wig of a man. That's all.

LRH: All right. Since the last time I audited you, has anything been decided? All right, that seemed clean. All right. And one more checkout here, missed withhold. Have I missed a withhold on you? Yes ma'am?

PC: ... Well, I still haven't thought of what to get you for Christmas.

LRH: Oh, this is...

PC: Missed withhold from me, too!

LRH: Comes Christmas time.

PC: Yes.

LRH: All right. Have I missed a withhold on you? I'm afraid there is one there, Suzie.

PC: Yeah?

LRH: ... There.

PC: Well, that was um – Mary Long, won't be here tomorrow. She has to go up to uh – Guys hospital. Uh – they want to have another look again at her thyroid. And she's going to refuse. She's been refusing an operation on it. But uh – she's going up tom... tomorrow to see how it's going to run. And uh – she showed me one of the tests, you see, and – that they would conduct on her, and it seemed like it was pretty good. Uh – she was able to – you know, you're supposed to hold your arms out and stretch them out and something or another. If your fingers shake or something, well, then this indicates parathyroid trouble and uh – her fingers were pretty steady. So, it looks improved to me.

LRH: All right. Have I missed a withhold on you? There's one.

PC: *Mm. Student not being facile in questioning on case analysis, you know. Ask a question, and – and they don't know how to ask another question in order to verify what they've gotten, do you see what I mean? You know. Also, this one student, everyth... everything the pc said, he checked something different, you know. So I thought, dear! Sort of refusing the itsa of the pc. By at least not being courteous enough to check it, you know? Even though*

it is wrong. You can at least be courteous enough to check it. Well, that's all.

LRH: All right, very good. Very good. I will check that one more time. Have I missed a withhold on you? All right. That – do you agree that's all clean?

PC: *Mm-hm.*

LRH: All right, very good. Thank you very much. Take a momentary break, would you?

PC: *Mm-hm.*

All right. Now there you've just heard the routine actions that you're supposed to take in starting a session. And the silences you heard were not the auditor's silences. That may come as a horrible shock to some auditors. They were all the pc's silences. The auditor's right up on top but except one instance when the TA was moving like it was taking off from a launching pad. All those silences were the pc's. And the auditor was riding right up straight on top of it, bang! In other words, the pc finished off finally, bang! The auditor was in there again. Bang! He's in there again. Bang! You got the idea?

This is – this is not worked the reverse way. That the auditor sits silent while the pc has nothing to do and so forth. There you see, of course, the fast check on the last five buttons, and a permissive check on the first three. In other words, the first three of Suppress, Careful of and Fail to reveal, of course are permissively checked. They are not checked on the meter until the pc says, "That's it" – said, "That's all." And then they're checked on the meter. And the rest of them are just rapidly checked on through.

This is standard, and you even saw an instance of steering. And that instance of steering was on the last button there, of the mid ruds, I think it was. And it was just a matter of pc couldn't think of anything there. Couldn't think of it. Well, having given the pc all possible scope to promote and increase her itsa, naturally we had one – we'd gone to a point where the pc couldn't think of anything in particular – I think that was on a missed withhold – pc couldn't think of anything in particular and the auditor then watched the meter and when it ticked the auditor said "there" to attract the pc's attention to what the meter was saying.

But you see that was only carried out when the pc was just floundering, was unable to see what was making the meter read. Now there – there is just standard, terribly, terribly standard hard, fast model sessioning. The number of TA divisions which were gotten in that little short space of time were *fourteen*. That was not twenty minutes. Much less than that. I don't know, it's on the report here someplace. But there's fourteen TA divisions in that short space of time.

Why? Well, the auditor was working. The auditor was being a pro. The auditor wasn't there for the ride. Anybody who doesn't audit that way handling those things is going to get

minimal TA action. Now, I don't say I'm the world's most perfect auditor, but I'm doing better than you are right now. So let's take a look at that.

Now, let's get into something complicated. Let's not – we'll just pass over finding this next goal. I was able to find that rather easily but did it in a rather unorthodox fashion, since it was right there ready to be grabbed. I was able to list up from the top oppterm of the previous bank because the pc had already had a great many found. Let's just cut into this at random here and see what we find.

LRH: This list complete? Ticks.
You have any heat on this list?

PC: *Mm-hm.*

LRH: You have?

PC: *Yes.*

LRH: Well, we may have something on it. Okay? We listing closer to present time? Or are we listing earlier? Neither one of them read.

Let me null this list, and see what you get here.

PC: *Mm-hm.*

LRH: To be wild. To be wild. To be impetuous. To be impulsive. To be dashing. To do whatever I want. To do whatever I want. To have a gay time. To throw caution to the winds. To be incautious. To be uninhibited. To dare. To be daring. To proceed courageously. To proceed courageously. You thought of another one or something?

PC: *To do as I please, I thought. Is that – is that the same wording as the ones there?*

LRH: I don't think so. Okay.

PC: *Mm-hm.*

LRH: How's that?

PC: *Hm!*

LRH: All right. To act with courage. To be carefree. You thought of another one?

PC: *No, just that "to do as I please." That seems to have heat on it.*

LRH: Is that so?

PC: *Yeah! Only I never do as I please. So it might – if there – if that is a goal it's failing already.*

LRH: To do as I please. To do as I please. On this item has anything been suppressed?

PC: *Well, I always want to do as I please. But I never do as I please. You see?*

LRH: Hm!

PC: *Oh, I know a good one for that! To be irresponsible.*

LRH: Okay. All right if I continue with the list?

PC: *Mm-hm!*

LRH: All right. To be carefree. To be carefree. To be careless. To not care. To not care. To care about nothing. To care about nothing. To follow any whim. To follow any whim. To go off half-cocked. To be a daredevil. To do as I please. To do as I please. To be irresponsible. To be irresponsible.

PC: *Isn't there to be daring on there somewhere? You've already read it?*

LRH: Yes, there is a "to be daring." Check it again for you. To be daring. To be daring. To be daring.

PC: *And then I thought of another one. "To dare." [laughs]*

LRH: All right. To dare. To dare. To – to dare. To dare. To dare. That's still in. Heat on it?

PC: *Mm-hm.*

LRH: All right, I've got one over here that tried to go. To act with courage. To act with courage. To act with courage.

PC: *Oh, that just went because it was amusing. You know, I just – that just read because it was amusing. It was one of those – you know [laughs]*

LRH: All right.

PC: *"To live with honor." [laughs] Die for – die for goals!*

LRH: All right. Read some more of these. I'll check this one now. To be daring. All right. And this one was trying to read. To dare. To dare. To dare. It is not now reading. And to do as I please. To do as I please. And to be irresponsible. To be irresponsible. To be irresponsible. Well, I'm sorry, I haven't got anything reading there.

PC: *Mm-hm. Are we listing for nothing?*

LRH: Are we listing into nowhere? Are we listing for nothing? Are we listing into nowhere? I don't get a read. Is there an item where we're listing for? Is there a GPM here? Well, that tends to slow. Is there a GPM here? All right, did you get more heat on this list when I nulled it?

PC: *As you were nulling, yes. Hm.*

LRH: What had the most heat on it?

PC: *Um, to do as I please, and uh – to dare, and uh – to be daring.*

LRH: All right. To do as I please. To do as I please. That's now reading. To do as I please. To ... That's reading.

PC: *Mm-hm.*

LRH: Now, is that the PT GPM? Is that an actual GPM? What do you think?

PC: *I don't really know, is that an actual GPM, do you think?*

LRH: Is that an actual GPM? It ticks. I'll check the rest of it. Is it an implant GPM? Is it only a goal? Is it only a goal? Is it an actual RI? Is it only a – is it a lock on an RI? I get a tick here, and when you said so it rocket read that it's an actual GPM.

PC: *Mm-hm.*

LRH: What do you think about this?

PC: *Well, I think that's very interesting. If that's the case, it's uh – pretty high, it's got quite a few items in it. Because, uh – I uh – never do as I please.*

LRH: All right. This an actual GPM? Well, that reads. All right, is this the GPM that's closer to PT than "To proceed with caution?" Is this GPM closer to PT than "To proceed with caution?" Or is this GPM earlier on the track?

PC: *It's earlier on the track. Is it? Does it read?*

LRH: I got a tick. Is this GPM earlier on the track? Is this closer to PT than "To proceed with caution?" What did you think of?

PC: *I'm just getting so much heat off I can't – uh – you know, I can't tell which way uh – it goes.*

LRH: Or is this earlier on the track? Earlier on the track? Or is this closer to PT? It's closer to PT? Earlier on the track? Neither one of those are reading.

Now, I had a tick there, that it was earlier on the track, but that just might have been your startlement.

PC: *Hm.*

LRH: Hm?

PC: *Well, check it again. Is this closer to present time than "To proceed with caution?" Or is this um – further from present time than "To proceed with caution?"*

LRH: When you say it, my dear, it falls very heavily on closer to PT than "To proceed with caution."

PC: *Oh. Was that on assert? No.*

LRH: Hm?

PC: *Was that on assert? No. I haven't asserted it.*

LRH: Well, asserts don't ordinarily read a full dial.

PC: *[laughs] No. Caught. Yes.*

LRH: Now, is that the GPM that is the PT GPM? Rocket read.

PC: *Rocket read.*

LRH: PT GPM? That's number one GPM? "To proceed with caution" then is number two GPM. Is "To proceed with caution" number two? Is it number three? Number four? Number two. "To proceed with caution" is number two GPM.

PC: *Hm.*

LRH: And "To do as I please" is the PT GPM. Number one. Is that correct?

PC: *Number one, yeah. Yes.*

LRH: That is the PT GPM?

PC: *Yes.*

LRH: The one that comes into PT?

PC: *Hm.*

LRH: Is that, "to do as I please?" All right. Would "to do as I please" – would the goal "to do as I please" oppose "to proceed with caution?"

PC: *Yes. Because it doesn't matter. Caution doesn't enter into the thing. It's merely just to do what I please. Whether it's incautious or – or safe or sane or – or responsible or anything.*

LRH: Hm. It would oppose it then?

PC: *Yes.*

LRH: Mm-hm. That rocket reads. All right, very good. And let's check how many RIs in this GPM if we can. All right, have you got any estimate?

PC: *I thought fifteen.*

LRH: All right. Fifteen RIs in this GPM? More than fifteen? Less than fifteen? Fifteen? I get a trip of the needle on fifteen. That too many? Too few? I notice it's an odd number.

PC: *Hm.*

LRH: There must be some odd number under sixteen.

PC: *It may – it may be sixteen.*

LRH: Hm?

PC: *It may be sixteen.*

LRH: Are sixteen RIs in this GPM? Now that reads nicely. Sixteen RIs in this GPM. So that takes it up to about the – what would normally be the third – the third or fourth pair.

PC: *Mm-hm.*

LRH: Hm?

PC: *Mm-hm.*

LRH: In the GPM. So that would make eight pair, eight pair from the bottom.

PC: *Um – yeah. Eight pa... eight pair from the bottom, yes.*

LRH: Yes. And it'd be about the f – eight pair from the bottom. That reads nicely.

PC: *And about two pairs – maybe about two pairs from the top. If there are twenty items in the GPM.*

LRH: Mm. Your guess is as good as anybody else's.

PC: *Yes.*

LRH: Yours contain variously, twenty, twenty-four, twenty-two, twenty.

PC: *Anyway, I know what the top opp – top terminal is.*

LRH: Oh, you do?

PC: *Yes.*

LRH: All right. Give it to me.

PC: *Doing as I'm told. [laughs]*

LRH: Top terminal, huh?

PC: *Mm-hm.*

LRH: Doing as I'm told. Well, that seems to blow down. Is that your item?

PC: *Yes.*

LRH: All right. Doing as I am told. All right, something suppressing it?

PC: *Yes, I thought uh – what the uh – was thinking what the terminal – oppterminal might be in there.*

LRH: And what did you get?

PC: *And I got uh – people who won't specifically tell me what to do. [laughs] But emphasis on the "specifically."*

LRH: Well, you know, that read and blew down like a shot. Beautiful!

PC: *Hm!*

LRH: People who won't specifically tell me what to do. All right. Something suppressed on it? It read, but short.

PC: *Um – well, just amusement.*

LRH: Oh, all right. People who won't specifically tell me what to do. All right.

PC: *"Specifically" was really the main thing. People say, well, um – uh – you know maybe my mother would say well, now – um – "Well, go to town and see if you can find me any – any thread" or something like that. Hm! Well, what color? What size spool? What uh – uh – commercial ou... uh – what – what sort of cotton, you know. I mean, you know, let's be specific about all this, you know. What exactly and precisely? You know. Or uh – someone says um – well um – "Write up that bulletin for me, would you?" you know. Well, what I'll do with the bulletin? You know? It's specific. Like, you know, generalities, no, no, no, no, no, no, no, no.*

LRH: All right. People who won't specifically tell me what to do. I'm getting a small kick on that. What's up here? You're not paying attention here, to me?

PC: *Well...*

LRH: Huh, is that ...

PC: *Maybe not.*

LRH: No, is that it?

PC: *Hm.*

LRH: People who won't specifically tell me what to do. People who won't specifically tell me what to do. There it goes. People who won't specifically tell me what to do. What's happening here?

PC: *Well, I suppose my ball of charge is blown off of it.*

LRH: All right. "People who won't specifically tell me what to do." All right.

It reads for me, it reads big strokes when you say it, but it's sort of against a cushion here. Is there any RI above this? Is there any RI below this? All right. Is this the top oppterm of this GPM? All right. Is this the – what'd you think?

PC: Oh well, it could be "in-specific people."

LRH: Inspecific people. Inspecific people. And people who won't specifically tell me what to do. I'm not trying to spoil your itsa here in any way.

PC: It's people who won't specifically tell me what to do.

LRH: Well, that reads, every time you say it. People who won't specifically tell me what to do. Ah, now it's reading for me! "People who won't specifically tell me what to do." It gets a choke on it.

PC: Oh!

LRH: No, no, no, I'm not trying to make you nervous here, I'm sorry.

PC: Hm!

LRH: But ...

PC: I get heat on it.

LRH: I know, but it's choking down.

Just a technical note here, because you're actually listening to this for itsa. But a technical note is, naturally, the top oppterm of the PT GPM, unlike any other oppterm in the whole bank, all the track, of course should just blow up, and shouldn't keep on reading. See, it should just go. And then that's the end of that, don't you see. And in this particular case it didn't do so, so here's the pc having a hard time.

Now the auditor knows, by this time, that the pc has a wrong item, and is itsaing a wrong item, and is selling it. Now, how can the auditor get out of this trap, because the auditor knows it, this item didn't blow up and cease to read. This item is now continuing to read. Now, that would be the only item in the whole bank that will do this. So this is a very peculiar little piece of technology here. The top oppterm of the PT GPM amongst all other oppterm is the one which blows up and ceases to read, almost at once. Because there's no charge in front of it, of course.

PC: Oh, all right.

LRH: Is there a suppression going there?

PC: No, it's just my item and it read, and it blew down and so on, and I don't know why we're – and it's read for you; you called it and it's read.

LRH: Well actually, it's blown down twice.

PC: Right. Uh – huh, and you called it and it did read on an instant read once.

LRH: All right. Yes, yes, it has read.

PC: Hm.

LRH: This is just auditor nervousness, top opp, bank bad.

PC: Hm. Hm.

LRH: Top opp wrong, bank – blooey.

PC: Hm.

LRH: All right? Respect your itsa. I got to just... People who won't specifically tell me what to do. All right. It – it – you have a – an allergy to my reading this. All right. Now...

Now, why didn't this do this? That's what the auditor is asking here. What's going on? And here we get into a considerable tremble and scramble. Pc is getting ARC breaky, because the pc has a wrong item. Now, all you'd have to do is miss your itsa once here and you'd have a screaming ARC break. It'd be the session mid rud would key in the bypassed charge of the OT process.

LRH: Is this the top oppterm of this GPM? Is this the top oppterm of this GPM? Is this the top oppterm of this GPM? That reads. Is this correctly worded? Is this incorrectly worded? Is this correctly worded? Yes. All right, that reads nicely. Is there any RI above this? Is there any RI – is this RI below the top oppterm? Or is it the top oppterm?

PC: *I keep wanting to itsa. There are items below it.*

LRH: Well, I'm sorry. Well, I'm sorry, my dear. All right.

PC: *Very amusing. I keep thinking of that, and I get – and you say are there any items above this and I don't get anything and I think what he's going to ask, are any items below this and the heat comes pouring off, you know. Are there any items below this.*

LRH: All right. People who won't specifically tell me what to do. All right. That's your item.

PC: *Hm.*

LRH: All right?

PC: *Yes.*

LRH: And how does this item relate to this GPM?

PC: *Oh! Isn't it the um – top oppterminal? Ask me the question, um – would it relate – uh – would sol – solve – would the terminal solve that.*

LRH: I'm going backwards. I'm going to take off from here.

PC: *All right.*

LRH: Now, would the top terminal solve "People who won't specifically tell me what to do"?

PC: *Well, I don't know what the top terminal is.*

LRH: I don't want to list it.

PC: *Oh.*

LRH: I just want to know its relationship to the bank.

PC: *Well, I suppose that's top term – top oppterm.*

LRH: Well, what's – what's the matter?

PC: *Well, I want the question.*

LRH: You're going to list it the other way.

PC: *All right! Well, we'll list it the other way but I don't know whether – I can't tell you whether we've got the top pair, until I – I've looked at that question.*

LRH: All right. I want to list in the other sequence.

PC: *All right.*

LRH: I'm sorry.

PC: *Hm.*

LRH: Something wrong here?

PC: *N – .*

LRH: ARC break?

PC: *Well, you never did it that way before.*

LRH: Well, that's because I don't want to oppose this twice.

PC: *Hm.*

LRH: I don't like that system.

PC: *Hm.*

LRH: You got an ARC break? All right. You okay?

PC: *Mm-hm.*

LRH: All right. We made an error here? What's the error?

PC: *Oh, that. You didn't tell me what you were going to do. And I naturally supposed that, you know, finding an item, put in the steps on it. I'm sort of on a wait now, waiting for that question to be asked of me.*

LRH: All right. Who or what would solve people who won't specifically tell me what to do?

PC: *Oh, I have to look at the item, I forget it.*

LRH: "Doing as I'm told."

PC: *Oh, "doing as I'm told."*

LRH: Doing as I'm told. Doing as I'm told. Doing as I'm told. On this item has anything been suppressed?

PC: *Well, yeah. We – I – I did it the other way to. Now we're doing it the other way around.*

LRH: All right.

PC: *I don't know if you're going to get any more reads on it or not.*

LRH: All right. "Doing as I'm told." It's a very flat item. It's read [past participle].

PC: *Hm.*

LRH: And blown down. All right. Would people who won't specifically tell

me what to do be solved by doing as I'm told?

PC: *No! They oppose, but they don't solve.*

LRH: All right, what's correct here? Is the top oppterm correct? Top oppterm incorrect? Top oppterm ticks as correct. "People who won't specifically tell me what to do." Is that correct?

PC: *Well, I guess so. I didn't start out on that basis. I started out on the basis of the top terminal being correct, I think.*

LRH: Well, which is correct here? The top terminal? Or the top oppterm? This – which is this? Is it people who won't specifically tell me what to do? Is that the top oppterm? Or is that incorrect as the top oppterm? Is that correct as the top oppterm? I don't get a read on either one here, you shut off here, what's the matter?

PC: *I don't know. It uh – you see, I suddenly was trying to a – ask myself that question, you see. I felt something was wrong, and I wanted the question asked. And I had to wait to go through all this paraph – this – this, you know, round-robin, in order to get the question, you see?*

LRH: Yes.

PC: *And uh – they don't solve, they oppose.*

LRH: All right. Well, which is correct?

PC: *The top terminal is correct.*

LRH: Is the top terminal correct? Is the top oppterm correct? Top terminal is correct. Is "Doing as I'm told" the top terminal? I'm getting my reads on the fact that it's the top oppterm that's correct.

PC: *Could be a protest, couldn't it?*

LRH: Is that a protest? In this session has anything been protested? Yes?

PC: *Well, doing it – doing it that funny way. We've never done it that way before. It confused me.*

LRH: Yes.

PC: *That – it upset my certainty.*

LRH: All right. Sorry. In this session has anything been protested? Seems clean. In this session has anything been decided?

PC: *I decided that the top terminal is "Doing as I'm told."*

LRH: All right. This reads now. Doing as I'm told. Doing as I'm told. Doing as I'm told. On this item has anything been suppressed? No. Doing as I'm told. You've gotten off on the wrong foot here, Suzie.

PC: *Well, all right.*

LRH: Something – something in error, here. I'm not quite...

PC: *Well, let's list for the top terminal then.*

LRH: Do you have to do it from the top terminal?

PC: *Hm? Well, that's normally the way a top bank is done, isn't it?*

LRH: Yes.

PC: *Thought so. That's why I said that.*

LRH: Because I think I found the top oppterm. Everything reads, that I've found the top oppterm, but not the top terminal.

PC: *Oh! all right.*

LRH: Unless that's a big suppress.

PC: *I don't know.*

LRH: All right, have we bypassed some charge here? All right, is one of these items correct? Is neither of these items correct? Is there some other item? Are some other items the top RIs of this GPM? Don't get a read on anything.

PC: *Hm. Well, I'm ...*

LRH: What's gone wrong here? I upset you with procedure?

PC: *We're maybe on a ... Hm!*

LRH: Maybe on a what?

PC: *I don't know, I thought we're maybe on a cat uh – kitty-corner, but uh – we're not.*

LRH: All right. Are we running a correct goal? Yes. All right, let's list here a bit for the top terminal.

PC: *Mm-hm.*

LRH: You got "doing as I'm told."

PC: *Mm-hm.*

LRH: That rocket read. But tightly. Doing as I'm told. All right, what might be the top terminal of this GPM?

PC: *"Being obedient."*

All right. Now, cutting into this, of course it turned out that "doing as I'm told" was the top terminal, because when it was all listed, got straightened out, and the top oppterm in this particular case, even though it had been – it had read and everything else, finally the top oppterm turned out to be "being disobedient," which she'd put down on the top terminal list. This all straightened out very nicely, two items were taken from the top terminal, went on down the bank in the remainder of the session and the only thing that happened of any vast

significance there was just panning out that area. Now, this of course is a most confusing area and the auditor upset her slightly by shifting the procedure which she didn't expect.

But that was beside the point. There was an ARC break situation, if anything ever happened. I'm just pointing your attention now to the simple basic auditing. This pc was permitted to say what the pc was permitted to say. The pc's it'sa was handled, promoting and increasing the pc's it'sa was paid attention to, and not talking while the TA was in motion, but not waiting to see if it moved again. Several instances of that showed up along the line. And everything went along swimmingly.

But that was basic auditing. Now, that's a considerable trial for basic auditing. Now, you probably when you went over that were paying attention to technique. Technique seems to fascinate everybody, and basic auditing is the char that keeps the whole place clean and running but nobody ever pays any attention to. But the basic auditing in that area, the pc's it'sa was not cut so we didn't have an ARC break. Also, the pc wasn't left with nothing to it'sa, so we didn't have an ARC break. All kinds of errors could have been made there in basic auditing. Because if it good heavens, this pc had a wrong top oppterm, and the pc's right top terminal, "doing as I'm told," had been abandoned!

Now, how complicated could you get? We'd accepted the wrong item and abandoned the right item. Now, that of course is a bypassed charge to end all bypassed charge, and there was no reason under God's green earth for that session to have continued on smoothly. That should have just been a screaming mess from there on. Well, let's just cut into the session at random here, and see what we've got.

PC: *That's it.*

LRH: All right. Lot of heat on it?

PC: *Mm-hm.*

LRH: Being socially acceptable. All right, is that your item?

PC: *Yes, that's my item.*

LRH: All right, very good. That's your item.

PC: *Yeah.*

LRH: All right. Is that correct item?

PC: *Yeah!*

LRH: Correct in this locale? You got a blowdown of about .75 on it. Does that item, by the way, take care of the others on the list?

PC: *Mm-hm.*

LRH: Hm?

PC: *Oh, yes.*

LRH: All right. Hm?

PC: *All of them.*

LRH: All right, very good. Now, would "social confusion" be solved by "being socially acceptable?"

PC: *Yes.*

LRH: All right. Would "social confusion" be solved by "being socially acceptable?"

PC: *Mm-hm.*

LRH: Yeah, there was a little bang left on it there. All right. All these items correct to date? All right. Read. Now what is the relationship between being socially acceptable in this GPM?

PC: *Third terminal.*

LRH: All right, very good. All right. We ... Hm?

PC: *That's all!*

LRH: All right. Are your items all correct to date? All right. Let me see if that item was left on there. There's nothing wrong with this. "Social confusion."

PC: *What are we reading?*

LRH: I'm just reading the item we're listing from, just making sure.

PC: *Oh!*

LRH: Social confusion. Social confusion.

PC: *It's cruelty doing that, because I'm already thinking about what my next item is, you know.*

LRH: Well, is "social confusion" still reading?

PC: *No.*

LRH: Social confusion. Are you thinking about your next item? What's your next item? Who or what would being socially acceptable solve?

PC: *Not being socially acceptable. Social ostracism. Being outlawed by society. Being an outlaw. Being exiled. Being sent to Coventry. That's all.*

LRH: All right very good. Do you know which one it is?

PC: *No. Ostracism.*

LRH: That's an additional item.

PC: *Hm. It's ostracism or being ostracized, one or the other.*

LRH: What?

PC: *It's ostracism or being ostracized. One of the other of those.*

LRH: All right. Ostracism, ostracism. Being ostracized. All right. Being ostracized. All right, is that your item?

PC: *Yes. Yes. The thing I don't like is being all by myself! [laughs] I like to do as I please, but I sure as h... as the devil hate to do as I please all by myself! It's no fun!*

LRH: All right, that's your item.

PC: *Mm-hm.*

LRH: And would being "socially acceptable" solve "being ostracized"?

PC: *Hm! Definitely.*

LRH: Did you have your mind on what I was saying?

PC: *No.*

LRH: Hm?

PC: *Not definitely.*

LRH: All right. Would being "socially acceptable" solve "being ostracized"?

PC: *Yes.*

LRH: All right. Now what is the relationship between "being ostracized" and this GPM?

PC: *It's the um – sixth oppterm.*

LRH: Third oppterm?

PC: *Fourth!*

LRH: Third terminal?

PC: *Pardon me, fourth. It's the fourth oppterm.*

LRH: Yes, that's correct. Fourth oppterm. All right?

PC: *Mm-hm.*

LRH: Well, by calculation there's, what, twelve more in the bank?

PC: Well, we found, how many? That's the fourth oppterm so we've found uh – three, six, seven, and we've found seven items. And we have something like sixteen in the bank, so there're nine more to go, aren't there?

LRH: Yeah. Nine more. All right, I'm sorry.

PC: Nine more to go, that means four pairs, huh? Yeah.

LRH: Four pairs and one.

PC: Four pairs and one.

LRH: All right. And here's your question. Who or what would solve being ostracized?

Well now, that's the way it went and that was the pacing out along the line, and by the end of the three-hour session the whole bank had been run, hundred and seventy five TA divisions had been racked up, the pc was perfectly happy and cheerful, making all goals and everything was fine and swimming.

But this was actually, although very useful from this line, since this is the only tape extant which gives the exact procedure, and actually hasn't even been written in bulletins for modern OT processes, what I've been calling your attention to is itsa. And itsa, itsa. You notice I wasn't talking when the pc was trying to think up the answer to something. I wasn't talking while the TA was moving.

Those inexplicable blanks that you hear on the tape are actually fast moving TA. And it's just held until the TA ceases to move. Now, that's – that is an auditing session. Regardless of what's going on, there is a high level of discipline in action in this session. It is the auditor who inserts the discipline into the session. This pc was never left with nothing to do, nothing to say, and nothing to think about. It was simply from the auditor's point of view, simply drive, drive, drive, drive. And from the pc's point of view, pc appears very leisurely about all this. But that's just the pc's speed of running. That had nothing to do with what the auditor's speed of running was. You don't Q-and-A with the pc's speed of running.

Here we have, in essence, auditing. Auditing the way she should sound. And if your auditing doesn't sound that brisk and if it's not right up on top of it that way, but there it is. But it doesn't matter whether you're running II, Level II, Level III, Level IV, it doesn't matter what you're running, these problems are problems of basic auditing. And if anybody starts missing problems of basic auditing – I played that rather bad patch of finding the top oppterm. It's awfully hard to do this, particularly in the PT GPM. Got off on the wrong foot. Nevertheless if there had been very many mistakes in handling the pc's itsa, in failing to promote and increase the pc's itsa, the amount of strain which occurred at that point of the bank would have ARC broken this thing across the boards.

Well, I played you a little bit, a piece, a little later in this session, and we found the pc very, very happy and laughing and cheerful and so forth. How? Why? Well, it's simply because in spite of the bypassed charge that might have been generated at any given moment and then was straightened out, the pc was not given an opportunity to ARC break because the basic auditing was held in very solidly and hard.

Now, there in essence are the problems of auditing. And that basic auditing is basic auditing. If your sessions don't sound like that I don't care what process you're running, if your sessions don't sound like that, why, don't call yourselves an auditor. Okay?

That's tough to lay it down like that, but if I hear of anybody doodling and letting the pc doodle and whistle and so forth, I'll have his certificate, man, because it's not auditing, it's fraud. You drive it! Keep that session driven. Keep that TA flying. The auditor takes action, let's have him take action. Take action right now. And keep the session going. Keep the session whirring. And that's auditing.

Now, I was just using my tape there as an example, because I've been studying itsa and the handling of itsa here for some months. If you care to listen to those bits and pieces again, on that piece of tape, which will be available to you for study, you will see that it is the handling of the itsa, the promoting, increasing the pc's itsa, it's not talking while the TA is in fast motion, but not waiting to see if it moves again. And taking up and handling the pc's problems either at session start or at – as they arise or at the session end. These things and the handling – the good handling of the meter, of course, these things are the problem of basic auditing. Now, if you don't get good at that, you're not going to make the way up along the line. You're just going to close yourself right off along the line.

So let's not have any more nonsense about: itsa is sitting in a doughy slump, with the pc trying to make a session out of it. That's the job of the auditor. And you make sure that you do.

Okay? We still all friends?

Thank you very much. Good night.

BASIC AUDITING

A lecture given on 5 December 1963

Well, hello!

Audience: Hello.

Imagine finding you here! Glad to see you today. Winter is upon us. In just fifteen days, I think it is, we get the shortest day in the year. And then the sun comes back north again. So remember at Christmas to burn your Christmas trees so as to attract the sun north again. Probably nobody even realizes why they have Christmas.

Well, what's the date?

Audience: December 5.

Five Dec., the nautical month, AD 13. And – haven't anything to talk to you today, about at all, I gave you vent of meanness, cussedness and viciousness yesterday. I know several of you went through the floor. Not those who had their names mentioned but those whose pcs had been humming and doodling in session. [laughs] The problems of auditing are divided into three classifications. I'm not mad at you. I wasn't then, I'm not today. I just want you to be successful, that's all. Sometimes I get a little snarly when I don't think you're being as successful as fast as you might be able to.

Auditing is divided into three areas. And these areas are basic auditing, technique, and case analysis. Now, when we say technique we mean the exact patter or procedure necessary to get something audited on the pc. We do not mean technology. The technique involved – let's take an old process – we're really exhuming them out of the ragbag. Reg was showing me a list of processes being compiled for Level II and nostalgia reigned in all directions! [laughter] Waterloo Station that – gosh! You know? I remembered one myself, I used to run on groups. Always very successful. The only processes anywhere in that lineup that were at all dangerous were the mock-up processes. And you just get those out. And sometimes running a Havingness Process, it is too far away from the pc's Havingness command and you actually tighten his can squeeze up. But at Level II that's just tough. You wouldn't do very much about that. Of course you wouldn't be getting tone arm action; Level II is run by tone arm. There is no needle in Level II.

So that this still would not go unnoticed. But I was looking at some of these old processes. And one of them I used to run on a group was "Spot three spots in the body, spot three spots in the room." Remarkable process. That is almost an optimum process. You'd be surprised what that will drag a pc out of. And drag him out of his body, too, on some cases, if you keep it up long enough. It actually tends to pull him out of pieces of the bank, don't you see, and so on; it's quite interesting. So any exteriorization process, short of actually exterior-

izing the pc, is quite valid. It's quite a decent process. You know the original exteriorization process, not included in that remark, and that is of course, "Try not to be three feet back of your head." That was the original exteriorization process. "Try not to be three feet back of your head."

I don't know if you know it but somebody put that over the air on a New York radio station. I can see the cab driver now, you see? Tried not to be three feet back of that cab. But these – the actual act of exteriorization generally brings the person back into his body more solidly. Because he becomes alarmed. He becomes upset. He is unstable. And this is – actually occurs at higher levels. You inadvertently exteriorize somebody while doing Level VI, what now amounts to Level VI processes, or Level V processes. You can actually blow somebody out for a moment, and he has some adventure that he doesn't particularly like and he tends to come back in and hold on harder. Fortunately at Level VI, with your OT processes and so forth, why, he recovers from that because the GPMs being gone, there's nothing to upset him.

But the fact is that various things happen to people. It's not that exteriorization is bad, it's just that they become frightened and stay in harder.

Such a fellow's walking down – or he's driving down the street, and somebody has exteriorized him and he's been exteriorized for a day or so and he's feeling wonderful by the way, and he draws up to a stop light, and there's the body in the car, don't you see. And he draws up to the stop light and stops the car. And then wanders off. And sits up on top of a building and starts surveying the city and how isn't it very nice up here. And then suddenly horrifyingly comes to himself that the light has changed and every car down there is honking and he becomes afraid that he'd just walk off and abandon his body and his property, don't you see? And this alarms him, so he goes *spang* back into his head again. And the next time you get him out it's rather hard to do. A bit harder to do. And then it gets a bit harder and a bit harder and so forth. Well, the reason why is that he's so mucked up with energy and masses-GPMs and implant engrams and all that sort of thing, you see – he goes through these ridges, they disturb energy masses and it's these which are upsetting him, not the misadventures which he has as a result.

He merely misassigns it and misattributes these misadventures to being frightened, when as a matter of fact the reason he was frightened is because of energy masses that are exerting certain emotional responses upon him. Otherwise he couldn't care that much about it.

But any exteriorization type process, like three spots in the body, three spots in the room, anything that tends to bring somebody out of something, like, "Where aren't you?" You know, "Where aren't you now?" and that sort of thing, why, these things are quite marvelous. And they work on groups and individuals and so on. There's tremendous numbers of recall processes and so on, which fall into those categories – which is, "Something you wouldn't mind forgetting – tell me something you wouldn't mind forgetting." That sort of process.

