So – at other levels, however, you have different actions. R3R, if your pc is laughing all the time he is having a grief charge, we would say something is – weird's going on. We're trying to run secondaries on the pc, we don't expect the pc to be cheerful. But your misemotion should be diminishing in a session – diminishing. It isn't that you have to suppress the pc's misemotion, but you'll find a good grief charge off at certain levels of auditing is a very fine thing indeed. But it must be diminishing and working back up toward cheerful. So it's – other levels of auditing, "pc cheerful" would become "pc working in a direction to becoming more cheerful." So at other levels you would have "pc getting more cheerful" as your indicator. It would be the change of degree. That's for lower levels.

Now, we don't, of course, have at lower levels "pc cogniting on goals and items," but we certainly do have "pc cogniting." And if you've got a noncogniting pc... John Sanborn once said very wisely – he said, "You know," he said, "I'm suspicious of this guy. I'm suspicious of him. You know, he never looks around and says, 'Well, what do you know!' you know? He never looks at anything and says, 'Well, what do you know!'" And he said, "I'd feel an awful lot better if sometime or another he'd look at something and say, 'Well, what do you know!'" Well, what he's spotting there was a pc who was not cogniting which would be a sure symptom that the pc was running in a present time problem, an ARC break, was running at a level above his level or ability to handle. Pc not cogniting.

"Pc's items found are the ones pc thought they were on the list." Well, of course, that is relatively inapplicable at lower levels except for this: You very often find that what a pc thought was wrong early on in his life turned out to be what was wrong. And if he – if he's coming up with things like this: "You know, as a little boy I always suspected it was because my father was – was so on, so on, so on, so on, so on, on – and, by George, you know that's a fact!" The rightness of the pc – the basic or fundamental rightnesses of the pc – are asserting themselves, is the way that could run at lower levels.

Now, you have "pc listing items briefly and accurately." That would apply to listing – any listing activity. But in other levels – giving things to the auditor briefly and accurately.

"The early items on the list turning out to be the right ones." That – that's – doesn't even apply anymore to Routine 6. Just scrub it.

"The right" – well, if overlisted it takes the pc too long to find out anything and so forth. You'd say pc finding out things or finding things rapidly is your good indicator. Pc is finding things rapidly. Takes the pc a *looong* time to find something. You've seen a pc sit there and say... The obvious answer, of course, is the fact that he's been beaten, you see? "Why do you feel bad?" you know, and the pc says, "Ohhhhhh," and so forth and it just takes him – takes him a half an hour or forty-five minutes to come up with the fact, "Well, I guess I

feel bad because I just got beaten." In other words – in other words, the speed of turnup – the speed of the pc finding something or giving up something.

This next one could be translated as "a proper reading meter." The next one, "items found not rocket reading," well, that has no applicability to anything except you've got to have – what's being done is giving proper meter responses. And you've got your "goals found rocket reading" – well, what's found gives its proper meter response.

And this next one could be determined as – "short item lists" – could be determined as "it doesn't take long periods of time to get something done with this case." This, by the way, is an indicator that a lot of auditors should pay more attention to. They – they – they themselves think it just takes forever.

I used to scare – I had an auditor one time that I used to scare half to death. The auditor would run something and I'd change and it'd get over and it'd straighten up and so forth and that would be that and the auditor was just settling down. And the auditor actually didn't like to audit me very much – I changed too quickly and had cognitions too fast and this was very tiring because he had to think up a new process at once, of course.

And you'll see – some auditors sit down and they're going to run "I see the cat," you see, and they're sitting that down for a nice long intensive and then it's flattened off in twenty minutes. We just had it happen out here. I gave a process over to an auditor to run and it was reported to me from all sides that the process hadn't been run. And I found out the facts of the case were the process had been run on the pc but the pc had been able to cope with the process and handle it and come up to a final cognition on it in a half an hour.

Now, the expectancy on every hand, then – that was going to take a long time to run that process. Well, it takes as long to run a process as it takes to run it. And a pc running processes easily and rapidly, and flattening them on comm lag or cognition or meter thing, is a good indicator. An indicator that's very often missing in sessions and you never notice it. The pc is taking forever to flatten something. Well, that's not necessarily a good indicator at all.

"Items being found rapidly without a lot of hassle, even though the right item was hard to make read." Now, that only applies to Routine 6. In ordinary auditing, it translates over into – into this: Being able to get the datum for the pc without an awful lot of wrastle. You ask the pc, "What's your name?" you know, and the pc three hours later finally guarantees with a giggle that he'll let you in on the fact that the first name begins with J. I wouldn't say that that was a good indicator. Pc giving the auditor information easily is the good indicator. See? Easily.

All right. Now, "tone arm continuing in motion – not stuck." Now, that's a good indicator. But that's an indicator which can be overdone. If you've got some other good indicators present, like pc flattening processes rapidly – if you've got these present and he's coming up with new things easily and rapidly and so forth, our action here is cancelled out. In other words, the tone arm keeps going flat. Well, it would be very dumb auditing indeed that would try to get a flattened process to produce more tone arm action, you know? "Well, yesterday he got beautiful tone arm action on critical thoughts of his father. But today we just keep trying to run this process and trying to run it and, you know, I don't get any tone arm action." Well,

never occurs to him the – another good indicator was present, and that was that the pc was easily and rapidly flattening processes given. That – that's a good indicator. So if that indicator was present, then we don't expect the tone arm to keep moving forever on the same old hassle. We – we've got to – we've got to – we've got to change our sights here on this case.

Now, "the needle active." Now, that's something in meter reading that you seldom see – you seldom really watch for. You're so worried, usually, about dirty needles and that sort of thing that you don't – don't really watch for an active needle. What's meant by an active needle? Well, it's a not s... it's a needle that's not stuck, but it's a needle that is fluid or fluent. It's a needle that moves around. It's a needle that – that is pretty easy to handle.

Now, these new Mark VIs – new Mark Vs, meters and so on (and there is a Mark VI, too), but that meter is so easy to set up to a high, high, high sensitivity that you can very easily lie – get it to lie. You can get it to tell you a lie. That it all – it looks like it has a more fluid needle than it has. And in a great – if I'm – if I'm trying to pull withholds or something like that, well, I pull out my crank on one of these new modern meters and I crank it all the way up. Sensitivity 128 and the sensitivity knob set over to 32 and everything on the fire, you see, and my trained and educated thumb having an awful time trying to keep that needle at Set. Because I want that thing to read all it's going to read. But that's – that's trying to clean things, you understand? That's trying to clean withholds. That's doing a very picky, particular job of the kind where it doesn't matter if you clean a clean once in a while. If you leave the withhold on the case, you've had it, don't you understand?

So, that kind of auditing – yes, yes, crank it up, man! That's what it's made that way for. And all other kinds of auditing *deeeowww* – down. I run one of those meters ordinarily – at Routine 6 – never run one of those things higher than sensitivity 8. Never. Never run it higher than that – for listing and items and that sort of thing. Crank it way down and get – make sure – sometimes you can be fooled. You can get that 128 button down there and it's all over to 128 and you're trying to crank your meter down and yet you've doubled and tripled and quadrupled your sensitivity down below. So get that thing set over at minimum and your tone arm set at about 8 and you can do almost any reading you want to read. And then kick the sensitivity – I said tone arm, I meant sensitivity knob – kick your sensitivity knob to about 16 while you're doing a mid rud. And just move it up and down between 16 for doing your mid ruds or since mid ruds and move it back to 8. And frankly, that's about as high as you would ever expect one of those meters to have to perform. Performing them wide open causes a lot of trouble, causes the auditor a lot of trouble and causes a lot of comm lags in the session.

Now, there's about where your meter ought to read and where you ought to be handling your meter. And now, I'm talking now about the sensitivity 8 set meter when I say an active needle. And that – that needle shouldn't be stuck. That needle shouldn't be hanging up. That needle should be moving.

And it drifts easy. And when we mean a needle active, we mean that it drifts easily or moves easily. The pc has a big think, you see, and the needle goes *pprrrrr!* And the thing is rising and all of a sudden strikes back a couple of divisions. And it ticks and tocks and it sweeps up and it goes down and so forth. Your needle isn't sitting around – your needle isn't

sitting around – stuck. Your needle doesn't – you haven't set your needle at Set and then it just sits at Set and it just goes on sitting at Set. Well, of course, this would mean tone arm action was out, too.

But do you know you can have tone arm action present and the needle not active or fluid? You can have tone arm action with a gummy needle. And you want to get educated enough so that you can see this because it's an important good indicator. You're getting some tone arm action, the tone arm is going up and down a little bit and so forth. But that needle's kind of going throb-throb clockety-clock – dirty, see, that's one of the symptoms – but actually doesn't move much. It'll go on a reaching upsurge or it – or a climbing surge or it'll do a fall and so forth on the things it's supposed to fall on but it – it acts gummy. And when you see it there that is a good indicator gone. A good indicator is your needle ought to be cleanly swinging about. And if you've got a cleanly swinging about meter, then your pc – your needle – your pc is running very smoothly and there's probably very little wrong in the session. That's a – that's a good indicator. Good indicator – that clean, active needle.

Now, going on down the line here, taking up a few more of those things. Here it gives you "pc not troubled with new mass appearing when item is given." Well, that's a Routine 6 indicator. But I would say "the pc is not being troubled with new pains and somatics and pressures and upsets by reason of an auditing question or its repetition." I'd say it was a good indicator that your pc was running easily. And if he is hitting somatics, they're discharging. Your good indicator is that any somatic the pc runs into is fluid. It is in and out. It is momentary. It's a twitch. Any pressure is a *prrrrrp* – and then off and so forth. Those are all good indicators. The pressure or pain or somatic that moves in and gets heavier and then stays there and so forth, inevitably and invariable means something is real wrong. You're doing something wrong.

But what – what you want, the som... when you get rid of somatics on a pc it ought to be flick and spick and swish and pang and – it's in and out, don't you see. The shoulder – all of a sudden he's got some pressure on his shoulder and then all of a sudden he gets hot and it's gone. That's a good indicator. You've given him an auditing command and he gets pressure on his shoulder. You give him another auditing command and he's got a bit more pressure on his shoulder. Give him another auditing command, he's got the same pressure on his shoulder. Another auditing command and he's got the same pressure on his shoulder. Another auditing command and he's got the same pressure – *ohhh*, nuts, man! There's a good indicator has started missing. Somatics aren't – aren't fluid. They aren't going in and out and so forth, turning on and off. You want to get changing somatics in a session, in other words.

And this, of course, is an R6 indicator – "RI given the pc blowing tone arm down when pc asked if it is it." Well, that's normal. But you ought to have your tone arm go down when the pc hits a cognition, and that's a good indicator. Pc cognites – needle down, tone arm down. Good indicator.

Now, "a further blowdown of TA as the pc goes on talking about something." That doesn't matter – it's just right here in the good indicators, but actually there's a normal session indicator that's comparable to this, which is that you're getting more action once a pc's talking.

If you're not getting tone arm action when the pc's talking, there's something wrong. There's something wrong here, that's not – not too – going too good.

"Distinct needle slash two inches or so when the pc is asked if new item solves or is solved by RI found just before" and so forth. In a normal session it turns into the same indicator I gave you before, which is simply expected meter behavior. Nothing unexpected in this meter behavior. A full-dial slash comes under the same one, the next one, nothing unexpected in the meter behavior. Meter's behaving the way it ought to behave.

And "heat on an item list" – now, a good indicator is pc gets warm and stays warm in auditing. Or gets hot and unheats and so forth while auditing. Pc does not get chilled in auditing – that's a bad indicator. And these – all these heat items are the same.

Now, of course if you could audit somebody with no pain ever and so forth, this would be very unusual indeed and is not even desirable. So at lower levels you run – and if the pc never gets a somatic, never has a pain and so forth in auditing, you wonder what's going off. So in lower levels it's "occasional somatics" is a good indicator. Somatics are a good indicator. Any kind of somatic – pain or so forth. That's a good indicator. Routine 6, we change horses: you get pain, there's something wrong, which is a vast difference in these things.

Now, we get "tone arm riding between 2.5 and 3.75 acceptable or 2.25 and 3 which is excellent." And you will find that that is a good indicator at any level. That's fine for any level.

Now, "good tone arm action on finding items" or good tone arm action on spotting things for any level. Good tone arm action on spotting things. But you already got your divisions for various levels of auditing and so on, and they all hold good and that you're getting that expected TA action is a good indicator. Getting the expected TA action for any level of processing is a good indicator, of course – the best.

"Good tone arm action" is – I just gave you that.

"The right item reading with only some coaxing." Well, that's peculiarly Routine 6. I would say that, you're getting reads on what you and the pc think is wrong – I'd say that was a good indicator. Getting reads on what you and the pc think is wrong. You've agreed that something or other – that there's been hell to pay about little brothers or something of the sort, and you're busy discussing this, and you suggested it and the pc followed in with it and you've discussed it back and forth and lo and behold! that subject is giving needle and TA action. That subject is giving needle and TA action. Well, that's a real good indicator.

You – you're dealing with things that the pc thinks it is and that you think it is and you're getting tone arm action. Now, if you're dealing with things that you think it is and the pc thinks it is and you're not getting any tone arm action and so forth, then somebody is wrong. It may be you and it may be the pc, but certainly a good indicator is missing from the session. And the good indicator is: is that you and the pc in thinking over what the score is about his case and so forth, get tone arm action on what you think it is, not something else.

All right. And this is a very important – very important indicator for any level: pc with no PTP. Doesn't mean that it's a bad indicator that the pc has a PTP, but if the pc is running along between sessions and during sessions with no PTPs, it's a good indicator. Unless, of

course, the pc is in total propitiation and can't even compos mentis. Then, of course, that's another horse of another hue. But there's – there's what that is with – pc isn't developing horrendous PTPs. Pc that develops horrendous PTPs between sessions and so forth – that's a bad indicator.

Good indicator: The pc isn't developing a lot of balderdash between sessions and isn't developing PTPs in session and so forth. That's a good indicator. You can take a look at the pc and you find this pc isn't developing a lot of PTPs, but just cheerfully happily cogniting and going on and so forth and so on. It's a very good indicator.

Pc that develops PTPs in session about session – ha-ha! Bad indicator – which has its own story, because we're only taking up good indicators here.

And "pc with no question as to what was the right goal or item." Now, that works out in all levels this way: Is the pc afterwards doesn't come around to the auditor and say, "Do you think that was really the reason I had the lumbosis?" see? The pc stays certain of the auditing solution. PC remains certain of the auditing solution. That's a good indicator. It doesn't mean terribly much that they are uncertain of the auditing solution – that's not necessarily a bad indicator. But it certainly is a good indicator that the pc remains certain that that was the solution to the situation. And they said, "So-and-so and so-and-so and so on." They don't afterwards say, "Well, *wah-wah-wah-wah-wah-wah-wah*. I'm not sure, sure, sure. Whether the – because *wah-wah*." That – that's all the reverse of the good indicator. So the pc remains certain.

And of course this is a Grade III indicator of any level: "Pc not critical or ARC breaky." Any pc that is critical of the auditor is ARC broken. Now, I can guarantee that. And I don't know how many auditors I have been dismayed that I couldn't quickly teach this to. They learn it eventually, but it's – it's just pc says, "Well, I don't know, I so on and so on and so on. It was this – that sharp tone of voice that you're using" and so forth. And the auditor is always so willing to be reasonable. I don't know why you run yourselves down like this. They're so willing to be reasonable.

I'll take that much chit-chat in a session for exactly – measured actually, measured actually by astronomical instruments – one-thousandth of a millisecond. I'm right in there – *bang! boom! zoom!* Because it's not reasonable to me that a pc would be critical of the auditor in a session. I don't care if I've just dropped the silverware on the floor! You understand? That's not reasonable to me. Why isn't it reasonable? Because the pc is there to be helped and I'm there to help the pc and I am doing my best to help the pc and that the pc is then critical – well, I don't find that reasonable. I don't care what mistakes I made – it still is never reasonable to me. And it never will be reasonable to me, because every single criticalness on the part of a pc can be run back to an ARC break that the pc has just had, or to an overt the pc has on the auditor or a withhold the pc has not disclosed. And those are the reasons for the critical pc.

I'll tell you what's happened. I have actually committed horrible blunders in a session, see? I mean almost tipped the desk over type of thing, don't you see? Just *whoa!* You know? And a pc would just say, "Oh, well all right. This is – so what? And so on. So you tipped over the desk, you know?" You know, "Let's get back to what I was running here."

"Well, did it distract your attention...?"

"No, no it's all right. Didn't matter. Now, what I was talking about here is my father..."

Had this happen too often, see? The pc didn't pay any attention. But this time, you see, I just adjust my tie and the pc says, "I can't stand this terrific motion that is going on in this session."

Heh-heh-heh-heh-heh. Then I'm expected to believe that it's because I adjusted my tie that upset the pc. Hey, come off of it! This is why you need to know good indicators, see? That would never upset anybody! So there must then be one of the other things which I just mentioned present in the session.

So – "pc happy with, satisfied with auditor, regardless of what auditor is doing" is a good indicator. And you state that for all levels and you won't be wrong. And that's a very extreme one and you won't be able to understand it sometimes or anything of the sort. I've seen auditors committing the most horrible blunders and their pcs perfectly happy with them and so forth. Well, that's because auditor behavior and activity actually doesn't influence to any great degree the attitude of the pc. What influences the attitude of the pc is an ARC break that, of course, is influenced earlier by the auditor's behavior or the pc's got an overt on the auditor or the pc has a missed withhold of some kind or another. And they influence the pc's attitude toward the auditor, but the auditor's actual activity, as long as that auditor is even halfway trying, as long as he's in there sweating, as long as he's working, as long as he's trying to get his job done at all – doesn't influence the pc's attitude. How do you like that?

So you can broaden this to "pc happy and satisfied with auditor" is another good indicator. Of course, this is aside of the fact the pc is cheerful and so forth. You got it? Pc says, "Oh, and so-and-so and so-and-so" – well, there's something gone wrong in that session, man, that has to do with the pc's case, has to do with blunders of some kind or another – and any auditor that's reasonable about how he, of course deserves to be criticized for the horrible things he has done, of course, is just missing the best indicator of all. He's got a – that's a bad indicator. And something wrong. Doesn't matter what the pc's saying, there's something wrong in the session and it isn't actually the auditor's tone of voice. There's something else wrong. And if the auditor starts monitoring his tone of voice and so forth, he's a total chump. Then he never gets in and finds out what's wrong in the session, don't you see? So the reasonable auditor messes up pcs like mad.

All right. Now, "the pc not protesting the auditor's actions" comes under the same heading which I just gave you.

"The pc looking younger by reason of R6 auditing." Actually, that's true of almost any level of auditing. Pc looking younger, better, skin tone, eye color – these various things are good indicators, but not very common ones. But they are good indicators.

"The pc without weariness." In other words, the pc feels more energetic is the good indicator.

"Pc without pains or aches or illnesses developing during auditing." Now, always regard any pain, ache or illness that a pc develops during auditing as due to some error in audit-

ing. Some bypassed charge usually has occasioned this. And a pc should actually be without pains, aches or illnesses developing during auditing. Now, we don't mean that he shouldn't have somatics – we mean that he shouldn't get sick. He shouldn't have a terrible pain in his stomach which lasts for a day or two. And at midnight last night, why, he all of a sudden was taken with an awful pain in his chest and that sort of thing while he was being audited and so on. That means something was missed in the auditing; something is wrong and that something needs correcting.

Now, "pc wanting more auditing" is a good indicator, as you already know.

"Pc's confidence" – now we can just – "in finding goals and items" and so forth, we say pc's confidence. Well, pc's confidence – we've got a good indicator. Pc is getting more confident. Pc is confident is a good indicator. Pc getting more confident is another good indicator. There are two indicators there which are both good. Getting more confident about what? Well, actually I can get a pc so darned insouciant that he's practically insulting to me as an auditor – I'm perfectly happy. You know a pc saying, "Look at all the – look at all the stuff I found in the sess..." You know, you're sitting there and the pc wandering around in a rat maze, you know. And the pc saying, "Well, I'm getting pretty good, I don't mind saying, but I found fifteen – fifteen items that fast in the session and so forth and so forth and yesterday I only found ten, you know. And today I found... So, that's fine. Oh good, great, great!" And, of course, they just forget that you did anything at all. That's all right with me, man! It's all right with me. I don't have to be told I'm doing a good job. I know my good indicators now.

Okay. This, by the way, is the best thanks an auditor gets and the best guarantee that he's doing a good job of auditing, you see? If all these good indicators are present he knows he's doing a good job of auditing and doesn't have to be thanked.

Now, "the pc's itsa free" – that's good. That's a good indicator. But a pc's itsa so extensive you can't get any auditing in – that is not a good indicator. See? In other words, the pc's itsa is free but just covers the subject; doesn't beat it to death. You know, pc says it and that's it. Pc's itsa can be so extensive that it becomes a bad indicator because the pc is using his itsa to stop the auditor from auditing. And that is a bad indicator: too extensive, too involved and too disrelated an itsa. It betokens various things. And there's various grades of bad indicators there. So we'd say pc's itsa is free but not too extensive. That's for any level, and that's a good indicator. That's two good indicators actually.

And "the auditor seeing how" – goals, goals, goals – well, we can just reduce that to the auditor understanding how come that's that way in the case. The pc says, "Well, the reason I really have a bad foot is because there were all these moon rockets, see, and they kept going overhead all the time and so forth. And then my name – my name at that particular time was Israel and so forth. And we had a big library and it had ten tomes of tums in it and so forth, and that's how I have a bad foot."

And the auditor says, "What the hell? Where did – where did we get – how – why – what – which – which door? Where did he go? Where did he go? Where did he go?" Well, the auditor didn't understand what the pc's talking about. The auditor didn't understand the pc, that – that's – pc's not saying comprehensible things, which is a bad indicator. But the fact that the auditor can see how it was, is the good indicator. That applies to any level of auditing. The

auditor can see how it was. How it happened that way. Can see – can see that that is the way it was. The auditor can see that. That's a good indicator.

Pc says, "Well, I don't know, I got into this car and it went down over the hill and ran into a tree and it certainly pushed my chest in for a while and I was in the hospital for a while and I had a plaster cast on and we've just found out this whole incident and so forth." And the auditor sees, "Oh yeah, that's how he'd – that's how he'd have a restricted feeling chest." Plaster cast – restricted feeling chest; that's a good indicator. In other words, the pc is saying things that make sense. The pc's add-up makes sense. If the pc's add-up doesn't make sense, that's not a good indicator.

Now, "the auditor sees how" – and this is just some more of the same thing – "auditor sees how RIs solve RIs." That's just – comes under the heading of the one I just gave you.

And the life of this person making sense. The way this person tells his life and adds it up and that sort of thing, it makes sense. It makes sense. That's a good indicator. But you have somebody who tells you, "Well, you see, actually, actually, I was for a very long time a page boy at the Catfish Hotel and then I quit and that's how I became bank president," and you don't make any sense out of this, well that's – that's a bad indicator.

Now, that just – the rest of this is more or less the same but – and you've covered the last one there of pc not developing heavy PTPs or somatics between sessions or in sessions.

[This tape ends abruptly as did the original master recording.]

BAD INDICATORS

A lecture given on 9 January 1964

Okay, how are you today?

Thank you, I like you, too!

All right, this is what? The 9th of January, is that it? All right. Nine January AD 14, Saint Hill Special Briefing Course. And this is a lecture on good and bad indicators and such other bric-a-brac as you might be interested in. I probably should put that as an addendum on all my lectures, shouldn't I? The bric-a-brac department! Trouble is I come up with things, you see, that I'm not at all sure you have a good grip on and I have to tell you about them as I go along.

What I want to cover today particularly is good indicators. How'd they do yesterday on that test? Did anybody look at those papers?

Male voice: Well, I haven't heard the results, but there were plenty of good indicators in the sessions.

There were good indicators in the session. How do you think you did on that test yesterday? Well, speak up. I can hear you! All right, all right. Now are you getting the idea – you getting the idea of good indicators? All right. Are you getting so you can look at a session and tell if it's a session and not a session? All right. Good.

Now, this will make a great deal of difference to you in running a co-audit, much less make a great deal of difference to you as an auditor. Now, in trying to relay truth it is always necessary to develop some breakdown of auditing or something of the sort, and in trying to get something across to you, why, I ordinarily will develop some sort of a – of a system by which it can be communicated. And we're particularly interested in this system which divides basic auditing, technique and case analysis. And all levels break down to these and you have in each level, its basic auditing, its case analysis and its technique.

Now, what's quite interesting here about good and bad indicators and what I've been working on and I've been springing on you here is: is we've broken down case analysis. I've found out this was the weakest point – was the auditor's understanding of what was going on with a case. So we've broken this down. And case analysis breaks down into the general subject of case analysis and the system by which it can be employed at various levels. But case analysis now – and be alert to this because this is the way it is – case analysis actually breaks down to good indicators and bad indicators. And you recognize that I saw the frailty of case analysis here and actually almost unwittingly got to work on the subject and broke it down into good indicators, bad indicators and the bad indicator system.

Now, case analysis then is something that progresses all the time regardless of what your basic auditing is and regardless of what your technique is. And also regardless of what level is being run. What level of Scientology. These things are always present. Always present. And the running fire of case analysis – the running fire of case analysis is simply a noting that the good indicators are still with us and being alert when one drops out and then looking to see what bad indicator has appeared and remedying it. Which brings us back into the technique department. Do you see that now?

And case analysis actually considers the observation – the observation of a – of the good indicators as a continuous observation. And knowing what they are, and when one of them drops out, then this is a one-two-three proposition – then noticing what bad indicator has appeared and the case analysis at that point will then tell you what technical action to take.

Now, that you take a technical action isn't really a part of case analysis. So basically, the case analysis whereby you find where the pc probably is or where he's located – get some idea of where he thinks he is or something like that. Like he says he's in a present time problem or something like that, and you get his considerations about this and then you find out where he's really located. You actually now, technically a very – very – very – very precise, being very picky about the matter, that is really not case analysis. Because that goes from case analysis, analyzing what the pc's got there, back to technique, which is a process, "What considerations have you had about it?" and then back to case analysis. The technique having been employed to make the case analysis easier. You see that?

So that you have an interplay. An interplay here between case analysis and technique. And the technique you employ depends upon the case analysis that is done. So therefore, case analysis contains programing. It says, "Here is a preclear!" – I mean it's as – it's corny as this, you see? I mean just as plain, simple and stupid as this, you see. "Here is a preclear." All right, that's case analysis. And you thought I was going to say something else, didn't you? That's a case analysis! You got a case there, in front of you! See, that's case analysis.

All right. Now, let's do a most elementary case analysis you could think of, see. Here he is in front of you. All right. So case analysis consists then of the existence or presence of a pc. Elementary, huh? Now, let's go into the subject of bad indicators.

I've been teaching you about good indicators, now let's go into the subject of bad indicators. And let's go in this on a very, very broad subject, just so you get a better understanding of it. These are not to be... Well, of course, you can, if you want to list these things as bad indicators because they in essence are the very worst. But you don't think of them as bad indicators because they're all accepted on this planet.

But he's sitting in a body! See, drag! That's about the worst indicator you could have! Here's a thetan that's wearing a body! So he obviously isn't an OT! You get the idea? All right, bad indicator. Good indicator: Well, he's there. That's a good indicator. But, until we've done a little more education on the matter, or a little more thought on the case and so forth, we can't really tell if that's a good indicator or bad indicator because he might be not there hardly at all. He might have been carted in on a stretcher. But let's take a look at the fact that he is there and the good indicator – let's get very elementary here – the good indicator is he is there on his own volition. He volitioned himself into your presence. He's willing to be in your

presence. He is there. You got the idea, he is there. Now that's a very good indicator that he's there on his own volition.

Now, let's take a bad indicator. Now, here's a way you go about this, see. I'm going to break this down into the most elementary elements you ever heard of, see. He's there. He's there. And he doesn't – he doesn't look like he wants to be there, and he looks like he's going to depart and he looks like he's sad and sorry that he arrived at this point. And he's wondering how he got here and, you get the idea. What is absent here is "there on his own volition." See. That's a good indicator, see. Well, it's "there on his own volition" that's missing. He apparently is not there of his own free will or free choice. All right. So, we see that he's not comfortably there, see. We see he's not really there there, you get the idea. So we immediately say then, that good indicator's missing.

All right, what bad indicator is present? Well, he has to leave in a few minutes. He actually – he actually has an appointment with Aunt Gertrude at 3:32, and it's now 3:30 and so forth. And really, he'd like some auditing next month, but just now he's pretty tied up... These are all bad indicators. What's he telling you? What's he telling you? They all sum up to an unwillingness to be there. And the case analysis point, simply, good indicator gone. Bad indicator – not there on his own volition, apparently. And the rest of the case analysis then: he must be there on somebody else's volition. See, that's the bad indicator. That's the next obvious bad indicator. And you'll find out that's almost always to be true. He's unwilling to be there himself. Well, he's there because you told him to be there. He's there because you sales talked him into being there. He's there because his Aunt Agatha thinks he's crazy. He's there because of this. He's there because of that. You get the – you get the idea, so forth.

Well, our first hurdle in auditing has been met. And that's on the basis of no free choice. What's the remedy? Well, the remedy – well, your technique. But your case analysis is finished. You see that? That ends the case analysis. It's as elementary as that. You see, that ends the case analysis. Well, what technique do we employ? Well, now that depends on the level being answered up. That depends on the level.

That depends to a very, very marked degree on what level the auditor is at and what level the pc is at.

Now, let's look at this. Case analysis consisted of what? Good indicator that you would expect. Now, understand you would expect this good indicator. You expect it. And the expectation of this good indicator. Now, please, please understand this. A being in his native state, in a cleared condition and all that sort of thing would naturally act that way. So you're really studying in good indicators what is the natural behavior of a being. What is his – his ability to understand is pretty good. Now, he'd know you weren't going to chew him up. If he thought that he needed a few cogwheels adjusted, he'd be perfectly happy to sit there and adjust them. He can recognize somebody wants to help him out. He can receive help. He's in a normally cheerful disposition. He's normally fairly optimistic. He normally is not in an agitated state but is pretty calm and so forth. So you're looking at a subject called basic behavior. And looking at this subject called basic behavior we don't find basic behavior as it was represented in Freudian analysis. Or as it's represented in "psyrology," which is an animated brain pulsing about. We don't find basic behavior of this kind. Basic behavior, *whoa*, in psycho-

analysis, *whoaa!* All due respect to good old Papa Freud, we couldn't do without him. But dear old Papa Freud, *heh-heh*, he had the idea – and that was the current idea of his day, it wasn't necessarily his idea I don't think – unless you inhibited the living daylight out of an individual he couldn't be happy. Well, let's look at it. Well, he might have looked at it and thought about this, that you should uninhibit somebody and talked about this and so on. But if that was the case why did he talk about this thing called a "censor?" Why was this "censor" necessary?

Well, this censor was to take the basic, nasty, mean, nagging, critical, vicious, ornery, rotten, derogatory, slimy, sewer-brained thoughts of the individual and keep them from coming into social presence. So Freud salted everything down with the idea that you had to inhibit the living daylight out of somebody in order to get a social presence. You show me some inhibited goon, and I'll show you an inhibited presence that compares to, I don't know – I don't know – pretty – pretty grim. Pretty grim presence – 1.1 snarling and sniffing around, and *nyah!* and so on and making trouble for everybody, and car... This is the social behavior. In other words, what they accomplished there, was a fundamental error. And the fundamental error was not knowing or having any real idea or any decent concept of what native behavior would be. What is uninhibited behavior?

Well, the world has been crashing along on this crashing lie. And that is that inhibited behavior is social behavior. And that any uninhibited behavior is antisocial. So, the criminal is uninhibited. So, you have to take the criminal and punish him and put him in a cell and do this and that to him; you have to take the bad boy in school and you have to do this and that to him; you have to punish him liberally and if you inhibit him enough you will make a social being out of him. Well, I've seen some of the products made that way and they're not social beings, they're social catastrophes.

This is superinhibition. Now, if you can't do anything about a bad trait, you can, of course, inhibit it. But the net result of this is an inhibited being. A being who can't move, can't reach, can't communicate, to whom nothing is real and who has the affinity of stab everything in the back if nobody was looking and he had a chance. This is your inhibited being. But you can take somebody who has an obvious social quirk, you see. At parties he inevitably – he inevitably will pour his drink on the piano keys. It just seems to be something he does, see. Well, we can make so much disgrace out of doing this and so forth, that he ceases to do it, at parties.

However, a thetan's forward push, or forward force, in any good direction is actually never lost. I was very amused at something that Edgar told me. He had picked up an old pc of his while he was off on vacation and the fellow – he wanted to audit him and he wanted some auditing. So, the guy had an old, failed goal of some kind or another, way back somewhere. So Edgar could hear him about the failed goal, so he went back and picked up this failed goal and what do you know, he got the failures off the goal and the guy did an interesting *resurge!* I think that's interesting, isn't it.

In other words, the goal had failed. He had an old auditing goal, I don't know, not to be so colorblind or something of the sort, you see. And that thing had failed. He hadn't mentioned it or said it in sessions for just ages. It's a failed goal. Edgar goes back, and he takes the

suppressions off of this thing and sure enough, here the fellow has this urge not to be color-blind. Now, Edgar didn't put anything there, he took something off. In other words, a thetan's forward actions, desires and so forth do not fade away. They only submerge. So, we find our fellow... Remember that, man! You could learn no more about handling men and people if you knew that one thing, if you knew that one thing than any other single thing I could actually tell you in a breath of equal length is, their impulses do not vanish. They only submerge.

You get a mutinous army. You get a mutinous army. And you hang the mutineers. All right, that's great. That's great right up to the time they hang you! *Yeah!* They will, too! The army's all snapping and popping and everything's going along fine, and then they experience a little bit of a defeat, and this old goal will come right up to the surface and they mutiny. It's very interesting, you have to get at the basic causes of the mutiny, not suppress the idea of mutiny. You would have to eradicate the reasons and causes for the mutiny. You'd have to find out who'd been whipping it up. And if they had any real beef.

You know how the Catholic church lost England, don't you? That's one of the biggest losses of more recent times, more modern times, only a few hundred years ago. That was great! That was great, it's Old Henry the VIII. Old Henry the VIII. And he wanted himself a divorce from Catherine of Aragon. Suzie was telling me all about it this morning at breakfast. And I kept telling her, I said – she's reading a book on the subject and it reminded me of those times and I kept saying, "Well, my wife really shouldn't be associating with such people – that's for sure." I was shocked at the whole thing.

Anyhow, what happened? Mr. Pope Benedict Pius Innocent whatever he was at that particular time, I think he'd already had a mutiny from his German troops who were now looting Rome and shooting monks or something of the sort. In other words, he wasn't keeping a very good house – typical Earth leadership. And think he'd gone and gotten himself captured or something and he was all messed up. And Henry the VIII – here was – here was all of England which could have done something for him. So in a typical failure fashion, one of his GPMs went up – not Henry the VIII but the pope's – one of his GPMs went up into high level of restimulation and when Henry the VIII says, "Hey, pope, give me a divorce from this babe!" you know, or whatever language was used in courts at that time, probably that's more polite – that one.

Why, the pope says, "Well, fow – wha – we got to think a – our ecclesia – oh, uh – if we, hmm! Hmm-hmm-hmm-hmm! What can I get out of this? See, *woff-woff-woff-woff-woff*" So he sent a gouty old fool of a cardinal up to hold a court with orders that if they granted – if the court in England looked like it was going to grant them divorce to Henry the VIII, why then he was immediately to remove the court to Rome. And they were to continue the hearings in Rome and so forth. And he went on doodle-daddling and monkeying and horsing about and getting no place and so forth and he just had himself a time. The pope did, you know.

And of course, he was dealing with an inhibited humanoid called Henry the VIII. And Henry – Henry had very 1.1 characteristics. He might have done a great deal for England in some direction but he certainly did hold a grudge. And you know, here he was – pope says, "no divorce" – Henry the VIII, "divorce" – so he fooled around, and the court – so on – it goes

on for years, and he monkeys around, they won't give him what he wants, you see. Finally they more or less gave him what he wanted, or he figured it out and they put some penance on him, or something of the sort, I've forgotten what they did to him. It's not important. And Henry the VIII bided his time. And that old goal, "I'm gonna get even with that pope," that came right to the fore. And we now have a separate Church of England. He showed him! You get that? The pope really disciplined the living daylights out of him and lost England. You got the idea? That thetan didn't give up, you know.

Now old Anne Boleyn, who still walks around the Tower, they tell me up there, with her head tucked underneath her arm, she, played footsies with Henry for about nine years. I think that's fascinating. Played footsies for nine years and kept him waiting, and had the Duke of Northumberland or the Earl of Northumberland or somebody on tenterhooks and she wanted to marry him and she kept giving the king the business. And if you note amongst the Tower exhibits – you note amongst the Tower exhibits, I think you will find the ax that cut off her head. He married her all right. But there was only one reason why he ever beheaded her. He just wanted to get even. He just never lost that impulse of hostility that she had generated through not being reasonable.

Now, you look through history. You look through history and you'll understand situations; you'll understand men; you'll understand people; you'll understand teenagers an awful lot better; if you realize that those impulses never die. The person wants to do something. He wants to do something. To him it's perfectly reasonable. Probably is! And he gets crossed up. And somebody does something unusually or, arduously, complicated about it, you see. And inhibits him for some fantastic reason or another. You are not now talking about criminal impulse. We're just talking about a reasonable human impulse.

Little boy, he can't ever ride his bicycle because it hasn't got any new tires. Tires are all worn out, and he's patched them up to a point where they're mostly patches and he has to walk every place. And he keeps talking about it. And the family isn't poor but he just somehow or another for the good of his soul never does get any tires. And he'll go on like that. It wouldn't take anything that small. He'd have to be balked not on a havingness basis, which is man's adjudication, he'd have to be balked on an ambition basis. For instance, he wants to take some music lessons or something like that, the family won't let him have anything to do with it. Somehow or another he's going to get even. Somehow or another he's going to get a recompense.

Now, you want to know what teenage conduct is, and the standard feeling toward the parent which customarily, I'm informed takes place in the teens. And a rejection of the family on which tomes have been written. And which the most learned minds have shown how unlearned they were, and the great problem of juvenile delinquency – all those things. They arise out of this particular level of action. It isn't so much. The child actually never forgives the parents for certain things. You'll be amazed how tiny they are sometimes but they tend to mount up. And he really never forgives them. And you say forgiveness is the answer. No, forgiveness is dropping down another tone to propitiation. You've got to get to the source and cause of the matter. It's got to be brought to the fore. Auditing does this easily. All the time.

But he just never, never measures up to this and actually doesn't have it in the forefront of his mind. So in his teens he does a revolt against his parents. And in his teens he gives a kickback and so forth, which is a rejection. Now what is that? He's just on the verge of being able to fly loose and he's saying all of these things. Now there is the heart of man's ingratitude. There's the secret of leadership and so forth. It's the recognition of the fact that a thetan never really gives up.

But when you know that – when you know that, you know more about behavior than were written in all the volumes of the Greeks. And you know something as an auditor. Because what are you auditing. You're just auditing all the nutty aberrated inhibited times when he never gave up. When he postulated something silly. When he tried to do something stupid. When he wanted to go forward in some direction and couldn't go forward. And when he committed overts. As a matter of fact you can graph – I suddenly realized here, you could actually graph the – where the innocent social goal of the individual dies down, inhibited, to a warped – a more warped form which then is submerged to below that, overts. Which then is submerged below that to withholds. And you could graph that. And you could graph that about any tone or ambition.

Why does an individual have GPMs? Why, so forth. Well, let's take it in the largest order of magnitude. It's on that scale there. And out of withholds we get unconsciousness. And we get unawareness. So unawareness is the lowest level of that scale.

Now, actually unawareness itself has a scale which goes down into actual unconsciousness. You see some pc start to boil-off in a session or something like that. It's usually compounded by a withhold, whether the withhold is actually a part of what you're trying to get off the pc, in other words, he's already put his goal or something on the list, or the item's already on the list, or the assessed thing is already on the list. And you keep him listing. Well, actually that thing that he put on the list becomes a withhold and he starts boiling off, and he gets dopey and he gets drowsy. So there's the scale of how a goal – how a goal becomes warped, becomes an overt, and below that level becomes a withhold, and below that level becomes unawareness and below that level becomes unconsciousness, and below that level becomes humanoid. All right.

So let's look at this boy who has come into your auditing session. You thought I'd gone someplace and forgot what I was talking about, didn't you? I fooled you! Comes into your auditing session. Well, what's wrong with this boy? What's wrong with this boy? What's wrong with this girl? What's wrong with this person? This being?

What are the good indicators? Actually the most – the biggest good indicator is the fact that he is there on his own volition. And that's the biggest indicator there is. Because surrounding him, man, there is nothing but bad indicators. Well, you don't pay any attention to those bad indicators. Let me give you an idea how to handle these things. You don't pay any attention to all those bad indicators because you can do something about them. And what you are going to do is one by one eradicate them. And in any system in which you are using good indicators and bad indicators which is any auditing situation, you note the good indicators present, and think that's cheery-cheery, isn't that nice. You understand? And you can even go so far as congratulating the pc on them. That's dandy. We like all those. That's fine. Pc's more

confident. The pc has less PTP. You can even remark on them to a pc. That's fine. Fortify them. Validate them. Three cheers.

When an auditor doesn't, by the way, he's not really putting in a hope factor. What is a hope factor? A hope factor is validating those indicators which – those good indicators which are present. And that is a hope factor. You say, "Well, you were talking much better in the last few sessions to me." You know, hope factor. "Maybe we can even improve it a little bit more," you know. "Well, you've seen a little less pain, you say, in your head. All right, little less pain in your head. Well, that's very good. Now maybe in a few more sessions, why, we'll be able to handle it a little bit further." That's a hope factor, don't you see. That's validating the good indicator, which is a lessening of the somatic or the condition.

All right. The best one then is he's there. The next best one is he's getting better. Now, how do you mean getting better? Well, he's restoring the native state. He's getting more cheerful. He has less problems. He's less worried. He's less anxious. And a reverse of all those things which I just described is humanoid. You see? He's getting better. Well, I don't care what you're treating, it's getting better! Which we mean less present. And betterness to us is "less present." All right, his bad ankle is getting better. All right, great! That's three cheers. We're very happy about that. What do we mean exactly? We don't mean his ankle is less present but we mean he's – the badness of the ankle is less present. So that's a good indicator.

Now, how much less present? The degree of the goodness of the indicator. Well, it's getting better swiftly. Well, that's very good. But it's still just a good indicator. It is getting better slowly. All right, that's not so good but, so forth. It's still a good indicator, see. So we don't bother to grade it particularly. It's as long – now get this – as long as we can get a lessening of the bad points present we are making progress and that is all we ask for. And if you as an auditor never ask for any more than that, you're going to know what an auditing win is, and you're going to get auditing wins and so forth.

It's been my experience with auditors, they will sit and chew away on something endlessly as long as they are bettering the condition which they are attacking. They will go on endlessly. It's when they don't go on that I worry about and that all adds up to the fact it – the condition – isn't getting any better. They're – we're not getting a lessening of the condition. So we're – because we're not getting a lessening of the condition we therefore, have loses. So betterment to us is a lessening of a bad condition.

Now, look at this as a new look of auditing. Look at this as a brand-new look. If all – if all you did in an auditing session, and you didn't do any more than this, was eradicate – eradicate points which detracted from the idealness of the session, and if that was your total program with the pc, you would have some miraculous wins. Now, let me state that in another way. If you looked over the pc, validated the good indicators that were present and then one by one – and this is programing with regard to indicators, and you have to know this to handle the case at all – one by one attack the bad indicators and handle them. See, validate the good indicators and attack the bad indicators and handle them and restore more good indicators – and if you just audited that way – you didn't have anything to do with whether or not his lumbar was better or worse, or whether or not you flattened so many processes or added quantitatively up to you've gotten in eighteen dozen hours of auditing – none of those – none of

those – none of those things – don't judge auditing that way, that's quantitative judgment and it'll wind you up in the soup.

It's how many good indicators are you restoring. Now, if you looked at auditing that way, and you worked in that direction and only in that direction, as just a picky, put – well, I just say this – it's like – it's like making one of these cross-patch quilts. They used to knit a patch and then they would sew the patch onto another patch. And then they would knit another patch and they would sew the patch – just endless, quilting of one kind or another where they were making each one of the pieces and weaving each one of them. And you just took the case, and you just took all of the good indicators, and recognized those because you see if you don't recognize the good indicators you can't look for any bad indicators and that's for sure. Recognize those good indicators, and then, and then look for the bad indicators. And then instead of taking a broad jump at the case and just hoping the good indicators will get better and materialize, you carefully took each of the bad indicators that were present, and without reducing the good indicators that were already present, turn that bad indicator off and turn it into a good indicator. You understand?

Now, I'll give you an idea of this. If that was all you did, in auditing at – now I'm talking of course, in auditing at Level IV and below – if that was all you accomplished in auditing, at any level of auditing at Level IV or below, that was all you accomplished, you would be the most successful auditor that anybody ever had anything to do with. And that is the secret of it. You'd just be successful beyond all success.

This pc is *always having present time problems*, and so forth. And this you just go ahead. Your pc's perfectly cheerful, perfectly willing to talk to you, got all that handled and so on, and you can go on, but the pc always has had present time problems. Boy I'd just go to bat, and I'd make a project, just out of this one thing. Well, let's see if we can't reduce the incidence of present time problems in this case. Not by eradicating each problem as it comes up – let's get at the root of the problemism of the case if we possibly can. Without, of course, going into VI – Level VI. Of course, you would get at the problem because that's the whole basis of the case. So what you want to do is destimulate the situation. Let's look this thing over, and let's handle it on a basis – we don't care what this pc is talking about otherwise or doing otherwise and so on, let's just get down and let's take this one bad indicator. The pc has present time problems between every session.

Let's then not sit there. Because that's a bad indicator. Well, of course, these problems are serious enough. But what is wrong with this case? What is wrong with this case at this particular time? The most dominant bad indicator present is the pc's having lots of present time problems between sessions. All right. Let's take that up as a project. Let's roll up our sleeves and let's just work on this. How? Well, all right. At Level I, it'd be on the matter of discussions: the values of problems, and what problems do, and what they are, and how one goes about solving problems. Let's just have a high-level discussion on the subject of problems. And let's go on and on and on. And let's ask him about what might be generating the problems in his life and let's just discuss this. Let's just whip this thing to pieces, meanwhile keeping him talking happily and cheerily and so forth, to us. And all of a sudden you're going to get the darnedest resurge in this case. Now, it didn't matter, you see, whether you did this in a week or ten weeks, or five minutes. It didn't matter how fast this was done. That case going

to get a big gain. That case going to get gain that's real to the case. He's going to finally sit down and he's going to say, "You know, I don't have any problems in this session."

He might not make a big deal out of it because it's a negative gain always – the disappearance. You see, that's one of the things that's very interesting. You know once you get rid of a bad indicator or something wrong with a case, the test of having gotten rid of it is whether or not the case ever talks about it again. If a case goes on talking about it then we haven't gotten rid of it. So we've got a negative gain. Therefore, we can conclude our philosophy about the fact that what's wrong with man is his additives, his bad additives. That is correct. Because when we delete them he is better.

So, if we delete them and he is better our bad additives are gone and the fellow doesn't even think about the bad additives anymore. That's one of the things that sometimes puzzles a new auditor. He's just gotten rid of all these fellow's carbuncles, you know. And the guy was talking very interestedly about his carbuncles just one session ago. But all of a sudden they all went. And he didn't have any carbuncles now and what's all this about? "Well, how's your carbuncles?" And the pc says, "What carbuncles? Oh, the carbuncles! Oh, yeah, all right, well, what – why do you mention the carbuncles?" The auditor says, "Well, I..." You know, the pc has never – never mentioned carbuncles at all. Pc is now interested in the fact that he's having dreams about freight cars. And this is his problem. Negative gain. You're always up against this negative gain. Because the auditor isn't trying to discipline the pc, you see, he's up against negative gain.

So if we just took these bad indicators, one by one, and we sorted them out, maintaining the good indicators and taking the bad indicators away, we'd find more good indicators appearing. And boy you'd have a velocity session. Theoretically you could build a pc up this way to a point where he would actually just blow clear on inspection. Theoretically. He'd become quite a powerhouse. All by himself. And you know your gains at the lower levels of auditing are all based on that. It's all based on that. They're not based on plowing the pc in or eradicating something which the pc doesn't have anything to do with. They're based on, technically, destimulation from Level IV down. The more you try to run anything out at those levels, why, the more trouble you're going to be in. Level IV gets up, there are some things you can run out and so forth. But at lower levels, you're going to run out all of this fellow's something-or-others, and so on, and you're going to run these out. That is a project in auditing. No, that's a lousy auditing goal. We're going to get rid of his bad indicators and build up and enhance his good indicators. And that's what we're going to do. Now that – that's a good auditing goal. That's good. That's good for an auditor to do.

Now, look at the things you could tackle and look at the very orderly progress that you could go forward with here. Number one. Number one. The good indicators and so forth, we have spotted and we notice that there is the pc's body – is in an uncomfortable sort of a state. And so forth. And we see in a little examination of the thing that we have this indicator present: The pc's nervous about being audited. Well, that's a blunt enough indicator, isn't it? It's a bad indicator. Pc's nervous about being audited.

Now, let me show you just this – this chart here. I'd give a great deal to have myself three or four months to sit down and get a lot of material together and so forth. I'm having

quite a time of it here. I'm faced with fantastic quantities of research compilation and developments, and getting just recording material and getting stuff down, and it's gotten me just a little bit overwhumped. And I'd – I'm trying to get around to giving you all the bad indicators and I must apologize for not having these things in a complete scale form. But I'll give you the form in which they are in.

All right. Here's a bad indicator. Number one: Pc nervous about being audited. This is bad indicator number one, see. All right. Level 0. At Level 0, you can explain Scientology and what auditing is to the pc, and see if the pc is there of his own volition and try to get him to come there of his own volition. See, in other words, get him to decide, not come there under protest. Level I. Of course, all later levels have the earlier level in there, too. Level I, we reassure the pc that auditing is not an effort to make him guilty or accusation of insanity or something of that sort. To make the able more able. We get other people's ideas, opinions and so forth, of treatment and what it might do to him. On an intellectual basis, try to cope with his various protests, his auditings, his self-determinism with regard to being audited. In other words, a discussion of his being audited is really what this amounts to at Level I. But we assume as I just told you a moment ago, we assume, that well, he's not there on his own determinism. He's there on yours or he's leery of this thing and so forth. He's got to make up his mind individually to have a goal not – to be audited, not to be forced to have an audit, because he won't get anyplace.

We've had – we had somebody around here for a long time that just had a – had – was there because somebody else wanted him to be there, and so forth. It goes this helly, you see. If an organization suddenly says to some poor staff member who has just found the most beautiful girl he has ever seen, and so forth and he's making time here, and all of this looks beautiful in the future and all of a sudden the Association Secretary points a long and accusative finger at him and says, "You are going to go get trained at Saint Hill." And he suddenly sees he's there for a year and his girl is going to run off with another man – he knows what's going to happen. And so forth, and he doesn't want to go, and he gets here and you know he can't really study. And he can't really make case progress. And he can't do anything else. Why? Well, number one here is being violated. The pc is not there – under his own volition. You can also say the student isn't there under his own volition. The student or the pc isn't there under his own volition.

That's why – by the way – I was going to get out a policy letter on this and I will. And let's make a policy right now: if you don't have – if you can't get somebody to be audited or trained on his own volition, don't audit or train them. And boy, you're going to – you're going to get rid of all your loses, right there! You'll get rid of them before they begin. And I'd like – Course Administrator down here, if somebody shows up, to go over this rather – rather strenuously with them. If they're here because they want to be here or if they're here because somebody sent them or are they here for some other reason than to be trained or audited? And somebody ought to take this up with them rather strenuously. And if they are such a thing as an organization personnel and we find out that – well, they were sent by the Continental Director and they really didn't want to come very bad, but they were ordered here. Now, the point is do we do anything to alter the situation by furnishing auditing, or do we teach that organization particularly a lesson by simply just putting the person back on a plane and send-

ing them back. And I think the last answer is the right one. Because they had no right to ship this person here under his own duress. Because he won't make any case progress and he won't make any class level progress or anything.

We know this, see. We know this. We've got the records to prove it. Any time anybody was ordered to Saint Hill that didn't want to come or already thought this or already thought that, it didn't matter who, that person is now nattering around. And any little rumor you hear about Saint Hill from – Jack was telling me the other day he said, "You know I hear all these rumors about Saint Hill, all bad, and so forth. And everything is so tough and everything is so awful," and so forth. And he said, "It's all – it's all... Come here and find a well – ordered, well-scheduled, well-conducted course and so forth – and very helpful and so on, no part of this seems to be true at all."

Now, where'd he get – what was the source of those rumors? Well, they must have been people – the very few people, it's a very few handful, you see the bulk of the students here, that are here under their own volition believe me! They're climbing over hedges to get to Saint Hill. But because this is so general and because everybody supposes everybody would want to go to Saint Hill and anybody ordering to go to Saint Hill never thinks twice this person might not want to. This person might have some bad withholds or something. He'd be afraid I'd find out about or something like that. And just feel *awful* at the idea of going to Saint Hill. It's *terrible*, you know. And come here and practically get sick and collapse and everything else. You know, all kinds of reasons back of this sort of thing.

The stunt here would be to better this bad indicator. Well, audited under his own volition. And as a subhead of that, is pc nervous about being audited. See? That's your bad indicator. And your bad indicator leads you immediately to suppose that the pc is not there under his own volition. See, that's the conclusion, and the Level 0 – of course, all he can do is explain Scientology and what it is to the pc and get him to make up his mind. Sell him a little, but we can't do very much about it. But we could do something. And at least find out who wanted him to have auditing. And then at Level I, well, as I've already given you, reassure the pc and so forth.

And Level II. Level II, well, Level II. Oh, we can run such – well, let's get real corny. I'll show you how corny this could be. Just figure out some repetitive process at Level II of, "What have you had to do that you didn't want to do?" Or, "What orders have you had to follow about your health?" See, we could just dream one up that would fit the case. All of a sudden it turns out this fellow's been in the army and he was always being sent down for inspections of some kind or another. It was all very embarrassing, and it was this and that and he's got auditing tied in, you see, with nonvolitional responses. He didn't choose to be there.

So we straighten this up. And at that level of course, we can run general O/W. We could run general O/W also as an action. Just general O/W, and we could get in such a thing and well, Level III – Level III we'd pull some missed withholds. Of course, for a person being audited on Level III, he's been over the jumps. But we could pull missed withholds about this and we could choose a suitable subject, on auditing or treatment or on past auditing, or on auditing goals, or on past auditing goals or some such subject like that, and prepcheck it. In other words, this would tend to straighten out all of this. And we'd peel a lot of idea about

being audited under protest and being forced to be audited and so forth. Such as "On being forced to be audited has anything been suppressed?" there, you get the idea, you see. If you found this was really the case.

Also at Level III, why, you could run what was formerly R2H or run 3H. Just ARC breaks in general or something like this. Person's had ARC breaks. Or remedy it by the early levels. You might find out after a while that somebody's missed this, you know. Person came into Scientology in order to make their husband guilty. Well! They've forgotten it. That's what's the joke. They've forgotten it, they wonder why they don't make any case progress, and they *waff-waff-waff-waff-wa-waff-waff-waff*, see. You've got trouble – trouble – trouble. What is all this trouble coming from? It's coming from their basic ideas about being audited. And they never wanted to be audited, and they never wanted this, and they never wanted that and they sort of drifted along. "Well, Harry would have left me if I hadn't agreed to take the HPA Course." And here's a... one of our poor Instructors down here, beating their brains out, trying to get this person to sit up straight in an auditing chair. They can't do it. You sit them up, rag doll, they fall off the side of the chair, you know. I mean, they can't confront, can't run TR 0. Just this – somehow or another it's all kind of missing somehow or another.

All right, some smart auditor looks at this idea, the pc's always late for his session. *Hmm-hu-hu-hu-hu-hu-hu-hu*. Bad indicator. And during session the pc seems to be nervous. And so a bad indicator. What's missing here is calm pc on time for session, see, those are good indicators. So those are missing, look for this other one. Pc nervous, and he's only late, so forth – *wah-de-da, de-da, de-da, de-da*, all right. Somewhere along the line here we've got audited not on own volition. We've got in Scientology not on own volition and so forth. We're going to plow into that, man, were going to straighten that up.

We give you the idea up here, at Level III you'd be using this kind of a remedy, don't you see. I've just given them to you. And we get over here at Level IV, oh my God, Level IV – we just got the book open. Because we can find out how auditing – being audited would make somebody – or refusing to be audited would make somebody wrong. And would make themselves right. And we've got all the kinds of service fac stuff here, and we've got assess for ARC breaks with auditors, practitioners and ARC breaks with life, or ARC breaks with various processes that the person's been run on, don't you see. And we locate and indicate the bypassed charge on it, and we run routine ARC break assessments for the sessions, and – they've had. You know, that kind of thing. We just keep putting it together here. But of course we've got all these earlier remedies and we – that still goes back to the possibility of audited under no volition.

We – if we found at – by the time they got to Level IV, if we just found one session, which they were audited and they were – had a withhold during the whole session they sure as hell didn't want to be audited during that session. We'll get that and what do you know, we're going to get a little resurge in that particular case. Because this is a *very key point*. Very, very key point. All right, so we straighten it up.

Now, let's take another. Let's take another bad indicator, high-generality bad indicator. And we get pc unfriendly to auditor. Well, that has varying degrees. He's critical of the auditor, or just cool and unappreciative. Now, how many unappreciative pcs do you know? Well,

that's a bad indicator. All right, so obviously the good indicator must be that the pc is friendly to the auditor and appreciative of what the auditor's doing. All right, the bad in... well, that's not there, look for the bad indicator, and you all of a sudden find the pc's kind of critical of this auditor and he's very cool about things. And the pc is – the pc – the pc is perfectly cool, calm and collected, but never even says thank you for a session. Now, what do you think about that? Now, how many of your pcs, here and there have never done this? All right, that's a bad indicator. Bad indicator.

Now, what's this mean? What's this mean? Well, we're opening the door of course, on the whole phenomena – the whole vast phenomena of withholds. Overts. Communication cuts. Itsa cuts.

Now a cut itsa can be cut by the pc having a withhold which prevents him from it-saing. He's got the withhold, the auditor doesn't have anything to do with it, don't you see. But the pc will be unfriendly to the auditor. Now how does the auditor get this? How does he get this straightened out? And that's the whole subject of how to get by this fantastic, inhibited, swirling, howling mess of inhibitions and still string a communication line. How do you do it? Well, sometimes it's very tricky. But if you just did that – if you just worked on that. Get the pc to be friendly to the auditor. Well, how would we do this? We'd run various processes. We'd handle it in various ways.

We'd say, "Well, in general in life this pc..." Well, I mean, we can defeat ourselves. We say, "In general life this pc's pretty cool. This pc's pretty cool. This pc is not very friendly to people. This pc is detached," and so forth. Well, to me that'd just be a challenge. It'd be a challenge, auditing can overcome that. Auditing consists basically of picking up the postulates, incepts, considerations, ideas which the individual has had and the problems which the individual has faced or confronted. And lower levels of auditing you usually address to just the one lifetime. Don't you get too specialized on solutions and so you never – it's true that solution gives you the tone arm action. But if you totally ignore the pc's wish to talk about problems, why, you're not going to get more itsa. One of the reasons why you run out of itsa is because you specialize in solutions and ignore problems. And you've got to sometimes sacrifice some tone arm action, and get the *wham-wham-wham* in on the subject of what problems have you had, fellow, in order to get something to itsa. Remember this.

Actually, if you spent fifty percent of your time on itsaing solutions, and fifty percent of your time on itsaing about the problems the individual has had, your case would stay in balance and you'd be stacking up tone arm action for the future. Even though it was cutting a bit of tone arm action at present. This is something that I'm sure you're hearing with great happiness right now, because you're – been a little bit afraid to attack problems. Well, I'll sure never be afraid to attack problems.

I'm liable to go right on down the track and find some basic problem the pc has had, and I don't care if I was sitting there for fifteen minutes with the tone arm not moving. When I do hit the jackpot, I'm going to get motion! And I'm going to get motion in that tone arm, and then the pc's *yip-yip-yip* on the subject of the solutions and what he's done about that and so forth – that's going to more than make up for that lost time. One of your reasons why your pc runs out of fat and you haven't got tone arm action on him anymore, is you really don't en-

courage him to dig up problems that he has, in the past, had to solve. It's a fifty-fifty proposition. The reason for that is, of course, at Level VI you will find that fifty percent of the RIs are oppterm and fifty percent are terminals. And they give you an equal amount of TA action actually in running out, and oppterm consist nothing – of nothing in the world but stated problems and terminals consist of nothing in the world but solutions to those problems. The fixed solution to the fixed problem. So you've got the oppterm as the fixed problem; you've got the terminal as the fixed solution.

So you see that if you could get somebody to state the real problem, you would get as much tone arm action, you see, as you'd get if he gave you the fixed solution, see. It's all in the cards that it'd be that way, at an upper level. But if you start working this too hard you move him back into his GPMs. All right, well, you – so therefore, you handle problems a little less heavily than you would ordinarily, and you don't try to search arduously for problems in the pc. But you don't start specializing a hundred percent. You really want to spin some pc just audit nothing but problems. The pc talks about problems, and just audit nothing but problems and ask the pc about – "Now have you got any more problems? Uh – oh yeah, well, that's a pretty bad problem, that one is," and so forth – and problems, problems, problems, a hundred percent about a problem. You're going to bog the pc.

Similarly, however, you'll bog the pc if you only talk about solutions, without having any problems. Because of course, the pc is going to become an – unfriendly to the auditor if the auditor never gives him anything to talk about. And the pc's basic interest is in some problem he has had or has. Do you see? So you've got to give the pc something to talk about, otherwise the pc can't itsa at all. And you might find that the unfriendliness to the auditor is the fact just – basically just the fact that the auditor makes the pc's case a missed withhold. Makes the pc's problems a missed withhold. Because the auditor will work for too long a period of time stressing some particular point in a pc's life, and not let the pc branch off sideways into the ramification of other problems which have accumulated around that particular point. But that's a problem of just cut itsa.

We're talking, however, in this bad indicator, the pc's unfriendly to the auditor. All right. Heh! Your Zero trick would be to get the pc to explain the damage the auditor might do to him or her. That's about as far as you could go on the 0 level. What damage, and so forth – and the pc, of course, that's a lousy solution, by the way, because the pc of course, is going to add up a bunch of critical overts and so forth – in the thing, but it is better than nothing. And it will do something.

Now, if I could get somebody to explain why he shouldn't be audited, you see, that's the same question. Just tell me why you shouldn't be audited, I will get the fellow finally into a very, very friendly discourse. I'll finally get the guy into session. So this is actually not necessarily the lowest-level solution, this is merely the crudest solution, but it's a workable solution. You've got old Grandma, she's sitting over there with her ear trumpet, and she's saying "This stuff Scientology, ever since George and Charles got into Scientology and so forth – and *so-so-so* and *nyah-nyah-nyah-nyah-nyah-nyah-nyahnyah-nyah-nyah-nyah-nyah-nyah-nyah-nyah!*" And we know that this is going to be a mess, man! Because we've got an un-auditable person. Well, we choose this pc as an auditor, right away, the pc is being audited not at her power of choice, we've already broke the back of that one. So we've got an uphill climb

here, man. So we could kill the two birds with one pc on the basis of saying, "Well, just explain – explain to me why – why you shouldn't be audited."

"Oh, pooh-pooh! Nonsense! Uh-ho! Wa! And so forth! Yip-yip-yip-yip-yip!" And the next thing you know she would be sitting there telling us, "Well, actually I have a small pain in the back of my shoulder that I wish somebody would do something about – of course, you probably couldn't do anything about it, but I wish somebody would do something about..." so forth. This is one of the oldest tricks I ever saw. I heard over the intercoms – listen systems, used in Central Organization one time in Washington. A staff auditor back in those days, giving the business to a sea cook who had dropped in, who was pretty drunk most of the time, and he was clearing help. And boy, this guy just couldn't answer the question, couldn't do anything. He was actually upgrading this; he should have started at a lower level. But he actually walked it in on the subject of help. And I think at the end of one hour – I think at the end of about an hour, the fellow finally found a way he could help the auditor. He finally found it; he got very expansive on this particular thing, and really started to get very friendly and go into communication. *"I could go out and find a bottle, I could find a couple of boys out on the waterfront, see,"* and he *"could really help him by doing that, and so on, have – have a good time, he really could help him."* And yeah – he could help him and he started in, and the next thing you know they were – he just felt very friendly to the auditor and everything else – wildest demonstration of something or other I ever heard of! He was just remedying this one point. The guy didn't want to talk to the auditor. He didn't want to be audited either.

All right, so don't sneer at your lower-level remedy. Your next level there, of course, I. You could get the pc to explain any trouble he's gotten into by imparting confidences or talking too freely. That's pretty – pretty clever. Most anybody who is – who is unfriendly to the auditor and so forth – is afraid of talking, that's sure, because it's all based on missed withholds of one kind or another, but let's get him into this, and of course, that gets off a few missed withholds. Get the pc to explain any trouble he's gotten into by imparting confidences or talking too freely. Now, it gets the pc to give you long expositions at Level I, on the subject of the dangers of free communication. And you're going to get yourself some interesting stuff.

This I'm giving you is grass-roots stuff. This is cold, out of the – out of the basic dregs of human relationships. These things have worked – these are the last tools in the kit, ordinarily, and therefore they are put at those particular levels. There are a lot of other such tools. But those things have been very good.

And at Level II, you'd get A: "What would you be willing to talk to me about?" which is a standard remedy or similar processes. And don't get hung up on that as the only process; use your wits and imagination. You're trying to get the guy to as-is various reasons he won't talk to you and run them out, and so forth. So you've got a lot of processes there that you can use at that level. And B, Level II B, would be general O/W on auditing or auditors or general O/W on auditor or auditors. That would be the – not auditing, but auditors. You'll find – you'll find a lot of stuff there, man; you'll find a lot of stuff. You can really dig up a lot of stuff.

Now, number three, Level III, of course, you're getting into more high school actions, you could pull missed withholds about auditors or auditors. What withholds have auditors missed and that sort of thing. And you could prepcheck auditors or practitioners and help or

failed help, as indicated, see? You could prepcheck, in other words, help or failed help, see. And you're getting into this auditor-preclear relationship. That's all the thing you're trying to improve. And then of course at Level IV and so on, why, you start pulling the cork on the subject of help, failed help, on a sort of service facsimile basis and so forth.

"Now, if you were really helped by auditing, if you were really helped by auditing and so forth, if you were really helped by auditing, how would that make you wrong?" *He-he!* Interesting question! And "If you weren't helped by auditing at all, how would that make you right?" Now, the better question of course is "How would you be made right by not being helped by auditing." But that's quite – of course quite accusative. But you've got that and all the lower remedies.

Now, of course, Levels V, VI, VII, we naturally use these lower-level remedies, and they have their own bad indicator systems, and we consider the individual is far above being unauditible and having such problems. And as a result, why, you find nearly all these problems occur at Levels V, VI and VII, these problems occur, you know, unfriendly to the auditor and nervous about auditing, and that sort of thing. But they stem from the root stuff of the mind. And the thing you've got to do is straighten out the track. Where's the missed GPM? You know, where's the missed items? What's happened here? Where's the bypassed charge? What's – that's – that sort of thing.

Now, I'm just giving you some ideas here. You'll eventually get this stuff in the form of bulletins, and so forth, with scales and so forth providing I ever get myself squared around here to a point where I can get you out the scale. I don't know if you realize the level of precision that's required. I worked for some little time to give you just the assembly of stuff on just those two points and so on. It isn't that it took me long, actually, to do it, but it takes time to do. And I like to give them with some precision.

Now, let's take up another bad indicator; the pc nervous about being audited in a selected auditing room. In the selected auditing room, the pc's nervous about being audited in that. Well, that's the auditing environment. Now, we've got the subject of auditing – look how elementary we're getting, see, back to 1955. The subject of auditing, the subject of auditor, the subject of auditing room and the good indicators are present when these things are accepted and cheerful and all that stuff, and the bad indic... and you – when those aren't present then you look for the bad indicators and you'll find out that they run down to – and get this – these things always run down to a magnitudinous present time problem of some kind or another, which you could handle. These things always get into that or they get into some horrendous ARC break on the subject, and you clear those things up, you've done a lot for a pc! Don't think you haven't.

Now, I'm not going to give you all the levels – about the auditing room, they're quite obvious. When you get up to Level II you're starting to – your first levels are environment and havingness is Level III and discussions of the dangers of the environment at Level 0 and that's of course where Level 0 lives. The dangers of the environment. So if pc's nervous about the auditing room, why, the dangers of the environment. You find mostly it solves on that one spot. "Well, it's all right but the room we're in somebody might bust in any minute and I'm in the middle of a comm lag and startle me out of my wits." Well, all right, dangers of the envi-

ronment. And number one, why, dangerous environments. That as a subject is perfectly all right, the trouble he's – trouble he's had in auditing rooms and in practitioner's rooms and all of that sort of thing and let him get some of his solutions off on the subject of how he has gone about solving it.

As I said Level III – Level III, you're – Level II, III, you're in clover, you're getting up into your havingness levels. And at Level IV, well, you – the roof's the limit. You've got discussions of associative restimulators you will see in there eventually. Finding things that are not restimulative, things that are safe. Of course, that is quite runnable – quite runnable down at Level II, it's perfectly allowable process. So that one – dead-easy.

What I'm trying to give you an idea of here... I'm not trying to give you all the textual material because the textual material of this for heaven sakes is staggering. I mean, the amount of cross-reference and coding which you get into for all of these levels for all auditing bad indicators is quite interesting. And what's horrifying to me is just the amount of work I have to do on it and the amount of accuracy it has to have. And what should be horrifying to you is if I didn't do that very neatly because you're going to have to know them all. I should have it written up very neatly indeed. It ought to be put together very well.

The point I'm trying to make with you is the organization of this sort of thing – the handling of this kind of thing. Now, if you – if you want a mental exercise and you know – you know actually I'd far better that you sat down and extrapolated it for the good of your own – hey, what do you know – for the good of your own immortal soul! That's pretty good, heh? By the way, where are you keeping it these days? The... I'd much rather you sort of dreamed it up, and worked over these things. And if I had enough time, and you had enough time in the matter, I probably wouldn't train you any other way, on any other level.

I'm trying to give you the woof and the warp, the put-together of this kind of action and the handling of it. And I'd like to give you now an exercise. Like to give you an exercise. Now, I don't want your papers on this or anything of this sort. But I think it might be good for your immortal soul – I think that's probably an item that one of the earlier saints had or something. He probably had an item called "immortal soul that burned holes in the back of his neck" or something like this. I think you should write down a list of the bad indicators, which would be present at your own level auditing or any lower level. Don't bother too much about the level organization of it but just go ahead on a basis of dreaming up all the bad indicators that could be present if a *Homo sapiens* were shoved into – and now get that advisedly – a *Homo sapiens* were shoved into your auditing room. I said *shoved* in. And all the bad indicators that would be present and what you might be able to do about these things.

Because one of your troubles as an auditor is the trouble any auditor gets into. He hasn't, every time measured up to the bad indicator. He's seen the bad indicator, he didn't – he's too busy coping with something or other to do something effective about it and so he slipped his gears with regard to it. He hasn't paid much attention to it; he's lost his temper instead or he's done something or other that was totally ineffective. And you've seen situations like ARC breaks and that sort of thing that you couldn't handle. And eventually you get less brave in the subject of these. But do you know that it is well, well, within your control. I mean that! Well within your control to be able to take somebody who was dragged into your room at the other

end of a chain! And eventually have him decide with the greatest cheeriness in the world, that was just exactly where he wanted to be, not because you overwhelmed him but by picking up his various considerations. Oh, it might take you – might take you months, of momentary meetings with this character and so forth. But it's well within your power to turn him into a high-flying pc. I don't care how he was dragged in.

That's interesting. It's an interesting challenge. And it's all on the basis of seeing that a good indicator is missing and then looking for the bad indicator and – I don't care how many dozens of bad indicators were present – then selecting and here's the key of it, see, here's what's going to give you wins – then selecting the one which is most in the road of auditing, and – using that as a criteria selecting it – one by one, eradicating those bad indicators. Each time using as your criteria the bad indicator, that – you choose it because it is most in the road of your auditing. Always choose that, that way.

You can make out a list on this one pc, let us say, of sixty bad indicators. Oh! It's a horrendous and overpowering list. See, long! Now remember, the key is: handle those bad indicators – that's auditing the pc in front of you – handle those bad indicators one at a time. And how do you find which one to handle first? It's the one which is most in the road of your auditing. And now, how do you choose the second one you're going to handle? It is the one which is now most in the road of the auditing. And what happens if some other one suddenly moves in during a session and gets in the road of your auditing, so that you have to handle that, too? Well, that's your problem! I'll not give you any fixed formula for that. But it will only occur because you've done a lousy job of basic auditing. I don't think I ought to give you a solution to it.

You just go on plugging with a good job of basic auditing, using a technology adapted to the remedy of that bad indicator and converting it into a good indicator that you're working on. It's just – it's like this: "Well, Mr. Smith..." – I saw Mary Sue handle a mad woman one time. It was just fantastic! Woman was throttling her and howling, and so forth, and actually I don't think that there was very much auditing connected with it and so on. But just one bad indicator. The person couldn't keep in mind who the auditor was. Kept losing track of the auditor. And the auditor would give an auditing command about something about the environment and then, the pc would lose track of who the auditor was. And the auditor would say, "Who am I?" And the pc would say, "Oh – you're – you're, uh – Aunt Agatha!" or something. "Oh no, no, of course, I know who you are, of course, I know who you are, you're Mrs. Hubbard," and so forth. And it was all very fine. And you know that pc came through a psychosis which had prevented the pc from ever going near her husband or living in the country where he had to work. And she left for the country shortly afterwards and so forth. So don't think that clearing up one of these auditing points, you see, is a light result. It isn't.

I ought to get Mary Sue to tell – you get Mary Sue to tell you that story sometime or another because she tells stories very, very well, and it's really a howl. But that was just this one thing – just this one thing is: identification of the auditor. And it straightened out a psychosis. So don't think that you need wild numbers of techniques at lower levels. You don't. All you need is to be able to recognize good indicators and when they're not present, recognize the bad indicator that's present and then go ahead and handle the bad indicator. Convert the bad indicator into a good indicator, take your next bad indicator, handle that, convert it

into a good indicator maintaining at the same time all the good indicators that were already present. Of course, it's kind of tricky, it takes some experience and so forth. Boy, you'd have pcs flying if you did that. You'd just have them flying.

What I've given you here is a system by which this is worked and evolved. Much more than tremendous quantities of data concerning it. But the organizations of the system is simply that there are many bad indicators, many bad indicators. And bad indicators are bad indicators, until you get up to Levels V and VI they are merely handled differently. The indicator doesn't change much. The indicators are there. But when you get to Levels V and VI you of course, get other bad indicators of a lighter nature which can block off and prevent other indicators from happening, which are not present at these lower levels.

But you can have some wonderful – wonderful success with cases, working on what I have been telling you. And remembering as you work that no matter how light it is or how modern or how much in this lifetime it is, this person at sometime or another has had a social idea which became thwarted. And if you can trace those things back, no matter how you are working the case, if your auditing is directed mainly in that particular direction – is eradicating these wild offbeat ideas, thrusts and impulses of the individual. In other words, the motivations back of his overts – your original times when he decided this or that about something or other, by George you're gonna – you're gonna have pcs that really fly. And then, of course, you get up the upper levels you can run out the GPMs, of course and things that made him have those impulses in the first place.

All right. I've shorted you up a little bit here tonight – I overtalked it by five minutes, I was five minutes late, so you can be five minutes late for your sessions. Okay?

Thank you very much. Good night.

AUDITOR SELF-CRITICISM

A lecture given on 4 February 1964

All right. How are you today?

Audience: Good. Fine.

Well, I'm glad to see you, too. We have a date here. What's the date?

Audience: Fourth of February.

Fourth February, 1964. The – AD what?

Audience: Fourteen.

All right. All right, I'll get close to it here. Saint Hill Special Briefing Course.

All right. Well, enough of this goofing off. Enough of this goofing off. I wasn't speaking about the beginning of the lecture. I'm speaking about auditing. This is a lecture on the use of self-criticism in auditing.

Now, some of you – some of you have been the source of deep wailing, crying in the Kleenex, many puzzled looks on Jenny's face, incredible remarks in the Instructors' conference and incredulous gasps. Because the subject of self-criticism of one's own auditing is very, very, very misunderstood at this particular moment. And the reason it's misunderstood, of course, is because it's too simple.

Now, I've just been over the high spots in R6 in the month of January. And – my theory being it was better for me to knock me 'ead off than for everybody to knock their 'eads off. This being a theory I work on. But sometimes it deprives you of lectures and this body of some years of future life.

Now, we've – we got this one pretty well taped. And R6 is of a complexity – R6 is of such a complexity that – well, it's impossible to learn it; it's impossible to do it and yet you have to. Its complexities are sufficient to fill the most avaricious appetite of any complexicator. So, we might as well just lay aside complexity until we get to R6. There's where it lives. R5 seems complex, but R6 is incredible. And yet it's one little doable action: the running out of the actual GPM. All right, that's very complex – and, by the way, we'll be rolling that unit here any minute now and starting in with a dull thud. And what I'm about to give you – what I'm about to give you, by the way, is germane to it, because this point has to be reviewed. And completely aside from all other levels, if you haven't got basic auditing as required in smoothness at the level of R6, you don't lay eggs. You don't lay eggs – you lay ostrich eggs and emu eggs and other large varieties which have sharp corners. So in actual fact, you can call this a lecture for lower levels. And so it is. It's something that you should learn in lower levels, but it's peculiarly germane to R6 and you can call this the first R6 lecture.

Now, what's this thing – this thing called self-criticism of one's own auditing. Well, this is very simple. This is – this is too simple and it misses horribly and everybody gets very tangled up in it. And I have seen some of the most remarkable responses I think that anybody could ever add up. And these responses are in answer to the question "What happened in the session?" They're – they're really gorgeous. I should have a stack of papers here in front of me but I will spare you that embarrassment. What went on in the session? Week after week – week after week, papers were handed in to me and everybody was trying to find out what I meant and what I wanted. Oh, I'm actually fairly easy to please, but I just couldn't seem to be pleased by any of these reports. What R6 requires is one thing, but self-criticism of auditing applies to all levels, in actual fact, from III up. II – that's getting – well, you should know it in II, but it's quite a bit to teach at II. III – it becomes absolutely vital; you'll still get some results without it. At IV, it becomes pretty confoundingly pressing because you're going deeper into the case. At V, well, you'd better have it pretty well, and at VI you're not going to get anyplace without it.

In other words, the deeper you reach into a case the more expert your auditing has to be. And when I mean auditing I mean your basic auditing. The deeper you go into cases – the higher up the level, the deeper you go into the case, of course, and your auditing is – must comparably keep pace. In other words, the more – the more reach the processes have, the more vital it becomes that the basic auditing be perfect, or as near perfect as it can be made.

In other words, somebody could get away at Levels I – at Level 0, I, something like that – can get away with some pretty fantastic flubs. Before I finish that, let me just tell you, self-criticism is simply making a tape of your own session, listening it back, and say what went wrong. I mean that – that's the whole thing. How could you improve your own auditing? After listening to a tape of one of your sessions, how could you improve your auditing? And that's all there is to self-criticism. And we'll go into that at much greater length.

But you understand that at Level 0 or I in a co-audit in Poughkeepsie, somebody can sit down and say, "Well, what – what solutions have you had to your lumbosis?" and just sit there and run it off. It's not – it's not going to do too much because if the basic impingement of the auditor is not very great, you're not running very deep into the case anyway, and if the auditor makes any flubs, well, the flub isn't impinging either. You see? See? [laughter]

So therefore, it sometimes looks very mysterious to one of you, operating as an Auditing Supervisor in a co-audit, to have all these brand-new people fresh off the street sitting there, yippety-yapping at each other and everybody happy and no ARC breaks and nothing going on at all. Well, of course, they're not reaching any deeper than a molecule and the auditing flubs, of course, have no more impingement than the auditing question, see? So therefore, it looks good. It looks good and you say, "Well, why can't veteran auditors audit this smoothly?" Well, the veteran auditor, of course, is going in with a pickax. He's going much deeper in the case. He's doing open-pit mining. And he's got himself quite a battery of processes. And he starts using one of these processes on the pc and he's no longer dusting it off one molecule thick. He and the process are making an impingement, man! And what he says has an effect on the pc. So, of course, his auditing flub has an effect on the pc, proportionately. Right?

Well, so much – that would be at repetitive level. So it... the bum pieces of auditing which recur at Level II also have an impingement. See, they have an impingement as great as Level II has. And Level II, with a tremendous number of repetitive process... Mary Sue is doing a chart of these things and we're doing a "Guidebook to Scientology Processes." And she's been digging up some from yars and yars ago, and I never knew there was that wealth of repetitive processes. That's about the wealthiest level that anybody ever had anything to do with. Good heavens, there are processes that I'd forgotten and put to bed ages ago, and so forth. Did you – do you remember Viewpoint Processing? Well, you may have and may not have because I didn't, and Mary Sue promptly produced a big sheet that she had salvaged out of an ACC. She's really done a wonderful job keeping odd bits of records and that sort of thing. And she'd salvaged this sheet out of her papers. And I looked at this – what's this, you know? Well, those – just repetitive processes, but frankly, they were enough to tear anybody's head off, see. Viewpoint – rehabilitation of the pc's space, for God's sakes. *Krrrrr!*

So – well, that's quite a bit of impingement. And so we consequently, with that much impingement of process, we're going to get that much impingement of flub. And so we have to have TRs in pretty good condition in order to run that particular level. Person isn't going to get much results – we'll go into results in a minute – if he doesn't have his TRs in such a position.