Now, the liability of these is that they run into GPMs which have RIs in them, such as "forgetting," see? You run into the RI "forgetting." This becomes restimulated and pulled out of line. But this happens less often than you would think. And frankly, the individual audited up to about Level III the way you will see them coming up, are just about as far from a past

life or a GPM as you actually could get. They're riding in all this overcharged fat in the top RIs. And anything is a lock, and anything you audit off of that is improving the pc's perception, his orientation, making him wiser with regard to his environment, so he's in better shape with regard to his environment and as a result the GPMs tend to destimulate, not restimulate. But always remember when you're running a repetitive process – always recall that the danger of restimulation of an actual GPM RI or a lock on an actual GPM RI or an implant RI or a lock on an implant RI and so forth is always present. And the fancier and more comprehensive or – or goofball the wording is of the process, the more likely you are to do this, see.

Now, you actually run this same problem at Level I, of all places, when you say, "What solutions have you had to that?" Because what is the entirety of the track but a series of solutions? And the only thing that saves your bacon in this particular instance is because they – they don't have any reality on any earlier lifetime or any other interior proposition; these things just bite in this lifetime.

Now, if in doubt – if in doubt, you should presage your auditing commands with "In this lifetime." And you'll probably start doing that at about Level III. That starts to get possible. And by Level IV – present Level IV – you will find that you jolly well better had! Because this individual's awareness and alertness with regard to his existence is coming up to a point where he slides through and out of this lifetime just about as easy as slipping on a banana peel. You couldn't move him out of this lifetime, ordinarily at Level I, with a building jack, don't you see? You couldn't do anything about that at all. Let's take – let's take Doctor Snodgrass. And he's been working away for a lot of years and he knows all about life and death. He's seen more bodies, you know, lying there dead, and he knows all these things, this tremendous overburden of false knowledge, don't you see, that's sitting there. Why, you start running a process on him, he'll always apply it to this lifetime. See, automatically and immediately.

When he gets processed enough and he gets enough charge off this lifetime, he'll begin to realize that it isn't this lifetime that is aberrating him. And let him collide with this reality all on his lonesome. Nothing's happened to him in this lifetime enough to aberrate him to any great degree. And let him run into this propounded problem. Self-propounded! "Well, if there's nothing in this lifetime that could make me hate spinach, ahhh, where's it coming from? Must be coming from someplace." And this dawning feeling, "I wonder if I ever lived before, that might have something to do with this?" And by that time he's getting creaky. Well, by that time of course, you must start limiting your processes if you're going to run repetitive processes and so forth. Otherwise you really will collide with GPMs, RIs, implants and all sorts of stuff of this particular character.

Well, they slip through in due course. And they will collide with the materials of the whole track, willy-nilly; some sooner and some later. Main trouble you will have is the fellow at Level I who's on a manic on backtrack and hasn't been in this lifetime yet, don't you see? [laughs] He keeps arguing that he can only run stuff on the whole track and so forth. Well, that's all right. That's your problem. I've already had that problem. A problem of that type was what first shattered the first foundation in Elizabeth, New Jersey. We had a couple of blokes around there that could only run past life engrams on each other. Couldn't find any present life engrams. And they were busy running past life engrams, and I remember poor old Joe

Winter and Parker Morgan and John Campbell and the rest of them, all sitting around there and they proposed a motion that past lives must not be researched or mentioned. Of course, they didn't know up to that time that I could get mad. They found it out right then, right that minute! Upset them! They went into terrible shock! Walking around sadly for days.

But they were in terrible shock because they were trying to make me guilty and make me back down on the thing, because they said it had *bad public presence*! That was their argument. Well, one asks this fantastic question: Public presence? What are we doing? Public presence? Or are we trying to pry people out of the mud? Now, which are we doing? And the *Saturday Evening Post* reporter that was mucking up my weekend here a couple of weeks ago – I finally recovered from it – took some doing. He had collected every bad news story that had ever been printed anyplace about anything anywhere and he was sitting there with this stuff stacked up at about a foot and a half high, don't you see? And he's trying to take up each one of these stories one by one to find out if there was any truth in it. Of course, I just cut his throat and let him bleed all over the place. Because I told him no American newsman has ever interviewed me to get any of the material for any of those bad stories you've got there, so why are we taking them up? That finished it! Left him completely adrift.

Anyway – well, it was! It was nonsense! But the point here is that the university depending for its endowment upon its public presence; the politician, depending for his next election upon his public presence; this planet is public presented to death, see. And there's no room in all this for truth. No room in all this for truth. Because, of course, if anybody – even in the field of psychology researching, they have to think of this because the university in which the research is being done of course must think of its good name. I think it's a remarkable state of mind in which to do research, you see. Well, now, you can go over the other way and become completely antipathetic with what you research. But my point of view is that truth came first and everything else fell in second, and if you could fit it in second or third in line, good! By all means do so, but truth came first. And that's how we got where we got to, which was good, forthright, straight look at the whole situation.

Public presence, though, very often got in our road. You – you'll have these problems and so forth. This dear, sweet soul who has been the – just as calm and as pleasant and cheerful in this particular co-audit comes in one day and she's found out that she was a submarine commander in World War I. Or something like this, you see, or she was a space commander, you see, in the second galactic battle, or something, you see, and the other people start getting upset with her, you see, and try to jar her, and you don't want her reality to be knocked apart. And you actually don't want their reality to be knocked apart. So you ordinarily solve it by being just pontifical about the whole thing. And standing beautifully aloof, telling them, "Well, if she believes it she believes it. And if she was she was, and if she wasn't she wasn't, and that's all there is to that." Truth is truth, and that is all there is to it. A truth – a fact is either true or false. And no amount of opinion will make it either one. So you get around it to this degree. But you're going to run into trouble in that particular direction, even at Level II and these low-level processes.

Now, I don't think you will often run into it at Level I. But even then you might run into it. Because I remember one time at a swimming pool out in Kansas – it was a very country-club type swimming pool. And this society matron had been reading *Dianetics: Modern*

Science of Mental Health and was pleading with me to tell her that children could not remember prenatal existence. And she read it in the book and she was pleading with me to tell her this and so forth and I said, "Well, I can't tell you that," I said, "you've got a little boy over there, he's four or something like that, why don't you ask him?" She called the little boy over and says, "Now, how far back do you remember, Johnny?" And he said, "Oh, I remember when I was in your tummy, mommy." And went over and jumped in the swimming pool. Very embarrassing!

But there's apparently such a thing as acceptable truth. And I don't think that's true at all. I think that's the biggest lie at all, because that gives you a – that gives you a bonus for not telling the truth. So you actually can't compromise with truth at certain levels. About the only thing you can really do is to hold the line. On the average, with a pc, any effort to go back into past lives or something like that early on before their PTPs are handled will be met with catastrophic results. They will turn on somatics the like of which you never heard of, they're stuck into things that they can't handle, they're disoriented and so forth. They're actually being audited against hidden standards; they have terrific present time problems. They don't know yet whether they should go down to the doctor or not, to see about their tonsil which is sore. They're not quite sure in this direction or that direction. Life is just sort of a disoriented confusion to them. And all of a sudden you blang them into some new, startling datum! Well, you haven't got their present environment resolved at all and here they are confronting this big, new datum. And it turns on somatics and upsets them. Op... also lays them wide open for invalidation.

So you'll find most of your problems are solved by following this rule of: process them within their class.

Now, you're going to ask yourself, "Why? Why within their class? Certainly cases can be processed at once, higher than Level I. Certainly. They can be. Certainly."

You'll find the bulk of them can't be. The bulk of them really can't be processed higher and that accounts for most of the processing failures. They want to talk about it. They want to talk about it a little bit. Their idea of control is so nervy and so upset that to do more than to just sit there and say some things about some section of their life is quite beyond them. They want to talk about this or that or the other thing, even – if you start to guide them into O/W or something like this, they can't take that much responsibility. You'd be surprised they even get results getting off motivators. As – knowing the mechanics of the mind better, you'll often be surprised at how improvement can take place in the teeth of some well-known datum. This guy sits there and gets off all his motivators, don't you see, and of course if you could get off the overt the recovery would be quite rapid. And the recovery really doesn't take place fully until you do. But nevertheless getting off the motivator does get them some distance. Of course, that's an auditable situation. Somebody can do that with this person, but also this person is capable of doing that.

Now, if we look at all these various classifications and so on, we'll see that it's just an increasing level of responsibility for self and for the dynamics. And this is what this is basically plotted against. So the processes laid out for the individual in any given class – of course that's a gradient scale of processes, too. That gradient scale should be plotted against increas-

ing level of responsibility. So it starts with motivators more or less, and ends with overts, don't you see? So any type of gradient that can be made inside a class is actually just increased level of their own awareness of their own responsibility. You'll find out that this is a fairly successful pattern of operation.

But oddly enough – oddly enough – as simple – I've just discussed these various levels to increase your familiarity with them. Still talking about these three factors of basic auditing, technique and case analysis. You are still looking, don't you see, there, at technique, when you are looking at these processes. Now, those are all techniques. Those techniques must be programed. The programing of those techniques is based on case analysis. Which technique do you run first? See, that's case analysis. What's this fellow really worried about? Well, that's what we're going to do with him, don't you see? That's a case analysis. So in actual fact, every level – not for somebody just at a high-level auditor, but in actual fact every level – has its own case analysis. Has its own case analysis. And case analysis rises up to the highest level at the high complexity of GPMs and implants and all of this sort of thing. All the bric-a-brac and machinery and bits of mass of the mind are taken into account there. But you can say almost the same thing at a very, very low level. At II you can ask the fellow, "Well, was this something that was done to you?" (implant) "or was this something you did?" (actual GPM). I'm indebted for that clever wording to my friend Edgar. He slickered somebody here into a case analysis situation, did something with his potential tuberculosis in thirty-five minutes or something with this type of a case analysis. Now, he just took the basic steps of case analysis, discovered what the pc's sitting in, get him to itsa it and then fix it very – as accurately as possible. See, there was those three steps of case analysis.

Well, you find out that there's no need to depart from that pattern of case analysis in any level. And that, oddly enough, probably delivers the whole world of – this mustn't be on the tape, Peter, so don't bother to erase it – the whole world of healing, the whole world of healing is actually at this moment, at our complete mercy. At our mercy! We may not take it up, but this was one of the research targets that I set last January. And it unwrapped itself. And you got it very casually the other day as case analysis. And these steps of case analysis have some fantastic workability. And apparently have a fantastic workability in the field of illness and disease, which I think is quite remarkable. Now, no auditor is being advised to use these in this particular field, but there it sits! There sits the H-bomb that blows the medical profession over the hill and into oblivion.

Every one of these levels has its own approach for case analysis. But this first level is just sort of an – at Level I it would just be a discussion of how they're feeling or something like this, don't you see. Or what considerations have they had about some illness which they have. You possibly wouldn't be more definitive than this. But certainly that's a perfectly valid itsa. Now, as soon as we move up to Level II or Level III, certainly, we're into a case analysis which goes like this: Where is the person sitting? In other words, what engram or something are they sitting in? What life... we used to do this, by the way, in Dianetics. We'd say, in – "When I snap my fingers an age will flash (snap)." And the person would get something like twelve, something like that. "All right, is that twelve years old? Yes, well, all right." That's where he was sitting, see.

"All right, what happened to you when you were twelve years old?" See. And you'll finally be able to fix the fact that he was sitting in an engram which occurred when he was twelve. And the thing is frozen there in his mind. Now, there's a crude level of that same case analysis going forward. Of course this moves up to the situation at Level VI, "Is this an implant GPM? Is this..." you see? "Is this an actual GPM? Is this only a goal? Is this an RI? Is it an actual RI? Is it an implant RI? Is it a lock on an actual RI? Is it a lock on an implant..." Well, look at the technology here, which the pc has to know. Actually progressively he has to know more and more technology from a Level I up, to get any response at all.

But at Level VI we have all of this panorama, but only those three steps of case analysis. See. Discover what he's sitting in, you know.

"How do you feel today?"

"I have a cold."

See, that's Level 0 – Level I, you know. Well, that's it, good.

"What have you done for it?" See? "Do you feel better?" They're – actually your three steps, don't you see, of case analysis, shoved in at Level I. They're – they sound almost social. But as an actual fact they are those three harshly definitive steps. Which is – discover what the pc's sitting in; get the considerations he's had about it, in other words get the lies off of it which tend to make it persist; and then establish accurately this – conditions, see. And tell him about them. These are your three steps in every case.

So case analysis – case analysis has a considerable breadth of view. It apparently takes anything in, from healing out, very broadly into the whole track, all the rest of this.

Now, a word of warning. As a pc runs additional actual – this is – well, let's go really out of this world, now – as a pc runs actual GPMs and starts stacking up actual GPMs, the sub-itsa and the pc's ability to itsa – in other words what the meter reads and what the pc can actually see – come closer and closer together. And they come closer and closer together and then on case analysis fold over. And the pc can see better than the meter.

You can get a condition which develops about halfway through to OT, where if the pc doesn't say it is it, you won't get it to read. And you try to do a case analysis this way: "Is this an actual GPM?" See? That's it. Your needle just kept on – maybe there was the tiniest, little stub here; if you had a microscope, you might have seen it go, see. Maybe. But no significant read that anybody in his right mind could detect. Pc sits around and thinks about it for a while.

Says, "Yes. It's an actual GPM." Crash! Rocket reads, bang! Down goes the tone arm.

"Are we – is this a wrong item we have here, or are we listing from a wrong source? Are we listing from a wrong source?" You see, you can't find the next item, it won't prove out. "Are we listing from a wrong source? Have we found a wrong item? Are – are we listing..." That meter's not doing a confounded thing. Doing nothing! Obviously one of the two are true. See? There's only two things can be wrong at any given time. You found a wrong item or you listed from a wrong item. That's why you're messed up at this particular line, see.

It's only two, and you get a smooth flow on both of them. It's got to be one or the other! Pc sits back, thinks it over, "Well, I told you all the time it's a wrong source!" *Psssswww!* Crash! Bang! Down goes the tone arm. Everything blows down. In other words, there is a point of case where the meter becomes useless.

Now, originally that itsa gap between the itsa and the sub-itsa – what the meter reads, and what the pc can tell you-that's pretty wide! That's reading down below all the fat, don't you see? That's pretty wide! So your case analysis can be very adroit at about Level III. And practically ceases to exist at the upper end of Level VI. Quite interesting.

Now, you get somebody with eight, nine or ten GPMs run, actual GPMs all run accurately and the whole case smooth and so forth, you will see this. You will start running out of meter. It isn't registering, because of course, the meter depends on mass and the meter depends on connections and short circuits in that mass and that sort of thing, in order to read. And you're getting a person up to a self-determinism where unless they think it, it isn't so.

In other words, your basic auditing at the beginning of the line, in the earlier parts of the line, particularly Levels II and III, has to be magnificent. Because the pc doesn't know what the hell you're talking about. You get the idea, see? Pc, in order to work anything through this about his own life, or something like this, is a herculean proposition. He's got no nomenclature, he has no reality on this thing, he can't put these things together easily or smoothly and so forth. And what's the whole burden? The whole burden is on basic auditing. Which, of course, is just handling the pc's itsa, improving the pc's itsa. Most basic of basic auditing. You've got to handle the pc and handle the session and handle the meter when it's present. But above all these things, you've got to handle the pc's itsa and improve that pc's itsa because if you're not working all the time in improving the pc's itsa – in other words, never give it to him on the meter when he can give it to you. That's one of the little laws that go along with this. But at the same time the pc says, "Would you check this on the meter? Is it a guffball or a gumshoe?" See? And you say, "Naw, you tell me!" I'm afraid that violates handling the pc's itsa. It actually isn't being courteous; isn't helping the pc.

But somewhere along the line you got to wean him. You got to wean him off a meter. Give less and less dependency because it's going to happen anyway. And if you haven't enormously improved the pc's ability to itsa as he came on up the line, God help you if you get half through a bank having knocked the pc's itsa in the head all the way. Pc's now in a condition where he can't tell you and the meter won't. See, you could get yourself into a wonderful impasse here. On Level I they don't know what you're talking about. The thing is turned a full cycle. In both of those cases you've got basic auditing standing in.

The easiest area where basic auditing can be poor and not be noticed is at about Levels III and IV of the present chart scale. Basic auditing can be pretty cotton-picking poor. Because you've got a meter and it answers most of your questions at those levels and you haven't got much to worry about and so on.

So... but even through there, if you're not working at handling the pc's itsa and improving and increasing the pc's itsa, why, he won't make anywhere near the progress that he could make. So regardless at how the basic auditing – I mean, at what level basic auditing is applied, it is the dominant point in all levels. Now, you get – there is a technique and many

techniques and types of techniques for the various levels. Those things are something you can learn. Like a good pianist learning a new tune. Doesn't take him long to do that. Your basic auditing is grooved; that's fairly easy to do. You have to do these things and they have to be quite precise.

And your case analysis – your case analysis is on the same fundamental steps, but it is quite variable, all the way up along the line. And the only things that vary in basic auditing – the only real things that vary is that a – your start with a meter tone arm. You've still got a meter, there isn't any place on that scale where you omit the meter. The meter can be at any place on that scale. You can also run without them at the very early scale. But you expect somebody's going to be sitting there with a tone arm. And we don't care what level, their auditing is going forward; at least get them used to that tone arm. Because they will get a familiarity with a meter and they'll begin to appreciate what it is. And you've gotten a tremendous bonus so that when they get trained on the meter it doesn't appear to be an unfamiliar article to them that scares them to death. And so you've got, as you move along this lineup, the complications of metering are added to basic auditing. Metering gets more and more complicated as you go on up along the line. And you think you're playing a theater organ on a meter when you get to Level VI. If you can't handle a meter that smooth, fast and good, why, it will find you out, man! If you're having any trouble.

There's little tricks on these Mark Vs. By the way, there's something I've been meaning to tell you for some time. You know you never run these Mark Vs at Levels V and VI – you never run a Mark V meter higher than eight sensitivity. And a lot of your trouble, if you're having any trouble at such a level, comes from setting the meter sensitivity too high. I've had some trouble lately – a couple of times, I've set it too low. I've left it on one and wondered if the pc's RR was shutting off or something until I suddenly wake up with a shock and realize that I haven't advanced it from the start-of-session can squeeze. Just a point of amusement.

See, a pc gets so – needle gets so loose as you're – as you're moving up into these levels that frankly, Level I on a Mark V is reading quite nicely and it never occurs to you to run the Level I because it looks like somebody at about a Level III process, you see, operating at full blast on the meter. But eight – eight is about as high as you ever run the sensitivity on one of these things. You'll get any read that is at all significant at that.

If you're getting a dirty needle, your basic auditing is just too sour for words. You shouldn't ever have to advance sensitivity to get rid of a dirty needle so that you can move through it. Bah! It's just a horrible comment. And also I put out a bulletin the other day and I said that your basic – it was session ARC breaks that caused the dirty needle. And therefore those were solved by L1. And it's at – it's in that bulletin, but it possibly is not stated strongly enough that the violence of the ARC break is actually caused by the bypassed technical charge. Like the wrong goal or something like this and you've got to pick it up with L4 and so forth. But it isn't going to cure your dirty needle. It's just a technical fact that you've now got to go back to your session ARC break to cure that up. It could have sat there without a session ARC break and never keyed in and never given you any trouble. But you gave it a session ARC break, and it keyed it in. Quite in addition to that, none of these heavy charges ever have the power of creating a dirty needle. They don't create dirty needles. Dirty needles come

solely and totally from basic auditing. What's the value of this thing is not how you handle ARC breaks, but how you supervise auditing. Or how you supervise your own auditing. Because you see, you're sitting there looking at a dirty needle, you know darn well that you've done something in this session which was not very good in the line of itsa.

And also in supervising auditing you can go down a line of auditors and look at the meters. And anybody that's sitting there with a dirty needle, you've got somebody whose basic auditing is awry for that particular level. That's for us a very, very good point to know. It's not because he's got a wrong goal that he has a dirty needle, it's because his basic auditing is sour.

Now, basic auditing cannot help but increase – as you come up the line – cannot help but increase with practice and familiarity. I'm quite surprised the degree that the basic auditing can be improved. I was quite amazed a few months ago when I made some tests. I actually played you the tape I made some tests on – those of you who were here a few months ago – and I just busted the pc's ARC and so forth in the session with an inadvertent cut of itsa. And a few things like that. Well, it woke me up to the fact that my auditing could be improved. And so I set out to improve my auditing and to handle itsa and that sort of thing and just made a project out of it. And I've been working on that for about three months. Same length of time as some of you have been around here. My auditing has improved. Has yours? Aw, that's a nasty thing to say. But I have noticed a considerable improvement in auditing. Which is basically expressed in the tremendous amount of TA action which I can pull out of a session.

Now, of course, I know I'm running Level VII; you can't expect TA action like this at any lower level. But in the last five sessions of sixteen hours and ten minutes total auditing time, 638 TA divisions down making an average of 39.8 TA divisions per hour of auditing and 99.3 I think it is, per two and a half hour session. Average.

Now, that is done – that is done with basic auditing. Now, you can say the technique is responsible, but do you know the same technique used and the same amount of elapsed time and so forth, might only have brought off – you've only got as half as much work done – but it only might have brought off half of that, don't you see? It was the basic auditing which made the big difference. That's what made the difference.

Now, I listened to the tape that I played you yesterday and I didn't think I made my point well. Because I listened to that tape and it all sounded very comfortable and very easy. It sounded very relaxed. Well, that's a liability. Because from the auditor's viewpoint – was a liability as a demonstration. I thought maybe I hadn't put my point across at all, because I heard that thing playing on and it all sounded very casual. Very calm. Well, of course it was meant to sound very casual and very calm. Actually the auditor in this particular case was auditing like a mad, whirling dervish, you see. You know, that was really a driven session. But it sounded awful calm. But the auditor wasn't particularly calm running it, don't you see?

But here were all the factors of basic auditing. The auditor was not uncomfortable running this, don't you see, but he was right up on it. See, there was no relaxed frame of mind from the auditor's point of view. See, he was right up on it. You know, the "Do fish swim" or whatever it was, see? The pc was adding long comm lags, you see. She felt self-conscious about this later. Adding these long comm lags. Finally the pc answered it and said *t-t-t-t-ta-da, t-t-t-ta-da, t-t-t-ta-da*. The pc obviously had finished that answer, obviously said every-

thing she was going to say and so forth, and bang! There was another auditor action right there. Get that? It was no lag! No auditor comm lag, see, it was right there. Right on top of the pc, see. PC never had time to breathe. No wonder the pc was comm lagging – only time the pc didn't have to work! [laughs] But now, in that very session you were looking at, that TA was rolling – that TA was rolling all the time that was taking place, there. It was in constant motion. I gave you a slightly bum datum when I said you only go to the stop-point or a still-point of the TA, don't you see. You don't just sit and wait for the TA to move in case it moves again. You go to the stop-point of the TA. And I got to thinking about it later and I got to looking at it in last night's session and I was quite struck by the fact that there were no still-points of the TA. So I have to amend that for you. TA notably slowed down.

Doesn't have to be a stopped point of TA, because if you're really auditing they cease to exist. There is no moment in the session when that TA isn't jittering. It's moving from *whum to whum, to bing, to bow, to zzzzzzz-bump! To dip, to dap, zzzzzzz-thud! Up, up, up, up, zzzzzzzzz-bump!* That's the way it's going. It's just moving all the time.

You're only getting fifteen TA divisions in a session, see? That's what? Five every hour? No, it's not quite, it's – it's what? Clever arithmetic – six point something. You get – you know your TA is stopped most of the time. Stopped. Stopped dead still. There are long periods in the session when that TA isn't budging. Isn't moving a hair and so forth. Well, you get up to TA quantities like 99.3 TA divisions down in two and a half hours of auditing, which is at the rate of the one I just gave you, 39.8 TA divisions per hour. Actually, well below that point, I think it's about twenty an hour, you don't have stopped points. There aren't points when the TA is motionless. The more constantly the TA is moving, of course, the more TA you're getting. But it gets up to a certain accelerated type of activity and there just are no stopped points. It doesn't come down and stick. It slows down and drifts. And then it gets into businesslike action again, you see?

Well, that makes it, perhaps, very hard for you to judge when should you talk, and when not talk and so forth and it's basically on the basis of the big, fast swoops, you keep your mouth shut. If it just so happens that at that moment when you're expected to say something you've got a big, fast swoop in progress on your TA, you wait until it has eased off before you start talking. I wanted to give you a little more accurate presentation of this thing, because it's – I say – what I told you was not quite accurate. It would fit very well, see, on the auditing you're doing at the moment. But if you thought that was all there was to know about it you'd start coming a cropper a level or two above where you're auditing, you see? Because here you're getting accustomed to the fact that the TA stops, which it is doing at this particular time with you, and you go much higher in terms of levels than this and your TA doesn't stop. So you just have to learn to talk only when the TA is moving slowly.

Well, you get blowdowns such as... you don't have extreme blowdowns to get TA like this, by the way. Half – half of that action was from something like 2.75 to 3.5. No extreme highs, no extreme lows. Now, look how frantic the tone arm had to be only running over .75 area of a dial, see. That had to be pretty fast. And you run into oddities as you go along on this, you get such a steep blowdown that it doesn't have time to recover before your next blowdown, but does recover and then you get a blowup! You get into this kind of nonsense. And once in a while you'll sit there and be terribly puzzled as to what the devil happened.

Well, probably your meter didn't track with everything that was happening in the session. See, or you were busy doing something or other, and you didn't get the recovery that did occur. But you didn't set your needle to it, because it happened too fast. Something like this.

So you'll finally find that the rule gets to be at the upper grade of the thing is, when the TA is remarking with blazing speed, if it's moving with a blazing, white-hot speed, shut up! And if it's not moving much, talk. And you'll more or less keep out of trouble.

But you can turn off somebody's heat very easily by talking when the TA is in motion. Because if somebody's got heat on, they got fast TA motion going on and if the auditor says anything, they suppress the heat at these higher levels. And you've got to get the Suppress on. It doesn't do any good to get the Suppress on the item, you've got to get the Suppress on the heat. You got that? You've got to get the Suppress on the heat. "Has anything suppressed that heat?"

"Oh, yes, I suppressed it, because you said something."

"Oh? All right, thank you."

The heat goes back on, your tone arm's moving. Now if you went ahead and made the same stupid blunder again, your TA is now flying because the rest of the heat is coming off and you say, "Oh! Well, that's good! The tone arm is moving now!" You see? *Whohhhuupp!* That's the end of that heat blowoff. And you say, "On this item has anything been suppressed?" No, nothing's been suppressed on the item. The heat's been suppressed! So you'd have to get it back on.

This – I know this looks very complicated and something or other, but these things all have ramifications, they all follow in along the line of basic auditing. When you've got a bunch of action going on in the pc, when you've got a bunch of introversion going on in the pc, when the pc is very happy telling you all about something, when the pc is introverted and looking at his own case, when a lot of action is going on, what is an auditor doing starting action? I mean, it's as simple a problem as that. I'll show you how complicated the problem can look. You see, TAs move fast at some types of processes and don't move so fast at others and you have to adjust your TA and all this thing.

Yeah, but let's just get the basic rule, what really is this basic rule? If you've got a lot going on with the pc, shut up! If you've got nothing going on with the pc, right now start talking! Don't wait till next week. It's the auditor that raises the mischief in a session. Two ways. If there's nothing going on in the session the auditor should start something and he raises the devil with the session if he doesn't. And if there's something going on and the auditor starts something, why, then everything goes to pieces.

What is this? This is just a crude handling of communication cycles or action cycles. See? You've got a bad handling of an action cycle, that's all that is involved in that. Something's going on with the pc, why are you trying to start something with the pc? Nothing's going on with the pc, what are you doing not starting something with the pc? That's about all it breaks down to and therefore it's true for all levels.

But you'll find at the upper levels that you haven't got time to pay any attention to basic auditing. It better be something you're practically born with, you know? You don't go

along a street wondering about the steps of walking. "Now I pick up the right leg and I let the body fall slightly forward and I put the right foot out in front of me to catch the body so that it doesn't hit the pavement. Well, I've got that done now. *Whew!* All right. Now the left leg is back a little bit so I pick up the left leg and I put it slightly forward. Now the body must be made to fall slightly forward again and I catch it with my left foot. *Ahhhh!* I finally got that step!"

You shouldn't be in that condition with basic auditing when you're trying to run a whirling dervish type process like Level VI. I know it sounds obvious. I know it sounds awful obvious, but as obvious as it sounds, it is horribly true. And I had to learn it the hard way. It is something that you assume. You know, it's an "everybody knows" and that sort of thing. But you shouldn't be sitting around worrying about you talking when the pc's not talking and *oohroohroohroo* - sorting all this out. Man, you ought to have that stamped into the bone and marrow of your auditing. Because just handling an E-Meter at Level VI, well, that's a – that would be a – that would be a full-time job for a theater organist.

Keeping that thing paced in there and keeping that needle somewhere approximating Set and because I audit with a counter on the thing, of course I mustn't move the TA while the pc is moving. Because it throws your TA division count out. You'll have TA counters in the very near future. They're quite successful; they're marvelous. You'd never have time at Level VI to record TA. You'd never have a chance. You just wouldn't be able to do it. The only thing you can do is when you ask the question you can write down where the TA was sitting at that instant. And you better had, because that's the last glimpse you'll have of it. See? And then you know what it blew down from. Because you've got to mark your blowdown in terms of figures after the item when you've got it. Well, you've got lots of time to do that, because of course, you're marking it while it is blowing down. See, you use the time that you would be silent in order to catch up with your administration, without distracting the pc's attention too much.

Well, usually during a steep blowdown at having been given the item, the pc's too comatose to see it anyway. The pc wouldn't notice it if you were doing something, as long as it isn't too distractive. So you've got that little period there in which to do your administration and this thing went from 4.2 to 3.3. And you write that down, "to 3.0" You know, "4.2, to 2 – to 3.3," you write down, "to 3.0," which is their – they itsaed a little bit and it gave it another push. But that of course wasn't the original blowdown. That was the itsa blowdown so it's added with another "to it." And that gives you your codification. Therefore you know how this thing behaved.

Well, of course, you can sometimes notice that the tone arm is going up badly as you're doing a list so you can make a notation over on the left side of the list occasionally that the tone arm is now at 4.1 or something like that. It gives you – all you're looking for is the figure. Because when the blowdown happens you won't have a chance to see where it blew down from. So you just keep a handy reference. And that is [the] only tone arm noting that you have any opportunity to do at Level VI. It's just not possible to keep a painstaking tone arm record. You couldn't do it. You'd spend no time doing anything but that.

Prepchecking, oh, heck, in Prepchecking you've got all the time in the world! If you didn't have a tone arm record to keep, you'd get nothing to do at all! But the tone arm – tone arm counters are marvelous. And you have to be very careful when you're using a tone arm counter that when the pc starts using the cans for a pair of dumbbells to do some setting-up exercises or something like this, you see, you've got to notice the pc is doing this and then not touch your tone arm till they bring the cans back down into their normal position. Otherwise you're going to add a lot of false TA to your meter all the time, you see? Then your tone arm counter then is telling you a false story, continuously.

So you've got all these various things to note, and action; and of course, even at eight, a pc who is running at Level VI, even at eight sensitivity on one of these Mark Vs you get this quite remarkable meter response. Your meter responses are big. And they're not minute at all. And the pc's needle is so loose that you've got a problem in keeping the thing exactly to Set.

Now, you don't think this is a serious problem. Perhaps. But do you know you cut your pc's itsa to ribbons by not knowing the interesting trick of a trained left thumb. That thumb has got to be so trained that when you swing your needle back to Set, your thumb also puts the brake on the needle. And stops it cold at Set. In other words, you not only move the needle to Set, you stop the needle at Set.* Now, the delicacy of thumb touch and practice in order to do this is quite remarkable. If you don't believe it, turn your meter up to 128, put your sensitivity up here to 32, and try to kick the needle over here to Set. Just no more interesting like that. Just, you see? Just try to kick it to Set. Without that wobble. See that wobble? All right, let's – the needle came down here. All right. Now, let's kick it back to Set with no wobble. Notice I'm pushing it here with my fingers, not in an educated way. But you see? That wobbles all over the place! How do you get that needle back there to Set?

Well, while you're doing that, before you ask the pc the question you are putting in a silent spot and you're inviting itsa and you're chopping his itsa line to pieces and you've got his action cycle all disarranged, simply because you're not right there with your meter. See? And that's what makes a lot of auditors look kind of silly. They – auditors try to get this needle in and they – you can see them start tipping their – their heads.

Pc becomes interested – attracts attention, you see? Well, you should take and – and turn it up to an extremity like this, and see how – how good you are at bringing a needle back here to Set and stopping it. Swing it over here and just bring it around to stop and brake it. You actually can brake the needle right in at Set. I've just done it, but if I turned it around and showed it to you, I couldn't do it. Because I've not ever run a meter so the pc could read it. [laughs]

Now, all right, that's an interesting gimmick on meter reading. There – there's then refinements above refinements above refinements on the subject of meter reading. Possibly you hadn't even thought of that particular one, although you may very well have had trouble with it. But you actually can educate your thumb, believe it or not. That will bring that thing right back, it'll bring right back to pang, and stop it right on the button. And there it is, right there.

* Editor's note: This refers to the Mark V (and other meters like the Quantum) which don't have a damped motion so the needle's inertia makes it swing beyond the point where you have actually moved it with the tone arm.

Also you can get that so practiced that you begin your question as you do it, so that during the last half of the question the needle is freely drifting. The last half of the question. The first half of the question, you're talking there: "In this session, has anything been suppressed?"

"In this session..." needle braked, stopped, "...has anything been suppressed?" Click! This sounds like – this sounds like an old professional Marine or something like this, what they can do with rifles and so forth. And what they can do with drill manuals, and that sort of thing. But it gets up to that line you say, "Well, this guy, he's just doing a parade-ground drill." Well, you'd be surprised how that parade-ground drill can develop. The Princess Pats of World War 1 fame, particularly, used to have a manual they called the Princess Pat manual. And they would drop a rifle from slope arms, off of the right shoulder. The rifle would do a complete spin, opening its bolt, and move sideways to inspection arm. See, they just let the rifle fall off of their shoulder and then over the biceps and it would come up to inspection with the bolt open. Dropped more rifles doing that! [laughter] It's really goofball types of maneuvers.

I remember embarrassing a Marine captain, one day, I did a Princess Pats spin with a rifle. See it's – bring it up from order arms, catch it in this hand and without this hand being far away from you, since that would look clumsy, the rifle does a whole parabola – it goes all the way around, see. And drops to inspection arms. But it's like you handled a small straw, you know? The thing goes through the air like a – like a ton of lead, you see, traveling at a high speed. And these things weigh about nine pounds. And I think you get a deck court-martial in the Marine Corps for dropping a rifle. And he saw this happen and so forth. I'd seen an old professional Marine do it and was finally gotten able to do this thing, you see? And he said, "That looks interesting." He said, "How did you do that?" And he picked up this rifle, fortunately it wasn't my rifle – and he threw it up toward his arm, you see, and he missed and the rifle went about twenty feet through the dust, plowing up a canal of dust. He turned around and walked off the company street, saying no more about it. Even letting somebody pick up that weapon. Of course he'd laid himself open to a summary – I mean, a deck court-martial.