Now, let's take our old friend here the E-Meter. And let's take Level III with this E-Meter. Now, this E-Meter will dig. It's all right for the pc to sit there and say, "Yes. Hm-hm. That was in 1952. That was when my dog bit Aunt Agnes." That's all right. That's fine. But now we're going to find out the sub-itsa. And as soon as we get the meter we start mining in sub-itsa. Now, we're just mining in itsa at Level II. It's what can the pc remember, and the only improvement we get of the depth of itsa is brought about by the repetitive nature of the process, you see? Ah, but now we go into Level III, and we are no longer doing mere open-pit mining with picks and shovels and Chinese wicker baskets, you see. We have moved in a large crane, called an E-Meter, and it's taking bites out of the earth at a tremendous rate. And the pc doesn't know what's going to be bit up.

Just take an innocent question like this: "In this session, has anything been suppressed?"

Pc says, "No, no, no."

"All right, I'll check that on the meter. In this session, has anything been suppressed? I'm sorry, that reads."

"It does? Oh. ...oh, oh, well, yes. I suppressed – when you said 'start of session,' I suppressed it. The session never started."

Well now, how did we arrive at that? We didn't arrive at that simply by asking the pc a question and getting the snap off-the-cuff answer which was sitting there ready to be delivered. No, we asked the pc and he couldn't see anything so we looked at the meter to see if it could see something and, of course, it mines below his itsa level. It will read below where he can see. Well, now we're getting into an area of more impingement, aren't we? We're going deeper. And the impingement being greater, the handling of the auditing must be better. Be-

cause now the impingement of the meter plus the process is sufficiently great that the pc, of course, is impinged upon by the flubs that much more heavily.

So he begins to mind these flubs much worse. Now, this really has nothing whatsoever to do with whether one pc is touchy or another pc is untouchy. It has to do with the fact that the pc is being mined more deeply, and therefore the impingement is greater. Now, one of the things which happens when you run somebody over his level – this is only true, by the way, up to Level IV – but when you mine somebody above his level, you're running him on some process type and so forth that he is not accustomed to. You... he's over his head. Every time you pick up an answer it leaps full-armed and slays him. See – *bong!* You see?

This person ought to be audited on ordinary itsa – Level I, you see? So they chatter-chatter, the protective defenses of the mind are not disarmed, he's perfectly careful, he really doesn't have to talk to the auditor, he can sort of say, "Well, it's all right if I say I did this because the auditor really isn't there anyway." He's got all kinds of things, you see, that he can dodge away from. But as we've moved it up the line – as we've moved it up the line, he no longer can do this, and when you go into with a crash and ask something that he finds it very difficult to confront, you'll get things like bypassed charge accumulating. And he says the – picks on these little bits of rough auditing, see. And the – he minds these things. He's very upset about them. And when somebody is audited well above his level you can count on consistent and continual ARC breaky sessions.

It doesn't mean that ARC breaky sessions totally stem from being audited above the level, don't you understand? Because if you want to see a real prize ARC breaky session do an R6 with a wrong goal. You're going to have a sufficiently ARC breaky pc to please the most masochistic auditor ever made. It doesn't matter who it is. You see, he's just being audited wrong. It's not above his level. But this is true up to Level IV, that if you run a pc above his level you have a greater tendency to have ARC breaky sessions. So up to Level IV, the best handling of a (quote) "ARC breaky pc" is reduce his level.

Somebody who's consistently ARC breaky – you simply reduce his level. That's all. That's the best handling because when we're assessing cases we aren't necessarily looking over the quality of the auditing. And we assume that the auditor was there doing his best, but certainly the level of impingement of the error was much greater than the pc could tolerate. That's only true up to Level IV, you understand, because at Level V and Level VI the only thing that cures ARC breaks – the only thing that cures ARC breaks – is picking up *the* bypassed charge that has been bypassed. You reduce his level, he's just going into a sad effect. You know, you got somebody with a wrong goal so you – he's ARC breaky, so you reduce his level. Ha! Cut your throat, man. That wrong goal is just going to sit there from there on out, and a week later and a month later and three months later and six months later he'll still be in the sad effect from this wrong goal.

So Levels V and VI are not included in that reduction of level. Because the person who has been booted up to Levels V and VI jolly well ought to be able to tolerate auditing, because he should have been audited up to a point where he is not frightened of having problems. And he's not frightened of the horrible censor who stands over with a lion skin on and a club in his hand that Freud put there. The censor was an item invented by Sigmund Freud. We

are very indebted to Mr. Freud, and I'm – never say anything that is really to be taken in a derogatory fashion about Freud. But I can never fail to remark some of these things which going further in the work have suddenly revealed some of these gaping holes.

Have you – have you ever audited a psychoanalyzed pc? That is a ball, man! The only thing you get off the psychoanalyzed pc is psychoanalytic computations. And the auditor that will sit there and take these – I don't know.

This is a bunch of bunk, you see. What it is, is invented items. You'll find that a person who is given a wrong goal will dramatize it more than his right goals. You tell somebody he has a goal "to lasso bulls on the pampas," see? "To lasso bulls on the pampas," you see? Well, of course, such a goal is a lot of bull. But we can go – we can get this fellow then, short time afterwards – he's sold on it, and he'll just keep talking about having to go to the pampas, you know, and riding his horse while he's telling you, you know? And he's got to lasso bulls on the pampas. This is a most remarkable thing. And eventually you'll pick it up that it's a wrong goal and he no longer dramatizes it. In other words, you have an installed goal. And because it is wrong, a wrongness has been invalidated [validated], and of course doesn't as-is, but beefs up. Now, you find the person's right goal, he will dramatize it less. This is one of the ways of telling what is a right goal – not a very effective way, but a little cute trick that lies alongside of the thing. You tell this fellow – you tell this fellow he has a goal "to sneeze" and all the next day he does nothing but sneeze. You can conclude at the end of that time that that is a wrong goal. Because if you'd found the goal "to sneeze," he would now sneeze less. If it was an actual goal, you see.

But if you found a wrong goal "to sneeze," you have validated an error. And he will now sneeze worse. You've given it wrong source. If you date a somatic with a wrong date, it won't go away. That's for sure. But an auditor can come along shortly afterwards and find the wrong date of the somatic, and get very nice meter reactions and a reduction of the somatic. You understand what I just said? An auditor comes along and he wrongly dates a somatic on a pc. This pc didn't get any better, see, in fact his somatic probably got a little worse. And then another auditor comes along shortly afterwards, can find the wrong date of the somatic, and even though he uses that as the date, he runs off the charge of it having been wrongly dated, you understand, and the somatic slightly reduces and he thinks he's got the right date. You understand? Very cute.

Now, of course, if he went ahead and found the *right* date, the somatic would go completely. You understand? Well, this is the validation of an error, and a person tends to dramatize a validated error more than an actual aberration which has been contacted. This is very mysterious, but is something for an auditor to watch for because he'll sometimes see some very amusing examples of this. They're very amusing. The – very often he will get a pc from some co-audit or from some other area who has been told something of this sort, and the pc will sit there with this big sell. Your best thing to do is do a case analysis on it. Find out where he got this idea, see? Where he's sitting – he's sitting over there where he got the idea, of course – get the considerations off of the thing and then find out where it really is or if it really is true, see. And you'll find out these things will go away.

Well, now you could do the same thing with a psychoanalytic patient. I've told this story many times but the most unkind thing I did, I think, to – ever did to a pc from his own point of view, was the associate editor of *Collier's* magazine, back in the early days. And he had been psychoanalyzed and psychoanalysis had kept him going for a number of years. When the psychoanalyst picked him up, he had ulcers. He had ulcers so you could see daylight through him, you see? And he had ceased to have ulcers, oddly enough, apparently. But he had to be very careful. This is always true of a person who has been – had errors validated by some psychotherapy, or medical treatment or something of the sort. They have to be careful. That's the common denominator. That is something you want to watch for in a pc. What is he being very careful of? That's why that careful button is so gorgeous. What's he being careful of? You know, well he has to – he has to have nineteen hours sleep a night. He has to be very careful to get nineteen hours sleep a night. You trace that back with some kind of a case analysis, you'll get into some of the most amusing ramifications you ever heard of. And finally you will find out that this was a piece of advice that he got to cure his insomnia or something, and it was a validated error. That wasn't what was wrong with him at all, see? Somebody has found the wrong combo of the case, and worked it around, and now the fellow will dramatize it.

Well, this associate editor at *Collier's* magazine had been psychoanalyzed since he was a small boy, and he was being very careful. He – if he – if he didn't ride on certain kinds of trains (maybe I exaggerate this a little bit, you see) and if he didn't – if he was very careful to drink only out of square tumblers, and if he only thought the right thoughts, and if he sat in a certain way in a chair, he could live, you see? He wanted to know what this Dianetics was all about and I gave him a session. And the first thing I did was take him back to the beginning of his psychoanalysis and scan him rapidly through to the 1a – from the first session to the last session he had ever had. At the end of the first scan, his ulcers were on full. Gave him back every symptom that psychoanalysis had cured him of. Every single symptom was there glaring him in the face. We used to audit in those days on a couch. He got up – he got up off the couch and he staggered into the bathroom and he was dreadfully ill in about eight different directions. [laughter] I scanned him through it another time or two and it eased the symptoms and that sort of thing. But the poor fellow now had nothing to hold on to. He had nothing to hold on to. So he didn't write a good article about Dianetics, you see. We'd taken away his id and his ego and his mother complex and his censors and how it was looking through cracks in the bedroom window that had aberrated him, don't you see. And we'd just taken all these things and torn the whole thing up and thrown it in the air and given him back his ulcers in full, but the man could breathe. He didn't recognize in himself that he was now freer than he'd been for seven years.

And, oh, he got subsequent auditing, I'm sure. But personally I myself was not terribly fascinated. Because he was only supposed to be a demonstration. And he kept comparing Dianetics to psychoanalysis, which I think was awfully fatal for him. [laughs] He knew at the end of that time that we were sufficiently powerful to be able to tear up another psychotherapy. Naturally, the course of action would have been to just erase the psychoanalysis just by chain scanning and return him into proper cycles of processing and put him back together

again and get him into some kind of condition so that he could function. Obviously his ulcers were not from his id having skidded into his ego, see? [laughter]

So, I remember then. That was fabulous. Some other auditor took him on. They did quite a bit for him afterwards. But the point startled me. I hadn't recognized myself the frailty of psychoanalysis – the tremendous frailty of it. In other words, this thing was by invented-ness. It was a cure by inventing new evils. And the cure by invention is an alter-is and sometimes you can do things with it. But remember, it would be a very, very grim sort of an approach, that if this fellow had serious headaches to give him an awful stomachache so he took his attention off of his headache. But don't you think that that hasn't been done? And many times, and several therapies can be attributable to it.

But there's a very shallow draft. That's a very shallow draft. And actually telling somebody about his ids and skiddings and the censor and how he had evil thoughts all the time and he just thought evil thoughts all the time but had to suppress them – and he was very close to suppress as a button, don't you see? All of these things had added up into a very shallow draft action which had simply submerged the actual symptoms. Well, now what do you think an auditor's flub – a failure to acknowledge or something like that – would have done at that level of case operation?

Nothing. The auditor could have failed to acknowledge or acknowledge or double-acknowledge or triple-acknowledge or walked out of the room or sat on the desk with – leaning back with his feet higher than his head, snoring, and it wouldn't have had much bearing on the case, don't you see? Case was just plunging himself in with overcommunication of some kind or another. That's the psychoanalytic approach, you see?

We don't do anything quite as light as that. In other words, that's a negative it'sa. [laughter] See, the person is examining things that never existed. Well, let's look at this. You get an E-Meter loose amongst a case and you can start pulling a case up by the roots. And this is getting pretty doggone fundamental. You just ask this fellow, "Since the last time I audited you a week ago, has anything been suppressed?" And he comes up with his problems and upsets and so forth, but he himself is buried. This is sufficiently true that you won't care to use many "Since" mid ruds at Level VI.

The reason for that is, of course, they are sitting – all the events of the last week are sitting on the last item you left him in. It's going to take you about – well, five or ten minutes to list and blow that item. Why spend a half an hour? You see what I mean now by depth? Let's take those two extremes. All the events of the past week are sitting on this item. Well, you're going to blow the item. See, it just happens to be the item he's sitting in. So you don't pay much attention to it. In other words, you're now mining so deep that the shallow mining hasn't got very much bearing on it.

Well, let's take the intermediate step – Level IV. Level IV, now, we're going for service facsimiles. We're going for long chains of stuff. We're going for assessment-type things. We're going to plow around in this case and find out what combo of this and that reads. And we're going to do something with this, with the E-Meter. And we're going to take up this guy by his roots and we're going to say, "How are you making people wrong?" Now, that is a very accusative level of auditing, I must assure you. But it's nevertheless a very factual level of

auditing. Now, if the fellow hasn't graduated up through the levels as a pc to a point where he can take enough responsibility to have been wrong occasionally or catch himself out doing something antisocial, he isn't going to buy this at all, you see. So the auditor's error is a crashing shock to him. See, you've got that much charge – that much more charge at Level IV than we had at Level III. Because we've got that much more charge, we can bypass it more easily. And bypassed charge is usually bypassed by a session flub. It's the session flub that will key in the bypassed charge. It doesn't create the bypass, that was done by a technical error, but it doesn't – some... very often doesn't key in until somebody's made a session flub.

So we have at Level IV a greater opportunity to mine deeper and miss more. Now, at Level V we find the pc in a very nasty, cantankerous mood, anyway. First place, he doesn't like to be run at the idea of total effect. He doesn't consider this healthy. It's not inducive to his fine independence of thought. And that he's going around on a little post being banged at from all different directions – it gets real enough to him after a while, but he doesn't appreciate it as an activity. So you leave one of these RIs a little bit charged or you haven't studied your E-Meter book at Level II and don't realize that a pc's sudden exhalations can cause rocket reads. You haven't studied body movement effects on the E-Meter. You don't realize that a pc shoving his feet about on the floor can give you some very gorgeous rocket reads, and some pcs simply by stretching can give you some of the nicest blowdowns you ever wished to see. Having missed this chapter on the E-Meter book, you let the pc shout the items. You see? So you get beautiful rocket reads for each one of the items, but they're all remaining there completely charged.

Now, the auditor gives a sort of a half-acknowledgment. He falls down on the TRs, just a pin-width, you see. He looks differently out of his left eye than his right eye, don't you see? Bang! ARC break, see? Why? The opportunity for an ARC break is the bypassed charge. It's tremendous! So any little auditor flub and so forth precipitates it. So therefore, the ability to handle the basics of auditing becomes very, very critical indeed by Level V.

Now let's move into Level VI. Well, a whole implant GPM sequence of twenty-six goals, twenty-six implanted goals, would undoubtedly produce less commotion if totally and suddenly keyed in on the pc than one actual RI. The amount of charge which you're handling looms like the Atlas Mountains to the pc. One of these items is standing up there in its pristine ferocity, ready to swoop. And all he does is regard the fact that he is going to list on it and he's got it right in the chops. You ask him one of the new auditing questions for Level VI – it delivers the item something like shooting it out of a Roman catapult. It almost can't – can't help but list the right item. All the auditor does is ask the question and the item is there. Because you're dealing with the basic, complete pattern of the actual GPM and it has ferocity. Now, I'm not just talking for advertising purposes.

You see, for three years, up to August of 1963, we were insufficiently close to an actual GPM to cause much trouble. You could find a goal, all right. You could run "oppose" on the goal. And on one goal I ran seventy items out of the goal – and ran it the other day with the actual pattern of the goal with the actual command necessary to run those cases, and there wasn't one single RI had been touched. It hadn't even been jostled.

In other words, you could run all over the top of the thing and so forth, and get a lot of charge off and feel fine, get rid of your lumbosis and everything was swell. Of course, we didn't have it set enough to put the pc into the middle of it. *Whu!* That's not the case. That actually hasn't been the case since August. And that's when you saw me close the gate on R6, hastily. We were hanging in August between being able to safely run them and to hell with it, with the old R3 processes, and we were right in the middle. We didn't have it sufficiently canned to run them absolutely accurately, and we had it sufficiently close to tear the pc's head off. Now, going all the way through and running the actual pattern with the actual commands – *kabang, bang, bang* – you actually can get away, perhaps, with a little more cycle flub than if you were running the not-quite-correct commands of this middle band which delivered in nothing but ARC breaky sessions one right after the other, you see. Because everything just stirred up and bypassed, you see.

But the auditor fails to clear the auditing command with the pc. Oh, my God, how stupid – years since you cleared the auditing command with the pc as a serious operation. Bang! ARC break. Why? Listing from the incorrect goal as an RI into the next top oppterm. And the auditor – never occurred to the auditor to say, "Is it all right if I ask you this auditing command?" see, but simply asked it. That was enough, see? Because, of course, it was a wrong auditing command because those goals weren't adjacent. Look at the niceties we are now dealing with.

The auditor doesn't understand what the pc has said – and wraps the pc around four telegraph poles. Because the pc has said "second terminal from the bottom" and the auditor thought the pc had said "fourth terminal from the bottom," and the auditor started to repair the fourth terminal from the bottom – which was all right – yanking the pc two terminals up the chain and producing a yo-yo effect of the RI the pc was sitting in. See, auditor failed to understand what the pc said. Elementary, isn't it? Oh man, you're getting down to basics now. You're really getting down to basics. Now you know what these things are all about. And as you come up handling each level in turn, handling each level and running through that level, you tend to get cocky toward the end of the level because your auditing has come up to a potential of being able to handle that level. So you get up to the next level and you say, "Well, my basic auditing is now perfect. I am – smell like lilies all the time and I... no improvement possible!" You know? "You can't improve a perfect work of art!" And you go up into the next level, and with a crash you all of a sudden find yourself unable to handle the pc. And I mean, what's all this happening? Well, it's simply a flaw – the undetected flaw – in the basic auditing. And that's what it is.

And you can... of course, to that is added unfamiliarity with the technique, unfamiliarity with how a pc should act and it all looks very clumsy, and you're liable to overlook this little interesting factor: is the reason it's happening is because a new strain has been put on your basic auditing. New things are being demanded of your basic auditing. So that's why some Scientologists think they have to be retrained all the time. Techniques are advancing – their auditing cycle has to advance with it.

Now, I invite any one of you, particularly when he thinks it – on a day – on a day when you feel your auditing is at its absolute lowest ebb, see? You've practically blown the session, you've chopped the pc to ribbons, so forth. You actually looked at the meter – you

looked at the meter and you said, "All right, why are you such a lousy pc?", [laughter] you see? I mean... You've done your assessment. [laughter, laughs] At your very worst – at your very worst here, at Saint Hill, I wish you could simply transport yourself (you will be able to do in not too distant future!) suddenly and instantly into the beginners' classes of an Academy somewhere. You'd start immediately thinking of yourself not as a work of art, but you'd see that they had a long way to go.

So the division of Scientology into levels is actually dictated by what is demanded of the pc – primarily what's demanded of the pc – and almost parallel with that, what's demanded of the auditor. Now, you think it's divided because it's primarily what's demanded of the auditor and secondarily what's demanded of the pc. No, it's not quite that way. It's really what's demanded of the pc and then what's demanded of the auditor. Actually, a very educated pc who is fully and thoroughly trained could guide a rather lousy auditor over an awful lot of rocks and shoals in R6. And a fairly well-educated auditor at Level IV can drag a pc who is auditing him through a lot of muddy water. He can suddenly say, "Hey, wait a minute, did you get a blowdown on that assessment?"

The auditor says, "I'm – I'm sorry, I – I – I don't think I did."

"Well, I don't think we ought to be running it. You getting any tone arm action now?"

"Well no, I haven't gotten any for a little while."

"Well, all right, let's – let's look over that assessment list. Let's look over that assessment list. Where did the tone arm dip while you were assessing?"

"Oh, that was back there at the beginning of the list."

"Well, read it over to me again and see if you get a read there."

"Oh, yeah, all right."

"You got – you got some tone arm there? Oh, oh all right, all right. Well, let's use that one."

And the auditor says, "Okay." [laughter] Well, what do you know.

See, that's your educated pc. And I don't know. I don't know. Self-auditing – self-auditing is absolutely out.

I just put in a series of tests and so forth on this – we had to know this point: Could an individual run out his own actual GPM with a one-hand electrode? Could you do this? Well, this is something like tackling lions and tigers barehanded while being painted with bait. And I was able to get through – I was able to get through one bank, before it fell in. And you can't do it. I don't care if I got through the bank, it can't be done. Why can't it be done? Because the mechanics of the situation is that an auditor giving himself the auditing command does not produce tone arm action. *Huh-huh-huh!* Horrible, isn't it? So you get down toward the bottom of the bank and you've left every item charged behind you. Because really none of them blew. It takes the impingement of an auditor calling the items to deliver the tone arm action out of the GPM.

Oddly enough, you can plot your own goals plots. You can plot your own goals plots. This is not a talk on self-auditing, and I'll have to give you a talk on self-auditing someday – it's something that everybody says, "No, you mustn't do it," is usually the upper limits of the thing. There is a certain amount of self-auditing possible and every auditor does it. You burn your finger; you stand there and run the incident out. Or you keep touching the thing you burned your finger on after it cooled down or you give yourself assists and that sort of thing. You wonder sometimes what it was that kind of made you creak in the last session, then you suddenly remember it was so-and-so and so-and-so. Well, what is that? That's a sort of a type of self-auditing, isn't it? And – but self-auditing becomes very interesting as you go up through the levels, because there's nobody there but you, handling your mind. Well, that's something to think of, isn't it? That's something to think of. That's – that's something to know.

You mean you're going to be out here, eighteen light-years beyond Arcturus, sitting on a satellite enjoying life, and a comet goes through you or something like this – you're going to get a session, are you? No, you're there holding – you're there in charge of your own mind. And when you come up to a certain level, you are less the effect of the mind and are very definitely cause over the mind. There is a point. I've been trying to discover where this point is. See, at what point does a person become total cause over his own mind? It occurs somewhere in Level VII, it doesn't occur early on in Level VI. But up to that point, an auditor is necessary. Which is the point I am making here.

You can straighten out an ARC breaky session. There are things you can do with self-auditing which are quite remarkable. You've had an ARC breaky session as a pc – well, you can go reeling off and get yourself under control one way or the other and say, "Let me see," you know, "maybe I ought to run a little O/W on the auditor." Finally you get sensible enough to do something like that. "What did I do to the auditor and what did I withhold from the – oh hell, I had a withhold. That's why I'm blown up." And all of a sudden you feel all right, see? You've spotted the charge or something like that. You've puttied yourself back together again to that degree. Well, that's all very well, but that is all assist-type approach. And you're in perfect order to use assist-type approach on your own mind. But what it doesn't do is produce tone arm action. It doesn't produce tone arm action. That's the only thing about it. Well, why doesn't it produce tone arm action? Well, you're up against a magical thing called the two-terminal system of this universe. And when a person is this enmeshed into this universe, he is part of the two-terminal system of this universe. This is a two-terminal universe. And because he's up against this two-terminal system, one terminal all by itself is inert in this universe. And a thetan has become sufficiently enmeshed in this universe and has taken sufficiently the universe's characteristics as his own that he actually follows to a large degree such things as Newton's laws: the laws of interaction and so forth. These things are only applicable to the mind when a person himself is pretty confounded MESTy. But then anybody who is smeared into the universe to this – a great degree is pretty MESTy. So he's following the laws of MEST to a large degree.

Well, it's utter magic then, that the communication cycle does produce tone arm action. But that is what produces tone arm action and that's what blows charge. And it is charge being released that is the primary source of a person's eventual freedom. There are two things which hold a person down: One is significance and the other is mass. These are the two things

that hold a person chained. That is why you are in a body; that is all there is to it, really. Now, to mass, you of course can add the ramifications of energy and space – but the – and time and so forth. But these things are not of primary consideration – you can just say mass. The things which give you the psychosomatics you get, are mass. It's the significance that makes you think you're nuts. All the think – this is from way back – there were two effects: a person either could go sort of screwy mentally or he could go crazy physically. This is from 1950 – two types of insanity. Some people seem to be able to throw it into a physiological basis and some people threw it into a crazy basis and so forth. There was a lot of discussion of that at that time. At Level VI this breaks down much more simply. There are two things contained in a GPM: thought and mass. There are other things contained in it, such as space and energy and that sort of thing. But mass disintegrates into energy, but it doesn't translate purely into energy. You get the right item in the right place in the right GPM, and you'll get a vanishment which is so startling as to leave you blinking.

For instance, here sits a mass. You get the right item in the right place, compared up to the right things in the GPM and it's just as magical as that. You say, "Where the hell did it go? Gone." Here is this towering – this huge, overwhelming piece of mass, which if it hit you in the teeth or got crisscrossed on the track or in juxtaposition with some other item would practically break your neck for you. Would! And you've gotten the right idea in the right mass and you get – bong! You see? There it is, there it isn't. It's just like that – bang, bang! It's astonishing. So it isn't a dissipation, even though you get a resultant heat from it. It isn't a dissipation because, of course, it's being created by the unit called a thetan. And the second he triggers that combination, he no longer creates it. So you don't have the idea of mass dissipating into energy and disappearing. You have – yes, when you contact it there's heat, but that's just a symptom of contact. When you get the idea and its location and arrangements, you see, with the rest of the GPM, you just get a no-create of it anymore. And it'll go *psssswww!* It's – it's – without any pyrotechnics or fireworks, don't you see, it's gone! See? It is – it isn't. Because you're dealing with the unit, of course, that is making it when you're dealing with the pc.

All right. Let's – let's look at this. Let's look at this. There's thought or significance and there's mass. And these are the two dominant phenomena in the mind. Now, you can change thought, change thought, change thought. But you might not make anybody well, because his illness is being occasioned by the mass. Now, each GPM is surrounded by so many ramifications and locks, so many things are hung up on these things, there's such an endless parade of things, that you actually come out through all of your levels. And the levels are really just touching them, going a little deeper into the locks, swinging a little deeper in with Prep-checks, going a little deeper with running service facsimiles, and then running off implants at Level V that surround it, and then at Level VI just crashing in on the middle of the thing and tearing it up and throwing it away.

A person, by the way, hasn't a dog's chance of getting to the actual GPM successfully and continuously through all of that overburden, unless he has to some degree progressed up through the levels. He just hasn't got a dog's chance. In the first place, he has insufficient mental stamina. He understands too little of his mind. He gets too worried, too upset, too concerned about the various things happening. Furthermore, he gets an – all of a sudden his chest caves in. Something goes a little bit wrong and his chest caves in. Oh, my God! If you were to

take some man up here on the street and he's walking along and all of a sudden his chest caves in – *augh*. Same velocity as though he'd just been hit with a cannonball, you see. *Blaugh!* Well, man, he'd be up here to the doctors insisting they operate and take x-rays, and he'd worry and he'd sit home and he'd gloom and he'd – "What is it?" And he'd be very upset about it all, and he would be unable to eat or sleep or anything else, because of this very peculiar thing that's happened to him.

For instance, I know of a girl – a Scientologist now, but I knew her a long time ago – and she sat in the house for several years, because she'd walked into an office one day and found a terrific mass of energy suddenly settle over her head and down around her body with a sudden thud. She just sat down in this office and there was all of a sudden this terrific mass of energy hit her from all sides. And it frightened her so that she went home and didn't go out of the house for seven years. You going to – you're going to run this character, huh? Oddly enough, somebody ran her, ran out an engram, straightened her up a little bit, she got outside and she got along on early days. But what was that? That was an RI, maybe only a lock on an RI, but that's what hit her. And it worried her to that extent that it immobilized her in life. She quit doing everything she was doing – everything else. All right, so a fellow has to become kind of accustomed to living with the tiger, don't you see? And you take a Scientologist who's been processed quite a bit, he's talking to another Scientologist. "I got an awful somatic," he'll say.

The other fellow will say, "Yeah, where?"

"Oh, I – side. Well, let's go have lunch."

I've seen – I've seen a medical doctor – I've seen a medical doctor go, "*Ohhh! Augh! Augh!* Put him in bed! Put him in bed! Look at him! Look at him!" You know – absolute hysterics. I'm not exaggerating it a bit. In fact, it was worse. Guy was running a session and he turned on some heat. I never saw such an hysterical response in my life. Fascinating.

In other words – in other words, one has to become to some degree familiar with what's going on in the mind or in life or... and so forth, before one can handle it to some degree. And the levels are a subject of familiarization with what can knock your 'ead off. You learn how to handle these things. You get a little bit of cause over these things. You learn to grapple with these things. Well, you've graduated upstairs and it doesn't scare you out of seven years' growth when all of a sudden you feel your whole body wrapped around with glowing, red-hot energy that is liable to melt you to the bone any second. And you go on listing. And then you say to the auditor, "I think we've overlisted here." [laughter] "That's my item." Nothing to it, you see. Compare this type of poise and response in the auditing chair to the girl who had to go home and stay in the house for seven years because she suddenly felt a little energy touch her from all sides. Get the idea? That's why the levels exist as levels.

Well, what's all this got to do with self-criticism? Well, it has this to do with self-criticism: is self-criticism is based on the same auditing cycle – all the way. It's the same cycle. I don't care whether the person doesn't know it at Level 0, knows it only slightly at Level I or is using it at Level VI. It is still the same auditing cycle. And it must exist as an auditing cycle, because this is a two-pole universe. And without an auditor you don't get tone arm action adequate to a case resolution. That is all there is to it.

You can look on it as the auditing cycle is totally magical, if you want to. And it sure looks magical. But it is the basic discovery of Dianetics and Scientology, is the auditing cycle. And all by itself it does things to people in Comm Courses. "Do birds fly? Do birds fly? Do birds fly?" And all of a sudden the guy's got one less somatic or something. Or he's got three new ones. But that's the auditing cycle at work. And you should recognize the auditing cycle as a fundamental – as an extremely fundamental part of your auditing tools. And recognize that it is all right to use a perfectly sloppy auditing cycle at Level I. Remember it's got to be less sloppy at Level II and it's got to be less sloppy and more neat at Level III and it's got to be far more neat and expert at Level IV and it's got to be a *great* deal more expert at Level V and it's got to be smooth as glass at VI. It's the degree of charge that can be bypassed. It's the depth that you're looking into the case. But it's the same auditing cycle.

And that auditing cycle is with you all the way from Level 0 to Level VII. And only ceases to be necessary somewhere in Level VII. Still necessary in Level VI. You've – you get so that you can juggle GPMs around a little bit and you can list up your goals plot and you can do this and you can do that and pretty soon you're sitting there looking at the meter and you realize that tone arm has had .25 BD in the last fifteen minutes that you've been sitting there with a one-hand electrode plotting goals, see? *Oh-oh-oh-oh-oh, oh, oh, oh, oh*, that is not enough tone arm action to care for the amount of charge you are restimulating. So what's that meter going to do very shortly? It is going to pack up. It's going to send that tone arm up to about 5.25 and it's going to lock up that needle very nicely and it's going to leave you with some 'orrible, crushing somatic some way or another. And yet you actually had progressed up through the levels to a point where you were actually able to lay out and get accurately which goal followed which goal with a one-hand electrode on a meter, see?

Even though you'd progressed to that extent, the auditing cycle was necessary because you're still in a two-pole circumstance to the rest of the universe. If you haven't got an auditor, you don't get tone arm action.

Every once in a while you hear of somebody plotting his goals out or something like that. Well, don't blow your brains out. Say, "Fine, fine. Good. Good. Better get an auditor. That's – that's the – the way." You find somebody trying to self-audit implant GPMs, you know. Well, I'd wait till I was well above Level V before I attempted that. I wouldn't attempt it from Level II or something. But you get at Level VI, you should be able by that time to be sufficiently competent with regard to this sort of thing to: "Let's see, I wonder if that – I wonder if that's an implant GPM that – I don't know, I don't know, Joe found this GPM. I don't know whether it was really an implant GPM or not. I'm not – I'm not satisfied 100 percent." You could pick up a meter and you could say, "'Nix absoluteably spit.' Rocket reads. It's an implant GPM. Skip it." You say, "What wild abandon." Actually, if you were to take some pc as he started in on Level V and say to him, "Nix absoluteably spit," you know – this actually is not even the top of the implant, don't you see, you've just slammed him one down – he'd go creak, creak. "*Ow! Ow!* What's this? *Brrrrr*. I'm cold as ice." He would be, too. You get the idea?

Familiarity – familiarity is operating here. You're not afraid of the tiger. You've had several tigers eat out of your hand. You walk up to the edge of the jungle and you say, "*Whsst!* Hey! Come here, puss." [laughter] In your first approach to the beginning of Level V,

you crept up with a whole safari full of howdahs, three elephant guns handy, you heard a monkey cough, knew it was a tiger and turned loose with howitzers. Difference of level of familiarity. Difference of charge handleable. But how did you get up to that point?

Actually it's discharged charge. Not only must you get the familiarization as an idea, but you must also discharge charge. If you haven't got a lot of charge off your case, you can't do anything with it. It's like trying to batter through bullet-proof armor-plated walls. You can't get any answers. You take somebody with no charge off, you might be lucky and find an actual GPM on him. But if you tried to move the GPMs around so that you could find an actual GPMs – *gluuuh*. They'd think they were being attacked by an army. It would be too frightening to them.

Now, what's the – what's the final – what's the final word, here, on self-criticism? Well, it – self-criticism must be that the auditor's auditing must be adequate to the level he is running. His handling of the auditing cycle is the only thing which is delivering tone arm action into the session. And I know we say it's a process, I know we say it's this, I know we say it's that, I know we say it's the other thing – but it isn't. Go back to what I told you. It's a two-pole system. Self-auditing would be perfectly feasible if it delivered tone arm action, and it doesn't. Run an actual GPM on yourself, get two tone arm divisions of charge off in twenty items. You know what's available on an actual GPM? A hundred and seventy-five TA divisions down. Therefore you've stirred up and left on the case a hundred and seventy-three TA divisions down. *Gluuuu!* You'll feel like it, too.

All right. An auditor sits there, and he audits an im... a regular, actual GPM and he gets the hundred and seventy-five divisions. Why? Because he's an auditor sitting there. That's the magic of the auditor, is the two-pole nature of the situation. The auditor's auditing, we get tone arm action by the simple fact of his being there and following the communication cycle in the – necessary in the session. And that gives us tone arm action.

So, if an auditor – well, regardless of technique or any of these other considerations – if an auditor's sitting there auditing, his handling of the communication cycle with the pc must be adequate to that level so that it doesn't interfere with the auditing, but produces tone arm action. Now, this doesn't say that the fellow at Level III has to be as expert as he'll have to be at Level VI. But it says he has to be expert enough to handle Level III. But it's all the same cycle. In back of all auditing, we have that very interesting discovery. And it is a basic discovery I made many, many years ago. And this brought about the development of TRs and other things.

But remember, it is a peculiarly native and original thing to Dianetics and Scientology. It's only in Scientology, see, that one thing. And that's peculiar to it. It is an understanding of this thing that permits cases to get better. It's a very important bit of stuff. But because it sounds so this or so that or some other thing, well, you have a tendency to overcomplicate it for the level you're running. How complicated do you think my auditing cycle would be to Mary Jo Ann who has just walked in from the Poughkeepsie co-audit and I'm going to give her an assist? How adequate do you think that auditing cycle's going to have to be?

First place, she isn't going to hear me any much in the first place. She's not going to be able to pay much attention to what I'm saying anyway. I'll tell you what has to be adequate is

your TR 2. You can produce more magic with TR 2 than you ever saw. That's very, very magical. Wouldn't matter how long you carried on or what you said or what form your response took. If you could bring home to her that somebody had heard her and that she had been acknowledged for it – if you could bring home this *one fact* – you would probably get a big send on her case, see? Why, your auditing cycle could be pretty crude and you could get away with it. But that would be no level to think – no reason to think that you were now the world's greatest gee-whizzer on the subject of the auditing cycle,

Now, let's move on up through the line, let's get a little bit later, let's move on up the scale, and let's take some self-satisfied, totally successful, never-had-anything-really-rough-happen-in-any-of-his-cases auditor. And we say, "Son, we is grooming you up. And we want you to run service facsimiles."

"Well, I don't know that I've ever run any service facsimiles, but I can handle this. Ha-ha-ha-ha!"

ARC breaky pc – what – what the hell? Obviously can't be his auditing cycle because that's always been perfect, that has never been left wanting. Ah, but it is. It is, because the auditing cycle which is being demanded of him at this particular level of penetration into the case is very senior to what has been demanded of him before. And he doesn't see it as a necessity to change or smooth out his auditing cycle. I myself have fallen into the trap, so we're all talking here together with our hair down. I found out when I started to audit Level VI, I was getting dirty needles on a pc and I said, "Well, this pc so and so and so *wha wha*" – just like you do, you know – [laughter] "and the pc – pc's this, the pc's that and so forth, the pc would just get enough rest," you know? "Pc would just get enough rest, why, be all right and we wouldn't have all these upsets in session. After 1:30 at – in the afternoon, the pc's tone arm gets sticky." Smell. What corn. "The – this pc is always sleepy after dinner and never gets good tone arm action after dinner in the evening. And that's why I'm not getting good tone arm action on the pc, because the pc is..." The pc is – , the pc is – , the pc is – . "The pc's house is not in sufficient juxtaposition to the current position of the sun, and Saturn is out of nodule phase to Mars. So therefore we're having ARC breaky sessions." You get the idea?

Well, the funny part of it is, completely aside from everything that I have given you as the reason why this gets overlooked and the reason why it's important, there's another fact: The auditor's error is always prior to the rough part of a session. And therefore the error, being at the time it is at, is not therefore easily discernible as having come from the auditor's action. In other words, it's after the fact. The pc's roughness is after the fact of the error sufficiently that the auditor can't spot it easily. And you get in this self-criticism some of the most remarkable things. But a self-criticism should be run in this particular fashion. We'll get down to cases now.

An auditor should sit up – set up a session and run a routine session with a microphone on the desk and the session being recorded. Preferably – preferably a very normal session, not a stunt session just to do this, but one of his regular sessions. And he ought to have a couple of hours of tape or at least an hour and a half of tape to run off. Three and three-quarters speed and so forth, and the pc's voice particularly discernible and the auditor's voice

particularly discernible on the tape. And you should always put a microphone a little bit closer to the pc than the auditor, ordinarily.

All right, the session goes forward. The auditor carefully notes, in running whatever he's running, any rough moment in the session. He notes it on his auditor report, he makes a note of it. Or he notices any dirty needle or any sticky TA. Any other significant, you might call, bad indicator, which occurs in the session. Any natteriness by the pc. Any point of criticism. Any point of hecticness or anxiety on the part of the pc. Any worry, any appearance of a PTP on the part of the pc. He should note all of those things on his auditor's report, as they happen, quite honestly, just going on auditing. Not because he's taping it, withdrawing everything that he can withdraw from the auditing session because it might get on the tape. Just go on and audit normally and make an honest record of everything that's happening in the session.

Now, that record – that record has a level of importance which is quite remarkable. See, the session is on the tape. But remember what isn't on that tape is visual observation of the pc, visual observation of the meter behavior, visual observation of the tone arm. Those things are not on that tape. So therefore you make a very good record of that on your report. And having brought the session to a successful or unsuccessful close, you let the pc pack it up and it is now between you and the tape and your auditor's report. And you don't give a history of the session. We do not care what was run in the session. And the reason we don't care is we've got lots of processes, but we have very few good auditors.

Now, listen. Let's take this tape. And just leave it there, as a unit, but with some idea of its time of run. You started the tape at 1:02. Therefore the first moment on that tape is 1:02, isn't it? Let's look down here, and we see we had a dirty needle at 1:16. Actually you can figure this out – it's so many feet of tape per minute. But you see what was happening in that session. You run off about sixteen minutes worth of that tape, don't you see? You get – let's pick up that point on the tape. We're not interested in the auditor listening for one minute to his session consecutively from beginning to end. Scrub it. Who cares. We want him to find these points. But we just want him to find some points on this tape. So we're going to run off sixteen minutes or fourteen minutes of that tape and we're going to get this point when the pc was talking about "yipsnoo" as of 1:16. And now we're going to go backwards in the session, a few inches at a time, until we find the breakdown of the basic auditing that caused it. Because the auditor is never aware of it until he hears it on the tape.

You're going back there a minute – thirty seconds, a minute, two minutes, three minutes, five minutes – and you will find it. You will find it. *It is what the auditor failed to carry out in his communication cycle.* And you listen back there and you will find the auditor gave an auditing command wrong way to and upside down. He's been saying, "Do fish swim?" He all of a sudden actually said – this would be pretty corny – he said, "Do fish float?" See, this is awful corny. We'll find the mistake. So let's take this report now and, on tape, what caused it, see? What – what caused it. Let's write that on the report. What point in the tape caused it, see? Now, let's take another one of these points, see. Let's take another one of these points. Pc toward the end of the session all of a sudden said, "But I didn't say so-and-so and so-and-so." Well, this is an interesting – you know, the pc's being disputive, there. Something about goals. Auditor says to himself, "Well, obviously he didn't make his goals." No, nope, no, no, no –

damn! See? Let's forget about the figure-figure, see – let's forget about all this figure-figure. The only reason that pc snapped or snarled in any way at all about his goals or had a present time problem, was the auditor did something a minute, two minutes, three minutes, before that point. You understand? This really makes a citizen out of you, man. Wow! This is rough on you. And you take hold of it and you say, "Aha, there was a snappy moment there, just at the beginning of the goals. Pc – pc anxious about goals," see, or whatever we put down on the report. Let's find that point, now let's roll it back. Let's roll it back on the tape and listen forward, and roll it back – boy, you're going to find a piece of corn. And you're going to say, "Did I do that?" [laughter] Because ordinarily when you did it, you thought you got away with it. But it took it a little while to show up. And it will always show up. And if you do it this way, you pick up the bad indicator and then roll your tape to the point of the bad indicator and then roll it back and listen to it – to the point – you will find the breakdown in the auditing cycle. And we're only studying the auditing cycle. We're studying the auditor's delivery of the command, the pc's receiving the command, the pc's answering it and the auditor acknowledging it, don't you see? We're only studying that.

Pc originates, the auditor understands it and acknowledges, don't you see? We – we're – that's all we're studying. We're just studying actually the basic TRs: 0, 1, 2, 3, 4. That's all we're studying. How – where – where did one of those break down that caused the pc reaction? And this becomes the wildest thing you ever wanted to see. You won't believe it until you yourself have done it with your own auditing or have done it on some other auditors. You won't believe it! A pc never has any independent reaction in a session, independent of the auditor. *Never!* That's the wildest thing you ever wanted to see. Listen, a pc can be sitting there on the bypassed charge of wrong goals and wrong items and everything upside down, and audit smooth as a baby carriage. No ARC break, going on reasonably talking to the auditor, everything pleasant – feeling sick, but everything's pleasant. *Aaahh*. No – nothing wrong with the needle. Tone arm running okay. Everything fine, all the good indicators, pc's cheerful – a little sick at his stomach, but he's cheerful. And you're going to find something. You're going to find that the pc never causes a confounded thing in the session. And the pc's environment never causes a confounded thing in the session. And this is a *shock*.

There's only one thing that causes anything in a session, and that's the auditor. And this is not an exaggerated viewpoint that I'm trying to give you to persuade you to be, all of you, perfect auditors. I don't care if you're not perfect auditors. Trying to make perfect auditors out of you – I'm trying to make effective auditors out of you. And you're in for a shock if you follow that self-criticism through. You will find out that there's only one source of a session and that is the auditor. And it has nothing – to do with the moon was in Saturn. It had nothing to do with the pc not eating supper right. It had nothing to do with the lateness of the hour. It had nothing to do with how the bank had been sloshed up by Joe Blow, another auditor. That pc behaves exactly in response to the auditing he is receiving now. So he comes into session, he's got a present time problem, body hasn't had any supper. Well, there isn't any reason why this should be handled in any other way than a perfectly cheerful way with all the good indicators in, and he handles the present time problem – that's great. That's what auditing's for. The personal problems. Pc – so he's just been jilted by his girl or something of the sort; so he's been jilted, so what? He might cry for a little while, but if he isn't consistently

getting a better emotional reaction straight on up through to a fairly high tone as he comes through that session – well, of course, you can say the right process isn't being audited on him, but let's leave the right process out of it. He's – the wrong process is really not going to make him misemotional. It would be insistence on running the wrong process without getting it cleared and okayed with the pc that would make him emotional, isn't it?

It's not accepting the pc's answer.

"I don't understand the process and I haven't got any answers to it."

And you say, "Well, I'm going to ask it again, here." [laughter, laughs] You're going to have a mess on your hands, man, because you haven't got an auditing cycle! Where you don't have an auditing cycle, you haven't got a session! And where you have a pc that isn't sitting there with all indicators in and the tone arm flying, then the auditor thinks it's because the sun is not properly arranged in the house of Leo that the session is going wrong.

This is no effort on my part to suddenly bring it home and put it in your lap. I'm telling you about a technical – a technical discovery. I know when I graduated up in levels, I found that my auditing cycle had to be improved. And therefore this gives me the courage to tell you that as you're graduating up in levels, I think your auditing cycle could be improved.

But I think it is one of the most astonishing experiences an auditor can have – to do self-criticism on a piece of tape against a timed session of an ordinary kind. It's one of the most startling experiences he can have. And after he's done it a bit, maybe two or three times, something like that – he may not have to do it two or three times – he knows now why. And he doesn't go looking for the lateness of the hour. He flubs an acknowledgment, he knows what is going to happen *nooowwww*! So he probably puts it right before it has a chance to happen.

And it is quite an experience. It's quite an experience. And I've had the experience and it was a great shock to me. I used to be able to believe that it had something to do with the lateness of the hour when somebody told me that their pc was restive every evening. I used to believe these things. I don't believe them anymore. Because I know my pcs aren't reacting that way. They're reacting very precisely and exactly against the communication cycle of the auditor and they're not exacting – acting against any other slightest thing under the sun, moon and the stars. That's what they're reacting to and that's all they're reacting to. And you're as good an auditor as you can handle the communication cycle; you're as skilled an auditor as you can choose processes to throw onto that communication cycle line. And when you've said those things, you've actually said it all.

So, thank you very much. Good night.

THE COMMUNICATION CYCLE IN AUDITING

A lecture given on 6 February 1964

Thank you.

Thank you very much.

Now, what is the date, here? What's the date?

Audience: Sixth of February.

February what?

Audience: Six.

Six – sixth of February. What year?

Audience: AD 14.

Thank you. Thank you. February 6, AD 14, Saint Hill Special Briefing Course. I'm going to talk to you about a very arduous subject. The subject is the communication cycle, and I think you might like to know something about the communication cycle as used in auditing. It's a new subject – [laughter] new to many. [laughs]

If you look over communication, you'll find out that the magic of communication is about the only thing that makes auditing work. And if you could sit down to a meter – a one-hand electrode – all by yourself and run some process on yourself, it'd make a citizen out of you. And the reason it'd make a citizen out of you, is you'd see a little bit of tone arm action at first, or if you tripped across something like an active, loud, large GPM, why, you might get yourself a quarter or a half a tone arm division, or a couple of needle flashes. Now, you can always get a needle flash. You can always get something of that sort.

Now, the amount of tone arm action you would get doing this would make you blink, because it's none. And you could run some hot process on you that had been run by some auditor and which gave him good TA, you see? This process that has been run, give you good TA, when the auditor was auditing it. Then you sit down there with a one-hand electrode while the process is still hot and run the commands on yourself, you're going to get for a moment the residual of the auditing. That is to say, the auditor will have stirred up enough so that you'll see a little bit of charge go off, and then your tone arm is going to go dead – and it's going to stay dead.

Now, the reason for this has to do with the thetan in this universe. Now, he has begun to consider himself MEST, and he's begun to consider himself mass. And the being who considers himself mass, of course, responds to the laws of electronics and the laws of Newton,

and is actually incapable of generating very much, you see, or – which was what we're interested in – as-ising very much. There's not very much going to disappear there in the way of mass. And this is a very discouraging sort of an activity.

Now, I have had to explore this particular field of auditing – self-auditing, because most anybody does it, and so forth. And what was this all about. And I have even gotten ambitious enough to run an actual GPM, *bangity-bangity-bangity-bang*, on a one-hand electrode. That makes your hair stand on end. Well, it made my hair stand on end. And my auditor fished me out. It didn't kill me, I was able to breathe afterwards – that is, if I didn't move much. [laughter] But the same GPM, run with the same items and so forth, would produce upwards to 175 TA divisions, down. And the GPM, self-audited, produced 2.

Now, what was this all about? What was this all about? It tells us (now, it isn't that experiment; other experiments were made in this particular line) – and it tells us that an individual considers himself MESTy, or massy, if you see? And therefore he has to have a second terminal. And a second terminal is required to discharge the energy.

Now, a lot of auditors go further than this, and they go downhill to a point where they think they're being the second terminal to the degree that they think they pick up the somatics and illnesses of the person they're auditing. Well, get that.

Actually, there is no backflow of any kind hits the auditor. There is no backflow hits the auditor of any kind. But if he is so convinced that he himself is MEST, why, of course, he will turn on somatics and everything else in echo to the pc, because he's simply doing a matched terminal with the pc, don't you see? Actually, nothing hits the auditor. It has to be mocked up or envisioned by him. I think you find that's quite amusing, because there are whole schools of healing, back in the early days of Greece particularly, where they picked up the pain out of somebody's 'ead, or off somebody's arm, and they got the somatic very nicely and took it away and dumped it in the trash bin. Spiritual healing has this in its textbooks, and so forth. Well, that is its genus, is just this two-pole proposition.

Now, you don't have to know anything about electricity or electronics in order to go into this very deeply, but it's obvious to you that for a motor to run or for something to occur, like a light go on, that two poles have to be involved. And energy passing between two terminals, or two poles, makes an interchange, and it gives you what you call electric light.

Now, of course, that is the burning of energy. In this particular case you don't have the burning of energy, you have the as-ising of energy where the auditor and the pc is concerned. Now, the ability to hold a position, or the ability to hold two terminals apart, is a definition of power. Not how much energy can be thrown by a unit, but the base, the strain that is put on the base, the ability to hold these two positions. That's a little bit outside of what we're talking about. But here we have two poles. We have an auditor and a pc, and as long as the auditor audits and the pc replies, we get an exchange – an apparent exchange of energy from the pc's point of view, which doesn't hit the auditor. But because they think of themselves, don't you see, at this low, subvolitional level, as terminals, why, you get these exchanges of energy going on, you see? And nothing hits the auditor, and it as-ises as far as the pc is concerned.

But you have set up, in essence, a two-pole system, and that will bring about an as-ising of mass. It isn't burning the mass, it is as-ising the mass. And that's why there is nothing

hitting the auditor. Now, that is the essence of the situation, and the magic involved in auditing is contained in the communication cycle of auditing. You see, now you are handling the smooth interchange between these two poles. Eventually, the individual will get up to a point where he does not consider himself to be matter, and this no longer occurs. When you've got a pc's – half of a pc's actual GPMs run out, you start running into trouble. I'm running into that trouble right now.

Unless the pc makes up her mind, or recognizes the truth of the situation, I can't knock any energy off. I can ask the question, and the meter is the deadest-looking meter you ever saw in your life. Yet there's a red-hot GPM sitting under this sort of thing. See, there'll be a red-hot item or a red-hot this or a red-hot that. But I have to ask the pc whether or not that is it. And when the pc looks at it and decides that that is it, or that isn't it, only then do I get an active meter.

And this is most amazing. This is most amazing. The GPM can be sitting right there ready to read, and unless the pc has looked at it and has thought it over, why, nothing happens on the meter. Yet this same pc, before those – half of the bank was run out, don't you see? All I had to do was sneeze at the meter and I got rocket reads on anything, and the pc didn't know anything about what was rocket-reading and what wasn't rocket-reading. You get the advance?

The advance is upwards toward knowing one is one, see? And you get out of these automatic physical-energy manifestations of the physical universe. And getting out of these things, you then get to a point where you've got intention.

Now, what is one of these GPMs, anyway, but a method of limiting the pc's ability to intend? And that is the whole idea behind implanting or anything of that nature. The whole idea is that if he intends positive, he gets negative. If he intends negative, he gets positive. So, therefore, he cannot decide.

Now, if you take somebody and every time he says yes you say no, he eventually will get into an indecisional state of mind. He can no longer intend yes, completely, see? So this is how you could wear somebody down, break his spirit, or make him a private in the army. Get the idea? Every time he has a thought, you deny it. You see? There's where you get your original power of choice. The ideas of power of choice – and all such other ideas. The ideas of self-determinism versus other-determinism. All these other various ideas stem out of this alone. It is the ability to intend something.

Now, somebody cannot write. He intends to write, and he'll go around talking about writing, but he doesn't write. Well, what is happening there, he is intending to write, but something is intending that he not write. And that is his mind kicking back at him, which is simply a positive-negative proposition there, of two poles. Do you see this?

All right. He intends to talk Arabic, but the mind says that he can't talk Arabic. See, there's your positive-negative. He intends not to talk Arabic and finds himself chattering strange phrases, and you get these speakings in foreign tongues that the hysterical religionist very often is found to have, and so forth. In other words, you get the positive and the negative proposition. Well, a person has to be very MESTY indeed before they are subject to these particular phenomena. And the more MESTY that they consider themselves, the more en-

meshed in matter that they consider themselves, and the more energied up they are, why, the more trouble they have with this particular action. And, of course, as you go upscale this phenomena drops away as progress is made in this particular direction.

Now, what value is the auditor? Well, the auditor, of course, is at his greatest value at the lowest level of the case – is necessary all the way up through to step six, end of actual GPMs, is necessary all the way. But the auditor at very low levels can produce some of the most interesting phenomena. And it was in the Dianetic days that they were able to absolutely break their hearts, because you could say to somebody so-so-so-and-so and so-and-so, and you could handle engrams, you could handle matters associated with the bank, and the pc would lose his or her arthritis, would lose psychosomatic ills of one kind or another, and never find out about it.

In other words, the auditor could sit there and as-is bits of the thing, just by the automatic mechanical process of a two-way communication with the pc. But the pc was so snarled up and so sunk in, and considered themselves so much a brick or a piece of rock or a wooden slab, that they would never find out about it. And after the auditor had cured up somebody's lumbosis completely, why, the person would say, "Well, yes, but you haven't done anything about my worries about my wife." Well, yes, he was incurable, he was bedridden, he had to go around – the most he could look forward to was a wheelchair. And the auditor would fix him all up and he's walking around now, and he complains because he hasn't had his wife straightened out.

In other words, he was actually influenced without his knowledge. Do you understand this, now, from a two-pole arrangement? Wherever an individual, wherever an individual, then, thinks of himself as an animal, as matter, as a bit of mud, as algae which has coagulated into the difficulties of manhood, when you get these various things, what do you eventually see? You see a whole scientific world indulging in the philosophy of "man is matter." So the spiritual values and natures of man are, of course, lost completely. Only auditing can restore these. Nothing else is going to restore them.

But when you look over the difficulties of auditing, realize that you are handling simply the difficulties of a communication cycle. And when you, yourself, as the auditor, do not permit a smooth flow between you as a terminal and the pc as a terminal, and the pc as a terminal back to you, you get a no as-ising of matter. So you don't get tone arm action.

Now, part of the trick of course is what has to be as-ised, and how do you go about it? But that we call technique. And if you remove technique, if you remove technique from the area – let's not worry about the particulars, what *button* has to be pressed or stepped on. We're not going to wonder about this – what button. We're going to wonder only about the communication cycle. We find, oddly enough, if the auditor is actually capable of making the pc willing to talk to him, he wouldn't have to hit a button to get tone arm action. Do you see this?

Now, the person who is insisting continuously upon a new technique, a new technique, or a very fancy technique, or that sort of thing, is neglecting the basic tool of his auditing, which is the communication cycle of auditing. He cannot make the pc get tone arm action. Well, he can't make the pc get tone arm action, basically, because the communication cycle doesn't exist. And when the communication cycle does not exist in an auditing session, we get

this horrible compounding of the felony of trying to get a technique, but the technique cannot be administered to the pc because there's no communication cycle to administer it.

So basic auditing is called basic auditing because it goes prior to the technique. The communication cycle must exist before the technique can exist. And, therefore, any Case Supervisor is very, very well advised to merely heal up the various points and portions that are missing as far as that communication cycle is, and hit it as buttons. And in view of the fact that the auditor is trying and the auditor is doing something, to actually neglect whether or not the auditing is good or bad – that's up to an auditing Instructor, isn't it? Just neglect that. But just look at the case from the basis of "What parts of this communication cycle are awry?" and "What isn't here in the form of a response to the auditing question?" And simply heal those points up.

Now, if you had a man lying unconscious in the street, you certainly wouldn't be thinking up what technique to run on him. If you wanted to bring him back to life and livingness, what you would want to do is get him to talk to you, or breathe, or flutter an eyelid. That would be something. Oddly enough, the communication cycle all by itself will cause him to flutter that eyelid.

You can take an unconscious person who has been in a coma for some time, and by picking up their hand and making them touch the pillow, and even touch your arm – you know, picking up the hand (they have no volition here) – picking up the hand, touching the shoulder, picking up the hand, touching the pillow (giving them the command at the same time, talking), and so forth, that person will come back to life. This is the greatest magic that anybody ever saw. It's very startling, but look, you're just trying to get this man into communication with the auditor and communication with his surroundings. And he'll come back to battery. And there's no technique.

So, that should demonstrate to you that the fundamental entrance to the case is not on a level of technique, but on a level of the communication cycle. Now, all you have to do is mark out how many branches of this communication cycle can there be. There can be a communication cycle between the pc and the auditor, and the pc and the auditing room. And that's about it.

Now you can get particular, and you can have parts of the auditing room, or you can have specific portions of the auditor or the auditor's beingness – you can mark down to that. And then you can maybe go afield from this particular zone or area – if the person is already in a communication cycle with the auditor – you can go afield and start to address his present time problems. Now you can address whether or not his wife fixes the tea properly or puts arsenic in the coffee, as he is worried about. Now you can address that sort of thing.

But this, of course, because it is distant from where you are sitting, requires a technique. First you have to know what he is worried about out there because it is not present and visible for you to see, or for him to see. So the technique selects out what he is worried about – a little form of assessment, don't you see? And now you're into techniques and processing, having left the field of the communication cycle. If the field of the communication cycle with the auditing room and with the auditor is all solid ground, and if all of that is squared away, you can now worry about technique.

Now, the auditor who comes tearing down to you sometime as – when you're D-of-Ping someplace – and the auditor who comes down and says to you, "*Ho-ha-hai*, I – I just can't get anyplace on Mrs. Hepsibah. Can't get anyplace on Mrs. Hepsibah," and you say, "Well, why don't you run so-and-so and so-and-so," will inevitably come back (you give him a technique, you see) will inevitably come back a half an hour or so later and say, "That doesn't work either." And you can keep up this silly cycle for a long, long time. Because of course there is no technique being delivered to the pc because there is no communication cycle present.

Now, what needs to be repaired is the communication cycle, and when you've got a communication cycle repaired, then you can audit a technique. It's as elementary as that. Now, there are many parts of this communication cycle that can be addressed, because you have the pc there and you have the auditor there. And, of course, the first part of it that has to be addressed is the fact that the person is having a session and is in a room and is being faced by an auditor.

Now, if you take all those and write down the categories – you write down all the categories, all the different little bits that can be written down that are part of this (it's best for you as an auditor to imagine them rather than for me to give you a long catalog on them, you see). And then figure out how you're going to get him into communication on each one of these points, realizing that communication is simply a familiarization process based on reach and withdraw. Even when you speak to a pc, even when you speak to a person, you are reaching; when you cease to speak you are withdrawing. When he hears you, he has something withdrawn – and at that moment he's a bit withdrawn, don't you see? But then he reaches toward you with the answer. And you'll see him go into a withdraw while he thinks it all over. See, he gets back and, well, he's – "Which – why did my grandfather have to marry the girl?" See? And he thinks over this, and you'll see him think this over, and he thinks that cycle through on a withdrawal, don't you see? And then he will reach back to the auditor.

Now, he's already reached this reason. Now he will reach the auditor with the reason, and he will say that was it. Now you have made an exchange from the pc to the auditor, and will see it reflect on a meter. Because that exchange, now, is giving an as-ising of energy.

In the absence of that communication, you do not get meter action. So the fundamental of auditing – the fundamental of auditing – is the communication cycle! *That's* the fundamental of auditing! And that is really the great discovery of Dianetics and Scientology. It is such a simple discovery that... and everybody does it. But you realize that nobody knew anything about communication when it came along. The number of – the number of chaps in communication companies and that sort of thing, who fall around our neck saying, "Really!" you know?

You say, "Well, communication, it consists of cause, distance, effect," you know?

"I – yeah! By golly, it does, you know!"

Well, it's just this sort of thing. It's a fundamental that everybody knew was there. They've been watching apples fall off trees for a very long time and Newton had to come along and see an apple fall off a tree, see? And he said, "Hey, apples fall off trees, and when they leave the tree they hit the ground!" [laughter] See? Everybody says, "Wow!" you know?

"Terrific!" you know? And his name has gone singing down through the ages, because he noticed that apples fell off trees.

It's always this sort of a – it's always this sort of a thing. It's always this sort of a thing which escapes the attention of people. Because MEST is basically very complex stuff. And being very complex (composed as it is out of electrons and molecules and minerals and gee-whizzes of all kinds or another, wavelengths and all this sort of thing), because of its tremendous complexity – so complex that nobody can understand it, they can only... you know? Therefore, people who are very plowed in, you might say, into matter, and who are themselves thinking as matter, think very complexly. And they cannot observe the simplest things with which they are confronted. And they observe none of these things.

Now, you look over this. I call this to your attention. The ease with which you can handle a communication cycle depends on your ability to observe what the pc is doing. Now, we have to add to the simplicity of the communication cycle, the obnosis – the observation of the obvious. If the pc hasn't been talking to you, and if the pc hasn't said anything to you for a very long time, it is no time for you to be thinking on the subject of "What do I say to the pc?" You say, "What do I say to the pc?"

Please! I invite your attention that your inspection of what you are doing should have ended with your training, and thereafter is taken up exclusively with the observation of what the pc is doing or is not doing. And your handling of a communication cycle ought to be so instinctive, and so good, that you are never worried over here about what you do now. "Let's see, am I doing it right or am I not doing it right? Let's see. I wonder how my acknowledgment was that time. Did I say 'Okay' in an artificial frame of voice or should I say it naturally, like 'Ooo-kaay.' No, that wasn't right." No. The time for you to get this all fixed up is in training. And in actual auditing, the communication cycle that you watch is the pc's. *That's* the communication cycle you watch. You know yours is good. So you don't worry about it anymore.

Now, if you know your communication cycle is good, you haven't any longer got to be upset about whether you're doing it right or not. And you ought to be well enough trained that when somebody says "Catfish" to you, you look at them and recognize they are no longer saying "Catfish" and have finished saying "Catfish." And having finished saying "Catfish," it is time for you to acknowledge. But you only acknowledge because they have finished the communication. And your observation is simply limited to the fact that they have completed their communication, and that is your observation. Your observation is the observation of the communication cycle of the pc. And you get good enough so that you just lay in mothballs your worry about your communication cycle when you're finished training. That's the time it goes into mothballs. You understand? You know how to do it now. Your business is the communication responses and cycles of the pc. Do you see that?

This pc: You ask me, "What technique shall we run on this pc?" Technique! What are you doing with a technique? Let's look at the pc for a few minutes. "Oh yes, but," we say, "well, the pc has got to have something to talk about." Oh, come, come, come! You've been in Scientology or Dianetics all this time, and you can't dream up something for him to talk about? It's as corny as this: "You had any problems lately?" See? Or it's corny as this: "How

are you doing?" Let's get this pc to talk so we can see what the score is. Now this is the true, *the true*, touch of genius on a case. This is what makes that auditor who can crack any case, and when it's absent, has an auditor who couldn't crack an egg if he stepped on it. [laughter] *This* is the difference. *This* is the difference. It's whether or not this auditor can *observe* the communication cycle of the pc and repair its various lacks.

Now, I'm now talking to you – when I talk to you about the auditor's communication cycle – I'm talking to you about something that's so simple. It simply consists of asking a question that the pc can answer, and then the pc – observing that the pc answers it. And when the pc has answered it, observing that the pc has completed the answer to it – that the pc has answered it and has completed his answer to it and is through answering it. And then saying "Cheerios" – giving him the acknowledgment – bang! Like that. Say, "All right, you finished that." And then giving him something else to do. That's all. You can ask the same question. Or you can ask another question. It doesn't matter. But the communication cycle is simply asking something that the pc can answer. There's a lot of little trickery involved in this, because that includes clearing the auditing command. See?

You don't say to somebody who's got a – you got a five-year-old kid. And you say to him – you say to him, "Have you had any marital troubles lately?" and I don't think you're going to get much of an answer. See, it requires that much good sense: Ask a question that can be answered, and then ask it of the pc so the pc can hear it and knows what he's being asked, and then the pc answers the question; and being bright enough to know that the pc *is* answering that question, not some other question, and then knowing – and this, by the way, is a very interestingly developed instinct – you can tell when the pc is finished. And if you don't develop that instinct, you're very often lost. You'll say, "Well, did he end, or didn't he end?" and so on. Well, some auditors try to make it up, making another technique inside a technique, like, "Have you finished answering that auditing question?" Of course this is so much balderdash. You should be able to know. It is a piece of knowingness. See, you just know he's finished. He looks like he's finished, he feels like he's finished, your telepathy tells you he's finished, you get the idea? It's that esoteric.

He said, "Well, I – I didn't have a grandfather." And you now know that he is not going to say any more. See? It's part sense. It's part his vocal intonation. You see? But it's an instinct that you develop. You know he's finished. So, knowing he's finished, then you tell him he's finished. It's like pointing out the bypassed charge, don't you see? "You've answered it," you say. "You answered it." Actually, if you said "Okay, good," you might as well say "you've answered it, you have now found and located the bypassed charge in answer to the question, and there it is, and you have said it." See? That's the magic of acknowledgment, don't you see? But, naturally, you say, "Good," "Very good," you know, "All right," "Okay."

But if you got a long continuing thing, you don't want to stop him too hard. So the degree of stop you put on your acknowledgment is also your good sense. Because you can acknowledge a pc so hard and if your impingement on pcs is way up in the stars – that you finish the session right there. You just end the session. You waste all that remaining two hours that you had to go.

A lot of you take over a case, and the guy is going, "*Yip-yip-yap-yap-yap.*" And he says, "*Waffle, waffle, waf* and so forth and so on, and so on and I really don't have any and so on and all these lollipops, they keep coming out of the *wah-blah-blah...*"

You say, "Thank you."

And he goes, "*Wa-wa-wana-nawa-wa*"

You say, "Thank you."

And "*Wa-wa.* And then the – all the lollipops and the wife ran away with the chauffeur, and so on. And it's all very terrible..."

And you say, "Thank you," and so forth.

"And it's all very terrible and the wife ran away with the lollipops and, oh, the chauffeur came out, and..."

Oh, don't be an idiot and sit there and let this go on forever. He isn't talking to anybody. Now, that's what you've got to recognize. Let's get down to some of these problems here. Let's get down. What is this guy doing with his communication cycle? You want to know how to bust cases, that's how you bust them.

What's he doing? I'll give – you an idea. Let me give you a very, very high school, way – upstairs analysis of this situation, show you how far this can go – way up in the clouds. Bang! Pc takes twenty minutes to answer the auditing question. Now, the auditor, see, in this particular case, he knows Scientology.

He knows it backwards, forwards and upside down, see? Guy takes twenty minutes to answer the auditing question, and in that answer of the auditing question, doesn't answer it. Now, the very smart auditor, the very, very, very smart auditor, in repairing this communication cycle from the pc, would look at that, and he'd have three processes just like that. Three processes he'd know he'd have to do on this pc. *Pang, pang, pang!* This, I told you is very high school, see? It's very up. Very upstairs.

(1) Pc cannot have an auditing question. It's pretty obvious, isn't it? Didn't answer the question, so he couldn't have gotten it. So your first process would be "What auditing question wouldn't you mind being asked?" or "What auditing question should you be asked?" or "What question could you answer?" This is getting very elementary, isn't it? "What question wouldn't you mind answering?" You say that's running him at effect. No, it isn't, because you're asking him to have the power of choice over what question. You'd be surprised. You could probably run that as a repetitive process for an hour or two, and everything would get much brighter to this person. Person would say, "Terrific process! Absolutely terrific process. Never heard of such a process before! When did you dream that process up?" I mean, dream a process up, be damned. You just start processing him on a part of the communication cycle.

Now let's get more esoteric. Let's get much more esoteric. If he says he hasn't had any auditing, we obviously would adjudicate that he can't have any auditing. But we'd have to repair something of the communication cycle of "What question wouldn't he mind answering?" before we could ask him a question that he would answer. Quite obvious, isn't it? So you'd have to take first things first. And then we would have to find out about this auditing

thing, and I think you'd find out, as your second process, it'd be necessary for you to get him to get the concept of wasting auditing, and others wasting auditing. Well, if he can't have it, he's wasting it, because it's sitting in front of him. Can't have auditing.

Well, if you got him to waste it in concept for a few minutes or a half an hour or a session or something like this, "Get the idea of you wasting auditing." "Get the idea of someone..." not have him pick up anything on recall, man, because if you're auditing a case like that, you're obviously auditing somebody who doesn't dare go back on the backtrack. So don't say, "What auditing have you had that you wouldn't mind?" you see, because you're asking him to go into the past. Well, obviously, that is like going out into the outer perimeter. The past is not in the session. That's going abroad, isn't it? Memory processes, and that sort of thing, are out of the session and out of the communication cycle. That's something you repair after you've got somebody in session.

So your next process would be, as I said, waste auditing. "Get the idea of wasting auditing." "What could you do here that would waste auditing?" That's very good, you see? "What could an auditor do here that would waste auditing?" Because a person can't have something, they must waste it. If he isn't getting auditing, he must not be able to have it. I mean, let's get elementary. Let's go way back to 1952, get Elementary Have. The ability to do. You could also get him to waste communication or anything else, but I'm just dreaming up three processes in a row here. Your first one is what question could he answer, see, wouldn't he mind answering; your next one is "Get the idea of wasting auditing"; and the third one, "Who would I have to be to audit you?"

Now you've done a subvert, here. You've gone below the session. See, you've brought him up to a point where he could hear the fact that you're going to ask him a very significant question. After I did that, I'd maybe work on his memory. Because those three points would really be healed. You'd see that whole case change. You'd see that *whole* case change. And yet you're worried because he keeps talking about his lollipops running out with – away with his wife, or something of the sort. And you just get fixated on the fact. You say, "This guy can't be audited because he talks all the time, all the time, all the time, about lollipops and the chauffeur, and it goes on and on and on and on and on. And, therefore, if we don't – if we don't remedy this button about the lollipops, the chau – " Why, hell's bells, he doesn't even know what he's talking about.

It's whether or not he can receive an acknowledgment, whether or not he can receive an auditing question, whether or not he can have an auditing session, whether or not he can sit in an auditing room, whether or not he can have an acknowledgment, whether or not, you see, he can say something to the auditor, whether or not – so forth. You get all the little processes that go with this, see? Now, the person took twenty minutes to answer an auditing question and didn't answer it for those twenty minutes. Three processes. Based on what? Just your knowledge of Scientology and what the pc is doing in front of you. Simple, huh?

All right, we got a pc who's sitting there, and he doesn't say anything. Let's take another case, let's just do all this off the cuff. Pc isn't saying anything.

"...Yeah."

"All right. Do birds fly?" (You're running some process, you know?) "Do birds fly? I'll repeat the question..."

"...oh, hmm. Oh, hmm. (sigh) Yeah."

Well, let's dream up a process. We obviously can't have "What question wouldn't you mind my asking you?" because he's sitting there silent, man. Probably not a question of being asked a question, it's a question of not being able to respond to a question. Let's take it apart, let's find out what the pc is doing, dream up something accordingly, see?

So we say, "What could you say to me?" Elementary. Long comm lag, and he finally says something he can say to you. You get this question over somehow to him. What could he say to you?

And he finally says, "I – I could say hello." Good, big win, see? All right, let's build this up on a gradient. Next thing you know, you've got him talking to you.

But you see, if you don't have the auditing cycle going from the pc to the auditor, if you have tremendous communication disabilities on the part of the pc, you actually don't have any auditing cycle going that will discharge energy, and so you don't have tone arm action. That simple? That's all there is to it, actually. So, as soon as he can talk to the auditor, don't get so overjoyed about this wonderful change in him that you cease, now, to inspect his communication cycle. Because if you've cured that, you will now find another piece of it that's missing. In other words, you can go the whole way. Do you see?

After he's gotten so that he can say something to you, well now, now you might have to figure out what would he answer, don't you see? And now you might have to figure out if he could have an auditor. Now you might even go so far as to find out what constituted getting better. I don't think you have to invent a process as complicated as "What would be worse than getting better?" But what the pc isn't doing is where – well, let me put it this way, there's a little formula involved: It's what the pc isn't doing that it might be possible for the auditor to get him to do. See? That's the – that's the formula. It isn't what isn't the pc doing that we're going to get him to do – what is the missing ability? Because obviously he's not OT, so you say, "All right, be OT." Now, you're going to have a lose here. I'm afraid that's going to be a lose. Do you see? So, it's what can you get the pc to do that the pc can regain the ability in doing? See, that's the formula on which you're operating.

And, operating on that formula, you can find all sorts of things. You can thresh around in the environment of the pc, one way or the other, and if you're an alert auditor, you'll see these little disabilities showing up here and there, and so forth. A stammerer is about the easiest diagnosis anybody ever had anything to do with. But how many stammerers have I seen being audited on processes and techniques? Well, it's absolutely foolish to audit a stammerer on a technique. He obviously is having difficulty communicating. What are you doing in an auditing session, doing anything but to improve his ability to communicate to the auditor?

Now, you might find something silly like this happen if you were auditing somebody who stammered: that he would talk to the auditor eventually with complete clarity – still stammered to other people. Well, this is quite obvious. This is extremely obvious what you would now do. We now – you don't now instantly extend it to other people, because there are

other pieces of the communication abilities right there in the session to be straightened up before you go out into the outer perimeter of the society. And usually where the auditor gets his lose is he repairs something, gets a *big* win, and then there's thirty other things to be repaired, sitting right in front of his face – right in front of him – and he doesn't. He does some kind of a jump into memory, or engram running, or something. My God, just because the pc is now perfectly willing to talk to you is no reason that the pc – who a few minutes ago could not remember anything – it's no reason he now can remember something. That's another ability.

Let's say somebody is trying to improve their memory. Well, you improve somebody's memory after you've got somebody who can receive an auditing question and answer it, and then receive the acknowledgment resulting therefrom, and who can sit there in an auditing session and be a pc and be audited. Now you can go about improving memory, but oddly enough, memory improvement starts with being able to remember something in the auditing room, not something that happened to him eight trillion years ago. It begins just a minute ago.

I've seen a pc absolutely ruined, become unauditably, by repetitively being asked questions having to do with memory that the pc couldn't answer. So another rule in observing the communication cycle, and so forth, is don't ask the pc to do things the pc can't do. And if you've inadvertently asked the pc to do something the pc now can't do, well, for heaven's sakes, be enough on the ball, be sharp enough, be really bright on this and recognize that you've asked the pc something the pc can't do, and therefore you've given a lose, and you better not compound the lose. Don't ask them to do the same thing again that they now can't do.

This goes very elementary. You talk about flattening processes. Very often you're asking a pc a process, you see? "From where could you view catfish?" See? "From where could you view catfish?" "From where could you view catfish?"

And the pc finally says, "That's all the answers there are."

And you know, the process had better be flattened. So you say, "Well, from where could you view catfish?"

And he says, "Well, that's all the answers there are."

And you say, "From where could you view catfish?" And now he has to invent an answer, and you're running a create process. Your pc, if he doesn't ARC break, snarls up right there.

I always respect a pc saying, "There aren't any more answers." I bail out of there in a hurry. And when I ask the pc – when I ask the pc "From where could you view catfish?" and – we just took off into the blue here – "From where could you view catfish? See? That's the question I want you to answer now. Answer the question." And the pc says, "I'm sorry, I – I never viewed any catfish," I know right away I have been guilty of giving the pc an auditing question which the pc couldn't answer, and I am guilty of not having cleared the auditing question. I've given the pc a lose.

Let's have a pc who is very deathly afraid of touching mantels – mantelpieces. Just an invented nuttiness, see? All right, we'll say, "All right, walk over there and touch that man-

telpiece." (We already knew he was this way, see? Or we don't know he's this way.) We say, "Walk over there and touch that mantelpiece."

And he says, "*Ughh*, I – I – I can't do that."

Soon as you've gotten into that situation, you got yourself a lose. Let's find out if the pc could do these things. Let's discuss this process a little bit with the pc. Like, "How's about..." I don't care how grammatical or esoteric or patterned you are about this, you see, because sometimes you have to be very, very communicative. And you say, "How's about if I ask you to walk around here and touch parts of this room? What would you think about that? What if I ask you to do something like that?"

And the pc says, "Oh, my God, I couldn't do that! Ho-ho-ho-ho, no, oh-oh! Particularly a mantelpi – oh-oh-oh, no! Don't ask me to do anything like that."

You say, "All right, I won't."

See? Swift recovery. Now, you haven't given the pc any lose. In fact, you might have given him a little win. This caused him a spooky feeling. "You know, I'm really – I don't really want to walk around here and touch the room."

Ah, he's interested now. "Well, is there anything around here you – you – you wouldn't be too upset about touching? How's that? How about – how about some question like that?"

"Oh, I could – I wouldn't be too scared of touching that – that spot on the floor."

"What else wouldn't you mind looking around here and...?" [laughter]

Smooth as glass, you see? See? You cleared it, he said he couldn't do it, this intrigued him, now you can hit a gradient that he can do and build it back up, and you've got it made.

Every once in a while you see something like this. But if you're not – if you're not observing what the communication cycle of the pc is, why, you're adrift all the time. Pc isn't answering the question. Well, that's obvious. Maybe there's a hundred thousand remedies could be dreamed up for this particular activity, all within the perimeter of the auditing room. Pc is this way, pc is that way, pc – every time they sit down in the chair they dust the chair off very carefully and take some Kleenex and wipe the arms of the chair, and then they sit down very gingerly into the chair. You've observed this a couple of times. Well, there's no point in bringing it sharply to their attention, but you must realize, it must be borne home to you – with that much exaggeration, certainly it'd bring it home – that this pc doesn't want to touch very much around an auditing session. I mean, that would be an elementary observation, don't you see?

It might have to do with chairs, it might be a GPM, but you can't run all of that. Let's just chalk this up. Let's chalk this up. Pc gingery on this subject. Obviously, somewhere up the line you're going to run some objective process on this pc – somewhere up the line. But ahead of that there might be some much more attainable, but much less obvious thing, such as the pc never looks at the auditor. That might be touchable. "If you looked over here, what would you see?" Doesn't really require him to look over there. He only need guess at it. "What might you see?" You could even soften it up to that, don't you see?

There's all kinds of things here that depend on auditor observation. Where the pc breaks down in his communication cycle with the auditor and where the pc breaks down in his communication cycle with the environment is your entrance point to the case. Those are the entrance points to the case. If you haven't got him squared around so that he can respond to the auditor, he of course can't answer any auditing question, so what's this technique worry?. Why are you worried about a technique? No technique you ever dreamed up is going to arrive.

Well, you have some fortuitous feeling that an automaticity will turn on in the pc and answer you. Well, that's how you're going to get the pc getting well and never finding out about it. They ran into that in Dianetics. They could actually run 'em through an engram. The engram was so easy to trigger, and the bank responds to the auditor so beautifully, that practically the whole session could be carried on without the presence or benefit of a pc. PC didn't have to enter into it – and case loses occurred resultingly.

But these are the ways you crack cases. And the best way to study it is just walk around it and take a look at all possible ramifications that could be done about it, get some acquaintance with processes from '52, '53, '55, wonder which one of these processes are applicable to what, don't you see? There's all kinds of these processes. First Saint Hill, "Who would I have to be to audit you?" see? That's a nice process, see? But there's tons of these processes you can... oh, Lord! Well, they're being cataloged now, lots of them. But they're honeys. They're honeys.

Sometimes you find a pc can't, absolutely cannot run some process because one leg of it is wrong. Let's say SCS, and yet the pc can't stand still. And it's required in the process to stand still, and yet you're running Start, Change and Stop on the pc.

Well, the pc's disability is the pc can't stand still. The pc can start, the pc can change and the pc can stop, as long as they don't have to stop much. So you say, well, we can flatten stop – this will be all right. Oh, no, there must be a leg underlying this. See, a pc disability – the pc cannot stand still.

Well, what would you do about something like this? Well, I'll tell you what not to do about it: neglect it. Don't keep on running *SCS*, *SCS*, *SCS*, and the pc is going on, and they go on. Because what are they doing? They're running with a prior consideration of the process. Therefore, they never really take on any of the auditing commands.

They are running each auditing command, ("When I say 'Start,' you start that body" and so forth), "All right, I just – that – that'll give me a chance not to stand still," see? The pc always amends it. Always amends the auditing question, always amends the auditing question. Don't you see? "I'll stop it, but I'll stop it quick enough and get off of it so at no point during the stop have I stood still." See? You get this idea? Well, a little discussion with the pc will show up these various things.