No, a real pro – I'm not making any real point out of this – but in any particular field you'll find that the real pro, the guy that's been around for quite a while – take a professional truck driver. Let's get down into those levels, you know? The things those guys can do with trucks! The ways they can turn them around and that sort of thing. It's unbelievable. Nobody can do that. You can do the same thing with meters.

At first it just looks like it's very simple. And there's not much to a meter and there's nothing much that you could amplify with a meter. But you finally get up to a point where there's just tricks galore that you can pull with meters. And you can set meters up in various particular ways. You can make meters – well, if you're really used to needles you can tell whether or not the pc is telling you the truth or not without even asking for missed withhold. Have you missed a withhold on the pc? If you're really smooth as ice, why, you know you've missed a withhold on a pc. If your basic auditing is so good you know he didn't – you didn't cut his itsa. And you just look at your needle and you could go on talking to the pc along these lines. And you say, "Well, and so on, something you didn't mention to me in the mid ruds, so forth?"

"No, no, no..."

"You sure there isn't something you didn't tell me?"

"Oh, well, except last night I was drunk, and I..."

Brrrrr! You see. Pulled a withhold without withholds. You can watch the responses of the needle. You can see how – well, let's take can squeeze. If you're real sharp as an auditor, you don't have to run Havingness. You just ask the pc what has upset them. What's upset their havingness during the session. Pc tries to give you an introverted remark. Well, they thought something or other, they thought something or other. No, it'll be something with regard to the room. It won't be anything with the session. So you say, "Well, was the room too hot? Was the room too cold? I mean were you uncomfortable at any time? Was it noisy around..."

"Oh – it was awful noisy around here."

"Thank you very much. All right, squeeze the cans." Bang! His havingness is up to what it was at the beginning of the session, you see. They're just... [snaps fingers] And here is lots of commands of Havingness and getting the pc wrestling around down in the middle of the bank where you had just fished him out of. Do you see, it's clever. Ways to bring up a can squeeze. It comes under the borderline of meter handling.

You know that meter is responding to pulled-in mass, or the pc is more introverted than he was with regard to the room, not with regard to his case! And you can bring up his havingness accordingly.

You can inspect the meter during the last part of the session and know that his havingness is down. You can also – you can also look at the – at the way the tone arm is riding, to be very obvious about something. You can look at the way the tone arm is behaving in the session. And you know this tone arm up here – I'll give you the extreme view – it's up here at 5.25. It's been there for quite a while. Well, anybody would wake up to the fact that there was something wrong around here with that. Well, let's take it just a little bit more mildly than this. Let's take a higher-level process. The tone arm is at 3.5 and has not been riding at 3.5. And for the last couple of minutes has been riding up here at 3.5, which is brand-new. Then we see the tone arm starting to rise one way or the other. Conceive that the pc must be upset about something. Conceive that something must be wrong in what we are doing. Conceive that something is going awry. And simply keep an eye on it, expecting trouble. Doing no more than just expect trouble. And then of course be not startled at all when it suddenly breaks around our head, and say, "Well, I don't know..." You've already sorted it out: "Well, the pc probably listed down into something or other and, I don't know, we probably missed an item here, we – something's – something's going on here that – probably some implant RI or another that we haven't gotten ahold of. Hmm, or haven't fully discharged something, I don't know, I don't know – don't know."

You're going on auditing all this time, you see, and you're just waiting for the first – the first break-loose on the part of the pc. Well, all this is informed meter operation; you've already been told this pc's going to ARC break if you're not careful, because this meter is behaving differently than it was behaving before and it's starting to ride higher than it was riding

before and all is not well. All read off a meter. Well, it's not in the textbooks that you should use meters this way. Well, I gave you an idea of the pro, see?

Well, it's like the thumb trick. Is bang! It goes down, so forth. You bring it back to Set, stop it dead on at Set. See? Of course it goes bang! Down again. All right. Bring it right back to Set, see? Stop it motionless every time it comes and so it can – you'd be surprised, with a little practice, how you can manage this sort of thing.

Well, if you're that familiar with the meter, you should be that familiar with the communication cycle of the pc. What do you mean, having trouble with a communication cycle with the pc? Any more than, well, you have trouble with – you missed a read? That sounds awfully corny, this sounds something that might have happened in – oh, I don't know, I guess you could hear – somebody in Poughkeepsie at some time or another might miss a read. Or Los Angeles... They – something, you see? Something. But no Scientologist – certainly no Scientologist would miss a read. Or clean a clean. Now, if your worries about meters are at the level of missing reads or cleaning cleans, well, that's fine, that's down there at perhaps Level III, Level II. And I'm sure that one should worry about them at some time or another, at about the same time he worries about the on-off switch. But there is a – if you are – if you were to have no greater familiarity with the meter than you're still worried about things like that, man, you could never run Level VI for the life of you. Because you've got no attention for the meter! This meter is something – you don't sit there and worry about how you put a piece of beefsteak in your mouth! You've got no time at all to spend on this meter. And your technique is an all-devouring monster.

You know, I've had to develop shorthand methods of recording on Level VI, just to keep up with it. And even that the only thing that slows down Level VI now is the recording of Level VI. If I could figure some way to speed it up again, Level VI would speed up again. But it's practically at zenith. You can't – you can only write so fast. And you can only shorthand what you're doing so well. And never write an item twice, never do this, never do that, got those things all cut out. And keep the thing all straight on the sheet of paper and so forth. But that's what's slowing things down.

Now, it's – that's no time to be worrying about your basic auditing. About the handling of the pc for instance. Let's see, the pc has now answered the question. Let's see. Now, I think – I think I'm supposed to say something now. That is not the level in which you should be worrying about that. Now, let somebody at Level II worry about that, see? But not at Level VI. See, you just won't ever make it.

You've got to get it up to a point where the pc's itsa is just rolling along like a well-oiled perambulator, see? And you instinctively promote the pc's itsa. Well, you got a list here, and you see the pc's looking very introverted and so forth and you say, "Well, which one do you think it is?"

And the pc says, "Oh, *uhhhhh*. Cat whiskers! Cat whiskers!"

"All right, that reads. Is that your item?" Now, there's an opportunity to do that. But next time the pc is looking, you know ... That's not the opportunity to say, "Which one is it?" He's liable to say, "How the hell should I know? My God! This is too terrible!" You almost ARC broke him, you see, by overloading his reality. His reality, his reality you can... is pretty

poor at this particular line. He's just done a long list and he's very puzzled. "Which one do you think it is?" That would be about all you'd need to torch off the haystack, don't you see? But a lot of times you can do that.

But doing Level V or Level VI is not the time to be worried about how you handle basic auditing. Now, I admit that I've learned a great deal about basic auditing while doing these upper levels. I haven't had any opportunity to do it any other way. But I've been quite surprised that basic auditing is basic auditing regardless of what level it is practiced. Any level it is practiced, it's still basic auditing. And there's practically no zenith on how good your basic auditing can become and there's nothing unknown about any of its laws. These are the laws – simply are based on observation; and you say, "Do fish swim?"

And the pc says, "Hmm..." A long silent period. Well, that's no time to say, "Well, all right! All right! I'll check it on the meter!" See, no! Give the pc a chance to answer the auditing question, man! You busted up your comm cycle. Of course, you're going to bust up his itsa, you're going to dirty up your needle, you're going to distract his attention, you're going to shift him, startle him one way or the other, you're going to throw him out of session, turn him against the auditor, pull his attention out of his bank, put it on the auditor – can you think of any more?

See, I mean it's not just a crime. It's a hanging offense! So, no. The pc – you say, "Do fish swim?" you know, and the pc says, "I don't know. I – I don't know." Well, you know better than to say, "Yes, thank you, okay!" at that point because he's – says, "I don't know, *yah, oooooohhhh...*" You can hear the rest of the communication that is going to follow this, see. "*Oooooohhhh*, don't know. Well, I don't think they do."

"Thank you." See. Now, here would be another horrible error, you see: "Do fish swim?" Pc's silent.

"Well, I don't know. I don't think they do."

Auditor: "..."

Pc: *Hmm-hmm-hmm-hmm-hmm*. [hums a tune] [laughter]

This is too corny for words, don't you see?

Well, the funny part of it is you could probably make some mistakes with technique, you could probably make some mistakes in case analysis – not very many – and get somewhere with pcs. But I'll tell you where you can't make mistakes. And that's basic auditing. And it sounds like it is the area where you could afford to make the most mistakes. And that isn't true at all.

The advance of your pc is totally dependent upon your basic auditing. And it's no better than that and it's no worse than that.

So here's your three zones of auditing. They are – actually, if you do sloppy technique you'll pay the penalty. Your basic auditing will be stretched to a singing high whine. It'll sound like a banjo – banjo tuned up for the days of 49, you know? *Bzzzz!* Because your basic auditing will really be called on here. You didn't quite master how to handle getting down an implant GPM pattern and he gets halfway down and you've left half the items charged. Your

basic auditing is now going to be under strain. That I assure you. But it's your basic auditing that's going to be under strain. Let's say we analyze the case wrong. We decide that he really should have this particular next series of whatever it is run, don't you see? And we shouldn't finish off the engram – the whole track engram that we were doing because it's getting too hard and solid on the pc. So we make a mistake, you see, somehow or another. We cut off something he was deeply interested in doing. Your basic auditing is going to come under a fantastic strain. But the funny part of it is, nothing very serious is going to happen to the pc because of errors in technique. Nothing very serious. And errors in case analysis. Nothing serious is going to happen to the pc. This is mostly true below Level VI, because a pc is pretty much under stress at Level VI, and... Nevertheless, it even holds true at VI.

It's basic auditing that's going to pitch him on his head. If your basic auditing is bad, no matter what level you're on, that's going to catch it. If the technique is wrong the basic auditing catches it. Case analysis is wrong, it's going to be the basic auditing catches it. So let that be a good, strong wall on which to build your sessions and you will be all right. And if there's anything awry with basic auditing, then you're going to pay the full penalty. Slightest error in technique – *crash!* There goes your session. Slightest error in case analysis – *boom!* All in flames, right now, see? Do you get the difference of ratio here? You want to know why some pcs are feeling badly. Well, the auditor – the usual thing is, the auditor's basic auditing is out. It's missing somewhere. Of course there can be technique errors. Don't forget this. You can start down a GPM – an actual GPM, with the wrong technique and you'll have more pc into more ditch in a short time than you could possibly shake a stick at. And a case analysis – case analysis has to be pretty accurate. Nobody's running these things down.

But you can recover easily on those and they actually aren't terribly hard on the pc unless the basic auditing is out. The only place you get somatics turned on, for instance – and this is a new datum for you – the only way you turn on somatics in Level VI OT processes is by invalidation. You found an item, you said it was the item, then you said it wasn't the item. Result: somatics. You found an item that wasn't the item, you said it was the item and said another wasn't the item – you see you're invalidating items: somatics. And you can really wrap a guy around a telegraph pole with somatics. Somatics are very, very rough at Level VI in exact ratio to the amount of invalidation done. It's an exact ratio. Lot of invalidation, lot of somatics. Little invalidation, little somatics. It isn't that items turn on pain. You'll get your pain turned on in this wise: You find the goal "to spit"; you analyze it all out! Rocket read, everything said it was an actual GPM and then somehow or another because of the collusions of the confusions of the something or other and the next session and so forth and couldn't get it to read and so forth, so you abandon it. And decide to extend the goals list. And so forth. Don't be surprised in thirty-six hours if you got a good, sick pc on your hands. Invalidated the goal, don't you see? Well, you ca... it's also true that you can find things that aren't right. So, you pay your money and you takes your chance. And that's about the only thing you can do. Just do it as possibly – as well as you can, with as little invalidation as possible. That's a pretty hard one. So that makes the steps of case analysis mandatory in preparing these things. The considerations must be taken off. These things must be straightened up before you go on. Otherwise, your pc is going to be bogged down with somatics.

But even so, if your basic auditing is in, that is cut to minimum, too. Because the pc has an opportunity to talk to you about them. The pc has an opportunity to comment on it. The pc expressed his opinion concerning the thing and his itsa's being promoted up along the line, his opinion is apt to be more accurate so you make less mistakes. So even that buffers up against this potential somatic situation. You see how we're headed in this way?

Now, those are the relationships of the three parts of auditing. I haven't too much stressed technique, I haven't too much stressed case analysis, but both of them are built on the single point of basic auditing. And I'm just giving you a wide-open invitation to become an absolute, whiz-bang genius on the subject of basic auditing. Not talking when you should be silent, not being silent when you should be talking, riding it right straight up, driving the session all the way through in a very relaxed attitude which is going forward in an awful hurry.

And you'll find out that the heaviest dividend that you can get out of auditing, out of auditing training, is actually the perfection of your basic auditing. And you can move this – of course that includes metering. And you move this all up into a zone of perfection and so forth, you'll find you're so relaxed you've got an opportunity to learn a technique. You'll find you're so relaxed about this you can do an accurate case analysis. This gone, you can't even start on the others. That's how these things sit in their relationship.

I know I've been studying my own basic auditing for about three months. I was never any slouch at auditing. But when I think back over what I once called good basic auditing, I'm horrified. I'm actually horrified! Because the blunders are just wide-open. It looked very smooth to everybody else, it looked very smooth to me at the time. And I had to really work on it for quite a while to find out how bad it was. Maybe some of us are in that particular condition. I don't mean to say so, I'm just saying that I had been in that condition. And I'd be very happy with you if you'd – if you'd sweat this one out and make it look real grooved in and alert and carry it on down the line. And I can guarantee your tone arm motion will triple with some concentration spent on this particular subject. Okay?

Thank you very much!

SCIENTOLOGY ZERO

A lecture given on 10 December 1963

I'm glad to see you, too.

Well, it works out this way: Having completed the entire span of Scientology research at all of the upper levels and rounded it all out, I never thought I'd be called upon to suddenly undercut the lot, find a brand-new series of processes, and a processing theory and philosophy on which to build the edifice. You don't think that's quite a trick?

Of course, actually knowing the upper strata, it might be seen to be very simple to build the lower strata. Well actually, it's quite the contrary. You see with such enormous clarity exactly what has been going wrong and exactly what you've been doing that you wonder how anybody could miss it. You see? And you say, " Well, it's a very simple matter, you know. You got into a knuckleheaded frame of mind and started postulating purposes, you see. And then these accumulate mass, and the basis of the solution of your difficulties in the physical environment and for the last trillions multiple, some vast figure, you see – you been lousing yourself up. That s what it is. You get it now, huh?" [laughs]

And you wonder, "Why don't you understand this, you knucklehead? It's awful clear to me! It's very clear to me. I postulate these things and get all messed up, and so on, and so on, and then all this energy mass is still around and its automatic solutions to everything, and it knocks hell out of me, see? I can't do anything and I have to wear a body and all kinds of wild things occur. Don't you get it?"

I'm afraid you'd find people would look at you blankly. They would look at you blankly. They are worried just today about the fact that the stock exchange trembled, and that "Tel & Tel" rose while gold shares sunk. And this shows that there is some interesting implication concerning racialism in Lower Slobovia. And that's what's really wrong with them, they know. It's the fact that they might go broke if they didn't go broke or something, you see. If they didn't have enough money in order to buy a *wah*, and then the *waf-wah*, and then the boss is a *waf-wah*, and then so *fo-wah-wa*. They know what's wrong with them; and their wife was cross at them at breakfast. They know what's wrong with them.

And you say, "Well, actually, you just think that that's what's wrong with you, because in actual fact what you've been doing is carving yourself down. See, a lot of trillions of years ago you had these goals and postulates and so on, and you run around and make these GPMs and so on. And they react against you, and so on, and you're not very able. And your environment and so on... Don't you get it?" Well, of course, our communication line is absolutely stopped at that point. You can know so clearly exactly what is wrong with the being, you can know so brilliantly, with such insight, exactly what's wrong with you, and see it unraveling at

great speed and with considerable accuracy; and so seeing it, you wonder how anybody else could fail to see it.

Well, the funny part of it is that if you try to... You got a fellow there, and he's facing this boa constrictor. And this boa constrictor is about to constrict. And you say to this fellow, "We're going to run a little process on you. In your childhood..." I'm afraid you're not going to get much attention from this fellow, see? He sits there looking fixedly at this snake, you know, ho-ho. He knows what's wrong with him: he's about to be constricted.

Well, some religious activities have had solutions to this. They say it's very simple. All you do is say, "There is no substance to reality." And you see – you look at the boa constrictor and you think good thoughts. And you think, "There ain't no boa constrictor," you see. And if you think these thoughts strongly enough while you're being constricted, you won't mind it. They've had methods of coping with this in the past. So we're not completely original, here.

But to jack up Scientology one level and run a whole new philosophy underneath of Scientology, which is immediately graspable, understandable and quickly agreed with, which can be discussed in the highest intellectual planes, over the very, very best breakfast tables, and in the lowest hovels, all with complete and utter reality the whole way, and to provide in that sphere a therapy, based on no different an understanding than this, and a reason why... And the last few weeks I've been walking around in a small circle trying to do just that and finally succeeded. And finally got a Scientology Zero that undercuts Scientology One, and which everybody would, I'm sure, agree with.

Scientology Zero, as you knew before, was descriptions of the environment and what was wrong with it, and so forth. This takes care of the world in which the person lives. Has nothing to do with his mind at all. Scientology One is the isness of things and takes care of his mind as well, but Scientology Zero simply takes care of the environment in which the person lives.

Now, the whole subject is instantly summable in – of its own heading, which is "the dangerous environment." That's all. You just say, "the dangerous environment," you see. And that sums up what you're talking about, and the frame of mind of the individual who is listening to you. You have immediate agreement that the environment is dangerous.

Now, the funny part of it is, a great many people who are professional dangerous-environment makers – these include the politician, the policeman, the newspaperman, all of these blokes are specialists – the undertaker. These birds are specialists in the dangerous environment. That's their mainstay. They sell a dangerous environment. If they didn't sell a dangerous environment they feel they would promptly go broke, and so on. So it is to their interest to make the environment far more dangerous than it is. The environment is dangerous enough. But they make it far more dangerous than it is.

They sell a dangerous environment – 100 percent. And like judo, the avidity with which these people sell a dangerous environment can be used by the Scientologist. The whole activity of judo is using the strength of the opponent to overcome the opponent. He aims a whale of a blow at your head and the strength which he used to propel that blow takes him over your shoulder and onto the floor.

So understanding Scientology Zero would include an understanding that the very person who is the worst enemy of Scientology – the chaos merchant, the slave master, the fellow who's trying to hold everybody down, the fellow who's trying to keep everybody shook up one way or the other and so he can't ever get up again, and so forth, the fellow who makes his money and his daily bread out of how terrible everything is – that fellow, of course, would forward Scientology Zero for you with great speed. It's an interesting comment to make and it's worth thinking about in passing.

Now, let us take – let's go in now to modern – ha-ha! – philosophy of the Toynbee school. Fellow by the name of Toynbee – he spent a lot of time in a library, back end of the library, you see, and he knew life finally. He finally knew life; he'd read enough library books written by other fellows who had spent most of their time in libraries. And he came to a great understanding of life.

His actual information on the subject of Mexico, of course, is the tourist poster and the picture of the Mexican sitting against the wall with his sombrero over his eyes and his serape around his shoulders, sitting in the sun. There he is. So he says, with great conclusive exclamation points followed by innumerable degrees, "The reason the Mexican does not succeed is he has insufficient challenge in his environment – not enough challenge in his environment. Therefore, he doesn't amount to anything. The reason the South American, see, isn't an up-and-coming breeder of countries and so forth, is its people have an insufficient challenge in the environment. The reason the African black has never made any progress in civilization is because his environment has insufficient challenge." Then he closes his library books, having written these asinities, and goes back to sleep. He'd never talked to any Mexicans.

Out in the Philippines, why, a brassy, energetic white man jumps up and he says to the Igorots, "Now, if you will just cut a pathway from the village down to the river and take a bullock cart in the morning and go down to the river and fill up a water tank and bring it up here, why, your women will not have to be making that walk to the river. And you should engage in this public works project at once." And he's absolutely outraged because these people do not engage in it at once. And he goes away, and he says, "Ha-ha! Those people have insufficient challenge in their environment. Nothing for them to measure up to. No ambition. Not like us in the West. We've got challenge in our environment."

This guy had challenge in his environment, huh? His mama opened up his mouth and spooned Wheaties into it [laughter] and papa wrote all the checks as he went through college. And the way was paved in all directions with machinery and vehicles and the environment had been licked. So of course, he can stand up there and be brassy.

What's the real environment of this Igorot sitting there around the fire listening to this fellow telling him how he has to cut this path down to the river? What's the real environment? He's got a little boy and he thinks this little boy is a very nice little boy. And he knows this little boy hasn't got a chance in hades of living until he's seven. He knows that – disease, bad food and so forth. So he just sort of quits along that line; gives it a lick and a promise. He knows that when the rains come they won't just be rains; they'll just flood every seed out of the ground and pound the fields to pieces and if he can salvage anything out of that, why, maybe – maybe – why, he might live a few months. And he knows very well that all he's got

to do is walk under the wrong tree and get hit by a snake and that'll be that. In other words, he already knows he can't live. That's what he knows: He can't live. So why try?

In other words, the challenge of the environment is absolutely overwhelming to this fellow. I've studied twenty-one primitive races, including the white race. I know these boys pretty well. I've eaten lizard's tails around the campfires with them. And it's absolutely staggering – staggering – the threat of the environment of such peoples.

Mexico – the political situation, the crop failures, the avarice of taxation, religious taxation, two or three different kinds of courts that you could be hauled up to, everything going to hell in a balloon. And if you haven't got that, you've got bandits, dysentery, so forth. Strictly a case of "why try?" So why not put your back up against a wall and pull your sombrero over your eyes and just go to sleep? It's just too much.

And that's your black in Africa – same story. Too much challenge in the environment. The environment is too dangerous. And that environment is too dangerous for a fellow to have ambition.

Now, they like to tell a favorite type of thing – that you must have challenge in your environment. They like to tell a story about, well, how about this young painter and here he is out there in Terre Haute, Indiana, and there's no challenge in his environment at all; he doesn't have any friends. And he eventually, of course, moves to the big city. They make a big deal out of this thing, you see. The environment, you see, offers no challenge or something of this sort, you know. Heck! The reason he became a painter in the first place is he didn't want to work down there at the feed store with Butch Gregerty, throwing bales of hay around. This guy beat him up during kindergarten, beat him up during grammar school and beat him up during high school; now he's supposed to work for him in the feed store. That's a little bit too much challenge.

Nobody around there buying any paintings, too. And he's prompted by the fact that nobody says "sir"; the environment is hostile to that degree. Nobody believes in what he's doing; it's hostile to that degree. He doesn't have any future, as far as he's concerned, in any line that he can do. In other words, he faces continual starvation. He faces social ostracism. He's unable to communicate or contribute to his community, and so forth. That's a very hostile environment. So he goes to a friendlier one: Greenwich Village. See?

He'd rather – he'd rather starve to death quietly down in Greenwich Village, don't you see, than be threatened to death out in Terre Haute, Indiana – challenge of the environment. And we come to the conclusion that the individual – whether he be white, black, red or yellow – if he is a man and if he is on this planet and if he has not been able to achieve his own destiny; we must conclude that he is in an environment he finds overwhelming, and that his methods of taking care of that environment are inadequate to his survival, and that his existence is as apathetic or as unhappy as his environment seems to him to be overwhelming.

Now, if we get those principles down we have Scientology Zero. Of course, the chaos merchant, who wants an environment to look very, very disturbing... Somebody says there's such a thing as a good news story. Have you read a paper lately? There's no good news stories. "Train wrecked, child raped, murder" – what's good about these stories? There is no such thing as good press. These are fellows who are shoving the environment in your face and say-

ing, "Look – dangerous. Look – overwhelming. Look – threatening. Look. Look." Well, they not only report the most threatening bits of news that they could possibly – couldn't have any possible effect upon their readers' lives, but also sensationalize it, and make it worse than it is. What more do you want, as a proof of their intention? Well, of course, this is the chaos merchant. He's paid to the degree that he can make the environment threatening.

Now, it isn't just and only the politician, the soldier, the militarist, the fellow making the big rockets and the newspaper reporter and so forth, that's making the environment threatening. There's a lot of people spend their whole lives as professional chaos merchants – just worry everybody around them to death. In fact, the percentage is pretty good. The percentage is probably one out of four. Pretty good. "If I can just keep Henry worried enough, why, he does what I tell him" – this sort of philosophy. Just spread the confusion, spread the upset, you see. And along with this goes, "I wonder why Henry doesn't get ahead?" Of course, they're making Henry sick.

So the chaos merchant has lots of troops – a lot of people with vested interests. What's a blackmailer but somebody who's trying to extort money by telling somebody that he can make the environment far more dangerous. "If I just tell people that you and Mamie Glutz were seen in the tourist cabin... A few quick pounds will keep this environment a little less dangerous, see? Because I won't tell." You get the whole theory of the thing? Well, it isn't as crude, you see, as extortion. The newspaper prints "Thousands dead in...", and the thing lies there on the newsstands, and people think, " God! Thousands dead in ...!" You see, they're hit with the news, they can't let go of it, and actually they respond to an extortion – they throw pennies down. And you turn the inside page to see the rest of the headline and it says, "... history." "Thousands dead in history. Past strewn with death." "Have you been plagued lately? The great plague took twelve million citizens in the year 1204." "Will you be a cancer victim? Support your local doctor."

The medico, you know, he doesn't get paid for the number of people he makes well, he gets paid for the number of people in the society who are sick. Don't think it's any accident that the cops will take a dangerous criminal, throw him into prison, make him more antisocial and more dangerous and then release him upon the society. Don't think this prison system which is being used is an accident. It's a marvelous method of getting police appropriations. If you didn't have that much crime, why, nobody would permit police salaries and equipment to be extorted out of them. Of course, the police chief, he's as important as he has policemen under him. He's got fifty policemen or he's got a thousand policemen. He's important and draws pay in ratio to the number of policemen. Well, the number of policemen give you the number of – amount of crime there must be in the society. If there's no crime in the society, naturally you don't have very many policemen. If there's lots of crime in a society, naturally you have lots of policemen. See? So, the more crime, why, the more cops. And the more sickness, the more doctors, see?

Newspaper reporters, for instance, sit around and think solely on this basis: "If I could just run into a big story..." I can see this fellow sitting there now. There's a schoolhouse, you know; a big beautiful school has just been finished, you see. School children are playing out in the yard, playing happily ring-around-the-rosy. And this newspaper reporter is sitting there looking at the schoolyard, "Supposing that should all catch on fire, just as they all go inside?

What a story!" You know, "What a story. I've – sitting right here with my cameraman, why, I'd become famous overnight," you see. "Time magazine, Life magazine – probably give me coverage all over the place, you know? Charred bodies of little children," you know? Well, that's what he eats. That's what he eats. That makes his life forward.

And of course, that's an exaggerated case, but this does run and is to be found in the society to a very, very marked degree. It isn't just the newspaper reporter, the politician; it's also the individual who – here and there that you see – that engages upon this sort of thing.

So the environment is not as dangerous, ever, as it is made to appear. Here you have tremendous numbers of people – vast amounts of money. In fact, I think three quarters of the national income of the United States right now is dedicated to atomic war. Well, that's interesting. There hasn't been one. If they hadn't developed it, there wouldn't be one. Elementary. So the money that financed the horror is now busy supporting the horror, don't you see? And you know, I don't think there have been two cents spent on the actual reduction of the threat of atomic war. They talk about shelters – people could crawl into shelters and that sort of thing.

The truth of the matter is that if you had a few billions to throw around you could probably dream up a defense for atom bombs that would detonate them in the air. You could probably render them null and void without too much trouble – if anybody – if any politician was ever interested in peace. They aren't. They get all their appropriations and public interest and so forth from the amount of disturbance.

Why, he could probably dream up some solution of some kind or another that would handle this international tension situation. And certainly if they spent as much money on it as they did on rockets, they could certainly come up to some kind of a solution. Oh, I don't know, in Scientology we could undoubtedly solve the thing without too much trouble. And talk about money and expense and so forth, it wouldn't take anywhere near the money and expense. But look at the money we would do people out of. Boy, look at the incomes we would cut! Oh, man!

So, anything moving forward that tends to pacify or bring a calmed environment is met and makes a ridge with – is met by and makes a ridge with the backflow of vested interest in making a disturbed environment. So you get this ridge.

Now, if Scientology moved on forward, the environment would become calmer and calmer. Not less adventurous, but calmer and calmer. In other words, its potential, hostile, unreachable, untouchable threat, and that sort of thing – the amount of threat contained in it – would reduce. That's for certain. Because, you see, somebody who knows a few more things about life and knows something about himself and knows something about others and gets a grip on the situation – why, he actually has less trouble – less trouble in his environment. Even though it's only reduced slightly, it is reduced, don't you see?

So, that's a reduction. We'd say, well, somebody hasn't heard of hardly any Scientology, and yet he's – one of the things you can say about him: "Well, he has less turmoil in his environment." Now, that of course is a movement in the right direction. And that would bring about all sorts of things. That would bring about the individual resurgence. So that an individual, less threatened just from the standpoint of the environment, tends to resurge. He gets

less apathetic. He thinks he can maybe do more about life, you see. He can reach a little further; therefore he can exert a calming influence upon his immediate environment, and so on.

Now, as that progressed forward, why, you would produce individuals, more and more and more, who could bring more and more and more calm to the environment or handle things better and better, you see. And it's only things which aren't handled which are chaotic. So we'd get a situation where the threat of the environment would be dying out. This overwhelming, overpowering environment would be tamer and tamer as far as this is concerned; people would be less and less afraid. You'd have more and more opportunity of handling the actual problems that exist instead of people dreaming up problems in order to make a couple of quick bucks or pounds off of them, you see? Be a different – different looking picture.

So in actual fact, the chaos merchant does not like calming influences. He tends to fight these things. This wife – she's made her coffee and cakes for a long time scaring her husband to death, and she keeps him good and scared to death. Scares him at breakfast table, scares him at dinner, and so forth and so on. If nothing else works she brings in the pile of bills after supper, don't you see. Stress. She keeps putting stress on it, and somehow or another consoling him during this thing about – you know, consoles him, about this, even though he is completely overwhelmed, there's nothing they can do about it, and so on. Got him completely under her thumb, see?

All right. This bird walks down to a PE Course. He hears about communication – talk to somebody or something like this. He starts talking to his wife, just as an experiment – saying hello to her or something like this, see. He looks a little calmer. This is not to be borne. And incidentally, at that time, you can expect a considerable explosion. She's going to go on a tirade about the subject that he *must* not have anything more to do with Scientology. And every once in a while you'll run into this in PE Courses and that sort of thing; you'll run into this in practices, and so on. Bill or Pete or Oscar or something – he mustn't have anything more to do with Scientology.

Well, what have you run into at that point? You've run into a chaos merchant, see? And they're buying and selling this commodity called "disturbance," and he's less disturbed. And so therefore, he obviously then is less under control and can be extorted from less, and so therefore, he is being lost as an edible breakfast. You're taking the food off the plate of the chaos merchant, see? Well, you'll see that ridge develop just on an individual basis, and you'll certainly see it develop on a third dynamic basis.

The newspaper – oh, my gosh! Let's take the story of Scientology. The simple story of Scientology is quite remarkable in its simplicity. And in all the fog of press, one loses sight of it. And I thought of this the other day when I was walking through a door into the lounge, and so forth. Almost knocked myself out. I suddenly thought of this and I began to laugh and I couldn't stop laughing. Because I'd been "pressed" to death here in the last few weeks, you see.

I've had more silly questions asked me by silly reporters than you could count... They're marvelous. They're marvelous. And I've developed a new technology for handling that's very disconcerting: I laugh at them. *New York Times* on the phone the other day – I went into howls of laughter at the fellow – a couple of the questions he was asking, and so on.

Standard patterned questions, always been asked before, you know. Goof questions, and so on. You'd be surprised. This guy almost went into tears. He almost went into grief. He wasn't bothering me. He wasn't upsetting me. He wasn't annoying me, don't you see? And, of course, even though he's only trying to annoy the public and disturb the public, when he's interviewing somebody, you ought to be worried. And if you're not suitably worried as his public should be suitably worried – taking this thing seriously and taking the potential threat that he has there seriously – of course, you've taken away from him practically everything he's got to offer. He can't hit you with anything, don't you see?

This particular bloke wound up very, very friendly, and made sure that he... do come by and see him, up in London, and so forth, if I got to town. Very happy to buy me a dinner and a drink. He was very, very cheerful about the whole thing. He wasn't trying to get more information. By this time, he was overwhelmed. He was – he was propitiative. It was him that was going to give up the dinner and the drink, see. Up to that time it was me that was going to give up the news. Only his impingement didn't work, mine did. I didn't take him seriously.

I've noticed lately that's very disconcerting. Or direct them to a sure, open-and-shut source. Just don't answer the question, just direct them to a source, and the source... Smile at them and go, "Oh, you're asking that," you know. "Well, see so-and-so and so-and-so and so-and-so. Let's talk about something that's more important."

But let's look at the true story of Scientology. Let's put it into its most banal form, but nevertheless, a very true form. A Doctor of Philosophy develops a philosophy. Step one: Doctor of Philosophy develops a philosophy. Step two: People find it interesting. Step three: People find it works. Step four: People pass it along to others. And step five: It grows. That's the story of Scientology. If you think it over for a moment, that is the story of Scientology. It really has no further ramifications than that. It's just blunt, straightforward. That's exactly what happens, you see. Doctor of Philosophy develops a philosophy, people find it interesting, people find it works, people pass it along to others, and it grows.

Next time you read the news story, think of this story. I went into stitches over this, when I thought, "Look at the story that they're trying to make a story out of. There's no story there!" – except it's just an interesting story, the way you'd sometimes read in the old Spanish newspapers: "The roses of Valencia are beautiful at this season of the year." A modern story has got to have disturbance and chaos in it. It's got to have conflict, it's got to have upset, it's got to be chewing everybody up. Must be conflict. How do you get conflict into this story.?

Well, this is – obviously they're dealing with something potent because it is growing, because it is spreading, because people are doing things with it, because it – organizations are appearing with regard to it. Obviously there's something going on here! But still, what is going on – that a Doctor of Philosophy developed a philosophy and people found it interesting and people found that it worked and people passed it along to others and it grew.