Now, you can take a process and you can walk parallel with SCS, and you can repair that point and run SCS afterwards. Well, how would you go about standing still? Well, the crudest way to go about it is just say "Stand still. All right." "Don't stand still. Thank you." "Stand still. Thank you." "Don't stand still. Thank you." That's the crudest thing I know of, see? This is obviously right out of the textbooks and technology of Scientology, you see?

"Stand still. Thank you." "Don't stand still. Thank you." "Stand still. Thank you." "Don't stand..." Automaticity is going to go away; this must be some kind of an automaticity that's all ready to trigger there. So if we get the person into any familiarity with it – because the person already realizes they can't do it. That recognition tells you that it's within the range of itsa.

But if you get somebody walking in on crutches that don't know they're walking on crutches, you wouldn't say "Throw away your crutches. Now walk." See, too high a gradient. And they don't even worry about it. You get somebody walking in and saying, "I got to get rid of these crutches, man" worry, worry, worry, present time problem, see?

Well, the thing to do is inspect their communication cycle and their communication cycle with the auditor, communication cycle with their mind, the communication cycle with the environment – see. There's many of these little communication cycles. Let's inspect these various things. Let's find out he's all right before we say "All right. Throw away your crutches. Thank you." You got the idea? See?

Normally, what the person is worried about is in actual fact not what the person is bugged with. You very often will get somebody running off on a total automaticity of what's wrong with them, and they're not even listening to themselves talk. Actually, they will run off a total automaticity of what's wrong with them, and they're not even listening to themselves talk. Sometimes they listen to themselves talk to find out what's wrong with them. [laughter] When you get into that situation, why, it's elementary to repair the existing livingness of the pc, but only after you've repaired their auditingness.

An auditing session is a highly artificial action. Highly artificial. It's dreamed up, invented from scratch. Nothing like it has really ever existed before. That's why a psychoanalyst would lay an egg a minute – in a minute – if he cracked a textbook on Scientology and took it back to the office to run it on one of his patients. *Aughhh!* And boy, do they lay eggs! Why? Well, they're running Scientology with a psychoanalytic auditing cycle. And, of course, that's a wild auditing cycle if you've ever inspected it.

One psychoanalyst said, "I don't see how you can stand to listen hour after hour after hour," and the other one says, "Who listens?" But that's their appreciation of the auditing cycle, and it's too bad to produce any great effect, which is probably fortunate – because the theory which goes back of it, and so forth, is highly artificial. They don't produce any impingement, the auditing cycle isn't there, and so on.

But this artificiality of an auditing session approximates – it's only artificial because it approximates in such harsh, staggering, visible reality, the exact precise points of contact with existence. And what it is, is a hopped-up, gunned-up contact with beings in existence, don't you see? Way up! It's something like putting a Model-T Ford and putting a Lycoming aircraft engine in it, see? And *bzzzzz-zzzzz!*

Well, all of communication always has consisted of cause, distance, effect. Well, you jam it up into an auditing communication cycle and it's full of bombs, man. See, bang! Things are going to happen, because it's highlighted the exact important points. For instance, you ask somebody on the street out here, "What's important about communication?"

They say, "Well, being polite."

"Good. What are the parts of communication?"

"Oh, there's past participles and there's present participles and there's grammar and..."

See, they couldn't tell you any of this, don't you see? All right, you gun in there, with cause, distance, effect, you see? Ask a question, get it answered, acknowledge it, see? *Porowww!* See? *Wrooof!* You're handling raw meat. And you rehabilitate any part of this, and so forth, and then something wakes up. Thetan can't help but wake up. The ability to communicate is always terribly visible to a reporter or somebody doing work in this particular field. They get around Scientologists, it knocks them flat. And this photographer that was here today from *The Saturday Evening Post*, and so forth – who has gone now, I imagine – this boy – this boy's first remark to me is "They're all so uninhibited!" after he got through taking pictures of you, you see? "You're all so uninhibited."

He sees communication happening. He's very impressed with you, you see? You're walking straighter, and you aren't all tightened up, and you're not a bundle of nerves, don't you see, and all this sort of thing. And he can't quite express this thing, but he's already in a state of shock because he's been hit, you see, with too much life, livingness, you know – just hit him in the face. And yet, none of you really probably said anything to him. It's that apparent.

Well now, you take this up and gun this up into an auditing cycle, and the auditor is saying, "Do birds fly?" and the pc is supposed to listen to this, and he is supposed to understand this and he is supposed to sort out the answer to this, and he is supposed to deliver it up now. And he's going to get for that, "Thank you" straight into his skull. And it isn't the parts of grammar, and it isn't this, and it isn't that and it isn't the other thing, and – if he can stand up to this, he'll start getting the idea that he can communicate. And he goes out of session, and he'll start communicating with the environment. And the only thing really wrong with people is, is they've withdrawn from contact.

If you wanted to capsulize the entirety of difficulty with the mind, take somebody who is no longer looking. The last time he looked, there were three saber-toothed tigers ready to bite him. Now he is no longer looking. Of course, he believes that there are three saber-toothed tigers there. He'll sometimes put up screens between himself and the tigers. And then, of course, he never dares take down the screens, so he never finds out if the tigers have gone. And he does this throughout enough trillenia, he's got an awful stack of tigers – all of which have left! But he doesn't know it. He can't be sure they've left.

And so he's in a condition of total withdrawal – from his environment, from himself. He's safeguarded himself with an automatic bank; he's safeguarded himself with an automatic beingness; he's got a valence standing where he ought to be, and he knows that he came straight from mud and that he is mud and that he'd better not be anything else, because mud is relatively unpalatable when eaten by saber-toothed tigers. [laughter]

And a capsulization of all aberration is just a total withdrawal. I don't care – that's a psychiatric term, of course. They have some condition they say "total withdrawal." The psychiatrist is standing there totally withdrawn, telling you about somebody who has gone into a

withdrawal, which I always considered very interesting. This is not an apt term. It's one point where we're crossing terms. But we're not talking about the psychiatric withdrawal, we're just talking about the fact the guy has retreated, that's all. He no longer dares put out a beam a mile away. First he could put one out a light-year, then he put one out a year, you see, and then he put one out a mile and then he got down to a hundred yards. And each time he got enough "being bitten," don't you see, that he no longer puts out to distance, his remedy is always shorten the reach. And the thetan has, as his standard remedy for safety, shorten the reach. And what does he do when he gets into zero reach?

He actually can figure out how to invert a withdrawal into an inverted withdrawal, and you get the cycle of the dynamics coming on down, which is – he comes away from actual reach, don't you see, and he comes down to zero actual reach. Well, he's got to reach somehow, so he figures some other way to reach, don't you see? He reads travel books or something, you know? And he goes into these various cycles. And there's always a zero of what he is doing, which then has a remedy which is lower than that, and he gets down into not just a total withdraw, he gets down to an inversion of the inversion of the inversion of the inversion withdrawal. Of course, the first point this shows up is in an auditing session, and his ability to talk to the auditor – about pertinencies.

The sensibility of his communication is also in point here. You've asked him, "Do you have a car?" And he has explained to you that General Motors stock has gone down for the last year or so, and drops it at this point. So pertinencies – he didn't answer the question, did he? So you get him into some condition where he can answer the question, he can speak up, where he can hear what you're saying, where he can therefore receive the auditor. Because you've got somebody on total withdrawal, one of your best remedies is to see that he gets reached, don't you see? And you reach him in order to get him to reach, don't you see? And these are the conditions which you're trying to remedy with an auditing cycle.

Now, if you want to be an absolute gee-whizzer to end all gee-whizzers on cracking cases, don't you ever go around drooling about this fellow sitting there, and he's saying, "And my wife lollipopped with the chauffeur, and – and it's just all too tough, so on and so forth, and so on and so on."

And you're trying to say to him, "This is – you know, the session has ended."

And he says, "and so and so on and came down the chute, and there were eight sides of it, and so forth; they were all hexagonal, you see, and so forth."

And you said, "The – the session – the session ended some time ago."

And he says, "... and so on and so on. So I've always said to chauffeurs since that particular time – I've said it lollipopped the chauffeurs!"

Don't now go to somebody, or try to crack a textbook to find out what to run – what technique to run on this case. It isn't a case of technique. He hasn't got anybody there to talk to. He isn't talking to anybody. If he is, it's somebody else. He isn't talking about a problem he could have, see? He isn't even talking about a problem he's got! He probably isn't even listening to himself anymore. He has no familiarity with the environment, he is disoriented as to where he is, and so forth. And you want a technique?

He's got a paw. Well, you could say, "Now pick up your hand and put it on the side of the chair and feel the side of the chair."

He might go right on talking for some time without noticing you're doing this. And then eventually say, "Hey, there's a chair here." Big win.

But if you're going to deal in pcs at all who have disabilities of any kind whatsoever, you've got to have a session before you can have Class IV, V, VI, VII, VIII, IX, X. You get the idea now? You've got to have a session before you can have a technique operating. This is the value of the auditing cycle, this is its use, and this is how to become one of the wildest case crackers anybody ever had anything to do with. You get to be a screaming genius on this subject, and something.

Oh, you make errors, you'll get too accusative, you'll all of a sudden find you over-cut – you've overestimated the pc's ability here and there, and so forth, and you have to cut it back. But remember that it always requires adjustment.

The only other thing I would teach you, and like to teach you about this, and I really wish I could, is that after you've remedied it, it's been remedied. And don't keep on; because this pc had a lot of tone arm action on what question he could receive from the auditor, and so forth, don't make that a lifetime profession. Because this is just another method of nonobservation. Now that he can do this and is doing it, note that he is doing it. See? He feels all right about it and he is doing it. Note that, and now notice – notice, in other words, that he's changed – and then notice what else you can put together.

So there's two more things to notice, don't you see? Is when has that condition been remedied? – when has that little ability been regained? – so that you can pull foot out of there. And the other thing is observe now, newly and freshly, for something else to do for the pc.

The reason I give you those other two is that sometimes it happens so rapidly that it – you're just rocked back on your heels. Pc has never talked to anybody before in their life, and you all of a sudden have them talking to you pertinently, in a blue streak. Well, let's not go on remedying their ability to talk to the auditor. See, ability regained. So you want to be able to notice that, and that's all part of the observation.

And the real hot – the real hot auditor, the real – guy that gets case wins all over the place, is sitting in there observing what is going on in the session, and if things are going all right, doesn't remedy them, and if things are going all wrong, picks up that point that can be remedied and remedies it, until they are all remedied, and then carries on. Those are the magic ways to go about this sort of thing.

Well, you take over the technical aspect of some Scientology organization. You're sitting in there doing nothing but coaching up cases, doing nothing but coaching up cases. Don't pay any attention to the auditing of the cases – consider that's sincere and it's being done as best it possibly can be. Ignore that aspect. Don't keep picking on the auditors; that's a training job. But just keep watching – watching those communication cycles. Note the communication abilities and so forth, the appearance and that sort of thing, of a pc. Don't depend on large tests having been made every fifteen minutes and fourteen pounds of auditor reports to tell you whether or not the pc's had a change. Let's look at this pc. Let's listen to this pc in session.

Is this pc talking better, answering more pertinently, and so forth? If so, fine! We're winning, and so forth. Let's not worry about that pc until we get a bog, and there's a no-change condition begins to take place with that pc. And the pc looking brighter and got more spark in the eye than they had: Well, their eye was – remember that this is a gradient – their eye was absolutely complete pebble, stone, flat, lightless. And now you can see a trace of color through the fog. That's an improvement. See? Note the improvements. Don't just be cynical about it the whole way, you see? Note the improvements, because they sometimes take place rather slowly.

And just keep them – keep them moving up, and only pay attention to – only pay attention to – the communication cycle and the ability of the person to handle the environment in his immediate vicinity, particularly an auditing session. And only pay attention to those things.

Never pay any attention to the person's problems, never pay any attention to their goals in session, never pay attention to any of these other things – because obviously, any auditor they got would take care of these things if the pc was in session.

See? Auditors are good at that. What they're not good at is having somebody there fully in session. Because, of course, that's the hardest trick. That's the roughest trick. But there lie the biggest gains. And it looks so easy, it looks so kindergartenish, that you very often neglect it.

So you see that somebody is all straightened out, he can talk to an auditor, an auditor can talk to him, that an auditing cycle can take place, the person can receive an acknowledgment, the person can have an auditing room, the person can have an auditing session, all of these things are possible, everything is fine, and so forth. Well, aside from occasionally catching somebody with a tremendous goof on the subject of – they're running the service facsimile on the person, and when it was – got a service facsimile, the auditor in this particular case couldn't find any service facsimile because the person had been raised in a poor family and didn't have any maids.

Then the thing to do is to get hold of the D of T and say, "That auditor needs some training on service facsimiles." Not to go into it. But the only trouble you're going to run into from there on, don't you see, is going to be the application of technique.

And that is *never* the trouble in Scientology, and it is *not* the trouble, it is *not* the trouble with your pc that you're having any trouble with at all. These techniques work like mad, but all of them have the dependency of the pc fully in session. The pc is fully in session, you can run almost anything on them and they'll sail, don't you see? Pc not in session, won't. The big bog is people don't get the pc into session before they start running something. And therefore they expect a technique will remedy something that's sitting right in front of their faces, which is the pc not at all in session. Do you see?

All right. That's actually – that's actually how to undercut cases left, right and center, make a wide swath in all directions. And I think you can do it.

Thank you.

WHAT AUDITING IS AND WHAT IT ISN'T

A lecture given on 25 February 1964

Thank you. I like you, too.

I'm the first survivor to return from the Battle of the Goals Plot. The casualties have been pretty heavy – pretty heavy, but fortunately it is mostly in terms of GPMs.

I was just telling Reg that there isn't anybody could have done it. And then he suddenly looked at me and he says – he says, "But you did it." And I said, "Yes," I said, "that's the – that's the joke." [laughter, laughs]

But the progress is going along. You're very lucky. That's all I've got to say. If any one of you had gone into this flying blind with your hands tied behind your back, why, you would have come up a mass of putty.

Trickery. The actual GPM contains trickery. Treachery. It's no wonder they never came apart. No wonder. And that's why we teach Class VI at Saint Hill and a few years from now, when there have been a lot of Saint Hill graduates and a lot of successes and we've made a lot of OTs and so forth, several years from now, why, we'll let Central Orgs teach this stuff. The franchised auditor who is sitting out there right now waiting for the next bulletin on Class VI, [laughter] you see, he's going to be very upset because I would just as soon place in his hands a hand grenade with the pin drawn, see? You know, "Here, here you are!" you know?

You see, as long as we were in old R3 we weren't deep enough to do anything to anybody. That was perfectly all right, you couldn't mess anybody up at R3. R4, we were still running at too shallow draft to upset anybody. Moved into R6, you see, and all of a sudden you stand there looking at the real tiger. These things had enough charge on them so then you could take off surface locks to a tremendous degree. And just as in processing level by level you can take off surface locks, well, so in these goals – actual GPM processes you see, you could also take them off at various levels. So at R3 you find a goal and run a terminal. Oh, there's nothing to that – fairly safe, you could do any of those variations because you really weren't handling anything, don't you see?

Then you finally get down to – you finally get down to, oppose – why, you can run a whole GPM on oppose. You can find seventy items, pc has tremendous numbers of cognitions, everything happy, and matter of fact I might even hand it out sometime as a process, you see? Let anybody run it, you see? Wouldn't do him any damage. Lots of charge comes off, lots of TA action, you see. Now the moment that it's moved into the bracket of "solve," the moment that you move it down toward a command like "solve" on an actual GPM, you're between the devil and the deep blue sea. You're close enough to the real tiger so that he can knock your

head off, but not close enough so that you can get back at him. So it becomes, at that point, a very dangerous process.

Now you take R6, where you're handling nothing but purebred Bengal type tigers, starved for a long time, and you take somebody that could have run the oppose line, you see, you take somebody that could have run the oppose line very easily, you know, find a goal, doesn't matter really if it's the wrong goal, right goal, that wouldn't have upset him too much. And he goes along, that type – that type auditor, see, and then you just nonchalantly say, "All right, well, just go through that door. All right. And, you find there on your right, you'll find a rather flimsy chair. Pick that up."

"Oh, is that what I'm supposed to do?"

"Yeah, that's all you're supposed to do, and then you lift the cage door at the far end, and in come the tigers," you see?

Honest, I'm not exaggerating, I'm not exaggerating. I have found enough aberration. [comm lag, laughter] You often want to know – if you want to know what it takes to make a thetan aberrated, you have to find enough aberration to account for the fact that a powerful being would now be unpowerful, see? How would he get in that state? Well, actually it's a direct proportion. It takes as much aberration as he was powerful. And there's that much aberration on the GPM – actual GPM lineup. I guarantee you, there is enough. And there's also quantitatively and qualitatively enough.

Actually then, the whole of auditing is simply peeling down toward these things from the first time you have a person sit in his chair, you see, and itsa. He's taken off some of the top crust. And it's perfectly safe on up to IV, service facsimiles, so forth – it's even safe into, as I told you, it's even safe into finding a goal and running oppose on the items. Perfectly safe. Nothing to that. Now, you really got to be an expert from there on.

Well, this is just a prelude to this lecture. This has nothing to do with it, I was just saying hello and telling you about where the score was about now. We got it – we got it licked, there's no doubt about that, but them tigers, the – them tigers have got some pieces of cloth in their teeth.

All right, what's the date?

Audience: Twenty-fifth.

Twenty-fifth? It's the 25th? No kidding. Twenty-fifth of February, AD 14, Saint Hill Special Briefing Course, student lecture.

All right, we've got – we've got some business today. We've got some business to transact. These are data vitally necessary to the auditing of Class VI and if you're very clever you cannot do without them at the lower levels. The main problem with the data I'm giving you is until you get to Class VI you can sometimes get away with it. At about level Class IV is the first time you could start teaching it. And it would be terribly useful at Class I, but you can't teach it at Class I. You can teach it and then the fellow will think he knows it, but by the time he's gotten up to III or IV, why, he would have to be taught it again because it would have brand-new values. By the time he gets to VI he can't audit without it.

And that's very peculiar, then, to go into this level and you're about to see some of the very fundamental fundamentals of auditing which will explain to you why auditing has or has not worked here, there and so on, and which will be very valuable to you at any level that you're operating at in Scientology.

So this lecture actually is useful for all levels and would be quite good at the lower levels but probably could only be taught at about Level IV with any real comprehension. And by the time you get up to Levels V and VI, becomes vital. Not slight, because omission of this data brings about catastrophe.

Now let us take this up then in a very *rat-a-tat-tat* fashion, and if you get this down, if you get this all squared away and get this all aligned in anything under fifteen or twenty hours of study, why, I'll be very proud of you. Because the first moment that you see this, you'll all say "Yes, yes, yes," and then you'll go tanglefoot with it. Because it's this type of data; it's too simple. I was tanglefooting Suzie Belle the other day with it, so don't expect to grab it at the first brass ring.

First thing I want to tell you though is there's something here to grasp. You have to grasp it with your total comprehension. And it's so confounded simple that – see I was using a very cruel example with her – I'll give you the same example.

Here we have a Ronson lighter in a little hide case. All right. Now, the task is to put the Ronson lighter there on that paper, you see, and then put it over here on these pencils, and then put the Ronson lighter in the center of the desk. Now that's the totality of the operation. See, heh! Got this object here and we want to put it on this piece of paper, then we're going to move it over on top of these pencils and I'm going to put it in the center of the desk, hm? Now let me show you what happens with this operation. We put it over here and we say, "Is that over there?" and somebody we're trying to train says, "Yes, but, that's got a hide case." And you say, "Yeah, well that's – that's true. However I want you to put it down over here on this piece of paper."

"Yes, but hide, you know, I imagine the Ronson company must have some kind of contract with the Indians up in Alaska," and you say "Yeah, I'm sure they do. Sure they do. Yes, but I want you to put it down over here on this paper."

"Yeah, but you know, there must be a terrific amount of trouble portaging skins, you know? They've got a skin there and they must have that, it must come from Alaska there, and they must have a terrific time trying to get these skins down the river and I wonder what design the Indians have on their paddles."

And you say, "All right, that – that's fine. But all we want you to do is put this object on this piece of paper."

"Yeah, but the Ronson company doesn't make paper." [laughter]

So when I tell you about the design on the Indians' paddles with regard to this while I'm giving you this lecture, you'll know what I'm talking about. Because you can make more complexity whenever you try to hand out an absolutely simple datum in its complete, naked purity. It, of course, blows more confusion in more directions than you can shake a stick at. And you just have to keep working with it. Now this actually is coached material, until a person can take

this and ask the question and get the answer and there's no design on the paddles that are coming down the Yukon, see?

They put you... you'll – you'll – you've got a future here, in just this. Now, let's just go at it hammer and pound. Let me give you first a very brief outline of what we're going to do.

I'm going to teach you the difference between auditing and assessing, destimulating and erasing, the difference between a present time problem and an ARC break – it's just terribly elementary propositions. And the targets of the auditor – what he – what he fronts. All right, that doesn't sound like very much, does it? But brother, I know.

All right, let's take up right away quick the last one I mentioned, which is targets of the auditor. The auditor has two targets. He has the pc and he has the bank. When that auditor speaks he is speaking to either the pc or the bank. That's just crystal clear data. That's two targets. He says, "How are you feeling?" or he says, "Catterwump." He says, "Catterwump" and the bank goes crunch, see? He says, "How are you feeling?" and the pc says, "Well, let's see, I'm feeling so-and-so and so on."

You understand? There are two things that an auditor talks to. Two things. One is the pc, the other is the bank. Auditing is addressed on the auditing cycle to the pc, and assessment is addressed to the bank. Once more – very, very simple. Nothing to this at all.

And you're saying, "Catterwump, cat whiskers, bat fur" and so forth, you're talking to the bank. And reading the result on the meter. Or reading the result on the pc's eyeballs. I don't care what you're reading the result on, but you're talking to the bank. Now, you understand then that when you are talking to the pc, when the auditor is addressing the pc, that he very often restimulates the bank and he very often has an effect or an influence on the bank. Very often. But, that as – does not debar it at all. Sometimes when assessing, the pc talks and the auditor has to acknowledge the origin and so forth. But these are separate actions. And I – if you could only see them as separate actions, you would save yourself a great deal of complexity in the matter.

All right. Now, two targets. The auditor has the target of the pc – a thetan, or the bank. Very good. There are therefore two types of processes. But they are not processes, one of them is not a process at all and – you're about to get your first headache – is not auditing.

Now what is auditing. Auditing is an operation which culminates in destimulation or erasure. It has only two end products: destimulation and erasure. You can get the pc to dust himself off or you can use the pc like you would an ink eraser to scrub off the piece of bank that you're heading for. In other words you can get the pc out of it or you can use the pc to wipe it out.

Many auditors have the custom of using the pc to wipe out pieces of the bank and then in view of the fact they can't wipe that bank out totally, then using the pc to wipe out another piece of bank which they can't wipe out totally, so they try to wipe out another piece of bank. The pc comes to session, he's got a present time problem, so they wipe out – try to wipe out the present time problem but they already haven't wiped out the service facsimile they were auditing yesterday, so now they've got this present time problem, so they're going to erase this present time problem and they can't really erase the present time problem because halfway

through the present time problem the pc comes up with the fact that he's worried about his mother. And when he was young he was very worried about his mother, so now, we try to erase mother and, having in the process of erasing mother, of course we run into the subject of father, so we try to erase father and so forth.

This is what is known as – this type of auditor is known as a "mudder." All he wants to do is erase. Throw the pc into the heavy energy and use him as an ink eraser. See, that's perfectly legitimate on erasure and so forth, as long as you complete your cycles of action. But practically all of the early levels of auditing are destimulation, which means you unrestimulate what has already been restimulated. I refer you to earlier lectures on the subject of restimulation and destimulation. What you're trying to do here is take the dogs that are barking at them and get them to lie down quietly. Erasure would be to go over and eat up all the dogs, you see? But all you want these dogs to do is lie down quietly and the pc to come away from there. That's destimulation, don't you see?

So we have this pc and he is – got a present time problem and therefore is not in the auditing room and therefore is not in session. So we say, "What kind of a problem – what – what's this problem all about?"

And he says, "Well it's about so and so, well, it's about my early life."

"All right, well, what about your early life?"

"Well, I used to have an awful lot of trouble with boys in my early life."

"Well, did you ever have any fight with boys in your early life? All right, that's good, pick up that early fight that you had. Have an overt against boys when you were very young? Oh, that – that's good. It's go – you got hurt, huh? Like where – where's the somatic?"

What are you doing? The pc wasn't in the auditing room to be audited; the pc was elsewhere. So you send him else-elsewhere. Now, what do you think this pc's going to do? Means that you could never complete your cycle of action, because the pc is elsewhere when he begins the session. You've got to get the pc here before you can complete your cycle of action. Now, therefore you never have a chance of completing yesterday's auditing if you can't get the pc into the session today. So if the pc has picked up new problems or new difficulties in life between sessions – this is quite common I am told – and if the auditor does nothing but plunge and Q-and-A with this new situation which is arisen, he, of course, never cleans up yesterday's cycle of action. You follow that?

Well, destimulation is the only tool or the only action you can undertake to get a pc oriented and located; and if an auditor cannot destimulate a pc, he of course can never follow his own cycle of action. Do you see that? The pc's restimulation takes charge. So therefore you can never bring it up to a point where you can finish that Problems Intensive you started last August. And ever since that time he kept coming to session and we had other things to handle. We've always got other things to handle if we can't destimulate the pc, so therefore the destimulation of a pc is a very, very important skill. Very, very important skill. There are various mechanisms by which one destimulates the pc.

Running engrams, no matter what process you use to run the engrams – running engrams, running RIs, implant GPMs, RIs, actual GPMs. I say implant GPM RIs and actual

GPMs – all are under the heading of erasure. Nothing but erasure. That's using the pc to eat up the dogs, you see? Now, there's always a certain amount of erasure takes place, even in destimulation. A tiny amount takes place, you see?

Let me give you an idea of destimulation and erasure and how one operates somewhat with the other one. Pc's fallen down, hurting – hurt his knee and we use an old-time assist, we say, "Where did you hurt it?" and "Where are you now?" and "Where did you hurt it?" and "Where are you now?" And what we're trying to do there is simply destimulate it. We're trying to get the pc out of that area of time and that location and get him where he is now sitting, you see? That's destimulation. We're not trying to do anything about the injury; we're just trying to get the pc to sit there in front of us. In the process of doing this, you will notice a pc quite commonly turns on somatics. A certain amount, then, of the incident or injury runs out in the process of destimulation.

Most wonderful example of this I ever saw – and I remember vividly – happened at 42 Aberdeen Road with no less a person than Burke Belknap.

Burke was having a lot of trouble casewise and he was having a lot of difficulty somehow or another and I straightwired him and – it happened in the little office, just inside the door, any of you there were there – and he was standing up against the wall and I gave him a – gave him a bit of straightwire and gave him a *clip-bing-bang*, hit the locks, the key-ins of this little incident, had to do with this – and man, he came straight up PT, practically Clear right there. See? You know, terrific result. You know, bang! You know, five minutes' worth of auditing and wow, you practically got a Clear on your hands. You see, that kind of action, see.

Then I turned him right around into the thing and erased the top engram on the chain. The second he hit it, it all keyed back in again and he collapsed, sliding down the wall and sat on the floor with his head in his hands. He had never felt better and never felt worse in two consecutive seconds in his life. The... oh, I got him out of it, of course. But the first action is destimulation. See, little straightwire, "Where was it," you know, and "When," and, "Who did you know – who did you know that was like that?" See, he's complained about a condition, you see, "Well, who did you know that was like that?"

"Oh, well, yeah, Joe."

"Well – well, did you ever see him – you ever see him acting like that?" You see?

"Oh, yes, I did, yes, yes, yes, yes."

"Well, all right, good. Does that have anything to do with the – what you're going through right now?"

"Hey, you know, it has a lot to do with it!"

And the guy's right up in present time – bang! See? All we hit was the key-in, see? We walked no closer to the tiger's cage than the outer perimeter of the bottom seats, see. We went nowhere close. And yet he came away from there, see? Now – now we go and find what keyed in and we throw the pc into it and start erasing this. Well, we can erase it, we've had erasure technique since the word go. You burn your finger, you very often erase it. Sometimes you destimulate it, sometimes you erase it. And you – sometimes you use a combination of both on

some light injury of this particular character. You tur... you go to the beginning of the incident and run yourself through to the end of the incident and so on and eventually all the pain turns off and you're fine.

You might, however, just do a Touch Assist on it, you know. Touch it for a while and you'll feel little pains come off of the thing. So it is very difficult to do a total destimulation, see, that's a difficult thing to do, because a tiny little bit of erasure will occur in any event. But you can do a total destimulation from the basis of totally destimulate something. I'm only saying the one thing you can't do is avoid erasure totally, because just the pc's attention on the subject for that moment necessary, you see, to detach him from the subject may bring about a slight amount of erasure. That's no reason then, when you wish to destimulate, to become a professional eraser. See, it seems to be an invitation. See, there seems to be an invitation.

You're saying, "Where were you? Where are you now? Where were you? Where are you now? Where were you? Where are you now? Where were you? Where are you now? All right, that's fine. Now how do you feel?"

"Well, I seem to be stuck with this knee here on the pavement and so forth..."

"Oh, yeah? Well, let's use some Effort Processing."

You see the temptation? See the temptation? Well, the funny part of it is, at that level you can get away with it. You can take the whole injured knee out. I did this just the other day. I first did a destimulation and got the pc feeling better and then ran the incident out, oddly enough, with nothing but Effort Processing. Way back when, you know? Because it was a serious concussion. I didn't want this hanging around and so forth and knew the pc was perfectly capable of doing so, so we actually then went into it and knocked the stuffings out of the incident, you see, and then did a destimulation and so forth and it all worked out just fine. One of the neatest assists I've done in many a day. But that's a combination of two things. And the auditor should be aware of the fact when he is combining two things.

See, you made the fe... we could make the pc feel better by destimulation, you know? "Where did it happen? Where are you now?" Any such process – destimulation. Now we got the pc feeling a little bit better, well, we got him a little bit better in control, right? A little bit better in present time. Now we could go back and start at the beginning of the incident, erase it right straight through as an engram. Or we can leave it alone and go on with the program which we started yesterday. But it puts choice back into the auditor's hands. The auditor now has his power of choice over the pc. It so happened with this pc I didn't have any cycle of action that was taking place yesterday, see, to engage upon. There was no reason not to do this. You understand?

So these two things can combine, but they are separate. There's destimulation and there's erasure. Very, very important to realize this. You're going to have a headache trying to work this out and then you'll finally get through – I don't mean to be a bad teacher and tell you how confused it all is and how difficult it all is. I tell you it's very easy if you're just simply willing to grasp it and use it. But along about this time we get into the paddles business, you see?

You see, it's birch bark canoes. And birch bark canoes are basically held together with gum, aren't they? Well, does Ronson have anything to do with Wrigley's? Because what happens here? What happens here? The door seems to be wide open here, that if you destimulate you can then erase and today we're busy auditing our pc on a Prepcheck on – see, it gets more complicated in its applications, but the same principles hold. Where we're prepchecking this pc on the subject of Mata Haris, see. And it's all very fine and we're prepchecking him just dandy and we're getting a lot of tone arm action and everything is going along. In actual fact we're carrying about a destimulative action. Prepcheck, destimulation, see. Synonymous. Well, we're doing all right here, see, and we're going along and all of a sudden the pc – tone arm, tone arm's beautiful – beautiful action on the tone arm you see, we're still getting nice action, you see, or maybe it's come to a momentary pause. If we ran for five more minutes we'd get five more divisions, you see?

And all of a sudden the pc unfortunately – pc, unfortunately for all concerned, happens to remember in the process of doing this that he had a goal, "to kitterwigit" that was found on him in 1961, that has a lot to do with this. So the auditor says to himself, "Well, look how much more we could do for this pc, you see, if we found actually the basic reason."

So he says, "Well, what – this goal to kitterwigit, is that – is that an actual GPM? Is that an implant GPM? All right, what number is it on the track? Is it upside-down? Is it backwards?" Well, oddly enough, the difficulty isn't – doesn't arise in trying to find this GPM. That's not the difficulty. The difficulty is missing. The difficulty is that you half-destimulated the subject you were working on previously, Mata Haris. You've half-destimulated – and in the process of destimulating it, you of course have somewhat restimulated it, right? You haven't got it totally destimulated, you've got it slightly restimulated in the process to destimulating it, you see?

You're right in this condition where the fellow has fallen down and bruised his knee and the auditor's trying to get him into the auditing room so that he can audit him, see, and then all of a sudden gives up and puts him back on the roadway and starts erasing the knee, you see? Well, if he'd just kept this up and brought him into the auditing room it would have been all right and he kept – could have kept along with another cycle of action, don't you see? The cycle of action which you already have in progress. But just in the process of doing this, the fellow's attention, of course, a little bit more goes onto his knee. So you take this pc whose attention is fairly heavily on Mata Hari – we're destimulating Mata Hari, we're not erasing her, you see, just bringing him out – the process of coming out the door however, he's still got his feet sort of tangled up with silk stockings and old German documents and then we've turned around and gone into this other activity which is never a destimulative activity – which is a cannonball erasure process.

You don't destimulate goals. You destimulate the whole track and the actual GPM, or even implant GPMs, somewhat like taking somebody up to the top of a springboard and telling him to dive in and halfway down you find that nobody put any water in the pool, so you say, "Go on back up top to the springboard," see? The destimulative activities which can take place now are minimal. Now, it isn't just that; if the auditor had simply made up his mind that it really wasn't Mata Hari – it really wasn't Mata Hari, it was goat's milk that was the pc's trouble, and has shifted his Prepcheck to goat's milk, he would have done the same thing. He would

eventually wind up all these areas of restimulation, which he was trying to destimulate. He would have half-restimulated them, you see, then not finished the job and so he would not have Mata Hari and goat's milk and if he went on with that a short time afterwards and got submarines mixed up into it he'd now have submarines and Mata Hari and goat's milk and this is why we would call that auditor a "mudder."

So there's three actions he can undertake there. One of them is just to give up the destimulative action and say "Oh, that's hopeless," because he notices some restimulation taking place and then begin erasure. See, shift his target from destimulation to erasure. Or the next action which he could undertake was shift his target from – that he was destimulating – from target A, while it was restimulated, to target B while it was restimulated or he could do a proper action. And the proper action is when you set out to destimulate, destimulate. When you set out to erase, erase. And in either event complete your cycle of action. In either event complete your cycle of action.

If you're going to go into the destimulation activity here and you decide that you had better get this individual destimulated on the subject of home and mother so that you can audit him on the subject of something else, or service facts, or get someplace on the case, because he's PTPs, PTPs and he's always got PTPs on the outer perimeter of the thing he's – he's so introverted into his own living room that we can never get him into the auditing room, and that sort of thing. All right, we're going to give him a Prepcheck and we're going to isolate what this is, then his PTPs – that is very, very rough, we're going to prepcheck this thing. All right, *finish it. Finish it.* Don't – don't say, "Well, that's – that's the – that's good enough, we've got the tone arm action down now – we've got the tone arm action down now to two divisions TA down in ten minutes of auditing. We got this cooled off now and he doesn't seem to be terribly frantic about it so now we're going to shift over and do something else, see. *Yeow!* Just practically murder, you see?

By the time you've done that three or four times you have your pc stuck in the restimulation of destimulation and he doesn't know whether he's coming or going. See what happens when you cross it?

All right, let's take the other cycle of action. We're going to erase – you never can erase a single engram; something we didn't know back in 1950, because we could occasionally erase a single engram. As a matter of fact, you apparently can erase a single engram. Now, let me put it this way. But you often can't. Our remedy in that day, you see, was to go find another engram that you could erase, see? Or go earlier. Now that was what we knew, we knew that you could go earlier, you see? So you couldn't erase this engram, then there must be an earlier engram and you better go earlier and erase that. That was the only remedy which we had. Therefore, some engrams won't erase. Well, why won't they erase? Because they're on chains. So engrams are always considered to be part of a chain. And new material on running of engrams which just came up last year is rather fantastic. And, my God, if we'd had engrams in 1950, the kind of running which you've got and this new technology on running engrams, nobody would ever have any quarrel. You can turn on anybody, as long as you get the proper duration, make no mistake in the duration, you always got visio in your pc, the one thing and so forth. And because you're working on a chain you can always get it back to the point of erasure, don't you see? These are not difficulties.

But sometimes – sometimes you run into an engram – and you run into an engram and you're trying to erase this thing. And it gums up on you or it gets stiff or solid or something weird happens with this thing and therefore you abandon the chain. You don't carry on and get the earlier engram that underlies it, you see, that will erase and finally pull the – pull the whole thing apart. In other words a half-completed engram erasing cycle. Absolutely deadly. And you can take a person and half-erase an engram and half-erase an engram and half-erase another engram and half... all di... on disrelated subjects, particularly – and half-erase another engram and half-erase another engram and the pc's stuck up like he's in molasses. He – what's happening? Well, the thing about it is, when you start to erase something, erase it.

Now, we see this in Class VI this way. When you get your hands on something – when you get your hands on something, why, you should finish it off. This is an ideal situation; the ideal is when you got your paws on a GPM, you erase it. You finish it. Right there. Well, this is debarred by the fact that it is held in relationship to the GPM above and below it by interlocking items so that you cannot complete its erasure without having the two adjacent engrams. This is further complicated by the fact that there's a vagary in the goals pattern that doesn't make it lie there neatly at all. So it's violated to that degree, but look, it doesn't have to be violated completely because you could actually take the guts out of the middle of the GPM this – these days. And you could leave four items in the GPM and take out the remaining – you could take out the remaining twelve. You actually could destimulate it to that – I mean, pardon me – erase it to that degree, you see?

Now, the ideal then is to finish it up. Well, really what you do is consider the whole of the first series of goals, the whole series, as the first action. Or some half of it or some portion of it and the more you have of it the better you consider that one action, and then you go ahead and you erase everything you've got, you see? That's – that's – you're still dealing with the form of a big cycle of action, see? You say, "Well, we're going to find half of the first series, we're going to find all of the half – first series that we can lay our paws on and we're going to get it lined up as best we possibly can and then we're going to erase that and then we're going to finish getting the remainder of the first series, then we're going to erase all of those." Well, that's a completed cycle of action, see?

Now, you're going – going down the row here, you see? But in the process of doing that you can also foul up like mad by half-completed little cycles. For instance, you've started to check out the goal "to sneeze," and all of a sudden the pc offers the goal "to row a boat." And so you drop that checkout and you – you get this other checkout, "to row a boat." And now having gotten a checkout "to row a boat" and so forth, that's inconclusive so you do a goals list on the "to row a boat" on a represent goals list. See if you can get the right wording of this thing. But you can't really find that because no goal fires after you've gotten the list done, so you figure you must have something spotted in an incorrect numerical sequence in the series, so you start correcting the series in its numerical sequence of one GPM to the next.

Well, that doesn't work out very good, because the pc seems to be terribly nattery, so the best thing to handle that is in the first place if you could just find number one GPM on the track you could always erase that, couldn't you, so let's start listing for it again. The heart of certainty is arrival. [laughter] And the anatomy of uncertainty is a failure to complete a cycle of action. Nonarrival.

So you want your pc to get less and less confident, doesn't matter whether it's Class VI or any other class, you want to get less and less confident, just never complete the cycles of action you set out to do and never complete your destimulative actions before engaging in a new destimulative action. Let the pc's new restimulations get in your road, you see, and just Q-and-A with his new restimulations and away we go and over the hills and far away, and *bingety-bang* and isn't life confusing and isn't the case confused, in fair rapidity.

This then – this then is the difference between restimulation and destimulation. And in either case, you complete a cycle of action. You get somebody into session by getting him into the auditing room. If he comes into session and he's got a lot of present time problems and then you decide to erase these present time problems, just run a – let's run a process, see, on problems. Every time he comes into the auditing room he seems to have an awful lot of problems, so we're just going to set aside the Problems Intensive which we are already doing and we're going to get started now and really clean this case up so he doesn't have all these present time problems when he comes into session.

Well, let's see – let's do, now, an assessment on his environment and let's find out what it is in his environment he's mainly having problems about and then we will run Problems of Comparable Magnitude on that or something of that sort and we'll get this thing all set up.

But, of course, in the process of doing this we run into his lumbosis. And this is side-tracked and there we go. We have now started the deadly – the deadly chase, where in a half-completed cycle of action we're going to get another half-completed cycle of action and so forth. All right, what is the auditor's answer to this? The auditor's answer to this is rapid destimulation, *rapide* destimulation. Techniques of rapid destimulation. What are these? Since mid ruds: "Since last time I audited you, has anything been suppressed?" See? "When was the last time I audited you?" Why, we don't give this guy a chance. We don't give him a chance to have present time problems in the session. And knowing pcs, I would say that an awful lot of pcs who can't be audited without very expert handling of since mid ruds or something of the sort – there are lots of them. I don't care what good shape they appear to be in, I don't care how they can live through this sort of thing and so on, the auditor is going to be invited to a Q-and-A party before that session is very far progressed if the auditor has not destimulated the case first.

Pc's been thinking about his service facsimile – let's take somebody at Level IV – he's been thinking about his service facsimile and what we've actually been doing is we've been running "How would chewing tobacco make the hall maid wrong?" you see, or something like this. Or "Who would it make wrong?" And the pc's been thinking between sessions – and we haven't got that flat, see – and has realized – has realized that when he was very young – when he was very young there was a hall maid and she used to hit him with brooms and so forth, and it was because of the neglect of his mother and what the process is really all about is mother's neglect. So really what he's trying to do is make everybody guilty because of mother's neglect and we – hadn't we better prepcheck this, see?

Now, actually he doesn't come out with all this if it's destimulated. What happens? He's got a present time problem of some kind or another – minor, small – he's been suppressing, he's been thinking, he's got a withhold or two from the auditor, you see? So when the auditor tries

to take control of the session, the pc is really elsewhere, there's a little, tiny bypassed charge situation because he hasn't informed the auditor of things, don't you see? And that alone is enough to cause a little bit of an ARC break. It's not really an ARC break, but you see a little alienness in the session and that, on the first slip of the auditor, can evolve into a – an order from the pc. See, this is just setting it up.

So you say, "But my God, at the beginning of every session I waste thirty-five minutes getting in my since mid ruds." Well, you waste thirty-five minutes but you get back – you get back an hour and fifty-five minutes of auditing. That's what you buy with your thirty-five minutes of since mid ruds. By not putting them in, you've wasted two and one-half hours of auditing. Flat. Not only that, but you have invited a mess because the pc isn't in session – that is to say the pc isn't even in the auditing room. The pc is not going to follow through; the pc is going to open wide-open invitations to the auditor at every turn to do something else, rather than what they're doing.

Now, these are the fine ramifications of the thing. But the point is, is life is restimulative. I don't know if you've noticed this or not, but between sessions you get that sort of thing. Now, this is not an advertisement just for the subject matter of "get in since mid ruds." I'm just giving you an example of destimulation.

Now, let me show you – let me show a case in point here. Pc – we're running, Class VI, we're running him – pc comes up with the fact "I – I – I don't know, I kept all night long – all night long I kept thinking about these – I kept thinking about these creative activities that I should be engaged on. And just all night long and I – I – I think – I think there must be a goal here, 'to create.' I don't care what you said, I – I think there must be. I don't care what you said last month while we were checking that goal, I think there must be one, I think we missed it. And that's what's worrying me." Well now, you're not doing that at all. You're trying to get – you're trying to get a whole sequence of goals having to do with understanding. And the pc all of a sudden throws this one at you.

Now, a good auditor knows what to do. He destimulates it and goes on doing what he's doing. He doesn't neglect it, he destimulates it. Anything that is not on his main line of action he destimulates, right now. Gone. You understand?

Now, the technique that does that is case analysis. Case analysis has really, for its sole purpose, handling the present time problems as they arise. You'll see "case analysis" has been misused as a term in the past. We're breaking it out into its pristine purity. There's been a missing word which is "track analysis," which is "Where do the GPMs fit?" That – call that "track analysis." This other is just a – just a case analysis. But it's destimulative. It's just got the exact steps that it's got in the bulletin. What – it doesn't apply only to GPMs, God help us! I've seen this used to a Class I pc, trying to put his GPMs into place. It's a very broad, any – level proposition. "What's the pc sitting in? All right, the pc's sitting in a present time problem. What's the pc sitting in? He's sitting in a bad foot." You understand? Your second action is get these considerations. What considerations he had. All right, let's now get the bad foot related to something, whether present time or other bad feet or he's come up to the time when he used to have a bad ear. You're just destimulating him, you see? And you relate it to something; you now

find the pc is sitting either elsewhere or in PT. And you can actually just go on along by a little concatenation getting his considerations of everything he is sitting in.

He's sitting in position one, position two, position three, position four, position five – get his considerations each time, get its relationship, find out where he's sitting now. Very, very elementary. Very elementary. It actually consists of, really, two auditing commands. It's no more complicated than that. Hey, you don't have to strain your brain on this one, see. "All right, anything you're concerned with, and so forth?"

"Well, I'm considered with the fact that I was up all night long, on – I was thinking about this – this GPM 'to create' and I'm a – sure I've got one. I'm sure last month when you said so-and-so and so-and-so."

"Oh, is that so? All right, what considerations have you had about that?"

"Well, so-and-so and so-and-so and the last month we checked it wrong and we didn't do it right and so forth, and it... "

"All right, good, all right. Okay. Now, you got any other considerations you'd like to talk about with regard to that?"

"No."

"All right. Well fine, now let's take up these goals that have to do with understanding."

The other course is completely fatal. Completely. You're already taking goals that have to do with understanding – the pc is – suddenly shoves a goal at you which is "to create variety," so you check it out *again* – *aw-aw-aw-aw-aw-aw-aw-aw-aw!* You pushed him into the mud. Well listen, if he was that worried there was nothing showing but a few sparse hairs on the top of his head anyhow, just about enough for you to pick up and grab out, see? Why push him in? An auditor not recognizing these things can get a pc in serious levels.

Now it isn't as apparent at Level 1. The dangers of this are not apparent at Level I at all. You can get somebody to chewing and yapping about this or that or the other thing – well, because he's running at about one-molecule depth, you see? And even when you get up to IV – even when you get up to IV, your processes are destimulative in the most part – you're really not trying to erase very much, there's no great difficulty with this. You could just get a pc so he felt kind of thick and jammy and kind of upset in general. And sort of nattery and so on, you wouldn't practically kill him. But you get to Class – Level VI, you might as well just take a pistol out of your pocket and shoot him between the eyes. It would be kinder. Well, you've got him in one great, big, overpowering actual GPM mass that you are busy checking out and you all of a sudden make him turn around while still stuck in that mass and get involved with another mass.

I had an example of this the other night. I had a goal – I was trying to place a goal, and when I hit the right number in the consecutive sequence, if I hit – I hit the right position for that GPM – I was trying to place another GPM in that sequence, see? This thing didn't bother me, this one that was hanging up, until I tried to place another GPM in the proper number it belonged in, don't you see? I'd gotten to the number the original GPM that I was stuck in belonged in and tried to place another GPM there and like knock – knocked the top of my head

off! The GPM that belonged there, of course, rose up, full-armed, you know – joke of course – but, "Get out of here, man! This place is occupied!"

It's a sleeper, in other words. You're in one GPM and you try to do something with another, see, or you tr... in one series you're trying to do something with another series. It's just too much – too much stress and strain, that's all. So you carry out and complete your cycle of action with regard to this sort of thing. Now, I don't want to leave you in any difficulties with regard to this. I'm talking a lot about VI. You can just forget what level I'm talking about because it applies to all levels.

You can destimulate or restimulate. And when the auditor is restimulating, why, of course, he's normally trying to erase something. But an auditor always restimulates slightly. Restimulation in these factors enters into this very little. Very, very little. It's whether you restimulate or not, that's almost beside the point. It's whether or not you erase or destimulate. What is your final target? Are you going to destimulate this thing or are you going to erase this thing, see. And you have to make up your mind what you're going to do with it and then stick by your guns. Complete the cycle of action. That's the way you handle it.

All right, very good. What is auditing? What is auditing? This probably could take up an enormous lecture all by itself. As a matter of fact I could imagine somebody talking for several minutes on this subject without drawing a breath. What is auditing? What is auditing? Well, you think you know what auditing is but I don't think you know what auditing is.

Auditing is the action of asking somebody else a question, getting an answer to that question and acknowledging it. You go a little more broadly: It's asking somebody a question about himself or life which he can understand and which he can answer, getting his answer to that and acknowledging the fact that it has been answered. And then, also, when the person originates some observation with regard to that, to understand and handle that origination. TR 0, 1, 2, 3, 4. No more, no less. That is auditing.

When that occurs, TA action occurs. When that occurs, sanity occurs. When that occurs, this occurs. When that occurs that occurs. In other words, anything you want from this other. That is – that is auditing.

Now you say, "Well, what is all this stress on this definition?" Well, you just never heard the definition, that's all.

"Well, I was auditing this fellow and we were assessing at the time." What is wrong with that sentence? You weren't auditing, you were assessing. "Yeah, but" somebody says, "but assessment is auditing. I felt a lot better many times when I've been assessed on something." Auditing doesn't have anything to do with somebody feeling better. The final ramifications of auditing have nothing to do with the definition of auditing. That's what auditing is *for*. It's to make people feel better and so on. But *what is* auditing – that is *all auditing is*. And any time you say anything *else* is auditing you're going to lay yourself an ostrich egg! I mean, this is one of these horrible things.

Now, I've told you a simple datum. And in actual fact the next immediate action, of course, is to discuss whether or not there ought to be British war vessels on the Yukon to protect the Indians as they bring their hides down.

That's all auditing is! The technique is Scientology. Scientology is the embracive word for all of these actions. But auditing is this one peculiar action. Therefore when we use the word "self-auditing," we're using a misnomer. You can't have self-auditing. See, it's impossible. Now, I tell you that there's solid gold at the end of this rainbow, if you care to walk that definition out to its final conclusions. If you care to understand your actions at any level as an auditor, only in the framework of that exact definition, there's gold at the end of the rainbow. But if you think you understand it and you don't understand it, you're going to get to the – not the end of the rainbow – you're going to get to the middle of it and fall off.

Now, this is one of those horrible definitions that admits of no exceptions, variations or anything else. And if you accept it at practically an engineering level of precision, you'll have it. And the next thing you know, you got tone arm action, you understand pcs, you can handle pcs, all this sort of thing, everything starts moving together – *click-click, whir-whir-whir*, nothing is very difficult.

You start trying to hang on to the fact that the reason this pc doesn't get tone arm action is because the technique – *ah-ah!* Well, yes, we can say the technique, we could say this, we could say that – but you're no longer talking about auditing. Oh, you can discuss technique, you can say, "Oh, it's this and that and so on," but don't get it so fuzzied up in your skull that you think you're talking about auditing. You're not talking about auditing.

Auditing is *one peculiar, particular action*. It's a cycle of action. And the odd part of it is that part of the cycle can be an origin on the restimulation of the auditor's presence – origin from the pc of something that then has to be acknowledged by the auditor. But that's just a comm cycle and that is the auditing cycle, and that two-terminal aspect which is what this physical universe consists of is what gives you tone arm action and is *what makes the pc better!* *It's not a technique that makes the pc better, and it never will be.* As long as you're counting on auditing, then auditing is that thing, and when it doesn't exist you don't get – it goes nowhere. Do you understand?

So you say, "Now, look, this..." Look – let – let me give you the nonsense, here, see? This is the – this is the South Sea Islanders, once used to boil sea water and it generated a gas and they put this gas up in this thing, because it got from volcanoes and then – then Ronson has – has bottled this, you see, and – and so forth and that's how you can – so therefore the relationships with the South Sea Islander are very important. See, that's one of these data when you're asking the fellow simply to put it there, see? But whenever you go into this statement or make a statement of this kind, you're cutting your throat as a pro auditor.

"The reason we aren't getting tone arm action is because he is being audited at too high a level for his case." This is not true. Because it isn't true that you shouldn't put people at one level or another of case, but the error is you have introduced the idea of tone arm action independent of the auditing cycle. See, that's the error. Can't be done. Now, you can do an awful lot of things with this auditing cycle, see? You can put an awful lot of television programs through Telstar. And they amaze and wonderfy the audiences that look at them. But without any Telstar they would never get there.

So auditing is the carrier wave – as far as the pc is concerned – that handles anything and everything in Scientology. That is it.

Now, it isn't that you can't teach a pc, it isn't that you can't inform a pc, it isn't that you shouldn't move your technology around, it isn't that he shouldn't go up through levels. It's just that that has nothing to do with the definition of auditing!

Auditing is simply auditing. It is that action of the auditor asking a question that the pc can answer, you see, or making a command, and the pc understanding it and responding to it, executing it, informing the auditor that he has done so and the auditor acknowledging that fact. And that's all auditing is.

Pc originates something of the sort. Well, of course, it's a result of an earlier cycle. So he goes ahead and the auditor acknowledges it. It's the same thing. So you could have somebody who was letter perfect on Class VI but who never audited. Wouldn't that be a wonder to behold?

It – it's one of these – it's one of these horrible things that – it – maybe someday you – some of you have got it already. That's – it's – some of these days – one of these days, years from now, somebody else will hear me and they suddenly say, "Well, *that's* what he's talking about, you know?" Because unfortunately it's one of these things that just shoots through everything. You want to know "How do I crack this case?" Well, define auditing. "Well," you say, "that isn't very informative!" [laughter, laughs]

All right, but that puts us into another type of activity in which an auditor can engage. There may even be an additional type of activity to this. But there is one other principal form of activity in which the auditor can engage and it's called assessment.

Now, auditing goes somewhat to the pc's bank or to the pc and it restimulates his bank and talks to the pc and so forth. It isn't that auditing goes purely and entirely to the pc. It goes mainly to the pc. But assessment nnnnever goes to a pc! And you cannot assess a pc who thinks he's being addressed. Now, you want to know what happens to all these wrong assessments, well, look at that definition. How do you ever get a wrong assessment? How do you get your E-Meter going so flickety-flock? How does it tell you so many lies? Well, you're auditing a pc who isn't up the level on this particular subject. He thinks somebody's talking to him. The auditor says, "Catburrs, batfur, caterwumps." And the pc says, "Oh, batfurs, yes, batfurs, yes, yes. I had a batfur once – so forth." He thinks he's being addressed. He thinks somebody's talking to him. And nobody's talking to him, man. His views of the situation are about as useful...

But this must be somebody who is pretty restimulatable and rather easily restimulated to be so egocentric that he is always being addressed. And he must have some fantastic protective mechanism into the middle of the auditing cycle to keep anything from going through anywhere. He must use his present time problems to defend himself at every turn, he must use this – his rebuttals and so forth to keep it going forward – a lot of things must be going on here the like of which nobody ever heard of wrong with the auditing cycle.

So when the auditing cycle is out, assessment can't occur. But that's the – about the only way that the – that the assessment can occur, by the way, with the auditing cycle out. Pc can be madder than blazes and you can still assess the pc. What I mean is, that the auditing cycle is out and the pc thinks he is being addressed, every time you say "catterwump" or "batfur" or any part of the list, and answers it as a question. You're never going to find out. You're never going to find any items or goals or anything else, see? Because he is insufficiently – insuffi-

ciently able on the subject of the comm cycle, auditing, you know – auditing. He's insufficiently able as far as auditing is concerned to be able to sit there relaxedly, because he feels, you know, alert. He feels nervous. He – he – something's wrong. Something's wrong with the comm cycle. His auditor, he doesn't like the auditor, something's wrong with his ability, he can't answer questions, he's afraid of this or that – some part of this thing is awry. So you try to assess this guy. You wonder why assessment was jacked up so high in these levels. Well, I'm giving you why right now.

Until the auditing cycle is very well remedied and the pc can sit there very, very relaxedly indeed, you haven't got a dog's chance of assessing anything on the pc because he crisscrosses in all directions, and his mind is like a darting sparrow or a hummingbird. It's all over the place – *zip, zip, zip, zip, zip, zip, zip!* You call "catterwump," you know, and my God, you don't know whether the rocket read had to do with the – with the pc thinking, "I don't like catterwumps." "He's now going to read 'catterwumps,' I know it!" you know? Never saying anything and so forth.

That auditing cycle is out so therefore assessment is difficult. And you very often have to do assessment with the auditing cycle out. And it will still stand independent to it because even so, if you ask the right question, even on a thoroughly ARC broke pc, if you ask the question exactly where the mind – not the pc – where the mind is living, that meter will read. And of course, the more the pc is calm and able to respond on the auditing cycle, the more reliable reads – the more, the deeper the meter reads, you see? An ARC broke pc himself doesn't read on the meter, but you can always bang his bank into reading.

ARC breaks. That, that I just told you, is a mouthful all in itself. That's about fifteen or twenty hours' lecture – the difference between an auditing cycle and assessment and what isn't assessment and so forth that – that – that's – that's all – that's all very interesting stuff.

Let me give you an example. R2H, ARC Break Straightwire, that's assessment, isn't it? No, that's not assessment, that's auditing. How is it auditing? You're assessing, aren't you? No, you never assess for R2H. What do you mean you don't assess for R2H? You got a list in front of you, you're reading off to the pc, aren't you? Yeah, but you're asking the pc the whole way. Now you could turn around and run it on an – on an overt assessment. Just do an assessment. But R2H is basically not an assessment but a two-way comm with the pc concerning what parts of the comm cycle were out here and seeing which one agrees was the one out in that particular incident. And you're asking the pc to remember the incident and you're asking the pc this and you're getting the data from the pc that and you're asking that. What the hell has this got to do with assessment, man? You start looking over R2H, it's nothing but solid auditing from one end to the other. What's the fooler is, is there's an assessment sheet in it. There's an assessment sheet in it. But you – actually, in its purest state and as best used, you do not assess with it.

"Well, Class VI – look, Class VI – full of goals lists and item lists and everything else – there's all kinds of assessments to do in there, yeah, it's nothing to do with auditing. Well, wait a minute, it gives you tone arm action so therefore it must have something to do..." No, I'm sorry, tone arm action doesn't have anything to do with auditing. These Indians, you see, when they come down often have grease paint. And the Ronson company... Doesn't have anything to do with it, you see? The point is here that assessment is assessment and auditing is auditing.

And you get somebody who is chittering away like a magpie while – while you're trying to assess, because you can't keep your auditing cycle in, you're in trouble. Also if he's in that state, why, you're probably going to get a wrong assessment anyway. Lots of things are wrong, but they're just – we're not talking about the wrongnesses of it, we're just talking about the purity of definition.

There's two targets: the pc and the bank. Assessment is addressed to the bank and is the one process that addresses straight to the bank. And it's just from the auditor to the bank. It has nothing to do with the pc and there's the meter.

Now, sometimes you run an assessment procedure on a pc while the pc is trying to put in the comm cycle and you get into trouble. But that's why you get into trouble, is you're trying to put in the – an assessment. You know, you're saying, "Is this a wog? Is it a bog? Is it dag? Wog? Is it eight years? Nine years? Eighteen years?" and so forth – and next thing you know your pc's ARC broke. Why is he ARC broke? Well, he actually originated and you didn't take up the comm cycle. That's why he's ARC broke. It's not the fact that you're talking to the meter. You di... he originated and you didn't take any attention to it and so forth, that's the source of the ARC break.

So you assess and audit and assess and audit and assess and audit and assess and audit and audit and assess – at the same time, sometimes. But that doesn't make them any – any the less two different actions. They are two distinctly different actions. You go, "*Bark-bark-bark, bark-bark-bark, bark-bark-bark*" on a list, you don't want an auditor – you don't want a pc doing this or that or the other thing – a pc... doesn't – it doesn't matter, he can be half asleep and you'll still get the same results on your meter. You shouldn't be assessing pcs in boil-off, because they're in boil-off because you've overlisted the list. But they could be in boil-off and you could still pull a goal off of them. See, it hasn't anything to do with the pc, it just has to do with the bank. It's between the auditor and the bank. So that action is peculiarly between the auditor and the bank.

That's another part of auditing. Isn't it? So if you've got auditing there, and you see, and in... Caught you! Hasn't anything to do with auditing. You say, "Yes, but I got a lot of benefit out of it." That hasn't anything to do with auditing. That's Scientology. "Yes, I know, but when you find an item you get this terrific tone arm action. How do you account for that?" I'll let you in on something: When you find an item when no auditing is present, you don't get any tone arm action. It is the auditing that gives you tone arm action, always. And the actual RI, big and juicy as it is, doesn't give you any tone arm action at all if there's no auditing present. Isn't that interesting?

Do you know that that happens to be an actual, provable datum? You can prove it yourself sometimes. You don't get tone arm action, you get a little needle slash. You find an actual RI – great, big, juicy beast of an actual RI. And you watch your meter behavior and if auditing were in progress, you see? You give it to the pc, there's auditing, he's in rapport with the auditor, you've got an auditing cycle going, so you get tone arm action because of the auditing cycle.

All right, same pc, let's put him on a one-hand electrode, don't go anywhere near the room, let him call out the next item that he's to find in the next bank that will give the auditor a

division-and-a-half blowdown. Let him call it out and he'll get little one-inch needle slash. And that tone arm goes exactly no place. There's enough residual auditing in the bank that he has had to give him that. This is – this is very interesting. Assessing doesn't give anybody tone arm action. It's only an apparency. He – he – the auditing is going on the same time, see – so you get the tone arm action because the auditor finds the thing and he says, "Catterwumps – is that it? Well, it's catterwumps, is that it?"

It's a very funny thing. You can – you can actually see an item start to go and you can't make it go all the way until you say to the pc, "Is that your item?" and you have immediately started the auditing cycle. It isn't that – any mystery about the pc put his attention on it – my God, how could he help but put his attention on it, he's sitting in the middle of it, see? And you say, "Is that your item?" And you'll see *pppsssswwwwww!* And you'll see the tone arm come down and so forth. And you very often don't get any blowdown whatsoever. You can find the item on the list, you'll see the needle slash. If there's residual auditing present, you'll get a little tone arm action.

But here's what I'm telling you: It's the auditing that delivers the tone arm action, not the assessment. The assessment is a pure, clean, clear activity all by itself.

So therefore, you should do case analysis during an ARC break assessment, shouldn't you? Well, you've asked the pc, you f... you found – you found that the bypassed charge of the thing was a wrong goal, so you – you – you ask him his considerations, in an ARC break assessment you ask him his considerations about this goal, don't you? Like hell you do! An ARC break assessment is given in times of ARC break. The list is also useful for other forms of assessment, but an ARC break assessment is simply an ARC break assessment. And it's a very elementary thing. All you do is assess the list, find out where the needle reads – it's between you and the bank – find out where the needle is and then you simply indicate what you have found to the pc.

That's all there is to an ARC break assessment. No matter how hard you try, you can't make anything more out of an ARC break assessment than that. And during an ARC break you *must not audit. Must not audit. Must not audit. Never audit.*

"Yeah," you say, "well, how the hell can you audit, possibly – now wait a minute, this is an awful brain-cracker, because if you can't audit, if you mustn't audit during an ARC break, why, how can you assess?" Well, an assessment doesn't happen to be auditing. You must *not audit* during an ARC break, period! All right, the pc sets very poor goals for the session and seems a little bit unhappy and says he has some problems. Does he have an ARC break? *No!* An ARC break is an ARC break. An ARC break is when the auditing comm cycle cannot take place. And that's what an ARC break is. The pc is very accusative and he's talking and so forth and he isn't answering any of the auditing que... well, that – that's – that's an ARC break. Pc's screaming, the pc won't talk, you understand – that's an ARC break. An ARC break isn't *anything else*, it's just an impossibility of comm cycle. If you force a comm cycle at that time, you will deepen the ARC break. You can practically kill somebody with this, man! An ARC break is an ARC break.

All right, at the beginning of the session, naturally you had to do an ARC break assessment because the pc didn't set correct goals. Aw! Can he talk to you? Well, what you doing an

ARC break assessment for? He's not ARC broke! He's perfectly auditable. Got a PTP. Do case analysis.

"Well, what's been going on? Where are you sitting? Where's your attention right now?"

"Well, I'm thinking about the wog-wogs."

"All right, what are your main considerations about the wog-wogs?" or any other little destimulative process. "On wog-wogs anything been suppressed? Since the last time I audited you, has anything been suppressed?" Anything like that. "What's your attention on? All right, let's do some case analysis and considerations, so forth and so on – ah, about that now. Oh, that's good, that's fine. Okay. Now, let's get on about our business." See? Get the idea?

Has nothing to do with an ARC break assessment. ARC break assessment is an ARC break assessment and what – why it is called an ARC break assessment is because it is given during ARC breaks. [laughter] And auditing – and auditing is never done during an ARC break. Never audit a pc during an ARC break. Never, but never, but never, but never! Elementary.

Now, this is some more of "You put the lighter on the paper and you put it over on the pencils and you put it over on the desk." Do you see how the confusions can arise in these very precise definitions I've been giving you? A lot of confusions.

"Yeah, but a lot of these Indians wear bear grease in their hair and – and the shopkeeper down at the corner has awfully dirty fingernails when he tries to sell you..." Hasn't anything to do with the price of fish!

What you've got to do is get these definitions *terrifically* clean – *terrifically* clear. *What exactly are they? Exactly what are the purposes of these tools and exactly what do they do? How broad can you apply them?* You can apply them awful broadly, man. Yes, you could use the ARC break assessment sheet to help locate bypassed charge in the pc and audit the whole time, you see? But that's not an ARC break assessment. It's mixed up your tools all right – so you mixed up your tools. The crime is not knowing you have mixed them up.

Now, there are other ramifications of this kind. I've told you some of these very precise actions and they are very important. If all you did was sit and remedy somebody's comm cycle and the auditing, even to this point: "What could you originate to me free and clear in a session?" You see? "What chair would it be all right to sit in, in an auditing session?" It doesn't matter what you ask them. As long as you're addressing their points of disability on the comm cycle, you're going to get yourself TA action. You're going to get this pc in session and you're going to get a pc who's whizzing and coming on upstairs.

But it's all built in on the basis of knowing with great precision the exact definitions with which you're dealing and knowing exactly what those things are. And if you know what they are, why, you're going to make it. If you haven't got them all split apart and figured out, you're not going to make it.

One day the pc is *wuba-buba*, and you pick up the *babba-galog* over here and you say, "Now we're gonna – we're gonna blah," and all of a sudden everything goes *bling!* You wonder

what in the name of God went on here. Well, you picked up this hammer, don't you see, in order to fix the watch. And it didn't work. But they're terribly elementary but you have to get them very straight so that at no moment do you have – no moment do you have any confusion in your mind.

The ARC break assessment, you mustn't have an ARC break assessment down so badly that you feel the thing to do in an ARC break assessment is argue with the pc, you see? Or if you read line two, then indicate the charge that you found after you've read line two, as line three. These things are apt to cause difficulties. When you have an ARC break assessment occurring by reason of Step Six and then ARC break it by reason of a session ARC break and you can't go on with your Step Six, be smart enough to realize that you now have an ARC break on top of the ARC break and reach for your session ARC break sheet. You understand? Know your tools. *Slippety-slip, slippety-slip*. Soon as you got the session ARC break straightened out you got that found, assessed, indicated to the pc – let's take the R6 one, read it down, finish it off properly. Bang – there it is, straighten it out. Destimulate the whole occurrence, maybe, with a spat – spat of mid ruds or something like this, after the ARC break is all occurred. Because mid ruds are auditing.

These are your various things. Now, I've given you an awful hammer and pound in this lecture of very fundamental fundamentals. And if you look them over very carefully, all of a sudden you will say, "That is why this, that is why that, that is why something else, that is why when I audited Josie-Belle I didn't, and that is why when I audited George I did. That is why I don't seem to make any progress on something or other," and so on.

In other words, all these things are figure-out-able at this basic level. Okay?

Thank you very much.

AUDITING AND ASSESSMENT

A lecture given on 3 March 1964

Thank you. What's the date?

Audience: The 3rd of March.

The 3rd of March, AD 14, Saint Hill Special Briefing Course. Well, I'm glad to see you looking so well. I'm glad to see you looking so well. And you do, too, you know? I've seen some creaks disappear here since the last time I looked at you.

Well, I got my complete line plot last night, thanks to my auditor. Complete goals plot from one to forty-two – the lot! [applause]

Yeah, that's much more to the point – the auditor on this case – what she's had to suffer! What she's had to suffer through. And it's very interesting, that until you get a goals plot done properly, the amount of faith and confidence that you can put in a goal, until it's been completely plotted, is so slight as to be negligible, on actual GPMs. And the wild abandon with which we've been running wrong goals is really marvelous! [laughter] Great, you know, great.

The materials – this lecture is not connected with or concerned with R6 – only slightly impinges on it; it's at lower levels. But it is interesting that the most complete body of knowledge today is at Class VI. That is complete, codified, completely buttoned up, squared around, all auditing skills, everything necessary to put it together exists there at that level. And this is not – was not an accidental or momentary achievement. The truth of the matter is it required thousands and thousands of hours of auditing, required fantastic amounts of put-together and look-up and square-around, and so on. And it is quite a happy thing to look at and see that that material is all squared around.

Oddly enough, it happens to be all codified. It happens to be all on tape, or in notes, or so forth; all for study, and so on. And from – well actually, Class II – Class II looks very thin and spotty with, you know, with a great deal of additional bits and pieces, and nothing lined up too straight and so forth. But the information is all there at Class II, don't you see? But it's not really in a concise, tight assembly, and so on. But Class VI is. Quite in addition to that, we have all of the Instructors and Saint Hill staff personnel are just finishing up their Class VI Course. So we even have trained Instructors along this line.

Of course, we don't dare say at this moment that we have trained Instructors, because they get their examination Thursday night.

But anyway, the information at Class VI is the most codified piece of stuff that anybody ever wanted to look at. And that is quite comforting in Scientology, because we're quite

used to having it all in fragments, don't you know. And it's released here, there, and this or that. And it's an HCOB that also contains methods of snapping your fingers, you know. And then there's another bit of vital information that comes out in 1958. At the same time, it's accompanied by "How to Assess for the Rock," and – you know? It has scattered and spattered about. So you have to root and dig for it. Well, that isn't true at Class VI. And it's a good thing it isn't, because this is precision skill to end all precision skills.

Now, the lecture I'm about to give you delivers into your hands some additional information concerning your more basic auditing. Now, this is, of course, also applicable to Class VI, but is the very stuff of which life is made at Classes III and IV. And frankly, I don't see how anybody could do anything at Class IV without this data.

Now, I want to – I want to give you – so that's... the tape – the classifiable level of the tape, of course, is Class IV that I'm – data I'm giving you right now. But it's also Classes V and VI.

Now, you are accustomed to regarding assessment as something that you use to find something to audit. That's the basic – been the basic purpose of assessment for many, many years. And then more latterly, to find the cause or source of an ARC break – assessment.

Assessment is an activity which is totally independent of auditing. And as you move up in the classes from IV on, you'll find that assessment commingles with auditing because Class VI is just practically nothing but solid assessment, don't you see, with auditing thrown in. We bring about the primary cause of bad auditing or bad ARC breaks from just one thing; is the inability of the auditor to differentiate between assessment and auditing, and failing to shift his gears or, schizophrenically, do both at the same time.

The way you do both at the same time is when the pc originates in the middle of an assessment. You're going down the sheet and the pc originates. Well now, you actually never do them both at the same time, but you must learn to lay aside the assessment for that instant, handle the auditing situation competently and then resume the assessment. And when you realize that all this may take place in a shorter space of time than twenty seconds, you realize that the auditor has to have a terribly good ability to differentiate between the two, and to shift between the two activities. The two activities don't really mix. They are entirely different things.

And let me give you some reason why. The assessment is addressed to the pc's bank. It is not addressed to the pc. Now, when auditing intervenes during an assessment, then something has been addressed to the pc. Inadvertently something has gone to the pc, but it's not that it's an accident or anything. You've hit something in assessing, so therefore the pc has been reminded of something and so originates. Well now, this is the pc talking. The assessment is addressed to the bank and the pc says something. This is perfectly all right; this happens constantly in auditing. Well, what does the auditor do?

Well actually, he lays aside his assessment at that moment, not with the physical actions of picking up the paper and putting it over alongside him, but with the mental realization that that is in effect what he is doing. Handles the origin competently. Understands the origin. Doesn't – doesn't... this is one performance which is utterly deadly: Auditor is so busy assessing that he hasn't got any time to understand what the pc is saying, see. So, he simply ac-

knowledges, hoping that it won't be noticed, you see? He just gets rid of this auditing action and then tries to go back to his assessment, and of course he can't. And the session will lock up, right there.

It locks up if only to the degree that the meter ceases to be as responsive. You might not notice it, you see. It might not be a glass-shattering ARC break. The pc might not even feel upset about his auditor. It's just that it ceases to be so responsive. Your assessment now doesn't run so well.

And all bad assessment, where the meter isn't operating properly, comes about because the auditor can't shift his gears between assessing and auditing rapidly enough and handle both of them competently each in its turn. Do you follow me?

I, by the way, am addressing this lecture to you with a great deal of hope and élan. I gave you a lecture on the comm cycle in auditing a few weeks ago, and I was also – learned something because I had the lecture – those two lectures replayed to you. And you – you immediately made tremendous use out of this. And a great deal of upgrade occurred, and so forth. And I was very pleased. It gave me a nice win. And I was very happy with you about that, so I'm not talking to you today as though the information will be 50 percent wasted. [laughs] I have confidence that you will use it intelligently. It was a nice win.

Now, I was amazed at the number of auditor reports which showed up exact accurate use of that information I gave you about that comm cycle. I've lectured about it before but it's never been picked up and used. So therefore, I was able to put it into a communication form which was understandable and usable.

Well, this is another one of these. And you also heard me talk a week ago about assessment and so forth. And I actually just gave you a bunch of hot bricks. I just took them right out of the furnace and put them into your bare hands. There's a lot of definitions in that last lecture I gave you – *rat-a-tat-tat-a-tat-tat-a-tat-tat*. It's practically a whole subject like chemistry, all in that short space of time. Well, I'm giving you some of the fruits of that information right now in talking to you about shifting gears between assessing and auditing.

Now, there's many an auditor thinks assessing is completely impossible. He gets of this opinion. He takes an old Prehav Scale, and he's going to find the Prehav level – which, by the way, are mostly items out of actual GPMs or locks they're on – [laughter] but he gets to going down this thing, you know, and all of a sudden, there's his meter. And his meter's – seems to be completely motionless. Nothing happening on the meter. The needle was sort of swinging about and all of a sudden it isn't doing so well. So he thinks he's hit something in the assessment. That's his first mistake. He thinks the pc must have hung up someplace. He thinks a lot of things. But that needle is no longer free.

So, he goes back over the list to hit what he had previously been going over and getting little ticks on. And he finds out that most of them are scrubbed and he can't get much of them back, except some other one that hadn't read before or something now gives a bigger tick. And he just sort of goes into despair about the whole thing and just hands up any level and of course, it's usually the one that's most protested by the pc. Then he audits this on the pc and wonders why he doesn't get any gain, you see.

Well now, that's a failure of assessment, what I've given you there. Obviously, isn't it? It's an assessment failure. But actually, actually, it's an auditing failure. It's an auditing failure. The auditing which got put aside shouldn't have been that thoroughly put aside. And the pc's origin, the auditor's inadvertent question of the pc, see: Like, "Well, is it all right with you if I now assess this list?" you see. That's an auditing question, man, that's not an assessment question. And the pc says, "Hm-mm-mm-mm..." and the auditor says – see and he – "All right," you see, "*pocketa-bock*, and *backity-back*, and *boobity-boop*, and *soopa-soop*."

What's he doing right now? He's got an incomplete auditing cycle. The pc didn't know if it was all right to assess the list or not. Really didn't know quite what the auditor's going to do. And maybe had his attention on some cycle of action that the pc thought was incomplete, see? So, he's given the pc – now you understand, there's two targets here: One is the bank. One is the pc. So he starts the assessment by addressing the pc. Look at how elementary non-sensical this can get, you see. And then doesn't permit the cycle of action to take place, you see?

In other words, he's going to assess, so he starts an auditing action. And then he doesn't complete the auditing action and keeps assessing. Well now, that in itself, all by itself, is enough to thoroughly defeat an assessment of such a delicate nature as old R2 Prehav Scales, or something like that. That's quite adequate, see? "Is it all right with you if..." (I'm just giving you the *reductio ad absurdum* of it, you see this), "Is it all right with you if I assess this list now?" See? *Buckety-bow*, *boppity-bow*, *bungity-bing*, *bockata-bok*.

Now wait a minute, he said something to the pc, didn't he? Well, the pc has heard this. As a living – we won't say breathing being, because there – the pc could be too – too far gone to breathe, or actually you could be assessing somebody who was up high enough so they didn't have to. But this pc is an analytically responsive character, see? When he's asked, "Do birds fly?" then he expects to answer "Do birds fly?" Furthermore, he is not, probably, very well indoctrinated as a pc, and so thinks all assessment questions are addressed to him personally, too. And has an anxiety... But you won't find that enters into it very much providing you keep your auditing cycle going. But having asked the pc this question, if you don't complete that cycle of action, then you tend to channel the remaining assessment to the pc. Do you see this?

So the pc now feels honor-bound to answer, whether or not communication, and so forth, is the level. So the pc sits there and says, "Well, it really shouldn't be communication. No, I don't think it's that. Well, I don't think it's this," and so on. Why is he going into this? Well, he could be going into this for many reasons – but... in anxiety about questions, and so forth, he's not well in-session or something. But remember, part of this and what keyed him into going into this was the fact that the auditor asked him a question and then didn't complete the auditing cycle and so threw the whole assessment on to an auditing line.

Pc is still trying to sit here, saying, "Well, is it all right for him to go with the..." The pc didn't get a chance to say, you know, "Well, I don't know, I feel sort of dopey and groggy. Will that have any effect on the assessment?" See? Only the pc doesn't say it. So, well, look at the mechanics involved here. The pc has an incomplete auditing cycle, may have had an answer, is therefore put on a withhold – and this is what you're going to assess through.

Now, this gives you some idea of how sharp an auditor's got to be to differentiate between auditing and assessment. You complete one – particularly the auditing cycle – and you complete the other. They're both action cycles and they both have to be completed.

Now let me give you the reverse look at this thing. It looks kind of idiotic when you start looking at it, but you'd be surprised how easy it is to slip into this one. I mean, what I'm talking to you about in general – it's how easy it is not to differentiate between these two things. Well after all, you've got a pc sitting in front of you and you're just there, aren't you? You're doing this for his case and naturally, he has his opinions. And we've got all kinds of rationale, you see, to go through with this that breaks down what should be a very, very sharp view of this. We're auditing or we're assessing, see? We're either/or, you see, that's all. We're not auditing and assessing.

So, the pc – the pc sits there in a state of batter-batter, yackle-yackle to himself; comments on everything because he's already on a withhold to the auditor. Now, there's many a pc, when he sees an auditor assess, goes on to an immediate detached withhold state of mind. Well, how did he get there? That's what you should ask yourself. Did he just get there automatically? No. He has to be put there by disobeying certain little tenets that are the ideal operation, see?

Perfectly all right to say to a pc – oh, yes, you should – "Is it all right now if we assess this list?" Perfectly all right. But for God's sakes, look. You got an auditing cycle going. You've asked the pc an auditing question. Now the pc has to say it is or isn't all right. And he jolly well must have answered that question to his satisfaction. See, it's all just the standard auditing cycle – answers the question to his satisfaction and says to the auditor yes, no, or whatever it is, you see, and the auditor must acknowledge that. And if a present time problem or something pops up with regard to this, the auditor certainly had jolly well better handle it.

See, this is just all auditing, see, going on here. The auditor had better... "Oh, you've got a little headache. Now, when did the headache turn on? ... Well, it did? ... All right, fine... Yes ... Uh-hm. All right. All right, how're you doing now? ... All right. Thank you. Thank you very much. Now, is it all right if I assess this list?"

And the pc says, "Yeah, it's all right if you assess the list."

And the auditor says, "Okay. Thank you," and without further ado, turns over to this assessing operation. *Backaty-back, bop, boop, ta-da-dap-pow, pow, pow, pow, pow, bang, bang, bang, bang*, and you'd just be utterly fascinated. The needle stays loose and when you hit the right item, why, it goes *klablang*. And all is well, and the pc – all of a sudden, you've got the right item, and you ask the pc something about, "Is that it?" you know?

Well now, now watch this one, see. He says, "Is that your item?" you know, or something like that, see. Well now, that's just tossed off as an idle patter or a piece of courtesy step or something, isn't it? It hasn't any, any real bearing. It's part of the assessment, isn't it?

Oh no, it's not! You started a brand-new auditing cycle. And when you say, "Is that your item?" you have asked an auditing question. And you jolly well better get it completely carried out into its auditing cycle, or the next thing you know, it won't be the pc's item, nothing will repeat on the meter, the pc's in a bunch of withhold, he doesn't cognite on anything –

and this is where you throw most of your cognitions. See. That's how they get thrown in the ashcan. That's how pcs feel they aren't cogniting well and that sort of thing.

Well, the auditing question is asked, "Is that your item?" you see, some such thing. And the pc of course is going to take a little while to answer that. Completely aside from the fact that you shouldn't be talking while the TA is moving. Completely aside from that mechanical bit that's thrown in sideways. Pc's item: "Sponduliks. Hmm. Sponduliks. Hmm. Sponduliks. Oh, yeah, yeah. When I was – when I was umpteen, uh – I uh – yeah. And – yeah, yeah, yeah. That's why I left Isabelle! See? Yes! That's right."

And now, now, now, beware auditor, is that an answer to your auditing question? It jolly well isn't. That's a halfway point. Now, the pc will either get around to eventually telling you this – you've just handed the pc a heavy bomb, right in his paws, you see. It takes him a while to get through the circuitry, see. Well look, you're looking for something that's got his mind all circuitried. Why, why be so surprised? Why be so surprised that it takes him a long time to answer this auditing question? You've just put him into the middle of the complete rat race. And he's supposed to see his way through this in a split second, so you can get on assessing, or something, see.

No, he's not going to. You dumped him into the middle of the whirlpool, see? You just said, "Sponduliks. Is that your item?" see?

"No! Sponduliks. *Oh, oh, rrr, rrr, rr, rrrr, rrrrrrr,*" grate, grate, grind, grind, the wheels crashing, you know, gears grinding, and so forth. "Oh, yes." Cognition, see? "Well, that's why I left Isabelle, see. Yeah. Yeah. Yeah."

Now, watch it, auditor. That pc hasn't answered that auditing question. Pc's saying, "Yeah. Yeah. Yeah. Yeah." He's just saying, "Yeah." That's how he left... "Yeah. Yeah. Yeah. Yeah. Yeah ... Has a lot to do with military training at uh ... Yeah! Yeah. Ha-ha! Yeah, yeah, yeah. That damn sergeant, he used to come out there on the parade ground all the time. He'd keep saying, 'Sponduliks,' you know? No wonder! Ha-ha-ha! Yeah. Yeah. Yeah. Yeah. Yeah. Yeah. Yeah. Yeah, that's my item."

But maybe he forgets to tell you! And after a while, he just sits back with – if you've done a proper assessment and everything is in and rolling like mad, and your good indicator in – he sits back with a grin on his face, and so forth. And that's the end of that, see? And he hasn't said that's his item, you know?

And the auditor now would have an uncomplete – an incomplete cycle of action, unless he got the question answered. The auditor shouldn't say, "I will now repeat the auditing question." I don't think that would quite be in order [laughter] since it would now invalidate all his cognitions. So he'd say, "Well, Sponduliks. Is that your item, then?"

"Oh, yeah! Oh, yeah! Hell! I thought you understood that. Yeah, of course it's my item! Yeah, yeah, that's my item. Yes sir!" You see the tone arm start going some more, see? You say, "All right. Sponduliks, that's your item."

Now, the pc hasn't been asked anything, has he? He's not given a command to do anything. So you can say, "Sponduliks, that's your item," without expecting anything else to hap-

pen, because nothing else will happen. He'll just sit there. You'll get a great big surge of the needle and that will be that.

But you see – now, I've just given you an example here – that failure to differentiate between the assessment and the auditing messes up the meter, messes up the session and makes the assessment all but impossible. They are two different distinct operations.

And there's a very funny thing about it: Assessment must never interrupt the auditing cycle. But the auditing cycle may at any time interrupt assessment. So therefore, the auditing cycle is the senior operation. Now, that sounds very funny. If we say it's a senior operation, obviously you spend more time on that than you do on anything else. No, listen, the whole of TA action obtained at Class VI is obtained quantitatively. It's the number of items you get in the unit of time that gives you the TA. It's quantitative. You find one item per session and you will get, oddly enough, very little more than the TA action resident in one item. If you want ten times that, why, you find ten times the number of items.

This is just arithmetically arrivable at. It's just – that's it. So therefore, the auditing cycle is senior to it because it can wreck the assessment. Not that it necessarily occupies more time.

Assessment can also wreck an auditing cycle. Pc is saying, "Say, you know, I've just had an inkling here that that goal you're listing for on the list..." or "I think my service facsimile is in actual fact..." and so on and so on.

"Oh, yeah. Oh yeah, okay. Sponduliks, *pa-da-da-da, pa-do-do-do, po-dodo-do, pa-di-di-di-du-du waf woo...* " What the hell's happened to the meter? What's the matter? I've got a dirty needle here. Pc must have missed withhold. "You have a missed withhold? You think something before the session that uh ... Yes, you been up to something between sessions I don't know about? Maybe it's a listing bypass, or maybe L4 ..."

Hell, no! You just mixed up assessing and auditing and put your meter out of operation.

Now, this will come closer home to you when I tell you that if there were two electrical lines leading out to two different objects, and you took those two lines and crossed them, you would get sparks. And that you have two lines going out to two different destinations, a pc and a bank, and when you cross them you get sparks. Very jammy type sparks.

Now, no auditor is so expert that he will *never* get these things mixed up, but let's look at some of the obvious faults that you can get into with this. Now, when you're assessing you customarily use, or might use, "Is it...?" See? Let's take a service facsimile list. "Is this list complete?"

Now, all of this actually should be threshed out, threshed out. It has not appeared too much on the research horizon. Because one can get away with saying, "Is it.....?"

But you know, there's no – there's nobody home in a bank. There can be appearances of people being there. You can get all kinds of wild things. If you want to mess up a pc good, go into conversation – through the meter – with one of the nine entities of the body. You'll get some of the weirdest responses.

You can give every sign of having animate intelligent beings. The first one of them that emerged, and that was used and so forth, is the file clerk. The old file clerk. You make an impingement on the bank-ask a question and make an impingement – and you'll get some interesting responses. I remember some publisher – lady in charge of publications of vast magnitude, and I was talking to her one day about Dianetics, something of the sort. And she said, "Well, what do you mean, people aren't in present time?" see?

And I said, "Well, they're very often stuck other places, and so forth."

"Oh yes?"

And I said, "All right, when I snap my fingers an age will flash," you see. "When I snap my fingers, an age will flash," see. And I said, "What age occurred to you at that moment?"

She says, "Four."

"All right, where were you when you were four years old?" Turns out, you know, the house burned down, and, "How did you know that?" and, "You must be very magical indeed." Well, of course, you just got the part of the time track that the person was most glued up in, and so on, and by making an impingement on the bank, why, you got a response. But remember, the response did not really come about from the – asking a question of a little man that sits in a box behind a wicket. [laughs]

Now, I myself at this particular stage of the game – and I may shift this for various reasons – do ask assessment questions as questions. I've noticed that this bothers the pc more than assertions. But it's easier to do, and I have never considered it a vital bit of stuff, but if you said, instead of, "Is it four?" "Is it five?" "Is it six?" – something of this character, you see, "Is the list complete?" You would say, "The list is complete; the list is incomplete." In other words, you would make your assessment statements and your questions otherwise. It all depends on how much control you've got as an auditor and what the pc understands. But I noticed that I occasionally do run into a cross – and you will, too – run into a cross between the pc thinks he's been addressed when actually you've addressed the bank.

Now, you won't get any reaction from the bank if the pc is intervening. So the more you can do to keep the pc from intervening, without putting the pc on a bunch of withholds – one of the cute ways to do it is the pc (well trained) then says, "I am not going to interfere with the auditor or stick my oar in during the assessment." And then, of course, you have a dead meter for the complete assessment. Pcs are very helpful, very often helpful. You say, "Has something been decided, or protested? Has something been decided? That read. What did you decide?"

"Well, that I was just going to sit here and let you address the bank all you wanted to, and I wasn't going to say a word or interfere."

"All right, fine."

Now you do the assessment and of course you get the reactions. So the pc can get between you and the bank. In other words, he can actually throw in an overwhelming postulate or decision of some kind or another that just holds the bank down flat, and you can't address

the bank. Therefore, the pc has to sit there with the rudiments in and without a bunch of cooperative – cooperative assistances before you can get any assessment done.

So let's just put it this way: If the pc is in good communication – oddly enough, it works this way; it'll sound the reverse, unless you inspect it carefully – if the pc is in good communication with the auditor, you can then address the bank very easily. That doesn't sound quite right when you look at it the first time. You say, "Well, yeah, be sitting there, jabbering away, talking away, yapping away, cogniting away, knocking the... having an awful time here keeping my tone arm on its proper position and my needle on Set, the pc keeps cogniting all the time, you know? And he keeps knocking it out."

So, if you're in good communication with the pc, you can be in good communication with the bank. So, the way to put yourself in good communication with the bank is to put yourself in good communication with the pc. So therefore, your auditing cycle must be in; your session rudiments must be in good condition before you do an assessment. And during the assessment, any communication with the pc that occurs must be completed as an auditing cycle.

This is pretty esoteric, actually; it is pretty esoteric. But it is this important, that you won't be able to assess at all unless you have some inkling of it. Now, the auditors who can assess and get away with it very easily – the auditors who get away with it very easily and assess well – simply are auditors who don't have too much trouble staying in communication with the pc.

So, if you had an auditor who was in relatively poor communication with the pc, then he wouldn't assess well, see. But you wouldn't have to understand this for that to work. But you've left a piece of stuff on accidental. So a day arrives when you're not in good communication with the pc on that day, and you can't assess. Now what happens?

Well, the assessment is up the spout, so you decide that there is something wrong with the case or something has gone wrong and you hastily repair a bunch of things that don't need repairing. Instead of repairing the communication cycle, you start repairing the work you have done with assessing.

Now, this can be serious enough at R4. It is utterly catastrophic at R6. You throw away the last four goals you found, and throw away a half a dozen other items, and get oh, everything in reverse, and so forth. Well, what's wrong? Why can't you assess? Well, it happens to be a *session* situation. It was your List 1 type situation in the first place.

It wasn't really an ARC break. It was just a gradual mounting up of the pc finding it was impossible to communicate to the auditor. And the impossibility of communicating to the auditor finally wound up to a locked-up meter.

Now, you'll find bypassed charge. There's always bypassed charge to find. You could search any case out and find bypassed charge. I could take anybody at random, just on the one evidence that he was in a body, and find bypassed charge.

So, you can go through this kind of idiocy: You can spend twelve hours or more on a meter locating bank – R6, you see, R4, List 2, 3, (bypassed charge, see) – you could just find

it, and find it. Keep plotting it. And then but – but try to clear this question. And this is one for the book. This – because this is a very interesting question on an E-Meter.

You've said, "Well, we've really found the service facsimile which belonged to Uncle Oscar. All right, that's fine. There's a nice fall on that." Oh, it's true, you did, you found the service facsimile that belonged to Uncle Oscar, that's right. And you say that's fine. The pc isn't feeling much better, but you got a good read, and so forth.

Now, after you've done this operation – I don't advise this. This would break your heart, by the way, if you did this as a routine auditing action. This is a research – this is a gimmick thing that just demonstrates something to you.

You ask on the meter, "Have I misassigned the charge?" "Have I misassigned the charge?" Meters are very good at picking up this kind of thing, see. And you'll get a nice, smooth fall. Yes, it says that you've misassigned the charge. Go back in and try to arrange some more of... "The service facsimile was on the left-hand side and really it was in the session of October *flumph*. And the earlier incident was – really concerned the fact that we had two jumwims in juxtaposition." And now, now you know you've got it, see. Now you know you've got it. You've straightened out the pc, now, you've got it all set, and you've gotten good reads on the meter, and the pc seems to be feeling better.

Now, ask the question, "Have I misassigned the bypassed charge?" And you'll get yourself as good a read as before. And you can frankly keep this up hour after hour after hour – always finding bypassed charge, not making the pc feel any better at all.

What's the meter mean? What actually is the source of that fall? It's that you've misassigned the charge on the basis that you're assigning it to the pc's bank, not to the session.

When you've got a session bypassed charge and you try to cure it by finding deep-seated bank bypassed charges, then this question, "Have I misassigned the bypassed charge?" will read perpetually, until you get... It's very funny. I mean, I've seen it read for twelve hours. Reads beautifully, doesn't wear out at all. You can even suppress it, and then you find some more bypassed charge that's become unsuppressed by that time. "Have I misassigned the bypassed charge?"

You talk about a heartbreaking proposition, man, you've sweated your head off, see? You've found that the ruddy-rods were on the wrong side of the wumpa-gumps, you know. And you found out that it's really because the person was eighteen months old, not three years old, when this happened. And you have found out it's because his past life wasn't really spent in Afghanistan.

Oh! Now we've cleared it up, see. The pc doesn't feel any better, but we've cleared it up, see. "Have I misassigned the bypassed charge?" – fall. Honest! It just goes on and on and on. And then get – at the end of this run, really clean it up. "Have we misassigned the bypassed charge by saying it was something in the pc's case when it was really something that happened in the session?" And your bypassed charge read will vanish at that moment. Interesting, isn't it?

Don't think I'm downgrading the bypassed charge. I've seen some mighty explosive bypassed charges practically blow the plugs out of the pc's ears, blow his eardrums out like

bullets. Yes, those bypassed charges are very important. But in the presence of a session ARC break, that bypassed charge can be assigned to the pc's bank. And you can always find something to assign it to. And it won't clear up. And the pc doesn't feel any better. And the auditor, out of professional pride or something, never thinks to ask, "Is it a session ARC break?" see? So that your ARC break assessments really should begin with "Is it a session ARC break? Is it an R6 ARC break? Or is it an R4 ARC break?" You see?

Do preassess. And actually it's as crude of "What list do I use to find the bypassed charge on?" see. It's as crude as that. Because you can just mess up the whole perimeter; tear up nearly all of your work. Let us say you've been looking for service facsimiles or something like this. And you've got it all set. You could tear up all that work, invalidate it all, suppress it all, throw it all away, wear yourself out because the pc's getting no better, and so forth. And then find out it's because you began a cycle of action in session, see, and you asked the pc some question. And you didn't accept the pc's answer. And the pc has been parked there ever since.

Present time always appears to be more important than the past. The finger that you smash with the hammer now is much more important to you – infinitely more important to you – than the whole civilization which you lost a hundred trillion years ago.

Well similarly, painful as it is to get two GPMs wrong side to, messed-up as it is to catch some service facsimile (for instance at R4) that the pc wots not of – you said, "Well, a dedicated elephant, you see, that's a dedicated elephant..." or "...ambrosious toenails," something, you see, "and that's your service facsimile."

And pc says, "I guess it is," and so on, so on, "Yeah." And you go on from this and you don't get anyplace and the pc hasn't ever accepted it as his item, see.

You didn't get – it wasn't that it was or wasn't his item, is the point I'm making. It was the fact that he never had a chance to say it was or wasn't. And you go back and you look this over and you find out that's a wrong item, see. And you just tear up the ground, see, trying to straighten that all out, you see, as having been the wrong item and so forth. Hasn't anything to do with whether it's the wrong item or the right item, you see? It's the fact that an auditing cycle began there and he never got a chance to say it was or wasn't his item. And actually, ARC broke at that point.

Do you see? Therefore, you got to be pretty slippy as an auditor to shift your gears from the auditing cycle over into an assessment, and shift your gears from assessment back to auditing again, and know which one you're doing. It's a very, very wise auditor that knows what he's doing. But there is no substitute for it.

Now, 99 percent of your assessment trouble is not assessment trouble at all. It's auditing cycle trouble. Anybody can sit there and read off a list and read a meter. But nobody can sit there and read off a list and find an item on an inoperative meter, sitting across the table from an inoperative preclear. That happens to be impossible. Therefore, you say, the obvious thing to do, "Well, you just better train auditors up to assess better. We will clear up their diction. We will put into the course 'diction' so that auditors can diction better, see. So that they throw their R's in the right place," you see.

And after you got all through, their assessment wouldn't be any better at all, you see? You can just beat your head against a wall trying to straighten up the ability of the auditor to assess. What's wrong with him? The reason he can't assess is he throws his comm cycle out. You see, similarly, just like you can wrap yourself around a telegraph pole trying to find the R6 bypassed charge when it's session bypassed charge. Similarly, you could do all sorts of things to improve your assessment when that isn't what's wrong with the session.

Now, there can be things that ... You see, now what fouls up all this, and the reason I have to differentiate from this point of view – what gets all this a different look – is the assessment errors can themselves be so catastrophic, so productive of gore on the auditing room floor – bent cans, dented meters ...

I'll put you one in, by the way, sideways: Never have a steel-heavy steel-auditing electrode. [laughter] Just never use them! Never use them. Refuse to use them at R6, and so forth. Refuse to use them as a pc. Refuse to use them as an auditor. You want something light. [laughter] Something light. I have seen an auditing can go thirty-five feet in a nontrajectory course. I'd never have anything that if it hit me in the face would do me any damage as an auditor.

That's the first method of studying the handling of ARC breaks. [laughter] That's the first step. The first step is not how to handle an auditing cycle.

I've really seen them go up in smoke, man. Pc can't help it.

So, assessment can produce some of the most flaming ARC breaks, that it totally obscures the fact that there might be another source of ARC breaks. You see, one is – one is viewing the spectacular. Who's going over here and look at this flower bed with these pink flowers in it, you see, when there's skyrockets going up in the air going bang! you see. But unfortunately that little pink flower bed over along the side there is very often the reason why you've got so many rockets going up in the air. You made a misassessment because the pc was out of communication in the first place.

But that isn't the sole reason for it. Now, with – now, let me make this plain to you: With the comm cycle in perfectly, with the auditor and pc in the very best of rapport, with all going along swimmingly, the good indicators can go out faster than a stopwatch could measure it. Everything can go out and go down the drain on a bad assessment.

I'll give you an idea. The pc sitting there, and the auditor's calling off skwumperjacks and piddleboofs and so forth. And he's going on down the list, and he gets down to the bottom of the list and nothing's read. So he says to the pc, "Please continue the list. What batterboof would cuppawup?" And the pc gives him a few more.

And maybe the auditor's got his head down looking at the piece of paper, and so doesn't watch the first – you can't have your eye on the pc all the time – doesn't see the first dawning crashes of what's happening here. And your first intimation is the rising strident tone of the pc talking about something you weren't talking about a moment or two ago, you see? You might even have, as your first warning, two cans flying through the air, see, or being thrown down, or something of the sort.

Because the pc can be took quick. It's particularly true on goals. Goals of course have many times the power of items. But items, man, I've seen an item drive a pc straight up, over the crest and into a sad effect in less time than I could possibly catch up the reins anyplace. You know, the reins are just dragging along the road, and you're just trying to pick them up, pick them up, pick them up, and you just can't get them picked up.

Well, there's two sources of the ARC break. The most violent of them, of course, is you bypassed the pc's item on the list. You've just gone down past skutterwups and marked it out. And this doesn't catch up until you ask the pc to continue the list. Well, that's purely bypassed charge in the bank. That wasn't anything else going wrong. You'll find now the auditing cycle goes wrong. You'll find everything goes wrong. Assessment becomes impossible. And usually the only thing the pc will sit still for is some kind of an assessment on the bypassed charge. The pc will usually sit still for that.

You're very foolish to argue with a pc or do anything with a pc but try to locate the bypassed charge in an ARC break. You must not audit during an ARC break. You must know that, too. I mean, it's absolutely deadly to audit during an ARC break. You mustn't address remarks to the pc. You mustn't ask the pc anything. You mustn't ask the pc for his considerations of anything. You just must not. That's all auditing.

"Well, what do you think this ARC break's..." Well, take a pistol and blow your brains out, man. "Well, what have been your considerations in this session with..." Oh, what the hell? Strychnine is quicker. Yeah, I see from your faces that you didn't realize in that last one I meant exactly what I said – that you never, never, never audit in the presence of an ARC break. And I meant just that. You never ask the pc a single question. Nor do you acknowledge anything the pc says. You don't do a... You see, it's one of these all-propositions, see. *You do not audit during an ARC break.* What is auditing? Auditing is the process of asking a question that the pc can answer. You see, just the standard definition – you just must not audit during an ARC break.

Now, somebody sooner or later is going to take that, that you mustn't assess either! [laughter, laughs] That's all you do. *You assess.* If you're so confused you don't know which end you're standing on – and that's very easy. Because I frankly have sat drop-jawed looking at the meter, trying to figure out *what happened* because there didn't seem to be any obvious source for an ARC break here. See what I mean? But nothing that we had been doing would have provoked this particular ARC break. Trying rapidly to go through my skull trying to find out if I have filed away any bits and pieces of missing good indicators or something in the session that something dropped someplace. Something has gone. Something has gone awry. Something has happened here, and so forth.

And I tell you, you look awful silly sitting at a meter with your jaw dropped. And it doesn't promote the pc's morale at all to have a silent auditor sitting in front of him. So if you find yourself confused, you use the one thing that will give you control of the situation. You take a break. That requires no answer. Doesn't even require the pc to take a break. He doesn't even have to follow your orders. He very often doesn't. He just sits in the chair and fumes! [laughter]

And if you find you're not immediately and smoothly and gracefully going into gear here, and shuffling the right assessment down – it's all assessment from here on, it's not to the pc, any part of it. "Is this a session ARC break? Is this a R6 ARC break? A bypassed charge from R6? Bypassed charge from the session?" That's all metered stuff. You don't care what the pc says. "Yes, it was! I told you a while ago, goddamn it! I told you that you didn't acknowledge that communic... !" That's all, had nothing to do – nothing to do with anything. Nothing to do with it at all. You're just going to get in trouble with that, so you leave it alone.

Long experience has taught me that you cannot communicate with somebody who is out of communication. [laughter]

No, you find yourself in any kind of a state of mind or any kind of guesswork is going on here whereby you immediately – don't directly and immediately reach for the sheet and start your ARC break assessment, in spite of any action taking place that flaming ARC break is going on and the only thing you can do is assess. And all you do is assess, and you do not audit. And if you find yourself in a condition of confusion as an auditor as to what you should do, or what it's all about, or burning under the collar because of all the mean, vicious things this pc is saying or anything else, your response of course is just take a break and go walk in the room or go out in the hall. And don't keep talking to the pc, don't stay near the pc, see? See, you're just going to aggravate that ARC break. And just go out and figure out what the hell went on.

And all of a sudden, in your state of shock – because the auditor very often gets into a state of shock about something like this. It happens quick. He's all in – he's interiorized into what he's doing. The next thing you know he's looking at an ARC break. What happened? "Oh! Well, let me see now. I was doing a list, and I asked the pc to extend the list. Yes. Yes. That's what was going on. Now, let's see, and then... There was no ARC break before this last list. No, there was no ARC break before the last list. Must be this list. All right. Now, there's only three things can be wrong with a list. It's from a wrong source, I have bypassed the item on the list or the list is incomplete. And any one of the three will produce an ARC break. All right, that's probable. That's probable, what it is."

All right. Sail back on into the session, you can tell the pc something, you can inform the pc. Say, "I'm going to do this assessment now" – not "May I do this assessment now?" That's an auditing question, see? "I'm going to do this assessment now. All right. Pick up the cans. All right. Are we listing from a wrong source? Have I bypassed your item on the list? Is the list incomplete?" None of the three of them read. [laughter] Take a break. [laughter]

Don't stay in there arguing with that pc, man. You're just put... It's about as safe an action as pouring kerosene on a fire to get it out, see. And you say, "Oh, I better do a full assessment. Session ARC break, R6 ARC... session ARC break. I don't remember anything happening," you know, to yourself. "All right. Here's the session, and so on. And so-and-so, and so-and-so, and so-and-so, and so-and-so, and so-and-so... An earlier reality has been – an earlier break in reality has been restimulated. The bypassed charge here is an earlier break in reality has been restimulated." That's easy to see. [laughter]

"Oh, yes. That session last Tuesday."

Recognize at that point that communication and auditing is now possible. Don't keep pushing at it; say "All right. Okay. Feel better now?"

"Yeah, I feel all right, now, I'm sorry I yelled at you so loud, and so forth."

"All right. Good. Now, I've got to ask one more question: Is there anything wrong with this list we're doing?"

"No, there's nothing wrong with the list at all."

Go on, null the list, find the pc's item on it and that's it. You're left stonied by these things sometimes. The most obvious thing staring you in the face. Eventually you'll find out there *was* a reason for it. At the end of the session, something like that, he may say – or a month later, you might possibly remember offhand – that the item that you were listing for was the same item that he had ARC broken on two weeks before, you see. Or there... that item was on the list. The wrong item, that he'd been given as a wrong item two weeks before – that had caused an ARC break two weeks before – had reappeared on the list you were nulling. And you had just re-called the item, which restimulated the earlier ARC break and break of reality, don't you see? And he momentarily thought of telling you "That is the same item," but then didn't want to interrupt you and instead just went into a complete ARC break – just went out of control, just that fast, see. See, they're very, very tortuous and complicated, these things. That's the way you handle them. That's the way you handle these things.

Handling of ARC breaks has to do with assessment. The meter won't read during an ARC break on anything except what is causing the ARC break. It is fortunate that a meter will read on that. Because the meter is shut off during an ARC break on all fronts, except the thing which is causing the ARC break. And the meter will read on that. Fortunately.

Otherwise you've got a dead meter during an ARC break, because the pc won't take any communication from you. He's protecting his bank from you, he's doing everything under God's green earth there. And you don't get through, you won't get anything through on your meter. But oddly enough, the reason for the ARC break is sitting right on top and it will read.

Then if the ARC break isn't totally cured, and you've found some bypassed charge for the ARC break, then you'd better suspect first that there is another source of ARC break – there's another bypassed charge here – and that it very well may be a session break is sitting on top of the other break. See, you've found a bank case break, you see, and then you've found a – everything didn't go all wonderful at once: Then you'd better suspect either you've found the wrong case charge or it's a session charge or something. You've not selected out the thing right, in the first place.

You will find, when you get very experienced on this, that there is *always* a reason and that you can always keep going till you'll find it. But a lot of times, early on, you will simply despair of this. You will say, "Ah, well, I couldn't figure out a reason on it. Can't get the meter to read on anything."

I just saw an auditor doing this the other night. And all of a sudden, "Is there an incomplete auditing cycle in this session?" The meter all – practically came apart at its pins, from being a totally dead still needle, see? *Bzzzz!* We're in action. Indicated it's the bypassed charge, that was the end of the ARC break.

The auditor doesn't ever, in doing an ARC break assessment, doesn't ever audit, even to this extent, "Is that the ARC break?" What are you doing? You're doing R2H. R2H is not ARC break assessment. R2H is a process which uses the auditing cycle to assist in the location of bypassed charge. And it's all done by auditing cycle.

There are two ways of doing R2H. One is with auditing cycle only. You use a list, but you ask the pc, is it this, is it that, is it the other thing. And the other one is, you just do a straight piece of assessment.

You'll find the most successful of these – if R2H were being done in the hands of the relatively unskilled, auditor – the most successful is to keep the communication cycle in all the time. And do no assessment of any kind whatsoever with R2H. Don't assess with it. Say, "All right. On that upset you had with Norma there, do you think that was a breakdown in affinity?" And the pc says, "Well yeah, it could have been, I don't think so."

"Well, all right. Was it a breakdown in reality?"

"No, I don't think so."

"Was it a breakdown in communication?"

"Well ... I don't know, I don't know."

"Well, well, all right. Was it caused by an earlier breakdown in affinity?"

See? You're asking the same questions, you see. You eventually get down, you find out it was an earlier breakdown of communication had been restimulated. Pc, oh, he remembers this, he tells you all about it, and the ARC break's gone. That's not assessment. That's a process.

Now, you could do R2H with an assessment. You could sit back and you could go, "*Putter-putter-pow, wa-da-da-da*, affinity, reality, communication, earlier affinity, or earlier communication. Well, that reads. All right. I've got here something that reads." And you start throwing in your auditing cycle again. But you're asking the auditor to shift his gears from assessment over, and you'll find out that they're not too successful at it early on, see? Best thing to do is just stay in communication with the pc and do just auditing cycle. Because that's the one that can go out the easiest, so stay with it.

So R2H has nothing to do with this. But you'd – in an ARC break, in a real, honest-to-God ARC break, where you're working one – not working past ARC breaks as you are in R2H, you *never* audit. Right, that's never, man! That's spelled *N-E-V-E-R*, and it's capital N, capital E, capital V, capital E, capital R. It is underscored. And then underscored, under the whole thing, you have the wavy line that means italics. You don't audit. Don't audit during an ARC break. You'll find that your trouble in handling ARC breaks, inevitably and invariable, is because you are trying to audit during the presence of an ARC break. And you just must not do it.

If you do it very much you'll drive the pc into a sad effect. Pretty grim. The pc is still trying to make this point. Something has gone wrong. The pc is still trying to get control of himself. He's still – h e can't answer up sensibly. He feels that life is going *bzing*, and he feels himself disintegrating, you know. And now you're giving the additional burden of having to

handle a communication, and so forth. And he will... It doesn't matter whether he's talking or not talking, he's not in communication, that's for sure. And you'll find out that he'll go right by the boards, just as slick and neat as you can be, if you talk to him on an auditing cycle or try to tell him anything or try to reason anything with him or try to get anything out of him or make any sense out of what he's saying, and so forth. It can only be done as an assessment.

After you've located and indicated the bypassed charge – you see, you've just made these two statements to the pc. You've located it on the meter. And you indicate it to the pc that that was the bypassed charge. All right, having done so, you'll see the ARC break evaporate. The ARC breaks evaporate. You can, of course, return to auditing. But you never audit as long as there's an ARC break in progress.

Now, if you get the precision then – that's just an example of this – if you get the precision with which you split assessment and auditing and get how they never encroach on each other's borderlines, you'll be able to assess like blazes. And you'll be able to audit like blazes.

Now, everything from IV on up in the classes depends on accurate assessment. Everything depends on that. And an auditor therefore must be able to assess accurately. If he is having any trouble assessing, it's because he isn't differentiating between auditing and assessing, and doing one and then the other. Even though he seems to be doing both of them at the same time.

I told you earlier, doing both of them at the same time is a joke. It's a similarity. You... it looks like you're doing it both at the same time, but by God, don't ever do it both at the same time. You assess when you assess; you audit when you audit.

And this can become completely catastrophic – I'll show you how important it is – when the pc gets into an ARC break, and you try to audit during an assessment. That's absolutely impossible. You'll practically destroy the pc trying to go on auditing in the teeth of an ARC break.

Therefore, you have to know what is auditing. And this is a very good subject for drilling. You take the materials within the last tape and this one, and you take the subject material – break it down into its definitions. And say, "What is this action? What is the definition of this action? What is auditing?" Lot of auditors, you just have to drive it home, drive it home, drive it home. They've still got a reservation, you see? They've still got a reservation. See, they still feel that.

Well, just asking the pc – this wouldn't be auditing, you see, or they've got a disagreement with it or something of the sort, when as a matter of fact, it's absolutes, practically – about as obtainable as absolutes can get. You just don't cross them. Auditing is auditing, and whenever you enter in on any part of the auditing cycle – you ask the pc a question, you have started an auditing cycle. Now, you must get an answer to the question and so forth. Of course it must be the kind of a question that the pc can answer. All of these other ramifications that had to do with the auditing cycle, all build up in there.

If you do any part of these things, then of course you're auditing. It's that exclamatory.

And assessing is straight from the auditor to the bank and the meter is simply reacting to the impingement on the bank. The auditor's impingement on the bank. And an auditor can

control the bank, as a matter of fact. Auditor can control the pc's bank much better than the pc can. And he gets the impingement on the bank and he's getting the reaction on his meter. Now of course, the think of the pc can also react on the meter, and other things can react on the meter. But hit... assessing is simply the auditor's impingement on the bank and its response on the meter so he can select out the most charged response. And that's all assessing consists of.

Now, an auditor has to know these operations completely, and has to really, really know it. Not just, you know, say well, of course auditing's so-and-so, and it's just defined as *brrrrr*, and assessing is so-and-so, and just define it – *brr*.

No, you have to – you have to know those so well that you're not in any disagreement with them of any kind whatsoever. This is this, and that is that, and you can do A or you can do B, or you can do B and A. And you sometimes have to stop A in order to do B. But you never let assessing chop up the comm cycle of auditing. But they are two precise, different operations. And being two precise, different operations an auditor, to be successful in the accomplishment of either one, actually, has to understand utterly.

Now, at Class VI level, you'll find occasionally, somebody starting in at this level will make the mistake of 100 percent assessment. It's so easy to do a 100 percent assessment. They just assess, assess, assess. It's all assessment, see. And they can get tone arm action with assessment, and all of a sudden, why the case packs up.

Well, they don't complete their auditing cycles, you see? They – see, there's no auditing present in the session. You can actually go to a point of practically deleting all auditing from a (quote) "auditing session," and expect it to be an auditing session, and expect to get along easily and everybody to be happy about it, whereas that's impossible.

So there's two different operations here, and they're each themselves, until an auditor can differentiate them – *plingo, plingo*, as precise, chop, bang – these are... Well, it's like a drill, like this, you see: The coach says, "*Bow-wo-wop*. All right, what action is that?"

"Well, that's a so-and-so, and so forth, see. That's auditing."

"*Bwr-wrw*. What action is that?"

"All right, well, that's an assessing action." And so forth.

Don't you get the idea? So he's – divide it up so he can get himself doing these things, one and then the other, and not get them all balled up. And you'll find out it all goes smooth as glass. It's quite amazing that unless you have this piece of data, a great many auditors would have so much trouble assessing that they never find a right level. They never find a right item. They never find a right goal. And they simply wind up believing that it all doesn't quite work, see?

Of course, they get the service facsimile, and they've had it. Because the service facsimile was actually a protest of the pc of an incomplete auditing cycle which was begun half-way through the assessment of the list, in which the auditor didn't pay any attention to the answer to. And he got that as a protest on the very next item he read, which read beautifully and big. And we're auditing this big tough guy, you see. We're auditing this big tough guy on

a service facsimile of "knitting needles." And it just doesn't quite hang together and his case doesn't make any progress and we wonder why, see.

The only reason why is a misassessment. And the reason for a misassessment was a failure to differentiate between these two different operations.

Okay?

Audience: Okay.

Thank you.

CASE ANALYSIS – HEALING

A lecture given on 5 March 1964

Thank you. What's the date?

Female voice: 5th of March.

Fifth of March? Five March AD 14, Saint Hill Special Briefing Course. A little news bulletin here, you know, you know the nervousness with which you go on for a TV demonstration. Well, just about the complete, total exclamatory height of that has just been reached. Melbourne – you know, they're having hearings on Scientology, you see. The legislature of the great State of Victoria – that's just south of the deserts there – you heard that's the government of Australia, actually it isn't the government of Australia, that's just the government of Victoria. That's formerly the government of Australia, so that its old comm lines are in and it's been raising the devil, and we finally found out who was doing it. It was the BMA's committee – a Doctor Daks – arms with "yak." I mean it rhymes with "yak." [laughter]

Anyway, we've gradually, consistently been winning here. And they were coming down on it, and they were raising the devil with *History of Man*, they were doing all kinds of things, and so forth. The moment the government began to attack Scientology, the newspapers started to swing in favor of it. [laughter] The wheel has turned. The wheel has turned.

And those hearings are going very successfully, and the people conducting them are getting more and more friendly, more and more friendly. What swung the day, Saint Hill graduate audited pcs of the selection of the legislature on TV for the hearing. [sounds of amazement from audience] Running such things as R2H, and so forth, and he was knocking off cases left and right, and the last one he ran, why, the board was trying to get a note to him in a hurry not to stop because they wanted to hear the rest of it. [laughter]

They were all sitting there, absorbed and anxious and – to get it all and very interested and laughing in the right places and... [laughter] But that's definitely duty, above and beyond the call of. [applause]

Well, they – we win. We're definitely on the way now. I was – already started running my goals plot, and you miss something here or there. Trouble is I've had holes run in my goals lineup, you see, so I can get to a certain point – all of the research on this was done on two banks, Mary Sue's and myself, and the biggest weight of it had to be carried by my bank, so we – I've had a lot of GPMs run out, out of sequence, don't you see, and so forth. And boy, you hit one of those and you don't know whether it's gone or not, you know, I mean from a standpoint of did you get all the items in it. And the difficulties of actual GPMs is the goals series are consecutive, and it just goes in over and over and over and over, same goals series,

same goals series, same goals series, same plots, with different GPMs, you see? Same line plot but different GPMs, and they just go on and on.

So you run out one, you're immediately convinced you couldn't possibly have run it out, because of course it's sitting on one of – the same one of the earlier series, so it looks like all the goals are alive there. So if you run one too deep you fall through. You go into an earlier goals series. Well, the only way you can turn on a somatic and tear a pc's head off, skip some goals. Well, try skipping forty-two at one fell swoop.

And this can be pretty gruesome. So it's dicey just to this degree. The more we get to one of these GPMs of mine that has been run previously, the question is have the items been run out of it all or haven't they been run out of it? Since if you simply bypass it and start the next one, you see, you turn on some very interesting somatics by reason of bypassed charge if there is any. Very, very, very gruesome. But in any event we're making very, very nice progress, and there's enough GPMs there to please almost anybody.

I just want to give you some kind of an idea of exactly what you face. I wouldn't want to upset you, anyway, but you've got fifteen thousand of them. Isn't that horrible? In consecutive serieses of forty-two. There's forty-two goals, forty-two LPs, they never change, but they're consecutive, and they just go forty-two, and another forty-two and another forty-two and another forty-two. They're all the same, and they get bigger and bigger and bigger and bigger as you go back – bigger and bigger and bigger. I suppose some of the early track RIs – some of the early track RIs are about the size of Mount Vesuvius. I don't think you'd ever get anywhere near one. But anyway the GPMs – this lecture doesn't concern this, I'm just giving you some notes on it. The lecture concerns case analysis.

The first series – the present time series – you will find it – we proved this conclusively last night, and if you don't get it right, your pc goes into a sad effect which is something on the order of bailing out of an airplane with no parachute at about fifteen thousand feet. Sad effect. You've seen a sad effect take place by somebody being audited up against some ARC breaks. You've seen a pc, I'm sure, get sadder and sadder over a period of a couple of weeks, till somebody kindly found the bypassed charge and so forth. Well, this sad effect takes place in about four or five seconds. You get the wrong GPM to start the series with, you see, to begin with, and you're running the pc where there is none, only he's trying to pick up the items from the second series, which are forty-two GPMs away, because there isn't any goal formed yet in the first series at that point, and you hit a sad effect that is just like that: fifteen thousand feet bailout of the airplane with no parachute. And you're just about to catch up with a sad effect just that fast. I never hit a toboggan so quick in my life!

And we actually were quite unwilling to believe, because we've had so many troubles with truncated, you know – not all the GPM formed, but the idea of not all the first series formed yet. See, the line plot incompletely formed, and then the first series of goals, the first forty-two goals on the track from present time back, you see, only some of those formed, you see, moving up from forty-two on toward present time, you see.

But I had become frankly very bored with the whole subject of truncated anything, you see. So we were saying, just to hell with it and we started in at GPM number one. I told the auditor, I said, "I think – I don't think the two items which we're calling for here, for GPM

number one, I – I don't think those are standard. There's something about the first two items on the track that are not standard." And I'd started to list some odd randoms, and the auditor said to me, "Oh, well, your proper item here is..." and gave me number one GPM top oppterm, see.

Well, it was just exactly like stepping out of an airplane with no parachute. Because that GPM wouldn't have been formed for four more GPMs. I was – I was perfectly – I was perfectly correct. The items I should get to begin this series were not the items on the line plot. But the third pair of the fifth GPM, or the fifth goal of the series, that was all the GPM existed at that point. There was no GPM – there was no upper fifth, the last five pairs of the fifth were missing, the fourth was missing, the third was missing, the second was missing and the first was missing, which is very interesting. Took us quite a while to untangle this situation. Be... mostly because we had just stopped believing in truncated anythings, because we'd been bitten too many times. Find number one GPM; oh, it's truncated; run a couple of items out of it and the pc wraps around a telegraph pole, see.

The rest of it was there, don't you see. So it was crying wolf one too many times and when we confronted the real article of real truncation and so forth, we were all set just to abandon the whole subject, and there we went. Bang! And the auditor did ARC break assessments and so forth, trying to knock out this sad effect, you see, and decided we'd gotten rid of it, and audited awhile and obviously hadn't gotten rid of it and so forth. And then with great brilliance after some hours finally – must be truncated. The series must be truncated, and the goal is truncated. Hadn't even formed the whole series, much less just one goal truncated, the series was truncated.

So you can expect – you can do your line plot as long as you talk about goals – the first goal of the series, the second goal, the first actual goal in the series, the second actual goal. As soon as you start saying the first actual GPM of the series, you'll probably get away with this, but of course it's not there. The first actual GPM of the first series undoubtedly is not there. But of course the pc does know, and you can get the response of, the first actual goal of the series, you see.

Quite a fascinating proposition. This quantitative approach, I can tell you, you have fifteen thous... we had the first evidence, first real evidence that a person does make these things himself, makes them exactly according to a preconceived line plot which everybody has in common, you've learned your lesson well, Lord knows when, before the track began, or something of the sort. You knew just exactly where to put what, and it doesn't vary from pc to pc. It's the most marvelous thing you ever saw in your life, and there's forty-two goals in the series, and they go in certain harmonics, and it's all taped, you see. Well, it isn't too peculiar. You look at a body. It – every body has a liver and it has a left ear and so forth.

Well, GPMs are exactly this way, and that's why it takes a trained auditor. Because this is tricky stuff, man, tricky stuff. An untrained auditor, running one of these things against its actual line plot, wrap a pc around a telegraph pole so fast the pc wouldn't know what hit him. Somebody in Keokuk offers up his goal, "to be a very good girl all the time." See? So the auditor takes this LP, that's no more her ac... an actual GPM or an actual goal than the man in the moon – takes this line plot. He will be able to get fragments of items, maybe out of

a goal "to be good," or something like this, you see. And to get those fragments of items, partially run out of sequence with all of the GPMs skipped before you get to it, pc all of a sudden feels the head being severed in half, stomach torn in two different directions, the four corners of the room go into a complete out-of-plumbness, and you see why we're not releasing this materials indiscriminately.

I've seen some of the things people have been willing to buy as goals. *Thaahh!* It's fascinating, you know, everybody's very interested in the second dynamic, and so on. And we, we... there are no actual second dynamic goals, far as I can tell. I have never found one, never seen one. Might be a goal, an actual GPM, "to feel," or to something or other, you see, or "to have sensation" or something like this, but there are no sexual goals, otherwise you'll see goals like that, "to suffer," and "to enjoy life" or something like this. You might see something like that. But that's about as close as it comes to it.

A lot of implant GPMs "to be sexual," you see, "to have sex," all that sort of thing. We owe to Papa Freud, you see, this tradition, that if you audit somebody you should get into the second dynamic. And here's a funny one for you: I've never seen a case cracked – never – by touching on the second dynamic. Isn't that interesting?

The only thing Freud got on a resurgence on patients – because he hit the second dynamic, it was a fruitful source of withholds. So he'd get one withhold, see. So he got one withhold. Auditor worthy of his salt who can't pull fifteen, twenty, thirty withholds in a session, a withhold session, ought to quit anyhow, see. So he'd work for seven years to get one withhold off, see.

But this gives us tradition, tradition, that the second dynamic is something we should operate on. Of course it's pleasant to operate, it's not without its recompense from the standpoint of titillation, and so forth. And it's interesting to listen to some girl or some young man get rid of all of their second dynamic peccadillos of one kind or another. It makes good stuff, but better stuff for *True Romances* than auditor reports. [laughter] So I'm afraid I haven't much faith in that.

I want to talk to you today about case analysis. And this succeeds in the various lectures that I've been giving you here lately, and you've been making very, very good use out of those lectures, and I thank you very much. This is the stuff of which case supervision is made. And if you really want to – want to be a good Case Supervisor, you'd have to know all this stuff cold. And if you want to be a good Auditing Supervisor, and so forth, well, you ought to be able to whipstall this stuff, back and forth, and upside down, and if you want to be a marvelous case cracker of some kind or another, to Homo sap, without going up to OT, if you want to stay in the lower levels, then you'd better hear this lecture. This is how to become a healing wizard, and upset the AMA. [laughter]

Healing is not in man's tradition. It's not in his tradition as such. It's usually in the tradition of graft or fraud or picking on the poor dear departed. They've had six hundred successful kidney implants and transfers in the medical profession in the United States in the last couple of years – taken a kidney from one person, put it in another person. They've had six hundred of them. Which is marvelous. I think they're to be – to be credited with this a great deal. Pavlov used to swap kidneys around, and hearts and things, amongst dogs. And they're

right in the tradition there. And obviously somebody can't live without a kidney or without his kidneys or something of this sort, so it's a good thing to transplant kidneys.

But to give you some kind of an idea of the validity of a medical report on the subject of healing – I'm not berating the medical doctor. You need plumbers, you need medical doctors. Somebody's got a leak in the pipes, why, you should have somebody there who knows how to operate a blowtorch and put some lead on them. But that's just about the end product.

They're talking – now they're going upstairs into healing. Now that isn't healing, that's plumbing. [laughter] And what do you get? What do you get? You get six hundred kidney transplants, and then they don't bother to tell anybody that the whole ruddy crop of them died within two years. Some of them died in days, and some of them died in weeks and some in months, and the longest lived ones were two years.

I think it's a very interesting commentary on the released data, you see? Now, these are the boys who are coming down on us and raising the devil with any group that is trying to handle any subject like healing. And their first accusation is fraud. Well, you're acquainted with the overt-motivator sequence, I am sure. Guy will always accuse somebody else of committing the overt which he is committing because, you see, he needs the motivators. He's got a scarcity of motivators and so there it is.

Well, these boys, these boys have given healing a rather bad name, and over the period of years healing has ebbed and flowed and gone up and down, and we've had barbers and phlebotomy and goofy activities. And the Aesculapians used to keep a high rate, down there.

I was down, a few years ago, alongside the Parthenon, taking a look at the old grounds where the Aesculapians used to heal people, and they have a great big bath, a swimming bath, there. And they used to dump them in this as holy springs, and that sort of thing. The remains of their old buildings are there, scattered down the slope. And it's quite interesting, but even as many years after their last activities and so forth, their tradition survives. And their tradition locally in Athens is that – well, they were – they were pretty slippery people, because if anybody looked like he was getting worse, why, they quickly and quietly removed him to his home so that he would die there, and then published abroad, you see, the fact that they had practically a hundred percent healing record. Well, their hundred percent record was based upon those they kept, who would get well, got well. And those they didn't keep, of course were no longer part of their records. But it was even dicey then back in the time of Socrates.

And coming up the line, man knowing nothing about the mind, knowing nothing about the preconceived efforts of individuals to aberrate themselves, knowing none of the more basic fundamentals of existence that – well, not even knowing about overt. The best way they could handle overt was repent, repent, the kingdom of heaven is at hand. That's the way you did your overt, and so forth, I – and it's not an adequate process. [laughter, laughs]

So anyway, here was – here was the mind of man, ready to upset the most cunning devices, which were about to heal somebody, so man more or less went into structure. And got healing very closely associated with structure. Because somebody had a broken leg you could at least set the broken leg and so forth, and his most – his most successful areas of healing of course, knowing nothing about the mind, had to do, then, with structure. And he could see

obviously that he could set a broken leg, you see, something like that. He knew nothing about disease, and to this day knows nothing about disease.

And I was on the heels of disease not too long ago. I found that a GPM, if you fragmented it and it slapped you in the face or something like that, that you could develop for instance a sty in the eye, or something like this. And apparently infection has something to do with actual GPMs. Now, we don't know whether it had anything to do with bacteria or not. In spite of the fact you can see the bugs wiggle under a microscope. I don't know what that proves, see. Nobody has ever proven that it proved anything. Because there are enough variables in it to make other theories possible.

In order for something to be true it has to be sweepingly true. It can't be partially true. There are no such things as partial truths. Something that is true on Monday, Tuesday and Wednesday may be only vaguely workable but it isn't true. If it is not true on Thursday, Friday and Saturday then there must be something wrong with that truth. So man tended to go into structure. And he really has no healing background. Because healing was done by the body, by the individual, it was not done by the doctor. The doctor would arrange the parts so that they would grow back together again and hope that the patient would do the rest, you see. So the healing was always resident upon the individual who was injured or ill.

And until you have cracked the problem of the individual wish to be well or sick, until you've cracked the problem of how the individual influences his own healing, of course healing is impossible – broad, broad healing is impossible.

So no wonder man has been up against it, and no wonder his healing associations or activities or practitioners very often fall within the frameworks of fraud or monopoly. And he goes in two directions. He either tries to make a healing practice legal by becoming a monopoly, and getting laws passed that enforce it as the – is the case with psychiatry. You know it's against the law in some states not to electric shock somebody, you know. You see, it's – they become a monopoly and get laws passed to enforce it, you see, or they stay as somebody who is still trying – still trying one way or the other in the field of healing, but actually for financial reasons and so forth passing off into the borderlines of fraud. Promising cures that cannot be delivered and so forth.

So he varied, man varied, between these two activities. In the center ground there were some fellows who hoped you could heal something, that would try to heal something, that would – who would make some effort of it. But the main bodies of healing professions have sharply divided into these two classes, up through the years. So you can say there's three classes, those who were still trying to heal something, those who knew they couldn't and were charging for it anyway, and those who were trying to enforce healing practices by monopoly.

The modern medico and psychiatric professions and so forth have chosen the monopoly road as their method of progress in this particular line. To this they have joined research. And their research is quite a racket these days. It – you... they can work it up so that they can devour billions of dollars in research. And you notice that it's *re*-search. Somebody has to have discovered something for the stuff to be *re*-searched.

So they fall back on such people as the witches, the witchcraft and so on, and they get various types of healing that they drag out of the hinterland, and they go over these things at

vast rate. This is not an exaggeration by the way, this is discovery of foxglove, digitalis, and so forth. Well used, consistently used, by the people in Scotland for various cures of various things and well known in its dosages and so forth. And one day a student at Edinburgh happened to be out in the country and happened to find out something about it, and actually devoted his life trying to get the doctors to use this stuff that the witches had already been using for a long time.

This is usually the background, the background of such material. And so research, research has amounted to fabulous sums of money, and there'll be a promoter, and he will get together a great deal of research money. And then he will turn loose teams of (quote) scientists one way or the other (unquote) on this, and recorders of some kind or another, and they plow into it and busily, busily, busily, busily, busily muck about, and write papers, and then read each others' papers, and then rewrite the papers of somebody else's, you see, and fill up file cases full of stuff, and they come to some very remarkable conclusions. [laughter]

One of the remarkable conclusions which they've come to recently is there is such a thing as standard science. I think that's a very remarkable conclusion. Because outside of the field of the exact sciences so-called, which are very inexact, physics, chemistry and all that, to call anything standard science, you see, or orthodox science, and so forth, well, that would be one thing, but to use it in courts of law to demonstrate that something is or is not true, demonstrate that it isn't true, because it isn't accepted by orthodox science, of course is to bang the door shut on search – not research, but on search. So the door is kept pretty well shut on the subject of search, by those who seek to dominate the field of healing by monopoly. They have to keep that door shut, because at any time somebody might discover something, they feel, and so on.

This is not a self... this is not an egocentric lecture of what is happening to us, it just happens to be a – because it isn't really happening to us. You would be amazed of how little of it is happening to us. We're getting a lashback from their efforts against other healing activities. And the reason they're laying an egg is, is we're not really not basically a healing activity, you see. And they really haven't anything they can put their paws on. So they have great difficulty in their understanding of what it's all about. We don't fit, you see, into their two-camped group. The monopolist and the f... and the honest frauds. So as we don't fit into these groups, we don't easily communicate what we are doing to these fellows, because they have certain stylized methods of thinking about these things.

Well, sooner or later, sooner or later, in spite of all this, in any society certain discoveries get made. Harvey Firestone dropped some raw rubber on a kitchen stove and finds out that it's now pliable and usable, which it never has been before, and all of a sudden we have a rubber industry, or something like this. Various accidental or on purpose discoveries get made, and the society pushes along and these things get developed and researched. And then researched and researched and researched, and then somebody comes up and finds out that ruddy rods really didn't exist in the first place, and that's a brand-new discovery, don't you see. And takes off on a new line of scien... (quote) "scientific approach," for research, research, research, you see. Vast sums of money expended.

There are a great many fraudulent activities go on in the United States and abroad concerning, concerning research money. For instance, the American medical profession gets itself – the Medical Association gets itself a big propaganda campaign going against cigarettes. Even gets town councils sufficiently upset down in Texas to make it, I think, three years in prison for anybody caught smoking a cigarette on the street. And that went into law just a few months ago. I mean, I'm not exaggerating it, it's a matter of record. And they're not going to investigate people in their homes and they're not going to bother tourists going through the town, but their local residents have had it if they're seen smoking in public. Well, they've got this big – big – big smoke going, if you'll pardon the pun. And they've got all of this hammer pound and blast of various kinds as – on the subject of tobacco. What was this all about?

I don't think you'll hear too much more about it in the near future. But for a while it was very hot and very heavy indeed. I – reading, I think in "Pogo," the joke of the general was going to be shot and they blindfold him, and offer him a last cigarette, and the general goes straight up and screams in their faces, "My God, haven't you read the report of the Surgeon General?" See, [laughs] marvelous gag.

What was that all about? Well, the tobacco companies have finally run up the white flag and they've given the ten million dollars in research to the American Medical Association that was required of them in the first place. I'm afraid you won't hear much more about that now, because the blackmail has been accomplished. I'm not giving you anything inside track, I've given you Associated Press reports. Straight on the wire. It's a – it's a method of getting funds, don't you see?

So you want to know what our meter case is all about. Is anybody interested in meters in the United States? No, they weren't interested in meters. During this entire time they weren't interested in meters. They were hammering and pounding around trying to get more appropriation for the Food and Drug Administration, so they were making a great deal of smoke. They were just hammer and sh... and shout, and bang and bang. And they've got more Legislation now, they've got Legislation which is very, very full of teeth, and they've gotten their appropriated funds, and unless – if of course they want some more funds, we may still hear about the E-Meter, see. But the probability is we may hear nothing about it at all, they simply drop it. It was a mechanism by which to obtain research funds from the United States government. They just collected a bunch of odd things that they never had to prove but could shout into the papers about, and make a big confusion about, don't you see. And shake Congress down for some money.

So research – research is very current and is the thing to do, all that sort of thing. So anything that we're traveling along on, is – looks very strange to these chaps. Looks very strange, because things are being found out and things are being done, don't you see, and so on. Well, that's because research isn't being used as a means of obtaining money, do you see. And the materials involved are not being dedicated to the creation of a monopoly and they're not being dedicated to fraud. That makes us very peculiar. So we become incomprehensible.

But then of course we would have been incomprehensible from a viewpoint of the monopolist or the fraud or any of these fellows, in any society, at any time in the past, be-

cause we travel forward on the assertion that there was such a thing as truth. And actually that it was dangerous to know a half-truth. And carrying forward in this particular direction, one could possibly succeed in bettering the lot of his fellows and himself, you see?

But we've come to that point in our development where our goals and dedications, which is a greater freedom and a greater state of beingness – which state of beingness, by the way, is beyond the imagination of the ordinary man – having parted company to that degree and ascended above his level of reality, it is necessary then to bridge in the fellow in the street on up. Well, the classifications plan is part of that. It brings him in at certain levels, and moves him on up along the line.

Now, with the advent of certain recent techniques based on early work, it becomes possible to make freedom from psychosomatic illness one of the gains of one of the lower levels. This is so easy to do that it puts us into the front rank of healing. It is not a direction that is a particularly desirable direction, it is not a direction which has very good bedfellows. But if you enter the field, where they all are – exist in that field are monopolists and frauds, what do you think you're going to do? What do you think's going to happen? What catastrophe is liable to occur here?

Well, in the first place you'll be fought by the monopolists and shunned by the frauds. So the first thing you should know about healing I have just got through telling you – the nature and state of the world of healing as man now knows it, divided up more or less in that fashion. And the second thing you should know about healing, that if you're moving up into the field of healing, heal. That is the one thing that would move you through and get you through. In other words, if you're going to heal, heal. Don't heal in order to... Just heal. And you'll find out that this becomes a relatively simple activity.

Now, almost any one of you going into a community would find yourself in a very, very desirable position if you started healing people. You would be up against the monopolist on the one hand and the fraud on the other hand. The ins and the outs, you know. You'll be up against the government of healing, but if you could lick that, in some particular fashion, then the fellow down at the garage with lumbosis and the fellow up the line with swellisis – these birds, these birds would carry the day.

Now, the only reason you don't get into that field much is you're talking about making the able more able and so on, but it doesn't mean that it isn't a fruitful field for the auditor. If the auditor had tools with which he could heal and if he could use those tools adequately and if he could go up against the closed circle of the monopolists and actually escape the wrath of the frauds, and so on, he'd probably make himself very wealthy and very famous indeed. This would be the – this would be the gamut, however, he would run. And one should look at that with some reality.

I don't for a moment say that you can't get away with it, that it's easy to get away with – I'm just showing you what you have to get away with. That's all. It's just a factual statement.

Now, if you made your business at the lower levels that when somebody came into Scientology with psychosomatic illnesses, and so on, this person was rid of these – if you rid the person of these – providing you had given him some earlier indoctrination, providing you had given him some earlier training, providing he had someplace to go, and providing you

didn't do it all in an afternoon but made him come to several meetings before anything was done – you get the idea?

He's only got one goal being there, he wants to be rid of his lumbosis. Well, you just better make sure that his horizon is a bit wider open, don't you see? Let's make sure that his horizon is just a bit wider before we take his lumbosis away from him. Otherwise he falls back into his indoctrinated classifications of "there is somebody who heals and there is somebody who fixes pipes, and there is..." – you know, this specialized society.

The road that he would be walking would be blocked just to the degree that he thinks his goal in life would be to get rid of his lumbosis. Well, this means then that to go at healing on the standard pattern of opening up an office somewhere and hanging out, a sign that you heal lumbosis, and so forth, is not the way to go about it at all. But oddly enough you do have in your hands, whether you have any reality on it or not, you have in your hands the means of healing.

Now, I relapse into some instructor sarcasm here on the basis – of course, if you go on auditing the way I've seen some of you audit lately you never got a prayer in hell of doing anything, but that's just a – an aside. I'm afraid I saw somebody yesterday running a double Q-and-A process on a pc there. Every time the pc answered the question I heard the auditor interjecting something to find out something else that had something else to do with something else, and we had an auditing cycle there which was a perpetuity. We had no complete auditing cycles of any kind whatsoever. You do things like that, of course, you're never going to heal anything. But we're just going to leave that aside. That wasn't too bad.

Now given, then, the ability to do an auditing cycle, given the ability to handle the session, given an ability to read a meter, see, given these fundamentals, there exists actually a technology that you know of – and it will surprise you a great deal when I reintroduce you to it – that is totally capable of healing any disease or illness to which man is subject, of a chronic nature. Any chronic – I'm talking now about the difference between acute and chronic. Acute is somebody who gets a cold and he has a cold for a week and then it's gone. Now that is an acute illness, and that is opposed to, that is opposed to another type of illness which would be chronic. And that you would then call sinusitis, or something. He had – sort of had a cold all the time. See, that's different. So the difference between acute and chronic is just time duration. Now, of course somebody can split hairs and say how long does an acute have to be acute in order to become a chronic, and so forth. Well, I'll leave that up to you, since it's your question. The division line is not that sharp.

Well, I think somebody who's been bothered with a cold for a year, you see, I'm afraid that's chronic. So the way you do separate the line I won't – I won't quip with you. There's a way you do separate this line – is when an illness exceeds its expected course we can call it chronic. And that's a fairly sloppy definition but it's quite workable within certain limits. When an illness exceeds its expected duration you can call it chronic. This fellow – this fellow – ordinarily, ordinarily people recover from a scraped knee in a matter of a week or two, see. Certainly they have nothing more to do – their knee would no longer be showing abrasions and contusions after a week or two, see. But for some reason or other this fellow's knee,

a month or two later, is still in a bad state of dishabille, what then is this? Well, this must be something chronic, then. See, we've moved over into that field.

Now, that is what we mean, although we can say all illnesses are basically psychosomatic, not seventy percent of them, all of them are basically psychosomatic, we'd have to pull some torturous mental logic in order to get some of them into this classification. You say a broken neck is psychosomatic. Well, yes, the fellow had to have rocks in his head in order to make a mistake that would cause him to break his neck. There's certainly even... you say, well, how about an accident? A fellow going along in an airline – well, you're dealing with a fellow who is – who is very happy to get into this type of argument. It gives so much latitude for imagination, you see. You say, well, how about this fellow that's gotten busted up in an airplane crash. You say there must have been something wrong with his intuition not to know that if he went he was going to crash. He must have had bad judgment or something like that, see.

You can even get silly on the subject of accidents this way, but we don't have to get that silly to demonstrate the psychosomatic nature of illness. In the first place psychosomatics begin with the acquisition of a body, so that makes them all psychosomatic, doesn't it? Guess that dealt with that subject. [laughter, laughs]

Now, well, how come this fellow's stuck in a body? Well, that would be a very large problem. And that doesn't get settled until you get up there into Class VI, or something like that, to anybody's satisfaction, see, so it'll stay that way. So obviously that's beyond the range of healing.

And one of the first lessons you should learn on the subject of healing is that because you can see the individual is sick from something is no reason why you should treat it. In other words diagnosis immediately flies out of your hands as an unnecessary and often retarding activity. There's really not much difference between diagnosis and evaluation. And evaluation is more or less – well, it is forbidden by the Auditor's Code, so that just knocks out, in actual fact, diagnosis. Now we're talking about healing diagnosis, you see.

To say what this fellow was suffering from is an adventurous statement. Because it may be so purely psychosomatic that it isn't a nose at all, don't you see?

Now, I've conducted some experiments in hypnotism, in... early on, no longer using anything like hypnotism, never did use it in this particular field, but it's terrific, terrific piece of research material. And I've caused somebody's nose to run for two or three hours. He had the worst cold you ever saw in your life. Person didn't have any cold at all, caused the person's nose to run simply by an hypnotic command – when you wake them up they're going to have a cold and their nose is going to run, up until the time you snap your fingers and say abracadabra, see? So person wakes up, and he has a cold for two or three hours, and I'm telling you, that nose will really run. It's quite startling. You say how on earth could they get into that condition? And then say "Abracadabra," see, and no – it just – it's gone, you know! No slightest residue, no runny nose, nothing, you see. Unpleasant subject, but it was unpleasant to the person going the experiment, too.

What's this all about? Once you've conducted a few of these experiments there's not much doubt in your mind that the autosuggestion, or the various mental mechanisms of the

individual himself can bring about or perpetuate any illness. There's not any doubt in your mind after you've conducted a few of these. But you have in actuality the genus of psychosomatic illness in the matter of suggestion.

Now, to a Scientologist suggestion becomes postulation and a much more clearly stated proposition. Because actually nothing can be suggested to the individual that he himself has not earlier postulated. There's nothing. Nothing can be suggested to the individual who has not himself earlier postulated it. Which is quite remarkable. And people can figure out, well, they're not guilty of any overt acts, because if everybody does it to themselves... oh yes, you're guilty of an overt act, of keying it in on them – because it's now gone beyond their power. [laughs] Pretty good, eh? You... people try to argue themselves out of the fact there are no overt acts. Well, the only overt act would be key in what the individual had once had intended to happen anyway. But nevertheless it is an overt act.

So if these things can be produced hypnotically, under laboratory conditions, and if these things can be produced by suggestion, and if key-ins can occur of a person's past experiences or postulates, and if rather violent reactions and malformations can be brought about in this way, then we see the genus of illness is psychosomatic.

The individual must have willed the destruction of a body before his own body could even be bent out of shape. This is the philosophic line-up, and it happens to be an actual one. He must have conceived the possibility of breaking legs before you could break his leg. In fact, he must have broken a few.

Most pathetic picture of a psychosomatic illness I ever heard of was a bird who made his living of grabbing people up dark alleys and hitting them in the jaw and taking the money out of their pockets. It's very, very interesting that his arm with which he did the hitting, even yet, was paralyzed from the shoulder to the wrist. He could sort of hitch his back around in some particular way and still strike a blow with that arm, he was still doing so. This ostensibly traced back to the point that he used to be beaten up by a newsboy who took all of his money away from him. When he was a small newsboy, this bigger newsboy, you know, took all his money away from him. And the hold on the track was one morning he almost hit his mother when she woke him up. And this practically broke his heart and more or less paralyzed his arm.

Well, that's all very interesting, but you know that a fighter nearly always postulates a paralysis of the other fellow's arm. Well now, it really isn't then what happens to the individual that brings about the psychosomatic illness. It's what the individual is willing to happen. And as crooked and as upside down and backwards as that often looks, we nevertheless can trace these things back to that if we go all the way. But the odd part of it is, it is not either possible – now hear this very carefully – it is neither possible nor necessary to trace the psychosomatic illness to its genus and erase it in order to cure it. It is neither possible nor necessary to trace a psychosomatic illness to its self-generated genus, you see, that is to say, the individual's own intention of having it, and erase that in order to cure a psychosomatic illness. The word "cure" is used advisedly.

And why is that?

Well, he doesn't have to have a key-in to make his postulates come true, but when one of his early postulates suddenly, mysteriously materializes, in the physical universe, and he doesn't know anything about it, it was necessary for something else around him to key it in. So the key-in is other-determinism.

Now, this is very, very slippery. You sh... you should get this very... this is one of those things I – your jaws almost dropped off your faces the other day when I told you that an ARC break assessment was – well, I'd already told you that in an earlier lecture, and you all said, "Oh, yes, yes, yes," put it all down in your notebooks and you were all very happy about it, so forth, and then when I told you in the last lecture I gave you that you never audit during an ARC break, I thought your faces were going to fall apart. I never saw such a silence occur in all directions in my life. And yet that's the obvious conclusion from the earlier datum I gave you. How did it surprise you so much? So don't be surprised at this one, see, when it all of a sudden comes up and hits you in the face, because it's the same kind of datum, you see.

The individual did it himself. But when he did it himself he knew he did it himself, don't you see? And if it's happening and he doesn't know that he's doing it himself, then it must be the result of a key-in. You see? It's this old intention has been activated which he has not wot of. He doesn't know he's doing this, but something has happened that causes it to go into action. Hypnotism, for instance, is merely a key-in of the person's own basic postulations. There's no such thing as an other-controlled human being. But there is such a thing as an other-keyed-in human being.

Let's put up a gag here that will drive this home a little more closely. Let's take this fellow, we want him to become a prisoner. We want him to become a prisoner of some kind or another. So we lock him up. Well, how are we able to do that? This is – this is marvelous. You mean you can lock up a thetan? You can puzzle this one over philosophically for some time. How does this come about that anybody can be put in jail? I've had to crack a lot of these conundrums along the line, and disentangle an awful lot of things, in order to get data on which life operates. And that was one of the stoppers. How in the name of common sense could you ever lock anybody up? If it is true that man is a spirit and so forth, how does it ever come about?

Well, it must have come about – it eventually materializes – and when you get up to Class VI you certainly know why and how! He had to lock himself up first. He had to lock himself up before you could ever lock him up. And the only thing you can do is key in his locking himself up. However he's doing it. It's about the only way you can ever make a prisoner.

Actually, in an environment if you're going to govern it well or keep it calm you must be careful of what's being keyed in – careful of what's being keyed in. You've seen civilized men, I'm sure, go into a heav... high level of bestiality when faced by war. The most fantastic things occur in war, and so on. Well, how come? Well, it's the key-in-ness of the environment. It isn't war does this. It gives enough key-ins to key in his bestialities. And they were absent – that is, like sleeping dogs lying quietly behind the chair until all of a sudden, why, you've got a bunch of key-ins going. Now you could key in all sorts of viciousness. So you

can key lots of things in on a being because he is basically a complex person. Very complex. A thetan is unbelievably, numerously, prepostulated.

Do you know that you can just find 2-12 locks on an individual practically as long as he will sit still, and years after you're liable to take the same case and find out, hey, what do you know, they've all been off one actual RI, you know. Here's fifteen thousand GPMs. You multiply – that's a rough number, but you multiply that by the sixteen RIs there are in a bank, that's sixteen times fifteen thousand, see. And then recognize that any one of those items from that result can have thousands of locks. We can add it up to man's extreme individual age, which is very extreme. He's had tremendous quantities of experience, you see. So there's an almost unlimited fund of things to key in. You can key in almost any combination. It's not even hard to do. [laughter]

He may not be master of his own destiny, but he is sure victim of his own postulation. [laughs] So anyway, anyway, to make a long story short here, what are you healing when you're healing with psychosomatics? What are you handling?

Out of your reach, if you're below – auditing below the level of Classes V and VI – completely out of your reach, are the basic postulations which brought about the conditions. You just say that, just cut it off right there at V. And below that, man, that's out of your reach. It's out of the reach of the individual, it's out of the reach of the lower auditing skills, and fortunately is not necessary to effect a cure. Because we're now dealing with a very low-level auditing result. Believe me, it makes – awfully spectacular to somebody who's going along and had headaches, headaches, headaches, headaches, all his life, to cease to have this headache. That's very spectacular. So this looks fabulous as a result, see. This looks huge, as a result.

Well, it's a result, compared to the retain... attainable results don't you see, like – so you can feed him some cereal, or you can – you can look at a tree. I mean, there – it isn't anything spectacular. And unless you cease to regard it as a miraculous thing, you see – it's – if you cease to – you have to take it out of the religious tradition entirely, although it – healing probably belongs more securely in religion. You have to take it out of the tradition that religion has assigned to it. Which is, this fellow was a saint – I don't care how much you let the public believe this, that's beside the point. This fellow was a saint, man, he was – he was terrific! Magnificent. Fellow just marvelous! Cured boils. [laughter] Pure, pure evidence of his godliness. He could cure boils. That's the religious tradition with regard to healing. And you just have to stop regarding it with that much awe. Because it's not that complicated. And it basically also is not done by feeding him some more illness, spoonful by spoonful. [laughter]

He will bust out in lots of side effects, because to cure him you're keying in something else. This fellow's had suffering from these two cycles of action. See, these – out... these are – these two steps on the cycle of action. First, he had to determine it. But that may be in such an unthinkably long past that we don't want that much to do with that. Next, he had to do it to somebody or something. And then for him to mysteriously get ill and not recognize what it is, he has to receive a key-in. Something has to be done to him which restimulates it.

Now, nothing violent has to be done to him, so it might be something quite mild has to be done to him. I wot an experience that was happening to me. I used to have – when I was a

very little boy in this lifetime, I used to have sore throats around my grandmother. And she used to sing – whose song is it, "The Little Toy Dog... is covered with rust..." you know, and "the tin soldier..." you know, that sort of thing, whatever the quote is on the thing, very sad song! She'd sing that song to me. Well, she wasn't giving me a sore throat, but she was sure as hell kicking in a picking up a baby in 1870, and having his heart stop beating and looking up and seeing a little toy dog sitting alongside of his crib, see. Gave me a good sore throat. Got the idea? In other words, there was an action, don't you see; there was a symbol, which represented the event. And here is the symbol mysteriously reappearing in a song from a beloved person.

So you see, you're not looking for violence. You're just looking for a key-in. And it may be anything. May be anything.

Well, the first two of these things – the first one, that is the business of Class V, VI, VII, those, particularly Class VI. And that is such a restimulative process that a sick person probably couldn't do it. Whole thing is a defeative action, trying to handle this. I notice some of you, every time your pc doesn't feel well, reaching for an L4, now it's called – it should be called an L6, ARC break assessment sheet, to get his GPMs in order. That's pretty heroic! That isn't what you should be reaching for at all. As unless you're going to run him out, the only thing you can do is pull him out. If you're going to run him out, all right. That's Class VI, man. And that's the whole operation, not devoted to illness, believe me. That's the whole operation from one end to the other. That is a full, complete overhaul. You jack up the car and put a new one under it. Nothing to do with healing. So you can just cancel out all of your handling of GPMs, implant engrams, all this sort of thing, all running this kind of thing, and what you've been calling case analysis on the thing, and getting that to cure somebody of – just knock it out, man. Has nothing to do with healing.

You can do some remarkable things with it, with a very advanced auditor, who is probably all ready to do so, and the other day I handled a PTP – here's a little two-bit PTP – by simply finding the GPM that was causing it. But this on a pc who has practically a complete line plot, you see. This person's already on the way. So you don't – you don't fool around with those things. Those are basic causation, see. You'll find all this basic causation lies in that particular line. But you don't want anything to do with that in healing.

Now the person, in doing this to somebody else, probably did it so long ago, and it is so far off course of any current activity at all, that to get the basic overt on the track is equally – well, actually it's something you would probably never do now – I mean, you probably never will pick up the basic overts on the track, you see. There's no point, once you've got the first postulates out, why pick up the overts that keyed them in? But you can pick up the key-in of the overt.

So we've got another factor going here, of a subdivision under the heading of key-in. So there's another kind of key-in. He does another little overt that keys in the big overt, see? So there's the big postulate followed by the big overt, so you get it up into PT, present life sort of thing, where he got this little tiny, little tiny thing done to him, where he got a little tiny overt. And you can make people well with just handling those little things. Yeah, it's all whisk broom stuff. You don't even have to know the basic postulates, you don't even have to know

its complexity. You don't even have to know the basic other-life way-back-when overts. These you don't have to have anything to do with at all! To make a person well it's only necessary to bail him out of his key-ins. And mark my words, for Homo sap, you better not try to do anything else than just bail him out of his key-ins.

What would spoil you as an auditor is to find this occasional and rare bird whose lum-bosis suddenly disappeared because you found the first Helatrobis on him or something. See, that would practically ruin you, because after that you'd be looking for the heroic. Now you see, you're perfectly right as an auditor, perfectly right as an auditor, to know that there is a great, big postulate, miles wide, broad and deep, which is attainable on this case. You're perfectly correct in assuming that there is such a thing on this case. You know that instinctively because you're always going for it. You're perfectly correct, you're perfectly correct in assuming that there's a great, big, huge, overt act, on the backtrack, you know, he burned a civilization down or something. You're perfectly correct in assuming this. And because you down deep yourself know this, you have a tendency to go for it to get out prime cause. You're not going to do that, by the nature of a case, and by the thousands and thousands of hours and years of research done on this very subject without doing a whole Class VI-ectomy. [laughter] That postulate's too big, it's too tricky. Its anatomy is too huge to be handled with the whisk broom that you're going to audit somebody with.

So the only thing you have to do is to pick up the key-in. Whether the key-in is an overt, or what, we don't care. But all you have to do is pick up the key-in. And you try to pick it up as close to present time as you can. You don't try to pick it up as early as you can – you try to pick it up effectively as close to PT as you can.

Now, someday you're going to be very unlucky and you're going to find somebody with chronic twistosis, who didn't get it keyed in in this lifetime. And now you're going to be in a little bit of trouble, and you're going to have a very protesting person, and you're going to find yourself suddenly slopping over into 1861.

I did this one time, a polio case, ill at two years with polio, and it dived instantly and straight back to about three lifetimes ago, in the middle of the nineteenth century. And that was one of the most unwilling, screaming pcs I ever had anything to do with, because it was of course by that time jammed up so that it was quite painful. Pc had no reality on any other lifetime, and yet any time the pc tried to give me anything about it, why, this other incident would come up, which was over a hundred years ago, you see. It'd practically been keyed in solidly continuously ever since. It was an unlucky break.

The way to take it apart was to pick up the key-in closest to PT that could be picked up. He'd even pick up the key-in of the key-in. You understand? Not to – the big key-in was too tough. Pc was going straight back to it, straight stuck in it, there they were, bang, and he couldn't do anything else, move him out of it, apparently moved him out of it and so forth, and the proper course of action there was to pick in a key-in – up a key-in of the key-in. Or pick up the latest overt on that subject. The latest overt on the subject might be – you see, this is all softly, softly, see. This is all quietly. This is all with the feather duster. You're perfectly correct in knowing that there's a target there, very suitable for eighteen-inch guns. See, you're

perfectly correct in this. But you're not correct in the field of lower-level healing in going for it.

So, if all I could teach you, if all I could teach you was just this: that yes, there's a great big postulate. Yes, yes, yes, yes, great big postulate. Oh, yeah, tremendous experiences that go back over God knows how many years, yes, yes, yes, they're all there. Yes, there's overts there that made that postulate backfire and gave him a switch of valences and all that sort of thing. Yes, yeah, oh definitely, yes, yes, yes. That's there. We agree with all this. And then teach you all we want is their key-ins, and the lightest key-in of that that we can approach. And that's all we want. Then I could teach you to heal.

Because healing is not in actual fact a very high-class activity, in spite of the fact that it has so much relief. Now, compare the fact that, "Well, I cured her bunions," as a statement to "I restored a being to his full intelligence, ethics and power," I'm afraid that's far more god-like. See, they are not comparable activities. But if you know that about healing, if you know that about healing, and know about what this field consists of, that it's the thetan versus the body, in his own worries anyhow, and you do it lightly, why, then I could open the door to that degree to show you how to – well, just heal anything you walked into. But if I – if I can't teach you that and make that one point first and have you understand that and think it over and look it over, understand it thoroughly, then you get trapped into going for prime postulate, see, on the subject. You get trapped into going for the dramatics of the prime overts, you see, and so forth, and your – you as a Scientologist could probably make it. But not the guy you're auditing. And you won't heal.

That's the first thing to learn. Now, you can see that that must be a very interesting lesson, in view of the fact that practically nobody in the field of healing has ever learned it in the history of man. See, so it's not much of a lesson, it looks that at first glance, but just let me call it to your attention that it really has never really come to anybody's attention. There's a little mention here or there, perhaps, amongst the various records. You could probably find something of – you shouldn't use such heroic methods, you know, that sort of thing – but it's the very, very lightest of the methods that succeed. And these heavy ones such as, well, fellow has a headache all the time, well let's cut out his brain. [laughter] Well, those fields are not successful. Because that is the physical effort to get to the ultimate postulate simply being dramatized by the healing practitioner.

Of course, you being smarter and better educated as to what there is there to reach for, have to practice in actual fact a little more restraint. Because you know what to head for. You say, well, "This guy, this guy looks like he's had his head bashed in. I wonder whose head he bashed in..." see, "...on the backtrack. All right. Whose head did he bash in? Oh well, let's see, let's go back, let's get it on the meter." All right. And so on. "Now let's find the first head he ever bashed in." You'd probably get it, too, see. And he'd have his head bashed in all right. He'd have it bashed in completely when – time you got through, because you could handle it as the auditor, but could he handle it as the pc? And you'll probably wake up at the end of the thing with finding the other side of his head is now bashed in. He wouldn't have made the grade. Your proper course of action is not withholding yourself from doing so, but just understanding the basic mechanics of how that thing is keyed in. And then taking out the little bits that keep it keyed in and the mystery of it all is why it all drops away and will key out.

That's the miracle. How come it can be keyed out as thoroughly as it can be? And yet it can be keyed out with great thoroughness. And the destimulation of the incident was easily the thing that will produce your great miracles.

Of course, the fellow's going to run on the backtrack, he's going to get into actual GPMs, he's going to get into the stuff of which life is made one way or the other, he may collide with his own overts and he may not, and when he finally gets back there, why, oh yeah, there was plenty of reason for him to do so, and he's actually likely to pick up the whole somatic, ten times as strong all over again, particularly if you make a little mistake as an auditor, or something like that.

But it'll be gone then because he's in the position and doing the process which is competent of erasure. But he's not in a position to do that when you first find him, so the field of healing will remain a closed door unless you find out that it can be done lightly, on tiptoe. Lightly.

Thank you.

SUMMARY OF LOWER LEVELS – CLEARING AT LEVEL IV

A lecture given on 10 March 1964

Well, I'm glad to see you looking so well. What's the date?

Audience: March the 10th.

March the 10th. Ah, well, 10 March AD 14, Saint Hill Special Briefing Course. And you today are going to hear a summary of lower levels and clearing at Level IV, in which you will be very interested indeed.

Now, I've been beating my brains out – not being inside them it's a fairly painless activity – trying to find out how, how – having shot the moon – we got our feet back on the ground.

Now, there has to be some bridge between 0 and V. Obviously V is becoming the catchall level by which the individual picks up and refines all of his knowledge of the mind and so forth, in order to kick off into the astronomic altitudes of VI. We have made the gun in VI, that's – that's there. In fact, I don't know of anything very much you have to do in VI.

Well-trained, this is very easy. Untrained it's impossible, see. And so having shot the moon, what's that leave you? Well, it's – I think Alexander, an old-time enemy of mine – every once in a while somebody comes along and says, "I'm Alexander the Great," don't you see, or something like that, or "I was Alexander the Great," something like that. They don't quite realize the hair going up on the back of my neck, don't you see. Because he got to a point where he had no more worlds to conquer. That's the traditional contribution of Alexander the Great to literature in history. And he had no more worlds to conquer, don't you see. Well, that's great. But he might have figured out how you got from Greece to India. When he got to India there were no more worlds to conquer, that's for sure. But had he conquered anything from Greece to India? That was the question. And he went and sat down in a royal palaces of a satrap and pined away, hadn't realized that he in actual fact had not conquered up to the point where he had no more worlds to conquer. Because that empire fell apart like a bunch of confetti at a wedding. And it was gone and in the dust in very short order.

Why? Well there was no way to get from India to Greece or from Greece to India. That's the fact. So he never made any bridge. He not only had no more worlds to conquer, he hadn't conquered the one he was living in. So we're in danger of getting up to the esoteric levels of VI and looking around and realizing we had no more worlds to conquer and that leaves thirty or forty of us as OTs and that's it. That's the end of the push, don't you see.

In the first place, you can't take somebody off the street up here and say, "All right, this is the way you go about it. You do this list, see, and you take the meter and when you get rocket reads and so on, why, you null that thing out and then you plot that on a goals plot as the actual GPM, and so forth, and then you do its opposite, and so forth, and then you add twenty-one and so on, and that's all there is to it." And I'm afraid about this time he'd be standing there with his jaw dropped.

Scientology progresses on reality. He's not in a position to recognize any part of an actual GPM and so he's really not about to get any reality on Scientology. So the lower levels is the contest of achievement of reality. It's not really the contest of making somebody better. It's the contest of achieving the stepping stones of reality. Of course, at Level 0 you're taking somebody who doesn't even know the world's here.

Reminds me of the position I was in when I was four, five in this lifetime and I used to look around this great bowl of the hills up in the Rockies and in a dim sort of caved-in way wonder, wonder if there was anything beyond those hills, don't you see? Very dim wonder. Not sure, not sure, just – just wondering. And that's all very well, but so is this guy. He looks at his kitchen and at the environment of the job where he works and the wrath of the boss and the inclement weather of his wife, and it's like looking at this bowl of hills, you see, "Is there anything beyond this?" See. And he isn't at all sure that there is.