Now, you begin to look over this situation, you actually can't make any more story out of it than that. You can tell some bits here that amplify the thing; you can get some statistics. Well, all right, "Doctor of Philosophy develops a philosophy, Doctor of Philos... All right. Well, it's – is he? and so on. Do you know anything about it?"

"Oh, yes. He's better – better educated in terms of semester hours, and so forth, than practically anybody that's teaching in philosophy in universities today, and didn't spend all his time in the back room of a library, but went out and studied various races of man and saw how their ethnical patterns fit together and saw how man was getting along, and found there was a common denominator to existence; and applying this to known philosophy and developing new materials on the thing, developed a philosophy." And it's all very adventurous. There's a lot of amusing anecdotes that go with it. But that's all the story you can make out of it.

Well, this reporter, he – he's got to – *ho-ho!* He – he's got to have some disturbance here. He's got to get this thing-*ho-ho*. How do you make a conflict out of it? How do you get the *wuhh* and the *rrr*, and how do these things go together with a *shwirr*. Well, we take point number one. He's got to say, "Well, this fellow actually isn't educated. He doesn't have any degrees. He's never been anyplace," and so on. He actually never gets as far as saying it isn't a philosophy because that's a bit above his educational level, see? But he can try to find something wrong with the fellow who is doing this thing. He can never really find anything wrong, but he tries hard, you see. And he punches in all directions and he comes up with some interesting adjectives and so on, but he really can't make the grade on the thing because his facts aren't supported.

Now, as a matter of fact, "people finding it interesting" – he tries to say that people are hypnotized or they become unwilling victims, or they're dragged off into lairs, you see or... He's got to do something here to make this disturbing and sensational, don't you see? Well, that's – of course, can't quite make the grade there, but he tries. He tries, you see. He leaves "it works" strictly alone. He drops that like the cat dropped the hot chestnut. Because he knows it works. There's not really any doubt in these people's minds about any of these points, you see, they're just desperately trying to make a story out of this thing.

As far as people passing it along to others is concerned, why, the medico, he thinks, "Gee, you know, if they passed this stuff along here to others, why, this would be pretty grim because people would become happy and then what would happen to my income, you see? And that must be stopped. So everybody's got to be hammered and pounded, and so forth." Actually the biggest job of work which we do is trying to smooth it out so actually there are no economic hardships or otherwise. I'm working hard on that these days where abuses might exist. But they immediately have to dream up a word like "cult." See? That bars everybody out because it makes it look like a closed group, see? A cult. The "cult of Earth" – that makes just as much sense, see. He's an earthman, so therefore he belongs to the "Earth cult," see? I mean, it makes just as much sense, you see?

But he works and sweats over this thing and he really can't get anyplace with this thing, you know. I noticed them sweating over this in the Washington raid stories, and so on. They found the box – "A message put into this box goes right to Ron," you know – they found this box, and my God, they took more portraits of that thing, I think. I don't know what they did. Seemed very, very terrible and unusual to them that a communication line did exist there. And it was very upsetting to them. How they worked at it, see! Well, yet they couldn't do anything much about it. And it grows, and that's what alarms them.

Saturday Evening Post's whole theme is how startled they were to find out that it had grown. They thought it had all died away and they were all being very complacent about it and it's... The writer told me this, you see. And everybody was quite relaxed about the whole thing and then all of a sudden they found out that it had grown to enormous proportions and had kept on growing all through those years. And it hadn't disappeared and it hadn't been just a twenty-four hour fad, and this was terrible, and so forth. And he became quite frothy about it. He tries to find things.

Now, as far as Scientology developing, here or there, some ridges and some upsets and so forth: look at the planet it's being released into. You mean to say we're responsible for the conduct of the planet? Well, we're not yet entirely responsible, but we'll make it. See, you start releasing things to people and races and that sort of thing, and here and there – there's going to be a little switch around and an upset or something like that, but believe me, we have less of them than anybody else ever had. And we straighten them out. Eventually we take care of these things. Well, that's quite remarkable. So there really isn't any real trouble for them to look at.

To make a story out of this you'd have to sock at each one of these points one way or the other, you see. And yet because there is no story there, of course, they can't write the story because it doesn't fit into the modern press specifications. There must be disturbance, there must be upset, people must be worried, and people must have, by reason of this story, a more disturbed environment than they had before. Nevertheless, all things to the contrary, the true story of Scientology is simply: A Doctor of Philosophy developed a philosophy, people found it interesting, people found it worked, people passed it along to others, and it grew.

Well, you could dream it up, you could even make a story out of it if it was a sane press, see. You could say, "Look. Nobody ever found these answers before. There has never been one on this planet." You could say a lot of things of this particular character, all of them equally true and very startling and well worth announcement, but there's no conflict in it. So therefore, the story of Scientology goes true as an arrow and nobody really can do very much about it or do very much to it, because they can't rough up its edges. If you ever want to be completely crashed, get in the road of truth.

Now, all disturbance and chaos folds up in the teeth of truth. The Duke of Alba is dashing about, losing battles left and right, and talking about how horrible the enemy is; and the – his troops and his government are getting very, very upset; he's a – and his king is getting more and more discouraged and so forth. And then one day the fatal shaft of truth cuts through this whole chaos. He's been in the enemy pay all the time. Immediately everything sets back to rights again and the troop morale comes back and they go and they defeat the enemy and the king... It works out at the end. Well, that's a dramatic incident with regard to truth. But all truth, whether dramatic or simple, has the same effect. Don't ever try to stop truth. That's the only thing that can go through sixteen-inch armor plate.

This fellow is screaming and howling and raving around and he's cutting you up one side and down the other, and if you know the mind you say, "The reason you're mad at me is because you had a withhold from me concerning my paycheck two months ago." Watch him

fold up if that's the truth. Don't watch him fold up if it isn't, because he won't if it's not the truth.

Fellow named Jones lives over here on the edge of Saint Hill. He has been snapping and snarling and screaming and howling about what horrible things we're liable to do to him at any minute. And I wrote him a letter not too long ago and I said, "If you'll just carefully review the things which you have done to us that you think we don't know about, you'll feel much happier about us." [laughter] I haven't had a word since. It's just been a tomb-like silence. Interesting. It's interesting. The clean blade of truth, and – it can't be stopped.

Now, in a universe which is kept going and made very disturbed continuously by lies, all the basic and fundamental facts of the universe had been completely covered up and particularly those related to life and death; these things were completely masked. And nothing but disturbance and chaos had been dug up around them for so long that that data was gone. It wasn't just hard to find; it was just gone. In fact, many data – many contrary data existed. It was pretty hard to sift this stuff out and get a toehold on to this sort of thing. What is the truth about man? What is he? What kind of a being is he? Who is he? What's he doing? What's he here for? What am I here for? What am I doing? What am I trying to do? What am I trying to get done? How long have I lived? What'll happen to me when I die? What kind of a being am I, anyhow? These are the basic and fundamental questions. Those questions and answers thereto – on the time-honored basis – belonged in the realm of philosophy. The answers to those things always have.

Well, philosophy had come to such a decadence that I think in the West it mainly was somebody sitting around a cracker barrel uttering witticisms. And I think the last time anybody really came up with any really civilized philosophy of any kind or another, they gave him a nice slug of hemlock. It's not been a very popular subject, but it was only unpopular to this degree: that it disturbed the merchants of chaos. And these fellows that had trouble with this were only luckless to this degree: that they didn't reach the truth. They had limited truth. And the road to truth is something that you must follow all the way down. There is not such a thing as a limited truth. You've got to go all the way when you start talking about the truth of life. You mustn't hold up and not find out what it is.

But people set you the consistent and continual example when they say, "Look, philosophy is very dangerous stuff." Well, yes, it is very dangerous stuff to a fellow who's supporting himself by lies. Who's it dangerous to? It's only dangerous to people who are dangerous. It's only dangerous to people who are dangerous to others.

Well, this gives us a very interesting view, when we start looking over the situation, not that the story of Scientology isn't a rather remarkable one. It's actually unparalleled. But it's very simple. It's extremely simple. And the goals and targets of philosophy are inevitable, whether I said they were this or said they weren't. By the mere fact of people looking at this truth, finding these things were true, applying these things and achieving a higher state of existence, you would inevitably get – whether anybody said you would or not – a calmer life, a calmer environment, a calmer civilization. And there would be less disturbance and there would be less pay for disturbance to be bilked out of that civilization. People would go uptone just on that basis alone. Therefore, the first target – the first target when one starts to intro-

duce Scientology to anybody would of course be that person's own environment. His own environment. Not his mind, but his environment.

And here is a whole worked-out philosophy, now, on the subject of the environment, under the heading of, "the dangerous environment." Now, if you scatter your own wits around in this thing, you could at once extrapolate – knowing, as you know, upper levels – you could at once extrapolate the ramifications of, well, diagnosis and treatment. You could dream up processes. On just this basis: This individual believes that the environment is more dangerous than he is – than it is. He certainly believes – this individual certainly believes – that the environment is too dangerous for him. That, we're completely convinced of. See, it's too dangerous for him. There are zones and areas in that environment which he believes are completely overwhelming and that he will not be able to personally cope with.

This we can say with absolute certainty, whether or not we're talking to Joe, Bill or Pete, or even a politician or a newspaper reporter or a cop. This individual – this individual would be able to agree with you on that basis, unless, of course, he were completely insane. He'd be walking around in a toga saying, "I am Emperor of Earth," you see, "and all Earth is subject to my orders," you see. And he'd be in a booby hatch someplace, see? He'd be crazy. He has, of course, got the final solution. You just make up your mind you're dangerous enough and you won't worry anymore.

But falling short of that, any relatively sane person that you can talk to will agree with you that the environment, and certain spheres of the environment, are a bit too much for them.

I'm not, by the way, reviling the merchant of chaos. He's completely crazy in that he thinks the environment has to be made chaotic. I don't know why he thinks it needs his assistance! But this fellow has his points and he thinks the environment's too much for him, and he certainly knows he's making the environment too much for others. He certainly knows this.

So in talking to an individual, we know that the environment is being made more dangerous for him or her than it is. Lord knows, it's dangerous enough. And Lord knows, there are real areas of danger in this environment. But also, we know that there are areas of that environment being made more dangerous than they are. See, we know that point. And that is one of the key points of Scientology Zero.

See, one point is that the – that the environment seems dangerous to the individual – you'll get an agreement on this – and that he is undertaking certain methods to hold the environment down and keep it from biting him. We certainly know that. And we also know, due to the presence of people who have a vested interest in this, that the environment is being made more dangerous in certain areas than it actually is. We know those things exist.

So therefore, we can then say that the individual could be marched forward into some sectors or quarters of this environment with his own inspection, in some way, and perceive that the environment was being made more dangerous than it was. Now, we can also see that, and another operating principle of Scientology Zero is that the individual's health level, sanity level, activity level and ambition level are monitored by his concept of the dangerousness of the environment. These various levels are monitored by *his* concept of the dangerousness of the environment.

Now, what have we got here? We have factors out of which we could work – well, we have factors out of which we could draw up an improvement program for any human being rather quickly. We could draw up an improvement program for any given human being. One, he considers his health and well-being and that sort of thing, to an enormously greater degree... This is the discovery. The rest of this is just built up on this one discovery. The discovery is that his health and well-being, his sanity, his ambition are monitored by how dangerous and overwhelming he believes his environment is; that he's actually not operating to the challenge of the environment; he is withdrawing from the threat of the environment to this degree. Now, knowing that, we could therefore improve these things in the individual without regard to his mind.

Ah, you see, now, we're dealing with a very interesting sphere here, aren't we? We've mentioned this before under "destimulation." This previously has occupied just one little level in the auditor handling the pc. He finds out where the pc's living is too restimulative for him; tells him he won't process him again till he moves; tells him he mustn't go home during the whole period of this next intensive but must stay downtown in a hotel where he's less restimulated.

We've seen this around, don't you see. But now, let's make – let's make a whole – a whole banquet out of this tidbit, see? Now, we're not explaining to this fellow anything about his mind; we're explaining to him about his environment. We know we're going to get – it does – it's a minor amount, but it'll nevertheless be a demonstrable amount – we're going to get a resurgence and a betterment in the area of his health. We're going to get a betterment in his physical and mental alertness. And we're going to get a betterment here on his ambition, his amount of activity and that sort of thing. And if we're working in this particular field – with Scientology Zero – then we're actually not going to work with his mind. Do you see that? We're not going to work with his mind, we're going to take this as another entirely different sphere and activity.

Well, naturally thee and me know that the reason he flinches every time he enters a red room, and so forth, has to do with a whole bunch of facsimiles he's developed on the subject of red rooms which are being firmly held in place by a bunch of RIs that have to do with this and that and the other thing. We know this mental combination and in the absence of that – in that mental combination isn't eventually subtracted or knocked out and so on, we know that his gain is limited.

But now let's talk within the real reality of the individual we're talking to. Now, what is his expectancy? What is his expectancy at this level? It may be this low: that he just won't be so frightened when the doorbell rings. You get a – we're talking now about a very tiny improvement. But nevertheless, this improvement would be quite real to him – be enormously real. And in the story of Scientology, what we're butting up against here now is this one particular level, three – people find it works. If people don't find it works, that is the end of Scientology's progress in that particular direction.

Well, this is an area of high-level workability. You see, all the fellow has to do is study his environment a little bit. He doesn't even have to study his mind. Well, this is a very, very good thing. This is a very easy one. So we're just going to get it that when he wakes up

in the morning he doesn't have an agonizing feeling like something horrible is going to happen if he gets up. You see? This is going to, not disappear, perhaps, but diminish – that he will be a little more active in life.

Now, the funny part of it is – I just tell you – you can settle for those gains. But the gains you will actually get will, in most cases, if you're settling for those, greatly exceed your expectations and greatly exceed his expectations. These gains are adequate here to startle a guy's ears into a thrumming quiver.

All right, how do we go about this? How would we use this material, using these various principles? Well, remember now, that most – the threat he is worried about is probably imaginary. See? It's really not anything to be worried about. Let's embark upon a simple therapy. This is a therapy at Scientology Zero. Don't read the newspapers for two weeks and see if you don't feel better. Of course, he doesn't read the newspapers for two weeks, of course, he'll feel better. He'll say, fine. Now read it for a week, and you'll feel – find you'll feel – at the end of that week, why, you'll find you feel worse. And after that time make up your mind whether or not you ought to pay any attention to the newspapers.

You could just lay this out as a simple experiment, you see? Well, he can easily do that because it's a negative action. It's not expensive, as a matter of fact it's slightly, microscopically, cheaper not to buy newspapers, you see, than to buy them. So it isn't a costly experiment at all. That's in the direction of destimulation, don't you see?

Now, that's all very well from his personal viewpoint. You could actually tell him... And here, by the way, you have the little junior cousin or the little gene that grows into all of the Havingness Processes later when properly placed in this position, see. Just tell him to look around the environment and find something that isn't a threat to him. If he ever gets too upset or confused, why, just start looking around his environment and find something that isn't being a threat to him. That's a magic process, by the way, and that is very smoothly worded. That is far, far more sophisticated in upper-level Scientology than it looks.

You could actually find what sort of a threat he was experiencing at Level Two, and run that as a Havingness Process on a negative. See, he's very worried that things are going to fall on him. So you could dream it up on the basis of "Well, look around here and find something that isn't going to fall on you," you see. And he would eventually, gradually, with great comm lag, find one thing someplace. And you must make him find the one thing, you see, that isn't going to fall on him. He feels much better. And he even has a lesser gain than that. He realizes, if he – if he just ran it to cognition, that he has thought that everything was going to fall on him. That's the cognition. He's already told you this, see. But he now knows it by inspecting the environment.

This – under the heading of this, in processing, is old "Take a walk." You feel bad, go take a walk, and look at things as you walk. Well, of course, this is a forward progress into the environment. And the reason that works, I can tell you now, is the person finds out that the environment is not threatening. This is a whole positive education on the negative threat. You understand what I mean? Positive education. Because he goes around and looks and see if something is doing this to him. And of course if he finds out, it's a negative threat.

This fellow is all in a sweat on the subject of the Chinese situation. Well, of course, you could ARC break somebody and chop him up with this thing, too, by just negating and not-ising the whole situation. You could say to him, "Well, what threat have the Chinese ever been to you anyhow, that you're so worried about?" Now, he has to protest and justify his own thinking. He has to get himself all tangled up trying to prove he's right and you're wrong. So of course, that has no workability at all. But this is true. But this you could do.

Now, in an upper-level process you'd run a repetitive process – something like "Well, what event have you heard about that hasn't affected you much?" You could run that as a repetitive process and you'd get big gain.

But your effort at Scientology Zero is somehow or other to get the individual to inspect the environment and find out that there is some slight greater security in it. That's all. That doesn't sound like much, but then I'm just dumping it on your head – a complete wagonload of work on the subject of Scientology Zero. I can give you the principles which I have just given you, and those principles are very short and sweet. And out of those principles you have to work with any individual as he walks up, because he's got a different environment than every other individual that walks up. So you – can't tell you too many processes to run with this individual. You see what I mean? I mean, he's going to come up and he's going to tell you he's worried about different things. I can only give you the principles by which you could get him to not worry about them quite so much. But it has nothing to do with talking to him, it isn't up to itsa at all. It all runs on the single auditing command, "Look. Don't worry." "Look and find out if the environment is as threatening as it appears to be." This is your single auditing approach to the thing.

Individual is very worried. He's sitting at his desk and so on. Papers are piling in. Everything seems to be going up in a high uproar, and he just feels completely overwhelmed. Well, he himself ought to be able to look at the papers on his desk. They're the source of the threat, aren't they? And find something about them that isn't a threat. The threat, of course, will balance out in the discovery. That would be an action. That's a sort of "Take a walk while sitting at the desk," see?

Person feels like everybody is hostile in the environment to them. Just say, "Well, now, you find – find something people say or do around here that isn't hostile to you." All on the gradient, you see. "Find – is there one person in the organization who isn't actively hostile to you? Is there anything said today that wasn't directly and immediately hostile to you?" This could also be played in the direction of exaggeration. But you get into mental things and so forth. You get into mental responses when you go in this direction and move up in levels. So you know what I mean by that; you can get the exaggeration of it: Get the idea of a Chinese in every corner shooting at you with tong hatchets, you know? You can do all kinds of wild things and an auditor extrapolating and auditing somebody and so forth, would undoubtedly go hog wild with it. Perfectly all right. Let him go do so.

I was running a process the other day – just on this basis; just readying up this material for Scientology Zero – and it was on the basis of "Look around here and find something that isn't trying to exteriorize you." Pc didn't find anything. But had the cognition that she thought things were. And was very happy about that. Did find two answers, both the same answer.

"Me. I'm not trying to exteriorize me." You see this? Almost any inspection that you give it is a valuable inspection – almost any inspection.

For instance, one of you, right now, sitting still or minding your own business or all by yourself, could just think over, carefully... It's a very bad thing to get into "What things in the environment do threaten me?" Now, I'm not – ha-ha! – I don't advise you to go off in that particular line, you see? But sit down and figure out if there's anything that isn't a threat to you. A fellow who has a PTP or something like that usually can't get his mind disentangled from it very far. But "Is there anything around that isn't pushing this PTP at me?" – that's an interesting question. Sometimes takes you a few minutes to get the thing answered.

The guy who has just lost his girl – he just lost his girl, and he feels the horrible sadness and loss, and so forth, it imparts to everything. Actually, everything in the environment will talk to him about this girl. You possibly have had similar experience here. Somebody just – you think of somebody's name and so on, you can remember a time when there was a moment or a few moments or a period of time in which it was impossible for you to look around and not be reminded of this person. Just *uhhhh!* That was a personless environment. When one's concentration has been very, very heavy on an individual or a person, it is sometimes almost heroically difficult to not associate everything with that person.

Well, the trick is to find something, of course, that isn't reminding you of that person. You might have to search a long way. This is how to recover from a love affair. This is a little bonus. Could have used it myself a few times in the last few trillennia.

But the situation is in actual fact a simple one. The individual has identified everything in the environment with his unrest. Everything in the environment has become identified with the threatening things in the environment. And the individual can't pull his attention off of these things. But by indicating things in the environment, even quite simply, and by directing anybody's attention to things which are not so connected, making the individual find things which are not actively reminding one, you get a differentiation going where an identification existed before. And where differentiation exists, intelligence and judgment can return. Intelligence and judgment cannot exist in the face of an identification, but can exist in the face of a differentiation. So this opens the door pretty wide.

Now, the funny part of this is that an individual, oddly enough, usually finds data more workable, that he can work on others, than data which is being worked on him, unless he also has the opportunity to work it upon others. You'll find this as a truth when teaching PE Courses or even small groups of people or even an individual; that if you give him something he can use to help others... It's an interesting commentary on the actual character of man. Man is basically good: If you can give him things which will help him help others, he'll be far more interested than if you're simply giving him things which help him.

And therefore, in PEs and that sort of thing, and in teaching the individual or in any booklets laying out this material and so forth, your supplementary advice in the matter should always go on the basis of "Who are you trying to help?" "Who are you trying to help find that their environment is not as dangerous as they think it is?" This is so true that many of the questions you get in a PE are from an individual are the hypothetical question which is in reverse to the doctor's question. The doctor's patients are always asking them for a friend. "A

friend has this trouble and what would be your advice that I could give my friend?" when it's the person himself that has this trouble, you see. The medico's always running into this that way.

Well, a Scientologist always runs into it – not being in the same profession and a more honest one, which is quite different, quite different. And in actual fact the individual will ask for himself because he wants it to help somebody else.

One of the things that plagues an Instructor is that – his questions he is being asked are very frequently simply being asked by a student so that this student then will make sure that some other student knows. Now, the question is being asked for the benefit of another student or other students. Quite interesting.

Now, that's true of all such wisdoms. So this Scientology Zero has to be pretty darn well understood by you in order to pass it along to Joe so he can help Pete. Because he will actually go help Pete with it, find out that it works to some degree and use it to help himself. And quite often that is the cycle it goes into; not, he uses it to help himself, don't you see, and then goes helps Pete. It's got a flip-flop type of cycle. That is to say, he helps Pete with it and then finds out that it helps Pete a little bit, so he takes some of the advice himself. It's quite remarkable. But that factor enters in particularly at this level of Scientology Zero.

Now, "Take a walk and look at things" is just the mildest, mildest, mildest advice that you could possibly give anybody that is almost certain to produce a result if the person will do it. It's quite a – it's quite an interesting process. There is nothing very dangerous about it. Of course, an old-timer like myself, I mean, I gave myself this advice one time up at 250 Old Brompton Road.

Several sections of the sky had fallen in that day, and there were considerable amounts of tumult and turmoil going on and so on, and I decided that it was just all too much. So I decided I would take my own advice and go out and take a walk. So I proceeded to do so and because I told people to look at things, so on, I went around Old Brompton Road District up there in London, and I was busy looking at things, and of course I looked at them real good. And this intrigued me very much. And I found out by the process of looking at things and then putting tension on the beam with which I was looking at them, well, I could pull myself forward. And I didn't have to walk. And this became very intriguing to me. And, skidding my heels along the pavement and so on, and I became quite cheerful about the whole thing, till I noticed a cop on the corner regarding me with some... [laughter] Shook me confidence, it did, a little bit. Almost pulled meself out of the body that way.

Anyway... Did me a lot of good. Cheered me up enormously. But there's – there's a level of action, don't you see? There's a level of activity, a level of something or other. Now, that was about 1956, or something like that. The only earlier one I had that could produce the same result was go out and clip hedges. And you know, you can only trim a hedge so often. You run out of hedges. It's quite effective. It's quite effective.

Now, the master question is "What part of the environment isn't threatening?" You're basing this on the identification – the individual's identification of everything. That is your master question. "Isn't" – it's negative. Because he has everything identified with that part of the environment which is threatening. Well, you get him to differentiate and find out there are

some parts of the environment that aren't threatening, and he'll make some considerable forward progress.

Then the individual can also arrange his life somewhat. And it's a funny thing that by making an individual plan a life by which he could live calmly and unthreatened, that the life he is living becomes less threatening. Well, this even applies to some guy who's on the – poor fellow who's on the complete treadmill; he has to keep this job; it doesn't pay very much money; he's got to stay there; there's no chance of his getting off of it and so forth. And he finds that environment very hostile. Well, he's sort of in a trap, isn't he? He's in a sort of a box, all of his own making. You get him to plan – we don't care how wildly he plans it or how he dreams it – but just get him to plan a life which would not be so threatening. And he will go on working at the job he is working at much more happily and much calmer.

Now, when you move this up, then, in Scientology One, and you start introducing communication factors and show him how to communicate to people, and so on, they find they can produce an effect upon people and people cease to be as threatening. And these things all tend to multiply on up the line. And if you keep havingness alive as you go on up the levels of Scientology – I mean you keep havingness in mind and don't drop it out of view completely and forever, you really never cease to lose, totally, the benefit that is started there at Scientology Zero. The environment isn't as threatening.

People are looking for a less threatening environment or, knowing mostly that they can't escape to that, looking for a way to be more enduring in the environment they're in. That's what people are looking for. It's a two-way look. They'd love to be able to get out, or they'd love to be able to master. But they don't think they can, to a large degree. They know they can't get out very far, and it wouldn't do any good. And nobody has ever been given – able to give them anything by which they could exert much more influence on their environment than before. And those are the basic goals and targets of the individual. There are no more complicated goals and targets than that that are completely general to every individual there is. Any thetan has these things.

In other words, not to have to stand up to the type of threatening environment he's in, or be more enduring or dominant of the environment he finds himself in so that it is less threatening – these are your basic PTPs of a thetan that have been with that thetan ever since he's been coming on up the universe. And of course, being a fairly nice bloke, he has actually been looking for something he could help other people be less intimidated or less fixed in their environment so they could get out of it, or so that they could endure or dominate their environment better. He's also been looking for something to help his friends. He's never really completely forgotten those. Even the drunk on skid row never forgets that. Even the bum in jail never forgets that.

These fellows, then, are actually trying to help others, and what you need is a level of help which requires practically no education at all. Or the education which it is receiving, of course, is a destimulation of the environment anyway. Just a discussion of the situation. Now, that's what's required. There's no auditing skill required there. There's nothing required there and yet there's a potential betterment.

This will become real to the individual no matter how crudely it is put to him. Just the concept all by itself that he considers the environment dangerous and overwhelming and that he doesn't quite know where that danger or overwhelm is coming from, that concept alone is an enormous piece of wisdom, see, that is just a square mile of wisdom dumped right on his head. It's never occurred to him before. He says, "It's true." He never thought of it. He never thought of it for himself or anything else. He's just felt it and was it, all the time. And what you've actually defined is what he was.

This is his is-ness. Quailing back from a very threatening environment that may overwhelm him at any moment, unable to progress forward into greater endurance or power that can handle that threatening environment – this is his life. You have told him the story of his life in just those few words, don't you see? Well, if you take it out from there and you actually provide a therapy, well, you say, "Knock off some of those things in your life that make you upset." Why, that's good, solid advice, see. "Who upsets you? Well, don't talk to them for a while." I mean, this is crude, see. "What activities leave you feeling worse?" and so forth. "Well, just don't do them for a while." "What things in the environment aren't really a threat to you? All right, you got some of those. All right. Fine. Associate with those. Pay more attention to them." You know, you're liable to shoot that person's IQ up fifteen, twenty points. You're liable to snap him around and get him out of the wheelchair, and so forth, just with no more wisdom than this little package that you've had in this last hour and a half.

So, what we needed was something that was very, very pervasive, something very simple and something that would go forward that had no auditor connected with it at all, it only had a teacher connected with it. And given that, and the developments which you can develop out of that, and which I will undoubtedly write and develop out of that, why, we have pushed a whole new philosophy under the tremendous structure of Scientology. It took a lot of doing. Looks very simple now that it's done, isn't it? But I had to think of: How do I think up a whole field of philosophy that has whole bodies of truth in it, that are an introduction to the man in the street, the person who knows nothing – you haven't any time to teach him anything – that he will immediately see the truth of, that requires no auditing, that requires nothing about the mind in connection with it at all. It was quite a specification. But there it is and I hope it's some help to you.

Thank you very much.

SUMMARY OF OT PROCESSES

A lecture given on 12 December 1963

Thank you.

What's the date?

Audience: December 12th, AD 13.

Twelve Dec. AD 13. The sun is still going south. I was keeping close check on it. It's very difficult to do this – I still have a tendency to go into suns and so forth. I don't hope you have that trouble in the near future, but it's a rather funny feeling, you know. There's the thing and it isn't that it's hot, it's that it's sort of going *slurp!* And you say, "Well, one too many crashes." (We'll probably have to cut this off the tape. We mustn't talk about things like this now, you see, because of Scientology Zero and all that.)

Perfectly all right in this particular lecture because I'm going to try to give you now a very fast and rapid summary of OT processes. And this is a matter of record; not so much a matter of education, but a matter of record. It's very important that we have a rapid rundown.

It may not have been entirely in your view that how OT processes are done and the technology which is the final finished technology of internal bank running and so forth has not been made a matter of record. It is not a matter of record. It's the bits and pieces which are around and even the materials on tape that are around do not form a concise picture. Yet the technology itself is very precise. It's extremely crisp. It's probably the crispest piece of technology which we have. And it is rounded off now to a point where it isn't varying a thousandth of a millimeter. It's just dead-on. It's not something you vary from.

Now, the liabilities are – is having a pc who doesn't know what the score is with regard to a bank and who will argue with you about the structure of a GPM.

Some people become very concentrated on various parts of the bank and very easily make mistakes about parts of the bank and so on and get misconceptions about what they're looking at.

You take some pc, for instance, who has two RIs in view. Well, let's take that. That pc could very easily say, "Well, I have two GPMs." You see? And become quite upset if you insisted they had more than that in terms of GPMs, because these are the visible manifested manifestations. They're just these two big RIs. And, of course, these are two horrendously overwhelming large pieces of mass and quite convincing and so on.

And you take somebody else that says, "Well, they don't have the Helatrobus Implants" or "they don't have this." This is at the lower level, don't you see. Well, there's some possibility that that's true. You see, they might have missed. And they might be from another galaxy. And that has already been cared for in some of the bulletins.

But you know what some implants they do have, however. They wouldn't be on this planet without having the Train Implants. That's impossible. You couldn't have gotten here otherwise.

So there are sets of implants there that you could run into and so forth. And there are variations and so on which occur at Level V – at what is now Level V. And there are variations. Somebody could have missed out on it. And I found the other day, back around trillions two, a whole set of implants – I say "the other day," I've been colliding with them here and there and going back on the track running actual GPMs – but there's a whole set of implants back around trillions two which are quite similar to the Helatrobus Implants, for which we do not have the pattern – which I don't have the pattern for. And yet they look quite like it: there's the standing parking-meter type of implant jet and there's the wide fields and the railroad track and that sort of thing. And here's this whole series of implants – GPM type implants – back there which we don't have.

Well, there's no particular reason for me to wrestle around with this – someday somebody wants to get his "star of something or other," why, he can go back and dig up the pattern for these things for me. I've taken enough knocking around on that line, thank you. And we're just lucky I held together as long as I did.

Now, the upshot of this is that you can get variations, you see, in bank composition, at Level V. Here's somebody without the Helatrobus Implants and here's somebody else with another strange set of implants that nobody's ever seen. You see? You get these ar... differences.

So, there are case differences. The patterns – if you've got the Helatrobus Implant, he hasn't got another Helatrobus Implant pattern. It's the same one. But case differences, don't you see? He's come down a different route because this has a lot to do with the individuality of the individual, you see, and what he – some of us were standing in the wrong place at the wrong time, and he was fortunate enough to be in the right place at that particular time, you see, and he missed. Maybe he was incarcerated in a stone while a lot of things were going on. Who knows what happened to him at that period.

But you can get variations at Level V, is the only point I'm making, but you don't get any variations at Level VI. If you had any variations the person wouldn't be here.

One person hasn't made different types of GPMs than – actual GPMs – than another person. But lack of data on the part of that person and an overburdened case and not any complete or comprehensive understanding of what the symbols are supposed to apply to, could bring about an apparent difference in the case. Am I making my point?

See? They don't quite know what you're talking about and therefore they say they haven't got them, they have got them or something. You've got a lead-pipe crash. I've already gone through thinking cases were different at the OT process levels. See, I've already gone

through this and I find out they aren't different. And that is that. The differences are simply mistakes being made by the auditor or the pc, and those mistakes show up catastrophically after a little while.

Now, every GPM is composed similar to every other actual GPM. Actual GPMs are not different in their basic composition. The goal as an RI always is the first RI in the bank. It then runs on up the line on a *solve* basis, not on an oppose basis. It's a problem – it's the Goals Problem Mass with the opposite items going on up the bank, don't you see?

But those masses actually are very huge spheres. They're the – all the accumulated energies and so forth anybody ever had anything to do with on this particular subject. And they have been lived through and they have been accumulated.

Now, an actual GPM – on the middle track, they have sixteen to eighteen RIs in them. That's in the middle track area. And late on the track they go – that is, closer to PT – they go twenty-two to twenty-four RIs. Each one has a crossover. The middle pair – let's say if something has twenty reliable items in it, then at the point of ten reliable items from the top, you see, you're going to get the crossover. And the crossover is very important: That means where the individual ceases to be for the goal and starts to be against the goal.

And on the opposition terminal side, you get a progression from all the way away from the goal, up through the opposition terminals to the top opterm, which is dead for the goal.

And on the terminal side, you have the goal as an RI at the bottom and it progresses up to the crossover for the goal and then on a gradient scale goes against the goal. The top terminal of an actual GPM is dead against the goal. If the goal were "to be strong," the top terminal would be something like "weak." See, it would be something like "being weak."

Now, that pattern has to be pretty well understood, otherwise the pc is going to get into trouble and the auditor is going to get in trouble. That's invariable. So those patterns are all similar; it doesn't matter where the thing positions on the track, the pattern is similar.

But this change does take place as you go earlier track: You get more items for the goal; the crossover drifts higher. But this is monitored by whether or not the pc, as a thetan, liked the goal or not. You can have the crossover appear almost at the bottom of the goal on one which the pc detests.

"To be a servant" – if the pc really detested that, you could expect the crossover to occur along about the first couple or three pairs.

There's this individual variation. They detest it, in other words. But this isn't something the auditor has to pay very much attention to. Doesn't have to pay very much attention to that eccentricity, so that it's not an important eccentricity. It isn't – it's something that you can expect to find occasionally.

"To be obedient" or "to be good" – don't be too alarmed if your crossover takes place very early and the pc turns against the goal along about the second pair, third pair up from the bottom. The pc is dead against it now, and the rest of it is just a long decline.

In other words, the point of the crossover can be monitored by whether or not the pc liked having this goal and living with it. Do you understand? There's only that variation as far as the crossover is concerned. And there's the variation of shorter GPMs the earlier they occur on the track.

Now, the time span occupied by a GPM is longer, earlier. In other words, the earlier an actual GPM is, the more time span it occupied. And the later – the closer to PT – that a GPM is, the less time it occupied.

It's nothing to have a modern GPM, for instance, only occupy a billion years, you see? And it is nothing for an early GPM to occupy as much as trillions thirty to trillions twenty. One GPM.

These things have a tremendous space – tremendous time spans early on the track. Horrendous.

There are about – this is now a guess, but is an educated guess – about twenty-six of these things or thereabouts in a bank. Very few.

The closest to PT GPM can be expected to be what is called truncated. And that makes it very difficult to enter the track. Because it may have any number of items in it. And if anything – anyone ever called an E-Meter a lie detector they were in error. On case analysis, you can only really take those things which blow down the tone arm. Don't take those things that just go tick. You can only really count on what blows down the tone arm, and you very often are asking the right answer without a tone arm blowdown and there are many variations of – and upsets which occur trying to Ouija-board an E-Meter; trying to get it to give you the truth as to what you are looking at. It is something for you to know that an E-Meter is not reliable in this particular line. It is only of relative use and if you find that all is perfectly correct on the E-Meter, why then there's some possibility that you're right.

But it doesn't work the other way. If it's all perfectly correct on the E-Meter and you take it that way, you sometimes are trying to pound square pegs into round holes and do all kinds of oddball things that won't go.

Now, you do know that a GPM when found will read.

It doesn't necessarily read forever but it does read and it does give you nice, long rocket reads and it does give you blowdowns when found and so forth. But don't expect it to go on reading forever.

Now, the present time GPM, of course, being truncated will have less than a full GPM, which makes it very hard to find its top. Let us say you are trying to find the top of the present time GPM, and you have gratuitously counted out on your meter that it has sixteen RIs in it, which means that it's well past the crossover and is not yet complete. The pc has not lived this one out yet all the way up, so therefore you won't have the exact top. Then it's something short of the final attainment of the goal on the opterm side and it's something short of being dead against the goal on the terminal side. How short? See?

And don't cut your throat after you have worked with the pc for seventy-five hours to get this all straightened out, to find out that your trouble is that it only had two RIs in it – the

bottom oppterm and the goal as an RI. And when you have done one on which you understood it only had the bottom oppterm – this is what you got off the meter – and the goal as an RI, don't be too alarmed or cut your throat or kill the pc just because you find that it was really the second GPM and is there in full and has its top oppterm and its top terminal.

You may not find this out until you've run eight GPMs out of the pc. In full beautiful confidence, you say, "We found his present time GPM. We ran it out beautifully," and you're getting down the bank and you find out every once in a while the pc has somatics and they're sort of sticky and things are upset and sooner or later you're going to have to repair all this anyway. So you go back and you take a look and much to your horror you find out that a full GPM – you didn't even find anything out of it really, because of course it didn't discharge, you didn't find the top items – and there's a full GPM sitting there as the present time GPM. And then you ran all that out, and you asked the meter, "Is there any GPM closer to present time?" And the meter just smooth, absolutely smooth rise. Not a trace of any, so you say, "Well, just in case here, we're going to try to do the present time list. In other words, we're going to list as though there is one up here because every time we mention this fact we get a rise – rised tone arm. Must be some mass there to make the tone arm rise, so let's see if we can't possibly try this."

You list it, and you do a relatively short list and the pc gives you *the* PT GPM. And it has six items in it and you do get all those and they run out rapidly and then you... Of course where you've parked the pc back down the track, that's now going to raise hell with you because you've poured all the charge of running where you had to patch up the upper bank, onto the RI that was waiting to be run. So your next list off of that is going to be awfully corny and messy and you're going to have trouble.

You cannot be sure you've got the present time GPM, you do the best you can, you find the next goals, you run them down. You do the best you can all the time, you do it as nearly perfect as you can do it and then always suspect that there are more RIs up into PT and that the thing can be straightened out and repaired. Do you understand that? See?

You go ahead with great confidence and do everything that you can get done, because after all you're getting charge off all the way. And it isn't unremediable if you make terrible mistakes with the first couple of GPMs. This is not unremediable. And earlier GPMs on the track will run. And they will give you trouble, and the pc will have more somatics ordinarily. It's harder to find items, but not much harder. And the pc can live through it. You understand?

This doesn't then – isn't any particular reason to commit suicide.

But don't underestimate the ability of these processes to practically kill the pc. That pc with GPMs missed, top of the bank chopped up, everything going to hell in a balloon, the pc not too well educated, auditor not too well educated – this is always going to happen at the beginning of the bank, don't you see? Now, you're going to have all the trouble sitting on your head and you're all of a sudden going to skip a GPM. Supposing you did anything like this? You skipped a whole GPM because of the listing, and you actually skipped two, and you started running one out below it and *oohhhh*, the pc goes around with articular sclerosis or palpitations of the medulla oblongata.

Feels like hell, man!

A pc can – never feels worse than on R4 run wrong. If a big error has developed in R4, you can guarantee that this pc is going to feel like a hospital case. Heart hurts, brain hurts, back of the neck hurts. You get into a (quote) "*actual* GPM" that has shown up every place as an "actual GPM." Oh, everything is fine and then you find out you're running an implant GPM with actual items.

You get the wrong – a wrongly worded GPM as you're going on down the bank. And the pc's RR shuts off, and there he is, sick at his stomach, throwing up. Bad, bad business. But he can live through it. The one you should be afraid of is the auditor not living through it; it's mainly the auditor. Pc will ordinarily keep going but the auditor sometimes gets very quivery indeed.

I don't wish to paint this up blacker than it is, but I'm certainly not going to give it to you whiter than it is.

So your PT GPM is the one you are listing for and working for and so forth, and very often isn't found until several GPMs are run. You think you have found it and then lo and behold, you haven't found it. You think you got all the items out of it, and you find out you've got nothing but items from other banks. You've made a mistake, but somehow or another you've kept going and you can always straighten these things out.

Now, the programing of this is only done one way. Now, let me tell you that with great earnestness: There's only one program. There aren't several programs. I've tried them all and they just don't work. They make trouble for the case, they make trouble for the auditor and they are undoable. There is only one program – I can't be too emphatic on that – and that is: You find the PT GPM, you find its top terminal, you list the top terminal for two items – in other words, you list it twice because you've got to get the first and second oppterm from it – and then from the second oppterm, getting the "solved it," you go on down the bank.

All right, I've said that very fast and probably left you a bit adrift, but I'm – I'll go over it again, but I want to give you the programing. You find the present time GPM, you list the present time GPM out, you find the next GPM and you list it out, and you find the next GPM and you list out that, and you keep going that way.

Now, you can cut in and find the second GPM by accident and find out later that it was the second GPM and then by doing a goal oppose of it find the actual first GPM, but that is always just in the – that's just at the risk of the game. You're just correcting a mistake made. That doesn't alter the type of programing you're trying to do.

The type of programing is: You find the PT GPM or something that you could believe was the PT GPM or that answers up and behaves like the present time GPM, you run all the items out of it, then you do a goal oppose list and find the next GPM and run – get its top oppterm and then run it on all the items out of it, and then find the next GPM and so forth, and you just keep up that action until you are at the beginning of track. And you will arrive at the beginning of track. And that is the only programing that is successful. Finding any GPM that fires and trying to goal oppose it to present time is not hard to do – it's impossible. You will not arrive with the PT GPM; you'll arrive with a messed-up track. It's not a doable program.

Now, somebody has had a goal – somebody has had a goal "to be mean." All right, had this goal and it was run back in 1962 and something like that. This case then is specially handled. Nope. You do the same programing as before. You can sometimes get away with doing a goal oppose, and it's been gotten away with often enough that it was not noticed that it wasn't gotten away with hardly ever. You handle this case the same way. In 1962 they had a goal "to be mean" and this goal was run out and two or three other GPMs were run out and all this was very interesting and copacetic and fascinating to one and all and so forth. This does not alter your programing one single scrap. The programing is: Find the present time GPM by listing for it. The command is very, very short and sweet: "What is your present time actual GPM?" or any other such wording. Just list for the present time GPM, that's all.

This can be a very long list and it follows a goals list. And when you've finally got the thing down to where you've gone fifty past the last RR seen on listing and you're getting no tone arm action while listing it, the GPM is on that list somewhere and you do it by elimination.

Now, oddly enough, it sounds impossible that it would ever arrive. It sounds impossible that this could be done, and let me tell you that in actual fact it has been successful wherever tried.

Now, the bar-out there was that it didn't sound like a guy would ever come up with his present time GPM. But actually that was only a theoretical supposition.

In actual fact, they come up with their present time GPM every time. You ask for it, you'll get it. Of course, this has to be an educated pc. A pc who hasn't gone through the lower classes up to this point hasn't got a prayer – not a prayer. I mean they – even if you got them into the top of the bank, you wouldn't get them anyplace. Well, I'm looking at an old-timer now, that says, "Oh, I bet you I could take it away and so forth and I could show them and so on," and he'd wind up with it and along about the time he was about four or five GPMs back along the track he'd wish to God he'd kept them on "Find something that is really real to you in this room." [laughter, laughs]

Look, it isn't that they don't know the parts. It isn't that they couldn't be tracked through on some brief instruction. It's they themselves have insufficient security on being audited to know they can be gotten out of what they're getting into, and they'll panic. And they'll panic.

Requires a terrific stability on the part of a pc to go through this. The auditor finds a wrong item, goes three or four down below this wrong item, gets into an endless list, somatic turns on, pc's jaw feels like it's being wrapped around to the back of his head, stomach feels like it's being tied into a bowline on a bight, feels worse at this particular moment than he's ever heard of, ARC broken like mad through some basic auditing flub which keys in all the rest of the bypassed charge. A pc without stability, education, the long haul and knowingness, who hasn't been brought up as an auditor at this point will say, "Show me the nearest hospital," and that will be the end of him. He gets in there, the doctors say, "Oh, your chin is on the back of your head..." He's had it. He's had it.

It's basically a matter of understanding that will carry him through it. And all too often, you – running up the line when you get there – you will finish a session where somebody

has wrapped you around a telegraph pole quite accidentally and inadvertently, and you'll say, "What's going on? What's going on?" And the only thing that's holding you steady is you know basically what's gone on, that it can only be a certain number of elements that have gone out. And you start sorting these things out. And the auditor has practically gone around the bend between sessions. And go into the next session and say, "Well, you found the right top terminal but the wrong top oppterm, so therefore we're bypassing the charge of the top oppterm and that's why we aren't getting anyplace." You check, it reads on the meter and so forth and he promptly and immediately gets the right top oppterm and you give him the terminal and he's away. But in that short space of time, why, an uneducated, uncomprehending pc just would have thrown in the sponge.

Now, it's the pc – this is what's interesting about this process – it is the pc who comes up with the answers. It's the pc who finds out what's going wrong. Now, a very, very clever auditor can very often take a pc who has quit, quit trying to find out, and get enough bypassed charge off so as to get some facts back on the table again.

I'll give you an instance: Pc's next GPM found, but wouldn't read. For some reason or other, a mistake made, wouldn't read, so the list is continued and continued and continued. All during that space of time the pc is doping off, can't keep awake. GPM's missed, see. Go back. The invalidation is so severe on the actual goal that it reads like a wrong goal. "Is this a wrong goal?" and it rocket reads.

After a while the pc says, "Well, it just must be something that's so invalidated that it's got everything all upset." Pc by this time might be quite ill, by the way. Feeling terrible and so forth and so, well, you just better get on to that goal. You just better get onto that goal and you better prepcheck it. The auditor's tried to prepcheck it before and the pc wouldn't consent to it because he said it was the wrong goal. Get the thing straightened out, all of a sudden, why all the somatics come off, everything goes back to battery, it rocket reads and they're away. Might be overlooked. Might be overlooked completely. It's mostly up to the pc.

That's a brand-new look in auditing, isn't it? You get the idea the auditor's supposed to sit there and drive this eighteen-horse wagon, and arrive someplace and so forth. And as a matter of fact, it's too complex a drive. There are just too many horses.

Now, a pc can also be absolutely sold on something and the auditor go along with it and wind the pc up in the soup. I've had it happen to be three-quarters of the way through a bank – this is before I became very, very wise. If you can get five items down a bank without turning the pc's RR off, don't ever let anybody sell you on the idea that the goal is misworded, wrongly worded or a wrong goal. The RR didn't go off in the first five items – well, that's the right goal, man. It isn't off one hair, that's a correct goal.

But when I was a bit younger and greener on this particular process, I let a pc sell me the idea of its – the goal being wrong. Everything was going wrong, nothing could be listed right, nothing was coming up right, the goals lists were all appetite over tin cup and everything was blowing up and so forth, and the goal had already arrived down around the cross-over area and the pc insisting it was a wrong goal. I've actually listed and found two new goals with the pc halfway through a GPM, until I woke up to the fact that it couldn't have been a wrong goal – it's just that the pc had gotten into a dramatization of one of the items and

so despised this goal and so despised everything about this goal, the pc wanted nothing to do with the goal. And it was coming from the actual sense and impetus of the goal, not from anything else. But because the pc was having a hard time running it, then the auditor was willing to buy the fact that there was more wrong than there was wrong.

Now, therefore, we get to one of the rules of this, of which there are many, and that is: *If it is running all right, keep running.* Don't make trouble till trouble happens. And you would just be surprised at how horribly true that is. It's trouble that takes time. That's one of the old maxims about these OT processes: that session time is consumed by trouble.

Well, I'll give you an idea: I got – in the last three-hour session I gave on this, I got out two-thirds of a GPM, finished, found a goal and ran a third of the next GPM, in a three-hour session. Well, there was no trouble being made by anybody. Take up the trouble when you run into the trouble. Don't handle trouble you haven't got. And if you can learn that real well, by George, you're going to be in clover. But don't handle trouble you haven't got.

Pc happy – go on auditing. Pc unhappy – stamp on brakes, throw out clutch, and find out what is wrong. Don't ever force the pc forward past an ARC break or bad trouble – find out what is wrong. But don't try to find out what is wrong when there isn't anything wrong.

Now, the reason for this is: is you can invalidate goals and items and make them read and behave like wrong items. And the auditor can actually make trouble. And an auditor who is bound and determined to make trouble in OT processes has ample field for his talent. Has tremendous areas of talent. He just hardly has to try at all.

Now, the read – the read which you get on an E-Meter is no read you have ever seen anyplace else. It is not an RR, it is not a fall, it is not a surge, but is itself. And it looks like this: it springs up against rubber, a rubber buffer here. If it goes tick and there's a sharp tick there, that just never will be the item. Never, never will be the item. But it's hitting this rubber bumper.

And the real item will hit the rubber bumper and then go – force its way through it. See? That's the way it will read. And it goes through – it looks like it's actually ramming through a stone wall of some kind or another. And it starts and then accelerates and goes on through that wall. And that's the way a real item look. And it only looks that way, and it goes the whole dial and it brings about a blowdown and everything else happens that's supposed to happen on the thing.

Goals – when there are real goals being found next up – often read that way, and they often merely rocket read nicely. That's unimportant. It's the item, the item-finding that's important. And the rule in item-finding is this: You let the pc list as long as the pc wants to list and then you find the item on the early part of the list.

That has variations to it. Sometimes the pc has put it on the early part of the list wrongly worded and you get a wrongly worded item reading and then the pc will correct its wording which makes it then appear that it's on the end of the list, don't you see. But the thing to do is – these are very short lists. Item lists are short and goals lists are long. That doesn't always hold good because my recent goals lists are one, two and three items long.

Well, I put it on the list, what's the use of going on forever? There it is. Blowing up the meter, rocket reading and so forth and that's it and heat blowing off and so on, so why should we go on? If you tried to go on after that point the pc would simply go into a blackout.

Well, that's a pc getting pretty educated, man. You see the thing there and you know what it is and it reads and so forth. But even then you get fooled. Show you how little of Scientology has come out of my bank, which is quite interesting to me. It used to alarm me every once in a while, "*Ugh!* Did I take this out of my own bank?" You see? "Was this some type of aberrative action?" Used to scare me half to death. I ran into "to destroy" the other day on the goals line, see? Well now, "Who or what would 'to destroy' oppose?" for the next goal. I know you could say it in chorus: "to create," see? Obvious, isn't it? My bank isn't rigged that way. And you know, I had the awfulest time trying to get my wits wrapped around what the actual item was. I gave a goals list of about fourteen or fifteen items which was then extended out for about four pages. Because I myself couldn't cognite on what the next goal was. The next goal was "to worship." "To destroy" opposes "to worship," and I – trying to get that through my wits. I was too well trained.

I knew what it should be: "to create." And that appeared on the first – first one on the list. And I gave it so much credence – it's nothing but an implant GPM, see? There's a lot of implant GPMs "to create." And it would rocket read, see? That must be it and so forth, and the auditor would say, "Well, is that an actual GPM? Is that an implant GPM? It rocket reads that it's an implant GPM."

"Well, I know. But everybody knows that 'to destroy' opposes 'to create,' see."

"Well, it still rocket reads. But it's an implant GPM."

"Well, go on and null the rest of the list." And finally she got the one halfway down the first page and so forth – "to worship."

She says, "Well, that rocket reads."

I said, "I know, but that couldn't be it. " [laughters, laughs] "Couldn't be."

And finally I squared it around – if I were coming up the bank this way and I had "to worship" here then I would, of course, postulate destroy if I got up to here. Well, it opposed that way but would it oppose this way, and I finally – creak, creak – managed to get the thing and of course it flew into line and after that read well. But because the bank had become so upset by this time, it stayed upset and was very hard to run. The only thing it had done for me was give me a somatic sometimes when I played the organ. [laughter] Actually had nothing to do with religion. That was what was the matter with the bank.

At that stage – because this was way back, thetan track, see – it had nothing to do with religion. And you try to list religious type objects like "believing," see, "belief," so forth. They weren't in the bank. See? You were merely supposed to worship objects and places.

It was back then when you'd dedicate yourself to believing absolutely that a mountain-top was holy, see – only no such word as "holy," you see – that it merely should be worshipped. Good game. You get up in the morning, walk out of your cave and you say, "Ah, I

worship thee, O mountaintop," you know. Which is quite fascinating because there are no ramifications of it.

Now, religion came along a few umpteen *brumpf* trillions *rumpf* years later, see, and somebody started saying there's somebody named God and it started doing this and it started doing that and you should go to church and so forth, and it sure raised hell with my organ playing. Anyhow [laughter] – because nobody could bend the GPM around to what the GPM would normally be considered to be.

Well, the earlier you go on the track – the earlier you go on the track, the simpler and more direct the things are. Now, late on the track – late on the track you will find that these items have a tendency to be dispersive. You'll have items like "certainty" and items like "predictability" and – solved by "unpredictability," don't you see. And then the very next ones to it.

In other words, it's a less neat pattern. A thetan is thinking more complicatedly. He's thinking more involvedly. He's in a more dispersed state, don't you see? He isn't really down to earth and down to the groove.

Now, you start getting back on the track a bit and he's getting simpler. I had a goal "to construct," see. And almost knocked myself out trying to find the bottom oppterm, you know. "To construct," you see. "Economic hazards," you see, "decadent societies" – trying to find the bottom oppterm of this thing, you see – "old empires" and so on. And I had an awful time trying to find it, because the bottom oppterm was "a lack of construction." [laughter]

You know, you've gotten so you're outsmarting yourself.

Here you are at this end of the track, you see, in a highly complex, complicated state of mind, frankly, able to think very complicated thoughts, don't you see. And early on the track it's awfully – it's – not even early, but on middle and backtrack, it is getting very simple-minded.

So the GPM and their wordings look a little different. And as you get back – as you get back about middle track on most pcs, you'll find out that a word like the goal is appearing in about 80 percent of the items.

Well, let's take – let's take this GPM "to construct," see? Eighty percent of the time you'll have "constructing" or "not liking to construct" or something like that will be appearing in the terminals and oppterm. In other words, there will be something about "constructing" or something like this appearing in those things, or "hoping to construct," you see – that will be the tenor of the items. And about 20 percent of the time you'll have something that is different, like "difficulties" – not "difficulties in construction," but "difficulties," see – that isn't related to it.

Now, you understand, I'm just talking about the wording of the items. And you get earlier track and it is all almost 100 percent this way. Where a word sense of the goal – well, let's take "to be," you see. All right, then "wanting to be" or "having to be" might be the top oppterm, you see. And then it's "to be," "to be," "to be," "to be," "to be." Everything is "being" or "to be" and all of the terminals have to do with "beingness" and "being" and "to be," don't you see.

So there's a "be" in every one of those items, one way or the other, whether it's "beingness" or "to be" or something of the sort. Well, there's just "be" all over the place, and only once in a blue moon do you get a rare item like "time," see. There sits "time" in virginal purity. Not "time to be," you see, but just "time." *Clunch*, you see – it's sitting there like an item. And means it, too. [laughter]

Well, but very close to PT – very close to PT you get tremendous variation in items and very seldom do you see the goal word repeating in the items, which makes it actually much harder to list. See what I mean?

Let's say we – and now, closer to PT your goals are much more complex. And therefore they're harder to get oppositions to. The hard end of the track is the present time end of the track – the beginning of the case. It's much harder to get oppositions to something like "to dance forever." Well, that's a more PT GPM, see, "to dance forever." Or "to be an aesthetic success."

See? You got various types of GPMs, in other words. They have a more complex thing about this – there's a greater complexity in the thing. "To entice lovers."

Now, you can just see the dwindling spiral of the thetan as you look over these GPM things. He's getting more complicated as he gets on and on and he's got less scope and he's getting less wide between these opposites and they are much more complicated and particularized and the dispersion that he is undergoing in terms of items is much greater, and he's being nattery and picky and so forth.

But you'll get types of items like "to hope everything will be all right." See, now that's a perfectly valid present time type GPM. It doesn't say he won't have a simple one in present time, don't you see, but the chances are far against it.

Middle track, why they're starting – they are simple by middle track. But let's say you get two or three GPMs back, you're liable to start running into the simpler types of GPMs. And middle track you – you'll get such simplicities as "to do," see, "to think," "to postulate." You're now getting very simple GPMs. And early track, of course, they just remain simple all the way on back. But your hard part of the track is the beginning of the track and those GPMs tend to be more complex.

As I say, they have more items in them, the word of the goal does not appear repetitively in each one of them. And I suppose you've gone through implant areas. You've gotten sick of these goals appearing. You've gotten allergic to it. You don't make the goal word appear every time. Doesn't mean your track is wrong, don't you see, when you're doing it on the pc, then, merely because you haven't got the goal word appearing in every item.

Well, you couldn't have in the first place. Let's take an actual GPM, "to look on the bright side." And you think this is going to be repeated as a mouthful in every one of those items, you see? No. Actually is practically nothing in that. Then you'll be absolutely sure that on a GPM like "to desire," that the second terminal from the bottom, of course, naturally, would be "desiring things," or something like that, you see. Obviously, obviously. It'll be some verbal form of that. And late on the track, close to PT, you see, this is just as likely to be

"wanting something." It's skipped the rails that fast. In other words you get changes – these are more changeable.

The pattern itself doesn't change – if anything the pattern is even more secure. The top oppterm is definitely the goal. The top terminal is definitely against the goal, you see. The crossover is there and so on.

Now, the hard things to list – now, let's get on to something else here – the hard things to list are the top terminal and the bottom oppterm. And that's shooting into the blue. Because there's no real clue as to what they'll be anything about. The top terminal is very often controlled by the next goal. But you get fooled this way – you'll think the pattern is going to hold and the pattern doesn't hold.

Let's have the goal "to postulate." And the top terminal of the GPM just before it, of course, would probably be like, you know, "postulating things," or something like that. It might be a preview of the goal you're about to get, see, as you're living up the track, see. And not so – not so, it can just be completely off. It might be just "sitting," see. It might be as far off as just "sitting." Doesn't smack of the GPM that follows it, you see.

On the other hand, it might be quite similar to it like "thinking." That comes very close to "postulate," don't you see?

In other words, you can't predict what that top terminal is going to be – that's what I'm going to – was talking about. You can't really predict what it's going to be, except that it's just going to be opposite to the goal. It might or might not be a foreshadow of the next GPM just coming up. It might or might not be. The bottom oppterm is the reason he done it. Of course the real reason he done it is the GPM he's just lived through. But his particular penchant, close to PT, is usually expressed in the bottom oppterm corner. That bottom oppterm sitting over there is opposite the goal as an RI. And it's going to say what he's mad at in your PT GPMs, you know, like "civilization," you know. Or "financial institutions" or something or other. You could just guess yourself silly, and if your pc wasn't fairly educated and his sight into the bank wasn't good and your basic auditing wasn't good and so forth, he'd just miss it like mad. Just miss it like crazy. It's a hard one to get, in other words. And that, of course, tells you that probably your two bottom oppterm and your two top terminals in any GPM forecast some difficulty.

The toughest ones are the bottom oppterm and the top terminal. They're going to give you some trouble, but that's in terms of difference of wording and that sort of thing. That's going to be rough.

Now, let's get into something a little bit more like technique. How do you really list one of these things and how do you find it?

All right, well, you do your PT goals list and you finally get a goal by doing that. And you try to count how many RIs there are in it and plot it up accordingly. You get your – well, you find out there's twelve RIs – twelve reliable items – in it. It's not a full GPM in other words. And you know with twelve reliable items, it's one pair past the crossover. So it's just a little bit against the goal. The terminal is just a little bit against the goal.

So you get the pc to list this, but also there's another trick: What terminal are you sitting in just now? That gives him – that's a good thing to list. Now, why don't you list the oppterm – that would be so much easier, wouldn't it? Yeah, the oppterm. Why don't you list your bank? That's the same question. He doesn't know what's there. But he is sitting in and is intimately connected with, as himself, this top terminal. Because that's the one he's living through life in.

Now, there can be several patterns at the top of the bank but the patterns that are mainly there are the most – is that it's just cut off at that point and there are two RIs at the top of the bank and one is an oppterm and one is a terminal. That's right into PT here. And here is a terminal and here is an oppterm.

All right. It is very difficult to list for the oppterm; very easy to list for the terminal. So you list for the terminal, find out what the terminal is and then do two lists from that same terminal. One is the top oppterm and the next is the second oppterm. Two lists from the same terminal. You see? Because the charge will expire on the oppterm. There won't be any charge left on the oppterm. But you'd have to do two lists from it.

You see these things always proceed from the oppterm. Oppterm over to the level terminal with it, then kitty-corner down to the next oppterm and then horizontally over to the next terminal and then kitty-corner down to the next oppterm and then over here to the terminal.

Now why? If you get this higgledy-piggledy in the first GPM you are going to be kitty-corner from the oppterm down to the next terminal below it and *that doesn't solve*. The bank doesn't run that way and doesn't solve that way and you just go skipping out into the blue. You're in trouble right away quick. So you get it level there, you want to get two opposition terminals from the top terminal.

Sometimes you almost wreck yourself – you get them on the same list. And there's two items firing on that first terminal list and one is the top oppterm and one is the second oppterm.

So you trace this thing back, you do your "who or what would solve," get your terminal back again from it – that takes all the charge off – take it down to the second oppterm, then solve it across and go on down the bank in that way.

Now, items always solve. Items always solve. Items solve.

Goals always oppose. Goals always oppose.

Never do a goals solve list. "What goal would solve what goal?" You'll wind yourself up and the pc in more soup than you've been in for some time.

Goals oppose, items solve. And there's never any difference from that.

Now, you're going to run into a little trouble on this, because you realize that the goal as an RI sounds like a goal! And you'll get twisted up here by not realizing that you're handling an item, when you get down to the bottom terminal, which is the goal as an RI. But that is an item solve list to the next oppterm.

Now, remember what you do now. You found the whole of your top bank. You've got that now. Now you're going to do a goal oppose list to get the goal of the second GPM. You now, by assessment by elimination, get that goal. You've got that goal. Now, that's the end of all oppositions. That's it. But you've still got an unsolved RI, which is the goal as an RI, and your next list is – and this is the most critical action in the whole kit and caboodle – is you take the goal as an RI: "Who or what would it solve?" and get the top oppterm of the next GPM.

You already find it, you know its name, so forth. But you want the top oppterm of that.

So that's: goal as an RI, solve, and you get a nice beefy list. And you have an educated pc, he'll give you this list very easily and very well. But it still must be a long list.

You have my permission to go kick yourself when you take a one-item top oppterm list for the next bank. Any time you do and get into trouble and intensives later are still sweating on it, why, you have my permission to give yourself a good swift kick in the shins because you didn't hear what I'm going to tell you now. Which is just this – just this: That is the touchiest part of the bank. And you get that top oppterm wrong, you're going to be wrong from there on out.

You're not even going to be running the pc in that GPM. The pc will skip and go into another GPM, and you're going to get nothing but hogwash from there on.

You get a wrong top oppterm, you've had it.

All else in that bank you're about to run is going to be wrong. And it is the easiest one there is to get wrong because it looks the simplest. It's the fooler. What is it? It's the – it's the final achievement of the goal. The top oppterm is the final achievement of the goal. The pc's now against it. Final achievement of the goal. Final achievement.

Oh, on a goal "to sneeze," it would be "sneezing" or "sneezed" or "people who sneeze" or "sneezers" or "having to sneeze" and "not wanting to sneeze." It's something like this, don't you see, that's what it's going to be. Now, if we were running implant GPMs, all we'd have to do is give the auditor a pattern, see, and the pc a pattern and they just fill in all the blank spots and everything is very happy. Only actual GPMs don't run that – that exactly. They are quite similar, one to the next, but they don't run with that exactitude.

You get yourself a slightly misworded top oppterm and you've had it for the rest of the bank. There's the touchy spot. So you do a nice, long top oppterm list.

Items lists normally are short. Goals lists are long. Goals lists are normally underlisted and items lists are usually overlisted when you make mistakes, but that top oppterm list has got to be a nice, long list. You want twenty or so items in that thing. You want a twenty-, thirty-item list up there.

I don't care if the pc is sitting there – this is one time you don't promote his itsa. Pc will always tell you, with what aplomb – I've done it myself, should know – with what aplomb they say, "Ah the next bank 'sneeze.' Oh, it's 'sneezing,' ha-ha, that's it." Rocket reads, blows down and so forth and you, you knucklehead, you take it. Whoa, only trouble is, "sneezing" is the third terminal from the bottom of the bank. At which moment the whole

bank goes upside down – see, you're handling actual mass here – and the pc doesn't know where he is and even if you discard it and get the right one, you now have the whole bank in a tangle. Oh, you can work through it and so forth, but you'll sort of wish you hadn't. It's all tough to do.

No, the time to do it is just to sit there meanly and viciously, regardless of the pc's itsa. That's the one point where the pc's itsa is totally disregarded. There's another point, is when the pc halfway through a bank where his RR has not turned off said that it's not his goal. You disregard his itsa at that point, too. Because it obviously is his goal.

Now, the upshot of this situation is you've got to have the right top oppterm. The best way to get it is to get a nice complete list for it. And you now null this list nicely and you will get the right one firing. Now, this has to be, of course, with the pc's cooperation to get anything to fire in this sort of bank. You get the pc to put his attention on it and go over it.

Do it by heat, after you've listed it down the whole way say, "Which one did you have heat on?" And the pc will say, "Oh well, it was – it was 'the awful necessity to sneeze.'"

And you say, "That's fine, that's fine." You see just above it "having to sneeze," so there's a possibility that the heat went on with "having to sneeze," don't you see, and he didn't notice it till you get to "the awful necessity to sneeze" – you're never quite sure about this type of thing. So you go back and you cover that little area there and see if you can't get that to read. And sure enough, "having to sneeze," you read it and it springs, and you read it and it springs, and you read it and it goes *rrrrrRRH*, and through she goes and she blows down and that is the pc's item. And that is the top oppterm.

Now, you go ahead and check it out. You say, "Is that the top oppterm?" And pc, "Yeah, yeah." And that rocket reads and that's all fine and everybody is copacetic.

Now, be very careful with the terminal. Don't necessarily do a short terminals list. Be very, very careful getting that top terminal because I already told you that is a very critical point. Because the meaning of it is very hard to get. It will simply be an opposite meaning to the bank at large.

Of course he has some clue in the bank he's just left and so forth. But he will normally get it, it'll leak through his skull what it is. He'll put it down on the list and you'll get that read. Now check them both out. Now that you've got the two top RIs, check them out. Make sure – go right through a song and dance here. Just make awful confounded sure that both of them are absolutely correct before you go another foot.

Now, the reason for this is a simple reason: You can get this going in a bank, and when you've got this going in a bank you've had it. It just goes hours and hours of slug and upset and so on. It's a sort of a circular invalidation. You find four items forward, then find one item back of you is wrong – three items back is wrong, so you go back and get that and then you correct the next three items and go two forward, and then you go back two and you find out one of those pair is wrong, and then you move forward... And you're always moving into a messed-up area, don't you see.

You've always overshot with – from listing from wrong items. Honest, it just drives a pc nuts because now he's listed – all the items he's got are on lists someplace but what lists are

they on, don't you see. And he can't quite see it and put it down. You're always listing into a messed-up area. Mess up the area and then go back and correct something, you see, which automatically means the area you went into now probably hasn't got any right item in it.

When you find a wrong item behind you, *you accept no items you have found after that*. Got that? It isn't correcting this little item and then taking the rest of them. *Nuh- uh*.

If any of the items you found after you found the wrong item – if you find any of them are right, just consider it coincidence. It's purely coincidental.

Now, the way you check up a bank to find yourself a wrong item is just go back to the top of the bank and start reading the items off with the rudiments of the session in. And read them off – session rudiments in, not rudiments in on every item – and you read those items off and the wrong item behind you will tick. The item that ticks is wrong. It does not mean that it has not been opposed – it doesn't matter if it rocket reads when you read it, it still doesn't mean it's not been opposed – it means the item that read is wrong, and that is an absolutely inflexible rule. I've gone through absolute hell to prove up that rule. And that rule is proven.

If an item behind you reads, it is a wrong item.

I don't care if it rocket reads or anything else. You could say to yourself – and you will – sooner or later you'll hit one and you'll be cheerful about it and you'll say, "Well, I guess it just hasn't been opposed so, of course, there's still charge on it. And pc says it's right – that it's right, so we'll accept it." And, of course, you'll run into the same cul-de-sac that you just went into before. You'll go straight into the same cul-de-sac. You go back and try to get – use that item again that read and you'll go into the same cul-de-sac. It doesn't matter what happened, the item should not be reading.

The item that reads behind you is wrong, and it being wrong throws into question and throws out every item found after that.

And it's only by accident that any of those items will be right so you pay no attention to them at all. You just go on listing the bank, muddied up now, as though you had never listed it before.

Now, you get back on to one of the items you've had before, you of course have to use its oppose list, but because you've got so much bypassed charge, it probably won't be correct anyhow. But you have to pay attention to it. You've got a mess on your hands, and you have to take what you can get to get yourself out of this wicked lot.