Well, unless you can show him there's something beyond that he's never going to take any step further. You've left him in that little depression of hills and that is that.

How do you walk him out of there? How do you get him from that point to some other point so that he can take off? Because, believe me, he must be walked from a point of no recognition of reality, to a point of some recognition of reality, before he can take off to an ultimate reality. It's done by gradients. One of the oldest tricks that we have and it's quite peculiar to Dianetics and Scientology – the idea of a gradient. Doing it a little bit at a time.

You jump too big a step in a gradient and a person goes unreal. Now, I was studying unreality the other day and I found out that unreality was associated with charge. Charge and unreality are the same thing. They are the same. If you overburden somebody too heavily with a bunch of suppresses and that sort of thing, he is incapable of understanding an RI. Be a perfectly obvious RI – the auditor sitting there, "Does 'to be hungry' bring about 'to eat'?" See? And the auditor's looking at this, "*Hah, bvo, ba*, of course, 'to be hungry' brings about 'to eat'," yeah, so what. And the pc now has invalidations, suppress, overcharge, he's sitting in the middle of the rat race, and so forth, and he says, "Well, 'to be hungry,' well, 'to eat'. Hmmm. Well. Let me see, let me say that over again to myself. Would 'to be hungry' bring about – I don't know. Let's see, to be hungry, what's that... and so on..." Wildest thing you ever wanted to see.

Now you get the suppresses and the invalidates off of these things and all of a sudden, why, he says – you know, you get it straightened up, get the burden off of it – and he says, "Well, 'to be hungry' bring about 'to eat'. I mean that's – what's so hard to understand about that?" But just a couple of moments before by reason of overcharge, in other words, too much – too much charge, too heavily burdened – he's a fellow with a ton of coal sitting on his head, don't you see, and you're asking him to look around and see the environment. And of course

he can't see out through a ton of coal. You move the ton of coal and he says there's an environment, see.

It's very funny, I mean because you can take the pattern items at Level VI and just throw your mid... your session ruds out badly on them. And the pc won't understand them. It's an interesting clinical study of understanding. Understanding then is directly related to charge. And a person who has too much charge on his case can't understand. Therefore, he doesn't have any reality. So an overcharged individual is incapable of achieving a reality. And a reality is necessary to the understanding and gradient steps that he has to take in order to go totally free.

Now, do you see what binds him in? Overcharge. His wife's always yapping and yowling at him or her husband is always yapping and yowling at her, don't you see. Here we've got yap and yowl. And we've got this and we've got this and we've got worries and so forth and all of that sort of thing, and finally people under those circumstances will do the stupidest things, see? Because their environment's too heavily charged. It's the actual active environment in which they live, it's too heavily charged. And they can't understand beyond that point. Their understanding is swamped. And of course they don't understand it either. They don't even understand they have a wife or husband. It gets down to that point. What is a wife? They will go around mutter, mutter, mutter to themselves, you see, "What is a wife?" "What is a man?" you know, mutter, mutter, mutter, mutter. It's just too heavily charged. All caved in on the subject.

Every once in a while, you'll see a couple go get married who have been fighting consistently and continually, see. They didn't do nothing but fight and worry and worry and fight, and fight and worry and worry and fight, and one day they walk down and get married. You say that's a stupid thing to do. Well of course, they've created themselves a mutual environment of overcharge to such a point they have no comprehension of what they're doing. You see that? If you want to see somebody do something silly, why, start piling up the charge on him. Give him lots of conflict. Give him lots of duress. Give him lots of this, that and the other thing. He'll do something silly. I didn't really – wasn't really at that moment trying to explain to you the workings and functions of an army or a government, but if it applies, apply it.

Stupidity then comes about from charge. What do we mean by charge? We mean it's unreleased masses of energy. Unreleased, unresolved, stored masses of energy, that's charge. It's no more than that. The significances aren't – don't enter into it. You get somebody to sort out his problems by significance and he's likely to not solve them. Because in actual fact it's his overcharged environment that is making him too stupid to solve his problems.

And we've got an awful lot of stuff in getting this bridge together between 0 and V – we've got an awful lot of stuff that's quite miraculous. And we've done an awful lot with it. And it's quite surprising what we have managed to do over a period of years with this material. You yourself know you can do this or that or the other thing with a pc and very often it works quite marvelously, don't you see, and you can do all kinds of oddball things and so on.

What's straining you is an effort to attain a consistency of result. That's your main worry: consistency of result. Joe, Bill, Pete. Now how do we get Joe, Bill, Pete bailed out of

it. Well, obviously we've got to get a result on Bill and then when we've done that get a result on Joe and then a result on Pete, don't you see? We've got to get a consistent result. And what breaks an auditor's heart is to get a beautiful result on Bill, no result on Joe and make Pete sick as a dog. See, that's an inconsistent result. So therefore, to get a consistent result you would have to deal with the common denominator of difficulty with Joe, Bill and Pete. And attack that common denominator, not the individual difficulties of Joe, Bill and Pete. You see how you could achieve a consistency of result?

Now, you see unless we can achieve a consistency of result on the Levels from 0 up through to V, unless we can achieve some consistency of result, nobody will ever make the bridge. So we're posed – in putting in the processes and activities of an auditor, between 0 and V – with the problem of giving the auditor a consistent result and enough result to bring about not only a reality on his own part, but on the part of the people he's processing – a mutual reality on the situation – in order to persuade them on forward.

Now if the thing that is making them stupid is charge and if this is the common denominator of no bridge – overcharged environments, overcharged individuals, the guy hasn't got a reality on something because he's just too plowed in, don't you see, he's got too many tons of coal on the top of his head – then it's quite obvious that what we have to charge and attack at those levels is this matter of charge. We've got to make somebody brighter and we've got to get him to be able to see further and we've got to get rid of, of course, some of the things he's worrying about. And then we would achieve it.

So that the only thing we can do – the only thing we can do – at Levels 0 on up to V, is get rid of charge. But in view of the fact that the basic charge on the case is the actual GPM, and as the person at that level – those levels – is incapable of attacking those – and that is said very, very advisedly, they – I mean very factually – they're not capable of attacking these things – and if that's the basic charge on the case and if we can't get anywhere by putting the pc into it but trouble – and believe me, we are going to get no place but trouble if we try to put the person into it at those levels before he's ready to and before he has any education on it – why, then quite obviously what we want to do is bail him out of the charge rather than get rid of the charge. So we have Level 0 to V devoted – that's up to V, that's not including V – 0 to IV inclusive – devoted to destimulation. The skills of destimulation. Which is to pull the pc out of the charge, not try to erase the charge.

A certain amount of erasure is bound to take place – bound to take place. But if we're concentrating on destimulation we will be achieving the same ends. We're getting the individual out of these masses of charge. So what we're really attacking at those levels are key-ins. We're trying to destimulate. So obviously Level 0 to IV inclusive, which is up to V, are addressed to the whole subject of destimulation. We're studying destimulation. Now, what do we mean by destimulation? Well, we're trying to knock out the key-ins that keep the charge pinned to the individual. We're not trying to destroy the charge or get rid of the charge. What we're trying to do is bring the individual out of it. And that is an art of a very high order.

We're trying to pluck the individual out of the roaring whirlpools of energy by tripping those little items which keep him connected to it. Now we're not going to restimulate anything until we get up into actual GPMs and then we're just going to throw him to the lions. Then he

can get rid of all of the charge and as-is the whole ruddy lot of it. Because that's all contained in one process – R6, see. And that's a – that's a completely rounded up proposition.

But the funny part of it is, the individual with all of his restimulations pinned together, is in actual fact incapable of recognizing an actual goal. So, if you take the actual goal and pile on top of it all of the key-ins, trying to get the individual now to recognize the actual goal is going to be very difficult indeed. So the right way to go about it is to pull the individual out by disconnecting the key-ins, pull him out of the actual goal, let the whole thing subside and then at Level VI shovel it all off into the gutter. You see that as a different proposition?

Now, if an individual standing on a pile of coal looking at a lifesaver – let's take a lifesaver and put it on the concrete and then put a ton of coal on top of it and then put the individual on top of this pile and say, "Now, all you've got to do is pick up that lifesaver." And he says, "What lifesaver?"

"Lifesaver right down there, of course, you idiot!"

"Where?"

"Well, you see, really, it's underneath the coal."

"Well, I don't see any. Well, I'll take it on faith."

All right, let's do a list for the lifesaver. Let's do this for the lifesaver, let's do that for the lifesaver. You can't find the lifesaver. Why? Well, now, that's not too perfect a metaphor. But, here is the position you find the individual in. You could get him back to a point where that pile of coal wasn't all piled up. But if it's subsided and lay across a low level – was only a couple of inches thick around the lifesaver – he could see the lifesaver. Then by getting the lifesaver, if you could imagine that the lifesaver would hold the coal there, the moment he grabbed hold of the lifesaver all the coal would disappear, then you've done the trick, don't you see? But that's what you're up against. If that ton of coal represented all of his key-ins and his upsets, why, he isn't going to get anywhere close to that lifesaver. Now that's perhaps not as smart a graph as I could make you on the subject, but it tells you what you've got to do with an individual.

Now, if an individual can be in the midst of an actual RI at Level VI and not understand it, merely because of some session invalidation, so forth – the auditor overlistered and the guy didn't think it was it and they found it once and they abandoned it and then they came back and picked it up again and suddenly he can't understand it. And then we brush off a couple of suppresses and destimulate its connection with the session, you see. Now, he all of a sudden can understand this RI and it blows. One has to understand RIs or they don't blow, because of course they are not in printed English. They're a thought. And a thought requires understanding.

Now, in view of this, if an individual can do that in the middle of a session, on an actual RI, what do you think he's going to do in life? These GPMs and the whole track and that sort of thing are so jammed up and so locked up with everything under the sun, the individual with his attention, gruesomely and howlingly concentrated on some little – not even a pile of coal, but concentrated on just a lump of coal – well, you've got to show him he can do something about the coal. He can do something about it. And he gets a big reality and a hope factor

and his confidence resurge on this basis: that if he could get his attention off just one lump of coal for a few minutes it would make him feel so different and so interestingly alive compared to how he has felt that now he gets a big upsurge in reality and you can get him to tackle four, five lumps of coal, see. You got a gradient. You got a gradient by which this can be done, see. And it's a matter of confidence knocking out the charge, destimulating him so he is brighter and so forth. And that's the problem between 0 and IV inclusive.

How do you do this? Well, you take this individual and he's so mired down in the middle of his family or his job or his social security work or something that he hasn't got any time to do anything and he can't even lift his eyebrows long enough to do anything and he can't spend any time trying to get out of this, he's just barely able to hold it at bay. It's like – he's in the same frame of mind of – you're trying to sell a lion tamer a padded suit, you see. And he's fighting forty lions, forty, and they're all about ready to come off of their pedestals, you see, and the chair's broken by this time and he's running out of blank cartridges. So you say, "Hey, I'd like to sell you this suit," see, "It's – it proofs you against being chewed." And you know he wouldn't pay a bit of attention to you. He can't take his attention off these lions long enough. Well, the thing to do – the thing to do, of course, is to take the lions – the immediacy of the lions – away, lion by lion. And then he begins to get the idea that maybe he doesn't need the blank cartridge pistol, and so forth, and you sort of play it back and forth and you destimulate his environment.

Now, an environment can itself be a present time problem. That fellow who was being charged for murder and who was going to be sent to the electric chair is very, very hard to interest in much of anything. He's – it's like the fellow who is going down a toboggan slide or like one of these – one of these Swiss ski runs that goes ninety miles an hour – right about the middle of the run you can't unload, see.

So there is a point of an individual being in – so involved and his environment so charged, that there isn't anything you can do about it. So the first level of processing happens to be – and this of course would not include all cases, but it's the most extreme case, which delivers it into your hands – most extreme case is the unconscious person, they've just gone down for the third time, you see – but that one point is, is you have to remove the person from his present time environment to some degree. And you'll find out that if you're ever called upon to handle the insane, the removal of the individual from his environment which is restimulative and overcharged, and giving him a nonrestimulative environment where nobody is bothering him, and where he can get some rest, will be your best route. You do very low-level processing.

Well, you say, well, some of these blokes are going to sit there and starve to death and they won't eat and so forth. Well, I think they're probably not eating because they're under such duress that they may be treated or they have to answer questions or something like this. You look around and all you do is keep removing charge from the environment, to the best degree you can. So some of them starve to death. Well all right, they go through the between-lives area and pick up another body. There's your lowest level of action. In other words, this is giving somebody a nonrestimulative, relatively so, environment. Removing him from the restimulative environment. Well, that's a pretty low level. But it exists as a processing level.

Now let's go from there – let's go from there – and we will find the individual is now so engrossed in his present time problems that he is obsessively solving everything under the sun, moon and stars. And he's just obsessively solving his present time. And his solutions are so pyramided that you don't dare touch any corner of the pyramid or you'll get a collapse of the lot. And you find out that that quite commonly states the average person in the street. You find the housewife going to market – if you were to walk alongside of one and say, "Now what are you thinking about right now, what's the stream of consciousness going through your brow?"

"Well, if I do this – and so on – I could get Johnny's – so on – and then I could do the – so on and so on and so on – and if I could save us a little bit of money out of the grocery money why that'd give us – *waf, waf, waf, waf, waf, waf, waf* – and I might be able to get that new dress if I could get Mrs. Jones – *waf, waf, waf, waf* – and if that *waf, waf, waf, waf, waf, waf, waf, waf*."

It's just a wild string of solutions. They're going on and on and on, one right after the other, solve, solve. Well, now you can come up to your lowest level of actual processing on the basis of its on solutions. Tends to take over that automaticity.

I'm just showing you the scope of something – I'm not giving you the fixed form of these things, I'm just showing you what could be done, see.

And now – now, let's look at the first – what in actual fact would be the first processing level that would – you would really saddle as an auditor, as a pro, that you would call processing. And that's your repetitive question or your objective processes at Level II. Now right up to this point – up to this point – you are not confronting... we, of course, have bypassed assists and so forth, there are other processes that do things at those levels which, of course, assists is just acquaintance, familiarity with the thing that hurts, or something, or where it was hurt.

But when you get a repetitive process, HQS level, now, that certificate – what is the bug from there on up that might make processing dangerous and that would give you loses. And that is the question your old man here has had to – had to answer and it was answered in this fashion. What isn't in an actual GPM? See, what isn't in an actual GPM? Is there something that isn't in an actual GPM that could be processed with impunity? And there is. There is something that isn't in an actual GPM, and that is a noun or a pronoun.

Now there are some pronouns in actual GPMs – there's such a thing as "myself," there is sometimes "I," and – but they're part of the wording of a goal, so pros... pronouns are not absolutely safe. But at Level II you're so far from the actual GPM you could probably use them with impunity. You're at such a distance, there's so much coal between you and it, and these things only form a very tiny portion of some goals that there's no reason to debar them at Level II. But as the pc progressed from Level II on up, I would begin to get wary of using a pronoun. And I'd begin to get leery. Because you do have to – "to help myself, to forget myself," things like this, don't you see; those things do appear in actual goals.

But aside from that, one little observation: There are no nouns in actual GPMs. None! There is – nobody has a goal "to be an assassin." Nobody has a goal "to be a God." Nobody

has a goal "to be a wife." Nobody has a goal "to be a goddess." Nobody has a goal "to be a criminal." They are not actual goals, see. And nowhere in it do you have a terminal, "a sultan" or "alcohol" or "cats," "kings" or "coal heavers." See, nowhere. There are no such terminals. There are no such opptersms. There's "-nesses" and "-ities"; there's "nervousness," you see, "ability." There's things of this kind, you see. The adverbial and adjectival nouns are present, so you don't use those: "-nesses," "-ities," "-ions" – "communicat-ion." "Think of a communication" is liable to be sending you right straight down the route toward an actual GPM. "Think of a communicator" and it wouldn't. Got the idea? You could process with absolutely – impunity "an assassin." You could prepcheck it, you could run brackets on it, you could do almost anything you ever heard of in the way of processing on the subject of "an assassin."

And we suddenly come to why the 20th ACC made Clears and the missing secret, why it wasn't general: it's because nouns were processed on brackets. Accidental, see. So you'd actually key out actual GPMs. Because "an assassin" might very well be the hundred-and-fifty-first lock on an actual RI, "death." So the individual's alert to this idea of an assassin. All right. "On 'an assassin,' has anything been suppressed?" Here we go. Fine! What are you going to do? You're going to key out that actual GPM. Destimulation. All of a sudden it's over there and the pc's here and his needle's flopping. *Interessante*, huh?

Well, now listen. What is an actual GPM? What is an actual RI? Completely aside from the other considerations anybody at Level IV – and this is what I'm teaching you today is Level IV – should at least know that these things exist and they are a mass with significance. Now that's really what you have to know at Level IV what they are. They're a mass with significance. That mass is very big and massy, too. And the significance is very significant. But they are mass with significance. So therefore masses with significances key in actual GPMs. What is the key-in of an actual GPM? A mass with significance.

What is a mass with a significance, aside from being an actual GPM? Well, I don't know, a man is a mass with a significance. A fireplace is a mass with a significance. A house is a mass with significance. A tree is a mass with significance. A desk is a mass with significance. A room is a mass with significance. A piano is a mass with significance. E-Meter, that's a mass with significance. Easel, that's a mass with significance. Pencil is a mass with significance. And every one of them is a potential key-in of an actual GPM or an actual RI. You's walkin' around in present time that is just full of restimulators! You's haunted! And I think we know now why everybody is in present time. [laughter] It's the most haunted area.

Now, you think it's a significance that keys in the actual GPM. No. Of course, if you've got an actual RI that's – has "communicating" or something like that as an actual RI and somebody says that to you often enough, I can guarantee that it will key in. There is no slightest doubt about that! I don't think it'd be very safe to process, because the individual's going to go down, but he hasn't got the actual RI – he probably even hasn't got it quite correctly worded. So if that was processed directly you'd have trouble.

Supposing you had an actual RI "help" – and there is such an actual RI. "How could you help? How could I help? How could you help? How could I help?" Cut your throat, man! You're slamming him right down the chute and the next thing you know he's going to be in the middle of a goal which is not in sequence, not his present time GPM; you haven't got the

goal that goes with it; you've got the pc now into an RI; he's going to turn on some somatics and he's going to have a ball. He may have some fever and chills to go along with it.

Well, how's the process become at all safe? Well the lowest level of safety on such a process is, "How could I help you?" and "How could you help me?" And it's the "me" and the "you" that salvages it. Why? Because it's a mass with significance. But you normally don't look at the pronoun as a mass with significance. See, you tend to forget it. Now you think it's "help" that's doing all this. We don't know that it's the "help" doing it at all. We might get just as much bang out of the process by just running "you, me, spot you, spot me, spot you, spot me," don't you see. Because you've got mass with significance.

Now, I'm not advising this as a process. I'm simply giving it as a sample of process, is "Recall a terminal." Terminal, of course, is mass with significance that is capable of receiving, sending or relaying communication. Boy, aren't we back into the old days when we were giving forth with this kind of stuff, see. "Recall a terminal. Good. Recall a terminal. Good. Recall a terminal." Why does old ARC Straightwire work? Well the laws of life of course are senior to the GPMs. We have laws of life which are not dictated to us by actual GPMs. We've got the laws of life which come about and make actual GPMs. And we had already entered it at a higher strata than that level, fortunately for the lot of us, see?

Now, the law in which we're involved there is that ARC Straightwire worked as long as it had pronouns. "Felt some affinity for someone." "Communicated with *someone*." "*Something* was really real to you." Now what were the little hidden bugs in those process commands? Those things were chosen empirically. These, out of a great many commands, were found to be commands that were workable. And I'd never sorted out of them exactly what it was that made them work. And we turn – turns out to be the "*something*," the "*someone*." That was the workable aspect. Isn't this fascinating.

Therefore, you can prepcheck a mass that has a significance. You can run it in brackets. You can add up other commands and significances to the auditing command, as long as it's there and you're running it. Now Level II, we don't have any assessment. So how do we get the auditor across this band? Well, objective processes of course, having him touch a wall, is a mass with significance, isn't it? And the control and the communication and the havingness involved in the action contain principles of life that are senior to actual GPMs, so those things added up – control, communication, havingness – added up to the mass with the significance, which is a wall, gave us 8-C as one of the highest level workable processes we ever had at that level, see. Isn't that interesting, see? But it was the wall. That was basically what it was, it was the wall. The mass with the significance.

That wall was very likely to key in actual GPMs, see. So when you got him familiar with the wall, the wall would key out. The actual GPM would resi... would – would go away, see, destimulate. Die down.

So, because you can't do – there'll be other devices of this sort of thing – because you cannot expect anybody at Level II to assess, therefore, can't expect them to assess, so therefore you would tend to depend on pronouns and objective processes such as walls and so forth to give workability to processing. You'll find things will get very real to this fellow. Level I, the basic mass with a significance that he gets familiar with and begins to trust and so forth is

the auditor. Somebody to listen to him. And that's all you could really expect him to do at Level I, was just get – get the idea there was an auditor there or somebody he could talk to.

But Level II you could introduce other things like "them," you see, "someone," "something," and add some significance to the auditing command, and then you've got the regularity of the auditing command helping you along, too – the repetitive nature of the command you see. Because your auditing cycle is in there, working. And very probably the best process at Level II was the process which is never noticed at Level II, which is simply the comm cycle. You ask a question the pc can answer, the pc does answer the question, you let it – making sure that he answered the thing completely and you acknowledge it, see. It's that cyclic action which is the process which makes Level II.

Now, how come – how come "auditor"? Well, an auditor's a mass with significance, but an auditor's a lot more than that. An auditor is apparently senior to masses with significance, see. An auditor carries hope and aliveness, and so forth, along with it. This is something new. Something different.

So an awareness of just the existence of such a person, and so on, is terribly therapeutic. A friendly mass with a significance that will give him a hand, see? That's all. Well, that tends to take the curse off the horrible masses with significance that are around, see. Here is one mass with a significance that is not an enemy.

Now, the nature of this universe is a two-pole nature. This is a two-pole universe. Ol' Bucky Fuller was sweet enough to come over one time and give me a lecture over in Elizabeth, all by my lonesome. I was very appreciative of that. Taught me a lot. Two-pole universe. Singles can't exist in this universe. Doubles can. And we look how thoroughly that is, we get the principle of the motor. Motors. Motors don't operate unless current is circulating between two poles. And those two poles have got to be fairly close together, but if the current can circulate between two poles, pole A and pole B – and you girls don't have to know anything about electricity, you probably know more about electricity anyhow than I do, because I've laughed off most of man's science, in the field of electricity. It's too incredible!

I ruined a whole university education on the subject for Mary Sue. She was utterly betrayed. I happened to remark to her one day that man had never seen an electron. See, he's seen only the manifestations that one might exist. But he has never seen an electron. And he really doesn't know what the pattern of them is and he really doesn't know what molecules are – these are all assumptions. And it was such a terrible betrayal that she threw away all of Rice Institute and the University of Texas into the wastebasket. Was very upset about this, because she'd had to memorize exactly how they looked and how many sides they had, you see, and how much they weighed and all this sort of nonsense.

Well, man does know that these things exist by third- or fourth-rate evidence, you see. But he's just guessing what they are and that he hasn't guessed right is obvious, because he has no flying saucers. See? He really has none of the energy devices that he should have. For instance you – to really get somewhere in a civilization you've got to have power – little packages of power of some kind or another. You don't want long cord dragged out, you see, a hundred and seventy-five yards of cord, with a fellow with one drill on the end of it, you know, everybody falling over this cord. Impractical. And he really has no source of power, so

he can't know very much about electronic structure or molecules or anything of that character, otherwise he'd be able to convert it to power, see. Costs him I don't know how many million bucks to turn over the wheels of one atomic submarine once, you know. And, I think they feed them pills, at relative intervals, and somebody told me – I was very surprised to find out that they only cost three or four times as much as fuel oil.

Of course in space opera one gets used to a little button one slides into the side of a gun that runs the gun all year, you know. Blows mountains down. But – packaged power. So don't be too upset because you think I am asking you to suddenly understand man's scientific – ha – equations in the subject of electronics and electricity. I'm not. I'm just asking you to fall back on the fact of just one thing, that every time you see a motor or any interchange, and so forth, it's got two poles and these two poles are standing there side by side, and that there's a magnetic interchange between these two poles. And as long as these two poles are rigid and don't collapse, why the push-pull in between those two, you can do things with. But it takes two.

Now, to give you how simple this is: take a single electrode on the E-Meter and hold the single electrode, but let the other electrode go to blazes and see if your meter reads, see. And your meter isn't going to read, see. And then take ahold of both electrodes and you'll see that the meter reads, both electro – I'm not talking about a single-hand electrode. If you get a single-hand electrode, it has to be split in the middle. You've got two poles in a single-hand electrode. So you have to have hold of two cans in order to make the meter read. That's to complete the circuit. Well, that's an evidence of the two-pole nature of this universe. And that's all there is to it. And things don't operate one on one – well on one pole. Now I've put myself over the jumps considerably to find out a little bit more about this and solve this a bit better in the earlier – well, I guess it's only a month or two ago. And I sat there with a one-hand electrode – double pole, one-hand electrode – and ran me out a whole actual GPM. It wasn't too gruesome an experience, but I had to find out if these things could be self-audited. And so forth.

Well you can plot goals yourself. I had to find out, see. Because you might get parked on Exnoo, or something of the sort and how – what do you do about it, you know, if you haven't gotten it cleared up and so forth, what does somebody do if he hasn't got an auditor? Is there a road in that particular line? Very well may be one. You'd probably be better off running them out that way than not running them out, you understand? I mean it's that – but it's touchy.

But what was different about that session? No TA. I who get lots of TA when audited by an auditor, running exactly the same materials with no ARC breaks, any kind, nothing – no TA! A little thresh of the needle, RI falling about that far, returning almost at once, blowdown represented by the fact that it didn't return from a little slash that big, you see. Usually find a real RI, it's anything from a half a division to a division and a half tone arm blowdown, see. No TA. Well, this revealed – this revealed something. This is a research exercise. I wouldn't wish it off on you. But it revealed that fact: In the absence of an auditor a pc who gets TA doesn't get TA. I consider this very, very interesting indeed.

And I think it actually describes any pc you've got who isn't getting TA. [laughter] I made that point fast, didn't I! You got it?

So the amount of TA a pc gets is proportional to the two-terminals-ness present in the session. If you haven't got two terminals in a session, you've got no TA. If you've got one terminal in a session, you get no TA, see? And if you've got one and one one-thousandth of a terminal, you get a little TA and if you get one and one one-hundredth of a terminal sitting across from it, you get a bit more TA, and you get your highest-flying TA, of course, when you simply had two terminals. You understand? So that we've got the auditor, sitting there, has to be real to the pc for there to be two terminals in the session. Isn't that – isn't that elementary. In other words the pc doesn't have an auditor, he doesn't have any TA.

Now this is not the auditor's fault. This describes the state of case – the native state of case of the pc. It's only the auditor's fault when the auditor isn't remedying it. Well, I've noticed something very interesting in plotting actual GPMs and in engaging in any new action. I can generally start a gradient on my pc, it starts at about forty-nine or fifty TA divisions down for two and a half hours of auditing and then begins to get some TA and goes fairly rapidly – a session or two later you'll find there's about seventy and then two or three sessions later, about ninety and two or three sessions after that has progressed up to about a hundred and three, you got the idea? In other words, here's an increasing amount of TA.

Pc is not introverted now on the newness of this exercise and activity and so therefore is more easily able to have an auditor – you got... less introverted into what's being done and more capable of having an auditor. So a new process to which the pc is very strange is also a factor in addition to the auditor. The pc is sufficiently introverted – he doesn't see his auditor, so to the degree he doesn't see the auditor he doesn't have TA, you understand? He's so – so involved with this mental exercise he's trying to do that he doesn't notice anybody else is around. And then the next session he's not that involved with the same exercise, don't you see, he's a little more familiar with it, so he's got a little more auditor, and the next session why he's even less involved with it and he's got more auditor, don't you see. And so you get a gradual increase of TA independent of whether the process is doing him any good or not.

Now therefore we were... Boy, I'm really dragging them out of the old history icebox here – but therefore we've got our "only one." Remember, "only one." Mind you, today I'm handing you significances and terminals and here's the "only one." And the "only one" gets no TA. Ain't nobody else alive. See. There being nobody else around why, naturally – he very easily assesses on self, by the way. That would be a natural assessment for such a person. There isn't anybody else. So he doesn't get TA. Funny part of it is, he wouldn't have had any TA years ago, either. That's the point you miss. It's very easy for an auditor to miss that the pc has been going through life without auditing, in the condition he is found in, in the session. And very often – very often, the auditor adds it all up that it just happened, just this instant, in the session, the pc is like that now, you see, and he doesn't quite wrap his wits around the fact that the pc's inability to answer the auditing question, the pc's complete driftiness and dispersal and inspecificity on the subject of anything under the sun, has been characteristic of this pc for quite a while. And he is just confronting a life product. This is where this pc has gotten to.

In other words, charge has accumulated on this individual to a point where he no longer understands that anybody else exists. See, charged up to a point where there is no reality on a second terminal anyplace. So, therefore we never get an energy interchange with anybody else. We've got a standing wave – an animated standing wave – walking through the society that blocks all incoming and all outgoing flow. Well, that's how he's trapped. There is his own trap – tailor-made – right where he is at. No flow. Now, he could be stuck on a win or on a series of loses. He could always talk to Joe, but Joe is dead. So he solves this by being in continuous communication with Joe. This, of course, denies him any other terminal. Because if people aren't Joe, they're nobody. See, that's one way it can happen.

And the other way it can happen, of course, is – he wasn't in communication with Joe either. Or anybody else ever, so just the fact that something might tick him a little bit that it might exist, causes him to clam up. It's like the psychiatrically treated patient who had learned through long treatment in psychiatry to keep his mouth shut.

Well, that's what life has taught this boy, you see. You mustn't be there and you mustn't communicate. So nothing else is real. And he is very, very heavily charged. Now, keyed-in are a lot of actual GPMs and so forth, but he's not capable of reaching in any direction to achieve these. Tremendous key-ins involved here and we're still talking now about the Levels II on up.

To get TA we would have to rehabilitate other-terminalism. And at II, we would do it with pronouns, because we can't assess – you can't assess at Level II – it would have to be "object" or "them" or, you know, "something," – "recall a time you communicated with something," you know, ARC Straightwire, that sort of thing.

At III you would move into a nebulous zone of no assessment, but observation. Actually, it's observation by assessment. We have worked out a Level III assessment which is a whole intensive. Just keep going over everything with the pc that is on this consecutive list. And you just discuss each one of these points with the pc and at the end of the discussion, of course, you do have – you have come up with a lot of conclusions but the pc has probably blown them by cognition by this time. In other words a dig-out, so you – you could make Level III – as close as you could come to an assessment would be do the whole thing by assessment. You know, do nothing but discuss what really at Level IV becomes an assessment. See, you dig the whole thing out by discussion. But then you don't do anything much with what you dig out, because it wasn't to assess to a certain end or a product anyway.

You were doing this, we were talking about it, it was fitted into glum areas and that sort of thing. You get what I mean, in other words it's just by going back and forth by meter steering and that sort of thing – we would finally wind up there. Well, there's better ways to go about this.

Along with a terminal we get a period of time. Time is the single source of aberration. The wrong mass at the wrong time or the right mass at the wrong time and this thing will lock up at any time. Time is very important. Very, very, very important. So much so that if a person has a somatic, if we simply date the somatic, it'll ordinarily fall away. Quite interesting. That's putting it in its proper time proportion. This is an interesting method of destimulation. Because all restimulation depends on a mistake in time.

Pc thinks it is Tuesday, last week. And Tuesday last week he had – he barked his shins. So he's made a mistake in time. So he has a pain on a Tuesday a week later, in his shin, because he thinks it's Tuesday a week ago. It's not actually sufficiently difficult to be able to teach – the time aberration. And therefore it gets very easily overlooked by an auditor. It's not something that you can easily teach. Once you've said he's made a mistake in time or there's a lie about time connected with the thing, you've just about said it, see. He thinks it's Tuesday last week. Now – now you can go out and you teach all sorts of things about engrams and everybody gets all bogged down into the mental image picture of the whole thing and so forth – the basic lesson you are trying to teach and the reason you dragged in these other things is the pc thinks it's Tuesday last week.

He actually can't have a somatic. Well, he's got a headache, you see, in 1964. How can he have a headache in 1964 and why does he have a headache in 1964? Well obviously the headache came from someplace. This is one point where medicine and ourselves part company. Medicine considers all injury sourceless. Injuries do not have sources. Psychosomatics have no sources. There can be malfunctions without cause. That's sort of a grim, hopeless, apathetic look at it, isn't it? No, we claim the headache, don't you see, has a cause, see. And the basic cause of the headache is a mistake in time. Time errors.

He hit his head in 1960 and he has a headache in 1964. Why? Well, because he thinks it's 1960, of course. So, therefore, you date the somatic accurately to 1960, and the mis... the proof of the pudding is in the metering. You date this thing – you date this thing and he ceases to have a headache. Gor, this is cool! You can do this – a lot of people have experienced this weird phenomena, particularly when it's well done. The only thing that keeps you from doing it well is that if it's been wrongly dated you'll get the date of the wrong date. See. That's the – about the only thing. You date another mistake in time. And this is the most baffling of all baffling experiences to an auditor, if he doesn't know that he can get a beautiful date on a wrong date.

Let's say the pc last Tuesday said it was last Friday. So you'll get the date of last Friday. Unless you straighten it all out and remove that. It's very easy to detect, don't you see. And that's how you miss. And that's about the only way you miss in dating somatics and getting rid of them. You always get rid of the somatic if you accurately date it. But what gets in your road is the fact that the pc has been there ahead of you. Pc has already wrongly dated it and you're liable to find the pc's wrong date or you can find the date when the pc wrongly dated it. And then this is overburdened on the actual date. So you find these others and then you re-date it and then it – pretty soon you come up and say, "Well, the E-Meter doesn't accurately date because I've gotten three dates for this one incident." You didn't realize you got the time when the pc wrongly dated it – first you got the wrong date the pc gave it, then you got the date when the pc wrongly dated it and then you got its right date, see.

Now, in view of the fact the pc may have wrongly dated it four times, you see, it can look very involved. But you can straighten that out. You can say, "Well, is this when you dated it?" or "Is this the date you dated it to?" or – see, something like that. You can straighten it out, within those limits. Why, you get this weird fascinating phenomenon of the fellow has a horrendous psychosomatic and you find out that it was on October the third,

1957, and bang and it sort of goes zzzzzz, like a little punched balloon and it's gone. Where'd it go? What happened? Well, you just discovered its source.

Now, in view of the fact that you cannot run terminals – in view of the fact you can't easily run terminals that have not been accurately assessed – you mustn't really play around with terminals that haven't been well assessed, you get yourself into a lot of trouble. If somebody doesn't know anything about assessment at all, who is busy assessing something, then comes up with his product and runs it you can expect hash. You know, the pc is protesting like mad, "billycans." He never heard of them! He never heard of it and you keep getting this read. It's because an E-Meter's a charge-meter, not a lie detector or truth detector – all it detects is charge. That's all it detects – charge. It's a charge-meter. And so, of course, if your pc is all heavily charged up on the fact that he's insisting it is not "billycans" on the list, you of course will get the result "billycans" and then you are running what you should have been running protest on, in the session and you're saddling him with "billycans" because it read so well. You see it's just a lousy job of assessment, that's all, see.

Well, that's where that gets you in trouble. So therefore, at Level III, whatever other process we use, we prepcheck at Level III, and so forth, we prepcheck at Level III, and do other – many processes at Level III, but I don't think that very much assessment should be brought in at Level III. We are given this beautiful thing of time factor. And so at III we could do a lot of tricks with time. Time factor. So we get a Problems Intensive as a very nice process at III. Now, of course, that takes a sort of an assessment, doesn't it? It takes an assessment of sorts. But it's an assessment which is then run for a long time, so it can be done by a higher-level auditor on the basic assessment. They had to do this in HGCs all over the world. They've had to take a higher-class auditor and get them to check out and do the Problems Intensive assessment. And where they did that, assessments were very, very successful, and their Problems Intensives were successful, you see. But where they didn't do that, why, it wasn't successful.

But time factors are something that can be used at Class III. The present time problem done any way, shape or form, don't you see, where the individual keeps saying he has a present time problem, and then whatever the present time problem is with, in terms of a terminal, you prepcheck. That's elementary, see. He has a present time problem with his wife, all right, now he talked about that in itsa and it got better, but by this time it's worse again, so you prepcheck "a wife" don't you see, something like that. Very arduous. But it's what the pc says and what the pc seems to be worried about.

So you can get – you – continuing to use repetitive processes and doing Prepchecks on things selected on terms of time or using – like your Problems Intensive – or using, just the other side of the problem. "Who's the problem with?" you see. Any other old problems – any other old problems process we ever had, see. We've got a grab bag right there. Now, if you throw into that class any other grab bag process we ever had, why it makes a class. Anything that mounted up to that.

Then we move into IV and we make IV a clearing level. Now, I'd like more time to talk to you about Class IV and so forth, but let me say that the technology of the 20th ACC – perfectly accurate technology – and that Prepchecking was probably much more successful

do you know! We're going to find ourselves on that list something we can prepcheck. So we knock a Prepcheck into this thing, *bokity-bok*, and we prepcheck it up to a point of high-level cognition where it just simply blows – and we won't get TA action after that – or we simply process the TA action out of it, keeping our session rudiments in. Well, that's great. We've had it. We're not going to do a single other cotton-picking, doggone thing with that goal and we're not going to do anything more with that terminals list. We're now going to find another goals list and we're going to find another terminal. Got it?

We flatten these things reasonably, but try not to plow the pc in. We're going to wind up at the end of this run with a completely free needle and a Clear. But that's actually all the mechanics there are to it. Providing we never upset the pc about what goal he's to put on the list, don't you see. He can put any goal on the list, providing we keep those goals lists, too, for later on. And providing we don't overlist madly and providing we get a terminal there that gives us some nice needle action and then providing we just mildly prepcheck this terminal. We're going to have ourselves a free needle.

Why? The only thing that can key in the actual GPM is the mass with a significance. Because an actual GPM is a mass with a significance, see. So we get the mass with the significance that's a noun, we know we haven't got an RI for an actual GPM. So if we prepcheck it we've got the thing which is keying in an actual GPM. So the goal we found on the list is thousands of miles from being an actual goal. We couldn't care less. We're not doing anything with it. See, it's some kind of a goal. Even if it's just an item on the list.

And it is probably the lock that is keeping the actual in, see. So we could probably strip these things off left and right. Now, if you're careful as you go along over such a route of clearing – if you're very careful – only to choose things which have recognizably good reads that don't come from a big protest or argument with the pc, see, this thing has got a read, so forth, there it is, see. And as long as we don't get it up that we're hotting it up to get actual honest-to-God real goals and start arguing with the pc as to whether they're actual goals or re-goals or something because – huh! They're all just items on a list. He's had this kind of a goal at some time or another, don't you see? You'll probably find he's very interested in one of those goals on the list and another one he doesn't want to have anything to do with, well, respect his wishes. Don't get in an argument about it. You have to handle it softly. You have to handle it gently. Otherwise you're liable to get your hands on something there and invalidate it and turn yourself on some somatics you'll wish you didn't have anything to do with.

So lightly, lightly. And all you're trying to do is destimulate the pc and you make yourself a Clear. And that's an R4 process, revised, from what we know now, to deliver a destimulated Clear. I was talking about this earlier – I didn't give you an active formula many months ago, by which to produce this. But you notice I did revive the HCS certificate and have been talking about this level. Now if this terminal is what you sum up a service facsimile into – this was probably what they were trying to make guilty – see, make right, make wrong, O/W, any of these things would fit in, you see, make guilty is the service facsimile cousin of O/W. See, make self right and others wrong, well, that adds up to making somebody guilty. You're probably having all of that delivered into your paws, except you're finding now what they're trying to make guilty, don't you see. So there's another possible family of processes

that add up into that particular lineup. Just pointing out the service facsimile has something to do with this, not that you necessarily use it. But you aren't left high and dry with no result.

This thing won't prepcheck – well, obviously then somebody's trying to make it guilty. Gives you the other line of process which you could use at that time, see, you could use your old service facsimile processes, you know. How would you make yourself right about it and how would you make others wrong about it. But that would be a rather extreme look. I don't think you'll run into that very, very hot and heavy, but that's the only thing I can think of that you would run into.

If you've got a noun, it's neither going to be a terminal nor an oppterm because it doesn't exist in actual GPMs. So you haven't got to worry about, any of that old stuff that we were worried about at that time. So I've given you actually a very simple rundown. List a little reasonable goals list, find a goal pc is really interested in and then just list nouns of who or what would have it and then prepcheck the result, and if you don't drive the pc into a hole with a bunch of out mid ruds and choosing the wrong item and only getting goals by protest, why, you're going to wind up after you've done this a few times – why, you're going to wind up with a lot of keyed-out GPMs and you're going to wind up with a Clear. So there is the manufacture of a Clear by destimulation, the destimulated Clear. And this is – be very, very handy to use.

This doesn't particularly invalidate anything else you know in the way of processing. I'm just showing you there is a route based on materials which are more or less in your hands, with this one addition that I've finally gotten the common denominator that isn't present in actual GPMs and so won't key them in. Which is very, very handy to have. So, therefore, that's very safe to process. And with that – with that squared away – why, of course the road is open to ordinary, run-of-the-mill Book One type destimulated Clears .

You can key out actual GPMs. Actual GPMs are keyed in only by masses with significance and oddly enough there will only be one mass with a significance in any given environment that is really raising the devil with the pc. He's got thousands of them apparent, they're all associative. There's only one that's keeping it stirred in. So eventually you will move along the line till you will finally fall into that one. And you find out the reason he can never walk down a main street and that sort of thing is because of the glass in the shop windows. And he thought it was the traffic and he thought it was policemen and he thought it was city life and he thought it was most anything. He thought it was his shoes, and so on. No, it was the glass in shop windows. And you'll eventually fall into that category and find out what it is that makes it impossible for him to walk through the city streets. This is the kind of thing that you run into with this.

But now, there – there is a map and design of perfectly safe, useable processes which will take the individual from Level IV up toward Level V, so he's got enough reality and is unburdened enough so that he can understand and you can get him searching for and actually finding actual GPMs so as to run out the bank in its entirety. The thing is to fish him out of the bank so that he can then go back and finish up the bank. All right?

That's it, thank you!

Lower Levels Of Auditing

(originally: The Road to Perfection)

A lecture given on 17 March 1964

What's the date?

Audience: March the 17th.

Seventeenth. Seventeen Mar., 14. Is that it? All right.

Well, going to talk to you today about some more lower levels of auditing¹². First I'd like to tell you something about the existing world situation. Very amusingly.

I've had a gamble on time going that began in January of 1963. And it was just a time gamble, no more – no less: Could I complete the job before the roof fell in? See, that was the time gamble. I took the calc... I knew I could complete the job. But could I do it before the roof fell in, you see?

There were many factors involved in this and it begins much earlier, actually, wondering whether or not there's going to be another war – saber rattling and atom-bomb sizzling going on and so forth. But the time schedule was mainly dependent on Scientology organizations and Scientologists – how long they could hold out? You know?

I took a calculated risk and neglected organizations and Scientologists during the period from January of 63, on through till, actually, last month or something like this. I started doing something about it in November, really, but not with enthusiasm. I started really crowding it home along about January, a year later. And that was simply to conserve administrative time and put all the time on research, making about an eighteen-hour research day, you see? I cancelled out all social activities, all foot-on-the-mantel sort of activities, cut down my breathing [laughter] and devoted every tiny scrap of time I possibly could to the research line, trying to complete a job which, of course, could not ordinarily have been completed in years and years and years – the amount of work which still had to be done.

And Mary Sue caught the brunt of that. For long periods of time there, she didn't have enough sleep to bother about. But we – we got ourselves straightened out. And August – August marked the point of "could be done." "Could be done." Here – here are the materials – we have our hands on them and so forth. September, those materials were understood, but not labeled or communicated. And the period from then, September of 63, on through till January were pretty well devoted to codification. The relay and communication, that is the labeling of

¹² The blue marked texts have been cut off in the original tape.

the material, the defining and looking exactly at what you had, putting it together in a way that could be communicated, you see, and forwarding it through to a conclusion.

This was, of course, all on the level of OT. Now, when we say OT, why, your imagination can just run riot. I mean, wh... what do we mean, OT? Well, I don't know. Think of something terrific – that's OT, see? What exactly is the zenith? Well, of course, there is none. It's – it's an infinity of up. And you can't really put a label on it and say, "Well, it stops here." Because the truth of the matter, it doesn't stop.

But exactly what did one have to do, one, to make an OT? Exactly what did one have to do to get the materials in a communicable form, labelled and so forth? And then, what did one have to do to communicate the materials so they could be understood and used? These were the immediate problems which were faced. And I think you'll agree that was a hat full of problems.

Now, at the same time, it was necessary to form a bridge from the individual, you might say, on the street on through to reaching distance to these materials. And that had to be solved, too. And, oddly enough, that is the more difficult problem.

That problem is now proving more difficult than the upper-level problem. Because, of course, with one's attention very closely devoted to the idea of exactly what it is and exactly where you can go and exactly what you have to do to come along and tell somebody how to get rid of his sciatica or something, at a level of auditing he can comprehend, so that he can get a reality, so he will move forward toward it is quite a stretch of wits.

Because you know what his sciatica is, you see? He's got a GPM or item that's out of place like crazy, see? He's going along in life giving himself a wrong goal all the time, you know, something like this. He's doing something goofy with Class VI materials. That's for sure. But of course, he's out of communication on the subject and you can't talk to him on this subject. It doesn't make any sense to him.

Edgar, I think, came as close to packaging that up as anybody. Had some fellow saying, instead of, "Is it your own goal?" you see, "Well, is it something you did?" And instead of "an implant GPM," saying, "something was done to you," you know? He was dividing these things up. And I think he cured somebody's long-standing TB or something. He cured TB with this. Just – not – not using "implant" or "actual GPM" or anything like that, but just saying, "Well, was it something you did?" and "Is it something that was done to you?" Rather terrific job he did. I think about thirty-five minutes of auditing on this sort of thing.

But exactly how does one get somebody up to reaching distance? You see, it's a – it's – it's a steep mountain, when you get there. It's – it's a steep, very exacting Mont Blanc. But as you have often noticed, walking in foothills, every time you come up to a hill and you say, "I have now climbed the hill," at the moment you reach the crest, you see a bigger hill, you see? Well, in this particular case, when you get to the last hill, you see Mont Blanc, you see? Now, we've got to scale *that*, you know?

But these little foothills become progressively bigger as an individual walks along. And unless he's walked securely up the hill to the crest of the hill, he's so discouraged when he sees the next hill that he quits. So, it's a progress of wins, in other words. And you have to

have materials which cause the individual to walk forward with wins. Well, what is a win? Well, if you – he accomplishes something that he wants to accomplish. That in essence is a win. And a lose is, he fails to accomplish something that he wanted to accomplish.

And it all comes back to this basic thing, what does he want to accomplish? So we're actually back on Class VI materials, aren't we? Rather – rather fabulous. If you want to turn on a feeling of sadness and apathy on a pc – I won't give you the process because for once in my life I haven't got my notes, but it's in Mary Sue's notes – an exact process that does this. But it just takes up his little goals in life and straightwires those that have been blunted, see. The idea of what's he tried to do that he failed to do, don't you see, and that type of process. I'm just giving it to you as a process type, not as the exact process. But the exact process does exist. In fact there are two of them.

And this is quite remarkable, because this repairs his ability to win. A brand-new thought to you, isn't it? I mean, to repair a man's ability to win. You don't realize that that pc that you get in off the street, who just came along for the curiosity, you know – because Anabelle had some processing and it made her feel better – may be unable to win at anything. And you're trying to give him a win, and he can't win at anything! See, he might be able to inherit a million bucks and he still wouldn't have a win, because he can't win.

So you get fooled, because you estimate that if this man had a million bucks, you see, then he would have a win. Well, then you could cut it down further and say, "Well, it's because he can't have a million bucks." No. It's because he can't have a win. He can't win.

So no matter what you did for him, get rid of his sciatica, arthritis, or anything else – no matter what you did for him – you would find this individual in a state that he couldn't win. So therefore, although he's gotten rid of his arthritis... He can have "no-arthritis," you see? He can have the item "no-arthritis," you know, in life, but he can't have the win of "no-arthritis." See. So therefore, he cannot go on with you, as the auditor, in any very good frame of mind. Don't you see? That's how beaten to his knees you'd find the bulk of the population.

So therefore, when we talk about mounting these little foothills one by one and finding another foothill a little bit bigger until we get to the mountain, we are actually dealing with a progress or gradient of wins. And it actually is a much more difficult job to get somebody from Level 0 to Level V than it is to get him from Level V all the way through.

I think that you would have a horrible idea of trying to walk up the easiest slope with some girl, let us say, who has French spike heels and they're made out of abrasive-type material, you see. I mean the type of material that just rips to pieces, you know. If you get a spot of water on it, it goes, you know. And she can't walk very well anyway, you see, and she's wearing one of these French skirts that permits a stride of a sixteenth of an inch, you see. [laughter] And she's held together with glue and sticky plaster, you know, the makeup is on. And if the slightest drift of wind came by, it would mess up her hair. And trying to get this girl over a little bit of rough terrain – see, now that's about your first – look at your first step.

Now, when you're taking this person from V up through VI, you're dealing with an experienced mountaineer in spiked boots who's perfectly decent with a rope, you see, and an alpenstock and so forth. And you'll find, actually, that it's much safer to climb Mont Blanc with him than it was to walk up this gentle slope with this girl. [laughs]

So those are the problems – those are the problems of the progress of Scientology. But the political problem which we were faced with is, we're facing a world which is more and more intolerant, and which is more and more bent on giving people no wins.

Literature is getting more and more apathetic. And the – a hero is something nobody could even imagine in these times, you see? And it's all pretty horrible and it's all pretty grim and man is born to trouble and dies in more trouble. You know? That's the motto. Win has almost dropped out of popular literature. You find – you find in even some of the more adventurous tales today, that the treasure is in the cave but somehow or other at the end of the story, they don't ever get it out.

And that is merely the acceptance level of win. That is all that is. And the acceptance level of win dwindles away to practically nothing. It can get to this point: "Nothing horrible happened to me today." And that is a level of win, see.

You've sometimes seen a pc set a goal like that, you know? [laughter] Session goal: To get through it somehow. But that's actually a pretty high level of win, compared to how low it can get on a social level.

Well, to get back to what I was telling you earlier, the calculated risk was, could I do it in time? Could I do it in time? And I did it in time. And we arrived. And this is about the first time it's ever happened in Scientology. But sitting down in Scientology Library and Research files and available to the thirty students who are on that course right now, is practically every scrap of material that could be assembled on the subject of VI. That's a fabulous thing. You say, "Well, naturally, get a piece of stuff like this, we could research for a long time, get an awful lot of data together, and there's a lot more things to know, and all that sort of thing." That is not true at Level VI right now.

I can tell you – tell you little things like, well, this is an actual goals pattern from beginning to end. Find a little thing like this. I just found that the – a create-type goal is never an oddnumbered goal. It is always an evennumbered goal. That create, therefore, in life itself, is twisted into a junior status compared to destroy. Destroy is considered superior to create, believe it or not. That's in the levels of Class VI, see?

Well, that's an interesting philosophic observation; all it does is make it a little easier for the auditor to plot the goals on the pc. Gives him a better start, so that – it gives him a little tiny clue, if the – if the pc is trying to plot a create-type goal, you know – no matter what the wording of the goal is – why, he would be foolish to try to plot it in the odd-numbered slots. But if he's trying to plot a destructive-type goal and so forth, he would be foolish to try to plot it in the even-numbered slots.

You see, that's just making life just a little easier. But that's about the level of advance that we are at there, a little odd bit that doesn't amount to a great deal, but is interesting to an auditor who is trying to get a goals plot together.

The one thing we don't know is, is we don't know how many goals patterns there are. But at a guess, there is a very finite number of actual goals patterns. That is, they're – they aren't random forever, which I consider is quite interesting. I mean, there are probably very few – very few. And so we can look forward to some time in the future when we say, "He's

pattern A," you know? "He's pattern B." If he's pattern B, well, then his goals are *brr brr brr brr brr brrp*. We have to find them all and put them all in Place, but it's just *pow, pow, pow, pow, pow*, requiring very little of the pc.

All of which gives a great certainty, because the diff... most difficult point in any of this is finding and plotting goals. You get one of those goals out of line, you'll wrap a pc around a telegraph pole the like of which you've never heard of, man. But it's interesting news that there are probably just a few of those. But you get what the level of advance is. We have all the technology, find them all and put them together, there's an infinite number of patterns, you see? These are little bonuses.

Well, anyway, after – here we are thirteen months, fourteen months – about fourteen months after the kickoff on this and the job is all done and wrapped up. And I've been involved for the last month or so, particularly strenuously, trying to put together and – organizational difficulties in auditor organizations and relationships and classification materials and consulting people about how they wanted classification to go and doing various things of this particular kind. That's been the more recent activity.

And with governments leaning all over Scientology and looking down our throats – for instance, the probability – Mary Sue was always curious. She always said, "The government wants something out of Scientology." She's always saying this. "The government wants something. There's some reason for this." And we finally found it. They want the E-Meter for front-line combat troops. I thought that was very interesting. Yeah, it's pretty crazy, isn't it? Typical.

You see, they get so much infiltration – this is serious – they get so much infiltration in modern warfare of the type that is being fought, that they can't tell friend from foe. So they're going to equip front-line combat troops with portable lie detectors. And, of course, there's only one portable lie detector in the world – the E-Meter. I knowed something was getting those chilluns, you see?

But apparently they have some kind of an interest in it. And you would – a thief or a criminal never can ask you for something. They've got to steal it. And I wasn't saying all the governments are thieves or criminals. Don't get me wrong. I think there's one or two that aren't.

I know this is about the wildest curve you ever heard of and it's completely unbelievable. You can see a soldier walking around carrying an E-Meter. Before he shoots the guy, you see, he puts the electrodes in his hands, you know? Bunch of psychotics. I know, it doesn't sound right. But it sounds – it sounds just exactly what a government would do.

Now, in view of the fact that nobody's going to help them run these things and nobody's going to tell them how they operate and so forth, I don't imagine their program will be very successful. But I don't think they're trying to be successful because I think their acceptance of win is a total crash. They know they've won because they're lying there with bits of meat splattered around the landscape, see. That's a government level of win.

Now, the situation can become very acute in the next year or so in Scientology, because, of course, we've got to win back any lost ground and put things all together and so

forth. But we've made it at this end. But remember, only we here at Saint Hill have any reality on the fact that it's made, see. Only we have an – a reality on that.

Earlier, Saint Hill training did a great deal for organizations and auditing all over the world. Levels and standards of auditing have just come up enormously in the last couple of years. So that I read, now, criteria from organizations and auditors around and – as to what's gone wrong with a case or what's gone wrong with a situation. It's very smart. It's very intelligent. They know what they're doing on that sort of thing.

So we've put their basic auditing into good condition. Now I've got to move some of the old processes, like Prepchecking and R2H, ARC break stuff and that sort of thing back into their hands. And we've got to put together this little gradient of wins and match that up and we will have this thing made. Because there isn't much doubt of turning out OTs at Saint Hill. As a matter of fact, my estimate to OT now, is in terms of hundreds of hours.

And it's very interesting, had a new – new datum. Recounted the number of actual GPMs on the track. Got rid of a few and was able to buck up to the tiger and count him by the nose, and there are only about ten series of goals, not fifteen thousand. Ten series, making only about four hundred and twenty GPMs. Not many. That's not many at all. And in view of the fact that you have a pattern, you could knock those off – a slow auditor could knock them off at about one every hour and a half in the early stages of the case, which quickly cuts down to every hour, which quickly cuts down to about every half-hour, see? So there's your case estimate. It's the number of time – long – length of time it takes to get a goal plot together plus what? And length of time to run that; you can count it up and you can't get more than five hundred hours no matter how hard you try, see, for a total case.

And we cracked this thing down the middle and crosswise and upside down. And it's been a long, hard haul. And it's been very hard on people in the field and it's been very hard with shifting patterns of processes being carried along the research line, changing organizational staffs and upsets and trying to get people trained and trying to get through, and hanging on somehow and so forth. It's been rough – been rough.

But roughness makes very seasoned people. It is not all loss, see? When you recognize that an individual, moving forward with certainty, will go through a fantastic amount of ramifications and upsets and that sort of thing – if he's moving on a certainty – you don't have to worry too much about how smooth it is. It's just how certain it is.

The hardest part of the problem, though, and what I'm talking to you about in this lecture – the hardest part of the problem – is getting the individual over these little gradients of wins. Gradient scale of wins. Well, this is complicated by the fact that an individual can get into a certain number of ARC breaks and stop auditing. He can – he can stop. He might not stop forever, but he'll stop.

Now, you recognize... Let me – let me make a few technical points. Let me – suffice to say, we started in January of last year to pour the coal on, we're in March of this year and we have won. And as soon as people find it out, why, everything will start going smooth again. And everything is working forward at a mad rate of speed.

Saturday Evening Post articles or Victorian Parliaments or something of that sort. For instance, Victorian Parliament thought they could completely break the back of Scientology by just shaking it down for counsel's fees all the time, continuing their hearing on and on and on and on and on. Well, I just cracked the back of that, I just wired Peter and told him I'd underwrite his counsel's expenses from here on out, see? Of course, poor Victorian Parliament. Because they'll be sued for every penny of it when we get through.

But the point – the point here is, we've achieved Mont Blanc, and Mont Blanc is surrounded by foothills. And how do we get the people from the paved street, over the foothills at least to the base of Mont Blanc? We haven't got any worries at all once we get them in sight of Mont Blanc. As soon as they've got a reality on where they're going, what they're doing and so forth, they'll go through hell and high water in order to move the rest of the way.

But those early wins – those early wins – they're the problem. There's your mother, or your father, or your relative, or somebody and there they're sitting there and "they don't know." You know, they say it so well. Or they're completely open-minded about it. What occurs at this particular point? Well, you recognize that there's no win available and so you give up. Ninety percent of the time, you give up. And all I'm putting into your hands here is a little piece of technology. What you probably recognize is that a win isn't available, so you stop trying. Or doggedly, you keep on in a frame of mind of realizing no win is available, so therefore, don't create one. Do you see that?

Audience member: Mm-hm.

Now, dissemination totally hangs up on this one problem – the win available. And it hangs up from the auditor's viewpoint; it hangs up from the Scientologist's viewpoint. That's where it hangs up. Doesn't really hang up from the pc's viewpoint. It's our recognition of no win available.

Look how long I kept trying with the US – ha! – the government. I used to write them a letter every now and then. I used to try to do this and that and so forth. I was eventually writing them in a very, very hopeless frame of mind. I mean my – rather antagonistically defensive, hopeless, "To hell with you, if you did reach out your hand I'd probably step on it," you know. That's this – that kind of a frame of mind.

And you just write them off, see? Just write them off. That's your recognition of how much win is available. Which, by the way, is monitored, and not only by the way – but is monitored directly by your acceptance level of a win.

Now, the scale of win – old Chart of Attitudes – the scale of win is a gradient scale and is not expressed in the early Chart of Attitudes. So I'm giving you a brand-new scale here. This scale is vitally important to anybody working in a Central Organization or working as a private auditor or any Scientologist trying to get anywhere with Scientology. This is the one that knocks his head off or lets him go over.

Now, there's two sides to this scale – two sides to this scale: an outward win of assistance and an inward win of being assisted. Now, it's a win for anybody if he assists. And it's a lose for somebody if he doesn't assist. This is all on the basis of failed intention – and we'll reduce it down to that in a moment.

You intend to help Aunt Hattie with her lumbosis and you give her some auditing and maybe she gets over it, but she doesn't think she has. She doesn't think it did her any good. What happened? Now what does that demand of the auditor? It demands that he has more confidence in his own observation than in the pc's estimate of the situation. It requires a certainty of observation, without reassurance from the pc.

Now, that's an old datum, but it's terribly interesting to get involved with because it means that you are so certain that you have accomplished something with the pc that you do not need the pc's statement that it has happened in order to be sure of what you have done. Now, frankly, that's an almost impossible level. But if you fall short of that level, you then go into agreement with the pc's acceptance of wins.

What's his acceptability of a win? And if you're expecting that pc to tell you that you have won – and that pc, being down scale, has a very low acceptance index of wins – you then will be made to feel that you have loses.

I doubt that there's an auditor here that's done any auditing at all that hasn't at one time or another run into this one. We get rid of Aunt Hattie's lumbosis for her or we got this person so they no longer have screaming nightmares or something and they tell you, "Well, that didn't help much."

They have various ways of saying it. "It was probably the Bromo Seltzer," you know. "I'm no longer taking the Bromo Seltzer."

And you say, "What the hell are you talking about?" you know? "Here I sweat my skull to the bone and – over you as a case, and there you are," and so on.

Well now, comfort, a relaxed frame of mind, any such acceptable level of serenity, you might say, being at ease and relaxed about things, requires that you know the exact situation and know that it is the exact situation. The whole component part or all the component parts of this thing called peace of mind or serenity or poise or self-confidence or anything else depends on the individual's... I mean – I mean true self-confidence, not walled-in, maniacal idiocy, see. The house is burning and you say, "Well, I'm perfectly happy."

This is the type – this is what this finally got to in India, you know. You – your Indian guru came down scale pretty fast over a period of time. And his idea is that you should be able to look any disaster in the teeth, you see, and be completely serene. Well, that's insanity, man! That doesn't apply, you know. In other words, he had it redefined into the ability to endure or the ability to suffer. It was no longer – no longer what it started out to be. And that is, you must be able to conceive the truth of any situation.

That is the true and complete answer to self-confidence, serenity, any one of these other desirable things which all adds up to simply peace of mind. Peace of mind doesn't even mean an inactive frame of mind, you know. It just means, well, you're calm about it, you know?

Now, that – knowing the truth of the existing situation – is really the only thing which supports self-confidence.

Now, it may be virtuous to be truthful and it may not be. We're not speaking of virtue; we're simply speaking of the – of the aspects of truth. But most departures from the truth have to do with an attainment of a point of safety. An individual departs from the truth in order to obtain a self-security or something of that sort. Either for the other fellow or himself, you see. Those are departures from the truth. That's a fear of what might happen to him.

Man is terribly complicated in his civilization by having these points very out – very, very, very out. For instance, civilization, at every point, can force upon the individual, lies. In other words, they can make the individual lie.

The – it begins with the social lie and then there's the police lie and then there's this and that. All the uncomfortable things that can happen to you if you were to tell the truth.

If you were just to tell the truth consistently and continually in the existing civilization, according to the standards of the existing civilization, you probably couldn't live twenty-four hours. See, in the first place, overfrankness would get you in trouble and cost you probably lots of your friends. These are the various arguments which have been offered by past philosophers and so forth. If you said nothing but the truth for twenty-four hours, why, you would lose everybody you knew, and you would probably wind up a suicide or something.

But it's built – even that philosophy is built to discourage an individual from an announcement of truth. Well, when one fails to announce truth, one is then, to that degree, protecting a lie. And thus, one begins to surround himself with lies in his social atmosphere. This is very esoteric. This is rarefied air of philosophy I'm giving you here, but it's nevertheless very germane. It's something that – something that you should look at.

The society, then, by various tricks and mechanisms, brings an individual into a state of tolerating lies or aiding and abetting lies and so forth and adds some virtue to this. And then "recognition of the truth" gets converted into "enduring the truth." You see. See, the "I'll just stand here and recognize the house is on fire and then I will be all right," you see? Well, this is getting pretty wild. It's taking very upscale characteristics and moving them down very low scale.

If you stand in the middle of a burning house, the recognition of your self-confidence, the recognition of the truth of the situation and so forth, is not going to keep you from being burned. As long as you're in a body and wearing flammable clothes, that I can guarantee. You're going to be roast long pig in no time.

So, what's – what's this thing? What's this thing we're talking about? Recognition of the truth in any existing situation alone has the power to as-is that situation. And very often one is confronted, without a gradient scale, with so much truth that one cannot assimilate it or as-is it. And then one gets swamped with it.

Well, this – this fellow's always had an unhappy marriage – let's look at this one – he's always had – always had an unhappy marriage and he's often wondered why. And actually, only the finding of the truth about the marriage – only the finding of the truth about the marriage – could bring a calm marriage about. Right? Or bring a calm frame of mind.

Well, that's an easy thing to state and so forth. But now let's take this fellow and he's got all of his normal aberrations and upsets and frailties and weaknesses and so forth and we

suddenly unload on him the reason why the marriage has been such a failure. You know, he get – he gets it, he finds it out all in one and one-half seconds, see? He is immediately and instantly overwhelmed.

See, that's more truth than he can as-is. Maybe he finds out that his wife has been unfaithful to him for ten years, you see? Something like this. Only it all unloads on him like that. Well, he cracks up. So this, actually, discourages a person from the recognition of truth.

So what is it, really, that brings an individual away from recognizing truth and makes him less clear-sighted? What is it? It's a lack of gradient. That's all. It's just a lack of gradient. It isn't done on a gradient scale. It isn't done one little step at a time.

Time, then, enters into this thing. We take a person who is completely in the middle of the Dark Ages, living utterly under an intolerant church and a ferocious political system and we take this individual, there he is. See, he's in Stygian God-help-us, you see. And we face him up with the situation that man would be better off if he were permitted to be educated and if he had some degree of political freedom.

Well, those are certainly banal truths to us here in the twentieth century. They're certainly banal truths. But believe me, when they hit the French population in the late 1700s, they weren't taken banally. Everybody went nuts! They went mad! France moved out – tried to move out of the Dark Ages into a higher level of truth in two minutes, with no breathing stops, see?

And truth, in that particular instant, taken on such a fast no-gradient, see, too quick, too fast. Man, there were aristocrats hanging from every lamp post, and sans-culottes in every gutter starving to death and on this pile of upset and shock... What actually were they advertising? It was a greater degree of political freedom, you see? That people ought to be educated.

I mean, you get back down to what were they trying to put across in the French Revolution. Well, they actually weren't even trying to put across that they should get rid of the king. They weren't trying to put across many of the factors which have drifted down to us through what is laughingly called a history book. What they were trying to put across is a bunch of fellows had gotten the idea that the Dark Ages had been over for some time, but nobody had been given the benefit of this. And so people ought to be a little bit better informed of things, and the political freedom ought to be a little bit better established. And they, frankly, in the early stages of it would have settled for almost anything. But nobody would give them any degree of truth. The king was very stupid. He could have issued a decree a year or two before he did, you see, that would have given them a certain number of these things and all would have been calm. But no, they were all faced with these situations.

And what turned against them? They got caught right into the middle of "There must be no truth." And the forces of no-truth loomed up over the heads of the French people and they went mad, you see. They had recognized what the truth of an existing situation should be, you see. But it was too great, too fast, no gradients of any kind. Murder, rape, slaughter in all directions and then finally, Napoleon, see? I mean, almost anything happened to them.

So, the situation – the situation is they came back to a very debased state. They were more debased after the revolution than they were before it. Don't forget it.

France, actually, has never been a political entity of any great stability, on a wide plain which is very easy for horsemen or tanks to operate on. And is very susceptible to invasion, at no point really protected by anything. And has therefore been an unstable political entity for a very, very long period of time. But she frankly has never since really ever held up her head amongst the nations of the world – never really since. She isn't right now. I mean, this fellow, Joan of Arc – pardon me – General de Gaulle looks awfully tall for Joan of Arc I... Do you suppose somebody has given him a wrong pitch on a past life? You know, he thinks of himself as Joan of Arc. It's puzzled me for some time. I just wondered if somebody over there hadn't made a misestimate, you know. Got a broken meter. [laughter] Something.

But the point – the point is, that this country has actually never risen to – to any great status amongst nations. And that sounds a very peculiar state, very peculiar to say that, until you realize that the diplomatic language of the world before the French Revolution was French. And no educated man ever spoke in courts of the world or anything but French. Interesting datum, isn't it? French succeeded Latin as the diplomatic language of the world. Here was a great power. They had an empire of a very great size and so forth. And they started going downhill.

Well, they hi... hit too much truth, too little – too little ability to use that truth, to recognize it, no gradient scale of approach to it. No evolution, in other words, from the darkness in which they existed into the light. Somebody just suddenly turned the Klieg lights right straight in their eyes, you see? And they went mad and they actually have never lifted their heads since.

All right. How do you protect an individual, confronting truth and knowledge, from this exact occurrence? Let me call to your attention that we very often don't protect the individual from that. They get ahold of some early work because this work was designed as a – as a research into life and the reason it succeeded is because there were no holds barred. And there was nothing held back. It existed as a study into what was there. Somebody gets hold of a book about exteriorization or something like this, they recognize the truth of the situation, see, like that, and they go right off their hinges.

Then they go around and you can't ever get them to talk to anybody, you see, about communication or you should run a little 8-C on the pc or you should do this or do that. No, this guy, "All you can do is tell him not to be three feet back of their heads," you see. "You got to bang everybody out of their heads," you know and so forth and "I was Joan of Arc," and "Everybody's had a past life," you see and so on. They go rattling on at this mad rate. Well, it's all true, see? It's all true. But they reached there with no gradient and they have no interim reality and actually get no reality on the truth.

So there's another factor which is involved in truth. I know it sounds strange that something else should be involved in truth. There's another factor called reality, which we could define as this philosophical oddity: The ability to assimilate truth. See, reality is the ability to assimilate truth.

And therefore when we talk about assimilation, we must come around to another point: Assimilation is dependent upon cause-distance-effect, or communication.

And then there's such a thing as an even balance of mind, while one is assimilating. And we call that affinity. You have, actually, your factors of affinity, reality and communication bound up in this thing called truth. So, truth is truth. But truth which has no ARC hooked up to it, is denied the individual and can wrong him and harm him.

Truth must go hand in glove with understanding. All the truth in the world can sit in the middle of a park for everybody to gaze at and if there is no potential of understanding of any kind whatsoever, it will not be truth to anyone. It will simply be truth. It's just truth; but not truth to anyone.

So there are two different degrees of truth. And it sounds funny, splitting it up. We'll get into Kant's untenable bailiwick, first thing we know: how things are knowable and unknowable. No, we'll never go that mad. There are things which could never possibly be known by anybody, anyplace and so forth. This – you don't realize it, but you know, that's standard philosophic opinion circa 1964. Nobody's ever bettered it – for idiocy.

Transcendentalism. Do you realize there are things that transcend your ability to understand, that you will never understand, that nobody will ever understand, that they transcend you forever and will always be unknown and so forth? The ego that would write that would be too big to fit in the normal hat. Because how could he recognize it? He's in effect saying, "I am in this benign position, where I understand all this, but you..." [laughter] Wonderful way to make a slave, isn't it? Debar him forever.

Well, fortunately, there are no such things – no such things as unattainable truths. All truths are attainable. We can just reverse transcendentalism. All truths are attainable.

But the work of Lao-Tze, the work of many philosophers in many ages, the work of the adepts, the common activities of a guru in India at this present moment, is totally concerned with the route to truth. How does one approach truth? They say the truth exists. How does one approach it?

That's an interesting point, when you don't know what the truth is. It's saying, "How do you get to Memphis?" without knowing that there is any town called Memphis or even that there are any towns.

Studying only the route to truth, then, with nobody around who has a final concept of what the truth is, is an idiotic activity best relegated to dog kennels.

"Let's all sit down and study how to get to *Rupf*." And then nobody ever asks, "What's *Rupf*?" "What do you mean how to get there?" Not even ask this: "Is it a road across space, measured by time? Is it a space-time journey that we are making? What kind of a journey is this to *Rupf*?"

"Well no, let's just discuss how to get to *Rupf*."

And of course, we get a total bog-down of every philosophic activity, at once. Kant "solved" it. He says you could never know what *Rupf* is. That was a good solution. That kept

a lot of speculation from occurring. The slave master's speculation. I mean, a slave master's operation to prevent anybody from ever reaching anything.

But now we happen to be in an optimum position with regard to this thing. We happen to be in an optimum position. By certain clinical demonstrations which are not necessarily therapeutic in any degree, we can demonstrate such things as exteriorization. We can demonstrate such things, then, as a disconnection, with total reality, between the individual and his body. All right, we can demonstrate, then, that the individual is not a body. We can demonstrate many points of this particular character. So we know where we're going, we're going toward freedom and we're going toward a free individual.

Now, we know additionally that what is, is the creation of such an individual. I don't care if he's the Big Thetan or an average thetan, it's still a creation of such an individual.

We've gone further than this. There's no difference of order of magnitude of life between a man and a vegetable. You wondered why on earth I was playing around with plants. I was trying to see if there were different orders of life that responded on different wavelengths, and so forth. In my own crude way, that was about as close as I could come to testing it out.

Very recently, one of the *great* universities with one of the *great* budgets with one of the – well, we won't go on, on that particular course – have finally discovered that you can train one generation of monocells and have them respond – have the next generation respond to the stimuli that the first generation was trained with. In other words, they're getting something there which they say the memory in the monocell transfers complete into the next generation.

That's better stated than their experiment, because I did those experiments in 1938 and they have not even come up to really interpreting them. Theirs is something like "Life eternal is about to take place via the monocell." They've come to the conclusion that all life is cellular activities and so forth and that cells are made out of mud or something. I don't know what they're – what they think or are up against. But they're about where I was in 38, see.

And they will branch off of that because they will very rapidly run into things which are not digestible as truth, you see, and they won't get their next budget. That's how truth never gets discovered, you see. It's unreal to the people who are giving them the money.

So anyway, we know, then, that certain phenomena exist. And a great many of these phenomena are demonstrable on a research auditing level which we seldom employ today since all that work has been done. So we know what truth we are trying to attain. Now everybody has, to a greater or lesser degree, some sympathetic harmonic with that truth, see. They know these things are true at some level, even the level of feel, do you see?

Now, what's their reaction to that truth? It all depends on how much truth they can assimilate, or how much reality they have on the approach to this truth. So what is life? What is life? Well, we know that it's not a city in the sky nor a spot on a road map. We know that it lives right where the pc's sitting. We know we're continuously in contact with it, so it's not really a journey across time and space. But it's a journey of undoing the lies by which the individual has road-marked himself in.

The lies, the nonvolitional actions, the conditioned responses – if you want to use an archaic term belonging to the nineteenth century. Various things have marked this fellow's road. And he has traveled downward. He's traveled downward. There's a lot of experimental data which exist on the fact that he has traveled downward. The size of the GPM in the third series is unconfoundably larger than the size of the GPM in the current series. In other words, you just go three series back from the present series, you see, and my goodness! This fellow's – you're staring at stuff that must have been made by a much more powerful being, you see? He made it himself. And so you can recognize that he is going downhill; that he is on a downhill road.

Now, we have to find out what mile-marked the downhill road. What put him down to the next curve every time, see? And all we have to do to recover the individual, fortunately – all we have to do to recover him and his ability, by our rationale, is undo these mile-posted turns for the worse. See, what was he doing, repeatedly and continually, that was putting him on downhill?

So we are traveling a road that has been traveled, but traveling it backwards. So we know what this road is. The Way, the Dao, whatever you wanted to call this thing, you see? We know what that road is. It is the road that the individual has followed from a degree of perfection and beingness and selfness – not selfishness, but just being himself – on down to a disintegration, forgettingness, bluntingness, until he's in the state you find him in the pc's chair.

Now, he has traveled that road and all the auditor has to do is walk him back that road. It's already – it's already there. It's all mile-marked, you see? And just get him to the point where he started to make that road downward in order to recover the individual which we know existed to begin with. The potential the individual has sitting right in the chair.

So the road to truth then, adds up to us as the individual potential. The situations in which that individual potential can be lessened – that's all part of the truth. And what has happened actually to this individual – that's all part of the truth. How this individual is related to the remainder of the universe – which is all part of the truth. And what we can do to restore the potential of that individual – and that's all part of the truth.

So, what's truth?

Now, seen from the viewpoint of an auditor – seen from the viewpoint of an auditor – it's what actually happened or the situation which actually exists at any given moment in the state of beingness of an individual. That's truth. Don't say, "Truth is the ultimate that we are seeking to attain." Truth is that which exists!

I know I contradict myself. I once gave a lecture on "The Road to Truth". Well, I might – might better have said, "The Road to Perfection," or "The Road to an Ultimate Truth." You see?

But we're just taking apart this thing as an anatomy. And by doing so we see, although this is a very esoteric discussion indeed – probably been more philosophy, factual and backed up, on the subject of truth stated here in the last few minutes than has ever been stated before on this planet – easily, see? Because it's usually all hedged-up, you see, in so many pitches

and so many directions that people want you to go, so many curves on the line, that you can't separate the wheat from the chaff.

We find ourselves in this then interesting position of knowing where we're going and knowing how to get there and knowing what the road is and knowing the processes that we have to go through and the disciplines which we have to master and execute in order to arrive at that point. All these things we have.

But amongst these things, this is one that we have not mastered: an estimation of the individual's ability to conceive of truth.

Here sits this greengrocer and you tell him something about Scientology. Well now, you might say – be using the word Scientology, but you are talking to him about the road to perfection. You are talking to him about the road to ultimate truth. You are talking to him about the composition of himself. You are talking to him on the subject of Who are you? What do you consist of? What potentials could you have? What potentials have you been robbed of or have robbed yourself of? Where are you going? What is life? What is your relationship to your fellows? What is your relationship on any dynamic? You may be using the word Scientology, but these are the things which you have embarked upon to discuss.

And the unanswered question is, what can he recognize?

Yes, you could throw all the truth down his throat and he might suddenly in a stare-eyed startlement, you see, go about half off his hinges. "What do you know?" You know?

There are several things you can do that perform an overwhump of this particular kind, minor and greater. And there's no reason why you shouldn't do it. I'm not saying there are certain things which you mustn't do.

But if you were to say to him, "Try not to be three feet back of your head," and he banged three feet back of his head, my God, he's standing there looking at this "*Hooh!!* There's an awful lot of truth! I'm me, and it's it! *Pheew!*" A lot of you have had – the old timers around here have had that experience, you know. "I'm me and it's it. Now I know... You know? *Huhh-wuhh. Uhh-uuh!* Yes!" See?

And you've also had this experience, two hours later: "What exteriorization? I wasn't exteriorized. Well, possibly something happened, but I don't know."

Now, you've shot the individual momentarily into the rarefied air of: he could see it, but he couldn't have it. So you can show people things they can't have. And there's how you generate an unreality. You show people truth which they are then unable to achieve, attain or accept.

For instance, if we didn't have a gradient scale now of getting from the man in the street to Class V, we would very soon, within a year or so, find ourselves in a very involved situation of nothing we knew to be true would be true to them. It would only be true to a few of us. We would become very unreal to these people.

Now, if you'll notice there's a common denominator to everything I've been telling you: Hit with too much truth, the individual thereafter degrades. That's a common denomina-

tor to all of this. Common denominator to France, common denominator to you getting off the airplane, any of this sort of thing.

You hit this individual, he exteriorizes, bang! He said, "I'm me. I'm a spirit. I don't have mass. The body is a body. I'm different than it." Two hours later, he's harder to process. Now, what's going on here? Well, it means the individual's acceptance of win, the ability to win, has been excited and has lost in the process. He can't have it. He cannot attain it. This one he can't win. It's too much.

And when I think of saints of olden times, and I'm very sure some of those boys were capable of throwing around the partridges and making the birds all sing in C-minor simultaneously, or something around this, you know. And piling up loaves of bread or driving swine off the Empire State Building. I'm sure there's been this kind of action, you see, in the past because it's potential. Notice that it's the common denominator of the type of action which excites man and which drives him afterwards into a degrade.

Quite interesting: Christians killed more Christians, in one year in Alexandria, than the Roman Empire in its entire persecution of Christianity ever executed. This is the action of a degraded people. Why were these people degraded? Well, they were hit in the teeth with too much miracle. Nobody could ever repeat the miracle. And you show me one method, one method in Christianity – I'm not against Christianity – but you show me one – one method, by which an individual living in a certain way can in actual fact achieve any of the abilities of sainthood.

Why, this is very, very interesting if you look this over. You go around repenting ye, repenting ye, and you go around debasing ye, debasing ye, and all you're going to do is key in a few actual GPMs. You go around turning the other cheek all the time, you're going to introvert. [laughter]

I knew we had it made when a *Saturday Evening Post* article began to paint us as a "dangerous people." There's just a thread going through that of the Scientologist is a sort of a violent fellow. There's this – just this hint coming up. That's very healthy. That's very, very healthy. Because every time a group or movement has been recognized as totally peaceful, everybody has shot them right down like dogs.

I gave you an example of that in one lecture, one day. Jewish people. Poor people. No more peaceful people on Earth. And look what's happened to them. So it's not unhealthy to be thought of that way. But it was interesting that this fellow, without any evidence, could come to these conclusions and so forth. We're not dangerous people. Nobody's just trying to paint it this... but to paint the individual Scientologist as a dangerous or violent person in any way, shape or form is about as far as you can get from truth.

But for the public to tend to believe that or for an individual to start to believe that or a Scientologist start to be fought in some particular line is not an unhealthy sign. That's a very good sign. It means that you're not that introverted.

But our materials – our materials are very prone to lay a great deal of truth out in front of people. Well, it puts you on a withhold not to do so, so there is no slightest reason under the sun to do so. Lay out the truth, but provide the road.

And that road is provided by having levels of acceptable truths or realities that an individual can attain – attainable realities.