Now, how do you correct this wrong item? You take the list on which it appeared and look earlier, and if it was the first or second item on the list look later, of course.

Look, you don't continue to list – you don't continue the list you got it off of, you look elsewhere on the list. Now, it could be the list is incomplete.

Let's say we're listing "sneeze." "Who or what would solve sneeze?" or "Who or what would solve sneezes?" or something. See? We're listing that list. We've listed it and we have found – we have found "drug preparations." We've gone six more beyond it and we're going to come back and checking out the bank because what happens is, is we all of a sudden can't find an item. We run into a list, it's blank. I mean, we can't get anything to read no matter how

long it lists. Where are we, see? We're going into nowhere. Where are we? And so forth. And you'll just dead-end. You won't make it. And so you've got to go back, because you can't get anything to read now. You've got to go back and you find out "drug preparations." "Drug preparations." Clank! See?

All right, that means the list "Who or what would solve sneezes?" – it means that you got the wrong item off that list. Doesn't mean the list is incomplete – it means you got the wrong item off of that list, so you look on that list for the right item.

Two items reading on the same items list means nothing. Listing rules apply only – and do apply ferociously – to goals lists. All the listing rules you've ever been given apply to goals lists, but they only apply to goals lists.

You can have six items reading on an item solve list. Doesn't invalidate the list, one of the six is right. And you don't continue the list.

You'll find that when you have a wrong goal, you'll run into a phenomenon: At first everything you put down reads. That's one of the gimmicks. Everything you write down reads. Everything you call back to the pc reads. Everything reads to the pc. And that will continue for a little while. And then nothing reads. The tone arm goes clank, the needle goes absolutely stiff as a poker, you can't get anything to rocket read, no RR, and all motion of the needle and the tone arm and everything else will turn off completely until such time as you continue the goals list.

Now, you start to correct it or can write a goals list or something else, it will come back on. As soon as you find the goal for that area, why *bango!* your RR is on at once.

The only thing that shuts off – the only thing that shuts off an RR is a *wrong goal*. Wrong items will not do so.

You can, however, overrun a GPM. You can be running down – they did it here when they were first running these things, a year ago or so. They'd go on down the list, pocketa-pocketa-pocketa-pocketa, and thirty or forty or fifty items later, the RR would shut off. Well, of course, they had long since ceased to run in the GPM for which they had a goal. And had a long time, now, been running in GPMs that they had no goal.

So, you can overrun the goal as an RI and it doesn't get on the list and shoot into the next GPM and the RR will go off. But even then, you see, it's not having the goal that shuts off the RR. You start listing too many items for which you have no goal and the RR will go off inevitably.

The way you lose somebody's RR, needle motion, surges and that sort of thing, the only thing – and this is a marvelous thing to know; when I finally found this out, I mean, I could heave a huge sigh of relief because it's the most marvelous proof in the world of a GPM. You get four or five items deep into a GPM and the RR is still on, why, you knew it was the right GPM. Anybody try to shake your confidence in that, *zzut!* The right GPM, man. That RR would have been off long since if there'd been the slightest comma wrong with it.

You say, "Well, it might have stayed on with 'to sneeze,' but maybe the goal is 'to be sneezed at,' and it could be slightly misworded..." No! Slightly misworded, off goes the RR,

you see. It isn't even slightly misworded, it's dead-on if the RRs – if the RR – if you've still got an RR, you've got the right goal. That's all there is to it. So relax.

Cruel thing to do to test a goal by seeing if the RR goes off. It's not something an auditor would undertake with aplomb. It's a very cruel thing to do to a pc, because it makes him feel like hell. But nevertheless is a last resort test. And you make this test every GPM you find. You never know if it's a GPM.

You're not going to sit there for hours pounding away because you're going to pull the goal as an RI up from the bottom of the bank up to the top of the bank. You're not going to sit there for hours and prepcheck it and call it and so forth and yip-yap at it endless... You're not going to do that, that's all. You're going to make it rocket read and it rocket read – rocket read instantly. And the pc says it's a GPM and you got a blowdown and that sort of thing, that's it. And after that you're not going to call it anymore. You're not even going to say, "How does this item relate to 'to sneeze'?" That wording is out. It's "How does this item relate to this GPM?" You never call the goal again. Not until you get it down to the goal as an RI.

You even refer to it by the number of GPM it is on the track. You refer to it as the sixth GPM. Sixth actual GPM.

"How does this item relate to this GPM?" You know, the pc runs much smoother, the GPM is much less pulled up. See why? Every time you repeat this thing, you're pulling the goal as an RI up toward where you are and you're disarranging the bank to some degree. So you just don't call it all that much. You certainly never prepcheck it. You never do anything to it. That's saved for when you are straightening out the whole track if you ever do, after you have run out all the GPMs. Oh, go back and prepcheck them by all means. And if you've invalidated somebody's goal to a point where it's made him sick as a pup or something like this, well, by all means, you've got to prepcheck that goal. But you say the goal as rarely as possible.

You say, "On 'to sneeze,' has anything been suppressed? On this goal, has anything been suppressed? On this goal, has anything been suppressed?" Got the idea? You don't keep saying, "to sneeze," "to sneeze," "to sneeze." What are you trying to do? You're trying to push the pc down to the bottom of that GPM or pull the GPM up to where the pc is. Got the idea? Use that with economy, then.

All right. In tearing on down the bank, you'll find there are many indicators. Many, many indicators. There is lots to know about this sort of thing, but the rules are relatively simple. And they're dead-on. They're dead-on. You always check these things out. You always say, "Is this an actual GPM?" after you have found the goal. "Is this this?" "Is this that?" "Is this such and such, so on and so on and so on and so on?" And you'll find out after you've run five or six out of a pc that you get no response whatsoever. None. Pc knows far more about it than the meter. Pc said, "Yeah, it's an actual GPM." One-and-a-half-division tone arm blowdown. "Yes, this is the top RI." Rocket read.

But you say, "Is this the top – is this the top oppterm?" See? "Is this the top oppterm?" There it sits, see. "Is this the top oppterm?" There it sits. "Is this the top oppterm?" Pc will say, "Well, what do you want?" "I want to know if it's the top oppterm." "Yeah, it's the top oppterm." Rocket read. [laughter]

If it's not the top oppterm and the pc says it's the top oppterm, it won't rocket read. But you'll find the sub-itsa line is moving up toward the pc's ability to itsa till they are almost at parity. And then it reverses. I don't know what you do then. I think that's a dangerous part of the track. I'm not quite sure how you run the early part of the track when you can't get ahold of the pc and so forth. We'll know all about that very soon.

Basic auditing must be very, very well in. Basic auditing must be well in on an auditor before he attempts to run this sort of thing, and the pc must be easily auditable before he goes on this kind of thing because the littlest piece of basic auditing can make the pc desperate and very ill. And you've got to be able to promote the pc's itsa, you've got to be able to handle the pc's PTPs, you've got to promote the pc's confidence, rather than – distinctly different than – his itsa.

He's got to get his confidence up. You've got to nurture that confidence, because in a very few GPMs you're going to run out of E-Meter. And if his confidence and knowingness isn't high, you have no substitute for anything. So, the pc is moving on up the line and your basic auditing has to be very nearly flawless. And you've got to be able to talk to a pc. The pc's got to be willing to talk to you as the auditor. All these various things about basic auditing have got to be very well in line.

Now, the only thing that makes a bad basic auditor is a person who is afraid of becoming OT or sees a great deal of harm or upset in being exteriorized or in being set adrift or alone without a body, or the idea of setting people adrift or alone without a body restimulates all of those people they've held down with one foot on their throat and stuck spears in their stomachs of. That's exteriorization, too. Murder, in other words. And you get somebody who is doing a poor job of basic auditing down around Level II, Level III, Level IV – their basic auditing will start to fly out like one of these Cape Canaveral boomerangs they're sending up into the sky and it will just start flying out further and further and further and further because they're getting closer and closer to actually going exterior or being exterior or exteriorizing somebody. And all of the perils and terrors associated with that go into restimulation.

It's a don't – it goes into many, many complications – it's "don't deserve to be exterior, don't deserve to be free, don't deserve to be Clear, mustn't be Clear," it makes them desperately ill, they get RIs go into restimulation on the subject of just the thought of moving out of the body. They go *dzzzzzzz!* "Oh, no! Not for me." And, of course, they know that's so horrible for them, they don't want to do it to somebody else. And what you actually do is run into a bunch of bank.

Now, it isn't the significance of the bank. So don't look for it in significances. This will be a great shock to you if you're trying to straighten out an auditor so he can run this sort of thing, and you're looking for a goal "to never help anybody," see? That isn't it. It's the pure mechanics of the situation. It will just be GPMs collided with GPMs in such a way that any thought of moving out of the body or moving into any exterior state throws energy masses into collision one with another, which brings about a feeling of *bzzzzzzz!* See? It's a mechanical situation, not a significance.

And it would be horrifying to you – you'll get a dreadful loss someday, you'll find "to never hurt anybody." And you say, "Well, that's the reason this character can't audit," you

see? And you run this GPM out, you know, like mad and you get all the items out and down to the bottom and they get down to the bottom and they give their next session and fall on their heads with basic auditing. Wasn't the significance, see? What it was, was just a terror of exteriorizing or becoming exterior which is brought upon simply by energy shifts.

Now frankly, you can set somebody up so they will audit and do absolute flawless basic auditing. For one session. And that is you run some O/W on them. And their basic auditing will be flawless.

Well, isn't it interesting that it's O/W that makes their basic auditing flawless, see? So obviously, then, they must consider auditing an overt. Otherwise it wouldn't be O/W that remedies it.

It's peculiarly O/W. This has been subjected to several tests, by the way. And this is a very well-known piece of technology now. First trace of this technology was Melbourne, 1960. Test of – or 59 – test of auditing a staff auditor on O/W and then having the staff auditor go audit a pc and see that the staff auditor at that particular moment would turn in a flawless session. I think that's quite an interesting datum.

I've carried this along, along the way and I've looked now very closely at basic auditing. Basic auditing is terribly important. And actually basic auditing does not improve under training where O/W is so much in the road that a person is practically swamped by it. You can stand and harangue, you can point a shotgun at them, you can do everything to them you could possibly think of, you could show them all the points in the world and so forth, but if they consider it's a terrible, terrible overt, or that it would seem awfully painful to them, or terrible loss to them, or something else – any one of a number of these combinations, all of which comes under the heading that exteriorizing somebody is an overt act – their basic auditing will be terrible. Terrible.

Now, there is a method of overcoming it. Give them a fifteen-minute session on O/W – just general O/W, not directed at auditing at all – just a fifteen-minute assist before they give a session and they'll turn in a flawless session, just like that. It's the most marvelous thing you ever saw in your life. It's absolute magic. And this is very unusual because you would say, well then, naturally, the person would have to have a fifteen-minute session before any session they gave. Well, I'm not pointing out to you that it's rough to do this, I'm pointing out to you that it's possible and it works. Because it is possible to give somebody a fifteen-minute session before any session they give. See? It is possible.

Now, there are no ARC breaky pcs. There are only bad basic auditing auditors. Now, an ARC breaky pc can be very ARC broke and so forth, but in actual fact, good basic auditing will bring them out of it every time. You do good ARC break assessment, find the bypassed charge of the thing, continue on with good basic auditing and that pc will not ARC break. The pc that is dangerous is the pc that doesn't ARC break but goes into the sad effect, and any pc by the way, if audited beyond the point of an ARC break will go into a sad effect. But the difficulty here is that the pc who goes into just propitiation by reason of an ARC break is actually much harder to handle or improve than a pc who simply screams.

A pc who yells like hell and raises hell is actually in the final analysis really easier to handle than the pc who simply goes into propitiation, don't you see? Slightly higher tone level. But a pc should never be pushed into either.

And if a pc *is* going into such states as a reason – as a result of running OT processes, it is not that the pc is being run too high necessarily. Has no basis on it, given that the pc is perfectly capable of being audited at... you know, I mean, he knows the technology at that level, that the auditor knows the technology at that level, yet the pc is ARC breaking, the fault is always basic auditing. And the fault is remediable by short sessions of O/W before the session is given by the auditor. And you'll find the ARC breaks just go like that. That's auditing the auditor of the ARC breaky pc, is what I'm talking about now. And this is very remarkable. So how much for your ARC breaky pc, you see.

Now you've got, then, a great deal of technology here and I've tried to give it to you just in a basket load. And I think if you ever listen to this tape and take all the notes off of this tape and so forth, you would have yourself a ball because I've given it to you in a running river. It's practically all here and the one thing that isn't here is the exact patter, and the exact patter used is on the demonstration tape of last Wednesday. And there are some sections there of exact patter. And there is a full tape and there are several tapes giving the exact patter.

We are about to make a color movie of the exact formation of the bank and all GPMs and so forth concerning it. And the technology is all being packaged up. But I did want to give you this lecture today so that you would have it, as you might say, in a nutshell, to be on the safe side.

Thank you very much.

Indicators

A lecture given on 31 December 1963

Thank you. Well, I haven't seen you for quite a while. I've been trying to groom in your Instructors and I've been working behind the scenes! My hand will have been felt here, shortly.

Well, it's a very beautiful evening for the old year to be dying. I hope it dies very dead! [laughs] I don't like to see it – any possibility of it quivering back to life, you know. We can bury it with all the sentiment of a drunken relative who stole all our money. [laughs] Yeah, 1963 – been quite a year. It's been very successful technically – fantastically. It will go down in history for that reason. But boy, from the standpoint of steady, uninterrupted screech of speed and action and so forth, it – I don't want to see it back!

Actually, that was – this has been the year in which we've achieved the technologies to OT and grooved them in and polished them up; the year in which we have taken all of the various technologies of Scientology developed over all these years, back from Dianetic days, and stretched them out into proper classes and prepared the way and opened the gates and laid the Bridge and done a tremendous number of things.

We've had our heaviest attacks since 1950 in this past year, and these things are folding up. The attackers look like a weak-kneed fighter who has been pulled off the mat the third time, and his manager is standing over there looking anxiously around the sparring partners for a new boy, you know?

And they for instance just, I think it was yesterday, why, Infernal Ravening, a organization over in the United States that practices legal banditry on all the citizens, and so on – the real government of the United States, since it's the one that has the authority over every individual citizen, including senators, congressmen and the president – it lost. It lost. It had attacked Mary Sue and myself, hoping thereby to get through to the FCDC and it lost. And it ran up a small, if somewhat dirty, white flag and that was the end. They were suing us for various things including falsely asserting that we had children. [laughter] And none of these attacks – none of these attacks actually very serious. They make an awful lot more noise than they have lead in them. They – mostly blank shots – they're mostly shot out for the press, and so on. And then they fade, and so forth.

For instance, I think the last – this one with Infernal Ravening was the last shot fired of the year, and it was a total loss to the enemy. But a week or so ago, why, Peter, down in Australia, was taking care of the situation and there was supposed to have been a public debate with members of the opposition: snarling, ravening, hydrophobic froth, you know, peering around their fangs. And these blokes were supposed to have appeared before a television

program and – for a debate on the subject of Scientology, and Peter got down to the station and there was nobody else there. And they didn't show up. And probably died by biting themselves, probably or something like that. But they didn't show up, and this left Peter sitting in front of a battery of television cameras and lights, you see, with nobody to debate with. So very brilliantly they decided that the public should phone him and ask him questions about Scientology. So he sat there for half an hour with the phone in his hand answering the phone, answering everybody's questions on the subject of Scientology. And the station liked it and the public liked it and they got lots of phone calls and traffic and so forth, and we don't quite know what happened to the opposition, but they haven't really appeared since – not only didn't appear there.

But then they're going to have a big hearing of some kind or another and he's got a shot in the locker that is something like dropping a cannonball on an ant! He's sitting there well-armed. And the FDA and so on – this ceased to be serious two or three months ago. There'll be – still be some uproar and upset but sooner or later they're going to have to run up their dirty white handkerchief, too. But everybody is very optimistic about this now and our attorneys and so forth are all optimistic about it over in the States. All you have to do is just keep winning, see, just keep winning. You don't have to win very ferociously on the legal line, but just keep winning. And the only thing we can really hope for in 1964: that all attacks on Scientology are senselessly brought. They bring a type of charge that they can't possibly win on. And if our luck just holds consistently they will continue to do this, you see?

Like suing Mary Sue and myself because we don't have any children. And because we haven't been in England and are not in England. I think those were the charges on which they were suing. But if they will just go ahead and continue this line of idiocy, why, we will continue to win with the greatest of ease. I hope we don't have to work any harder than we have had to work in 63 in order to keep on winning. But we've actually today, with the disappearance of this old year, got it pretty well in the bag. And of course I – look forward to a tremendous amount of very hard work in codification of materials and laying them out.

For instance, you haven't got a textbook for Scientology 0. You haven't got a textbook for Scientology I. You haven't got a textbook for Scientology II. I beg your pardon, you almost have one. I wrote one years ago – a Student manual and it's been sitting there waiting to be published, and so on. And lo, it exactly matches the levels of Scientology II. So we may have that textbook long ahead of any other textbook just because it was written, I think, back in 58 when all the material was still there and fresh. But then there's Scientology III and that hasn't been codified and Scientology IV and that hasn't been codified and Scientology V. And we got lots of bulletins on that, that's actually better – and lots of tapes – that's better done than a lot of other levels. And then Scientology VI, and it's just now in a state where your Instructors are wrestling at it, see.

So, the essence of the future is the compilation of existing materials and getting it out in a very ready fashion in order to get it assimilated easily. This new method of dissemination – I think you'll find it very, very effective. And the only thing I know that might modify this method of dissemination is that an upper-scale auditor will have certain processes which he can run on a lower-level or class person. Do you see what I mean? So that if you're a Class IV, you have a certain small bag of medicine-man tricks which you can trot out on a I or a II

or a III, don't you see, which produces some interesting magic and which they themselves at Level I, you see, would not be able to audit, yet they can receive that level of action. There are several of these and amongst them is this case analysis, of which you have a recent bulletin.

Edgar pulled some off on a brand-new raw-meat fellow and he hardly knew what happened. By the way, that fellow's cough is still off and those were simply a – it was simply a thirty-five-minute application of the basic fundamentals of case analysis adapted with no instruction or understanding on the part of the person receiving it. And it turned off what was apparently incipient tuberculosis and so on. Well, you take a technology of that particular type and so forth, that would be used by a higher-level auditor on a lower-level pc.

So a small little bag of tricks like this I'll manage to collect up and get together; and there are several of these techniques. And then probably – one more thing – there's probably, in 1963, we probably bent the old idea of "you shouldn't heal," and so forth – we probably bent that one very badly. And the AMA has been getting in our coiffure. They are very decent fellows as far as their membership is concerned, but I think that they themselves at the AMA headquarters are due in for a horrible shock because give us a couple, three more wins of the type we've been getting and give us a nice suit against the AMA, something like this – give us a few little more wins and we will open the door wide open on the subject of psychosomatic healing. And that will be the end, man, as far as they're concerned. Because we can then enforce an ethical policy, don't you see, that if you cannot – if you do not get results on the patient, you must refund his money. And we can put this out on a heavy propaganda line and, of course, that will finish any ineffective healing activity there is. The only person who can do this, of course, is the person who has very effective healing activities. That's what's known as – in bridge – as "leading from strength."

We have several of these things now. We have several of these things now which are quite, quite miraculous. And anybody running – anybody running at Level VI goes through – every time his auditor makes a bust he goes through more illnesses and more types of psychosomatics and so on that could be easily counted. All his auditor has got to do is get a couple of goals in juxtaposition and the – start running down the line of a misworded goal and you immediately have thrombosis articularosis of the lumbar – immediately. And you can turn on more ills and turn off more ills than you can shake a stick at to such an extent that I have now become very contemptuous of the whole subject. I mean, I see these guys floundering around. I understand what's wrong with them. I'm not contemptuous of them but I mean the idea of the ills of the human body and so forth. You get a couple of RIs in crosswise and man you've never seen any ills like they can be caught. It's rather horrifying from an auditor's standpoint to look at these fellows and see what this – well look, what is this fellow's coronary? See? Some other bloke, he has a bizarre pain in the sacroiliac of some kind or another. What is this and so forth. And everybody rooting around trying to find the right chemical, you know, the correct chemical in order to squirt into them. Or the proper torsion table on which to stretch them or some of this sort of stuff. And once you get accustomed to what exists on the whole track, it's just a little bit frustrating, because of the complexity of upper-level technologies, that you simply can't say to this fellow, "What would solve this? What's the RI? What goal does it belong to? What is out of shape here on the particular lineup, you know?"

You see this girl, she's crying, her eyes red and streaming, going down to the divorce court, you see, because her husband is a brute and so on, and the children home staring emptily into space – Mama and Daddy are... you know – and chaos reigning in all particular directions and so on. Examine the situation and of course it just – you'll find that she's had a consistent present time problem with the RI, you see, "bad men," or something like this. The amount of – the amount of difficulty that's caused by the misalignment of the psyche is fascinating in its tremendous complexity, and disillusioning in the simplicity of its cause. And you think of how few items can make so many complex troubles, and there it is.

But of course, I suppose that we'll make advance in that particular direction. But the ardures of Level VI technology and the ardures of running the stuff – you see, we've been at this now for about – trying to run these things for about three years and every time we'd make a decent breakthrough on the thing and so on, why, we'd come up against a small nicety, you see, that has to be observed in order to prevent this and that.

Technology itself has finally worked itself into a pretty confoundedly complex piece of technology. Really requires auditing; it requires an educated pc. But of course the end product of this, for God's sakes, is OT. That you can't sniff at.

Any goal we ever have had in the past went glimmering; some time about 62 it started to go glimmering and it sure went glimmering in 63. I mean the goal for the individual on an assured basis of what he could attain if he simply kept plugging at it and going forward and was well trained in it and so on, shot up factually as a realizable fact to some point which is, well, it's just so far out of order of magnitude of what anybody expected before that it's probably quite unreal to most people. And it certainly every now and then gets unreal to me. I get caught between a couple of GPMs or something like this and we don't find the goal on the list or something of that sort and we say there we are, there we are – and we're all set now except for this creak! [laughs]

And I take a look at somebody auditing this and recognize the tremendous skill which both the auditor and the pc have to have. Because even when they have that tremendous skill and even when they know all the answers, they make enough mistakes to keep them very busy. But the end product of it's fantastic.

I got a very great reality on the amount of gain which was attainable. Because for some months we've kept looking for the PT GPM on me. See, we've been running GPMs, but every time we get the track beautifully unburdened we find out there's more PT GPM, see. I mean, it's a closer to PT GPM. I think you'll find out this is quite ordinary, see? You find out that the truncated GPM you ran actually had a top, see. Well, if it had a top, then there's probably one on top of it; there's probably one closer to present time. Well, if there's one closer to present time, it probably has a top, too. And there's probably one closer to present time than that. We're now seven GPMs from the one we thought was the PT GPM – seven.

And just a few months ago – just a few months ago in running GPMs – that is, listing for goals and trying to line up a present time GPM – see, I've been running GPMs, and so on. When they run, they run. Because you can usually start in if you've got the right top oppterm and so forth – all it does is leave a little residual charge. You know where it went on the track. You've got it plotted out because you've got the goal below it, don't you see? And you take

that chunk out of the track. Well, it unburdens, you see, the case tremendously and your perception and ability to handle them increases.

And a great reality I connected with subjectively last night, was how much case advance I'd made in just about three months. Because about three months ago, boy, we were trying to list on a goal oppose basis up from an indeterminate base trying to get a closer GPM to PT, and I was being wrapped around telegraph poles. It was grim. I don't mean telling – mind telling you it was real grim. Of course, on my track I've done all the research that you're getting the benefit of and it's shot full of holes, you know, and things have been misaligned and so on, and things have been improperly run. For instance, I've got a lot of GPMs that have been run with "oppose." Well, that's unburdened them and taken charge off of them but it's still left tremendous numbers of bypassed items, you see, in the area.

Well, last night we were working at it. I was handing up goals lists amounting to five or six goals with the rocket reading goal on it; stacking it up, putting the GPM on top of it, you see. You know, there it is; all right, the next one. Listing in to the top oppterm to see if it was there, see if you could get anything to read like a top oppterm on the GPM in order to find out if there was a GPM closer to present time. And we handled four of them like they were just old sacks of straw, see. You get into it when you finally attack that particular hill and you think of the idea of just casually listing into the top of a GPM to find out if there's an item that's going to read there, see, will actually practically part your hair in the middle with horror because it just about rips you to pieces, you know. It turns on *creaks* and bypassed charge and howling ARC breaks and so on. We're sitting there; I just stacked up four GPMs on up to PT, got the truncated GPM and say, "Well, it cuts off right there." And for the first time could look forward into the future, you see, and there was nothing. Nothing. Where did it all go, you know? Just like it had been sawed off with a band saw, you know? And we had stacked up four of them, bypassing all the items, listing into the tops of each one, chopping them all to ribbons and so forth. I didn't turn a hair. Not even a quiver.

I got up this morning and I wondered, "Well, I wonder if a couple of those are backwards," you know? And I went *creak!* and I said, "Well, they're not backwards! Let's see, what are my considerations on this?" – a little bit of self-auditing [laughter] – and I said, "Well, my considerations on this: there were a couple of them backwards." No creak.

Oh, that's a far cry, man, that's a far cry from three months ago. Ah, I got a big subjective reality on it; tremendous subjective reality. An awful far cry from last spring, man! We couldn't tell whether it was an implant or a splant – of course we didn't even know if there were – was such a thing as an implant GPM last spring, You couldn't tell what was which and who was where and so on. I think I turned out last spring some of the most remarkable line plots, I think, that will ever be seen. Maybe you can do better when you're learning, but that was pretty good, because they have – didn't even know – didn't even know implants existed, you see. So you get things like "being active," you see, solving "somebody or something with the goal to be active." Implant RI sitting alongside of an actual GPM RI. Boy, that must have made plenty of creak, man! Take the middle of a GPM – an actual GPM with great big sixty-five-foot by twenty-feet by ten-foot mass, pull it down into the Helatrobus Implant area and pin it up against one of their parking meters, see? Wild! Absolutely wild! Incredible! Survived it.

I will say I sometimes felt lethargic. My weight built up very, very badly and is falling off now at a tremendous rate. I mean, about four or five – the last four or five days I've lost about twelve pounds – because these things are what give you weight. See, they give you a residual body mass. You see, you never created them ordinarily – your early ones particularly – you didn't make these things when you were in the body. And you made them foot-loose and fancy-free. And running them while you're in a body, of course, is not the way most of them were made. And it's a little bit hard on the body. And the body's in the road of the RIs and is expressing and experiencing all the heat and other duress that occurs. And every time you make a mistake, the duress is tremendous and the body goes *creak, crack, blump, thud*, you know, and you take quite a beating in this particular direction if you're doing an incorrect job of the thing.

Sixty-three was the year I had to do all the research work. I've sacrificed everything now. The other day, the other day – not too long ago – I was outside, taking a look at the dawn and it was a great relief. The Van Allen belt is nice and warm and you can sit in the Van Allen belt amongst the radiation that's supposed to be so harmful. It's nice that it's there. It holds in the warm air, you know, and you can put out your beams and warm your hands. And rain clouds – rain clouds are absolutely beautiful there. They're almost as good as a drink of Coca-Cola. And my... you can get into the ice crystals of a rain cloud and it's very nice. It's very nice. It's cooling, refreshing, you know – like taking a cold shower on a hot summer day. And all of a sudden you're not stricken by these fantastic temperature reactions. See, you're in a body, you see, you get a temperature difference of ten degrees up or ten degrees down and you're kind of miserable, you know? And outside, you get a temperature differential of two hundred degrees centigrade up and two hundred degrees centigrade down – it makes a nice change! Slight variation. Slight difference of aspect.

But I do have one problem and I end this year with a problem. And it's a tough problem; I don't know if I'll be able to solve it or not. But as an OT, how do you drink Coca-Cola? [laughter] This is! This is operating as a problem with me and I've been trying to solve this in various practical ways and so forth. I'm far too big to get into a Coca-Cola bottle. You see, when you really go bad as a thetan and become a drunkard, what you do is you take a few drops of liquor and you drip them on the barroom table, you see, and let it evaporate, see, in your face. You're wearing a doll body or something like this, you know – you let it evaporate, you know, into your face, like brandy sniffing, and you can get drunker than a skunk! It all depends on the degree of volatility of the liquor you happen to be dedicated to. But alcohol works pretty good in this. And you know, Coca-Cola doesn't evaporate. See, you can pour it on the table and it doesn't evaporate, it just gets sticky. And, so I – I don't know, I – I thought in my various offices in various continents and that sort of thing we could get a small tub and empty a few bottles of Coca-Cola, you see, in the tub and dump some ice trays in, you know, and you could get in! [laughter] You could get in. Maybe that would be better, so forth.

Yeah, that's operating as a problem. That's the biggest present time problem I have. [laughs] So that's a fairly good one to be ending the year on. And it's worrisome, though.

Well, we have quite a bit – quite a bit that – ground we've covered, gains we've made and that sort of thing. And we're, in actual fact, we're the gainers; tremendously and all out of proportion the gainers in 63. We actually never really thought we could fly so high so

smoothly. The only real drawback is the fact that the technology that takes it to the highest level is a complex technology. But I'm working hard on it so that it's fairly smoothly rounded and can be learned rather easily as I think the Instructors who are – I'm briefing at this particular time will tell you – it's fairly well rounded up.

Not much doubt about you making it. Of course you're sitting there now, you wonder if you'll ever make it all the way. And I can tell you that if you are or have wondered if you're ever going to make it all the way, while you are making it all the way, you will have many other periods when you'll be absolutely certain that you will never make it all the way. That's the greatest certainty I can give you.

You have just been dropped in the middle of a wrong goal at the end of an intensive that is half-run and the right goal can't be found; and for a week or two you'll be very sure that you will never make it all the way. But the nice part of it is, you can pick yourself out of these things, and you do go on and just the action of getting tone arm action actually restores your hope in the matter and you can keep on going. The finite end product results – I was joking with Suzie about it this morning and I said maybe we're going to do a totality of OT on a gross basis: just handling and messing up GPMs, you see, and handling more GPMs and finally we'll get so accustomed to handling GPMs and the familiarity will be so great, we'll never have to run any of the items at all. [laughs]

Because at this stage I think to some slight degree, I think two-thirds at least of all the GPMs which I have, have either been partially run or placed on the track and discharged to some slight degree. This is not necessarily good, don't you see, because they have been put into considerable restimulation. And you're in the middle of the tenth or twelfth GPM from present time in the goal as an RI and you pack this with you as you come back up, you see, to straighten out the PT GPM. You feel a little jammy. But nevertheless, nevertheless, I hope that – I've been over the jumps on this stuff very hard and very harshly; there's no doubt in my mind it's just a matter of time now, let's get it run out. And I've been – felt horrible and I've felt this way and I've known many times that it was impossible to make it. I've also known that it would be impossible for you to make it. I've known all kinds of pessimistic and very, very sour ideas on how tough it was and that sort of thing. And I've managed to recover from each one of these, so let's hope you do, too.

The final end product of Scientology, or a thetan in this universe, has been achieved in 1963. So whatever else can be said for the year, at least we can give it that. Okay?

Audience: Mm-mm.

All right. Well, I just wanted to talk to you about it a little bit and get it off my chest and talk it over with you.

This is what?

Audience: Thirty-first December.

Thirty-first of December. The last year, all right, of 1963, Saint Hill Special Briefing Course.

[part missing]

All right. I'm going to give you a very brief lecture on the subject of indicators as they apply to lower levels. This is a brand-new subject and the Instructors know all about it; they've gotten the lot. And I didn't bring my notes. The whole subject of indicators is a new one. And when you learn something at an astronomic, stratospheric level, such as Routine 6 and Level VI material; it of course can turn around and go down into the lower levels. And this is exactly what has happened with indicators.

Routine 6 cannot be run without indicators. An individual... this is not a lecture on Routine 6, this is a lecture on lower levels. Routine 6 auditors must know their indicators – bang! They must know the indicator and what to do – bang! All auditing time is lost if it is lost by a failure to know, recognize and do the proper action indicated by an indicator. You could lose 90 percent of your auditing time at Routine 6 if you didn't know the indicators. That's how serious it is. You probably, if you didn't know the indicators at all, you would never make an OT at all.

All right, so much for that level. Indicators are present at *every* level. You have indicators at 0, I, II, III, IV – you've got them all – and V. You've got these – indicators are present at every single one of those levels. Indicators are divided into two classes: good indicators and bad indicators. Accuse me of involved technology if you wish, but I don't think you can get much simpler than that. There's good indicators and bad indicators.

The first thing you must know about indicators is that if an auditor doesn't know the good indicators, he does not then know what the bad indicator is occurring into.

Now, let's go over this a little bit slowly. Somebody comes along and he tells you that you must not cut the pc's itsa. All right, so you don't cut the pc's itsa because of an Instructor or you don't cut the pc's itsa because you've read it in a bulletin or you don't cut the pc's itsa because you'll get an infraction sheet. You get the idea? Well, why don't you cut the pc's itsa? Well, you don't know the good indicator, see?

Cut itsa gives you the bad indicator of a dirty needle and an ARC breaky or gloomy or not-running-properly pc. Those are all bad indicators.

Well, what's the good indicator? What's the good indicator? Obviously the good indicator is a smooth needle and a cheerful pc. I mean, it's elementary as that. And that's why you don't cut the pc's itsa, see, because you want a cheerful pc and a smooth needle. You follow it? You don't – it isn't that you don't cut the pc's itsa because it says so in a bulletin or because the Instructor will be mad at you. It's because the good indicator would not be present and a bad indicator would appear.

Let's follow this now. I have many times had this gruesome experience: I've given an auditing demonstration and had a lot of people sit there and learn absolutely nothing from it except that was how auditing should maybe look when I did it. It didn't look anything like that when they did it, so that was just my peculiarities of auditing. Or: anyone with my altitude, of course, with regard to an auditing session, could not fail to have a good pc and have the session look good. You follow what I'm trying to tell you? In other words, the people sitting there watching the session did not know the good indicators. Because I assure you that I learn – every time I turn around at Routine 6 level and so forth – I can have ARC breaky pcs that ARC break much harder than your pcs.

The level, of course, gives you greater stress on the case. And when you get a Routine 6 ARC break, man, you get a nice, juicy, squeezey ARC break. It splatters all over the ceiling. It's big! It's a Cecil B. De Mille production! It's not only a little "Well, you have offended me," you know. "Blankety-blank, blank-blank! Pow-pow!" And it sounds like that record I gave Reg for Christmas of the "Overture of 1812," with the actual cannon shots in it, you know? And I gave it to him with malice; I want to see if his new hi-fi set would stand up. [laughter] It not only stood up to it, it stood up to it very gorgeously, but it almost – the cannon going off sounded so real unexpectedly that it almost blew Jack Horner's head off! [laughter, laughs]

Now, looking at something like that, we know what we're looking at, what should music sound like, see? Well, it should be intelligible and you should tell what's being played and what is playing it and it should sound real as though it's in the room. You've got various good indicators.

But now let me give you an index about music. And you will see something here. A very, very good electronics chap told me this and this is a very good test for "Is hi-fi equipment hi-fi equipment?" and "Can you really – are you really dealing with a good recording" and things of that particular character. "Is it a good microphone?" – this type of test is very simple. And this is what I would mean by a good indicator.

See, this bad indicator: you say, "Well, the hi-fi equipment sounds corny," and you read up what does – "What is bad hi-fi equipment?" you see? Well, it sounds dissonant. It sounds this and that. You get woof and wow and you get this and that and you get an imbalanced decibelization of the lower condenser areas, you see? And the tweeter – tweeter very poor, it's not matched. Has a different impedance. Didn't tell you a confounded thing, you see, and yet those are all apparently bad indicators and so forth that you have.

Well, the question is – is do these things mean anything, unless they are compared to the comparative datum? Now, you know in the Logics it says for a datum to be understood and so forth, it has to have a comparative datum. So you have to have a good indicator.

Newspapers, by the way, are playing this on you all the time. They're saying how bad everything is, how bad everything is, how bad everything is. I don't know; they don't tell you how things should be good. They shouldn't necessarily tell you how good everything is, but nobody says how things should be good, yet they're apparently always working against an ideal standard. There must be no wrecks, there must be no fires, there must be no, be no, be no, you see – on and on and on. And apparently they're working against the standard which is some kind of a good standard. But they never tell you what this good standard is. So, of course, it's just all bad, bad, bad. Well, let's get back to hi-fi equipment.

You could say the woofers are not woofing and the tweeters are not tweeting and the wow is disgraceful and you can say a lot of things about this hi-fi equipment, don't you see, but how should it sound? All right, there's how it shouldn't sound. Well, how should it sound? That's the important one. How should it sound?

And this old electronics whizzeroo told me – he says, "Now," he says, "it's like this: You walk into the lobby of the theater when the aisle doors are closed and you listen to an orchestra playing in the theater. All right," he says, "that's poor hi-fi equipment, see? Now,"

he says, "you open the doors, and walk down the aisle to about the center of the theater and listen," he said, "and that's good hi-fi equipment." And you know, you can tune a set with it. You tune a set up until it sounds like the musicians are in the room. And you can keep balancing things until you move the musicians into the room.

And oddly enough you can take a well set up panel like Reg's new hi-fi has down there, and you actually can move them into the theater beyond the lobby doors and move them right back into the room with you. See, you can move them out and distant and away. And in tuning up a piece of equipment, therefore, how should a piece of equipment sound? The good indicator: It sounds like the musician is playing in the room with you.

Well, it's almost indefinable, don't you see? I mean there's no decibels or woofs or wows or any other descriptions in this thing, so actually anybody then can figure out what was good hi-fi equipment. Is it capable of putting a clarinet in the room so it sounds like the clarinetist is standing in the room with you playing the clarinet or does it sound like he's back in the bedroom playing the clarinet, don't you see? That's all you have to know about it.

All right, you take it on that basis. Now, we can go woofs, whatters and flops and you put the condensers through into the ruddy rods and so forth. Well, all that is doing is monitoring the reality or present or nearness or clarity of the sound. So if you're going to teach anybody to do anything – I have just learned this principle very recently, not the hi-fi, but learned this on teaching Scientology.

I've had a barrier to overcome. This is a problem I was trying to overcome. And that is that I've had many people listen to or watch an auditing session and not know what the devil they were looking at. I know this for this good reason that I get their comments afterwards written down and it's some of the wildest piece of commenting I ever heard in my life. They don't – they haven't grasped what occurred in the session. And you turn me in a bunch of criticism of your own sessions as taped and so forth, which demonstrated rather conclusively to me that you needed a tool with which to appreciate what a session was all about. What was a session? What should it sound like? And I finally worked this out on good indicators and bad indicators. And that's a direct result of it. And if you don't know the good indicators, of course you can't ever tell what the bad indicator is.

So what should a session sound like? And one of the first things that an auditor should make it his business to know is the points which should be present in a properly running session. Not what's wrong with the session but what's right with a right session?

What's right with this session? Now, knowing what's right with the session, he of course can then tell what's wrong with the session. But if you don't know what's right with the session you can never tell what's wrong with the session. And that is the way I have licked this problem. I trust this will be successful and will improve auditing here and there and everywhere.

In other words, heavy concentration on teaching auditors what are the good indicators of a session. What are the good indicators of a session? They're *bong* and *bong* and *bong* and *bong* and *bong*!

And if these things are not present, then a bad indicator must be present. Well, what's the bad indicator that's present that cancels the good indicator? So I give you that: Don't cut the pc's itsa. Why not cut the pc's itsa? Well, you're going to get a dirty needle.

Well, all right, that's interesting as a statement. But it already assumes, you see, that this particular auditor knows that he ought to have a smooth needle in the session. See, it's as elementary as that but it makes that assumption. And that's an unjustified assumption because maybe he doesn't know that. And the good indicator is the pc should be cheerfully itsaing away. All right. Pc is sitting there cheerfully going on and happily carrying on and cogniting on things and so forth. Well, that's the way a pc ought to operate.

Well, all right. You say, "Well, if you cut the pc's itsa you make the pc unhappy." Well, this assumes that the fellow knows that a pc ought to be happy in session! And maybe people don't know that at all! A psychoanalyst doesn't know that. No other practitioner ever knew that. So this is unjustified.

How does a pc look in session when they are running properly? Well, they ought to be taking their case seriously, somebody will say, you see. They ought to be really concerned about all the wicked things they have done in life, you know? They ought to be – ought to be – ought to be – ought to be – ought to be, and you get seven thousand different varieties of "how the pc should look in the session," all matching the RIs of the auditor! [laughter]

What's the good indicator? Pc cheerfully itsaing. Well, you say, "*Cheerfully* itsaing? Why – what the hell? You mean this guy's going to run through some – you mean this guy's going to get better sitting there cheerfully talking?" Ho-ho! Yeah, he's not going to get better any other way, man! Because the only frame of mind that you can as-is in is a cheerful, high-toned frame of mind. And that's the high-toned frame of mind people as-is in. Now, we're talking about if we run a secondary, of course we'd expect somebody to cry through the secondary or fear or something like that. We don't happen to be running secondaries these days. And you can expect this to occur early on in a session that – or early on in a process that the pc's looking sort of gloomy and he's looking this way and he's looking that way and so forth. But only early on when you're handling the thing he is gloomy about. You're bringing him out of the gloom and the good indicator is that the gloom is decreasing or the tears are decreasing, you see, and that he is moving forward toward the good indicator.

The pc's moving straight ahead toward the good indicator and should arrive there fairly rapidly. You don't want somebody weeping for seventy-five hours. It's all right for a pc to weep. I've seen pcs running a secondary weep a dozen years off their apparent age. There's nothing wrong with this. But that's running, of course, a secondary. Now, the truth of the matter is as the pc rapidly moves on forward, how long should the pc be weeping? Well, how long should the pc be weeping? What's the good indicator?

Well, the good indicator is that it fades away and the pc gets very cheerful with no suppression of the weeping at all. That's the good indicator.

And the bad indicator would be he went on crying for seventy-five hours of auditing. And you would say there's something awful wrong here, man.

So you get a good indicator: here's the pc cheerfully looking at his life and gets interested, talking to the auditor – these are good indicators, you see – tone arm riding at an acceptable range on the E-Meter, you see, with so much motion. These are the good indicators, you know. You can stack these up. I'm not trying to give you a list of them at this particular time. I'm trying to show you what they are.

And we get this picture of what an auditing session is out of the good indicators that should be present in the auditing session. And if these good indicators are not present, then bad indicators must be present. And if bad indicators are present, then certain actions must be taken by the auditor.

Now, certain actions must be taken by the auditor to continue the good indicators in existence. Those are the routine actions of auditing. Those are what you're taught as the TRs and so on. You just go on doing these things and you're not cutting the pc's itsa so long as the session is running.

All right. But when a bad indicator shows up, one or more good indicators tend to go away. And the bad indicator indicates another course of action must be taken by the auditor.

Bad indicator inevitably and always means that the auditor must now do something. Good indicators mean that the auditor must continue what he is doing and bad indicators indicate the auditor must do something else. That's the general picture. But actually, for any given process, the bad indicators give you a precise and immediate thing to do.

This requires more listing and more workout, but you can admit this is pretty clever. See, pc something-or-other and something-or-other; well, you're doing so-and-so.

I'll give you a gross one right now: Pc makes a critical remark of the auditor – makes a critical remark about the auditor. All right, now at one of your Saint Hill levels, of course, that means you do a session ARC break assessment. At a lower level, why run some O/W – or pardon me – at a very low level you'd run some O/W. At intermediate level just pull the missed withhold, or find out what the person's done, see? But there is the action pursuant to the bad indicator.

Bad indicator – you see, the bad indicator doesn't mean there's anything wrong with the auditor. The bad indicator simply means something has gone wrong with the proper form and action of the session. Something's gone wrong here, so it is now up to the auditor seeing this bad indicator to do something about it.

Now, there's several things that – you can overdo these bad indicators and you can get ahead and get all plowed up and messed up and do nothing but remedy bad indicators, remedy bad indicators, remedy bad indicators. And of course, "What's the matter with this session?" Well, none of the good indicators will be present. So if you don't know what good indicators are and don't know that you should continue what is bringing about these good indicators – if you don't know what good indicators are – then you won't know what to continue. Do you see?

How should this pc look? How should this pc sound? How should this meter react? How should this bank be responding? Now, those all have good indicators in connection with

them. Now, here's a good indicator. If you don't know this good indicator then the bad indicator makes no sense at all.

Let's give you the bad indicator and show you how it drops you into the soup: tone arm was high. Tone arm on this pc was running consistently high.

Well, what's – what's consistently not high? See, you have to ask that question, see? What – how should a tone arm operate? If a tone arm shouldn't be moving between 4.5 and 5.5, then where should it be operating? Well, a tone arm oper... out of the broad range of optimum action of a tone arm is from 2.0 to 4.0. That's the broad range. Common range is about 2.75 to 3.5. That's a very nice range; very nice operating range. If you're really hotter than a pistol at Level VI, you'll get the pc operating between about 2.25 – because now you're operating a thetan, and male and female have nothing to do with it – Level VI. It starts in about Level V that you cease to lose the male and female significance of your meter and at Level VI you've for sure lost it. And a pc starts plowing along there, and the pc's running between 2.5 and 3 – 2.5, let us say, and 3.25 – optimum running range. Pc's running in that range. Man, you've got it made! Nothing's wrong. You haven't missed any items, it tells you – so on and so on. It just gives you a avalanche of information just seeing the tone arm moving where it ought to be moving.

Now the tone arm is now moving between 2.75 and 3.75. Well, it still – there's a little something awry but we're not going to bother with it. It's a light indicator, don't you see? It's too light to fuss with. But we've got something crossed up somewhere on the track, and we're not enough sure at this particular time what it is. But the tone arm is running and running like mad between 2.75 and 3.75 and, you see, it's just – it's all right. You don't do anything about it. Just that little bit high. Just that little bit high. Something's been missed somewhere.

Well, of course, the time to use a bad indicator is when you can't go on with the good indicators. Just because a bad indicator leaps up into view – at a very light level of bad indicator – is no reason you knock it all apart, if the session is still full of good indicators, you understand? So the pc's talking cheerfully, everything is going along fine, you're finding items; everything is going along beautifully, and so on and so on and so on. And your tone arm is running now between 3.25 and 4.0. But it is running between 3.25 and 4.0 and I do mean it's running. The pc is getting heat on the items; the pc is so on. All the good indicators are present, you see – they're all there, they're all there, they're all there.

Well, eventually you get down to the bottom of some bank or another and you find out that you've skipped a GPM back there and it's just coming into view – heh-heh! And all of a sudden your tone arm starts to run up now around 4.75 to 5.25. Well, this is definitely in the road of the session. You can't operate this way. You can't operate at all. So you now have got to do something about it; and you very nicely put it all together and do the right thing and go on with your action.

This just gives you an idea of a good indicator and a bad indicator. So there are three grades of indicators. There are two kinds of indicators and there are three grades of indicators. Just thought you'd like it nice and neat. There are light indicators, medium indicators, and heavy indicators. The two grades of indicators – I mean, the three grades of indicators are simply the suddenness with which you have to take action. On a medium indicator, action

must be taken. And action must be taken as soon as you can comfortably get to it. And on a heavy indicator, emergency crash action must be taken right now. And the light indicator is normally plotted so as to show you that something is wrong. You know something is wrong so that you can be alert to find out what it is without actually interrupting the session of the pc. The purpose of the light indicator is just to show you that somebody is moving over close to the edge. And they may move back onto the main road without you doing a single thing about it. But they're over close to the edge and the auditor had better be alert.

He doesn't want that moment when he hears the rending of wheels on the abutment and the crash of the car as it goes over the cliff and the long dwindling scream. That's grade four. And he never should get up to a grade four indicator. He never should get up to a grade four indicator; which means no slightest possibility of any more auditing of this pc ever. We don't even put that in as an indicator, because it would certainly indicate something; because we already have at grade three "pc not wanting auditing." That's an indicator. That's a bad indicator. Now this, of course, automatically assumes that a pc should want auditing as one of the good indicators, see. So you got a pc and there's the pc: what's the good indicator? And by good indicator we mean normal or reasonable; not extraordinary or bonus indicator. This is what we expect, you see?

You expect to sit down to a table and eat off a plate. See, I mean that's the level of expectancy, you see. I mean there it is, you know. You're not going to eat off the floor off a dog's dish, you know – at least not on this planet at this particular time.

Now, you've got, then: what's the expectancy. Well, the expectancy is if you've got an indicator like a bad indicator – pc not wanting auditing – you must realize that there must be such a thing as a good indicator which is: "pc want auditing." Good, you see, doesn't mean superlative or bonus. See, it just means that's expected, normal indicator, see. It's just normal. Pc wants auditing – pc wants auditing – that's normal.

Well, I can tell you how far out indicators are on an awful lot of pcs. See, "Where's my session? Where's my session? Oh yeah, when are we going to have my session? All right, fine. That's good, good," – not anxious to have a session, but he wants his session; then he sits down, and so forth. You don't have to go out; whistle and dig and beat up the brush, you see, or anything of the sort. There's the pc, you know? The clock has wound up to a certain period of time and there is the pc; and perhaps getting a little cross with you for being a few minutes late for your session, or something like that. See, it's all an indicator that he wants his session.

Not anything you do anything about. It's almost a good indicator that he is a little bit, "Hmmm, you weren't here," and so on, "we lost five minutes of my auditing time!" Weren't on time, didn't start the session on time. You wouldn't attach anything to that as an indicator. See, it's not really a bad indicator. It frankly is a good indicator. Pc wants his auditing. You see how this gives you a different frame of reference? Normal, good indicator. The pc wants his auditing. That – that's it!

Well, if he doesn't want his auditing, that's a bad indicator. That's a real, real bad indicator. That's a grade three bad indicator. So it tells you that all of your devotion to session, and so forth, must be on that indicator. Pc doesn't want his auditing. Well, you better not do anything but handle that indicator. You can take it up eight dozen ways from the middle and

you're going to eventually collide with the reason why and it's always going to surprise you. It'll be some elementary simple thing you should have thought of all the time except it's very complex and the pc never would have noticed it. But the point I'm making here is the good indicator is: pc wants his session.

Now, our ARC break with governments and that sort of thing is probably because we're not auditing them. We must remember that Harry Truman going along pertly and so forth, God help us, I certainly would have been much happier to have educated that bloke that did his auditing, but man, he was being sweated over on engrams God knows how long! He practically cleared that man. Every piece of information that came out was immediately snafled up by the White House psychiatrist. There are even rumors floating about that they were spending time, you see, the President was getting psychotherapy of some kind – a mysterious kind of... Well, we ought to know what he was getting, because we were – we would have been much happier to have given this guy some information instead of him culling it out of bulletins and – and he never even had any tapes, don't you see, or anything like that. All he had was Book One – Book One and whatever other bulletins and correlative information was issued.

Well, that's rather interesting. Truman apparently wanted his auditing. Well, possibly – the rest of the government wants auditing and probably lots of people in the world want auditing and we probably ARC break them by not auditing them. They will ask for auditing in numerous ways, including try to blackmail you and so on. The truth of the matter is, though, that wanting auditing is far more common as an indicator than you would suspect. And, of course, it is the expected good indicator. When it is absent, the pc says, "Well, I don't know if I want to be audited – I don't know, *rarh-rarh-rah*..." He's being late for his sessions and he's hard to dig up, and so forth. Man, you're dealing with a grade three indicator. I mean, that's a bad indicator. What's expectancy? All right, what's – you could – I'm just giving you a brief glimpse here: The needle and meter should look a certain way; the pc should look and sound a certain way; the pc's attributes should be so-and-so and so-and-so.

Now, oddly enough it is a grade two bad indicator that a pc has a present time problem. That's a grade two. It isn't to be considered in the line of absolute, crashing emergency because at certain periods of the session the pc will develop a little PTP which you eventually care for, and so forth, just with what you're doing.

A grade three indicator means immediately emergency action. But this is something you attend to and something you attend to right now. Why? Well, the pc makes no case progress of any kind whatsoever in the presence of a present time problem. How do you like that? Present time problem: no case progress. It just equates that way. That's it. There's no modification on that statement. This is borne out over the years, man; this is really borne out over long periods of time: that a pc with an ARC break gets a worse graph. His graph worsens if he's audited in the presence of an ARC break, see.

In other words, there's an ARC break has occurred; the ARC break isn't remedied, then you can reduce the pc's graph. That's the only thing that will worsen the case – is auditing a pc over and beyond and ignoring the ARC break. That's the only thing that will worsen the case. And the only thing that will make the case not progress – not one-quarter of an inch – you

couldn't put a building jack under the case and have the case advance. Pc with a present time problem: that graph is going to remain the same. Present time problem plus an ARC break: God knows what happens to the graph! But, we've got this, you see?

So, we say, "Well, the pc shouldn't have a present time problem, and so forth. You must always audit the present time problem and this is something that you have to take care of," and etc., and etc., and etc., and etc. This is all very interesting. But where's the good indicator? Obviously the good indicator is the pc in an auditing session should have no present time problems. Well, then, obviously your pc couldn't be in-session if he had a present – if he'd always had a present time problem while being audited, then nobody had ever worked forward to getting the pc into session because the good indicator of no present time problem has never emerged on this case. So if no present time problem – good indicator has never emerged on the case, then we can obviously say the case has never been in-session. That is quite remarkable.

When we put these good indicators up in the framework that they deserve to be in, you see immediately they start to show you an awful lot of bright, bright look here, see. Well, you could check a pc out on good indicators, you see? Well, now, this is particularly important to you because you're actually going to supervise as much, or more, auditing than you will do. You're going to supervise an awful lot of auditing and I mean you, and you – all of you; you're going to supervise auditing. That's for sure; you're going to supervise it.

A lot of these new level programs – don't think otherwise. Any auditor becomes an Auditing Supervisor. So much so, that the hat "auditor" is practically synonymous with the hat "Auditing Supervisor," see.

But, auditing supervision – how are you going to do auditing supervision unless you know how a session looks, man? What are you going to do? What is this thing called a session? We have no descriptive material that covers it whatsoever. Can you walk down an aisle and look at [snaps fingers] – *bing* – and say "Is that a good session going on?" Well, is it a good session, or isn't it a good session? Well, you could say it isn't a good session because certain bad indicators were present. Pc's cans have been on the floor for the last half an hour, don't you see, and the pc is facing the other direction looking out the window and the auditor is humming. [laughter] Now, that's auditing supervision by bad indicator. And if you only supervised by bad indicator – now listen carefully – if you only supervise by bad indicator, you will never get any auditing done. If it does occur, it'll occur by accident.

You cannot auditing supervise by bad indicator. You can only auditing supervise by good indicator because when the good indicators cease to exist, your action, then, must be in the direction of re-creating them. But if there's nothing toward which you're re-creating, of course you can't make anything there anyhow.

Let's say, all right, let's say we've got fifteen bad indicators present in the session – let's just be outrageous, you see – we got fifteen bad indicators present. So, very brightly and smartly, you eradicate two bad indicators. Hah – you still got thirteen. You haven't yet got a session going there! So you must learn your good indicators and you must learn to do session supervision by good indicators.

In other words, you can tell everything is running all fine and everything is going ahead and you actually could fix your level of expectancy of how much gain these cases are going to make just on the number of good indicators present. You can look down the aisle and see that so on and so on – just glance down the meters, and the needles are clean and the tone arms are running in the expected course and there is tone arm action going on; the pcs are talking cheerfully about their own case and the auditors are listening to them, and so forth – and it's all these good indicators, you see. One, two, three, four, five, six, seven, eight, nine, ten – good indicators all present, so forth.

Well, you know now that group of pcs – there's going to be an awful lot of psychosomatic difficulties going to disappear, and their difficulties in life and livingness are going to go by the boards and their lumbosis is going to diminish and you can just be comfortable, man – comfortable. There's nothing spectacular going on in the whole length of the room. See?

But all the good indicators are present in those sessions. You could just sit back and relax, put your feet on the desk man, and you just say, "Ah, well, that – all those things are going to happen and everybody's going to be happier and better and they're all going to be cheerful and everything's going to be fine," see; because that's what it ought to look like!

Now, if it doesn't look like that then some bad indicators are present. And for every one of these actions that are going on which aren't going on properly, there is a major bad indicator present. All you have to do is establish what's present – *pow, pow, pow, pow, pow, pow, pow* – and give an immediate auditing response to remedy that one. Your good indicators will pick up a little bit; make sure there are no other bad indicators present. Get these things out of the road, weed them out and you've restored the session, then, back to all good indicators and it goes on swinging. That's how to auditing supervise.

Now, therefore – and let me impart this to you before you really get swinging on the subject of auditing supervision – you should know good indicators just *brrrrrrrrr!* What I'm trying to tell you is you should know good indicators more by heart than bad indicators because if you find out that there's a bad indicator present in the session, believe me you can always go to the textbook and try to figure out some more about it. "Oh!" Because I myself sometimes in undoing a case will have a fantastic comm lag. "Oh! That! Oh! Ha-ha! *Whhuuu!*" You know? That kind of a particular response. After all, you've been walking around the edges of this case for some little time and you knew there was a bad indicator here, you see? You knew there was a bad indicator. But there could have been four or five responses to this bad indicator. You could have done four or five things in order to make this bad indicator right itself. You just didn't quite have the tail of the piece of string; you couldn't quite pull this – the right raveling, and so forth. Well, all right, well that's undoing cases. That's straightening up an individual case. And all cases aren't like that, thank heavens, and so on.

You finally realize, "Oh! The pc's goals are directly – the pc is with a PT problem. We've run PT problems on this pc for some little time in order to straighten up PT – why is it this pc always has PT problems? Oh... so and so on, and so on, and so on and so on. Well, it's... these PT problems all the time. We keep straightening out PT problems, PT problems,

they never straighten up on this pc. Oh? Oh, well, Ron said one time or another if a pc continues to have present time problems and always seems to have difficulty and you never can seem to clean up the present time problems, then the pc's goals must be completely different than the auditor's goals and the session must be a total disagreement. And it must be that the session itself is the PT problem."

Pc's goals completely divergent from the auditor's goals. Auditor trying to make pc survive; pc trying to succumb. Auditor trying to make pc well; pc sitting there trying to make husband guilty. You get the idea. Must be a divergence of goals here – must be a wildly divergent set of goals between what the auditor's trying to do and what the pc's trying to do. So we will remedy it now from that direction. We will get a heart-to-heart talk on this particular subject and all of a sudden you'll see that case unwind.

Of course, the bad indicator isn't present on the next case. Pc doesn't even have a present time problem. He's just sitting there talking happily, so you say, "Well, I had such remarkable success with Lisa Jane in finding out a divergence of goals between the..." so on and so on. You see the bad indicator isn't present in this, but you apply the remedy of the bad indicator and the case suddenly starts picking up a whole bunch of bad indicators and you wonder what's going on here. Well, you remedied a case that was running.

In other words, you've corrected the no-necessity-to-correct. No need to correct it, and you're correcting it. You get the difference between good indicators and bad indicators?

The auditor will ride a hobbyhorse. Every once in a while you always – you always tend to ride a hobbyhorse. You have a big win, see – wins ruin auditors, man! It's a tremendous, crashing win, you know? And you found out that Mrs. Snodgrass was putting rat poison in her husband's breakfast cereal, because she actually had a something or other about "children." So you get children straightened out on your next two or three pcs and then you find out that none of them straightened out on the subject of children, see. In other words, you are remedying – you are remedying a nonexistent bad indicator.

So, there are several things that you can do and err in, but they're all very good sense. And the only thing I want to communicate to you is learn what an auditing session should look like. And when I give you your list of good indicators for an auditing session, snaffle on to it. And when you're training people to audit, hit them over the head with it, you know. These are the good indicators for a session – the good indicators, see.

Good indicators are more important than the bad indicators because auditing only happens in the presence of the good indicators. Bad indicators are used simply to reassume the good indicators. Therefore, you must know your good indicators.

Now, when you get to be a screaming genius and an Auditing Supervisor like – you can say to this person – like I am; when you really get sharp, as I am, you see, well trained, then you can pick up the bad indicators and straighten them out. But that requires genius. Just for now, you go on with your good indicators and make sure that they continue in the session. Cultivate them. You get this level of approach?

Of course I'm giving you a joke along with it. I can see you now, in desperation trying to keep cases from being corrected that don't need correction and trying to get cases corrected

that desperately need correction but the person is sitting there; the pc is dumped over – bent sideways from the trunk, you know – and you didn't see how this could happen. The person seems to be out, boiling off, knocked in the head, every single session; never can be really persuaded to come to the session in the first place, and you're trying to convince this auditor, "You know, there's some bad indicators present in this thing and you – you really haven't got the good indicators of a session because a session doesn't look like that!"

"Oh! Doesn't look like that. Oh, the pc is leaned over to the left!"

You wait! You wait! One of the things that's very disappointing is to give a tremendously effective auditing demonstration, just glass-smooth, you know, every good indicator there, you know, just everything sharp, you know. Everything present that should be there, you know. And realize that some students who were watching it had never seen it. And they tell you what the pc's withholds were is the sole thing they learned out of the session! It staggers you, man! You become staggered when you look at it. Because – but then you'd recognize that they don't know what the good indicators are – what should the session have looked like, so they don't know what was a good session and what was a bad session.

Now, you're going to tell this person get in there and run a good session. What do you mean a good session? You only mean a good session, of course, if it has a good – it's full of good indicators. If it's got the good indicators in it it's a good session. As the indicators drop away; as the good indicators drop away you'll find bad indicators are starting to take their place. And as the bad indicators come in you'll find certain remedial actions have to be taken. And when these remedial actions are taken your session snaps back to battery.

Now, this throws away the idea that some people are auditable and some people are unauditable. I just look down your throat, and say, "Well, after all, you're an auditor!" How do you materialize all these good indicators in a session? Well, that's what you're being trained to do. The standard operating procedures on which you're operating and so forth are all calculated to bring about these good indicators, and continue them flowing in a session. It's elementary as that.

Now, you wonder why Joe Blitz has such an awful lot of trouble with – in the co-audit here, and why is Joe Blitz having so much trouble, and so forth? You don't understand it. Well, Joe Blitz doesn't know the pc's supposed to sit in a chair. See, he doesn't know what – he doesn't know what he's trying to make take place here! So not knowing that, of course, he can't make it. He can't create it.

The gains of auditing are astonishingly automatic these days. Astonishingly. You have a series of good indicators present in an auditing session and you audit the pc just so many hours and you use no brilliance at all of any kind. You just keep on and keep the good indicators in – the pc wins! And he all of a sudden comes around, you know, and you're checking up – their chronic headaches are gone and they now don't have to be operated on by Dr. Sawbones and you'll hear all of this stuff. Why, when you're an old pro, why, you take this in stride. You take this in stride, because all you were doing was just a standard auditing job and the good indicators were present and of course you expected a good result and that's about the way it was. There's nothing very spectacular about it from your point of view.

But it looks totally magical to this person, you see. All right, how does it look so magical to them? Well, of course, they don't know anything that's going on, because they have no point of view with regard to the situation. They just know they've had this wonderful, magical experience. Years and years and years after I've audited somebody, I'll occasionally get a letter from them – they've had this fantastic and marvelous change and so forth, and it changed the position and condition of their life, and that sort of thing, and they really didn't know what happened. What happened? Well, nothing happened very much except just more or less what was then at that particular current time, standard auditing took place. That wasn't any particular fantastic wand-waving went on or magic occurred. There it was. That was what occurred.

And, if you fix your sights at good indicators and standard sessioning and continue those and then when bad indicators pop up take care of those – take care of the worst one first. That's the other little rule on the thing; always take care of the worst one first.

I'll give you an idea: you've got a dirty needle. Well, I don't think I'd worry about a dirty needle if the pc was throwing the cans down on the floor and screaming with a bypassed charge of items ARC break. I'm sure I wouldn't be worrying about the dirty needle. And if there's big bypassed charge possible in what you're running, of course I sure wouldn't be worrying about the session mid r... I mean I wouldn't be worrying about the session ARC break assessment. Much less mid ruds! My God! In the presence of an ARC break start worrying about mid ruds. That's something like you see, this fellow sees this warehouse full of nitro-glycerin burning, you know, and he goes and gets a glass of water to throw on it. Of course each tool has its own position, you see?

Naturally you want to get the heaviest bypassed charge out of the way first – get that out of the way. Then get the lighter bypassed charge, session ARC breaks out of the way and when you've got that all squared out, why, get something like a little O/W in – something like that – if you're really still patching this thing up. And at some point you will, by the way, patch it up to a point where the patching starts creating bad indicators, you see? No auditing starts occurring, or something. You have to use good sense with regard to that.

But you'll have very smooth sessions as a result. The results of Scientology – the results of Scientology are terribly elementary in their action. What's the good indicator with regard to an auditing question?

The good indicator is that the pc has received something to inspect. He inspects it, you know; he's itsaing it and telling you what his insp... and then he tells you what he has inspected and he answers the question fully, as far as he is concerned, and then you acknowledge.

Now, it doesn't matter whether it's by repetitive – that is to say you got the question fully answered by repetitive commands, or you got the question fully answered by giving him one command and he took a half an hour to answer that one command. He's going through an electronic circuit and he finally comes out the right end of this electronic circuit and he's free of it. He's inspected it. In other words, he's walked through the labyrinth of thoughts he's had crossed up on this particular subject and he's fully answered the question and now you can see this and so you respond.

Now, if at any time you cut his itsa, you of course don't let him walk all the way through the labyrinth, so not having walked through the labyrinth, you'll interrupt him someplace and he feels lost. Of course he's lost! He's lost in the middle of an incomplete inspection. And, in this incomplete inspection, it's electronic materials that he actually is inspecting in the mind and it turns on a dirty needle because you have cut his itsa.

Now, you know this, so you let this person insp... you give him something to inspect; you let him inspect this and when he is finished you tell him he has inspected it by acknowledging it. I don't care whether you did that by repetitive commands or otherwise. That's the basis of all auditing. There is no other basis to auditing than that. And that this – this operation is taking place in the knowledge of certain mental mechanics and activities and there's certain types of questions you can ask and so on... But the person who is answering these questions that are being put to him, and so forth, because he is undergoing conditions and he's doing actions which are bringing him up the line, he will come up with a higher IQ and he'll be brighter and he'll be this and he'll be that – providing you're not auditing him during the presence of a present time problem; you're not trying to press ahead while he has an ARC break; providing these things are occurring; providing you are getting tone arm action, why, the guy can recover from almost anything, don't you see?

I've given you, just in these last few words, the – really the basic essentials of auditing. They're just spit out that fast.

Now, if you can bring that about, you've got all the good indicators present, don't you see – the bad indicators are absent. When a bad indicator shows up you immediately take the lightest necessary action – quickest, quickly to set it to rights – you recognize it swiftly, you take the action necessary to correct it, you've got it corrected and then you're away and not making a profession, now, out of this one bad indicator. And you've got the session wheeling and it's going and so forth, and you keep that ball rolling and just the essentials which I just gave you: keeping the pc's confidence built up in that you're not chopping him down all the time, making sure the pc doesn't have PT problems, making sure that you're not auditing him – somebody over the top of an ARC break, this type of thing, and my God, you'll emerge at the other end – even at your lower levels of auditing, you see – you emerge at the other end with a brand-new being.

You can keep – you can keep doing this. But, of course, if you don't know what auditing looks like, then auditing is to a marked degree quite downgraded. Do you see that?

Well, I've given you a rather long lecture; you can come back fifteen minutes late and we'll start class fifteen minutes late.

But I wanted to particularly go over some of the points of 1963. I thought you might be interested and amused. Tell you how it looked at least from my point of view and to wish you a very happy New Year!

GOOD INDICATORS AT LOWER LEVELS

A lecture given on 7 January 1964

All right. Thank you.

Saint Hill Special Briefing Course, January 7th, AD 14.

All right. Now, I've got something – the reason I'm giving you a lecture today, even though I was apparently a bit under the weather and so forth, is I've got something I'm trying to teach you. And tomorrow in the demonstration you will be able to put this to good use.

Now, you have in front of you HCO Bulletin of December 28th, 1963. And this bulletin here is the "Routine 6 Indicators Part I, Good Indicators." Now that bulletin apparently would refer to Routine 6 and apparently only refer to Routine 6. But in actual fact it contains the most complete list of indicators for any session. Of course, there are several of them that don't apply. Now amongst those that don't apply are whether or not the pc thought it was his own goal. You're not going to get that at Listen-style Auditing, Level I. But if you look this over, you will find out that these apply to most sessions.

And I'm going to take this up with you, rather carefully.

Now, if I could teach you – if I could teach you what a good session looks like, and teach you so that when you look at an auditing session in progress, between an auditor and a pc out there – if I could teach you to be able to say, "That's a good session," or bang, "There's something wrong with that session," why, I could make a whale of an auditing supervisor out of you, see. And you'd really get a lot of success, as a D of P, or something like that – why, you'd just come crashing down the line there. You'd have gains, gains, gains, gains, gains.

And the reason why I'm teaching you this way is because if I can teach you what good indicators are, you can then pick out of the muck – well, what a bad indicator is. And we will take up bad indicators in the next lecture. But if you don't know what the good indicators are, you will never be able to figure out what the bad indicators are.

Now, the reason for this is an auditor's tendency to look for wrongnesses. He's always trying to find something wrong with the pc. Well, that's the nature of Scientology. We assume that there's something wrong with somebody. Otherwise he wouldn't be here on this planet. Otherwise he wouldn't be dead in his head. He would be capable of doing a great deal more than he is doing at the particular moment.