In view of the fact that you can't start running him in the next ten minutes up the side of Mont Blanc like a mountain goat, it requires that you establish and rehabilitate his ability to win in some fashion and then increase it in some fashion to eventually achieve the point where he can have truth. And that way you won't just throw everybody around you into a complete, frothing, ecstatic, worshipping apathy. I can't think of anything worse, myself. You may have – you may have different opinions about it. You – when you get them run out, you let me know.

But that is – that is where any philosophy errs. This has been solved in the past: When anybody got ahold of a piece of truth they then built up a hierarchy of secrecy. They then built up a class secrecy level. Well, that will operate in any event because you can't expect somebody who knows nothing about TR 0 and has never audited a pc – to be able to sit in an auditing chair and audit a pc, much less on anything very touchy. So, a certain amount of training and skill – a lot of it – has to exist before that level is attained. This is a self-denying mechanism. This is a mechanism of automatic denial, due to a mere fact that it intervenes some training, you see? And it intervenes some understanding. It takes a while to assimilate the materials involved and so forth.

But outright pitch for secrecy is intolerable. "Well, you can't know that because you are only a Class III." We can hear it now around the Central Organization. The Class IV Auditors have a secret meeting because they're covering materials which shouldn't be known at Level I, you see. I can just see some haggard-looking girl, standing sadly out in the hall and so forth, she's just been ejected because they have found out that she flunked her Class III examinations and she was present in a meeting that – that was now going to take up Technique Zed, you see. And she's not supposed to know that because... If any – if there's any similarity between what I'm talking about and certain orders which exist on the planet, it's purely intentional.

No, the route – the route only demands this. It only demands this of you. It does not matter what you tell people, it does not matter what you show people, it does not matter to what degree you momentarily or temporarily overwhelm a public. That is not the final point. The final point is whether or not you provide for them a gradient scale of acceptable wins and acceptable realities, by which they can progress to a higher state and a better understanding.

And if you can do that, you succeed. And if you can merely shock them out of their boots, you'll inevitably fail.

You see, actually, it doesn't matter what percentage of them does take that route. That doesn't happen to matter. You don't have to have a full, 100 percent sweep, you see.

But that route must exist. And it must exist wide open, not back of narrow, locked, closed doors. Otherwise, you never make any progress toward any ultimate freedom or betterment of affairs, anywhere.

Okay?

Audience: Mm-hm.

Thank you.

Flattening a Process

A lecture given on 19 March 1964

How are you today? Good! Thank you.

What's the date?

Audience: 19th of March.

19 March. 19 March, 14.

All right with you if I begin this lecture now? [laughter]

What would you like to know about today? Anything you want to know? [laughter]

Well, in view of the fact that you have no preference, I'll talk to you about auditing. And this is some of the basic know-hows of auditing.

Somewhere along the line, many an auditor lays aside some of his basic information on the subject of auditing. He hides it under his E-Meter, or something of the sort, and starts doing something silly and then wonders all of a sudden why he's having trouble. And it's very interesting how silly some of these things can be.

Now, there *was* a subject called "flattening a process." Now, this has been mostly forgotten. It's even part of the Auditor's Code, but it gets forgotten. It gets forgotten.

And what you need to know about this – what you need to know about this is that there are two aspects to ending a process. There are two aspects to this thing, and they are both concerned with, *What are you doing with the process?* That's the main question. What are you doing with the process?

Well, what you are doing with it tells you how to end it and how you can end it. And these two things are: you're trying to fix up the pc so he can be audited – that's number one; and number two, you are trying to audit the pc. And they give you two different endings.

Now, you can see at once that number one is basically concerned with rudiments.

"You got a present time problem?"

"Well, yeah. I have a present time problem. So on, so on and so on."

"All right. Very good. All right."

"And I – yeah, I did. I had an awful problem and so forth. And, well, I guess it was mostly my fault." Cognition, see? Serves as a cognition.

"All right. You have a present time problem?" No, you don't get any read on the meter, you don't have anything, and that's the end of that process. What was the process? Well,

the process was just doing enough to cure the elsewhere-ness of the pc. Trying to get him into the room.

Now, if you don't know that there are two different directions in processing, then you will seldom have a pc in front of you to be audited. And you will never finish a cycle of action.

Let me show you what happens to a cycle of action. You start in a Prepcheck on "gooper feathers," you see? You start in this Prepcheck on "gooper feathers" – that's the fuzz from peaches. [laughter] And you start this thing and you got it going in the session on the twelfth; and you got it going and you got one or two buttons in.

And the pc comes into the next session with a big present time problem about Los Angeles or something. So now you run a process about the present time problem in Los Angeles, and you get a couple of buttons in on that.

But he comes to the session the next time, you see, with an even worse problem, you see, about Seattle. So you audit the problem about Seattle, so forth. Well, that's just because you as an auditor wouldn't know the purpose of your tools.

You got a little hatful of tools that takes out of the road what is getting in your road in trying to complete a cycle of action on your pc. You have no business whatsoever – present time problem, storm, rain, night, income tax, any other catastrophe, see? – you have no business whatsoever permitting any present time catastrophe to get in the road of your auditing.

Well, you've been presented with a little kit and it says on it, "How to get the pc going in a session." And included in that is keying out, knocking out, destimulating, getting rid of the things which have him so distracted that you can't go on. Now, if you never use that kit, you will do nothing but Q-and-A, you will do nothing but leave unflat cycles of action.

Do you see what happens? You get something started in session A, and the pc comes into session B and he's got a present time problem about something or other, and he's just had a big cognition, what's really wrong with his lumbosis is something or other – so you audit this!

No! No, no, no, please! Please, please, please! What in essence have you done? You have mistaken your tools. Made a complete *bust* as far as what you're supposed to be doing is concerned.

You got this big set of tools over here, you understand? And they got hydraulic high-pressure drills and dump trucks, and all that sort of thing. That's all sitting over here, you see? And you got this little bunch of shiny instruments of some kind or other over here, and they're just supposed to get something out of the road fast, see?

And the pc comes in, "Oh, I had this big cognition about once upon a time in Los Angeles. *Wohwohwog!*" You're halfway through this Prepcheck on gooper feathers, you see? So look! Look! Look how idiotic it is! You reach for these dump trucks and hydraulic drills over here to handle this problem about Los Angeles!

Oh man, you know, just sad! It's sad. All you need is this little whisk broom. See? You're supposed to take this problem and this cognition and you're just supposed to take this

little whisk broom – the little kit over, that comes in on top, about half the size of the tool box on the hydraulic drill, see? You're supposed to take this little kit, and you take out the little brush out of it, and you go *fzt, ztt, fzt*. That's the end of that process, see? And you put that back in again and you say, "All right now. On the subject of gooper feathers – on gooper feathers, in this lifetime, has anything been..." And we're away. You understand?

So, it's just basically making a mistake in the purpose of the tools. And therefore, this leads an auditor into this kind of nonsense: Well, he's always had trouble – he's always had trouble with his back. So for some reason or other, we're doing a Prepcheck on his back. I don't say this is a good process or a bad process, you see, but we're doing a Prepcheck on his back. And we're going to end this after five minutes on a cognition? Hey! What's this? Now, *that* is, we have shoved the hydraulic drills and the dump trucks over here. And we've picked up this little tiny kit, and we've got this thing that's bothered him all of his whole lifetime, and we've taken this little brush out of the kit and we've gone "flick, flick," and nothing happens, see? So we kind of brushed the brush off, see? And we take this other little thing and brush at it and nothing happens. And we say, "Well, auditing doesn't work."

You're using the wrong pickaxe. You see what I mean? Naw. This is a... Really, you have to audit a thing proportionately to the amount of trouble it has given the pc.

So there are two ways to end a process, and they all depend on what you're trying to do. So we're processing this guy on gooper feathers. Big Prepcheck in progress. It's all compounded with all kinds of oddities, ramifications and cognitions, and it's going on and on and on and on and on. Well now, that is done only with one blunt instrument called a tone arm. And that tells you when it is flat. And you, frankly, have to unflatten the whole subject before you flatten it. He's got it beautifully suppressed. That's tone arm flattening. And today you only flatten with the tone arm while using dump trucks, hydraulic drills, and so forth.

You're handling the big case. You're handling the big stuff of the case. And you handle that by tone arm. And that is how you end the process, and that is the only way you end the process. And that is auditing, with an exclamation point! That's main-session auditing. All done with the TA.

Rudiment-type auditing is simply there to have an undistracted, comfortable pc who is happy about sitting in the chair and getting the main performance on. And that's rudiment-type processing. And what I've seen of your auditor's reports, what I've heard of your auditor's reports, in recent times... I may be very unjustly cruel. Maybe I am being cynical and sardonic, professorially "sneeresque," but the truth of the matter is, I think you are using rudiment approach to main-session processing. I think you've gotten it mixed up to the point where you take the main-session process, the big Prepcheck on, and you're ending it as though it were a rudiment process, as though you were merely trying to get the pc to sit still so he could be audited. How much auditing do you think you're really going to accomplish? You're not going to accomplish very much, because you're using the wrong ending.

So, you take this big thing over here: You're going to get rid of this bad back, you see? And "On a back, has anything been suppressed?" See?

"No, I don't think so," pc says.

I would sit there with my eyes rather wide open, as an auditor. "Does your back bother you or doesn't it?"

"Well, yes, it bothers me."

"Don't you think someplace in your lifetime, somewhere or another in your lifetime, in some place or another, there's a po... for instance, you ever have any accidents with it when you were a kid? Something like that? You ever have anything going on?" (You know, a re-stimulation.)

The guy gives it away, "I guess I have! Must have, because I have a bad back now."

"All right, now you let me repeat this question: On a bad back, or on a back – now, listen to me carefully now. Lis-lis-listen to this auditing question. Listen now: On a back, has anything been *suppressed*? Suppressed? You got that now? Got the question? All right, now go ahead and answer that question. Got it now?"

Huh, we're away for the long haul, man. Now, this is the reverse. That's the main session. That's the big show way of getting this thing on the line, see? That's the way of getting it all squared!

Now, get this approach. Just get this other brush-off approach: "Well, you say your back's been troubling you. All right. Is that a present time problem?"

"Yes, it is. *Y – heh!* Come to think about it, it is!"

"Well, good. You've had a cognition. That's the end of the session." [laughter]

Do I make my pernt? You got to get in there and sweat!

You know, you can take one of these old – you're going to see a lot of Auditing by Lists. This is moving up. The first Auditing by Lists we saw was O/W and so forth, but there are many types of lists that can be designed. And I've got this right on the assembly line for HGCs: Auditing by List. It's *Auditing* by List, not ARC break assessments by list. But you could use an ARC break assessment sheet to audit by list, you see? But you do it differently. It's handled like old R2H was. Take each point that you get a read on up with the pc, see?

So you take this old O/W, this list of overts, you know? The old Johannesburg – the Joburg See Check list.

Well, do you know that by very carefully modulating your voice and making no impingement on the pc – being very careful not to make any impingement on the pc; covering the questions in a sort of a throwaway tone of voice, you see? – "You ever stolen anything? Ah, I guess not. No. Well that's fine. That's flat. Nothing to that. All right. Did you ever work under an assumed name? Of course you wouldn't; I know that, and so on. I sort of got that. Well, that's flat."

"It's all flat. It's all flat. It's all flat. Oh, this fellow's passed his Prepcheck!"

I've seen Herbie here almost just growing *sparks* out of his head on the subject of checking out somebody who has been sec checked on that old Joburg list, you see? *Keow!*

As an auditor you should be able to make an impingement. So the Instructor checking the thing out, with that altitude, fixes the person who is being checked out for a clean sheet, you see, with a gimlet eye and says, "Have you ever worked under an assumed name?" Pow! The meter blows up, see?

The poor student says, "Why didn't that happen to me?" See?

You know, "That's a flunk! flunk! flunk! Your checksheet is not complete! You've got to do this whole case over again." You know?

"What's happened to me?" You know? "How come? How come?"

Well, he didn't bother to restimulate anything to pick up, that was how come!

Well, now, in main-session auditing, that which fits between the start of the body of the session and the end of the body of the session, that sort of stuff is laid in with a club! *You purposely restimulate what you're trying to pick up!* You don't want this to end in a hurry, you want this auditing to go on for a while.

Now, this auditing that occurs *outside* of the body of the session, you know, in the rudiments: that is just "Well, you don't have a present time problem, do you? Good. Ah, thank you!" See, that's the approach you use, then you restimulate nothing.

"Well, you look pretty good! How are you doing? Oh, you're doing all right. All right. Is it okay with you if we start the body of the session?"

I know you don't have that in your Model Session right now, but I'm putting it down here as emphasis, and maybe it ought to be put into Model Session to show you where the "club" fits! But first, before that starts, you see, that's just "Well. All right. Well, your tone arm is nice and loose here. Tone arm seems to be low, rather. And your needle's nice and loose and everything seems to be okay. Nothing worrying you, is it? All right, all right. Good. Good. Good. I'm glad of that. Yeah. All right. Oh, you say you do have a present time problem? What was it about?" [laughter] "Oh, yeah? Yeah? All right. Yeah? All right. All right. Good. Good. All right. Well, how's the present time problem now? That didn't read! All right.

"Now – now, is it all right with you if I – we get to work here on this subject of gooper feathers that we were prepchecking, now? You had any thoughts about this since the last time I audited you there, you know? You gone over this in your mind? Any improvement at all on the subject of anything? So forth? Oh, you have, huh?"

(Restimulation, see? Getting his mind, getting his main concentration.)

"Oh, you have, huh? Oh, is that so! Yeah, yeah, yeah, yeah. Tell me you used to... telling me you used to have nightmares about this. Did you have a nightmare about it or anything like that last night? Oh, yeah? Yeah? Is that so?"

"Well, let's see. We'd gotten along here pretty well down on the subject – we've gotten onto 'suggested' here pretty well. And I think your last answer to this had something to do with what – what was your last answer to that?"

"Oh, yeah, yeah, yeah. Well, that was on this subject. Yeah! All right. Well, here's the next question on that. Here's the next question on that: On gooper feathers, has anything been

suggested? You got that question? All right. Good. Now, on gooper feathers, has anything *been suggested?*"

All right. And here we go, watching that tone arm. It's just sitting there taking down the tone arm reads and keeping the pc going. And the pc finally said, "Well, that isn't any more. There – it just – that – there isn't any more. I haven't got any more answers to that. I'm protesting the question."

"All right. Is this question being protested? I'm sorry, there's no read there.

"Now what – what else might we have run into on this? You might run into something else there that you haven't told me or something like that? Did I miss an answer or something of this sort? Oh, I did miss a 'suggest' answer? Oh, all right. Well, good. Thank you. I'm glad we got that cleared up. And here's your next question: On gooper feathers, has anything been suggested?"

Get the idea? You're just keeping it in there, man! Keeping that in the groove. Keeping that grinding on and on and on, see? Tone arm action. When do you leave it? Needle isn't flashing around anymore and the tone arm isn't blowing down on this particular subject – well, let's unload!

Tone arms have tendencies to go very, very quiet. I give you something like a twenty-minute test. That's a little bit cruel on the pc sometime. An auditor can tell when a tone arm is flat: It isn't moving. Also, when you tend to flatten one of these things the meter starts to look gummy.

You can tell when they're flat. Shift to your next question. You're trying to cover a subject in the main body of the session, and you are trying to recover a pc for your session in the rudiment approach. So realize that there are two targets for auditing in a session. And that gives you two different endings. You don't want this pc to be dispersed out of what you are already doing, so you put in a rudiment-type approach. "Since the last time I audited you, has anything been suppressed?" Well, you spend fifteen, twenty minutes getting in those "since" BMRs – oh, marvelous! Marvelous! That's good! Now you can start in your main session.

But it is not with the same approach! You're not doing the same thing.

I could be very cruel at this point and say, "Well, I want to congratulate most auditors, because they've gotten up to a point now to where they are ready to learn how to run the body of a session, having handled rudi..." That'd be a shade too cruel, wouldn't it? Bitter! Bitter. But I watch this; I watch this consistently. And I notice that auditors vary in this approach. And they very often start treating body-of-session material as though they're just rudiments. And believe me, they don't do very much for pcs. In fact, they damage pcs. How? By leaving unflat cycles of action.

If you really want to lash a pc around the telegraph pole, man, just start cycle of action after cycle of action and don't flatten any of them. You just get enough cycles of action unflat on your pc and he'll be in a mess.

Now, let me give you some idea of how to *really sock* a pc. Let's take Class VI. Not because we *have* to reach into that zone. Because that is the most brutal area, where things

stand up in tremendously bold relief. You make some mistakes in that area and you know it. You get the evidence immediately. The little men in the ambulance backs up to the door, don't you see? And it's quite embarrassing. The neighbors talk.

You start to sort out goal A, but you don't sort it out; and then you get interested in goal B, but you never bring it to a conclusion. And then you wonder if something's happening with the E-Meter, because you don't seem to be able to get any reads. (In other words, you really can't think of anything to ask the pc that gets a read on it.) So you ask... You start asking some questions about the E-Meter. But you really don't clean up the subject of the E-Meter, don't you see? And then you wonder if there's any wrong goals that the person has had that are troubling him, but you really don't find all of those and clean those up.

Believe me, about that time the pc practically goes straight through the bottom of the chair. He will be dealing with a wog and he'll be turning on pain. He will be turning on dizziness. The corners of the room will start going out of plumb on him. He can't focus the auditor. The winds of space start blowing his eyeballs into the back of his skull. You know you've done it!

And what happened? It's just incomplete cycle of action followed by an incomplete cycle of action, followed by an incomplete cycle of action, followed by an incomplete cycle of action. You really didn't do anything *wrong*. You just didn't do anything complete. And that all by itself will wind a pc up in a ball.

Well, now, that's a very exaggerated level, but things stand out in such bas-relief at that level that it brought me around to inspecting the lower levels of auditing. And I found out that the lower levels of auditing are peculiarly subject to this, but it's not so dramatic. In other words, it takes a while for it to sneak up. And you don't see it all in twenty minutes of auditing, you see? You see it over a year's worth of auditing. You get lots less action. And the pc is just feeling sort of groggy these days. He just doesn't feel too good, and so forth.

Well, if you were to take almost any pc in the place and say, "Has any process ever been left unflat on you?" and you just ran that as a process... Don't Q-and-A with him and try to flatten any of the processes, just run a process, "Has any process ever been left unflat on you?" And you'll see your pc start brightening up. Somebody who's had quite a lot of auditing, he'll start brightening up. Even though it is not serious on his case, it is quite capable of producing a considerable improvement or result.

He'll give you the considerations concerning it just in the matter of fact of the question. But it's just a repetitive question process.

Now, what do you think happens when you start a Prepcheck on gooper feathers and shift over to a bad back before gooper feathers are flat? And get into a bad back and then get into this and get into that. All kinds of oddball things start occurring. The pc's ability to be prepchecked starts blowing up, amongst other things. Pc can't be prepchecked easily anymore. The auditing tool starts getting all blunted up and messed up. Oh, I think that's quite remarkable. The tool has been abused.

Now, you can put in bad comm cycle with an auditing tool also, like Prepchecking, and get the tool very badly blunted up.

So that you can actually prepcheck Prepchecking. See? Prepchecking. Just put in all the Prepcheck buttons on Prepcheck. "On Prepchecking..." and so forth. You can do this several ways: "On Suppress, has anything been suppressed? Has anything been invalidated?" You know? Put in all the buttons on Suppress. There are several ways you could go about this. Just as a general subject, put in all the buttons, you see? As each button.

It's quite remarkable. I've seen a case all hung up in a mess on the subject of a goals checkout and so forth, till somebody was suddenly bright enough to say, "On Suppress, has anything been suppressed?" All of a sudden it's an operating button again. Quite a remarkable revelation.

But the basic reason the button goes out is an incomplete cycle of action.

Now, you should, as an auditor, be very, very well aware of this thing called a cycle of action. It predicates this one basis: that things have a point where they start, that they have a period when they continue and that there is a point when they end. Now, that is a cycle of action. It's your create-survive-destroy cycle of action. It's start, change and stop.

Actually, you could put it down probably less effectively as a philosophic definition, but more workably, as "a start and an action and a stop." See? A start and an action and a stop. You could be more explicit by saying, a start, an action which then continues, and then a stop. And that is a cycle of action. That is just in that whole line.

Life is probably cruel because things seldom stop. There is a great deal of thought put into continuation. Continuance is one of the bugs that thetans are addicted to. They like to see things continue.

And you've got actions going right now which began with the beginning of the universe and nobody has stopped them since. See? They've never been stopped. And that alone gives the longevity and mass of the physical universe. Actions which were begun were never unbegun, you know, or stopped. Time itself is probably some basic agreed-upon postulate which nobody has ever thought the end of, so you've still got time, you see?

Now these things, of course, are done by postulate, but at a low level an individual is subject to them. And any case is subject to the cycle of action. Maybe he will get up to a point sooner or later where he is above the cycle of action. Oh, I say maybe: Yes, undoubtedly! Class VI, we've got all the stuff to put him there. And you get such oddities as a guy being able to move around in time. This is one of the more peculiar aspects of high-level action. You're not fixed in a time span. You can widen your time span almost at will. And there doesn't have to be anything there in the past time, but you can be in that past time period, and so on. It gives you all sorts of involvements. For instance, you can be at the event while it is occurring by having been in the future and come back to it, and undo it before it goes on. It's very confusing.

Well, because it's confusing and because it's upsetting – let's take two armies fighting each other. And army A attacks army B. So therefore army B knows that if it is in this position where it is being attacked at the time it is attacked, why then, it will be attacked. So the thing to do is to be in yesterday and not march to that place. And we very soon have generals out of a job. We have various things going awry. A game becomes very difficult to follow and

trace. So the thetan settles for the simpler life. And that is "What is, is. What will be, will be. Inshallah," see? "Fate..."

Well, what they're involved with there – kismet and everything else – they're just involved with the inevitability of a cycle of action. Fatalism is the total subjugation of the individual by the cycle of action. "What will be, will be." "If he starts going the car, he will then go down the road, and eventually the car will stop." Well, they even have it rigged that way. They've got oil prices up to a point where it'll run out of fuel. And they've got tires to a point where they wear out. And the time payments will catch up with him, and the skip men will come and get him. Something will stop this car.

In the main universe by friction and other conflicts, a particle traveling is acted upon until it stops. In other words, it's all... below the level of time, everything is sort of geared up to follow in along the time. If an action begins – I mean a single, individual action, not a postulate like time – if it begins, it is sort of geared up to stop.

Now, there are some of these things have not stopped, as I said a moment ago, which might be the composition of matter and such things as that. But even those things have a tendency to deteriorate as they go along.

Now, the point I'm trying to make here is that everybody is used to and in agreement with this thing called a cycle of action.

You aren't using it in your auditing because it is true. I spoke to you the other day about gradient realities. Well, it's one of the realities and it reaches pretty high at case level. It's a reality which fades out just before a person can put some universal laws under control. I mean, it's way up! So the reality of the pc that you process is tied in from the very lowest to a fairly advanced level with this thing called a cycle of action. And because the pc's reality is tied in with it, violations of it bring about an unreality.

So if you want to tell him "What can you find unreal?" just start busting his cycle of action as part of the auditing. Start a process, don't end it. Get a process going, drop it. And the next thing you know, he starts going all unreal on you.

You've got an agreement with him that he is going to get processed in a certain direction to a certain distance and then that's going to all come about. He's still sitting in the middle of his bank, not yet having as-is-ed all the material available on this, and suddenly there he is parked. There is nothing more done about it. And he's got this mass now, and these questions which he finished up – (quote) "finished up" with, since he didn't finish up – and he carries those on over into the next process. And then he never gets that finished, so he carries on *both* of these now into the next process. And he never gets that finished so he carries all three into the next process. And you'll find yourself all of a sudden dealing with a pc who is unflat on four processes.

Well, he won't smoothly as-is anything, for the only – only for this reason: because it looks very complicated to him. It's getting more and more complicated. He's not getting free, he's getting bogged down! His idea of freedom is finishing up some cycles of action. And let me assure you that that is a very, very good observation, well within his zones of agreement.

He knows that if he finishes his work he can quit. See? These are realities. Their truth is... Well, it's very funny to tell you this, but their truth is limited. But everybody *agrees* with it.

So therefore, when you start snarling somebody up, you have these two factors: The mass he is mixed up with in his mind is restimulated but not as-ised, so he's left with some mass hanging around. And he carries this incomplete cycle of action over into the next-begun cycle of action. And he will start accumulating mass and start accumulating upsets and he'll start getting loses.

Now, the idea of a win is very closely tied in with the cycle of action. Very intimately. This fellow wins, ordinarily, by having accomplished something. You could even win to the point of having gone to a point and then not having been destroyed when reaching that point, so therefore you would have accomplished something. You could even have a negative approach, you see? "Well, I've accomplished something: I came downtown today and didn't get killed." See? Even at that low level, that's a win.

Now, where does all that come from? Now, what is the upper echelon to what I've just been talking to you about? What is the *upper* echelon of this?

Let's really have an esoteric flight here. It comes under the heading of intention. Intention is part of the comm cycle. But intention is senior to the comm cycle. Intention. The ability to intend. An intention contains in it every power the thetan has. Every power the thetan has. The ability to throw a lightning bolt, the ability to hold something in position, the ability to make something continue, the ability to do away with something, strength, accomplishment, power, wit, ability – these things are all wrapped up on the one common denominator of intention. Intention.

When you're just half... Oh, no, no. Well, when you're just half-shot as a thetan, and you've almost had it and you think you're on your last legs... Not in the condition you're in, I mean, but pretty bad off, you know. You're not yet wearing a body. You're probably packing around an effigy. You have to be recognized and people have to say good morning to you or you're unhappy, this kind of thing. You're pretty gowed-in with mass. Your own actual GPMs are wrapped around your gullet. Your intention (this is a low-level skill, this is not a high-level skill) is quite good enough to, for instance, intend this crayon into the air in front of you, to intend this E-Meter over to the other side of the desk. This is low-level stuff I'm talking to you about. A guy is, oh, practically on his last legs when he can do this.

Answering a telephone, one simply intends the telephone up into his vicinity where he is listening and can talk. He intends it off the cradle up to his (quote) "ear" (unquote) and intends it back onto the cradle. Giving you straight stuff now. This is almost recent time. You've been able to do this in recent times. It baffles you sometimes when a piece of MEST does not instantly and immediately obey you. But that's simply intention. That's low-level intention.

I'm not talking to you now about something very esoteric. This would sound very startling and make a newspaper reporter turn gray overnight. But, intend him in a horizontal position outside the door, five feet off the pavement, and let him stay there for a while and cool off. I doubt he'd write it. Because he of all people knows he couldn't do it.

But there is intention. You get what I mean, now, by intention? You intend something to happen and it happens. The ability to intend. And that is all there is to a thetan's power. There is no more to his power than that. There's his ability to throw a lightning bolt, to set a house on fire, to make the roof fly off, to turn a planet upside down. That is everything – his intention.

So all you have to do to weaken a thetan is to get in the road of his intentions. Foul up his intentions. Now, if you can foul up a thetan's intentions, you can weaken him.

Now, what do I mean by weaken him? A person picks up, on Monday, a five-hundred-pound weight, but on Tuesday can only pick up a three-hundred-pound weight. Between Monday and Tuesday he has been weakened, right? Do you understand? It's this graphic. It's not the philosophic derivation of his morals become weak, don't you know?

Well, on Monday he can throw a raw energy beam a hundred yards. On Tuesday morning he can only throw one ten feet. Between Monday and Tuesday he has become weakened. That's what I mean by weakened, see? And the way that is done is to give him losses on his intentions. All you've got to do is foul up or counter or blunt his intentions and he becomes weaker.

Weakness and strength in a thetan, and of course, well, his weakness is the only thing that holds him entrapped. Weakness is the only thing that keeps masses pulled in on him. Weakness is the only thing that keeps him pinned down. You can only trap a thetan when he is weak.

And you need only really be afraid of things that are very weak, with, of course, the proviso of certain magazine editors; they – skip them. Leave them out of that category, because they've had it.

The main thing that we have to watch in this, then, in auditing, is that we do not weaken the actual intention of the pc by blunting his actual intentions. And in order to do this, we must differentiate between his reactive intention – his dramatization, in other words – and his own intention. So we have the subdivision of the pc and his bank.

A person who is dramatizing during an ARC break actually is not intending anything they say. This is simply bank dramatized, do you see? It's all bank dramatized. "*Rowr, rowr, rowr, rowr, rowr, rowr!*" He isn't intending anything. That falls out, then. That's a recording or something going off, you see? That is not his intention. So we don't say that everything somebody must do we must validate. You start validating the bank a hundred percent and you've had it as an auditor.

But we're talking about, now, the actual intentions of the person.

He intended to have a two-hour-and-a-half session. And you give him a three-hour-and-a-half session. You have blunted his intention. He intended to get off this stuff about Aunt Hattie, and you called the process flat long before it were flat. So therefore, you have blunted his intention.

You can't ruin a pc. I'm just talking about how *smoothly* you can audit. You understand this? Because you're not going to spoil anybody's intentions or cave them in by auditing,

let me assure you, see? But you can key in incidents on him, and so forth, where his intention is very badly blunted by simply taking an auditing cycle of action and not completing it. In other words, he intends, so forth. You intend, so on, you... so on. And there you go. And you finish it off, and you wind it up. You've completed a cycle of action. That intention has gone through a complete cycle of action then. If you interrupt it halfway, no intention.

Goals for the session. Goals for the session. Here's a good point. You get a pc to put in goals for the session; that's actually a participating intention. So I always work hard on giving a pc goals for the session. I almost work harder to give the pc his goals for the session than I do to give him a session. See?

I can give anybody a session to cure anything or straighten him up, see? That doesn't worry me. But this pc sitting down there has just got through saying, "To feel better about my lumbosis." I'll put that in. I won't take up the body of the session till I've got the oddball goal out of the road. But I can – any pc that is trying to break or stop or not go through with a flattening and so forth, putting in a bunch of sideways goals, could actually stop you from auditing or completing your cycle of action and roll himself up in a ball.

A reactive barrier can arise out of this situation. So he puts in a lot of oddball goals that don't have anything to do about the price of the thing. I'll still clean them up. I'll still clear them up.

But I take out the little kit, you know? The little kit with the little whisk broom. I get those out of the road. And notice the pc apparently has a present time problem. This is in R6 auditing. This is not our ordinary auditing. This is... therefore, any kind of auditing, if you'd pay attention to the pc's goals for the session at R6 when you're totally capable of getting a hundred TA divisions, you see, in two and a half hours, well, good heavens, how much would it apply down at the levels when he's getting fifteen in a two-and-a-half-hour session and lucky to get it, see? So this very definitely applies.

So here's – here's – the person's got goals for the session. I'd look those things over – *pickety, pow, pow!* "He's got a present time problem here. Ha-ha-ha-ha-ho, ho-ho-ho. Let's get the considerations for that present time problem." "Are you... I suppose you have a present time problem here. What – what considerations have you had about that? All right. That's fine. Okay. And you had a bad neck? Been bothering you, and so forth. All right, is that an R6 phenomenon? Is that from goals and... ? It doesn't seem to be from goals, GPMs.

"Something else seems to have gone on here with regard to this. What was the first you noticed this? All right. Good. All right. Well, let's date this." Pow! Pow! Pow!

We're doing about a four- and five-minute process, don't you see? I mean, we're driving it right straight along the line. We got the pc on it. We're just brushing this thing off, see, getting this out of the road. But we're doing this other thing: We're giving him the goal for the session, see?

Oh, we got that out of the road. We dated it, the somatic blew and so forth. You have to be quick on this kind of auditing. He's made that goal for the session right there. I haven't even started the body of the session.

The session, now, is – with "since" mid ruds and everything else that has happened – is only thirty-five minutes deep, and we're away into the body of the session on what I want to do. He's already made his goals for the session.

You want to see the good indicators come in? Ha-ha! Make sure the person gets any PT-problem-type of goal for the session and so forth, get him a win on it in the first five minutes of play. Then get down to something important.

"Oh, yeah," you say, "this takes very skilled, very fast, very tricky auditing. You really have to know what you're doing to be able to get rid of somebody's lumbosis that's been keeping them up all night in the first ten minutes of the session." No. No, no, no. Who's getting rid of it? We just keyed it out. We just gave it a swift kick, so it isn't bothering the pc. Made his goal for the session, too. Therefore his intention level is up. So therefore he's more powerful in the session. Therefore he can look at his bank better. See this?

That's why a person makes no progress while he has a PTP: His intentions are being blunted or overlooked. And so he cannot rise superior to his bank. So he makes no progress.

What is a PTP? It is postulate-counter-postulate. You could just as easy interpret this as intention-counter-intention.

You will not find a present time problem where a person's intentions have not been blunted. Something is fighting his intentions. And he – it seems to him that it's of equal magnitude. Intention versus intention. He has an intention, somebody else has another intention. These two intentions lock together and you get a present time problem. It tends to hang up in time. And that's how you get a time hang-up, basic time hang-up: intention-counter-intention.

Let's look at Class V for a moment – not because we're teaching you anything about Class V but because this is a marvelous field of demonstration.

Why do you think, in the Helatrobus and the trillions-two, and other implant areas, *oppose* was in vogue? It isn't even the actual GPM. The actual GPM is a subvolitional intention which is way downstairs. It goes in with an axe. "Everything inevitably brings about something else. It doesn't matter what happens if something else is going to be brought about." It's very apathetic. Very low.

But these brisker levels, more ambitious levels: how did they knock out the power of a thetan? How could they possibly do anything to a thetan? Well, the implant means, by using key goals like "to go," "to stay," "to move," "to go away," "to forget," "to remember" – this type of goal, all mucked up with innumerable variations of that goal, serve as key intentions. So what he *intends* to remember, he of course will get "nix to remember." He'd get an automatic and instant blunting of intention. That was the intention of the implant.

Very far from flawlessly works. Thetans transcend this stuff rather easily. But there, there is the woof and warp of implants and how they are done and why.

Anybody setting up implants that are going to be successful would simply blunt intentions. Blunt intentions, that's the whole thing. So he says "to move," he immediately gets "not to move." See? And then the implant GPMs interact one against the other, so if he gets the

idea to stay, then he feels he has to move. And if he gets the idea to move, then he feels he's got to stay. So they counter-oppose each other, too.

So opposition or oppose is the keynote to an implant. And this is the only way that they're aberrative. There is no other reason. Bah! The amount of mass and – mass – mass, the thetan only keeps the mass of these things around because he can't get rid of them and he's automatically creating it and he's doing other things, but an implant GPM has too little mass to be very upsetting to the individual, but it upsets his ideas. So he gets the idea to go and he gets the counter-intention – hits him in the face.

The way they "civilize" a child, for instance, is to... all they have to do is break all his intentions. Somebody talking about spoiling a child or upsetting a child: That's very silly to say that by giving a child everything, you spoil the child or by being nice to a child, you spoil the child. They're just drawing a longbow. They couldn't be further from the mark.

It's blunting every intention the child has. And remember that there are reactive intentions and that there are analytical intentions – two varieties.

So we let the reactive intention have its way. Child cries, screams and throws a tantrum, we instantly give him what he wanted. That validated the reactive intention. The child wants to sit quietly and look out the window – analytical intention – so we get him busy doing something else. By the time we've crossed these things – in other words, validated the reactive intentions by rewarding the child and obeying the reactions, and blunted every analytical intention the child has – we'll of course have weakened the thetan (becomes susceptible to illness and that sort of thing), simply because masses move in on him.

I mean, a very... a person who is weakened is unable to hold anything at a distance, so everything collapses on him.

You understand what I'm talking about? This is *terribly* simple. And there it evades understanding just by being in itself so idiotically simple.

So your pc has two types of intentions. And one is totally reactive. It's just a dramatization. So we won't call it an intention; we call it a dramatization. Every time your pc dramatizes, you let him have his way. And every time your pc pleasantly, nicely wants to do something analytically, you blunt his intention. After a while, you're going to have your pc practically spinny on the subject of auditing reaction. He won't be able to handle things in session. You'll find the pc isn't cogniting. You'll find this and that, and so forth. There's many an auditor pays nothing – no attention to the pc until the pc starts ARC breaking.

Now the auditor knows something is happening, so he decides to do something for the pc because the pc has ARC broken. But actually the pc has been sitting there auditing splendidly, beautifully and smoothly. His pc'ing is very nice. And he sort of timidly brings up the fact that he would really like to – you know, he'd really like to look at this engram he's seeing there just a moment longer. He brings this up; he says it's bothering him a little bit. He doesn't quite know what it's all about. It's a little bit of an origin, you see? It isn't going to take any time. You don't give him an additional restimulation. You say, "Yes? All right. All right. Well, what's it all about?" (Something like that.)

"So-and-so and so-and-so and so-and-so."

"All right, that's fine." You get that out of the road and you go on, don't you see?

But every time he says, "Well, I uh... I don't know... I don't really... I don't really have any more answers to that question. Uh... I uh...."

"Well, you're damn well going to answer the question!" See? This is getting on to the borderline of intention, don't you see? So he kind of gets upset one way or the other.

The auditor doesn't pay any attention to what's going on there. We've got an uncomfortable situation. Pc's intention, cycles of action, what he's doing and so forth – they're all kind of getting mixed up. And the auditor's paying no attention to this because the pc is still in a fairly sweet frame of mind, you see, when the pc finally loses... You understand, a pc doesn't turn nasty, a pc gets overwhelmed by his bank. That's always the case. And the pc, own intentions having been blunted badly, then loses control. And the bank, powered up, overwhelms him and takes over control, and on an automaticity, starts blowing its head off! Going into all sorts of dramatization of one kind or other, even though it's just the dramatization of apathy. Bank is in a dramatization.

Well, of course the auditor acts. That's what we know as acting too late. That's catching a slipping situation too late gives you these explosive ARC breaks. They generally telegraph themselves way ahead. But what's happened there is really the pc has become overwhelmed by his own bank. You're not watching the pc's intentions now, you're watching the pc's dramatization. But you don't do anything about the pc's intentions, you will eventually get the pc's dramatizations. It's quite an elementary situation. It's one which an auditor should understand.

Now, I spoke to you some time ago in a lecture about what is a win and what is a lose. Just going over that cursorily, a win is accomplishing what you intend to accomplish or accomplishing the not-accomplishment of something you didn't intend to accomplish. You get the idea? You intended not to have any ARC breaks, and in the session you not-had any ARC breaks. You understand? Well, that's a win, see?

And a lose is just exactly the reverse – just exactly the reverse. Things you intended not to happen happened, and things which you intended to happen didn't happen. And that's a lose. And that's all a win is and that's all a lose is. That's all.

So when we compare this situation to auditing, we find out, then, that the auditor's intention is valuable to the session. And because he's less susceptible to dramatization from the bank in the pc – since he's not really at all greatly susceptible to the bank in the pc; it's the pc's bank, it's not hitting the auditor – and because the auditor is capable of standing outside that perimeter of potential dramatization, the auditor's intention in a session is therefore senior to the pc's intention. But if the pc's intention is totally neglected with regard to a session, we again get a weakening of the pc and an encroachment of dramatization.

So the auditor intends to flatten off such and such a process. And the pc intends to take care of something else he has thought about overnight. Well, that pc has been subject to dramatization because of restimulation. You'd be very foolish not to flatten out the original process, because that was the original intention, wasn't it? That wasn't finished, and yet the pc wants to do another one. Well, this is going to hang him up with an intention loss whether he

likes it or not. And the auditor, standing outside this perimeter, of course, can complete the cycle of action on which he began. And that gives a win to the auditor and the pc. You follow this?

Pc's analytical intentions, then, are valuable to a session. And they are very often expressed in the goals of the session, and they are cared for accordingly. That's the way it is.

Now he intends to get a certain distance, and actually, down deep he really intends to become OT. He's never investigated this. It's running far too deep. But way down underneath all the layers of God-help-us he intends to get to be OT, that's for sure. In other words, he intends to recover. He doesn't even, though, have enough analytical awareness of where he is going to know what he intends. He intends freedom and a return of power – which is to say, he intends freedom and a return of intention. Well, he now can go all the way. He now can go all the way. That is well within grasp. If he walks along a certain path, and doesn't keep jumping off the cliff and so forth, why, he will arrive. Well therefore, the intention for him to arrive is very *sotto voce* in him. And an auditor with some experience and action on this, intending him to arrive. The auditor's intention is actually more reliable than the pc's, even though the pc is more deep and fundamental than the auditor's. Why? Because every time he starts coming up the line, this pc is going to short-circuit into some direction, fail to complete a cycle of action someplace, leave a rock in the road somewhere or another. And he'll get some wild idea and – well, I've seen it happen, man. You... This pc is supposed to be prepchecked on something or other in order to get something or other accomplished so that he won't always be coming to session with this gross PTP about his domestic affairs or something like this, don't you see. And somebody has decided to get this out of the road so they can proceed. And he's thrown that all sideways, and he's spent the night listing goals. See?

Well, in the first place is, the reason he listed goals had to do with the fact that his intention about his marital problem was being blunted. So case advance is now reinterpreted into some kind of an escape from his present time problem. So he doesn't know which way he's going; he doesn't know what cycle of action he's on. Is he on the cycle of action of completing his present time problem with his domestic affairs? Or is he on the cycle of action of becoming a free being? Well, he's on the cycle of action of becoming free from his wife. He's not on the cycle of action of becoming a free being.

Well, something weird goes on when you've got this kind of thing happening. He's on a small perimeter. He's on a little cycle of action, and he's using a huge cycle of action potential to accomplish this little cycle of action, you see? He's using a 20-millimeter machine gun to shoot a grasshopper, see? And of course he can't shoot this grasshopper, because actually you can't get the muzzle depressed enough. You get this kind of... He's got freedom mixed up with escape. He wants to fix it so he doesn't have to confront things any more. All this kind of thing goes on and all that can get in an auditor's road hugely.

I'm talking to you now about fine points. You know – you know, in spite of all this, you can blunder through. You know? I'm just giving you some fine points here.

You could get there somehow, prepchecking the rough edge off of a person's lumbos, and somehow or another this. And somebody puts him together with sticky plaster because too many unflat processes exist on the case. And then somehow or another you finally

find the GPM, and you get enough tone arm action out of the GPM to – you get the idea – to sort of cancel out some of the other sins and ills that have occurred in it. You'd get there somehow; you could muddle through.

But these are the fine points. These are the fine points of the business. He's as weak as his intentions are blunted. He will become as strong as his intentions are free. The greatest holder-backer of intentions is the person himself. Because he puts himself in danger every time he has a dangerous intention.

I think your international champions in boxing, let us say, or something like that, probably have an awful time. They probably educate themselves right out of a hard punch, merely because they're walking through the society all the time. It'd be very, very dangerous indeed for them to uncork a hard punch in the Bide-a-Wee Cocktail Bar, see? That's supposed to be reserved only for the stage, see? So here's an intention that is becoming narrowed and specialized. They eventually become quite weak.

I'm not talking about something that you could measure by the diameter of the biceps, the number of foot-pounds of punch deliverable. You see, they're having to withhold this intention. This intention has got to be very much pulled down. They've got to condition this intention.

If they have a trainer and a manager that tells them, "Now only hit with your right hand during moments of something or other." Some fellow across – as their opponent in the ring – could stand there with his guard dropped. The person's left hand, in perfectly good condition to deliver the final blow that would end the whole match, you see, and yet would never strike the blow. See, his intention – his intention, now, is far, far too specialized and channeled.

Now, you ask a fellow, "What restraints do you have to put on yourself in your everyday living?" You're going to get almost a roaring automaticity, see? He has been taught that his intentions are dangerous to him. He's been taught that he can get a dangerous intention. He's been taught as well that his intentions can get out of his control and he can accidentally intend something.

So every once in a while you have somebody walking around in circles – there's been a fire in Birmingham or something of the sort – and there will be somebody walking around in circles worrying because he might have let an intention out from underneath his hat and started the fire in Birmingham. See? And he'll actively worry about this. You see? Whereas the guy couldn't even warm up a cup of coffee if he had a stove, see?

But thetans become very worried about this sort of thing. And they become very protestive. And one of the big games is to make somebody protest his intentions, you see. "What are your intentions toward me, sir?" You see, that's the standard girl's question. "Clarify your intentions," and so forth.

Wasn't it Voltaire that won every argument before he even began it? He said somebody had to define his terms before he could argue with him. Well, that's very interesting. But if you carried that a little further, you'd find the guy would get so busy defining his terms that

his intention to have anything else happening would be nil. And you wouldn't find much of a debate in progress here, don't you see?

"You must define your intentions or what you're doing." Society does this to us in Scientology. Fortunately, they don't know what our intentions are. And frankly, we've never really sat down and mapped it all out as to what our intentions should be. Which is probably the way it should be, don't you see? Because therefore there's nothing to blunt. Nobody has ever expressed the matter. That's sort of a lazy way to go about it.

But they have all sorts of assignments to us in Scientology as to what our intentions are. They wouldn't believe our real intentions, so we'll probably make them. But we lose – for instance "a world without insanity or war," or something like that. It's a perfectly valid intention. Well, they consider this too high-flown. "What are their intentions?" So they assign a whole bunch of false intentions to the Scientologists, see? Well, let them. That's what makes their attacks look so silly, because of course they're fighting a set of intentions which don't exist. So it makes them look like they're walking around talking to shadows, or something like that. It leaves us completely free and rather unwound, into the battle.

The intention, actually, any broad intention we have is quite clear-cut, appears in many books, but it's way over their heads, you see? They can't figure they could blunt that intention because that's... Well, you take a war without – I mean a world without insanity; you take this as an intention. Well, that's good roads and good weather; of course, very unreal, unaccomplishable. Anybody'd look this over, they therefore couldn't have anything to do with that. One of these days they're going to be awful surprised! See?

We'll have that intention moving. See? I even spent a little time in on "How would you handle vast numbers of insane?" and so forth, see? Out of that original speculation, we got Scientology 0 processes, by the way. I mean, they're just an offshoot of that. I'd hate to have to confess that to you, but that was the body of research that came out of, which is just des-stimulate the environment. Give a stable datum for the environment.

So, intention – intention here is everything in case recovery. If a person is regaining his power or ability or something like that, he's merely removing out of his road what blunts his intentions and what has blunted his intentions, and that's really all he's doing. So if we look this over with a very critical eye, we find out that the auditor, going through almost any sincere job of auditing – even if clumsily done – will inevitably unblunt some of this pc's intentions. They will be unblunted one way or the other. And we're talking about the upper esoterics of auditing – how to keep auditing from blunting the pc's intentions, you see.

Well, an intention is a cycle of action. Any time you say "do," you add *time*. So a doingness intention or accomplishingness intention has time added to it.

The moment that you add time or doingness to the thing, you've got a cycle of action. So an intention is at its highest echelon, totally independent of time and the cycle of action. Intention is simply pure intention and is not necessarily tied into time at all! You could just as easily make a postulate in 1492 or in 2658 as you could in 1964. There isn't any intimate and immediate relationship.

But as the individual has gone down scale, he has of course more and more associated his intentions with a cycle of action. You make the intention and then a certain thing occurs, or the intention goes across a space – as in communication, you see – and then it arrives at the other end, and a certain result therefore takes place at the other end. So we have a cycle of action. We have the intention, now, worked into time and space.

So the intention originally is totally free of time and space and has nothing to do with it. And in actual fact, time and space have, as their only reality, the fact that they are made out of an intention. Doesn't matter whether this intention is an agreed-upon intention or otherwise. There's a basic intention which gives us time and space. So it is actually superior to all MEST. And you'll have your fingers on something, it doesn't have to be MEST; but as it comes down scale, this becomes expressed to the pc, particularly at the lower levels of a case.

Lower levels of cases, this fellow's having a *dreadful* time (exclamation point)! See, he's just *staggering* through life, man. He's hitting both walls and walking backwards and falling on his knees every time he turns around. Well, that individual's agreement with a cycle of action means that an intention... There are no intentions any more. There could however – might be a cycle of action. See? The intention has disappeared out of the cycle of action, and you simply have this cycle of action. When he goes down any further, he goes down into pure chaos.

So therefore, you can take a person who is having a terrible time and tell him to touch the wall, and you've shown him an intention and shown him a cycle of action. You can short-session him. You can start a session, run a session and end a session. Ten minutes' worth, see? Then start another session, run a session and end a session. All you're doing is showing him cycle of action, cycle of action, cycle of action. The auditing command: cycle of action. The auditor's command, the acknowledgment... the answer, the acknowledgment: It's a cycle of action. All you're showing him is you're demonstrating the existence of a cycle of action, cycle of action, cycle of action – any one of these things as they come through.

And eventually, his own in... the reason he cognites is his own intentions start to free up out of the obsessive MESTiness of it all. And he starts seeing things. And he starts coming back to battery. He starts adding up what's going on. Well now, the only way the auditor can get in his road in all this, of course, is to foul up his own cycle of action – the auditor's cycle of action. Now we could foul this up. One of the ways of fouling it up is to leave processes unflat. Or misinterpret what we're doing with a process. We're trying to get rid of this fellow's lumbosis or lifetime problem here, so we treat it like it's a rudiment. We give it a little dust-off and so forth. Well, misapplication of tools. Well, you're not going to get the intention clear because that back is not going to get better under that kind of treatment, so the auditor's intention is blunted, the pc's intention to have a better back is blunted, everybody loses under that situation.

So our intention on the thing laid out: If we're going to have wins then we must validate analytical intention, knock out dramatization and be very consistent with completing cycles of action, even though it's an auditing command or getting rid of his lumbosis. And those are the factors with which you are dealing. The auditor must flatten the process within the reality of what he is processing. In other words, within the reality of, *What's he got here?*

He's got a little problem that's been generated since last night. So he stops auditing the back, which has been going on for nine or ten years, and starts using heavy artillery on this little problem that came up last night. Well, he didn't complete the big cycle of action, he's trying to make too much out of this other cycle of action – he's misapplying his tools, in other words.

He's working on this bad back and the only reason he gets last night's problem out of the way with his little dust kit is, well, just so he can go on and complete this bigger cycle of action. You've got to keep the pc on the main chance. You've got to flatten the big stuff that you start. You're doing a Problems Intensive – I don't think you could prepcheck it in under ten or twelve hours. If you did a proper assessment on the thing, you'd – ten or twelve hours, I'd think that'd be a long – a short haul to cover everything, let us say, from 1949 July on up to present time.

Well, how do you make it run that long? Well, it isn't how long you make it run: how much is there there? Well, that depends on how much you impinge on the pc. That depends on how much you make the pc work at it. That depends on how hard you sweat over this particular action, and how clean you keep the pc from ARC breaks, and how clean you keep his interim session difficulties – the between-session difficulties – from interrupting you from doing a cycle of action. And for that kind of thing, we've got little brush-off things. We just destimulate this stuff. The rudiment approach, then the main-session approach. And therefore, we can *achieve* the intentions of the pc, we can *achieve* the intentions of the auditor.

We flatten a process within the reality of what is there to be flattened, and how much is there to be flattened? How much are we tackling here? Well, the fellow was always – had a little problem that had to do with – he's always had this problem, and so forth: he thinks he's inferior. Well, that's great. That's great. Now, you're going to handle this with a rudiments process. No, I don't think so.

The individual comes into session and he stubbed his toe outside the door and it hurts. You're going to give this a fourteen-hour Prepcheck.

So the magnitude of what you're trying to handle, the duration of time of what you are trying to handle, to a large degree establishes how much time it is going to take you and how much heavy action you will have to take on it and how thoroughly you'll have to flatten it. And those are the establishing factors. But when all out – when all else is worked out, you're trying to *complete* a cycle of action. And on the very *bad-off* case, that is all you can do. That is the most basic process there is, is simply get a cycle of action completed. And I imagine that an auditing question like this: "What did you have to eat for breakfast?" Guy is having an awful time. Practically blindstagers, type pc, you see? And two-and-a-half hours later, with a great deal of two-way comm and discussion and so forth, he has answered the auditing question. It sounds incredible, doesn't it? And yet, you know the pc would have a win? Pc would have a big win.

You went in too high. It should have been "Did you come to the session?" That wouldn't have taken so long to do. But if you can get an auditing cycle completed, you get a win, and if you don't get an auditing cycle completed, whatever else you look at or what you think you are looking at, you're going to get a lose. Elementary as that.

So when the whole – when the whole thing is squared away, what you're trying to do as an auditor depends on what you're trying to handle in the pc, the order of magnitude in terms of time and trouble and duration and so forth, and that determines on what kind of flattening you use.

And the flattening of the main chance, the big long-term one and so forth, is done very arduously indeed. It's all done by TA. It's never done by anything else but TA. And of course your little stuff that you're trying to get out of the road so you can keep on with your main action is just a rudiments-type kick-off and you just flatten it to cognition or till it isn't bothering the pc and it's out of the road and you're away. You see why this is now? You see how this is? All right. I hope you can have some wins on this.

Thank you.

International City

A lecture given on 24 March 1964

[Part missing]

What's the date?

Audience: 24 March.

Twenty-four March AD 14.

Well, today I'm going to talk to you about something entirely different than ordinarily I talk to you about here at Saint Hill. I want to talk to you about a project having to do with world peace.

Now, you realize that a communication is necessary to stop fights. A communication is also necessary to start fights. What kind of a communication is it? Well, it's generally a communication that's a little longer distance than can easily be understood.

And you take these massive terminals sitting around the world, the world's capitals, various countries, very distant from one another, extremely distant, very much protected about by their populations. They're quite a distance apart. And when they start talking to each other, they don't talk very understandably, and the distance between them has a tendency to set up a considerable amount of voltage. They're too far apart. And they have to talk too loud. And they have to shout too hard. And after a while they begin to figure that they're mad at each other.

But it is a technical fact that the distance they are apart brings about a difficulty of communication which brings about an imperfect communication. And they're apparently – in the leaders' minds – sufficiently far apart that they can destroy or strike at each other with impunity. In other words, one can shoot at Moscow without wiping out Washington. One can shoot at Washington without wiping out Paris, you see? And they have the illusion, then, of security. And that illusion of security actually no longer exists because in any atomic conflict you have things called fallout, and the drifting winds of space, and you have other interesting things. Most of the atomic weapons designed for use today have killing elements put in them such as cobalt-60, and these tend to wipe out tremendous areas of countryside, and the drifting fallout resulting from a war, even if it's not terribly dangerous in test, would be very, very destructive to the nation who was declaring war.

Well, all of this brings about an interesting fact that these countries, then, are actually situated in such a way that they have the illusion of being able to execute hostile actions against one another with impunity. Now, none of these national governments are themselves able to operate broadly for the benefit of everyone, but they are trying to go out beyond their

own borders and influence other areas, and these other areas are being influenced by yet another national government. So they develop all sorts of brushfire wars. And these little brushfire wars will probably keep on going, they'll be more serious and less serious, but a man is killed just as dead in a skirmish as he is in a major battle. And the activities going on now in Southeast Asia are an example of that.

Here you have Washington unable to strike directly at Moscow, Moscow unable to strike directly at Washington, so they strike at each other in terms of a smaller nationalism in Southeast Asia. So you have a small war going on there, enturbulances going on there, consistently and continually, men getting killed just as dead as in any major conflict.

They have all sorts of odds and ends of battle and upset, and diplomatic coups, and influences of populations and... You have a bunch of people who really haven't found out that you really can't be at war with one another with complete impunity. And what they're doing is bringing about a dangerous environment. That is actually the whole thing in a – in a sentence.

They're still bringing about a dangerous environment. The citizen of the United States is being taxed to support fantastic armaments, to a point that it is utterly staggering. He's worked – this – the Washington government has worked itself into an economic solution by the manufacture of armaments. I think some three-quarters of the scientists and engineers in the United States now, now work for the government and so forth. Pretty soon there's going to be nobody left to work for the people.

The stores are becoming more empty, inflation is going up, and the reason for inflation is a shortage of goods. Whether or not you want to window-dress it in some other way, inflation takes place in the presence of shortage of goods, and a deflation takes place in the presence of an overabundance of goods. And that's about all you ever need to know about money.

If money won't buy things, it inflates. And if money will buy too much, it deflates. And although they tell you, well, there's plenty of products in the United States, tremendous quantities of products in the United States, nevertheless that currency is inflating. So that currency has gone international in an effort to reach out and do things politically, on a political front, and handle these situations with other capitals.

In other words, there's too little goods in the world sitting under the United States dollar which is now the basic currency of the world, the most frequent, the most fluid currency of the world.

It isn't that there's too little goods in the United States. Get that there's too little goods everywhere. Now, how does that come about? Well, it comes about through lack of production. There's too little production elsewhere. People don't have the facilities to produce. So if the people have no facilities or – to produce, and if they're being disturbed politically continuously, you get an inflating state of affairs. Some fellow works very hard, in his twenties, and puts aside a great deal of money, and finds out that it will buy a pair of shoelaces in his forties, you see.

China is a marvelous example. The whole country was practically captured by inflation. A friend of mine in Peking sent me an airmail letter just before the iron curtain went down completely. There were two letters, about six months apart, and the first letter had a

stamp on it, an airmail stamp, and its value had been overstamp on the stamp with a rubber stamp, so that the airmail stamp which should have cost thirty-five cents or something of that sort cost about thirty-five dollars. And that was fine. And a few months later I received another airmail letter from him, and it was quite interesting, because that was the last one, and the value of the stamp had been raised by the post office by overstamp so that the thirty-five cent stamp was now worth something like seven million dollars.

Now, this brings about conditions of slavery, no more and no less. You eventually have to turn to communism and no money because nobody can keep up with the inflation.

Now, Russia today is busy starving its population. It's having a wonderful time being the leading nation of the world, in political freedom, and it has never managed the problem of feeding its own people which is such a bad advertisement that not long ago one of the (quote) "new African states" that's awful cliché – one of the new African states, in conference duly assembled, was sitting about giving their opinions on what political philosophy they should adopt. And one of their leading lights stood up, and said, "Well, whatever we adopt, we must not adopt communism, because it finds itself completely incapable of feeding its people." Well, it took them a few years, but they finally found it out.

Communism tries to tell us that this is political freedom, but it isn't very much political freedom when nobody can receive a reward for his labors, and the communist worker of course is just on a continuous strike. If nobody's paying him, and he can't have anything in return for his labors and so forth, he just goes on strike. I think most of their food comes from the one-acre peasant plots which they are permitted, which the peasant is permitted to sell the produce of. And I think that's all the food that Russia has.

It's quite interesting because they've gone into tremendous reforms. It isn't political – it isn't lack of political cunning, and it isn't lack of plans that has brought this about. It really isn't too much in the field of political philosophy. Russia is having to support and maintain a front line which is vastly extended into many other nations, and has to support a tremendous array of armaments, which in fact with that many men under arms, that many of her productive people held into the dedicated service of Mars finds her rather incapable of doing anything mundane like making sure that the kids get enough milk to drink, you see.

So we have the world at large in political turmoil of one kind or another, and these national dedications to self-protection, to this, to that, the other thing. There's tremendous emphasis today on politics, and politics has entered very deeply into economics, and it makes in effect a rather unstable view in all directions.

It's not very comfortable for the common citizen filling out forms, forms, forms. It isn't very comfortable for the young man who just about the time he should learn to be a mechanic or something useful and so forth, has a finger pointed at him, "We want you," and he finds himself wearing blue or khaki or something of the sort, and walking around a place he doesn't want to be. And for a couple of years or so he has to go through this treadmill, and he gets – I've talked to these kids, and they're just in complete apathy in their teens. They don't plan their future in any way. It's quite interesting, the – this thing.

But then again, that's being in a place you don't want to be. That is not their decision. And when you get a condition where an individual is being forced to do things he doesn't want to do and being forced to be in a place he doesn't want to be, he degrades.

If there's any national degradation in progress, in the United States, it probably – it stems directly and exactly from the draft laws – Conscription laws. Readiness for war, readiness for war. Any one of these people would sit down and have a chin-chin with one another and settle their affairs and compare things. It's quite interesting that Iowa farmers were quite capable of talking to Russian farmers on their various trips, and they were swapping notes as how you could best raise this and best raise that, and getting all excited with each other because some of their practices were so barbaric and any time they met and talked to one another, they found that they could be very friendly.

Therefore, it really isn't the individuals of the world that are having difficulty or are causing the dangerous environment which we find here on Earth. The individual would probably be able to work it out rather easily. But impersonalized or depersonalized with a gun in his hands or a push button under his thumb, he of course can go to war with other individuals he's never even been introduced to, and we have a nice system going here whereby the organizations of Earth, which cannot bleed, which cannot suffer in actual fact, which cannot feel, are at war with one another. All of which adds up to a dangerous environment.

Well, this planet is going to blow itself into political unworkability or hot fission within the next decade or so unless somebody comes up with some workable idea which makes war a difficult thing to wage and which sets aside these economic stresses which are such a drain on the populations of Earth.

It's very interesting that such an objective would be possible. This is a pretty big plan. This is a pretty big think. Because there have been some big wits at work on this for some time. In fact, I think the first peace movements and so forth are probably discoverable in ancient Egypt. And a lot of fellows have been thinking for a long time on how you brought about peace. But there has been longer think on this than man's think. The left and right side of the body – let me show you some of the elementary actions on this – the left and right side of the body might very easily be at war with one another. You see, there's two eyes, and there's two ears, and so on. But what has happened there is the left side of the body is governed by the right side of the brain, and the right side of the body is governed by the left side of the brain. Maybe you hadn't realized that.

But this would – this would make a plan something like this – just to show you there's feasibilities in these things. You put Washington in Moscow. [laughter] And you put Moscow in Washington, and let them govern their countries from that distance. And of course their tendency to bomb each other out would be reduced to practically nothing.

Now of course, that's not a practical solution. But I have just given you a little taste of the fact that even though it's a ludicrous solution, it nevertheless can be stated that if that happened, you see, there then could be no war. You see how nice the Muscovites would have to be to the people of the United States, the people of that capital. You can imagine the Russian diplomat busy governing from the middle of the United States, you know. He'd have to keep

very good peace and personal relationships and understanding and so forth, with the American people, and vice versa.

You can see how the United States government would go about it. That's very easy to see. There would be three press-relations men and public-relations men, you see, for every political diplomat on the embassy and government staff. See, they'd handle that very, very high pressure. They'd make peace.

Well, you see, right now there's no vested interest whatsoever. That's of course not the solution I'm forwarding, but I'm just giving it to you. You see, it pays nobody now to advance the cause of peace. Nobody gets paid for it. They only get paid for war. A general only gets promoted if he gets some more troops under him. Well, how does he get some more troops under him? Well, you'd better rattle a few more sabers, you see? And the congressman doesn't have influence unless he's appropriating fantastic sums of money and buying tanks and things like that. Then he's got lots of influence, don't you see?

And everything is built up so as to go along, that the more trouble there is, the more importance the political figure has. There was a rule, by a woman queen, down in Romania – I think the name was Marie – and for a long period of time she conducted a very, very peaceful government. The country had more prosperity than it'd had for hundreds of years. And she got headlines only when she went over to the United States on a visit. Actually, that was one of the most productive governments that anybody had around for a very long time. They had prosperity during that particular period. But she didn't have much publicity as a great or very smart ruler.

Apparently man deifies what causes trouble. And it's – American presidents who don't have a war during their regime are hardly remembered in the textbooks at all. You remember the war presidents. Those are the boys. The war presidents. But not the peace presidents. See, they're something else, you see. And similarly things of that character are quite common, so the amount of dissension is sort of an index of their win. But the common citizen, the boy who's got to keep things rolling and that sort of thing, does not make his personal fortune or his life out of such chaos. The popularity of such people as FDR, a great war president, and so forth, was borne out of the broken homes of practically everybody who fought World War II, see.

You get a slaughter of the individual and his concerns, the aggrandizement and a few more stars on the shoulder of the political boss, but you don't get – you don't get any forward progress for the individual.

Therefore, if man is to make any forward progress at all, these conclusions and many others say that he will make his greatest progress in an atmosphere of peace. The only thing that would make the government back up and knock off on income tax and so forth, if it wasn't having any great demands on its treasury to build more tanks, don't you see? It's quite interesting. I have been in several countries which haven't been at war for some time, where other countries during the same period had been at war. And it was just the length of time the country hadn't been at war that gave it an atmosphere of calm and things getting along all right. You can notice this by going around and taking a look at the world, and you'll find those countries which have most recently been at war or haven't had time to go along are the

most enturbulated and the citizen is the most upset and everybody's all nerved up about something or other.

Now, if you carried forward a program then of international sanity, the easiest program to carry forward on international sanity would be a cessation of threats of the environment. You would have to reduce the danger in the environment to make people saner. If you wanted things to be better around, then what you would do would be to reduce the amount of strife and dissonance in the communities and so on. If you wanted the individuals of the world to draw saner breaths, why, you would give them less threat. You would involve them less in the dangerous future. Because the individual who has no future has a tendency to act very oddly indeed.

Now, man is tied to the fact that he lives only once, which is an interesting idea, quite novel, I don't know who invented it. But it was invented by somebody. But it gives him a certain irresponsibility regarding any area he lives in. And it's very interesting to hear somebody in his fifties, sixties, saying, "Well, I'm after all out of my prime now, and that sort of thing no longer concerns me," and to see him again in his seventies, with some dim inkling of the fact that he's got to come back and pick up a body in this mess, you see – getting very nervous about international affairs. In his sixties, you see, he couldn't have cared less, but in his seventies, he's getting very nervous about all of this, you know. He's trying to solve the problem at a subconscious level, "Where do I go next? Where do I pick up a body?" and so forth.

But in general, man is practicing a high level of irresponsibility with regard to his affairs, because he thinks he only lives once and he thinks he will not inherit anything that he himself has started or abetted in chain fashion. So you can't expect, in actual fact, a broad public movement based on the idea that you're going to come back. Man won't buy this, it's asking him to take far too much responsibility broadly. So you have to go into other fields.

Now, the problems that have to be solved in bringing about a world peace – an effective world peace program are then the importance of the politician – you've got to salvage his importance or he won't buy it – you've got to furnish a great deal of manufacturing and personal building and activity so as not to bring about a – an immediate collapse of the economy which is all bolstered on a war economy, you see? In other words, there's got to be a lot of construction. There's got to be a lot of things going on that require lots of money, you see, and that sort of thing. And – the – amongst the other problems that have to be solved is the shortening of the communication line between the capitals of the world, and therefore bringing about a greater understanding. And then you have to curtail the individual initiative of various nations for the waging of war, so that they no longer have the right to knock the lid off just because they're mad at somebody. And you have to reduce the amount of danger in the environment while doing something dramatically constructive about it all.

These are just a few of the problems that have to be solved, and you have to offer them some attractive objective which is startling, but which they wouldn't argue with too much. You have to give them lots of things to build and lots of things to do and it has to be a lot of trouble to bring all this about, you see. It has to be very complicated. And with these various barriers you have to overcome, the political objection and that sort of thing, you have to have in such a plan a sufficient and adequate solution to the situation that war would cease and

everybody would understand that it would cease. In other words, the solution to it has to be big enough to make the problem seem solvable.

Well, I put all this together originally as a mental exercise, and nothing more than that, to see what would happen with OTs. This lecture is part of the Class VI materials, oddly enough, because you answer this problem all the time. Some thetan says, "Well, now what could I do?" Well, let me tell you what a bunch of thetans shouldn't do. They shouldn't go off in eighteen different directions, each one banging the gong of his own dislikes. That's a production of chaos, you see. Now, one of the things, one of the things that we have to remember is that we have a base. And that base is called Earth. And we don't want the base any more enturbulated than it has to be. Nor do we want the base to be so aware of what is happening to it or that it is being called a base, that it'll be resentful of being one. See, these are very practical considerations.

Also, there are certain exercises which one should be able to do, in order to improve his skill and so forth, and they should not be of an hostile nature. At least toward this planet.

Now, it takes a lot of time to assemble a body of technology. It is resident in the individuals to whom it has been taught and who have experienced the long run with it and during its developmental period, there is – its communication lines, its suitability to the area in which it is being generated, all of these things are hard-to-win assets. And we have those assets. So our interest, our interest, in a peaceful Earth, is not only altruistic, which it is, because at one time in *Science of Survival* this was issued as a target, a world without war, without any slightest thought of first dynamic reward, you see? But each one of you now has a first dynamic reward in view. That is to say, you have just the first dynamic reward in view not of money, this has nothing to do with money, it couldn't mean less. It's wonderful how we get picked on about money all the time. I mean that's one of the least important commodities. These fellows are missing the shot rather widely. We're not interested in money, we're only interested in the planet!

But we have a vested interest, completely aside from our altruistic motives which, remember, do exist. We have a vested interest in a peaceful planet and the continuance of this planet. Because who knows, this planet may go on being very peaceful for a considerable period of time when other planets around about aren't being so peaceful at all.

This is a sort of a forgotten backwash in the middle of nowhere, see or at the far edge of nowhere, not even in the middle of nowhere. It's a rather minor sun, minor planet, out on the rim of a galaxy, rather a lost horseshoe nail, if you want to know the truth of it. If you want to know what the exact situation of Earth is, you would not look at any such point as having great value. But it does have the value of existing. It does have the value of having had a technology cultivated on it. It does have the value of our understanding of it, and it does have the value, of course, of not being immediately and instantly discernible as the center of anything.

Now, I'm not necessarily telling you they have vast, wide-reaching plans that are going to *waf-waf*, and then we are going to... and so forth. These are merely the practical considerations. Practical considerations of what happens. Once you recognize which direction you are going, you're a fool not to recognize the ramifications of what you are doing, and real-

ize that you have to take some responsibility for the effect it's going to have around and about. Well, it's going to have an effect on this planet, it's going to have an effect on the surrounding areas here, without even going space opera about it. And all that's very vague, purposely so. And... but I think you understand me. We need, then, a peaceful planet.

So I worked this out originally as what project – was it possible for a bunch of thetans to consistently hammer and pound along the way at a certain objective or project that would bring about something constructive? And it's not – it doesn't have much to do with international peace, you see, it's just could they go ahead, and so forth, and was it possible to direct their own energies toward such a goal. And I worked it out, worked it out, that it was possible for this to happen without too much coordination and planning. And the name of the activity in the exercise, originally, was not what it is now, but became an international – International City, International City. That's what became the name of the project. International City Project.

Well, I studied this for quite a while. Was there anything one could do about destimulating the planet and consolidating the circumstances of war and so forth? And finally came to the conclusion that if all the capitals of the world were located inside one city that they were not likely to bomb each other out, that they, in effect, would be very careful of declaring war. They would be close cheek by jowl enough to discuss most of their problems. They would have no great difficulties of interchange, you wouldn't have a vast whiplash of going to Moscow and the ambassador there talking to somebody there. You wouldn't also have the illusion of security involved with the distance. It'd be a matter of driving a couple of blocks, you see, to see the head of the other state. You'd be meeting him at dinner parties all the time and everybody knows that it's nice to keep an atmosphere so that you have a socially acceptable personality and that sort of thing and that might as well be introduced to international affairs. You very seldom see blokes like this declaring war on each other across a banquet table, you see. But they sure get awful loud and very discourteous, you see, a few thousand miles apart.

So if these capitals ceased to be located on the native soil of the countries they governed and became located, all of them, within one perimeter, the bombing of that capital would become a rather remote possibility, particularly if you never let people who seemed to be angry at each other leave the capital at the same time.

Now this gives them a new problem. It gives them the problem of the long communication line to their country. And gives a communication line that might possibly wind up entirely and completely in a new capital in their country. Well of course, that mustn't happen. So the communication line may only go to centers of states within the nation so that you have a nation and then say that it is composed of states or counties. So the communication line does not go from International City to another city inside the country and then go out – you see, a communication relay center. That doesn't exist. No, I'm afraid the message from International City would have to go directly to Helena, Montana, not via Washington. And there might very well be an assembly or a legislature of that state. Another one would have to go to Sacramento. Another one would have to go to Houston or San Antonio. You see? So you'd get a – you get a communication line from International City to each county or state head without any relay point in it.

Now, they would be the first ones to insist there was no relay point once they got the – even though they aren't processed and they're pretty stupid – they would recognize they were setting themselves up for a marvelous fall on their head if they put a central communication center. Because it would simply become a second capital and therefore a control point by which the country could be wrested from their control in International City with the greatest of ease. So their best prevention of revolution, of course, would never have a second capital form inside their nation; that their messages went immediately and directly to the governors who are the heads of states who were under their control.

This would be – they would insist on this. Which gives you the most fantastic communication network anybody ever heard of. That's a lot of building with that. Now, look at the amount of building in International City. Just look at the amount of structure involved here. And we find out that a duplication of the mall in Washington, complete, alongside of a duplication of Red Square, complete, all of it fanned out – even drew this out in sketches exactly how this would work, you see. Their suburbs stream out behind them, you see, in each one of these things. You make these things stand in a fan. And you have a fanned-out city which is going out with tremendous transport and underground and so forth. There's enough undergrounds in there to go around in circles and out to the furthest reaches of the suburbs so that you get any place in it. But it'd make a rather large town.

Now, you take every capital of the world and treat it accordingly and then treat it in such a way that transport within the capital is very fast and so that each and every section and center of the capital has some of its own atmosphere rather easily planned up, by the way. It isn't just a sprawling mess where you – by have a bunch of capitals sitting side by side and they are very definitely worked in such a way that everybody'd be quite happy with it all. And they're all built around a central capital of its own which is very bombproof. Built under a mountain. Artificial mountain which you could never destroy. This would throw everybody into apathy. [laughter] And a bunker of huge proportions and that of course would be an international parliament of Earth, which then had certain powers and so forth, over various nations.

Not unlike the United Nations today but with a different composition, a more British-American type of a composition so that you don't get four or five favored nations who can overthrow everything else and you don't get unequal stuff so that there's some country that has twenty people in its population and it has a member in the United Nations who has as much say, you see, as somebody who has a billion population. I mean, that's the way they've got it rigged now.

But you get an equalization of population. Well, you have to figure out how can you get a very equalized population. You have to invent a new method in the United Nations that you would put together. You have to get a brand-new method of representation. You have to represent by the square mile and the person in a formula. In other words, how much square mileage is this person representing and how much population and these two are put together in a formula and that country has that many representatives in the United Nations, you see. Which is rather fair. And then, of course, you'd run some kind of a two-house system and so on.

Well, of course these fellows would love to be right up against every capital that they were dealing with. These fellows that were elected to the United Nations and that sort of thing, if they were up against every capital they were dealing with, they wouldn't have great difficulties and big misunderstandings and if all of these nations that had their capitals there work cheek by jowl with the assembly which was doing all this, I don't think they'd get into too much trouble either. There'd be enough politicking going on. It would be sufficiently involved to please almost anybody. Particularly if it was based on a good, sound system.

So Wendell Willkie came out with something he called *One World*, and practically everybody shot him down in his tracks. He was a pioneer in this particular field. But nevertheless this idea has become more and more popular and it's actually sweeping in that direction. And you'll find out that togetherness is the watchword of all movements on Earth. It's togetherness, more togetherness. So soundly, technically, speaking just Scientological technical aspects of it, a proposal like this is far more acceptable than you would readily believe. Because it says immediately "togetherness," you see. Let's put them all together, see. Well, anybody can understand that, see? And they think that's a good idea.

Now, what does this – what does this immediately entail in the way of propaganda or action or something of that sort? Well, that's hardly even important. As long as some of the elementary steps are taken, why, the rest might very well follow through rather easily.

And you'd have to take a program by these steps: The first step would have to be you'd have to persuade all governments to turn over all atomic weapons, stocks, control of atomic manufacturers to the United Nations at once, you see.

Second step is persuade the United Nations and all governments to select a site for and construct an International City, preferably in North Africa on the Mediterranean coast where land reclamation can expand its area and where its communication lines can be easily centered for Earth.

Third step: Persuade all governments to remove their capitals to International City complete with heads of government, congresses and parliaments. Prohibit a secondary capital or even a communication relay center within the country itself.

Fourth step is secure communication lines and command lines from each country's head of government in International City to the government of each internal county or state in that country. And regard each county or state within a country as an autonomous unit under the control of the head of a nation in International City.

The fifth step would be to bring about a recomposition of the United Nations basing its member – delegates, on a formula comprised of land value – land area and value, production and construction value and population figures, a more complicated formula I just gave you, the most important one is what I gave you, but you could even make a more complicated formula for representation which had to do with its potential construction and production values as a nation.

Remove all special privilege categories for favored nations and the exercise of veto by a few. And form the United Nations into a judiciary division, two houses, an executive branch, the key officials to be popularly elected or selected within the nations they represent

and by voting by both upper and lower United Nations houses for the head of the United Nations. And reform the United Nations charter into an instrument specifically engaged in governing the heads of nations and international affairs and forbid in the charter all interference with individuals or smaller communities.

Sixth step would be forbid treaties of mutual assistance – warlike assistance.

Seventh, bring about the creation of a small, effective armed force for the United Nations, dismantling or abolishment of all other war facilities. Well, naturally, if they were the only ones that got atomic bombs then their main police action would be devoted to whether or not anybody else was manufacturing atomic bombs. And they just make sure that that wouldn't happen and they wouldn't make – require a tremendous force involved in it.

Persuade stable and real international economic measures. In other words, do something to keep money in balance, like the World International Bank, that tries to keep the lid on.

Persuade the United Nations and national governments that the activities of the United Nations and national governments should be limited to ... And then we limit what a national government should be up to.

And we go ahead with this plan and it has all been written up here, in considerable detail, which will – we go ahead with this plan on the basis, on the basis, that such a general agreement amongst Scientologists would push what efforts an individual was engaged in into a coordinated activity so that it would count. And here is a big plan that is sufficiently sloppy with a central executive, you see, a sufficient – and when I say "sloppy" I mean – I mean that – it's a – it's a plan which is centralized and it could be done very sloppily. You'd still get someplace, you see. There's no great damage would result if it went far awry, don't you see? So if everybody was moving more or less in that direction, you'd have some possibility of the attainment of the final objective.

Furthermore, it's a sufficiently interesting plan, I think you will agree, that it would cause a lot of conversation and I frankly don't think anybody else is doing anything for world peace at all. So that gives it a peculiar, lonely individuality. But it's a good conversation piece. It's a good thing to talk about, it's a good thing to speculate about, good thing to figure on. And it gives a cohesive action to what might be a great many individual actions.

If you're going to persuade some head of state in some particular line to do something or other there's many things which you could think of, I'm sure. But if you were in a position to do that, and any one of you were in a position to do that, in different areas or parts and you were all insisting on one objective, it'd be very likely to take place, you see, without any creation of chaos at all.

You'd have a situation here of – well, everybody sort of is insisting that this happen and if there was any persuasion being used, why, you wanted to know how to line up one's efforts with anybody else's efforts. Well, if you've got a plan of this particular character, your own imagination can fill in an awful lot of blanks and details and you still wouldn't go awry and the plan still wouldn't be wrecked. That's the basic virtue of this plan. The possibility of

its effectiveness, the fact that something like this should be done are compared to another datum. Is this – would there be any feasibility in it ever happening at all?

You would be surprised how many ideas that a – of Scientology have materialized in the world in the last few years. It's interesting. They very often get warped and twisted around in numerous ways but it's very peculiar how often this can occur. How often these things have been actually adopted.

So here's a plan, An International Objective is the name of the plan at large and the plan itself is the International City, which merely says a government of Earth.

Now, what does a Scientologist get out of this? Well, on its original release, of course the plan doesn't pay too much attention to what a Scientologist would do or not do or how you would get out of it or what he would get out of it or something like that. But let me assure you, if the Scientologist was instrumental in bringing about what amounts to a complete political revolution of this planet, he – nobody would be sitting around wondering what he would get out of it. It's inevitable. It's inevitable. If anybody starts getting into agreement with this plan, all you have to do is just keep the word Scientology parked someplace around the fringes of the plan and you'll get all sorts of credit in this particular direction. So there's good dissemination in this line.

And then of course having brought it about you eventually would find that they wouldn't want psychiatrists in International City. They have political use. And we could slip that one in. You wouldn't want any psychiatrist there, you see, because you could see – you could kidnap the head of another nation and brainwash him. This has got to be calm. We've got to have trustworthy people in charge of that branch of things. And about all I would ask would simply be a monopoly on all mental healing done inside the boundaries of International City. I think that would be about the end product of it.

Now, now you've got these people together, where maybe you could put some shoes on them. See? If you – if you had the popularity of having pushed this plan across, people would listen. People would listen to *you* as a Scientologist. And if you kept saying, well, you shouldn't have bad – bad healing facilities and so forth in International City, you see, and it shouldn't be all messed up, that sort of thing, and we ought to be taking care at least of that branch of things, why, I'm not now talking about doing any coercion or influence of any kind whatsoever. Political figures are always falling on their heads and their wives are always having snits and fits. In very, very short order if you merely were pushing on this particular point, why, they'd all swear by you. They'd say, "Oh, well..." They'd start listening to you. And the next thing you know, why, they're all members of a PE Course and you got the planet.

But that point we won't go into in the original releases. [laughter] It's nothing hidden, it simply makes it somewhat incredible. The point is the main virtue that it has, the main virtue that it has – it is doing something and is proposing something where there is at the moment notably a complete void. I haven't heard a world peace plan for literally ages. Those that have existed have all folded up. This is something nobody's thinking about. This is long gone. And that one emerged on the stage of the world, which had any idea of workability or talkability, that in itself has some value. It gives a coordinated direction and one of the targets and objectives, I'm sure, of every one of you, is you wished to God that things would calm down

and wouldn't be blowing its head off every fifteen seconds and the environment's dangerousness would just subside, just a little bit, so you could get on with your business. Well, this is of course one method of bringing about on an international level.

Now, you notice I'm not particularly trying to sell you this plan, I'm merely informing you of the plan, informing you of what value it might have. Now, there are other – undoubtedly there are liabilities to such a plan. Undoubtedly there are liabilities to such a plan. But I don't think the liabilities are such that they outweigh the values of the plan. You say, well, some bloke could come along and make himself a dictator of Earth in this particular fashion. Here is everybody all sitting there together ready to be gunned down, and so forth. Well, I don't know. Pretty hard to do today. Pretty hard to do. Communication lines and so forth.

We had a bloke tried it, fellow named Hitler, not too long ago, and he didn't make it. And nobody's made this target recently. In fact nobody's ever really made it. Yes, it's true that it puts all the political control of Earth in one particular area. But it also puts into that area an awful lot of wily guys, see. These guys are of a different nature than what you might expect of just legislators coming to a capital, don't you see. They are – they have their own vested interest. They want to walk their own way through all this. They want – they see that they cannot attain their objectives by war, and man will always try to attain an objective. So if they can't attain their political objectives by war, they will try to attain them by diplomacy. And they would welcome the proximity of other capitals, and a large legislature to lobby in, and that sort of thing. And they're not about to give this up into a dictatorship. They would not even think in that particular direction. They'd never cooperate with one, that's what that amounts to.

Now, another liability is this might leave countries wide-open to – wide-open to revolt or revolution or something of this sort or they might revolt against their internationally located government, which is quite absent, and things might be very upset in that particular direction. Well, I think that – I think that that possibility would be equally apparent to the head of every state in International City. And I think it would tend to govern in such a way that it wouldn't happen. Absentee government has not recently been posing too much of a problem. Britain, for instance, has no real trouble, and has had no real trouble, governing absently, unless she was so distracted or no longer cared. And what people think about the British Empire and its particular breakup seldom take into effect [account], well, maybe they got tired of the wogs, you see? And that I think is the real explanation for it. I think they just got tired of it.

When you recognize that one small rock down in the – the Caribbean and so forth drains directly out of the British treasury every year about a million and a half pounds just to pay for its government, and it furnishes nothing back to anybody for anything, after a while a fellow, even a tax collector who's sweating to get the money in, says, "Well, why should we be spending a million and a half pounds so that island down there can have its own government, and what use is it?"

The truth of the matter is when you had sailing ships, out-flung and far-flung bases were of great use. But when you can get three hundred marines there in transport planes in a matter of a few hours, there is no need of that base. So it's an archaic method of control and it's been dropped.

No, I don't think that this – I don't think this would bring about any vast upset. You say, well, that government, of course, would maintain a standing army of some kind or another. Yes, yes, it'd maintain a standing army of some kind or another, they always do. Probably maintain a bodyguard within International City. Well, that puts quite a few troops in International City, of very dissonant lots and that sort of thing. Yeah, that also puts quite – that also puts quite a force of control under International City government.

Well, there's a solution to the overthrow of the capital by force by putting the political control of the capital out from underneath the United Nations. So that the political control of International City should consistently be independent of any government. It merely has to do with the safety and security of the individuals inside the boundaries of International City, and that would be their end product. That would be everything that they would be interested in. And they would have a sufficient force there to do that and that force would have to be sufficient to outnumber any even summed-up bodyguards inside the City. In other words, the political control of International City ought to be itself.

Well, how do you keep it itself? Well, you make it terribly profitable. See, you don't make it political, you make it profitable. So how do you finance International City? Well, you finance it originally in such a way that it itself becomes a property which becomes very profitable to some people. We don't care anything about who these people are, we only care that they consider it profitable, see, to have International City, and that they go on having International City, and that they consider it a governmental responsibility because it's profitable.

Now, the Russian would scream over that logic, but there's where he falls on his head all the time. The way to have a calm International City is to make sure that the ownership of the land and property of the International City brings in money to a small group who sit as a council in International City and make sure that things remain nice and peaceful and profitable. Just cut the whole thing sideways from political control whatsoever. You figure out then that there's a member of the International City government, a member of that government. Had nothing to do with a nation, has nothing to do with the United Nations. He has only to do with the physical construction and property of the International City.

Well, you hold out this sort of bait to some construction company that after it built its buildings it's going to draw rent on these buildings from here on out and that a member of that construction company is going to sit on the governing board of that city with no government over its head. And all it has to do is sit there and keep the peace in International City, you have then whipped the government of International City sideways from underneath the political ramifications of otherwise, and you put a very hard core, of very hardheaded guys who want to make awful sure that they keep dragging down the rent, you see, from the White House. And this is profitable. And you make it profitable and you make it rather terrific to have a seat, you see, on that council that governs International City. And it's not governed by the United Nations.

Now, that splits up political control so much it puts another interest into the area which upsets of course any effort to upset International City. Now, these boys would always be eager beaver. They've already got troops, haven't they? They've got lots of troops, they got police of one kind or another who are used to dealing with the citizens of this city, where they

always would have their ear to the ground making sure nobody got assassinated, making sure that no parades got interrupted, making sure that there were no demonstrations messing up their buildings, see? Making sure that there was no sudden coup going to take place and over-set their this and that, and they would sit there and keep the thing on an even keel.

In other words, it would only be to one person's interest. If you want to see a lousy capital, take a look at a capital which is owned by the government. Governments take very bad care of the capitals. Do you know that the Washington Monument sat I don't know for how many years, some disgraceful number of years, as blocks of stone out in the middle of a little meadow because of, by private subscription, was being put together one way or the other, and the government wouldn't help them out and it just sat there. It just sat there, blocks of stone scattered around. And somebody finally put it together after I don't know how many years, twenty or thirty.

If you want to look at a capital which is having a hard time, it's a capital that only depends totally on the – a government for its maintenance, and which is of no great profit to anybody. And the governments come and the governments go and nobody really takes care of the place.

So the way to get International City built, of course, is to hold out the persuasive fact that those who build International City, govern International City as part of the International City council. They do not govern Earth but they govern International City. And you all of a sudden throw the main capital of Earth in the Western World, which is construction capital, immediately and directly behind the project with a crash.

Now, somebody is going to have to operate and act as a clearinghouse. Somebody's going to have to operate as a clearinghouse as to who is a member of that council. And that is not particularly provided for and we'd probably get forced into it sooner or later. Somebody'd take the bit in his teeth, the way I figured, and so forth. We'd be perfectly happy to operate or act as a central which exchanged information concerning International City, the books and pamphlets and wrote letters about it and that sort of thing.

But that's about the extent of our direct interest in it, of our direct public interest in it. That's the extent of it. Something to be interested in, something to bring about world peace and that sort of thing.

Now, on the other side of the fence, you consider this a training ground for the budding OT. And it becomes very fruitful. It's a nice school exercise. And it's all very, very constructive and he doesn't – isn't left standing around with his hands in his ex-engrams wondering what he should do with himself.

The upshot of the thing is then that there is – this was my conclusion on the original – that it was possible to put together a piece of planning which had some possibility of bringing about world peace. That was the first thing that I was assembling on this, that it was possible to do this. My next conclusion was that it wasn't being done. My next conclusion was that togetherness was the main forward dynamic thrust of most of these societies. And that then – that this then formed also a way of exercising the talents of people in Scientology and it seemed to me that it became a feasibility. But more important, perhaps, even than this, it holds forth a bit of hope that there is something can be done about it.

I think people have gotten to a point where they have no recognition that anything could be done about it at all. And it holds a bit of hope forward in that particular direction. Now, it gives the Scientologist something else. It gives him a town. It gives him an area of interest and town that could be put together and straightened up. It gives a piece of planet into their hands, no matter how mythical it is at the moment.

There's a tremendous amount of desert down there. I haven't been down and taken a look around there recently, but somewhere between Carthage – I'll come up to present time, excuse me – Tunis, and – modern name Tripoli – along this line of coast and so forth, there's a tremendous amount of back country. Old communication lines have also gone into there. It's time immemorial this place has been operative. It was knocked around pretty badly in World War II, but there's possibilities open up of tremendous scope, so that you're not building on top of a – or around an already existing situation. That looks to me like a fairly good view, but of course it – I've merely picked the oldest natural communication lines of the planet, and they went into that particular zone and area.

And looking over – looking over a – possibilities, feasibilities and that sort of thing, I saw that there – a lot of Scientologists might be able to have some fun with it one way or the other. They might be able to do something. And I wasn't thinking now in terms of OTs. I was just thinking of somebody or other; he knows somebody in the construction business, you know and, why, he can get him all smoked up like mad, you see, so on, with – very legitimately so, you see.

Because in actual fact it creates a fantastic amount of new wealth. See, there's new wealth created when you start to take a large area of the world that's completely arid and throw it into a usable state, and you get a lot of fellows interested in putting construction together on the spot and harbor facilities and this, that and the other and airfields and buildings and *wa-wap* and more and wow, you know! It's a creation of wealth.

And then you start figuring out your communication lines and that sort of thing and where they all go and the remodernization of various county and state capitals. In England here, they practically had to build another half a dozen, you know, because it's gotten very centralized. Here's stuff going up in all directions, you see. Here's busyness. You can get awfully involved, you see, in a project like this. You can go beat the drum on something or other.

Now of course, you say, well, it doesn't have too much to do with Scientology. Yes, it has a great deal to do with Scientology since it's simply a broad, fourth dynamic method of dedangerizing the environment. That's as a process. You just – you're just pushing in that direction. Now if you're merely saying something could be done about it because a feasible plan does exist, you've actually made the environment less dangerous. So it is a method of making the environment less dangerous. It is a fourth dynamic process, technically. It is a method of achieving eventually dissemination to the heads of nations in one small area, all at once. And now, I'll give you another little secret with regard to this. We have had some trouble with governments recently. And I think they've been insolent. They've been disrespectful. And I've looked this over carefully and I've decided that we shouldn't stand for it.

Now, the way – the way you really upset a government is to move its capital. Now, if you are saying that you have in your power the ability to move all capitals of Earth, you have raised your comparable magnitude to the governments of Earth from a government of Earth, you see?

This is the little odd piece of magic back of it. The fact that you are talking about moving all the capitals of Earth at your discretion to a new situation depowers all of those capitals with regard to Scientology. And I think they ought to be taught a lesson. And that is the innocent threat that is posed back of all that. You see, a terminal has its force in power of being able to maintain and hold its position. You destroy this in a government by merely saying that it would be a good thing to do. This makes them very, very weak and tottery, as far as you're concerned. And I think everybody would agree that it'd be a very good thing to do. And I even think governments themselves would agree that it would be a very good thing to do. And therein lies a very interesting little piece of magic. Because it upgrades at once the power and magnitude of Scientology, simply that they would say, "Well, all the governments ought to move down to International City," see?

And that leaves those governments with a odd feeling, not knowing our technology they would not be able to explain it. But they have been threatened with inability to hold their position. They – now, of course, they don't even kind of want to hold their position because they don't even come up scale to a point of realizing that's very important. But it *is* very important. It is very important and I frankly don't think you'd have anywhere near as much trouble with them if you were espousing such a plan. I think you'd have far less trouble with them. They'd feel shaky talking to you. Because they'd feel they couldn't hold their position while confronting you. They'd feel they're kind of slipping off to North Africa already. [laughter]

This is not trickery, this is just technology put to a good use. Two-terminal situation. All right, they're holding their terminal lines stretched out, so as to hold the whole world in threat. Well, let's just spoil the power to do so by shifting those terminals or proposing to shift those terminals.

Now, I will write, a lot of, oh, not a lot of stuff, but I will write some more on this. We'll put this together into a pamphlet of some kind or another. It's been written, in actual fact, for some time and I was just waiting until I had Class VI pretty well settled. And we will put this into a bit of a pamphlet that can be distributed around and maybe I'll write up some more material on it, if I get around to it. This is quite interesting as itself, but I should imagine there should be better agreement on this.

It's a very funny thing is, although people will have a lot of different opinions, if we hold to a central agreement line, and so forth, they will eventually accept the central agreement line. This, if it takes care of most objections, would then come about as the materialized plan even though a lot of people were trying to change it, don't you see? And it looks to me, it looks to me, like it is an interesting answer. It is nothing where somebody would take off the week he was going to give an intensive in, don't you see, and spend that whole week pounding the desk about it or something like this, but it would certainly be something that would be interesting to do over the weekend, don't you see, or something like this, you know. And it's interesting to mention and hand out to PE Courses, and they might not be able to understand

how they're thinking, but they might be able to understand that you could have an international government of one kind or another.

Now, somebody's going to ask Scientologists, "Well, who is back of this? Who is back of this?" And the only thing you want to tell them, "Well, just we are," you see, or "Ron is." I don't care what you say, you see. But there – frankly, there is no moneyed group or no moneyed individual of any kind back of this. You see, there is nobody back of this. But there's a huge vacuum provided here that would pick up such people and put them into it. Only remember, they're not now in back of it. They're in it. [laughter] See?

So we in actual fact are in back of it. But we are not being paid in any way shape or form to beat the drum one way or the other. We merely figure it'd be very good for the population of Earth if they were just a little less restimulated. And it was – originally took place of, "Is it possible to do anything about Earth? Would it be possible for an OT to agree upon some project or another? Agree on some project that he might possibly care to push toward? And would there be some constructive project which put – made life a little easier for one and all," and so forth. These were the considerations which motivated this, all very mild considerations. I think something of this sort depends for its power upon interest.

I remember when I first wrote this up, it was lying there very quietly minding its own business, and I had really last seen it on my desk, over to the side in a huge pile of papers of one kind or another, and it – that's where I'd last seen it. And here was dear Joan, standing there in the middle of the carpet in my office, saying, "Can I run this please, in the next issue?" I thought, isn't that interesting! It has disappeared out of my desk, and it's mysteriously about to be printed as the British *Certainty*, because of course, she's the editor of British *Certainty*, you see. And it struck me as though it must be considered a somewhat interesting project. Because it's been quite a while since anybody stole an article out from underneath a pile of paper. [laughter]

But has no more – it has no more force or vastness to us than that. It's almost an incidental fourth dynamic project, if you can have any fun with it, why, by all means, do so, and I will see that it's distributed to you. The mimeograph of – the mimeograph write-up of the whole thing, giving all sorts of odd points and so forth, with regard to International City and its formation and what it should be about. And I'll see that those get handed out to you in the next day or so. It all depends on whether or not they have a stock of them in mimeo.

But anyway, I wanted to talk to you about it, because very often it occurs to you, well, we're powering up individuals pretty heavily, here. This is getting more and more so. And you'll find that people around might also become uneasy. What do these people mean to do? We already have one Scientologist up in the – up in the north of England up here who's so horrified at the idea of making some OTs, he said the atom bomb would be far more preferable. Atom bomb would be far preferable to making some OTs. That'd be absolute chaos and disaster.

Yeah, a very interesting point of view, you see. But they get these odd – they get these odd lines. So what do these people intend? All right, if they're bringing off anything of this sort or if something spectacular is happening, what do these people intend? What are their intentions toward this planet? I think it's a nice thing to have some sort of a plan sitting there

that explains that your intentions are basically good roads and good weather, and then if you have some time, even give it a little push. And it seems to me like that's a sensible way of going about it.

Well, what do you think of the project? [applause] All right.

Thank you. Thank you very much.

HOW TO MANAGE A COURSE

A lecture given on 10 April 1964

Instructors' Conference, 10 April, 1964. I'm going to – taping this because there is a little bit of data here that I want to give you which you probably will feel is very unpalatable, but which is the *ne plus ultra* of training. I want to give you this very rapidly. It is also in the form of a policy letter of 10 April. I want to discuss these various points, and – since it's difficult to put all these things out in a policy letter.

I'll first just merely read you the policy letter. Scientology Courses. This does not necessarily apply only to the Saint Hill Course; this applies to all Scientology courses. And they consist of, as follows:

"There are three zones of responsibility in course management. These are:

"1. Providing valuable subject materials."

Well, of course, that could apply in college as well as it could apply anywhere – is providing valuable subject materials. What determines their value? That might even be something else. But ordinarily, is it useful? Is it going to improve somebody? Is it going to forward something, or something like this, or going to make something effective? That's the subject material. That could be physics, and so forth, and oddly enough, could even go as far down scale as metaphysics.

Now, under this particular zone in Scientology right now, we have, oddly enough, culminated – and this is hard to believe, because it is such a wildly embracing figure – we have culminated in anything that was desirable in the fields of religion, mysticism, spiritualism or mental sciences; anything desirable in those particular fields have been discovered and culminated in the field of Scientology right now. That's why I say it's rather hard to believe, but you look at it, that's true. So we do have valuable subject materials.

Now, that job is complete. And so, number one of these, course management, as far as we're concerned, on a Scientology course, that is complete. We're even throwing away material now which would have been enough to have made a complete science and revolutionized middle Europe, you know, two hundred years ago. We're just throwing it away. It's – we've got stuff that's more effective than that and so we don't pay much attention to it and so forth. There's tons of such material that is just going out the window now. It goes into codification archives, research-level actions, contributive actions and so forth. And the truth of the matter

is – and this will shock you, on the subject of valuable subject materials – on this little sheet* which you see in front of you, right now, this little sheet here, is contained every process and auditor skill. This does not contain the philosophic side of Scientology, but this contains the auditor technical side of Scientology. And every process and every action on this one type-written sheet, one side, eight by ten, is contained on this sheet.

And this last – you see, most of it is right up here at the top, a very small, little area here at the top. Well, that contains all of the auditor skills. And this long one here is just everything a Class VI Auditor ought to be able to do. It's down to such tiny, little things as knowing about "no auditing." See, that "no auditing" can upset somebody, you see? And the valuable subject materials, then, that we are teaching on all Scientology courses, and we're teaching all of this at Saint Hill, are contained on this one little sheet. So there is not a vast amount of data when we get under valuable subject materials.

The whole philosophical side of this is, of course, left wide-open. These are sometimes what you call basics, ARC, and that sort of thing; we haven't gone into the nature of man on this sheet. But this is the technical auditor side of the picture.

Now, the next one, number two, is "Organizing and codifying those materials so that they are highly effective and comprehensible."

Now, that's a codification of the material. And one early dawn here the other day, Suzie and I whipped out the form of presentation of a proper bulletin or a piece of data. And we're actually throwing this stuff together – she is – from bulletins and so forth, with considerable speed. It's under twelve headings, is it, or is it thirteen?

Female voice: Twelve.

Twelve headings. And these twelve headings, oddly enough – each one of these pieces of material is under the twelve headings, and the twelve headings comprise the question the Examiner should ask. All he's got to do is convert it to a question, like what this process is for, you see, or something like that. All he has to say is "What is this process for?" Don't you see? So there's a simplification even to that little piece of stuff.

Now, therefore, there are very few processes, and these are being codified up on very, very exact basis of format. So all a student has to do is know those. And that sheet that has to do with a process also contains the technical drills and the auditing requirements. So they're all on the same sheet, but of course your technical drills and your auditing requirements – because one of them lasts for two or three processes – these are grouped as a separate group for your practical. And then the auditing requirement, of course, is whether or not the person can audit this. And that, of course, is the only auditing requirement there is, is "Can he audit it successfully?"

So the codification of these materials to comprehensibility is underway. I will not say at this moment they are instantly and immediately available to you but if you recognize what we are heading for and if you have in hand this little sheet, you can make do with the instruc-

* Editor's note: Refers to HCOB 10 April 64, "All Levels Auditing Skills" or a write-up of the same contents

tion materials which you have up to the moment when they're published in this very harshly pure format, and so on. For instance, you've got the materials for R1C, and so forth. Well, R1C is being converted to this other format. But you still have the materials that you can use and apply.

Now – now we get to the third – the third.

That's just the comprehensibility of the materials and packaging it, and so on. That, of course, gets together your checksheets for the various levels, and that sort of thing. That all depends on these things, and these checksheets are still on this one little typewritten sheet.

Now, the third one concerns you very directly and very intimately, and that's "Instructing the student in those materials to a point of high comprehension and competency." Instructing the student.

Now, if you've got the materials and you've got the know-how, and then that know-how is codified, we still have the problem of instructing the student in those materials. We still have this problem. And this is the part which you at first may not agree with, and you may find is too gruesome to confront for words, but I'll just go on and read the remainder of this very rapidly.

"In Scientology, (1) has been done, fully and completely. There are no gaps or unanswered questions.

"In (2) the very best of Scientology has been selected out for instruction and is being written in such a way as to minimize any confusion and maximize the communication and practice of the data."

Now, "In (3)," – which is teaching the student with it, "we have our largest potential randomness. And it is this which this policy letter is concerned – with which this policy letter is concerned. The instruction of the student is a personalized matter. Students require answers to their own questions and clarification of their own understandings."

The student comes up with a lot of preconceptions and so forth, and these get in his way most ghastly, and so that his clarification on the data which is being given to him becomes an important part of the communication of the data. But remember that the student is interjecting this barrier and it is up to the Instructor to keep that barrier wiped away.

And, "The burden of this falls on the Instructor.

"In auditing it has taken us a long time to learn that there are no bad preclears. There are only auditor errors."

And, "We have now learned a similar thing about instructing. There are only slow Instructors. There are no slow students."

Now, that's a terrible thing, and I imagine that would seem very unpalatable to you, but I myself had to confront up to this as a datum.

"The length of time a student is on course is a direct index of the quality of instruction on that course."

And, of course, we're held back with the fact that we've only just culminated the material with the codification of "it's in progress," so that, of course, is part of our difficulty at this present instant. But with those out of the way, you only have instruction.

Now, "A fast course is well instructed. And a slow course is poorly instructed."

And the subject of this, of course, is how are we going to make this a fast course? See? Well, we're taking care of these other zones, what our responsibility is, but this one is our zone of responsibility, too, and it'll be this one that we have to continue to live with. "A fast course is well instructed and a slow course is poorly instructed."

"A bad course gets bad enrollments." This has to do with the number of people you have on a course. "A good course gets good enrollments. If enrollment is down, the course is a poor course. That has been observed continually in Academies for years and has no variations. If you want a full course, provide a well cons – instructed course."

"If course enrollments are down, don't ponder beyond how to improve the course." Don't ponder beyond this how to improve the course. "And you'll win if you improve the course."

"This is a brick wall datum: a poor course will become an empty course."

"The speed with which a student can go through a course depends only on (1), (2) and particularly (3) above. It does not depend on the student."

And at this point, you poor Instructors who've had to live with these lines, of course, will probably throw up your hat and say, "Well, that's it. I've had it. Now he's said too much!"

But "Don't blame the students. Look at (1), (2) and (3) above.

"There are no slow students. There is only slow instruction.

"The future of Scientology courses depends on getting the student rapidly through the course and graduating him or her at a good level of competence.

"Scientology course futures do not depend on lowered rates.

"You're already selling pearls for pennies.

"Just make sure you are selling pearls.

"I have taken care of (1), (2) is very thoroughly in hand, and (3) is up to the Instructors.

"A fast course is a well-instructed course. A full course is a well-instructed, fast course."

And, "That's all the mystery there is in it." There really isn't anything else to a course and its management than just those factors.

Now, where does that bring us? Now, this meeting is timely and actually is not in condemnation of instruction, because you've had your – your worries have existed in (1) and (2) to a very marked degree. The valuable material was there, and actually it's just culminated to a complete completion. The codification of that material and so forth is just now in hand.

You have your worries with tremendous quantities of materials which may or may not apply at this particular time. You may have excess tapes and all that sort of thing tends to get in your road. Some of your drills may be completely inadequate to what you're trying to accomplish with them, that sort of thing. And you've had these things to worry with. But you also had, running along, this other thing.

Because those other things have existed, we have, to some degree, developed the idea of the slow student. And that one, as we repair (1) and (2), we've got to throw overboard. We could have such a thing as a troublesome student. He seems to be throwing more questions and misunderstandings into the situation than seems necessary at the particular moment, but under good instruction this is cared for. This is cared for. We had to develop methods of handling that, because he's interjecting worries and concerns into the course material and it's up to us to get those things smoothed out and put away.

Now, we have to have brief instruction materials and cover them extremely well, and this brings about our attitude of instruction. Our attitude of instruction should be very tough, but very helpful. We should be – learn to be very, very harsh on the subject of just pure obstructionism. Just pass on by it – don't fool around with it – and recognize whether or not this fellow really is in some kind of a weird spin, if he's just inventing one. And if he's in some kind of a weird confusion about something or other, learn to grab him by the nape of the neck and say, "It's yip and it's yip and it's yip-yip. Now, do you get that? Now, what don't you understand about that? All right, very good. Well, that's – well, what you're worrying about there is not an important part of this; actually it's yip-yip. Now, you tell me what this applies to," and so forth, and all of a sudden lights dawn.

An example out here. Fellow couldn't get what an opposite was until he was told that it was an antonym. And being a former English teacher, he of course could grasp an antonym, but up to that moment he was saying, "What I would do would be entirely different." And it merely had to be harshly brought home to him that nobody under God's green earth was interested in what he would do as an opposite action, that we were only interested in what was an opposite.

Now, you get there – we have, in one example, a clarification necessary. He couldn't get it through his skull. All right, so we transpose the material cleverly and we say, well, it's an antonym. "Oh, it's an antonym." See?

He's interposing this weird one: "What I would do..."

In that case we're just simply tough. "Who the hell cares what you would do? We only want to know what an antonym is." You get the idea?

Then, to be very, very – very, very demanding, extremely demanding, for speed, dash and accuracy on essentials and let the nonessentials slip. So he doesn't know the number of the bulletin. So he doesn't know where the paragraph fits on the left-hand side of the ruddy rod. So he couldn't find the tape if it had neon lights on it. So what?

"Is a pc audited during an ARC break?"

And he said, "Well, uh – le – uh – let me..."

"Flunk!" See?

So he didn't know where the tape was. So he didn't know what body of material it came out of. Well, all right, so what? So what? We'll skip it, see?

But if you say to him, "Well, is somebody audited during an ARC break?"

And he said, "Well, uh... well, that uh..."

"Flunk! Flunk! Flunk! Flunk!" You know? Say, "For God's sakes, why don't you understand this stuff?" you know? "Now, go on back and study it."

In other words, that's when to take it and what not to. That depends to a large degree on the auditor's judgment of the matter.

But what is essential material? Well, just be absolutely *vicious* on the subject. And nonessentials, *plfff*, who cares? Do you see? So you don't have a uniform level of examination. You have a – an examination level which is tough on essentials and just skips nonessentials. Guy can sit up against a wall and rattle off Model Session: *poppeta-poppeta-poppeta-poppeta*, *bang-bang-bangety-bang*. He can sit in a session, he can go Model Session all the way through, *bang-bang*, without a flaw or a droop, you see, anyplace along the line. Fine. Be absolutely death on his being able to do so, don't you see?

Now, he's rather worried about the evolution of a Model Session, and "Wouldn't it be something or other?" And "Wasn't it true that a Model Session once...?" and so forth.

Well? So he even argues about it on an examination paper. Well, we couldn't care less. Can he do Model Session *poppeta-poppeta-poppeta-poppeta*? That's all we're looking for. See? He doesn't even have to be letter-perfect on *why* he has to do Model Session. It's not for him to ask. We're making a technician.

So this – this level – this level of understanding of what's essential and what isn't essential is demanded of the Instructor. See? And that's where fast instruction comes in. Your instruction is fast to the degree that you appreciate that this guy is walking around in a squirrel cage, and you try to get the data through to him somehow or another, the essential datum, so that he says, "Oh, why...? Oh, well, yeah. What do you know!" You know?

Or we see he's walking around on a squirrel cage, "Wasn't this actually developed at one time or another by Gurdjieff?" See, or Goodgief or Harold Bell Wrightus, or something.

Somebody asked me if I'd studied the work of Frank Lloyd Wright the other day. I was quite interested. He concluded it with two philosophers, and so forth. I don't think he was trying to pull anybody's leg, I just think he didn't know.

But he's pulling something like this, you see? Well, the Instructor has to know. "Aw, lie down. Go off. Skip it! Get off that squirrel cage. It hasn't anything whatsoever to do with what you are studying. Now, so-and-so, this is what we're interested in. Now, can you do that or can't you?" It depends on the Instructor's ability to evaluate the important and the unimportant as far as the student training is concerned.

Now, that will make a fast course. That will make a fast course. Now, we're hitting for the moon, here. We want to get a Class IV through – and I mean through and competent as

the devil – in sixteen weeks. We just want to get him through and smooth in sixteen weeks. Just ride all over him until he is, see? Get a Class VI through in four weeks. These are ideal periods. Four weeks. And get a co-audit so that they can bust on through to OT in twenty weeks. Now, those are your optimum times. This gives us four weeks on Class IV, to smooth it out and be sure. This gives us two to four weeks more on Class VI, so that we can get any question out of our mind, don't you see? And we've hit the maximum period of time in thirty-two weeks to OT in the co-audit, see?

Now, we've hit the maximum periods. But we're inevitably going to hit these maximum periods, and all I'm asking you to do is try to make them the maximum periods. And the only way we can do that is try to go like the devil for the minimum period. Try to shoot that minimum period every time and just go along on a total expectancy that the minimum period will be met. And don't look for anything else to happen, but it *will* be met. Now, that gives you an expectancy of what you're striking for.

Now, if we can do that, and if we've got a tough course with a good spirit of help, we can actually accomplish that. And if we can accomplish that, we'll have a full course out here rolling very nicely and everything going along fine. And if we can't accomplish that, we *won't* have. That's about all there is to that.

Now, I'd want somebody like the Assoc Sec of – of Perth, let us say; he's got this policy letter that tells him to bring somebody else. All right, well, he can't be gone very long from there, don't you see? It's practically disaster he's staring in the face to move off of the point anyhow. Well, let's say he's a retread or something like this. Well, for sure we could get him through here in just a little handful of weeks, you see? Kick him through, kick the person he's brought along with him through, and kick them back onto an airplane again and be perfectly confident that something effective is going to happen in that co-audit team and that they will be able to carry on with the material, accomplish something when they get back there.

Now, if we can do this, we've got it made. We've got it made across the boards, because we'll find out, then, that people will very often take a two-course shot at it. They'll come on here at one period and get their basic and go home, and come on and get another – go on through to the end or something like this, or they'll try to take a one-shot at the whole situation, and so on. But they can adjust their minds accordingly as long as we won't put up with any other time budget than what we've got.

Now, I think you agree with me that it's feasible as long as our codified material is out and that all dross is thrown off the course. I'll read you here rapidly, just for your edification, and not for anything else particularly, because this will all be published under the classification bulletins, or policy letters.

"Level I: R1C for PTPs, R1CM." That's fishing with TA on the meter. Those are broken into two processes because you lost a process, which is a good process, in R1C, when you suddenly started converting it over to using meter fishing. Picking up the things that blew down the meter while the guy was itsainging, see? That was actually a specialized application of R1C, so we lost a process. Here's a process – the same process without a meter and the same process with a meter: Gives us two different processes.

We've got assists; and we've got "R2C," which is discussion by lists. For instance, Fred here prepared a list one time, lists of discussion. You know, just questions. And "Listen-style Auditing and itsa." And that's what that whole level consists of, see, and that's a pretty full level at that.

"Level II is repetitive processes, Model Session, Op Pro by Dup, 8-C, CCHs, Havingness, General O/W, ARC 63, auditing cycle." And other materials from the Class VI Basic Auditing checksheet. Can he answer an auditing question, see, and can he be asked a question? You know, that sort of materials are simply poured in on top of this.

Now, the reason 8-C is pulled independently from the CCHs is the CCHs are just taught as a theoretical action and 8-C is taught as a process. See, so we come down with a thud, you see, on – can he perform 8-C? Can he do that perfectly? Well, we can just skate over the rest of the CCHs here at Saint Hill, don't you see? In an Academy or in an HQS Course, something like that, why, they might hit them a little heavier.

Well, that's the totality of the second level. And the third level is "Auditing by List." This is a brand-new name for a very old action. You clean up lists. We've got tons of lists and all the auditor does is clean each question. And that can be addressed to the most wide and wonderful things, and it so happens that due to the composition of the basic bank – which is weird enough – that becomes a health approach, and will accomplish healing. And big future opened up for this particular goofball process. Big future opened up for it. Because health is totally the broken dramatization of the GPM. When a guy can't dramatize his GPM, he's had it. And, what about the "destroy" series? See?

So somebody's sciatica doesn't depend on what overts he's committing, but very possibly upon what overts he's been unable to commit. And you start running this by list, don't you see. And you bend the list over on the other side and you ask a couple of trick questions or let some Class IV Auditor assess it as to which side of the fence this person is on, then he takes a certain series of lists. Now you go ahead and clean up each one of these questions, and what you got? You've got assessing on a prewritten list. And you also got health very definitely in your hands.

So that is – that is not much to teach, since if he can do this he can also do ARC break assessments, you see, and he can do a lot of other things.

Well, that's of course Sec Checking by List and that's written down here at the same time, but mostly to get a referral to what we're talking about as Auditing by List.

"Prepchecking." Prepchecking not to destimulate, but prepchecking for blood, you know? Something that's almost dropped out of our perimeter. "Problems Intensive, mid ruds and Model Session." And that's the total of Level III, which mainly just puts it to Prepchecking, which is just cleaning a question on a meter, which is practically all Level III is. Can he take a question that he himself has asked or he's read off a list and can he clean it? And that's about all you're teaching him at that whole level all the way through, which simplifies training there enormously.

Then we've got Level IV, which is "R4SC," which is the service fac renumbered. That's just a service fac. "ARC break assessments, R4H and case analysis." And all of this is

assessment, assessment, assessment. So you're teaching him to assess at Level IV, whatever kind of an assessment it is. You're not trying to teach him, now, to clean a line; you're teaching him to find the line to clean. So that's the only – the only step up or improvement there, which makes it pretty easy to graduate up to in training.

And now we've got Level VI, of course, is "locating" – this is all Level VI now consists of – is "Locating the truncation, checking goals" – not finding goals – "running the line plot, and track analysis." Where is the pc, see? That becomes the totality of Level VI. You haven't got, actually, finding goals, putting together goals plots, or any of these other more difficult actions which made Level VI almost impossible.

Now, we get a Level VI Auditor here, and things an auditor should know at Level VI I will simply read off here very rapidly, as again, this will all be published for you.

"Case analysis, present time problem" – he has to know how to handle these various things. "Case analysis. Present time problem. Psychosomatic." Guy got a psychosomatic: What is it? "ARC break." Got to handle a session. "Class VI ARC breaks," is different than session ARC breaks. He's got to be able to do listing. He's got to be able to null a list, and of course that includes "Auditing by List." He's got to know the Auditor's Code. He's got to know about completing a cycle of action. He's got to know about havingness. He's got to know about "theory of restimulation and destimulation." He's got to know by "observation of a preclear" – what's the pc doing at the present moment? "Reading a meter. Executing an auditing cycle. Knowing not to Q-and-A. Knowing about 'no auditing.' Symptoms of an ARC break. Good indicators. Bad indicators. Not to mess up a good running pc. Not to continue the preclear who isn't running. Knowing when to stop auditing and ending up the session." And "how to handle a pc's PTPs at Level VI when they show up. Track analysis. Getting the preclear to follow a line plot. Guiding the preclear down a goals plot. Finding out where a series is truncated. Finding out which type of goals series a pc is in. And looking good, crisp and businesslike as an auditor." And that gives you the totality, and I mean absolute totality, of what a Level VI Auditor ought to be able to do.

Well now, he's got all the basics of that sort of thing. You understand that's – most of that is simply a repeated action on what you've already taught on the lower level. So it's just the refinement of this that has to be taught him in the Level VI Course. So it's not a brand-new subject.

So that is the totality of making the auditor. Now, I've just read you, on that list, what it all amounts to. Well, you say that looks difficult in some respects. But if you've noticed, we've thrown out fantastic numbers of processes. You can right now think "What process? What about that process? What about some other process?" Forget them. These are the senior processes of the bank. Under repetitive processes you have a very few processes. There's not even a great number of those things going to be in very active use. "What question would you permit to be asked of you?" or something like this, you see? That – they're that type of session cycle process – that one, see?

And then you've got your pc handling taped here just underneath "what processes will get the most effective results on the pc?" I mean, if the pc goes into this, then you use that

process, see, and it all weaves together so that none of an auditor's training is wasted as you come up the line and it all catalyzes into the end product.

Now, therefore, that leaves you very few practical drills. You've got your meter drills, your listing drills, you've got your track analysis type drills. And you got your basic TRs and auditing cycle drills. All right, that gives you the package, you see?

Theory – this becomes a pipe, because everything is well codified and well straightened out. It's padded up with lectures which, however, cover the same subject materials that are covered in the bulletins. So therefore lecture examination is not terribly important compared to bulletin examination because the same subject matter is covered.

Auditing is just a question, can the guy get a result with Process "XZ Ben?" See? All right. Well, there's only – there's only a dozen of these processes. Well, can he get a result with that one? Well, has he gotten a result with that one? Well, he's passed on his auditing checksheet if he cleared up somebody's PTP. Obviously he can handle a PTP; cleared up somebody's PTP. And if the student has to point this out to you, then he's now passed this requirement on the checksheet. So that becomes relatively simple in that zone. Is his case making progress is the other half of the Auditing Supervisor action.

Well, that becomes the totality and shape of a course.

Now, you already had a course that was running very well. Now, let's get off into something else. Course was running very well. We complicated the course a little bit. We're dropping back to the simplicity of that. There are no other administrative changes that are taking place. We're actually dropping back to the administrative action which we had of a month or two – three months ago or something like that. About the same administrative action, which was the simpler one with – we have had. So that requires no reformation.

Well, I've given you here a rundown on, really, not just the Saint Hill Course, I've given you a rundown on Scientology courses. These things ought to be crisp and fast and to that degree they'll be very successful. Okay?

Why don't you take a break.

THE CLASSIFICATION AND GRADATION PROGRAM

A lecture given on 14 April 1964

Thank you.

We've had preclears blow but I think I just saw a member of the audience blow. I...
[unclear voice from audience] Just a gag. Just a gag. I'm over your heads today.

How are you today?

Audience: Fine.

What's the date?

Audience: 14 April.

Fourteen April 1964, AD 14 and want to talk to you about something that is very, extremely important to auditors and preclears and so forth. Along about November the 26th released a policy letter that had to do with classification and it called for the classification of preclears and so forth, but at the same time this policy letter was not put into effect. It was merely proposed and it was expected that auditors around the world would answer up and give their opinions with regard to this classification program. They did so and it took a long time for everybody to get his answer in and lot of chitchat back and forth on straightening up these various answers. And finally we arrived at a new program – could no longer be called the classification program for the excellent reason that classification is confined to auditors. So, it becomes a Classification and Gradation Program. And perhaps a shorter, better name for it might be the Levels Program.

Now, the levels of Scientology became necessary when it was realized that no one was taking any pains to bring up the general public right. And they were picking them up and throwing them into the middle of a lion's pit and saying, "Well, that's it," and "All right, now, what's your service facsimile? Oh, you don't know what that is. I'm sorry. Well, I guess it's a failed case. Next!" [laughs] Oh, it wasn't quite as bad as this, but pretty near, pretty near.

Now, oddly enough that wasn't what was giving the auditors trouble. I foresaw that that would give the pc trouble, but I didn't really foresee what was giving the auditor trouble. And what was giving the auditor trouble was what I had just – well, I had proposed something that would relieve this trouble – what was giving the auditor trouble is the pc didn't know from nothing and that was what was giving the auditor trouble.

Now, I recognized that it would have some bearing on cases and I recognized a lot of other things, but I didn't realize the extent to which auditors were losing pcs not by throwing them in over their heads, but not throwing them in at all. And here pcs would sit yakking at each other in co-audits and talking to an auditor and the pc would get over his slight case of lumbosis and he'd say, "Well, I've been processed. Well, I guess – feel better now." And wander on off.

And oddly enough, accidentally put my fingers on why auditors were losing preclears. And it wasn't – it wasn't because the pc... this all – was all disclosed in correspondence and reviews of the situation and so on – and it wasn't because the pc was being thrown in over his head, but because the pc wot-notted what he was being thrown into. He hadn't a clue.

Now, well, let's take up why he hadn't a clue. Well, there's been the Aesculapians, and the best thing they did was slip somebody some hellebore or something like that and the fellow had a dream, see? And a god came to him in the dream, and the god said to him, "Well, you're all going to be copacetic now. Huh, pal?" And then the fellow got well or he didn't get well and mostly he didn't, and that was mental treatment.

And then there's – then there's the – the psychoneurotic analyst and he let the fellow sit there for five years and talk his havingness out, you see?

And then there's this other bunch of guys who have what's called the destruction method of putting a guy in an electric shock machine while packing him with ersatz or something, and that – that blew his brains out.

And then in the Western world there's not even a tradition of philosophy. There's no tradition of – there is – they – you say... what – what equivalent Western word is there for a guru? There isn't, and yet an Indian wouldn't know how to go through his day without knowing this word, guru, somehow or another. You get the idea, see?

We did a survey. I'll give you an idea of the state the public is in – we did a survey in Washington, DC about 1955 which was a very intriguing survey. Because I wanted to know – I thought these birds would realize that the psychiatrists were – let's put it in a more elegant sense – let's put it in a more elegant sense than it deserves – that the psychiatrists were cutting into their racket. So we got ahold of all the ministers in Washington, DC, on the idea that they might have some sensibility with regard to all this and asked them if they thought this was the case. No, No. Any time one of their congregation showed the least signs of becoming nervous, they instantly rushed him to the electric shock machine. Seventeen hundred and eight ministers out of seventeen hundred and ten were wildly in favor of the mental hospital and the electric shock machine as soon as possible. Why, the poor dopes! They didn't realize that that religious ecstasy was the only thing which kept them whizzing. If anybody had suddenly stood up in their congregation and said, "I embrace the Lord," or something like that, they would have said, "Dr. – Dr. Sparks, would you please send a wagon over right away, quick." See?

In other words, the whole field of religion had been eaten up in this particular direction which I thought was rather amazing.

And everywhere we looked, then, this member of the public – actually since time immemorial – has had failed help. Everywhere he looked he saw nothing but failed help. So he has no tradition of any kind whatsoever of what is treatment, what is healing, what is ability, what is getting better, what are any of these things at all, and you put yourself up in the field of the human mind and what does he compare you with, see? Neurotic analysis, see? Electric shock machines; stick the guy full of needles, you know, and give him the old biochemical whiz-bang.

I'm using very technical terms as they undoubtedly use them in their private conferences. "Well, what'll we feed the suckers this year?" You know, I mean it's not quite that crude, perhaps. They say, "What will we feed – what is – what is Latin for 'sucker'?" [laughs]

Now, your public has no tradition. The Western world has no tradition of self-betterment, and it isn't that they're suspicious of Scientology. They wouldn't even know what it was. Our biggest task has been to define Scientology to them and every one of us – every one of us has at one time or another racked his brains into a total stupefaction trying to figure out how to communicate this thing to these people. Why? Well, you're not communicating against any worn or traveled road. You're going right straight through the thorn bushes, see? There is no gradient there of any kind whatsoever. We're putting in the gradient. There we are. And so there is, to begin with, no common communication ground already established. Since you cannot, of course, compare Scientology with all of these other things that the public thinks has something to do with mental treatment. It's mental destruction, the whole lot of it. And – and it doesn't compare so that they can't get their wits wrapped around it.

That's why they – well, you take – take outfits like the – like the AMA, the BMA and that sort of thing, their attacks are so crazy because they don't even know what they're attacking. You see, they're in a total ignorance of what to attack so therefore their attacks are very stupid indeed. They're actually not very hard to whip, because they're too stupid. If you had a squad of soldiers out here that were fighting a giant who didn't exist and you were sitting on the parapet there – you were sitting on the parapet, you see, as an entirely different type of being and they kept on fighting this nonexistent giant, why, after a while all you'd have to do is reach out a stave, put it between their legs and let them fall on their faces. They don't even see you. They don't even know what they're attacking. They haven't any idea whatsoever because they are lost, too, in this communicationless area. There's no area of communication.

So we're having to create not only a science, but a communication road in the society. We're having to chop out the first path and the pc sits there in the midst of all of this confusion getting processed. Well, what's processing to him? And there is the biggest auditor failure. I've seen somebody after (quote) "two years in Scientology," still giving all the proper answers for psychoanalysis. I think some of you have seen them, too – giving all the proper answers for psychoanalysis, see. Try to run a repetitive process on this guy, you see? You say, "Well, now, recall a person you really felt some affinity for." Just one off the bat here, you see.

"Well, my id's been ticking today."

"Yes, what? Can you recall a person you felt some affinity..."

"Well, it's my id, see. And I – I – I – I recognized in myself yesterday some symptoms of fetishism."

You say, "Yes, but have you felt..."

Now, after a while the guy says, "Uh-huh," or something like this while still worrying about his fetishism that he has discovered in himself, you see. He's still being psychoanalyzed, because that's the only comparative understanding he has to Scientology. He has – he has never crossed the communication bridge to Scientology. It's actually a bridge before the Bridge.

What's expected of this fellow? Well, there is one of the largest data that fell out of the hamper in this survey and working this over, is that auditors were losing a large percentage of the people they were trying to process because they had never undertaken any real communication relationship on the subject of Scientology with this pc. In other words, the pc was completely untrained.

And if you think this percentage is slight, it's not. It's apparently 80 percent. There goes your forward progress. It's just going up in smoke. Out of ten people, you reach two. Even though those – eight of those people might have entered into auditing of some kind or another, they vanish because they never entered into auditing. They entered into psychoanalysis or they entered into something else or they entered into something else and they had no idea what they were going into, and nobody ever told them what they were in so they just kept redefining it and they finally decided they didn't like Christian Science, so they stopped being audited. Well, of course, that's an irrational statement but this is the irrational frame of mind those pcs are in.

Well, this is one of the first things that fell out of the hamper. Next thing that fell out of the hamper, just getting on with this, was the auditor in the field being upset about his pc having to take a formal course. And auditors all over the place were taking down flintlock pistols and loading them up ready to blow their brains out over this particular aspect of the thing. So that was going too far in the other direction. So what was reached here was a workable compromise.

There is a route known as the pc, known as the preclear, but it's a route by which the pc is educated. He does not have to be formally trained; he doesn't need any certificates, but before he can get out of his grade, he has to pass certain training requirements taught to him by his auditor and which will all be furnished along with this as the exact texts that have to do with this which he's supposed to be checked out on before he's permitted to launch himself into the next series of processes.

In other words, a compromise was reached here so the field auditor can go on processing his individual preclear and all he need do as far as this – this pc doesn't have to do any auditing – but as far – all he needs to do is make sure that the pc passes his training requirements and these are little booklets which are carried along for each level and they are very simply written and the pc studies them and the auditor has a question sheet which he checks the pc out on. Actually, in the logbook, which I'll speak about in a moment, there is a little checksheet at the beginning of each level, and this checksheet has to be completely passed by the pc, you see, before he's interrupted by this and that.

What kind of thing going into this checksheet, you see? Well, rather minor things, like, don't have withholds from your auditor or you will get upset with him. Don't you see? What is a withhold? A withhold is... Now, of course these things are filled with definitions of Scientology, metaphors, allegories, methods of communication to the individual as to what's going on and what he is trying to do and so forth. And it brings the pc up to a point of where he suddenly starts to recognize there is something here and that does align with his goals. But these goals are so failed as far as he's concerned that he would never even attempt to reach for them unless somebody revived them for him. That's actually what's happening. He's long since – has stopped trying to get out of the slough of despond. He's quit. He quit a long time ago, see? He'd like to get over his sporadic earache. See, that's as close as he can get to freedom, is freedom from. That's as close as he can get.

Well, you can bring him up through these various grades and you will achieve, of course, much faster auditing results as a reason for this. He can be taught, in other words, what is happening, what's going on, without in the least bit evaluating for him or trying to fix him up so he'll – case will run in an educated fashion. We're not interested in his case running in an educated fashion, but we are very interested in having a preclear who is being audited by Scientology who doesn't think he is in a psychoanalytic laboratory or a monkey cage or something else, don't you see?

This is the establishment of reality. Where is he going, what is happening, what is going on? There are some points of life and so forth. Now the philosophy of life is also put into this zone or area like your ARC triangle and little bits and pieces of this particular character. Things he's never thought about, you see?

Now, of course, this goes up to Level VI. This goes up to clay table work. This only becomes possible because of the late discoveries I have made at Level VI. It would not have been possible to have done this at all. A pc never would have gotten through if it had been necessary to actually get together his goals pattern. You won't have to do that on the pc so it made possible for classification and gradation which is one of the points of slowdown, by the way. I had to be absolutely sure this was the case before we could adventure out on this.

So at Level VI this preclear actually would have to be trained on a clay table in nomenclature and so forth by his auditor and rather arduously as to what was a GPM and what was a this and that and really be able to snap and point and pop and so forth, and he – if he weren't trained on a clay table as to exactly where was he going and so on, the auditor couldn't really ask him any questions about anything, but if he is trained on a clay table the communication is inevitable. He sees the GPM down deep in his mind – of course, it's not down deep in his mind – well, way out there he's got these things, you see, and he'll instinctively recognize the similarities between the things and he'll be able to put it together and so forth and so he'll be able to follow auditing commands and you'll be able to take him on up the line.

Also you aren't taking on up the line some ignorant being that's going to fall on his head because he's being taken up the line, because by the time he gets to Level VI we will have gotten to him on the basis of this is Scientology, this is what we're trying to do and this is where we're going to go. You get the idea. And even if a military organization was demanding that you train some OTs so they could spy on Russia – I'm sure this will come about, I can

see it now – I can see one of you now being approached by Colonel Swivelbottom with a – with offend, "Why don't you process some intelligence agents for us," don't you see, and so forth. Well, you possibly even could process these intelligence agents providing you process them all the way from scratch and they had to pass all their pc's requirements and he wouldn't have any intelligence agents by the time they got to OT.

This... self-preventive mechanisms. Now, let's get down to nomenclature here. Then what is a grade? A grade is something that a pc has. This, of course, fits in with his childhood schooling; it fits in with the colloquialism: make the grade; it fits in with a lot of things that will communicate, all of which have been rather carefully thought out.

So make the grade and there, of course is – there is no such thing, and actually, really, as a Grade 0. There is a Level 0 but there is no Grade 0 because who would grade somebody for being a man in the street? So actually the earliest grade is really Grade I and this is assigned to somebody after he has passed the Level 0 levels and he's been checked out and so forth, you have a Grade I pc. And then, of course, these grades compare exactly with the various levels of Scientology and as he's passed up through these grades he has a checksheet for each grade and his instruction material and his auditor has to put him over the jumps on these things, you see?

And – horrible thought just occurred to me, only I can see this happening. Some auditor is too busy, you see, so his pc just has a harder time passing through the checksheet than some other pc that he's got – wants to process now. You could almost adjust your schedule – a horrible thought occurred to me. I wouldn't advise doing that, but be very honest in trying to get the pc through.

Well, the pc is not well disciplined, to begin with, at all. And I have found it very difficult to audit an off-the-street pc or even get him to answer a sensible question because you say one thing and his language difficulties and barriers relay this to – as something else, and he's not quite sure which end of the stick he's on or what's happening to him and so forth. Well, by the time you get him up to Level II, this is pretty jolly well straightened out. By the time he's a Grade II pc, he's long since been a Release, see. That would probably – your level of Release.

Anyway, he goes on up through these various grades and each grade has an attainment of certain pc abilities and what we do is work it as an ability scale. He isn't having trouble in certain departments of his life that he was having trouble in before. In other words, we make his conquest of the environment the index of his grade. That's quite sensible. That's – because that gives him finite points of advance. He used to get into a shaking fit every time he thought about all of the problems he has and now he doesn't get into it. He can confront his own problems in life. That's – that would be a sampling of what a grade accomplishment would be, see? He can confront his own problems in life. Well, that's a very simple gain, but yet it is explicit and the individual says, "Well, what do you know. Yes, I can," and he's now made this grade to that degree.

Now, you've got another one there – you've got another one there. He is relatively free or at least not worrying about his aches and pains. It's another level. You see, there's a difference between hurting and worrying about hurting. You get some people who are going around

in circles afraid they will hurt, afraid they will get an ache or a pain. You perhaps have even run into somebody, although it's probably been a long time since you've associated with such a person, who has a funny, buzzing feeling over his left ear or something and this tells him he's going to be sick in a certain way in three days and that he had better promptly go take a hot pack for his skull and go to bed with a certain brand of hot toddy or something. It's – he's got it all worked out. His cure for this buzzing thing over his ear is practically a dramatization. And you've got him now to a point where – not where nothing buzzes over his ear; you've got him to a point where he doesn't worry about something buzzing over his ear, see. This type of thing. Not unduly concerned about personal, physical upsets, you see? He's just not unduly concerned about these things. That would be another type of level, don't you see?

Another one is not always dwelling on things that have happened to him in the past. Now you're getting up around III, you see – not always dwelling on things that have happened to him in the past. He's not worrying all the time about the fact he didn't get a chance to go to college or something or he isn't spending 90 percent of his time grinding his teeth about his elder brother who did him in. You know he isn't – he doesn't have all these horrible feelings about the past and so forth which you can say: relative freedom from the past. It's just relative – he just doesn't spend 90 percent of his time worrying about it. That's the gain, you see. You'd be surprised how many people are walking around doing just that, you see.

Another level is he's stopped trying to make everybody wrong and himself right all the time, see. Of course, that's recognizable as IV. Grade V – we'll just make that a catch – all because we actually have got the processes for Grade V, but we have skidded by them. It isn't necessary really to run them in order to attain Grade VI which is implants and whole track engrams and so forth. These things are all put together. The technology's all there. There's no particular reason to go through that. So what you probably do is put the guy through an auditing dust-off at about that period so that he can really – he can really preclear. See, we fix him up so he can really preclear. You get it on your auditing checksheet at Class VI. Now, he really can preclear at about this point.

He perfectly – he feels perfectly free to be asked any question or to say anything about himself or his past, you see. He feels – he's got a complete freedom in this department. He can receive an acknowledgment and so forth. He's also got enough sense to realize the auditor is addressing his bank, not him, in assessment. You know, those little points that you've got. In other words, he's a pretty accomplished pc. Now at this point it would be possible then, having come up through all these other levels to – for the individual to tackle, head-on, GPMs.

Now, if you'd taken this fellow right at the beginning and if you'd taken him and he's come in off the street and he's thinking all the time, "I – I – I wonder why she's mad at me all the time. I – I just wonder why she's mad at me all..." This is all that goes through his head for one whole morning, you see. "I wonder why she's mad at me all the time. I wonder why she's mad at me. I haven't really done anything. I've never done anything to her. I wonder why she's mad at me all the time."

This is what's called stream of consciousness, see. This is life to this individual, see? And we say to this person – we say to this person, "Now, we're going to count the number of GPMs in the series and find out where the series is truncated, you see." And what are you

going to get back? You're going to get back, "I wonder why she's mad at me all the time – wonder why she's mad at me all the time." See.

In other words, you have to have a certain amount of control and confront of the mind. So if you considered this – these grades a gradient scale of confront of the environment composed also of the individual's own mind, you recognize that this confrontingness can be improved by training and by processing. It's basically improved by processing, but it nevertheless can also be improved by training. He has to get some realization of what he's looking at and therefore he moves up on both of those tracks.

Well, that is the route of the pc. And any auditor can process a pc up to the class that auditor has. So it doesn't matter where he's gone. If he's gone to Class VI, why, he could take the pc all the way through. If the auditor's only a Class I, that's as far as he can take the pc. That's sensible, too.

Now, your routes are three in number and the pc is merely the first one of these. I frankly don't think the route of the pc – I don't think that pc's going to get there nearly as fast as the other two routes but – he's going to have more trouble and he's going to have more upsets and he's going to have more things he doesn't understand, but he'll get there. He'll get there as long as his auditor is patient and everything holds out along the line, you see? So it is a feasible route expressed in these lines.

Your second route is the route of the co-auditor. Now, this is something brand-new to you auditors and simply falls into your nomenclature as you and Bill co-auditing, but more recently falls into your nomenclature of getting a bunch of people together and have them audit each other. Well, this is something brand-new. It – make it a noun. An individual who isn't classified but has a certificate is a co-auditor. He may not charge for his processing. He cannot in any way call himself a professional. He is simply a co-auditor. What is he expected to do? Why, he'd probably run some processes on his friends, probably run some assists of one kind or another or even some high-level processes on one another. I'm not making nothing out of this. Probably audit a few of his business associates or something like this or use it – and he's even got a certificate. And he's been through the training courses and so forth, but at no time has he ever been classified and he can't be classified without being classified all the way. That would only be fair to auditors.

Now, what is this fellow: a co-auditor? Now, we saw him originally – actually we're going over our own evolutionary background. We saw the fellow who went to school for 30 days or 60 days or something like that and he got himself a certificate. And he didn't know from nothing. Yet he knew more than the man out on the street. Yet he was actually somebody and he was better than – wasn't he? And just because he's attended something for a few weeks, a certificate was put in his hot hand and that was the end of that. We saw this fellow. It happens inevitably. Even though you had careful examiners and so forth, you would still have a few of these people around. The co-auditor is somebody who has a certificate but no classification.

Now, every once in a while – this plays into your hands very well to this degree. You are in lower South Amboy, have gotten yourself together about twenty people and you've got a co-audit running there and because they're all running as pcs and very low-level co-audit,

you see, don't need any certificates or anything. You've gotten them trained. You haven't made that mistake. You've educated them up to knowing what they are doing and so forth and then you get very enthused and you put them through an HQS Course. Well great, that gives them a certificate, doesn't it?

Well, the number of these people that are going – that's perfectly legitimate up to these point – but the number of people who are going to go for a classification examination over to Melbourne or Los Angeles or something like that, are very few indeed. So that, in essence, has stopped your co-audit, hasn't it? They can never be processed beyond this point.

Well, supposing you had these twenty people and they were going along with vast enthusiasm and so forth, and supposing your classification had gotten up to Class IV. You pushed your classification up to IV. Now, the point comes about, can you teach these people a course for certificate? Well, now there would be several ways you actually could do this. One is to get them to go to Los Angeles – these are all possible routes – or get some Instructor to come over from Los Angeles and teach them a course, making them sweat it out for a certain period of time and reach certain requirements, don't you see, or get a special dispensation based on your own record to teach them a course yourself. Do you see? You wouldn't be able to charge them no money for this or cut corners in some other direction, you'd – it would have to be all very official and formal, but nevertheless this is rigged so that you get minimal stoppage of progress with minimal upset because of technical flubs.

Now, that's the way the thing is adjudicated. Are we going to have a lot of people in lower South Amboy who all have HCA certificates, who can audit nobody and do nothing, don't you see. And therefore this course that's going to be taught in lower South Amboy under these cla... these – these determinations just won't get taught, you see, because this might be very damaging. It might be very upsetting. Until some arrangement can be made where somebody has guaranteed the fact that – that their – their training was good enough to get them across at that level. That's what's being guaranteed here and that's really the sole criterion in this.

Well, now these people could go all the way on up. Sooner or later they're going to have to connect with or collide with some kind of a training course someplace, you see? But they can go on and they can get their certificates and so forth but if – they're conspicuously blank in their lower left-hand corner. There's nothing in that lower left-hand corner. This certificate is a certificate and all is fine but it is awful blank in that lower left-hand corner whereas a professional auditor certificate is very conspicuously classed in the lower left-hand corner. Got a great big class seal right there, bang, you see? And it says this is a professional auditor. And that is different.

Well, we've lived side by side with this – these types of auditors and these types of certificates all these years, and if all of my thirst for order has been unable to wipe out this particular line I don't expect it's going to get wiped out in the future. So you just might as well make up your mind that it exists. And what you should do to resolve this situation is just make sure that a competent auditor is harshly examined, harshly trained and is very recognizable. See what I mean by that, you see? So he's a pro.

Now, this takes the certificate at HCA/HPA that has always hung there – for some reason or other in the Commonwealth and in the United States there's different certificates – and puts them as both certificates in both countries. The one certificate the co-auditor does not have is HPA, Hubbard Professional Auditor. He does not have this certificate. He only has a Hubbard Certified Auditor. That's the only certificate he can get at that level which he is, of course, at once separated out in the sheep from the goats at that level.

Now, somebody then who goes through an Academy and works straight on through and – or returns to the Academy for his classification examinations – study and examinations, as he goes straight on through to his classification examinations from HCO – he is given a Hubbard Professional Auditor Certificate. And that separates the sheep from the goats. But they don't separate on up the line from that particular point except by designation.

And a classed auditor, then, is your third route. And your classed auditor is, of course, a professional auditor. And he has been trained formally and he has been examined thoroughly and he has been given his classification and he is permitted to charge for processing and he is responsible for pcs in his area and he is the one who occupies staff positions and he's the one who operates field offices and he's the one that does the business around the world. And that's the way it is working out and so we've paralleled to that degree.

But now let's take a look at the co-auditor as a route. This means that somebody can start co-auditing with Bessie Ann or Jane or somebody of the sort and can then, one way or another, at some degree of competence, the best that can be assured, move on up on a co-audit basis with another person or move on up on a co-audit basis with a group that is being conducted by a professional auditor. Numbers of plans are possible there, but this co-auditor is essentially paying for his auditing by giving auditing. He receives auditing and he pays for it by auditing. And he has a preclear logbook just like a preclear – and so does a professional auditor as far as that's concerned. But it's strictly a preclear-auditor swap-about, turnabout and that's about all except for the assists he gives his boss and his mother-in-law, you know? This type of usage.

And he's en route then, up through the line, on this understanding – that he is going all the way up through on a co-audit basis. Of course, in any person's life on this planet there can be many vicissitudes. There will be a period there when he belongs to somebody or other's co-audit and then another period when he and Joe have pulled off to the side someplace and they're doing a swap-about and then that kind of blew up, don't you see, and then he decided he's going to have some training on a little more formal basis and Joe's processing now looks pretty corny, so he now teams up with a fellow named Buster and you know, it's – it's – you know, it's the way it goes.

But he nevertheless has some guarantee that he's arriving. See, he's going over certain lines and he's got some guarantee that he's arriving and then sooner or later he's going to be able to get up within reach either of a professional Class VI Auditor, you see, that can do something with him and some others on an authorized basis or he's actually going to connect with a Central Organization Class VI Course for a brief period of time and get his lines straight and so forth and go on up all the way. That's the – that's his route, and he can go all the way on that particular route on a co-audit basis.

This, by the way, is far less expensive than the preclear route and it doesn't shut the door in anybody's face if he wants to keep on going and studying and making the best of it and so on.

Then, of course, there's the professional auditor route and we understand that route almost too well to say very much about. But let me add this – let me add this to that route. The professional auditor starts in and he gets his training one way or the other and he hangs on through this or that and he finally gets a classification and so on.

Well, the moment that this individual has actually got a classification seal, what happens to him? This means – this means that he has some kind of selectivity with regard to his co-auditing, doesn't it? So, who's going to audit him? Because he's got a classification seal, he of course is more in demand and because he's got a classification seal he probably audits with somebody with a classification seal. In other words, a professional auditor permitting himself to be audited by somebody who didn't know very much about what he was doing, doesn't happen too often because he recognizes it too clearly. It isn't really that Scientologists are harder to process, they are less propitiative and more outspoken.

In other words, their recognition of what's going on is so reaching... I wish I had had a tape many years ago of a couple of real old-time professional auditors coming in over an intercom listening system on their arguments with each other concerning exactly what the bulletin had said and they'd sit there and chew each other out on this basis and they were fumbling through a new series of techniques, you know. And brother, if you ever heard a pair of people that were lowering the boom on each other on the subject of *exact* adherence to the *exact* comma of *exactly* how it was supposed to be done, that pair certainly were. And neither one of them were going to go to pieces because it wasn't done right.

Well, you get some professional auditor, that would be a different type of auditing team entirely than somebody who was a little bit hazy about it or thought somebody knew best, and certainly a different type of auditing team than some preclear being audited; very different indeed! Pc sits there and well, what the auditor does or says goes, don't you see. Right or wrong, he doesn't know anything about what's going on, don't you see, and therefore the professional auditor is likely to get far more precise processing and errors which occur in his processing are far more likely to be remedied rapidly. And he has, as I've already mentioned, a much better choice of auditors and he probably would make it the fastest. Furthermore, he also has a source of income if he cares to push it to work which pushes him through training courses if he works it well with his pcs.

And, by the way, the literature – you'll be very happy with the literature at this particular field, because it points these things out to preclears: That the auditor should be of the class to audit them and if he isn't, why, then you should find that auditor some more preclears so he can afford to get that class and this is very fine because he then goes – he can then drop in on the local Academy or something of the sort and get his upper-class training, get expert consultation on his cases and discuss all these things with his fellow professionals, don't you see? And the pcs could help him out in this particular regard. In other words, it drops hints like you drop anvils, don't you see? It makes the way rather easier without having to explain all this and hint around, you see – put it right in the text, exactly what does go on.

Well, the professional, then, probably will make it the fastest and the quickest and the co-auditor will undoubtedly make it fairly rapidly, but with a few falls by the waysides and spins because somebody was trained but they somehow or another had slipped on their meter reading and they thought the needle should be rising on all assessments of service facsimiles and they took nothing but service facsimiles that drove the tone arm up and made the needle rise because a rise was a read and it said right there in the E-Meter manual... In other words, the very points which we have to clear up with pros coming in here will undoubtedly just become the order of the day with the co-auditor. You see, they make these mistakes.

Always – there's a certain set of – I don't know if you know it, but there's a certain set of mistakes that have to be corrected with every auditor who sets foot on Saint Hill. I don't care where he's been trained or anything else. We just expect these things will be in error and they will be. There will be various points which are awry because they are the frail points in training – the points that are easily overlooked, the points that are easily forgotten and nobody has ever stressed them hard enough to keep them from being messed up, you see? So you just expect that in – there's a certain list of things that one or another of one of these, certainly anybody coming in here is just going to have to have his head practically beaten off about before he gets the word, you see. We expect this.

Well, a lot of these people will have – those things will just be rife. So that will of course slow down their processing to that degree. It'll throw a few more cars in the ditch you might say, but they'll make it with a fair degree of certainty because they actually are operating on very precise information.

And the preclear – the preclear, of course, is the slowest and most expensive of the routes but the least demanding of the individual. And knowing man as he is at this particular time and with his tremendous tradition of being able to sit back on an easy – in an easy chair and somebody else does it all for him – knowing this frame of mind, that will be a very extensively used route, very extensively. It will probably outnumber the other routes by fifty, sixty times. And we do what we can to keep the pc educated so he isn't going it blind, at least on what he's supposed to be performing and what he's supposed to be gaining and steering him along the line and do what we can to straighten out any points that might come in his road; and beyond that we can't do too much for him.

Now, the three routes altogether make the Classification and Gradation Program. And the classifications of the professional auditor are just the classifications which have been published. They're already the same classifications, and they start in at Class I and wind up at Class VII. And the only other point I'd like to make here about this program is that that's rougher than rough – those classifications. We've suddenly stiffened that up. We've stiffened that up like mad.

It changes the original issue to this degree. That an individual, it's perfectly true, can go to an Academy for a certain number of weeks and get his certificate. Now – now he wants a seal on that certificate. Well, now he's asking to join the club and we have to open up the file drawer and all those infractions he didn't turn in that we were willing to forget about and all of this, that and that annoying habit he has of going into screaming peals of laughter when the pc says something which he thinks the pc means to be funny, these little points have got to

go, man. Do you see? It's same class. I mean it's the same level. It's the same level, but he's really got to be there. You get the difference?

And this guarantees – this guarantees us a very high grade of performance at that level. Well, in view of the fact that others are going by without that, of course, it throws more bearing on the person who is classified. So, classification really starts meaning something.

Now classification, of course, isn't promised anybody. A certificate, yeah, that's promised people, but not a classification. That isn't promised anybody. Now, what happens – this question will come up, speaking of general points now about these programs – what happens if Aloysius Q. Doakes of lower Cape Town all of a sudden – all of a sudden decides, having in his hands an HCS certificate, that he wants to become a professional auditor. Well, there he is, see? HCS. Well, he of course, is going to try to bull his way through on the basis that all he's got to do is take a little brush-up and an examination and he can have his classification and move over. Well, that route is not that simple.

In fairness to everybody else who is classified – in fairness to everybody else who is classified, you take an HAS Class I, you will see that has to be shifted. That becomes a co-audit certificate. So that becomes merely an HAS Grade I. It's HQS, Grade II and the "grade" just simply refers to his pcing. What about this fellow? What about this fellow with his classification now? He's up there at Level IV. No, he has to pass every classification examination right straight on up to Level IV. He has to pass them all to Level IV. In other words he's got to go through just as much mischief as anybody else had to get his Class IV, otherwise there – this would become very sloppy and upsetting indeed and that it would be very unfair to those people who had been perfectly good all the way up. Which means quite a bit of training all in one fell swoop for this character. He would have to get down and grind.

Now, we see this here at Saint Hill. We see people coming in here and they some... nobody has ever – has ever really gotten tough on the subject of exact performance and that sort of thing and they've let them go away with this and get away with that and it very often takes us quite a while to straighten something like this out.

So it's – classification, you might say is solely a matter of performance. And naturally, if somebody can't perform all the way up the line on these various classes, there would be no point in giving him a higher level classification, because a higher level classification must always take into account the earlier level classifications.

Now with all – with all fairness to one and all and the least interruption of the things which auditors are trying to do and trying to run centers and private auditors with reputations and pcs and all that sort of thing, out of this Classification and Gradation Program, I think will come a great deal of order. What do you think?

Audience: Yes!

All right.

Well, I've tried to meet in all of this all the objections that have been forwarded through and I was quite astonished – quite astonished in doing this to get some other, dis-related data that I had not expected. I hadn't expected any technical data to drop in my lap. There's a reason for this, because this is strictly an administrative program. But the basic one

was that pcs were failing because they weren't taught. That was the first one that dropped out, whereas, I had assumed already that pcs were failing because they were being thrown too far. That was my first assumption on the matter. That was not the case. It was they actually were not being taught anything and therefore were failing, so on.

That technical datum should give you pause when you suddenly get ahold of a pc and this pc doesn't know from nothing. Well, yes, you can always pull off your first trick. This is what fools the auditor, you see? You can always pull off your first trick. Raw meat, fat with charge, that sort of thing you're working with some altitude; you ask them to do this, this and this. See? And with great spectacularity they all of a sudden don't have lumbosis or something of this sort. Now, you say, "All right, he's an educated pc." Oh, hell no, man! He's an impressed pc! [laughter] You got this vast difference between these two beings.

He'll tell you, "Yeah, that Scientology really works." What is he saying when he says, "Scientology"? He doesn't know. He doesn't really know what you're doing; he doesn't know anything beyond the horizon of that psychosomatic he got away from and your next try – effort to pull off a trick may not be quite so successful. It might be indeed quite catastrophic. And you might lose this pc merely because the pc got going in this direction and then you didn't ever stop him and start him going in the right direction and he wound up in a horrible confusion. And so you lost him as a pc and then you go around scratching your head saying, "Why did I lose him as a pc?"

Well, you never had a pc. That's why you lost him as a pc. You had a – had him originally, probably, as the subject for a miracle. He actually would have done almost anything to have gotten rid of this lumbosis and you did almost anything and got rid of the lumbosis. [laughter] And you never made a pc. And I think that, all by itself, will be found of considerable benefit because it'll increase the extent and stability of the practice and activity of any professional auditor, just like that.

It's interesting, I also have some data on pcs being trained that comes from way back, but we used to push into the hands of a pc in one HGC a copy of *Scientology: Handbook for Preclears*, and we just made them do the exercises. This is quite fascinating. The studiousness and seriousness and enthusiasm with which these pcs went to work doing those exercises is a datum which I am using at this particular time saying the pc should be trained.

Well, I will say this: That the data must be concise and it has to be very easily understood and it has to be something that is pretty confoundedly personal to the pc for him really to get it straight. And it is better taught out of a textbook which he has certain lessons to do in before his next session. It's better taught that way than teaching him in a class. You don't have then, really, pc classes; you have pc assignments.

Well, he's finished it all up and you've handled this last PT problem he had with something or other and something or other and you end your session and then you take ahold of his textbook and you say, "Now you've got pages ten to eleven and a half there, now, we've got those two pages there, and I want you to cover those very, very thoroughly before the next session. Thank you very much," you see. After the guy – the guy's picking up his hat – "Remember to cover those," you know. "I've just noticed there that – that you haven't done your – your – your pamphlet on problems; I just noticed there you haven't done your pamphlet on

problems. And you realize that in another couple of intensives or something like that you're going to be coming up for another grade and we don't want that outstanding now. Get that done."

Now it gives the pc something to work forward toward instead of the negative gain of his own case, which is also quite necessary, you'll find, to keep a pc rolling.

But this pc keeps coming in and taking up half of your session – while you're trying to get it started, see – he keeps taking up half of your session with these horrible things that his wife is doing. This has been going on for some time. You've run several things. You can't seem to trace this to anything. What in the name of common sense is happening here, you see? Well, maybe it's some GPM at work or something like that or maybe it's a service facsimile at work but you're – you would make a horrible mistake trying to go into this because you've got a Grade II pc.

Well, what do you do? Well, at this level there are some good tips on handling his own life. You're just tired of these PT problems, you see, about something or other. You've been handling them, but actually he's not making any real progress because all you're able to do, session by session by session, is just to it'sa on these confounded problems, you see. And then this doesn't tell him anything about how to solve his problem, but it simply tells him what a problem is and that an individual himself must be contributing in some fashion – this lays it down with a thud, see – to the problem. See? He must be himself contributing to it. And any-time he has a severe repercussion from a problem, it's because he himself is unwilling to communicate to somebody about something that he has done with regard to this sort of thing. And we lay this down, you see? We just tell him the truth, see.

Now we expect the profe... a trained auditor – we expect this trained auditor – he'd know this. Hell, the pc, nobody ever bothers to tell him, see? He'd just go on and listen to his it'sa and that sort of thing and nobody is saying, "Now listen, bud..." You know. Because that would be auditor evaluation. Well, a book can evaluate without the auditor evaluating, can't it? [laughter] You say, "Why don't you review Chapter 3?" [laughter] And he'd be very appreciative about the whole thing. He'll come into the session next time and he'd say, "You know, I was thinking over about that thing, I was reading that, and you know there are some little things that I – I've – I've had some critical thoughts about that person. I think there are some things."

And you say, "Yes, yes. You had some critical thoughts?" "Well yes, there are some things that I don't think I have ever confided to that person, such as the trip to Kansas City."

Well, this gets to be a different situation all of a sudden. Why, you're half the session occupied with a PT problem, that problem evaporates as far as you're concerned without you having actually to do too much or jump up and down and scream, don't you see?

Now, all training – now enough of that – all training and all courses depend on having valuable material or data. That's number one requisite. You've got to have valuable material or data to impart. Well, you've got that in Scientology. And the next area of responsibility with regard to this, is that it be in a form or shape or condition to impart and inform – to be imparted and to inform others. There's a responsibility in any zone of knowledge of the communication of that knowledge. See, not only must you have valuable data, but also, if you're

going to train somebody or take that step, then that data must be in a state that can be communicated. Now, if that data is in the shape it can be communicated, you get to number three, which is it must be instructed. Because the variation and variability of questions which arise as a result of stirring up somebody's think-think on the subject will take a multiplicity of varied patterns and they will have certain questions which nobody could really guess at and which rise up and instruction, then, takes the zone of handling those things and showing the person where the correct answer to this is.

So there are actually three steps that have to do with training, whether it would be the training of a pc or the training of a professional auditor. One: you have to have valuable data to impart, two: it must be in a state or shape to impart and three: must be imparted on an instructional basis. Very possibly the modern university falls down mainly at level one – pardon me, not level one but part one there. See? Do they have valuable data to impart? See, that's the thing. The books of Thomas Hardy, you know – what's this? Which wall?

I told somebody who had taken a course like that that I'd read a lot of Thomas Hardy and he was very interested immediately and so forth and of course I gave him all of Thomas Hardy's potboilers. Nobody who's ever taken Thomas Hardy is really ever told that Thomas Hardy wrote mainly potboilers. They're worse than any penny-a-liner stuff that anybody ever tried to grind out, see. Now, if there's valuable data to impart there, I haven't seen it. But it wastes a lot of time, keeps a lot of people from doing something else and you can get education boiled down to a point where it's merely a restraint from being active. [laughter] And sure enough, modern kindergartens are conducted with that exact definition of why they are there – they are to keep the children from getting underfoot for a certain period of the day. And if you have all education starting out with a premise that we're merely starting to keep somebody occupied, ha – ha, it's liable to go rather adrift. And of course, sooner or later somebody will essay to teach a course on Thomas Hardy.

Now, the situation here is then that we in Scientology have now really two zones of responsibility. The valuable data is there to impart and one – about the only thing we share at that level now at the present time is just recognition that it's valuable data and know that it's there – know that it's there. That's about all that needs to be done at one. Because new codification of levels and so on gives certain basic auditing skills *pocketa-pocketa-pocketa*. And there are just – it's just a handful that carries the whole load all the way forward. You don't get this tremendous randomness that you had before, but you're still conveying the entirety of the valuable data so far as an auditing result is concerned so long as you back it up with philosophical understandings. Well, these philosophical understandings of course can come along at the preclear training level. But there's valuable data.

Now two – the two and three are where we sit, now. There's our main interest. Now it – Level II – it of course has been very difficult for me to package up a level from one end to the other without a totality of a finished product, you see, at the other end, because at any time some new data might spring out at the upper end which clarified the lower end. And that is what a student is mostly victimized by: is this was perfectly true and it is still true and everything is just fine on this data of 1956, but now we happen to know that you don't have to know all that. You see, we've got a simplification or a lower common denominator which of course alters the data of 1956. Well, this constant tumble makes the body of data studied by a

student rather confusing and all of Scientology at the present moment is being recodified with great severity and with a tremendous attention to pattern and ease of communication of the data.

For instance, there are twelve basic headings of a bulletin – give you an idea of this – twelve basic headings of the bulletin and they give you everything you have to know about a process. And to examine that bulletin, all the Examiner does is convert the heading of any section simply into a question. In other words, "What does (name of process) do?" That is one of its sections, see? It's this elementary, see? "What does (name of process) do?" is simply the Examiner's question, because on the bulletin it says what (name of process) does. So there would never be any worry in a student's mind about what he was going to be asked about this bulletin. It's just that question that's going to be asked, you see, and then you get the definitive words and so forth that follow on down inside one of these sections. He, of course, would be asked the definitions for those words, don't you see, and he'd be asked the right answers for each one of these sections. In other words, this is a very finite zone of learning. It's very sharp.

Now, I don't think there are but about thirty different operations that comprise all levels of auditing – wow, sounds fantastic that it's that small. But Mary Sue and I were burning the midnight-dawn and the midnight-dawn express and we got together an exact, compact listing of the totality of technical material necessary for processing at all levels and it – it came out to about thirty operations. A very small number. And evolved this style and type of bulletin and so forth to carry forward this data. And the style of type of the bulletin. And of course, there's the drill which we already have the style of – the TRs. And this is being sharpened up and brought right down the grades.

Now, what remains there? What remains there is number three. Now, of course, you contributed, knowingly or unknowingly, to the precision and conciseness with which this data is being put together because we can guess what questions will be asked about it and what's being thrown wrong and what troubles people have had with it. But let's get into number three, now – the instruction of this material – and that becomes the most random area. Naturally, because it is the degree that accuracy is demanded. In other words, the data is there and it's all accurate and if applied works, why then, what variable comes in on the heels of it? Well, the variability that comes on the heels of it is simply and totally the degree of knowledge of it – the facility and skill of the practice of it that is being demanded of the individual studying it. And this becomes quite a random factor.

So that you could toss somebody this bulletin; he could read it through – oh yeah, this is very interesting and so forth. You say, all right, you've passed the bulletin. And then you take somebody else and he reads through the bulletin. You say, "All right, now what is this bulletin for?" And he says, "Well, that's for psychosomatics," and you say, "All right, very good. How is the thing run?" "Well, you ask the fellow time and time again a certain command that's given in there. That's the way – that's the way it's run." You say, "All right." Not very much demanded of the person.

Now, we say, "All right, what is the basic – what is this process for? Yes, yes, yes, yes, anything else? You say nothing else. I'm sorry, that's flunked. There is one other use this process has out of the 15 listed in that paragraph."

Now, these are the materials of Scientology. Now, some of this falls into the preclear. These processes are being administered so certainly he gets wise to them to the degree that they're being administered to him. He couldn't do them in a thousand years, but he's familiar with them in that he's been run on them. But did you ever ask a pc what was run on him a month ago? That's the surest way to draw a blank I ever knew. They'll never tell you.

So we fill him in on the various basic philosophy of existence and the scope of the philosophy of life and so forth – it is Scientology and its definitions and that sort of thing. We can give him this philosophical background, but this doesn't train him up very far, does it? But actually he's being given, by being run on, and he's being exposed to, by having been given some little lessons on the subject, the basic data of Scientology. It's all there.

Now, let's take the co-auditor. Well, sometimes he's trained fast and sometimes he's trained slowly and sometimes he – all the time he was on the course and so forth he was having a worry about his automobile or something and he couldn't get his mind on his bulletins. He, of course, hasn't got this – he's got this data down so he can perform it. He might have to go and get hold of a bulletin and look at it occasionally to see exactly what it was. You see, that would be his level of command of the situation. Of course, he's been run on it so he's got a subjective reality on it. And he's run people on it, so he's got an objective reality on it. Now this is getting up to a higher level of precision, isn't it?

All right, now let's take the professional level of exactly this same data and this fellow, he's got this down and he could be sitting there dead drunk or with a hangover or something like this and he could still dish out the auditing command that – necessary to fit that process. And he would put down, in spite of anything that was happening in the randomness of the situation, the amount of TA which was occurring as a result and would suddenly notice that his pc was not running as well as he had been running, and that there was some bypassed charge and this randomness probably came from another process which had not been complete or something on the pc. There was a bypassed charge over there. In other words, we're entering judgment and practice into the situation. We're adding very precise drill; we're adding a snap and pop into the thing and a delivery of precision of – well, a precision of presentation and so forth.