When you get down to an examination of what kind of character a thetan is, we find that man has been making a consistent or even intentional error. And the intentional error is that a being is a piece of amoeba or something in the mud, and only by a great deal of punishment, duress, challenge in the environment, upset, holding a gun on him, giving him high taxes and treating him with medicine, is he made into a sentient being. Only by teachers rapping him over the head with a ruler and being put in there, into the grindstone, being conscripted into the army and made to shoot his fellow man – in other words, that's the only way you get civilized. That's the only way you get civilized.

Well now, remember there's an entirely different action involved here. There's an entirely different action involved here. We have a different concept. And until you can appreciate this, you – you'll see what it is. We see an individual, we see an individual as basically, routinely capable. He's basically and routinely good. He is basically and routinely capable of many actions. He's capable of considerable power and so forth. And we see him in, you might say, a state of a free thetan or a native state as a far more powerful individual than when he's been complicated up.

And we conceive here – we conceive here an entirely reverse idea. We conceive that all of this training in the school, all of this being sent to the front and made to shoot his fellow man, all of this being charged high taxes, all of this being lectured to about how he should be good and bow seven times a day due east to where the lodestone is – all of that sort of thing drags down his capabilities and makes him less capable. Now, we have tremendous evidence, overwhelming evidence all along the line that our concept is true, and that the (quote) "biological concept" is – to be colloquial – erroneous.

We tested a series of schools. Now, in the process of testing schools we found out that although the child was advancing in age, his IQ was dropping. As he advanced in school his IQ became less. Understand, that's very important. I think the highest IQ we ever tested in one Central Organization which was testing floods of people, was tested on a ten-year-old boy. Now, that's the highest IQ tested there. That's very interesting. In other words, the harder and longer they were kept in their basic education – the longer they were kept there, the more stable data was shoved down their throats, particularly false ones, why the less their IQ was. That's interesting.

Now, a college student in the United States has been very carefully masked, and the psyrologist – who was the – those are the ex-phrenologists, you know, the bumps-on-the-brain-boys. If you look up in the *Encyclopaedia Britannica* you'll find – particularly my edition – I have a very choice edition of the *Encyclopaedia Britannica* – it's an old one. I think it's the eleventh edition, I love it, man. It's got all of the, you know, "what is black magic," what is – and it gives long explanations of spells and it gives the early history of hypnotism and it just gives all kinds of things. And when you... most of its articles were written as though you didn't know. The modern encyclopedia is written only for the experts, you see. If you're an expert in landscape gardening and you go and look up landscape gardening, why you'll find out all about it – if you're an expert. Well, these old encyclopedias weren't written that way.

And there's an article in there on phrenology which is – which is marvelous. And it describes the bumps on the brain – bumps on the skull – and it gives a map of the head. And, all of this is very intriguing. Because down below it says this particular patient had an extra large meatus. We're not sure what a meatus was, but he had an extra large meatus which showed that he was fond of torturing animals – and as a matter of fact he was very fond of torturing animals and so became a medical doctor. [laughs] You know, when I read that – you know, I bet they'd burn that book, you know; they'd have a law passed in Congress, you know. They'd tell the president "We're going to cut out your adenoids, man, if you don't have that rescinded!" Of course my quote is very liberal – they didn't say he was a medical doctor who was a member of the AMA, trained recently – they didn't say that. They came very close to it, however! Anyway, I'm just giving you a gag.

The facts of the case here is the psychologist inherited phrenology, you know. Only they just went a little deeper into the subject. The phrenologist studied the skull, and of course the psychologist going deeper into the subject went just inside the skull and started studying the brain. And he has just as many superstitions about the brain and its sizes and lumps as the old phrenologist had about the outside of the skull. Now you might say we've gone to the root of the problem and we've gone to the center of the brain and we found a thetan.

Now, this has been much more productive – much more productive. Truth is demonstrated by workability. Now, this is a subject which would be contested in certain philosophic spheres. I guarantee this would be contested! There are those schools of thought which are so enamored of their own falsities that they demonstrate that no truth need be workable. I think this is rather marvelous. There are certain religious philosophies and so forth which say, "workability is not anything we should have anything to do with because actually it is very sufficient for us that Galen – that Galen said that the blood was like tides and so forth. And these fellows – Harvey – these fellows come along and they say it's pumped or something like that or it runs at the impetus of the heart – why, the workability and the fact that you can observe it and so forth actually has nothing to do with it. The beautiful aesthetic, the beautiful aesthetic of the idea of blood tiding back and forth with the tides of the moon or something of this sort – that is so beautiful and so aesthetic that even though we know it is false there is no reason for us to accept the truth."

Now, did you know that there were schools of philosophy like that? You occasionally run into one of these sad apples, and he will tell you that workability is no test of anything. He will say that – well, what he means actually is workability so challenges his own favorite ideas or philosophies that he mustn't have it anywhere near him.

Now, let us use this anyway: the idea that we can observe, that we do something and we produce an effective result. Actually, remember all the exact sciences built up to their present stature just on that idea alone – that you put A and B together and you'll always get C. Well, now in Scientology we have that level of workability. We have put A and B together and we get C.

So, we have this fellow with lumbosis. We have this fellow with lumbosis – this is the idea of the additive datum to the thetan, see – and this fellow has lumbosis. Now, we can give him heat treatment, we can operate on his lumbo, we can do all kinds of interesting things to

him, and he goes on either having lumbosis or kicks the bucket. Now, this is very interesting, that even Freudian analysts realized that some additive had been added that should be deleted. So the idea of deleting something in order to bring about a recovery is not new with us – but in this particular case we only need ask him what solutions he has had for his lumbosis for him to recover from the lumbosis. In other words, if we could pick up all of his decisions and solutions with regard to lumbosis, then we would pick it up. In other words, that's a perpetuation of an error.

Now, this is all part and parcel of additives. We add something to the being and he gets worse. You understand? Now, we take somebody who is feeling bad. I mean you as a Scientologist can put this to test every time you turn around, so you should know really what the basic philosophy of it is. We take this fellow who has had – he feels *bleau* and he feels down and he feels *baruahh* and life is pretty *nnnyah*. And here he is and we set him down and we put in the mid ruds, see, for the last week or something like this. Now what are we doing there? We're actually subtracting; we're subtracting actions. It isn't necessarily that we're subtracting bad actions, don't you see – we're not subtracting the bad actions and leaving the good actions which are beneficial. We're subtracting the livingness of the last week and he comes up feeling better. I think this is fascinating.

You can do that. You do it well and don't ARC break him and clean cleans, and know how to read your meter and audit him really, you'll always bring about this same thing. Well, what have you done in essence? You have subtracted something from the being. You've taken something away.

All right. Now I have made this test then. Let's – let's go a little more esoteric here. I have taken an insane person, subtracted from this insane being his body. I mean this is just figuratively, literally and actually – this isn't any other type of description. I've subtracted from him his body and had him immediately sane. And sane, talking, responsive and so forth. Added back to him his body – instantly returned to insanity. That's quite interesting. You say how do you do that? Well, you've walked his body off of him. You do it the same way by moving somebody out of his head.

Now, there is something that you can't argue with. Here's something you can't argue with. You take any insane person, he's rather easily handled or persuaded, even though he's terribly dispersed. He's in a point where anything has an effect upon him and he's very easy to exteriorize. Of course, he's still capable of talking through his mouth using his vocal chords, and that sort of thing. How do you know he was out of his body? Well, that hasn't anything to do with it. He said so, you knew so, and that was the only auditing command that was given to him. So there he was, minus the influence, effects or pushes of the body – and the fellow was sane.

Well, I can always produce five, ten minutes of sanity. It actually is not beneficial, doesn't last, it's just an experimental technique. But that's fascinating, isn't it? That you delete from this fellow his body.

All right. Now let's take – let's take this fellow who has been living... You say how about the good things of life? Well, I don't know, how about the good things of life? Of course we could all be pessimists here together today, and say are there any and so on. Well,

yes, as a matter of fact there are. But they are usually cessations. If you look over the good things of life, they are very often positive. Child gets toy or something like this. Well that's fine. That all is taken care of in Scientology under the subject of havingness. But it's *havingness at own choice*. You understand? The individual has this thing he wants. Now, you try to give somebody something he doesn't want and you're going to overthrow his power of choice. So what has happened to this individual is power of choice is the only thing he had to begin with which gave him power, capability or anything else. And that power of choice has been consistently and continuously overthrown by giving him things he didn't want and taking away from him things he didn't want to get rid of and back and forth, and you get the individual pretty overwhelmed and he goes down in power.

But let's take this fellow – he's been getting along fine, he has a goal "to be a great fellow," see – it's a GPM. He's got the goal "to be a great fellow."

He's going around patting everybody on the back, and he's a great fellow. And you'd think, for God's sakes, this is the one thing that makes this man a man, you know. The goal "to be a great fellow."

And unfortunately at the same time he has a bad pain in the back of his skull and he rather has consistent twitches, twitches. And he twitches and so forth. And we audit him up and what do we get? We take away the goal "to be a great fellow," the twitch disappears and he hasn't got the pain in the back of his head. I think this is very fascinating. So – but this was apparently something he was doing, apparently something he wanted. Well, what happened to him? What happened to him actually? He solved something that didn't need solving. There was something he couldn't confront so he solved it. And he fixed the solution. And anytime you go on and fix these solutions forever and ever and ever and ever and ever, you put an individual down grade.

Now, the only reason under the sun that we have any right whatsoever to educate in the field of Scientology – the only right we have to educate at all, is we are teaching things that are as close to fact as possibly can be made. And the technology or the doingness or how you do it or how it is put together and so forth, is so close to actually how it *is* put together that it runs itself out. If you say to somebody who has a solution for lumbosis, "The reason you're having lumbosis is because you have this solution for lumbosis," and sometimes he will get well from just that fact. Now, actually you can make people well simply by teaching them Scientology. So Scientology doesn't come under this ban of educational aberration.

Why? Well, Scientology is the only thing that runs itself out. Scientology is the only solution in this universe which erases itself. Now, for instance, right now, anything that you are being taught – anything that you are being taught – is in actual fact simply being a truth which is being pulled up through the muck and shown to you. And it actually by being shown to you makes it possible for you to reach other truths.

Now when you consider the power of an RI, or you consider the power of one of these fantastic solutions of medicine or something like that – like a big operation or something like that – when you consider the power of an actual GPM, when you consider the power of a service facsimile, all of these things – all of these things – well, I don't quite know how to put this to you, because it's something that I have recently studied and had been rather over-

whelmed with. And it's this – it's this: The data of Scientology, now the data of Scientology is so minor and so sweet and so pure with regard to the tremendous heavy, crashing, banging solutions like service facsimiles, RIs, GPMs, medical operations, all kinds of those other types of solutions – I'm beginning to be very relaxed. You can do almost anything you want to with Scientology, because it sits on the top of this. And when it has solved something it solves what has solved it. And that's never happened before.

In other words, these other solutions are so crashingly big and Scientological solutions are so mild that these – these things disappearing of course make the little mild Scientology solutions just go *phhhh!* And there's practically nothing to it. So we don't come under the category of adding aberrative data to the individual as a solution of his difficulties, because even though it might stand there for a while and worry him, it will eventually reach home and uproot the thing it is sitting on, and it blows along with it.

For instance, every one of you right this minute is sitting in some RI of some kind or another. And if anything made you flinch in the data which you've been given in the last twenty-four hours or its administration and so forth, now or tomorrow or eventually, that data is going to go *phoooo!* It's going to blow. Because it's sitting on top of what it is uprooting. You got the idea? So when it blows, the data blows – but you know the data, because the data is truth. And all of this is very fascinating. In other words, the premise here is that an individual – not to wander far afield now – an individual becomes aberrated. He becomes aberrative by additives. His experiences in this universe are usually calculated to degrade and depower him.

Now, all you have to do is pick up all of these crisscrosses and you return him to power. Now, I've given you a few examples of these. Of course, there are innumerable examples of these things. What we're doing is easily demonstrated. You pick up – you pick up a bunch of data out of this fellow, or know-hows or how-do-its or something like that, he becomes quite bright. You can raise IQ simply by picking up his school education or something like this. And in Scientological data, the data itself is a restimulation of more basic and fundamental truths which restimulated, tend to blow later data. As a matter of fact, some people just study Scientology and they can leap out of bed well. It has happened many times.

Now, what's this all add up to? It adds up that man – man is an added-to being. And everything that has been added to him has decreased his ability to cope.

Now, we've gotten him dependent on tools and that sort of thing. I've studied some of this in anthropology, ethnology and so on. I've studied, I think, twenty-one primitive races including the British and American – and I'm always struck in their history with the fact that they have gone through periods of handicraft which are quite remarkable – quite remarkable. You see them in their museums and so forth. Well, of course, you see these things amongst actual primitive races – the other big joke – you see these amongst actual primitive races down in the Philippines and so forth, and you see these marvelous little pieces of handicraft one way or the other. Somebody has patiently put – he's patiently put little lions' heads on the arms of all the chairs that he was making and something like that. And you see it down there, in – you see it in some of the primitive races as a painstaking job of painting up every stone in the yard with paint. And they're rather clever designs.

You see it – you see it in ivory work amongst the Eskimo – some of the most fantastic things. This fellow's just making a spear, you see. And you see this spear – my goodness, it's all chased and it's got pictures of walruses and so forth. This thing is just a workaday spear! This thing is something that Manchester would turn out zoom-zoom-zoom, you know? And he's got this thing – he has a lot of them, you see – and they got a – they got a walrus there, and there's a couple of seal or there's a little hunting scene of – depicting one of his activities at one time or another, and that's that particular spear. Well, these things are just spears. Spearheads – he's going to throw these things and forget them, and they're going to get stuck and so forth. Well, why did he go to all this trouble? Why did he go to all this trouble?

Well, he had obviously the patience and the talent and the skill with very, very minor tools in order to do that thing. And you find this in a race prior to its automation or mechanization or being provided with adequate tools – (quote) "adequate tools." I think it's quite interesting. You can see it in museums very often, if you want to study this particular point. It is – in other words, all I'm trying to say is, is you give him... This fellow up working in Manchester right now, my God, he's got drill presses and he's got lathes and he's got – he's got all kinds of furnaces and forging materials. And he's got everything under the sun, moon and stars. He's got everything there is. It isn't that he's deleted art. The more you give him to work with – the more you give him to work with, why, in actual fact the less he works. And that's interesting. It isn't that he doesn't have to work less – it's that his ability to work has been reduced. I think it's quite interesting.

You have somebody around sometime in a maintenance department, you'll remember what I say. If you've got somebody coming in all the time, all the time, all the time and he's got to have – he's got to have this and he's got to have that and he's got to have the other thing and he's got to have something else and he's got to have something else and so forth. You walk around the place, you're not going to find anything being done. There's a direct coordination between "got to have" and "getting done." And that's a good datum that you can use in any organizational action. You find the fellow who has to have, more, more, more, more, more in order to get his job done and so forth, is actually doing, usually, very little.

Now, what calls this to account is, that is an aberrative side of simply some thetan's bent for collecting havingness. I immediately think of my cameras. I collect cameras. I'll collect lots of cameras. But it's interesting, it's interesting that in collecting cameras I pay less attention to any one camera. And just had all of my Christmas pictures wrecked by picking up a camera I hadn't paid any attention to for a very long time and one of its buttons had been shoved over to another point and the flash was no longer synchronized with electronic flash. I didn't get any pictures.

Well, what is this? This – that's just having too many cameras, that's all! You didn't pay any attention to the camera you had, don't you see? I've got five, six cameras of one kind or another, see. And there's a good example – I was getting less pictures by having more cameras. But, of course, I just collect cameras for the devil of it.

Now, this is very interesting. It even follows through then into hobby work, and so on. Now there is some point – there is some point if you're dealing in the field of electronics, for

instance – where you require a minimum amount of equipment or a maximum amount of equipment or a certain amount of equipment in order to get something done. Very, very true. Very, very true. And if you don't have that equipment, you're a mess. For instance, you'd have no tapes at all if we didn't have a nice Ampex 600 running, don't you see. And you wouldn't have any television broadcast if we didn't have some cameras and that sort of thing. But remember, we're using these things. These things are in use. And as far as my cameras are concerned, I do take pictures.

But, you know, the people I'm talking about – the people I'm talking about "have to have." And never "do." And it's a good point for you to notice that they "have to have," but they never "do." And you'll see this thing. And it's a totally overwhelmed being.

Now one day up in the cold and dust of a Peking winter and so on, I saw a Chinese carpenter. I saw a Chinese carpenter working. And it's the wildest thing I'd ever seen, because there's an old civilization. There's a very old civilization. You expect them to be very sophisticated in all of their tools and so on. This little Chinese carpenter was working out there in the cold and he was mending up the pillars of the British Legation. They were built out of wood and they'd been gnawed at by dust for a long time, and they had some carvings and some things like this associated with them. And he was fitting in – he was fitting in a new beam and so on for one that had been rotted out, and he was fitting it all in very nicely. And I talked to him for a little while. And I stood there just absolutely fascinated!

This man had a little bow, it was about six inches long and it had a piece of string from the two corners of the bow, and he had a drill – he had a drill that he had taken out of a fish that he had had for breakfast. And he had a little piece of stone that he'd picked up in the street which happened to have a little concavity in the back of it. And he took the fish bone and wrapped the string of the little bow around it and then held it with this palm fitting – this stone – and went up and down with the fish bow. And he had a nice auger, and he was drilling holes in the wood and then he was taking – he was taking then a little knife that was hardly a knife at all, it was just a sliver of metal that he had managed to sharpen up, and he was taking bits of wood off of the old beam, of course – he – you know, that he was discarding. He wouldn't have used new wood for that. And he was taking these things and he'd flick up a little piece like – off there, and then he'd go so-and-so and so-and-so and so on and next thing you know he had a dowel. And then he'd put the dowel where he had drilled the hole and then he'd tap it in with his – with this same stone. He was building more beam faster than a US carpenter. I looked at this and he was perfectly competent with these tools. And he was taking the greatest of care. And he was making the nicest possible things out of the thing. Interesting, isn't it?

This little fellow in other words, was perfectly capable of doing a job with – of course, you could say tools to which he was accustomed – but using the minimum tools. And you don't find people who are having a good time of it using a minimum of tools. Now, to him those tools were effective. Those were effective tools, man! I think to do the same job – nobody would have been putting something together with wooden dowels, anyway! They would have been nailing it together with nails at vast expense and so on.

You say, well, what about this fellow? Well, this fellow actually had never really been spoiled by being taught all of the things he had to have before he was a carpenter.

I think all you'd have had to do was added to his education of "You have to have nails and you have to have a hammer with a five-pound head and then you have to have actually three hammers, you have to have so on and so on, and then you have to have – and you have to have – and you have to have before you can drill a hole." And the "have to have" gets in the road of ever getting the hole drilled, see. It's interesting. In other words, you could have added to his understanding of carpentry to the degree of "you can't do without certain union tools" to a point where he can no longer carpenter. That's the only point I'm making here.

The earlier history of races or the more primitive cultures and so on are fascinating to me, to the amount of time and the amount of skill which is put into odd little bits. And now man is getting up to a point where he can mass produce these things and so forth, all of which is very, very interesting. I'm sitting here looking at a Georgian fireplace of the early eighteenth century, and the amount of work which has gone into chopping up that marble there, probably could not be found, modernly. We could say, "Oh yes, somebody could have made it." No, I don't think so. Because I've seen a lot of modern marble work. And they have better tools today but they don't turn out the same work. I'm also looking at a fire grate and so forth of the same period. Fancy, man – fancy! It's all scrolled and chased and that sort of thing. Why some of the best stamping machines and patterns they make these days don't turn those things out, and yet that was probably turned out with a blacksmith – by a blacksmith, all by his lonesome. He said, "Well, let's fix up a fireplace!" Bang, bang! "I think it ought to have some nice scrollwork and so forth and so on!"

What's happening here? What's happening here? It's just the more you add to the workman, why, the less individual work one accomplishes. You get the better workman, it isn't that he can make do, it's that he does anyway. And you say, well, if you kept taking his tools away from him he might not be as good a workman and so forth, because he couldn't do. Well, there is a point, of course, that we have to remember. He's working in a body; he's working at great limitations. But there is something in which I say – a fellow can have too much – he can have too much burden, he can have too much this and that.

What's this all amount to? This amounts to the fact that we're in the business of deleting wrongnesses from the individual. Now, because – now understand – understand this very carefully – because we are in the business of deleting wrongnesses from the individual, we darn seldom look at rightnesses. And that's what's wrong with most auditors. They are so anxious to find the wrongness – and quite properly – that they really never look at the rightness. And if they don't look at the rightnesses that are present, then they aren't appreciating the degrees of truth that are present which can be promoted up into more truth. In other words, they're starting at a level of no truth present all the time, so of course they never make any forward progress.

You must realize – you must realize that there must be truth present, and that that truth must be recognized. And that is hand and fist a part of auditing: the recognition of the fact that a truth is present. If you only look for wrongnesses and only recognize wrongnesses, then

you will never be able to pull anything up a – gradient because you won't think you have any rightnesses to work with. It just all looks wrong to you.

Now that's an interesting concept. That's an interesting concept. We have to be able to look at the wrongnesses in order to right them, but we also have to be able to look at the rightnesses in order to increase them. We're only trying to find wrongnesses in order to increase rightnesses. And that's very important. If you have no rightnesses present in a session, you will never be able to make any progress of any kind. Now that's what's interesting. Progress is built on a gradient scale of rightnesses by which you delete wrongnesses and they drop and fall away.

Therefore, processing is an action by which wrongnesses can be deleted from the case to the degree that rightnesses are present in the session. Do you see that? You cannot take a case that doesn't have any rightnesses present and delete a wrongness. That's not possible.

So you have to realize that there are rightnesses present and then you increase those rightnesses. And that makes it possible for you to pick up the wrongnesses. And that's what auditing – auditing really consists of. It's a contest of maintaining rightnesses so that we can delete wrongnesses.

Now if you keep on then deleting wrongnesses, all the while maintaining and increasing the rightnesses, you eventually wind up with a very right being. Now let me state this to you a little bit different so that you really get it. You're trying to get a right being. Therefore, if you don't continuously encourage right beingness, you never wind up with a right being. This actually is one of those things where I realize I'm stacking up little kid's blocks A, B and C and so forth, but I'm always astonished that they get missed.

You see, I've had actually ten or thirteen years of losses of trying to teach somebody to observe an auditing session and so forth, and I finally made a breakthrough here and I'm giving it all we have. You want your pc to wind up right. You know, I mean a right state. He's in a more native, more capable, less overwhelmed, higher power of choice sort of state. All right, you want him to wind up with more rightnesses. Well, therefore, if you audit so that you do not increase or encourage and increase rightnesses, then you won't wind up with a right pc. I mean, it – I'm – it's idiotic you know – I feel like I'm yelling in the wind here, to some degree, because I've tried to point this out before but I've really never had language to do so.

And if – for instance, if you want to pick up a God-awful, horrendous, crashing wrongness – let's put it in ratio form – we got to pick up this fantastic wrongness here. And we got this wrongness, you see. And it's something on the order of this big.

Now the degree of action which you have to have, or the degree of rightness you have to have present over here – the degree of rightness you have to have present must exceed the wrongness. In other words, you have to have at least this much rightness. I don't know if you can see those or not on the screen, doesn't matter, they're just two circles of similar size. In other words we're trying to pick up this wrongness and erase it. Well, to do so, we have to have this rightness present. In other words, you've got to have rightness in a session at least as great as the wrongness you're trying to pick up. It's a proportional action. Proportional. Now frankly, if you've got as much wrongness in a session as you've got rightness, you're not rid-

ing on any cushion. You've got – you've got yourself a comparative situation here that's going to eat somebody up.

Now the facts of the case are – the facts of the case are that if you – if you want to pick up this little rightness here – this little fellow, this little wrongness here – and you've got to have rightnesses – we've got to have rightnesses present, which are *that* big in order to engulf it. Now that's an easy job of auditing. Now these comparable – there's as much wrongness in the session as there is rightness, comparable magnitude, that makes a very difficult job of auditing – very difficult. But you get somebody who is – oh, he's singing and happy and cheerful and so forth and it's all springtime and so on, and you say to him and so forth – you say to him, "Did you know so-and-so and so-and-so?" And he looks at it and his ability to as-is is so great that he simply goes *pphhh!* and it's gone. Do you understand?

Now, you get this fellow and he is worried and he is nervous and he is upset and you give him a little, tiny, peanut-sized present time problem that is very, very little and so on, and the wrongnesses in the session – that is to say the rightnesses in the session are very minor, and the problem is a very tiny problem but there isn't enough rightness in the session to handle the problem and he actually cannot erase it. You get the idea?

Now, you – we could talk about banging somebody into a GPM and so on. But you realize that all you've got to do is delete good indicators from a session, one after the other, and your pc will not be able to as-is – he won't be able to as-is a speck of cigarette ash on the middle of the rug. In other words, he can't as-is anything.

So a pc's ability to as-is – and here is your rule and your datum and which you should remember well: *The pc's ability to as-is or erase in a session is directly proportional to the number of good indicators present in the session.* You see that? It's proportional to that – and his inability to cope in a session is also measured proportionally. His inability to cope in the session rises proportionately to the number of bad indicators present in a session. As we delete good indicators of course, we get bad indicators. Except they don't cross one to the other necessarily.

But if we had very few good indicators in a session we would have a very small ability on the part of the pc to as-is. And if we have a lot of good indicators in a session, then the pc's ability to as-is is much greater. And you can actually bog a pc down – you can bog a pc down. Every once in a while you'll find a pc sick. You know, I mean life and so forth, and he's done something or other. Pc's sick, you'll find – I don't say once in a while you find a pc sick, but every once in a while an auditor will have this experience that the pc is sick and the auditor can't continue to run the process he has been running, but has to drop back to a very minor process indeed. Auditors very often overlook this.

They were running this pc on service facsimiles and not for any reason of auditing, because of duress or weather or something of this sort, the pc got himself a stomachache or something and... ate something bad or something. And he gets back into the session again and the auditor tries to go on running the process and, by George, the process won't run. Well, the auditor's not on the ball. The good indicators, you see, are inadequate to the running of the process which was in progress. Got that?

So what's the score here? He has a sick pc. So he has to fall downstairs to running something like "Look around here and find something you could have," see. He's got to run the pc's Havingness Process, or give the pc a Touch Assist or something like this. He hasn't got enough sense to retrograde the process to cope with the state of the pc.

Now, what problem is he up against there? Actually, good indicators in the session are inadequate to handle the wrongnesses the auditor is trying to eradicate. Now, that's what's happening in the session. Now, you get yourself a sick pc every time you see the good indicators vanish – and the pc can be considered sick. You've just – you haven't got any good indicators in the session. Well, all right. Good indicators have dropped out of the session – your pc's ability to as-is is going to be very, very, very, very lowered. Going to be much lower than it was. The indicators are much low... the good indicators are much fewer, the pc's ability to handle wrongnesses is much less.

Now, you remember that the next time you see a pc start to bog, start to drag, start to flounder one way or the other. What's happening? These good indicators are not present, therefore the pc's ability to handle a wrongness is lessened. The pc – you've got to get the good indicators back in before you can get the pc to handle what you want him to handle. That's the only thing you can do about that. Now, how you go about that is a horse of another color, and is no part of this lecture. I'm just telling you the good indicator.

Now, I worked all this out, and every once in a while – I'm never – I'm never such a fool as to believe that I can't learn anything about auditing and so forth. In fact – in fact, amongst you there may be some of you who have no more to learn about auditing and so forth and I congratulate you because that is a very happy state to be in and I have never achieved it. That's a mean thing to say, but I've never – never achieved this happy state – I always have something new to learn about auditing. Always! I can always learn something from any given session. And I'm struck to the degree of my own ignorance sometimes as to what I have been neglecting. I'm sometimes overwhelmed by it a little bit and I say, "Hey, what do you know! All these years I've been watching *wah-wah*, and I never knew that a *wah-wah* – what do you know!" you know, and I get very interested in it. In other words, I can make progress along this line.

And after cursing and snarling about how it was almost impossible to impart to an auditor about how a session was put together – what a session should look like – and after having this problem on my plate for about thirteen years, I solved it – because auditors couldn't observe pcs. This has been nagging, nagging, nagging and this has been right up front as a research project. You think I've been researching only very esoteric things – no, that isn't so. I always have my eye on the fundamentals and the improvement thereof, see. I was snarling around, and "auditors never learned" – this will – this will give you – this is a good laugh, see – "auditors just never learned to observe pcs," you see.

And I finally figured out this system: good indicators and bad indicators. You see, when a good indicator disappears a bad indicator doesn't necessarily show up. They are not – they are not a justice scale, where you put so much on one side and take it off that side and put it on the other side, you know. That's why they're released here in two different sections.

Good indicators are good indicators and they don't become bad indicators. Bad indicators are something else entirely different. And good indicators are something else. Good indicator disappears – another breed of cat called a bad indicator shows up. And they're usually not at once translatable. You have to memorize them in their own categories.

But anyhow, I worked this over and I got it all worked out and I saw what it was and so on, and I thought, "Now," I says, "that will show them something – that will show them something," and so-and-so. I was very happy then because I realized that I could show you without a lot of trouble what an auditing session should look like and so that you could correct some of this and so you could get a raised workability out of auditing, see, so as you could make your auditing of a pc work better. I was very happy about it.

Here's the joke: I was sitting in a session I was giving, and all of a sudden I noticed that a good indicator was missing – pc cogniting. Pc had ceased to cognite. So slight a difference here, you see. I just said, "Hey, there's a good indicator missing. Hm-mm!" So I said, "I'm going to find out what's wrong here, right away." Pc hadn't even begun to dream that there was anything wrong. And – see, auditor finding out – you... auditor, by the way, you know – here's another rule: The auditor must always find out what's wrong in a session before the pc finds out. That's how you hold altitude as an auditor. That's how you hold control. You must always find out what's wrong in a session before the pc finds out.

When the pc finds out and has to tell you why, your – your altitude suffers and so forth, and you have less control over the pc.

Now, in this particular instance and so forth, I – very clever indeed – I said "A good indicator's missing. Ah!" And I looked at the list which I had in front of me and noticed that it was a very, very short list indeed, and that nothing had fallen on it, and the pc was just about ready to make a critical remark or say something or other and introduce some new bad indicators into the session, and didn't get a chance to introduce them. I said, "Complete the list!" That was obviously what I said. Pc says, "Oh! Oh! Oh, yes! Yes!" Completed the list and so forth, and we got the list complete and went on cogniting. Started cogniting again!

And we – pc and I laughed about this a great deal, because it was – it was so quick. It was so quick off the mark that the pc really didn't find out what was going on until it was all over. And yet was probably saved – probably saved a half an hour or something like that, of patch-up, ARC break, that kind of auditing. See? It undoubtedly saved a half an hour's worth of auditing, just that.

So right away I dreamed this up so as to make you a better auditor, and I've become a better auditor as a result. So thank you. But anyway, that was very good and it saved me just like that – bang! Just a half an hour's worth of auditing. Because that cognition drop out, that would have been followed by something else and that would have been followed by something else and the good indicators would have dropped out and dropped out and dropped out – and, of course, that's a very light indicator. The bad indicators would have shown up, then I'd have gone and had to figure out what was wrong – and I'd have had to backtrack where we were at the time when it went out and then I would have found that we'd had an incomplete list at that time.

Well, obviously it only – could have been only one thing wrong in the session at that moment because all I was doing was trying – was just doing a short list. So there was only one thing wrong and it must have been an incomplete list. You could just get off the mark like that because it wasn't overlisted; it wasn't long enough. So, bang! Good indicator disappeared, I say something's wrong with exactly what I'm doing because the good indicator disappeared right there, and it was right there while I was doing it and I hadn't cut the pc's itsa and my observation of my own auditing was high – so I said, therefore, we have an incomplete list. So, complete the list. The pc was just getting ready to say, "You *wah-wah-wah* and-and-and it – oh, all right. I'll complete the list!" That was the end of that.

In other words, there are three degrees of indicators: There's light indicators, there's medium indicators and heavy indicators. And the very unobservant auditor only uses heavy indicators. Screaming ARC break. There is a fourth grade: Pc won't come near an auditing session. And we never let it go that far. But the medium indicator – that's pretty darned obvious. And the light indicator is something you either do something about or merely get alert about. It's an alerting thing more than a using thing. A medium indicator is something you use and must do something about right now, and a heavy indicator means you've missed the light indicators.

Now, any process has its own series of bad indicators. And the bad indicator moves in when the good indicator moves out. So you have to have as a primary knowledge – this sounds odd – but you have to have as a primary knowledge, a knowledge of good indicators.

Now, you never look – don't look for a bad indicator. Don't look for a bad indicator on and on and on. Don't look for bad indicators all the time, all the time – you'd drive the pc round the bend and suppress your good indicators. What you want to do is to know your good indicators so well that when one of them disappears from the type of process for – that's for the level you're running – know the good indicators so well that when one of them disappears out of a session, your ears go up *spannngg!* and you instantly look for the bad indicator. And really, don't look for the bad indicator until you see the vanishment of the good indicator.

When you see good indicators vanishing, you look for the bad indicator. Otherwise, you are always continuously prowling around looking for wrongnesses in a session and you keep the pc very upset and you get no auditing done of any kind whatsoever. So this other system is far better, and quite usable and quite a good system.

Now rapidly, let's go over the Routine 6 and Level VI indicators. These are all good indicators. And I'm merely going to read them off. You've got them in your bulletin of December the 28th and can copy them from them so I'm not going to bother you with making notes of this particular set because you have no business being separated or away from that bulletin.

"Pc cheerful." Now, what do we mean, pc cheerful? Well, we mean the pc's cheerful. That's what we mean. The degree of misemotion that the pc is indulging in must be a diminishing degree. Interesting, isn't it? A diminishing degree. Pc hits a grief charge or something like that – now, these – remember, Routine 6. In Routine 6, pc cheerful. Your pc hits any misemotion of any kind whatsoever – that's all under the heading of bad indicator. So when we say pc cheerful, pc should be running like a grinning idiot. You understand? Cheerful!

You know? Teeth! Smiling! You know? Happy! "*Ha-da-da-da-da-da-da-da. Bow-wow-wow-wow!*" You know? "Oh, it's a dog and a bog and a bagitibog and a pokatawog. Oh, and that – ha! And what do you know about that! That's a wudiwum! Yeah, all right! Bang! *Kow-chow-pow! Cha-pow-pow-pow! Pow-pow!*" Cheerful! "Oh, a gugfrog! Oh, my – all my life, all my life I've been worried about gugfrogs!" You know? [snaps fingers] Bang! You know? *Pc cheerful!*