Now, that – those are the things which mark the three different routes to OT – the amount of knowledge which goes along with them. It's always the same body of knowledge. It's the degree which it is understood, it's the degree that it's performed that makes the differences. And as long as we make sure that that is what makes the differences and as long as we carry forward our responsibility to that degree where it is supposed to be carried out – for instance, let's take somebody in lower Amboy and he doesn't give an exact, Saint Hill, Tone 40 "Start of Session." So let's keep him in course for a year until he learns how to give an exact Tone 40 "Start of Session" the way it is expected to be done. You get the idea? That becomes purely pedantic, doesn't it? It becomes nonsense because this is not that important a point, don't you see? So we look at this fellow and he gives a perfectly adequate – he does

know enough to say "Start of Session" – see, that's good. He can carry on through – he knows he's supposed to stay with it. He knows he's not supposed to give up along the line someplace. He's supposed to run a process until it's flat; you get this sort of an approach. All right. Well, you've got an adequate co-auditor, haven't you?

Now, because these differences exist then you're going to have differences of speed and you're going to have differences result of this but I think we have covered some of the basic problems which individuals have had moving through and improving in Scientology plus the one that preclears are very often yanked fast forward without having done anything at the beginning and gone over their heads. I think we've covered some of the basic problems that auditors and preclears have with this program and the only possible excuse that the program may have for existence is will it make better progress in Scientology, will it make better individuals and will it improve the results which are being obtained, will it continue a preclear further in his auditing, will it see more people moving on up the line – those are the only things that would say whether it was a good program or a bad program. And in my opinion the Classification and Gradation Program definitely will improve this and will bring a lot of order to areas that we have had here that have been pretty random in the past.

So, it's been – it's published, now, although it is being printed. The preclear's logbook is being printed and the various papers connected with this are now being assembled on a basis of printing. We're just making sure the logbook is at the state now of just making sure there isn't anything else that needs to be in it before we send it out for estimates on its printing.

Is there anything else that should be in the logbook? We've got practically everything including the kitchen sink in there right now, you see? We've got the Auditor's Code and we've got why he's being processed and we've got definitions, we've got the section, we've got his checksheets, we've got – practically everything you could think of is in there, but somebody may see something we haven't got in there yet.

So, that's the state the thing is in, but other than that the program actually at this time and at this moment is in effect. And should be grooved in and followed wherever possible and should be published rapidly and some very shortcut rapid summaries of this should be released and will be released and available so that people can publish them and get things straight. And that's the Classification and Gradation Program.

Thank you very much.

AUDITING BY LISTS

A lecture given on 16 April 1964

Thank you. What's the date?

Audience: 16th of April.

Sixteenth of April. Have to make you work for this lecture one way or the other. AD 14, Saint Hill Special Briefing Course. How are you today?

Audience: All right. Fine.

Good.

All right. Well, I haven't anything to talk to you today about. You're all doing marvelously. You just couldn't do better unless you began to audit. [laughter, laughs] And all the departments are going well. They even tell me there's going to be a checkout in a week or two in Practical. [laughter] Yes, things are looking up, looking up.

There is one good news item which is marvelous, is apparently, *The Auditor* is going across with a smash – the new magazine. And we almost never have reader mail on these national magazines, and so forth, or PABs. Nobody ever bothers to write. They write on other lines, you know, but they almost never mention these magazines. And it's very peculiar that *The Auditor* on its first issue immediately – crash, bang! You see, letters pouring in to the editor and everything going off with a bang and a crash and a thud. So we launched that one into an aura of great success. So let's hope the whole Auditor's division goes ahead along that line. Let's hope they all go along with great success. And a lot of us were on to that publication and we have the magic key there.

All right. Now, I hope the situations in Class VI are going to remedy anytime now. And some of you are going to get brave enough to really go out and confront the tiger. I've been swamping up any little odd bit or piece that you might collide with. It's down to a point now where a collision with an error or an oddity wouldn't do too much to your pc anyway. You'd catch it in due course.

But that's pretty well ready to go. That's pretty well ready to go and I want to see some of those Class VI students here really moving up because – don't look so pale – because it – just because a couple of them got moved back off for inadequate TA division, and so forth.

It just shows you something. I had a lot of people finding goals on this, and they never found out that one of the series is nonexistent. Very interesting to me. I mean, I do this all the time. I mean, I'm working in some particular field and there's some glaring error to be found there, and so forth, and nobody ever finds it. And it drives me ahead into zones and areas of greater responsibility. And you really bog me down with responsibility, and so forth, because

I figure if I made an error, you'd go along till heck was a pup before you'd ever turn it up. And yeah, it's – really saddles me with one, you know. It's a serious situation. As a result, when I audit, I audit the bank and the pc and all the future mistakes you're going to make, and it makes my auditing quite difficult. [laughs]

But this area is pretty well swamped out now, and pretty straight and I've gotten into a zone now of overcorrection. I'm now, having made one little slip – see, I didn't release it. I was going to recheck it before I released everything and then before I released it, I – on the recheck, why, I found out there was an error. And there was also a bit of a line plot error. There was a word or so missing out of the line plot. But I'm now into an area where I'm overcorrecting.

You see what I mean. I mean, you do this with a pc every once in a while. You can also do it with a piece of research. You find out that it was the break of reality which upset the pc, you see, and then you go on looking, See. And if you go on looking far enough, you'll have the pc upset all over again. See, you get your good indicators back in and then you go looking for something that is wrong. I've now done this with some of our upper-level materials, and so forth. I've gone so far looking for something wrong, don't you see, that now all I can find is invalidation of what's right.

But you're in very good shape this way and things are all fine. I want to see some auditing teams going on it. And why, I'd say now that we lie about 200 to 300 hours of auditing from OT for about at least 30 percent of the people I'm looking at right this minute – providing, providing, providing you audit. That's necessary.

I want to talk to you today – those were all just announcements and so forth – I want to talk to you today about Auditing by Lists. And I'm getting so tired of writing somebody in north Darwin (you know you don't dare go too north in Darwin, you get your feet wet, you know) and somebody here and somebody there, somebody on course writing down the explicit directions of how you audit by list, that I think I had better make it public property. I think that might be a very good idea. I'm not yet in a position where I can release the whole of Auditing by Lists, because we haven't, you know, cleared up and straightened up all the lists by which you audit.

Now, Sherlock Holmes used to turn to Dr. Watson every once in a while and say, "Watson, the needle," you know. He used to turn around once in a while and he'd say this, you see, and Watson was supposed to give him the needle.

But Level III is the needle level. That's the needle level. Level II and lower are tone-arm levels. And your first level that pays any attention to the needle – except to use it for centering the tone arm – is III. Now, that's very important because that's your HCA/HPA level.

Now, as you realize now, a co-auditor can be known by the fact that at this level he has an HCA certificate, and a classified auditor can be known because at this level he has an HPA certificate. We're separating them right there, so you better get your certificates turned in and straightened out.

Anyway, a very, very careful study, a very careful study – of auditors and auditing lies behind all of these level divisions. And with a great deal of skill – and it does require appar-

completely out of sympathy with this pc who is just giving him the 5,765th problem, when all he's trying to do is to find out if the pc has suppressed anything. And the pc is going on at a mad rate.

Nevertheless, it is the auditor's reaction that gives the dirty needle. You would not get the dirty needle just because the pc is going on endlessly not following the process. But when you bring up the pc with a dull thud by failing to acknowledge, by insisting the pc answer something, by chopping his communication in some particular fashion, by not accepting his answer – any way that you could possibly interrupt the comm cycle – you'll see magically appear before you a dirty needle.

In other words, the pc could have done the wildest and most incredible things on a process level without acquiring a dirty needle and gets a dirty needle the moment that the auditor gives them a bad time or chops them or squares it up or does an unsmooth action.

So, there is a little piece of evidence that you yourself will see from time to time if you care to observe it. It might be a good thing for you to observe it occasionally, because you will never do a Level IV assessment unless you stand – understand the Level III skills of the needle.

Level III is almost totally devoted to needle. If you follow the needle, you will get tone arm action. If you don't handle the needle, you won't get tone arm action.

Now, the pc – let us say we have a question here, "Do birds fly?" and the pc has no charge on this question. There isn't anything in this question at all – "Do birds fly?" There's nothing to this question. The pc doesn't care about birds. He hasn't any answer to it. He has no interest in it of any kind whatsoever.

So you say, "Do birds fly?" and the needle registers absolutely nothing. It's a completely smooth flow. And at that moment you went slightly cross-eyed and you didn't see that it had a very smooth flow, so you decided to ask the question again. And you say, "Do birds fly?" and that's it; you've had it.

It's a sort of not handling the pc's answer anyhow. It's actually not taking the needle reaction which was there to be had. You simply didn't see it. So you forced this question down the pc's neck. Even if you say, "That was equivocal. I will have to ask it again." Well, usually that gets you over the hump but not always.

So we asked this question again, "Do birds fly?" And at this moment the pc said, "Oh, blank!" – to himself. And you get that registering on the needle.

Now, the uninformed auditor believes at this point that he missed the read the first time and now has a read. He doesn't bother to clean up the pc's considerations, but he assumes that he now has a read on "Do birds fly?" so he is going to clean this question!

Now, remember what I told you. The first reaction of a needle is to the session and the second reaction of the needle is to the question. So the auditor has assumed now – bypassing the possibility that it was a session reaction – he has assumed that he has a hot question, because the needle ticked. So he says, "Well, it read."

The pc said, "No, I don't have a birds fly – *bluaaaaaah.*"

"Yeah, but it read!"

"Oh, it read. Oh. Oh, I guess, let's see, 'Do birds fly?' I haven't got any birds. Let's see, do they fly or not fly, and so on. *Oooooooh*, let's see, *hmmmmoooooh*, let's see, 'Do birds fly?' – *duh – da – duh – da – da – da...*"

And you get the standard re... session reaction that some people like to think of as auditing. See, you've turned it on right there. Pc's out of session; he's not interested in what you're doing.

Now, you could sit there and you ask, "Do birds fly?" and you're going to get a bigger and bigger and bigger reaction to this question. Every time you ask the question you're going to get more reaction to the question, because your needle reacts first to the session and second to the process.

Now, the auditor eventually gets into an ARC break situation, let us say. The pc explodes all over the place. He eventually gets List 1, and he starts down List 1 and he clears up the ARC break, and finally, and so forth, and then he gets a smooth needle again. But supposing this auditor never had learned anything about cleaning up a needle or that the needle reaction was primary to the session and secondary to the process. And let's supposing the auditor hadn't any clue about any of this: While he's doing the ARC break assessment he does the same thing. He gets the wrong level or something of that sort, and he does it once more.

Therefore, you don't let auditors at Level III assess anything. This takes a senior understanding. Now, *if* the pc has already been upset, it will be because the auditor could not handle the needle. To let that auditor now do an ARC break assessment on the pc is going to result in a multiplication of the ARC break because this auditor has already not handled the needle, and handling an ARC break is a process of handling a needle. That's a technique of handling a needle, you see.

Now, even an experienced auditor – I've seen them goof an ARC break something marvelous, just wrap it around a couple of telegraph poles and leave it there in a pile of junk. ARC break the pc on an ARC break assessment. Pc all of a sudden originates and he says, "Well, the charge was so-and-so." That was what it was. Brightens up, everything is fine, and the auditor goes back to the question he is trying to clean. The pc now protests this question because it wasn't that question, it was the other question, so it makes it seem to the pc that the auditor has not received his communication. So he gets a dirty, chopped-up needle. The auditor tries to ask this question, "Has a communication been ignored?" And of course this question is being protested by the pc, so you get a bigger read on it. And the auditor insists that the bypassed charge is an ignored communication. The pc is trying to insist that it was a broken reality. And between the two of them they stir up the most gorgeous ARC break you ever saw in your life. You see how this goes?

All you have to recognize about a needle is that the needle, first and foremost, reflects the condition of the session and secondarily reflects other things that you're flicking and ticking at.

Now, you're very, very lucky to have a Mark V meter. Early meters were about as sensitive as a Nazi. You got nothing out of them. In fact, I have seen meters that had been manu-

factured out from under, so lousy, so horrible and so on, that you practically could short the electrodes. Now, the meters which are being – you know, no reaction – the meters which are being used by infantry in Vietnam to hand to the communist fellow traveler who has just come from general headquarters – whatever it is – this meter, if it isn't a copy of the Mark V, would be a complete bust.

They don't know what this thing is supposed to be all about. They have no real clue. When you get your lie detector buzzards going around and your medics fooling around with a thing called the mind – they know what a mind is; it's something you attack with a scalpel and a saw – when you get these, these... it's very hard for me to use just pleasant language in dealing with it.

And we've got one down which Reg bought at vast expense – and I'm awfully glad we've got it, though; it's still around the place. It is a medical doctor's E-Meter. Marvelous thing, I don't know what it's supposed to tell, but it's marvelous. There is no way you can reduce the sensitivity on the confounded thing, and it's geared up to read horses or mules or something. I don't know what it is, but all that needle does is bounce from both sides and so on, on body motion. It won't give you anything but body motion. It has no faintest mental reaction traceable on it anyplace. If somebody moves his foot across the room from the person handling the electrodes, this thing falls three and four dials. You think I'm kidding, man, but you ought to see that thing. It is an absolute beast! The medical doctor's E-Meters.

Actually even the sensitivity has nothing to do with it. It doesn't – it isn't how sensitive the meter is that makes it a good meter. Somebody can throw together some old pots and tin cans and so forth and say, "This is an E-Meter," and you look at it and you squeeze the cans and, oh man, it flies all over the place.

That factor – the looseness of the needle – does not establish whether or not your E-Meter is an operative meter; nor the inactivity of the needle, as some of these old pots and so forth that were counterfeited up the line in the earlier days – that doesn't establish it either.

An E-Meter must measure mental reaction with a minimum of physical reaction, and that is the trick and that's the design of the Mark V.

Now, the Mark V will register an analytical and slightly sub reaction. It is geared up so that if the pc has a reality on what you've asked him you will get a read on that thing on the meter, see. That's a very beautifully balanced little situation. And we're very lucky. It took years to evolve this meter. But it's a careful balance out of these factors. Every time somebody says, "Let's get a new meter," I throw up my hands in horror.

I remember, there's – there is a civilization a few galaxies over here that – it's got spaceships and backpacks and infantry zerp guns, and it's got this, and it's got certain types of motorcycles, and it's got that, and so forth. (Probably a lot of you are from there because every time it loses a battle they ship the people over here – the enemy does. They know what – they know how to get even.)

So anyway, this old civilization – this old civilization is just about the meanest area to try to put an idea into it you ever had. You see, they worked it out for years and eons and eons

– been going for billions and trillions and trillions of years with an uninterrupted flow – which is pretty unusual in civilizations anyhow, see, and is on a complete, perfect no-change.

And you say, "We got an idea for spaceships." Their spaceships aren't all that good. They're as good as spaceships can be, but you could undoubtedly make a better spaceship, you see. But they blow up on occasion and they do this on occasion, they do that on occasion. They mess up one way or the other. And yet to try to get any idea across to them fills the hierarchy of that particular activity with absolute horror. Because they've lived with and through all of the areas of innovation, and innovation to them is dangerous on a departure from the highly workable.

Well, the – what got them into this frame of mind was, is the degree of workability which they demanded was a fairly flexible, wide-open degree of workability, you see. It'd take you a thousand years to go from A to B. Well, naturally that's unworkable. "Well, could you get there in a month or two, you know, from one galaxy to another galaxy or something like that?" "Oh, yeah. Yeah. Oh, easy." "All right. Well, that's workable."

Now, when you try to vary off of this level of workability you run into undesirable factors. In other words, you can get a greater (quote) "workability" which is much harder to work, you see. They've been through this so often that finally – I mean trying to give them any new weapon, tool or anything else would be absolutely – you just might as well bash your head against a concrete wall. I swear, you couldn't even change the design of a trigger guard. They've seen it all, and so on.

I'm afraid were getting that way about the E-Meter, because this has a greater degree of workability than you will ever need. This is already up in the stars. We fought this battle a few years ago and it was a rough battle to fight.

But frankly, this thing will read almost anything you want to know at sensitivity 16. Almost anything you want to know, sensitivity 16 will give you just about anything you've got.

Now, if you want to expand and magnify the read – you've got on the sensitivity knob, you've got 32 – and if you want to expand and magnify the read, you've got 64. And if you want to expand and magnify the read, you've got 128. You're going upstairs now from any desirability. If this thing simply worked at 16 only, with the other knob set at 32, if you could never get it higher than 16, it'd still be usable at Level III.

We're in danger of stultification. I suppose if there's some new method of containing charge inside a battery comes out, that might possibly be altered in an E-Meter. You know, it'd run for ten years without recharge or something like that. That'd be desirable. But I don't think there'd be anything get changed inside the meter because as far as that's concerned, I've had it. I've fooled with these things for, ah, a dozen years! You never saw anybody get as sick of anything as experimental models of an E-Meter. If you want to really see me go into a screaming fit, bring me a proposed change in the design and circuit of an E-Meter so that it is easier to manufacture or something like this, or something like that. *What! No, no!* Horrible. Because I'm afraid we'll lose the workability we've got. And I want to impress upon you that that is a poised knife-edge.

You go pushing around this thing very much and depart from it very far, and you'll find yourself in a horrible situation of having improved yourself out of a workability. It may have some new desirable factor. You may be able to get it inside your pocketbook, but it won't read a pc, you know. So this is what's known as holding the line on this.

Now frankly, the width and latitude of this E-Meter is so great that at Class VI you have to audit down around 4 and 6. And you're a fool if you audit above there and yet when you begin to audit, you will do it. You will learn this lesson all by yourself. All with your own little paws. [noise of an airplane flying above] (I'd love to shoot those things down.) [laughter]

Anyhow, you'll find out that you think you can get a better performance, or something like that, out of your pc or something by carrying it at a higher level of sensitivity. Or to make – to agree with the fact that Ron says you ought to get dial-wide falls on a goal or something, then you start jacking up the sensitivity in order to get the dial-wide drop, don't you see? You don't keep sweating it out to try to get the dial-wide drop at sensitivity 4, see. Various odd things. But you will eventually come back to the complete boredom of running the thing at 8, and start bringing it back within the levels of practical action which is around 4 or 5.

I can tell the difference between setting an E-Meter at 4 and 5. On Class VI material I'll accidentally let it drift up just to 5, and all of a sudden, I'm – "Something's awful live around here. What's going on?" you see, and retreat it back to 4. You know, kick it with your finger or something like that and it drifts up just one division.

Well look, at the highest levels we're running this confounded E-Meter at about what? What's sensitivity 4 in relationship to 128, see? We're something like driving a Cadillac, you see – we're driving a Cadillac along a level, smooth highway where you have no need of its springs, you have no need of its shock absorption, body weight, its horsepower – none of these things are necessary for what you're trying to do. All right. Well, let's keep it that way.

Because the truth of the matter is the E-Meter is designed around the needle. You could design a tone arm meter, which you wouldn't need the needle reaction of, that would just perform fine at II. We've already done it. And you could design a meter that would be minimal body reaction at Class VI and you probably could get away with it so long as you never had to resort to the needle.

It's the needle that gives you trouble on a meter. That is the one thing which you got to watch. A bad meter does not give you needle response. It'll give you body responses or it'll give you something else or it won't respond to thought. It's whether or not this thing is geared up to thought. That's what's important, and the needle is what ties it in to thought. It's its needle response – that is thought. And nowhere is as much demanded of an E-Meter as at Level III.

Level III is then the hot meter level! And if you can make somebody run a meter at Level III and he can really make a meter snap and pop at Level III, I assure you he's never going to have any trouble in any other level.

He gets to IV, it's a pipe. What's the trouble with assessment? IV is your assessment level. What do you do at IV? Why, you just go down and see what reads most and then you take it. So your assessment has got to be good.

But what gets in the road of that assessment? The phenomena the person should have learned at Level III. That is that the needle reacts to the session before it reacts to the subject matter.

So you got to be hotter than a pistol; you got to be able to sit there and keep that needle clean. And that is the first and foremost skill, because it requires that you keep your needle clean. That is to say, you keep your session good, so that at no time is the session getting in the road of the needle ticks which you're using to audit the person. And all of a sudden you've got a stray tick or a dirty needle or something like that, you got to be hot enough to pick up the considerations which gave you that oddball phenomena.

At III it is demanded – or nobody could really run III at all – that all of this data about the meter – how it reacts to the session, how it reacts to body motion, that sort of thing – this has all got to be known and it's got to be known terrifically well. The thing's got a *bzz-bzz-bzz* – what the devil is that *bzz-bzz-bzz*? Well, somebody who doesn't know what the devil *that* is, is not going to be able to straighten out the meter, because that is a session manifestation; the auditor has goofed. Something has gone wrong with the auditing cycle in this session and he'd better jolly well straighten it up right now!

He's trying to put in a rudiment, "Has anything been suppressed?" Well, he has a clean read. Now, he maybe doesn't know whether he had a clean read or not, so he thinks he had better ask the question again. So he asks the question again, but this time it runs into the negative. The pc has thought "nothing there," see. So now he has a read on "suppress" which is a session read. Up to that time – up to the moment he got the clean – it was reading the bank, you see. And then he cleaned a clean. He saw the needle; the needle didn't even quiver, "In this session has anything been suppressed?" and the needle didn't even quiver.

Well, if he said, "That read," and demanded to know, or if he simply, really, even asked the question again, that meter manifestation has passed from process and mind over to session. He's moved the meter over from something that is measuring the pc's mind over to something that is now measuring the pc's condition of in-sessionness.

The pc was *with* the session and you were registering his mind. You make a goof with the needle and you've got a pc who is *against* the session and you are no longer reading his mind, you're reading his analytical session reaction. And you've moved the needle right out of moving in amongst the reactive bank into moving right amongst the session.

Now, at III a person has got to be able to tell that's happened. He's got to first know that it can happen and second know when it has happened. And when that thing has happened, not to keep on being a complete nitwit about it.

I've seen some real knucklehead – you know, I've watched a lot of TV demonstrations. I'm speaking from the – from the proud plateau of having made every one of these mistakes myself much worse than you ever made them. Because I made them with nobody telling me it was a mistake. I didn't have any help, see. I used to be in condition with a meter, I suppose –

the Mark Vs are very standard now but meters of earlier days used to vary from meter to meter and you'd give an auditor a new meter, it'd take him – take him as long as two weeks to get used to this meter.

Well, it's the same transition you make from a IV – a Level IV – pardon me, a Mark IV meter, your Mark IV meter, shifting to a V. I saw Mary Sue do that, and frankly her hair was standing on end. She *uhck!* She felt like she'd been put in a jet plane, see. This thing would barge and bang around like it, and so forth, and she had to train her thumb into tricks that she'd never wotted of.

You've got to break with your thumb the sweep of a Mark V meter if you're running it on rudiments that you're really trying to pick up carefully, see. And you've got to ask the question with a certain timing so that the end of your question comes when the needle is still on the dial. That's all manual dexterity. That's vocal and manual dexterity.

You dream up certain tricks. This can get very tricky. You have to know exactly when to start asking the question and when to arrest the needle and get your thumb off in time that your thumb will now no longer influence the resulting read that comes at the end of your question. Complicated, huh? So it's complicated. I've had to learn how to do it, so can you. Because if you're running that high, man, you can pick a guy's brains. You really can pick his brains.

Now, needle manifestations do not just consist of ticks. There are things called slows and a speeded rise. Well, within the last few weeks I dirtied up a needle, completely unintentionally. I was asking "Suggested" as a button and I got what might have been a sort of a slowed speeded rise. Something funny happened with the needle. It was almost imperceptible. And I said, "Well, I'm not going to nag the pc about this," and went on to the next question. And that one was a mess, and the next question was a mess, and the next one was a mess. And I couldn't figure out what was going on. Now, there'd been a – there'd been an answer. I finally hauled it back, rehashing, and hauled it back. Suggest – there'd been an answer on Suggest which then operated thereafterwards as a missed withhold, see. But this fantastically slight manifestation of that needle – it was so slight that it was practically guesswork.

In other words, any change of pace of that needle is a read, much less reverse direction. So you're caught between the devil and the deep blue sea. Because this thing will read all the way south – if it reads on the needle it'll be real to the pc; if it doesn't read on the needle it won't be real to the pc. Now, they're cut in; they're absolutely side by jowl there, and so on – it'd give you some of the experimental design problems of the meter.

You know, early meters didn't read on some pcs because they were off the bottom and didn't read on other pcs because they were off the top and – ah, wild stuff, see. Well, we've covered that whole band now. And we have something that exactly compares to if the pc's going to know about it or can know about it, you're going to get some manifestation on the needle. But a very fast swinging needle gives a less perceptible reaction. See, if it were going very slowly, you would have gotten the more perceptible reaction. But that needle was traveling at the velocity of near light, don't you see, and it just vaguely changed its pace and the inertia of the needle was sufficient to carry it through the read. So it can get that rough.

But what kind of a pc am I talking about now? I'm talking about a pc who is passing off the meter anyway. What do you mean off the meter? Well, along about VI, at Level VI, when you get them in around auditing actual GPMs, your meter passes out of this world. You've got to start running it – if you're going to put in rudiments on a pc, you've got to run it at a much higher sensitivity, and the pc is already reading better than a Clear on a meter, don't you see? You somehow or other got to mesh this meter in against a pc who isn't really reading on a meter, who hasn't got that much reactive mind left, don't you see.

It gets pretty messy. And when the pc's postulate made in the session gives you a rocket read – so that your greatest manifestations are off the thoughts of the pc. If you want to see a big read at – when a person's had a lot of Level VI stuff run on him, why, just have the pc decide something – *psheew*. "What was that?"

"Oh, I just thought we'd had it, you know. We'd gotten it now." Pc's postulates are rocket reading, you see.

You're actually auditing somebody who is an electric eel to begin with, and what you're mainly reading is reactive material and all of this reactive potential is disappearing; because a reactive potential is, oh, a trillionth or some infinitesimal fraction of what the person is actually capable of doing by himself. It isn't just the plain statement of what you can do reactively you can do better analytically. That is an understatement.

Somebody has a compulsion to wiggle his ears, you see. All right, so he wiggles his ears. Well, frankly, if he didn't have an inhibition on the subject of his ears, his ability to wiggle his ears could set up a hundred mile an hour breeze, don't you see, if you do it analytically. It's not a proportionate remark.

If a fellow could paint somewhat – well, take Rembrandt, something or other (reactive chap) – he could paint somewhat, and so forth. Think of what the guy would have done if he hadn't had any reactivity at all on the subject. Wow! It'd just be strictly *wow!* It'd be that much better. It's magnitudinously better. It doesn't just pass from reactivity under your control so now you can do it just as well. It actually isn't even in the same order of magnitude.

For instance, I didn't get bright about photography until I started chipping around the edges of the GPMs about making pictures. I started to get real bright about photography. I started to get bright on the subject, you know. I'd been going along, and so forth. And I realized, just all of a sudden, I had a perfect working system of photography all grooved in, so I'd never noticed it before.

We had a beautiful system of photography on the subject of color transparencies. Take a Rollei camera around here and just shoot about anything in the place and do it beautifully and gorgeous and everybody ohs and ahs over the thing. What do you do with it? It costs you three pounds five shillings to have a color negative made so that you can have a single print. And then the print costs you two pounds five. Something on the order of about five pounds ten, you can get a small snapshot, see. The interruption is, the color transparency doesn't cost all this, just they can't be made into pictures.

So, last night I was just upsetting Reg about it. So last night I just all of a sudden said, "Hey, what do you know," and turned on Reg's big Rollei projector, and turned it on to a big

screen, and took the Land camera and took a picture of it. The most beautiful color snapshot you ever saw in your life.

Brand-new use for Land cameras. Takes a beautiful black and white. You can then turn around and get a negative made of the black and white, by the way, for fifteen cents. We had – we had complete system sitting around here, and so forth. All it needed to do was to be put together and that was that, and we had pictures.

You can almost count on the fact that if you've got re... a reactive ability, you've got fantastic problems along with it. You could just count on that, if ability is at all reactive. Now, if you want to know whose ability is reactive, well, who is having problems with his ability?

The circus performer has a lot of worry about having to... so on. But he is the wildest cannon – human cannonball in the world, don't you see. But he seems to have this and he seems to have that and something. Well, he's reactively being a cannonball, and so forth. Well, if you cleaned him up on this particular subject, he wouldn't have problems on the subject of being a cannonball, see. That's all very interesting from a viewpoint of that. The problems get added by the reactivity and the reactivity also de... takes all the power out of it.

Well, this is completely reverse to the way the psychoanalyst thinks that the world works. He said, "Be glad you're a neurotic, because you wouldn't have any skills unless you are neurotic," you know. Ding-ding-ding, here comes the wagon. Well, of course, he wants everybody to be neurotic; that's how he makes his dough. They wouldn't sit there that long if they weren't so neurotic.

The scope, then, of a person's ability depends on fishing it out into the analytical realm. And the magnitude of performance and so on is some fantastic, disproportionate figure. You've got a grain of sand to the mountain, don't you see? Brahms versus a musician, you know.

It's a good thing for you to know this – I'm just not riding a hobby horse. It's a good thing to know this, because every once in a while you're going to get a pc who is going to balk: He – he – he – what – what – what if he lost his, you know, what – uh – uh ...

There's writers around that just go around cultivating neuroses so they can write, you know, as though this has something to do with it, and so forth. And you sometimes actually need the data I'm giving you now. But the softest statement is whatever a person can do reactively, he can do far better analytically. That's the softest statement made, but I'm giving you the actual scope of the situation. Anything he can do only reactively, he's going to have problems with of great magnitude, and the difference of proportion of ability and so forth is some – one to some unimaginably large figure, you know – trillions to one, you know, something like that.

Now, what's this got to do with the needle? Well, there actually isn't too much of a problem at Level III because you've got mostly a reactive being. He's on the reverse order. You got one trillionth of a being and the remainder of it is reactivity. So at Level III your needle behaves fairly well on reactivity and doesn't get in your face too much on the session thing. There's a balance between these things, you see. Somebody can still be upset about the session and sometimes still even read a bit on the needle, do you see?

At VI this gets reversed. Now, you really see, you really see it the wrong way to. You ask if this thing is this way and you get a little tick and so forth, and all of a sudden you get a rocket read and you say, "What was that?"

"Oh, that. *I* thought something or other," don't you see.

So, your reactive read is getting much tinier and your analytical read getting much larger. But at Level III the reactive read is larger than the analytical read. Got that? Which is the only thing that saves anybody's bacon at Level III if he's having trouble cuffing around a meter.

But you got to know how to keep a needle clean. Well, therefore, you have to know to complete an auditing cycle, to complete your auditing comm cycle particularly. You've got to know when the needle – and it's just guesswork – when you've overreached a point and you're not getting a consistency and the pc seems to be unhappy about what you're doing with the needle, you've got to know then that you've got to go into the session part of it and straighten up the session part of it.

But don't keep straightening up the session part of it with mid ruds to a point where you drive the pc out of session. That's the beautiful point of balance there. You can harass a pc who is running all right until he is very aware of the session. See, you can turn it around the other way to.

So what's the trick here? It's maintain the needle in good condition simply by maintaining your session in good condition. That's all you have to do to maintain the needle in good condition, just keep your session in good condition. Don't get the pc against the session. Don't get the pc against you. Don't start harassing the pc one way or the other about things that are not this way or that way or something of the sort. And then above all things, for God's sakes, never blame the pc because he's not behaving properly on a meter. All auditors sooner or later do this and then much to their embarrassment they find out they haven't been asking the right question.

It's this crazy. They've started from the last session – they've started the new session and they're not getting the same reads on the needle that they were getting in the last session. And they start blaming the pc for having done something between sessions. And then much to their embarrassment they look up at last session's auditor's report and find out they were running another question. See. They never cleaned off their last question; they did something weird, see. They're not asking the right question. That's why the pc isn't reading on the meter. Or they've got their session completely awry; they haven't got the pc in session at all.

The needle, how to handle the needle, that is the basic foremost skill of Level III. And a person, to be a Class III Auditor, ought to be able to handle the needle backwards and forward without ever cleaning a clean or missing a read.

You clean a clean, you're going to throw the pc into a session awareness. He's already given you all he's got. Now you're asking him for more. Ach! You're going to dirty this thing up. He's got an answer, you don't ask for it – you're going to dirty this thing up. In other words, you're going to miss a read. That kind of thing shouldn't go. You've got to – got to get those things ironed out as far as the auditor is concerned at Level III.

And he should realize that when he's getting screwball reads of some kind or another – like the pc says he hasn't got any answers but he's getting reads – it should eventually dawn on the auditor that the pc is protesting or invalidating or suppressing or doing something weird in the session about the session. He's got to recognize that the metering has shifted from the reactive to the session.

And with just that data – and practically no other data than that – you really wrap up needle reading. That is needle reading. The peculiarities, inconsistencies and oddball non-senses about reads... Well, let's just take body motion. So you got a big, sweeping read all of a sudden. I had a pc, every time a foot was scraped across the floor, an electrostatic current was generated and you got a read. And yet it was always done completely silently and without any other body motion. Well, that's a session reaction, isn't it? So, it doesn't fall beyond that, and it's simply up to the auditor to find out *what's going on!* That's all.

"What you doing?"

"Oh, I just moved my foot."

Now, with that data and knowing just that, you can do Auditing by Lists. And if you don't know that data, you can't do Auditing by Lists!

Now, Auditing by Lists is going to confuse people left, right and center, because they're going to say this has something, then, to do with assessment. No, it doesn't have anything to do with assessment at all. Because on Auditing by List you are not interested in which level or item of the list reads. That you are not interested in at all. You are simply interested in going down the list and making sure that each one in turn is cleaned up if it reads. You're not trying to go down a list and find one of these levels. Remember, that's the operation of an ARC break.

All right, now, get this – get this difference. Assessment means reading down a list to find out which item on that list reads more than the other items on the list, which is *the* item. We are trying to find the item out of a list of items – whether it's listed by the pc or an arbitrary list, see. That's assessment. That's trying to find *the* item.

Now, Auditing by List is no effort to find any part of the list greater than any other part of the list. This is just sawing wood. There are this many cords of wood up there and it's going to take so much time and action to saw up these cords of wood, and that's all he does with the list. He just makes sure that each question on the list, in turn, is no longer reading when he leaves it. And that's the whole action of Auditing by List: making sure that each question taken up in turn is no longer reading, which requires the action, of course, of reading the question to find out if it reads and then continuing to get actions to the question – get answers to the question until the question no longer reads, noticing now that the question is no longer reading and passing on to the next question.

Along with that – what I've just given you – noticing that he is getting reads that are session reads which aren't associated with the question, see, that's part of that. Otherwise he's trying to clean up session reads by reading a question. You know, pc's been protesting for a while. Pc has a withhold. He's messed up something in this session, see. So now he continues

to get reads on the list which aren't from the list. This requires the auditor differentiate between these two things. And that's all there is to it.

So, we get, we get, "Do I see a cat?" – tick. "Very good. I have a read here."

"*Yeow-yeow-yeow, it's...*"

"Have you done that?"

"*Yeow-yeow-yeow, yeow-yeow.*"

"All right. Do I see a cat? All right, that is clean. Do I see a dog? That is clean. Do I see a horse? That reads."

"*Yeow-yeow-yeow, yeow-yeow-yeow.*"

"Do I see a horse? There is *another* read there."

Boy, shoot the auditor who never learns that trick. That is one of the slipperiest tricks in auditing. That causes more ARC breaks to say, "That still reads." You see what happens is, you just told the fellow he hasn't answered the question. You've given him instantaneous ARC break.

Any time something – a question reads twice in a row, it is always *another* read. It's not the same read, ever! Nothing ever "*still* reads." It always has *another* read. It reads again on something else, always. That is the understanding of the auditor's palaver. The auditor works that into his patter. It's always *another*: "I have another read here." It's a major auditing error, it's a really a gross auditing error to say, "That still reads." Because he – what's he done? He's just refused – refuted the fact the guy just cleaned it up, and the truth of the matter is he has *another* read. It's not the same read that he had before. Always another read.

So, we just go down this list and we read the question and if it gives a meter reaction, we get an answer to the question. If it doesn't get a meter reaction, we don't get an answer to the question. Then we just simply check the question again. If the question now has another read on it, we get another answer to the question. And we keep getting more answers to the degree that the question is more reads, you see? And eventually, unless we clean a clean or miss it completely, we get a null needle on that question. And now we go to the next question and we do the same thing with it.

This is Auditing by Lists. This is all there is to Auditing by List.

You have put in the auditor's paws the *totality* of the process. And if you're doing auditing supervision on this and you have a bunch of people worrying about this, let me tell you something. You stand back in the corner with a sawed-off shotgun in your hand. You just wait for the first one to ask some dopey, stupid, Q-and-A question, and just blow his head right off. Just splatter it all over the other students and they won't do it anymore. And let me tell you from long experience, that's practically what it takes.

I'll show you what I mean. "Have you ever kicked a horse?" – this is the question we are asking – "Have you ever kicked a horse? All right. That reads."

Pc: "Well, actually I kicked a cow once. Uh – I know. I remember it very vividly; very vividly. I kicked a cow once."

"Oh, yes. Well, what about kicking a cow?" That's the moment you pull the sawed-off shotgun up, cock it and fire it. It's an incomplete cycle of action. The next thing you know, this person's needle is going to look like so much jam. You're going to have the pc all loused up and ARC broke. It doesn't matter how happy they look just now, all this is going to catch up with him.

His question – blankety-blank-blank it! – was "Has he ever kicked a horse?" An h-o-r-s-e, horse. So he says he kicked a cow once. Okay, so he kicked a cow. All right. And you simply let him tell you all about kicking this cow. And you give him a sort of a half-acknowledgment and you say, "Yes. Yes. Yes. Yes..."

"Oh, you're asking about a horse. Oh, yeah, there were some horses there. Oh, yeah. Yeah, I did kick a horse." Get the idea?

Or if he's answered "a cow," and so forth, and you say, "Well, all right, all right, kicked a cow. Now, how about a horse? You kicked a horse? The question was a horse." You have to do that very delicately because you ARC break the pc again that way. You're making him wrong, see.

"Well," he says, "Hm-mm. Hm-mm. No, I just never have kicked a horse." Needle.

Oh well, now, you've got one of your interesting problems, haven't you? You've got a needle reading one thing and the pc saying something else. What do you do?

Well, the one, two, three of it is you simply make sure that your read isn't coming from a session miss, see. "Are you protesting the question? You invalidating the question? Are you upset about the question? Am I cleaning a clean? What – something – something gone... Oh, that – doesn't it. All right. Thank you." Get that all straight. "Now, have you ever kicked a horse? That reads."

"Oh, it still reads? Well. Oh, well. Ha-hah. Guess I'd better think it over then."

And you'll find out that's about the most serious reaction you'll get. "Oh yes, and I never told my father either. Oh, man! Oh, that was – yeah, yeah, and he licked my older brother for doing it. Had hoofprints all over the horse, you know. Oh yeah."

"All right. Good enough. Thank you. Now, let me test the question; just let me check this question now, just to make sure it's clean: Have you ever kicked a horse? All right, that's clean. Thank you very much." And go on to the next question.

Get the idea? There's nothing really fancy about this. It's just the one, two, three, and you've got to – your auditor at this point has got to understand the combinations that can go awry, see, which is to say, it can come from reactive to session. You've got to get an answer to the question. You mustn't Q-and-A with it.

I've known certain schools of thought on this subject that if he said a horse – you said a horse and he said he kicked a cow, then you ask him about the cow, but halfway through that he cognited he kicked a dog. And then halfway through the dog, why, he cognited he kicked a pig, and each time the auditor said, "Well, how about the pig; how about the dog; how about the pile. *Zah-zah-zah, zah-aaaaaaaaa.*" There they go over there, way over.

They're going up that rise over there someplace, you know. Here's the session here, see, and they're just traveling up over the rise of the hill.

They've just left it, man. That's nowhere. They never completed a cycle of action. A Q and A is simply a failure to complete a cycle of action. Whether an auditing cycle or an auditing comm cycle or a program cycle, he just didn't complete the cycle of action. So you've got to complete those cycles of action on Auditing by List. If you start List 62, don't get a sudden wild idea in the middle of the night and start tomorrow on List 65. No, finish List 62. See what I mean?

Now, what are these lists? Well, they're nothing more than the plus-minus misdeemeanors and upsets that an individual could have. They're based in various lines and levels. A lot of technical aspects can go into the manufacture of a list. Now, we used to make auditors around here do lists for certain pcs. Now, that was a big gag. They'd do a list for a pc and everything would come along fine. So an auditor, also, should be able to do a list for a pc as well as take a canned list.

But once the list is made, it is simply – whether the auditor did it or it was done for him or he something, now it is audited by list and is simply taken at question one and is cleaned through to the last question in just that fashion.

Now, there's really only a hatful of little lists that can be done over and over and over and over again. And these are lists like L1 and what we've got as L4 in your mimeograph work – L1 and L4. You can clean L1 and then you can clean L4. Now, actually those are used as Auditing by List. They're not used for taking up an ARC break, because they're not on an ARC break pc. They just have all these factors in them, so you go ahead and clean them up.

Now, whether you vary the question or not is beside the point, but is "Have I ____?" would probably not be used by you. It'd be, "Has anyone ever ____?" or something like that. You Hobson-Jobson the question over to be a broader scope, don't you see? You don't have to put a time period to it or anything like that. You just go on and clean this list.

Well, you, oddly enough, can clean List 1 and List 4 and List 1 and List 4 and List 1 and List 4 and it just goes on almost endlessly. That's because of the generality of the list. It's not a particularized or peculiar list to just this one pc. It embraces all the actions of life, so it's a repetitive list and you can go over it and over it and over it. You could keep on going, in other words, and using a pair of lists alternately, one against the other.

And each time you're doing the same action and it's simply Auditing by List, which is an auditing action, which simply consists of what I've just been telling you about reading the needle, making sure the needle is clean on that question, making sure your auditing cycle was good, making sure ifs clean, going to the next one, making sure that that one was clean and so forth before you left it and just going on down to the last question. It's as simple as that.

No arguments with the pc or upsets, you see, about this and that. Don't monkey around with it. Pc who is very recalcitrant and so forth, it looks like this thing is all going to pieces, why, you might have a missed withhold or something like that crop up and hit you in the face. So it becomes part of Auditing by List to be able to keep your rudiments in, of which missed withhold or Fail to reveal is one.

But look at rudiments, in actual fact, and look at Prepchecking. Isn't Prepchecking really Auditing by List? It's just cleaning the question and then going to the next question, and that's actually all you're doing with it. It's a simple action. So Prepchecking comes in also, then, and anything we ever knew... [noise from an airplane above]

(International Idlewild* here today. I got to get that new machine gun; they just advertised it.)

The Prepchecking, Sec Checking, all of these other types of – of "clean up the needle," then, all come at Level III. And if you want to know what is Level III: Level III is that level where you clean the needle.

Well, that brings us to Level IV, of course. Well, what's IV? Well, IV takes the list for an entirely different reason. And the individual is now totally accustomed to lists, so at Level IV he takes this for an entirely different reason: He's trying to find *it*.

So, Level IV – you're trying to find something on the list, you see. You're trying to find that one level which you are now going to use and audit – that's for service facsimiles and things like that. Which one of these things is it? Well, it never bothers anybody at Level III, you see. He doesn't care which one of these things is it or not it. He just uses anything that reads. You got the difference? All right.

Well now, this permits you as a pc, of course, very, very little width. Yeah, you got very little width of wander. So therefore you find out that you have to kind of stick to it. And you can get sick of the question, but remember that you go up from boredom to enthusiasm.

Now, there's a lot to know about a needle, but none of it exceeds anything that I've been telling you and most of it's on the basis of familiarity.

I've done a lot of theorizing about why people can't read needles when they can't and so forth. I found out that they couldn't see a still. They couldn't tell when something was still. That was what they couldn't tell. It wasn't that they couldn't recognize a motion, it was because they couldn't see a still. They couldn't see a reverse of direction or something like this. It had to do with visual acuity.

And you get somebody who's got a comm lag in ordinary living of five or ten seconds, and so forth, he's going to have an awful time reading a needle. So it goes over rather easily into case.

But you know, you're only trying to do a familiarization deal with training. It's just the degree with which you'll familiarize somebody and you can lick all these things just by getting somebody familiar with the needle itself, even if that's as odd as just Reach and Withdraw from the meter. And just meter drills in general is being a – coming accustomed to the meter and watching the needle and doing things like this.

Now, one of the interesting things that we've had going around here is we've had two or three people standing around watching one person put another person on a meter, and the two – and two observers. And you know, the auditor and the two observers are just in wild disagreement as to whether the meter had read or not read.

Your bulletin drills and so forth have all been gauged to overcome these bits and frailties and so forth. There's been a lot of work on this as you can see the number of drills that exist. But there is your toughest – your toughest application is your Auditing by List, as far as the needle is concerned.

Now, if a person can get through that then, of course, a person can assess. A person can assess ARC breaks and they can assess Prepcheck subjects and they can assess this and assess that. And they can take up, of course, lists of service facsimiles, and they can also learn to list. And now they're getting all ready to graduate course into Class VI materials, which is – takes this as a matter of course.

It's really easier to read a meter at Class VI than it is at Class III. I think that it probably wouldn't be true if a person couldn't read a meter at all at Class III. He'd probably become very alarmed at the degree that meters read at Class VI. It's something to be alarmed about. You keep cranking it down and it still reads, you know. And you... An inch read is probably questionable at Class VI. "Well, it wasn't a read. I don't know, equivocal," so forth. Two-inch read: "Ah, probably." Two-inch read with a blowdown: "Well, that's probably correct." "Did the meter explode? Well, it's probably the right item." You know, that's the sort of approach to it.

Now, this is an entirely different field of area at Level III. "You missed a read." "A read? Where was it? Where was it?" "It speeded on that rise. There was an acceleration there for a period of over a quarter of an inch. It went a little bit faster for that period of a quarter of an inch than it did just before and did just after. That was a speeded rise. What's the matter with you? Can't you read a meter?" "That's, oh my God, a speeded rise. What kind of thing... *Huuuh! Ooh, horrors!*"

Well, you get the difference of approach? So if a person can read a meter at Level III, he could do most anything, because I see even old-timers have trouble reading at III. But that is Auditing by List. When I tell you to straighten out a pc's ARC breaks, I really mean auditing – this is, you know, ARC breaky type pcs, not now in an ARC break, you understand. But he's had a lot of trouble and upset and he sort of feels poor. He will answer auditing questions. Everything's fine.

It's just L1 – L4, alternately, Auditing by List. No fanciness to the question if – you know. Just alter the question so it's broader, you see. But don't say, "In this lifetime, if you were..." or something. Just give it a broad answer. Clean that line by line, L1. And then line by line, List 4, and L – line by line – 1, L – line by line – 4. This person will come up shining. I don't care what he – kind of condition he's in. Sometimes they do even when they don't know the nomenclature, which is quite remarkable.

Anyway, there is Auditing by Lists, and there is, actually, a very full rundown on what is contained at Level III in Scientology. I hope it'll be of some assistance to you.

Thank you.

Problems And Solutions

A lecture given on 21 April 1964

[part missing]

How are you doing today?

Audience: Fine.

Good. This is the what?

Audience: Twenty-first of April.

Twenty-first of April. And we have a lot of wind blowing out here today. Twenty-first of April, AD 14.

[part missing]

All right. Well, you're going to get a very complex, offbeat lecture here today – very complex, very offbeat. Nothing simple today. Tired of talking about simplicities, you just never seem to latch on. [laughter, laughs] Talk to you about a complexity here, and see if we can't do so.

As you may know, not contained in the body of Scientology but standing aloof, there are a series of research maxims, or data, which I have really never bothered to collect. You'll find some trace of them in, of all things, *Dianetics: Evolution of a Science*. Its got quite a few of them in it. It's, you know, the rationale and the how of how you figure it out. There's a whole book that was devoted to this – was "Excalibur," is how you went about figuring it out. And every once in a while one of these things cracks through and you get a grip on the put-together of existence, and that sort of thing, which is extremely useful.

These things vary. I'm not giving you a big mystery. These things vary all over the place; they go from the sublime to the ridiculous. One of the maxims – I'll give you an idea – is, take a body of knowledge which has produced very bad effects and results, and if that's the case, then you move it out and don't pay any further attention to it. Take the one which is least productive of results and rule it out, and you can eventually corral truth on this type of an approach.

Let's take all those things that haven't worked and let's throw them out, see? That's this type of data, see? And this is of assistance on analyzing cases, you know, like mad. You do it all the time. You say, "Well, this fellow's been run on this and he's been run on that and he's been run on something else, and nothing happened in those instances, so it must be something else." See? Well, this can be done on a broad philosophic basis.

But let's take something of an unworkability and let's throw it away. Now, that's a research datum. Doesn't sound like much, does it? But it has a broad workability. The reverse doesn't happen to be true: Because something has worked on a case is no reason it will work on all cases. Isn't that an interesting thing? That is to say, because something is true in one instance is no reason it's true in all instances. You've got to have it applied in several instances and directions before you have any confidence in it.

That's one that an auditor misses all the time. He gets a tremendous win. He's got "Recall being drunk," see? And he ran this on this old lady, and she got a tremendous "send" out of this whole thing, and it gave him a big win. And now he fails to apply this little research datum, this truth of the matter. You see, he's only gotten a workability on one case here, series of one, and he has no real idea yet whether or not that is applicable more broadly. And yet out of the enthusiasm of his win, he goes ahead and runs "Recall being drunk" on this one and that one and the other one, the village parson, and all of these sort of things, and he doesn't get any more wins with it. You see? So he feels very defeated.

Well, what he's done is fail to apply the other side of the thing: just because it had a workability in this instance is no reason it's broadly workable, see? That's the maxim that goes back of that. There are a lot of these, a lot of these. They're sort of idiot's-delight sort of things, and rules of thumb by which you progress.

But once in a while one of them turns up that has tremendous value. And this may or may not have some value to you. (This lecture, by the way, is about levels.) This may or may not have some value to you as a technical datum, but it certainly has tremendous value as a research datum, to such a degree that I was able to crack through some of the wildest web-work that I think I have ever gotten mixed up in, with this.

You see, you can get certain things to read on a meter. You get in the vicinity of "create" GPMs – let us just mention that in passing – and you can get, on Monday, this combination to read; on Tuesday, this other combination to read; on Wednesday, this other combination to read; and on Thursday you get an entirely new combination to read. By that time, you're pretty caved in, so the only thing you can run on is whether or not you've got a creak. So you try then to rule out the creak, and you go back over these things. And it just gets to be one of the wildest swamps that you ever got mixed up in, trying to pilot through the basic morass of the individual, because you can get so many things that contradict so many things.

Now, in view of the fact that a pretty well-off auditor – I doubt very much could pilot his way through a goals plot and still have a pc sitting across from him. Pc would probably be dead by the time he got the goals plot half-finished and there wouldn't be any point in finishing it. This is grim. This is real grim. I mean, you see the tiger here; he's got teeth, see?

You get everything checked out, and then it doesn't check out tomorrow, see; it's something different. And, so I had to have a datum which would pilot through this, and I finally managed to tailor-make a datum which piloted through this. And we get a maxim that doesn't sound like very much to begin with, but it's – it's very, very pervasive. And that is: A problem is as complex as it presents potential solutions. A problem is as complex as it presents potential solutions. How many – how many wild ramifications has this problem got? Well, you want to know how many wild ramifications it's got; how many potential solutions

has it got? And that gives you an immediate index of how complex the problem is. That's interesting, isn't it?

All right. Well, let's say this perhaps has some workability – there's some more to this which I'll just go into in a moment. But let's dispose of this first one first. Let's say this pc – this possibly has use in the field of figuring out what's wrong with your pc. So the pc comes in to you, and he's been to the chiropractors and he's been to the doctors, and a last result, last, last, last result, why, he went and saw – something practically nobody who is decent would do – he went and saw a psychiatrist. And he went even further downscale and he saw a medico. And he's taken up good-luck charms and so forth. Well, all of this kind of thing, don't you see, is – those are all potential solutions, aren't they? Potential solutions. Now, medicine just gets rid of this fellow by saying he's a hypochondriac. And I've run into a lot of hypochondriacs, and they were sick. They were sick enough to be worried about. I remember one famous case of a very dear lady, and her husband was practically ruined through this. He was quite a famous writer – and she always used to be worrying about her health. And she'd worry about her health and worry about her health, and all of his writing friends and all of their wives simply wrote her off as a hypochondriac. And he was dearly devoted to her and doted on her, and probably only the reason he kept on writing was because she encouraged him, you know, and she – so on. But nevertheless she was always worried about her health. And everybody was very sure that she was a hypochondriac – labeled it as such, brushed it all off as such, right up to the moment when she up and died on them. It's quite interesting.

That was the end, by the way, of his career. He went down and went to work for the government. He started writing Herbert Hoover's "Reorganization of the Government" or something like that, and he quit writing. And the clique that this girl more or less held together all broke up, and so forth. But it left everybody absolutely stunned, you know? She was sick. You know? Well, she was.

Some people are sicker than others and some people talk about it more than others, you see?

And a handy way of getting rid of it, you see, if you can't solve it or do anything for it yourself, just say, "Well, he's a hypochondriac," you know, and dust the whole problem off, you see? And in this case, this was all very handy, but the patient died, do you see? Kind of a grim look at the situation.

You get awful tired of somebody who keeps nibbling around and worrying about this, that or the other thing. And you get awful tired of this person, they... and so forth. But the problem they're presenting can be measured by the complexity of the solutions.

So this hypochondriac who has tried everything under the sun – (quote) "hypochondriac" (unquote) – he's probably – he's actually got a problem that's that complex. Do you follow that? I mean, there's that complicated a thing wrong with him, see? You got the way this works. This is another way of looking at it.

All right, now this defeats forever the idea that you're going to slip somebody "Pill 62" and have an OT. Now, you see the error? This used to be introduced to me about once a week or once a month. And we even have a cliché that comes forward from that time. It's called the One-shot Clear, see? It means a one-process Clear or something like that, see? And for years,

why, I was interested in this particular line and everybody was always dreaming up with this. A beautiful dream: all you did was sock somebody in the gluteus maximus with a couple of cc's of "whizzo," or something, you see, and they immediately went *bing!*

Won't ever happen. Why? If this datum is true, it never can happen. In other words, the problem they've got is complex as the number of solutions that are pushed in its particular direction, or have gone around its edges, you see?

The problem of government, then, must be terribly complex, because you think of the number of solutions. Look at the number of political solutions there have been to the problem of government. Well, that gives you an immediate index of how complicated is this problem of government. How complex a problem is it? Well, it must be terribly complex, don't you see?

Now, this thing which has just one little old "whizzo" solution, don't you see, and it surrenders to that, that must have been a very simple problem. In other words, there's a comparable line between the complexity of the problem and the number of solutions. See, it isn't the complexity of the solution, it's the number of solutions. Solutions, quantitative, and complexity in the problem. I want you to differentiate that rather cleanly, see? It's not "big solution, big problem," see? It's complex in the problem, and numerous in the solution, see? Something you should look at.

So this tells you at once that when a pc comes in there and sits down in the chair, and you have to start running up the solutions to his case, you see – see, and it isn't surrendering easily – you always blame yourself on the basis you haven't used the right process or something of the sort, whereas you merely may be looking at this mechanism. This is a terribly complex case. It's a very complex case and therefore is going to require numerous solutions. Do you see?

So you're just defeating yourself if you say you're going to run one process that's going to resolve this particular guy's problem in life. See, you're defeating yourself, because you're going to run that one process, and that's not going to defeat his problem in life. Just make up your mind that if his problem in life has received many solutions, then it is itself a complex problem and will therefore require a complexity of processes to resolve it. See? Elementary.

All right. And let's go on from there. Now, a solution must be as complex as the potentials of the problem. There's the other "whizzo" here. Now, let's look at it in reverse here. How complex does a solution have to be? Well, it has to be as complex as the potentials of the problem. In other words, here is, again, not a one-for-one. Here you have the solution being complex, don't you see? This is another view we're looking at, another maxim. The solution has to be complex because of the potentials of the problem. You get the idea?

Now, what do you mean, potentials? Well, let's just take old "survive." This problem has this potential of knocking out of existence survival along various fronts or in various areas, you see? It's a threat. See, here's a problem that is a big problem. So, the thing to solve that: you look for a simplicity in the solution to solve this big threatening problem. And here's the way you get defeated like that: This bird comes in, he's got this dangerous problem. Now, we're talking about a dangerous problem, see – potential of a problem, dangerous potential. He comes in and he's got this very dangerous problem, you see? They're going to throw him

out on the street tomorrow – very dangerous; going to throw him out on the street tomorrow, and he's going to lose his job as a result, you see, and he'll probably be sued in court for something or other.

But he comes in and he tells you he's going to be thrown out on the street tomorrow. All right, now you give him a simple solution. You say, "Well, I'll loan you five pounds" or "five bucks," you see, "and you can pay your rent." Did you ever have it happen to you, that you found out that he all of a sudden told you then, "Well, yes, but then how does this take care of Maizie?"

"Well, what about Maizie?"

"Well, she's pregnant."

You get it? So you've set up a defeat for yourself. He's got a dangerous problem: You offer him a simple solution. That's an immediate way of setting up a defeat for yourself. You're going to be defeated in this. You can sit and talk to these fellows. Eventually you say they're completely ungrateful. You just sit there and you give them solution after solution after solution, and they can't seem to buy any of them because they always say, well, there's always this other thing, too, see, and then there's this other thing, too, and then there's also this other thing, too. And then they finally shyly look at you and say, well, actually, the reason they can't marry the girl is because they're already paying alimony to a wife elsewhere, you see? You never knew this either. This all has to do with their being thrown out on the street tomorrow. See, this thing just travels miles. In other words, nothing ever really becomes a dangerous problem which is very simple, or the guy would have solved it in the first place.

Problems only become dangerous that are quite complex. They require, then, a complex solution. "Well, what we have to do, I guess, is so forth, and we..." Your level of solution – this guy is going to be thrown out on the street tomorrow, and so forth. "Well, let's see, maybe I could get you a job with United Fruit, and we could change your name. Take a little doing; we'd have to get you a forged passport. And then, let's see, I happen to know Joe; that will require that. And you better – in order to get financed for this, you better rob a bank tomorrow," and so forth.

I mean, you get the idea, this thing is going to mount up into this. If you were going to be real in your solution, to match the thing, see, well, it's got to be – this is a dangerous problem – if you're going to be real in your solution, why, give them a real complex solution, see? It's got to take care of all these ramifications this way and that, and it's a put-together the like of which because... In order to become a dangerous problem, the thing had to coast practically into an unsolvable condition, and therefore it must contain many (quote) "unsolvable" (unquote), points.

It's quite amusing to look at advising human beings from the basis of these maxims, see? If you recognize those two maxims, you'd always be a whiz. This girl comes in and she says, "Well, I'm going to leave my husband. I'm going to have to leave my husband, because..." so forth – "things have gotten too tough." For you to say at once, like a marriage counselor, "Oh, well, no, I think we could just patch all this up" – you better watch it, man, because this is a complex solution required here, because that's a dangerous problem. Well,

she's got two kids. She has no means of support. She's going to leave the guy. She's going to have no home. Well, let's just look at this, look at what she's threatening to do, here, see?

It isn't just a matter of blow, don't you see? It's a matter of she's got this very, very dangerous problem: she can't stay with him and can't go, don't you see? But this thing is pretty grim, see? Not just grim in her own mind, it must be that grim. Then your solution to that must be very complex. So if you just say, "Well, I'll just run a little O/W on him and her and then straighten it all out," you're going to get yourself in for a lose, see? Because there's a tremendous number of things surrounding that problem.

She's not saying, "Well, I'm mad at Joe and I'm not going to serve him any supper," see? That's not very dangerous. See, it could be – a few pots and pans blow up – but this is going to be a bust-up of some kind or another. This is big stuff.

Well, a marriage counselor always gets it when it's right on the edge of the precipice, don't you see? So you offer any simple solution, you know, to this, you're being a fool, and you're going to have a big lose. It necessarily requires a very complex solution – nice, complicated solution. So the thing you had better sit down and do is not give her a little "bing," you know, and say "I'm going to do that." Sit down and find out all the items that have to be solved in this problem.

Now, that would be your real action. How many – how many angles to this are there? See, not just a glib "Oh, well, I'll just run a little O/W on it; you can go home," and so on. No, no. There's this Gertrude, his former wife, who is in Tallahassee, and then there's the matter of his mother and father, and so forth, and they're bringing pressure on her mother-in-law, because, you see, they own the mortgage on the house. And... you get the idea?

This thing builds up, and you'll just be stonied to find out how many dead ends, see, that there are in this thing. It's just big! See? It's not little. So if there's a big problem, dangerous problem and so forth, then you can just count on the fact that this thing has a tremendous number of little things begging to be solved out here in the woods that you're not aware of at all. And we get that just out of this maxim here: A solution must be as complex as the potentials of the problem.

You can get yourself a big win on this sort of thing, you know? This person comes in. Oh, God, they're going to blow their brains out, see? Well, man, that's a pretty wild solution. It's all right for you to say, "All right, he's in GPM 'destroy self'. All right, that's all. So we'll just fix that up, and so on." Maybe so, and maybe you would get to first base on it, except for this: The individual is not up to running at this level, and the individual has personal pressures in his immediate environment which would distract his attention to such a degree he probably couldn't sit still. And what are we dealing with here? We're dealing at Level 0, aren't we? So he's going to come in and he's going to blow his brains out. Good. He's going to blow his brains out. Boy, that's a dangerous solution, you know? People get hurt doing that! And... You didn't get that gag! [laughter] And you just better decide at that point, just better decide that this is begging for a very complex solution, very complex. This solution is going to be awful complex by the time you get through with this threatened suicide.

My God, this goes back to World War II and the orphan asylum and the girl who is writing letters that unless... And it goes to this and it goes to that, and it's something else, and it's over here someplace.

Well, why – why get all worn out by saying, "Well, there's just one more." See, you're getting in the same frame of mind he's getting into. Just take your original assumption, which is the correct assumption to begin with, and then work with it.

Well, it's a very dangerous problem this guy is involved with. Well, let's see how complex the solution is here. Let's just find out how many things have to be solved in this problem. Let's see, let's roll them off here. All right. "Well, all right, let's begin. You're going to blow your brains out. Good. All right. Now, now – ahem. What's the immediate and direct pressure that's causing you to do that?"

He won't give you the immediate and direct, but he'll give you something or other. Well, he's worried about his income tax. He keeps figuring it out and the government keeps unfiguring it on him, and so forth.

And you say, "All right, very good." Well, you say, "Well there's got to be some solution to income tax, is that it?" And you don't offer a solution. There's got to be a solution to income tax for him.

"Oh, yeah. Yeah, but definitely has to be one."

"All right, fine. Now, let's see, what's the next one here? Is there anything" – take it by dynamics, you see? – "any group you're connected with, or anything like that?" and so on.

"Oh, well, yes. I haven't paid my union dues, and they're going to beat me up next week if I don't. I've already been posted for being thrown out, and of course that makes me lose my job," and that sort of thing.

"Ah, well, there has to be some solution there too. How many – how many of these are problems? Being beaten up? Is that all one problem, or is several problems?"

"Well, being beaten up. Well, that's a problem, yeah, and uh... yeah, there's two or three problems involved there. And I'd have to go and get a job in some house that doesn't insist that it be union members, and so forth."

"And you been posted, and so forth, for your dues, and that requires money – that comes down to there. All right, now, how many solutions do you think we have to have here?"

And he adds it up, see? All right, that's fine. You got that out of the road. "All right. Now, let's see, is there any sex mixed up with this? Any sex mixed up with this threatened suicide?"

"Oh, well, yeah, that's what it's all about. That's what it's all about."

And, "All right. Well, how many things are there there?" and so forth.

And there has to be this and there has to be that, and there has to be something or other.

"Oh, all right. Fine. Now, is there any other condition?" You're about to go up to the sixth dynamic, you see, "Are you going to lose your possessions, or you're trying to hold on to possessions, or...?"

"Yeah. Well, I – three-quarters completed for the payments on all the furniture in the house and they're going to take it away."

"Ah, there has to be some solution to that, doesn't there? All right. Solution to the payments, time payments, on the house."

By the time you finish up, you've got a big sheet of paper here, see? It's just scribbled all over. But the funny part of it is, he won't be blowing his brains out. You didn't give him a single solution. You just said where they were needed. Takes him out of the confusion, of course, because it puts up the buffer "needed solution" in front of every one of these problems, don't you see? And he'll come down to it, then, and he'll be able to think his way through to that, and then you can pull it off.

"Well, let's see, we could start these things one by one, couldn't we? We could take these things one by... Which one of these things could be solved now?" And then run a gradient scale on the thing. Straighten out his whole life.

See, if you know this, you could handle Level 0 like a breeze. And Level 0 is the rough one to handle, man. What makes it rough? Well, these guys' problems are so great they don't even know they got them. That's how great that problem is. This fellow is walking around in a body! He thinks he's an animal! He doesn't even know he's a spirit! He doesn't even know his right name! He doesn't even know where he is or what he's doing, and he doesn't look at the fact of the importances in his vicinity at all. He's looking at a bunch of cotton-pickin' little pieces of nonsense here that wouldn't have anything to do with anything. See? Level 0. This guy's in trouble!

"But that's the way it is. That's life. Huh. Everybody else is like this, so I couldn't possibly be in trouble, because everybody else is like this, see? I'm not in trouble. *Blah-lah-ruh-ruh.*"

So, you see, his problem is so complex, he doesn't even know he's in trouble. No solutions possible in any particular direction, and the man's state is that way because no solutions have been possible in any state.

All right. Now, any time you dream up a simple solution to a complex problem you're going to go appetite over tin cup, square on your cranial capital. Simple solution to a complex problem. *Nyaaaaa*. This is how guys go politically bug-eared, see? You got to have something complex, as complex as the problem.

I want to point out to you that the International City – International City, and so forth: you start looking at this confounded thing, it's terribly complex. You start getting into complexities, you see, my heavens! You're into economics, and you're here and you're there, and banking, and boy – this thing is complicated, see? Well, actually, if you just blow up each one of its simple mentions into all the potential complexities, you've got the size of the problem it's trying to solve. And it might have a show.

Now, let me show you the simple solution: "Vote Republican. We have a Democrat in, vote Republican. Now, that solves everything, and that's all you got to do, see?" And we have another four years with things just going worse, see? "All right, now the solution is to vote Democrat. Get that Republican out and get the Democrat in. That is the solution to all our affairs!" See the idiocy of the simple solution? See? Complete idiocy.

First place, you'd have to go find a statesman someplace. I don't know where you'd find him; going to have to find him. Then you might set him up with a big team of guys that had some inkling of what they were doing, and they might figure out for a little while. And if they worked for a year or two like beavers, they just might be able to cut the fringe off of the problems that the country has. They just might be able to come into some thing.

Now, all right. This is levels. Do you recognize I'm talking to you about levels? Now, as you go on up through the levels, you're actually apparently confronting more and more complex problems and more and more complex auditing. But that is not the case at all. You're actually confronting less problems, and you have less demanded solutions.

Now, previously, people in motivation – I mean, psychoanalysis – people have been asking me for years, "Do you have any contacts with industry, or doing any work for industry?" I never really realized that they were asking me (psychologists and that sort of ilk, whenever I ran into them, and so forth; I go slumming every once in a while, I have to admit it) – but they're always asking me, they're always asking me, if we're doing work for industry. I didn't quite understand what they were talking about until I read a review of what psychology was doing for industry.

Psychology is big business now, because it's moved in hand-in-glove with industry. It is a little bit into government, but mostly into industry, and it's hiring and firing their employees for them, and it's selling all their goods for them. And it's telling them how to advertise and package their goods. And that's what it is doing. And that is all it is doing. It isn't doing anything else for anybody. Its testing services and so forth are all in this line. Now that's where its money is coming from, and of course we're cutting their throat on testing by simply giving it free in several large cities. This really upsets them.

The point here, however, is not any rant against the psychologist. He, after all, has his cross to bear. This bird is not even vaguely concerned with any of the problems of existence. He's completely out of touch, man. But he thinks, and the psychiatrist thinks, that you go *down* in man's psyche.

Now, let me introduce to you a brand-new principle, a brand-new principle: You don't go down through three levels of subvolitional unawarenesses and so forth to rock-bottom motivation, and that sort of thing, the way they've got it dreamed up, see? You're there, man. [laughter] That's the one point they've never grasped. They've not grasped that point. The guy is there. You have to go up through heightened awareness in order to progress through these "deeper states," as they call them. In other words, a guy has got to be more and more aware of these various levels of awareness. He's got to have a better insight into existence before he can see it at all, see? In other words, his perception has got to improve.

He's at the bottom rung of the ladder, and the only route he has available is up. He really doesn't have any down route left. There isn't any hidden, deep motivation. All you have

left is the individual and he is motivated. You have a motivated individual. You don't have somebody who is unaware of his "motivations." He really is at no point where he is motivating anything; he is being motivated. And that is it. What are these areas?

Now, the psychologist and the advertiser, and so forth, trying to stir up these things which motivate the individual: to that degree they are aware of this but they think that they are proceeding through lower levels of awareness, of less awareness, to reach these things. No. These things are reached through *heightened* awareness. In other words, as they try to research to find out... This is why they never get anyplace with processing, why they dead-ended in the whole field of therapy and actually jettisoned it. It had been jettisoned, if you want to know the truth of the matter.

Now, this fellow hasn't got an unconscious to be probed. He's unconscious. You see? He hasn't got one to be probed. He is simply the effect of all of this. There isn't any place you go below his level of awareness. They get this idea because a person can go to sleep, you see. And they get this all mixed up with the fact that he can not be aware and be aware, and they've got "sleep" and "awake," which has nothing to do with it.

Now, they want to know what motivates this guy, so they put him out further, or they search "deeper," or they plumb into the hidden recesses of his – "hidden?" Gone, man! He's the fellow that's hidden! [laughter] See, they're looking for the wrong thing. They're looking for the deeper areas of unconsciousness, when as a matter of fact, they already have arrived there, they've got it sitting in the chair in front of them. [laughter]

Now, in order to discover anything more about this individual at all, you can only go up. You can't discover more about this individual, you see, by putting him in deeper, or something like this, you see? It's hard for me to make this point because it's so ingrained in us that we go deeper all the time, see?

Now, let's look at it from another point of view. See? You've got to make him more aware in order to find out anything about him at all. So there is no shortcut, as we have eventually learned – we even jettisoned Dianetic reverie – but there is no shortcut by which you can get this guy half baked-up on peyote, or something like this, so that you get to a deeper level of awareness, which you can then examine to find out what's wrong with him. You see that as a complete detour? You're going exactly no place.

I'll give you the actual experiment on this thing. You could run this experiment on almost anybody. You say, "What have you been upset about lately?" or "Why are you nervous?" There's a good one. "Why are you nervous?"

And then the fellow says, "Uhh – I – I don't know. Am I nervous?"

"Well, you look so. You keep going like this all the time."

"Uh... well, I – I – I – I don't know. I – I didn't... didn't – do – don't know what's making me nervous. I – I – if – if I am nervous, I don't know what's making me nervous!"

Run this little test, like this: "Well, what considerations have you had about your state?" Run it for a few minutes and then ask him, "What's making me nervous," and he tells you at once.

Well, that's very interesting, because, in other words, you had to heighten his awareness by pulling charge off of this subject of his state of beingness. And now he knows. He can tell you. Well, this isn't him going into his subconscious, you see? This is opening up a little bit upper strata above him. You've made his awareness a little bit better so he can look better, and you've gotten him up to a point of where he can look at a little higher condition of beingness.

And that's the route that you take with a pc. And you can very easily get terribly confused and upset by current nomenclature, Freudian nomenclature and current understanding about having to go into the lower levels of consciousness of the mind in order to... No, there is no spook. There's no bogey sitting down below, you see?

It's like on a ship, you see? It's like you'd walk down through all the ladders of the engine room, and you finally run into this black, grimy character, covered with coal dust, and he is sitting there staring into a huge, roaring maw of a fire. And you say, "I'm looking for the fireman." And he starts accommodatingly looking all over the whole fireroom to find the fireman.

You see, this is the exact idiotic thing that they're doing with regard to the mind, see? And he will be very accommodating. He'll go into every corner of that fireroom, he'll go all through the engine room, he'll look under the gratings, he'll look in the bilges, and he'll cheer you up on the road and everything else. And he's looking for the fireman.

Now, if you were a Scientologist and you just ran a few considerations about his identity, see, made him a little bit more aware of things, and so on, he'd say, "Ha-ha. Oh! I'm the fireman!" [laughter] You see what's going on here, you see?

So we must be careful not to fall into this same parallel line of balderdash. You're looking for man's spirit, see? Great! Men will be very accommodatingly – they'll accommodatingly walk with you almost every place to find man's spirit, you see? And there he is, right there! See, he's it!

Yet how many times have you had to explain to somebody, "We're not interested in your soul. You *are* your own soul!" See?

Everybody says, "A what? I – *duh-uh!*" See? That's the same gag as the fireman. Duplicate gag.

No, the guy is there, see? There are no rungs – try to go further south than the bottom plating of the ship. There's no ladder going down there because there's nothing there!

So, the fellow is almost a total effect. He has lost his identity, he's lost his true beingness, he's associated himself with other things. Now, you've got to *increase* his awareness to find out anything.

There is no reason why... and by the way, I've made tremendous experiments in this particular direction, in all ways and directions. You can't shoot him full of scopolamine or truth serum or something like this, or hypnotize him and ask him something or other. All you'd restimulate is the GPM "to create the past," or something like this, you know. And he'll create a nice past for you, because he's less aware now than he was before.

So you reduce awareness, you find less person, and you're looking for the fireman and you already got him, see? And that's all there is there. And you're at the complete bottom rung of the ladder.

All right. Now, how do you get anyplace else? This is your problem as the auditor, see? Well, there are seven levels up. And these levels are determined only by this – only by this: an increased awareness of his beingness and his relationship to existence, and the problems and solutions of life. You just increase his awareness of this. What is a problem to this man? And if you simply ask that of each one of the seven levels as you go up, you could draw those levels very nicely. What is a problem to this man? And when you raise him up the line, in some horror you get up about four levels up – oh yes, he's calmer about everything now, but he can take a look at the problems he has got, man. He's better able to confront them so that he doesn't shudder with horror. But if you were to pull him out of 0 and put him at Level IV with one dull thud, and say, "Now look at, look at the problems you really do have, brother," he is not going to be able to look at those problems at all.

One, he has never climbed a single line of the stairs, because you've never increased his awareness of his relationship to existence. Only by increasing the individual's awareness of his relationship to existence can you bring about any heightened condition of ability, performance, livingness or anything else.

Now, this seems to be argued with by the fact that some guy can fill himself up full of Bromo Seltzer or heroin or something like that and perform very fantastic feats in some direction or other. And you know, I think they're all fairy tales? I did a tremendous amount of research with drugs back in '49, '50, and so forth. And the only thing that ever happened: people went to sleep.

I've never seen any of these marvelous experiments that I see written up with such glibity. I never see the results of these experiments. I read all about them, but a scientific experiment is something that can be duplicated in a laboratory, and apparently none of these experiments so advertised can be duplicated in a laboratory. That's an interesting one, isn't it?

Yes, you hear about this fellow, he drinks a half a gallon of rum and therefore he can lift up a horse, you know? I've seen guys drink half a gallon of rum. I've seen them *think* they could lift up a horse. [laughter] I haven't seen any horses rising off the ground, man. Their coordination gets worse.

There are some writers that think they can write better when they have some drinks. Old Dash Hammett used to have a ring, one of these fancy service things that has a shot glass in six or seven holes all in a little wheel, and all of the thing beautifully rigged up here, so all you had to do was turn it around and you could pick out the next shot glass, you know – these little salon presentation pieces of stuff. And he used to set that down at the side of his desk and when he would finish a chapter he'd pick up the next shot glass, you see, and down it, and go so... I heard all about this and how well he did it.

But I ran into some other writers that weren't so good this way. And one finally put the cap on the whole thing. He says, "You know," he says, "I can't write when I can't spell." [laughter, laughs] That actually wipes out the whole theory of "how much better I write when..." A guy *thinks* he writes better because he's less aware. If he were a little more aware,

he'd realize that what he was writing stunk! [laughter] I don't know if you've ever risen in the middle of the night and written some deathless prose or poetry. [laughter] Let's say your sense of appreciation was heightened by being half-out. [laughter]

See, we hear about all these things, but in actual performance, and so forth, we don't see these things get delivered. We don't see the half-drunk guy suddenly capable of magnificent feats of something or other, and we don't see this and we don't see that. But we see guys *saying* that they are this way.

So we can see here that there's a bit of a hole in some of the logic that is presented to us whereby "if we just became a little less conscious of everything, why, we would be a lot better off." Well, naturally, that rationale is a very current rationale, because it's been extant since the beginning of this universe, and is probably the basic rationale that lies back of solutions to all problems – is "become unaware of them." And that is the final solution: become totally unaware.

There's one just before you become totally unaware, and that is "Whatever you're doing makes you right." Regardless of how irrational what you're doing is, it's this last point of assumption that, well, you're doing right, you see? Completely irrational action.

Well, just below that, as the next solution down, is simply "become unaware." That's a gradient scale of solutions, if you want to know the truth of the matter.

Now, where you've got, then, an individual who is trying to improve himself, and so forth, he has two routes open. One is to become more aware of existence so as to cope with it, and the other is to become less aware of existence – become less aware and hope that you don't get run over. Or become more aware and be jolly sure that you don't. So, the dwindling solution, the solution which is going out the bottom, and so forth, is full of hope, full of a lot of things, but actually doesn't lead anyplace. And it is a very treacherous solution, because it is simply hoping it will be all right. "Well, I'll just forget about it and hope that it doesn't bother me."

We see this type of philosophy: "If you want to know why you are overworried, remember what you were worried about yesterday and realize that you aren't worried about it today. And I'm very glad that all the things I have been worried about never happened." This kind of philosophy. Well, it's very witty philosophy, but is it at all factual? How do we know that that fellow's worry and the actions he took as a regard – in relation to that worry did not prevent the total catastrophe? See, we're not sure of that at all. So this other solution is a complete slipshod one and is hardly any solution at all, which is just: become less aware. As one is standing there and the lion is charging down on one, of course it's always offered as a solution: faint. See? In the nineteenth century, it's practically the only solution womankind had. She was not in a position – she was still in a state of chattelism – she was not in a position where she could fight back in any particular way. Her word wasn't really very good in court and that sort of thing. But she could still faint. She fainted like mad and she fainted by degrees. She "Camille'd," also.

So, this is a solution of sorts, don't you see? If you can't confront it, and you can't move away from it, why, you can become unaware of it. The black panther mechanism, I

think we used to call this in Dianetics. Some such – "ignore it," you see? This is worse than the black panther mechanism; this is just "become unaware."

Now, therefore, it becomes somewhat terrifying to people when you reverse the flow on them. And this is one of the reasons why it's difficult for you to do this. Although you can do this as an auditor very, very easily, it's still sometimes quite terrifying. And you'll have some people wondering whether or not they should run out their GPMs, or something like this, see? Almost anybody will hit that one. You know you've got him running pretty good if about the third time you start to audit him he becomes not quite sure that this is a good idea.

You're asking him to reverse the flow of the universe, which is gradient unawareness. This universe has simply been a progress of less and less awareness. It's the route to the total sleep. And the trick of the whole thing is, it's so rigged that you never get to sleep. The lower you go, the more problems you've got, because now the littler problems seem bigger. And nobody ever looks at this parallel route as they go down the route of unawareness.

Actually, their becoming unaware of the big problem brought them less power or force – it reduced their confront – and so now they are less able to confront little problem at that level. So therefore it seems as big now as the big problem seemed, and just one stage back. And it seems far more dangerous and threatening and – because it is! What's the condition of some individual who, because there's a slight wind blowing, goes into terror? What is this condition, you know? There's a little bit of wind blowing, not much, just a little bit of wind, and this individual is in white, blanched terror.

Well, now let's map exactly what happened to this fellow. There was some bigger problem, on the same gradient, that he ceased to confront. He became unaware of it – almost purposely – and this put him into a confront of a slight wind. See, he came down to where he could only confront this little breeze. But the big problem was full of terror, so the breeze is full of terror.

And there's your trick when you uncover hidden memories, and this is the big invitation to go uncover hidden memories; because you often can uncover a hidden memory, and incidentally increase the individual's awareness slightly, you see – and uncover this memory by some kind of trickery – and the individual will lose this particular little fear. That he shifts over to another fear now and doesn't go any further than this, is something they never really bothered to investigate.

Well, I could take almost anybody who had a phobia, and most of you, too, put them on the meter – you old smoothie – put them on a meter and start figuring out, "Well, what are you afraid of?" You know? "Oh, you're afraid of this. Oh, all right." And let's just find the bigger fear that made them prone to the lesser fear. This that I'm telling you, then, has direct application – actually wraps up psychoanalysis. Freud can go back quietly to sleep in his grave. This was what he was looking for. This mechanism I am telling you right now is what he was looking for, the only mechanism he was really looking for.

All little fears are irrational and are based on a bigger fear. That's what he considered, see? He said the little fear is irrational, so therefore we've got to find the bigger fear that promotes the littler fear. And he went off into all kinds of symbolism and everything else. He got

lost in the rat race; he got lost in the maze before he got through. But he nevertheless was on this thing.

Now, why does that work? It works because the individual solved the bigger fear by becoming less aware. That's the solution to the bigger fear. And let me tell you – because I've practiced in the field of psychoanalysis – you can throw the individual back into the bigger fear and knock him galley-west!

You can sit here with your meter and you can smoke the whole thing out very carefully – not processing him, see, not getting any charge off, no TA action or anything like that; just sort it out on the meter.

"This fear you have of cheesecakes: now, does this associate with your mother? Your – father. Okay. Cheesecakes, and so forth. All right. Were you afraid of your father? Did your father ever eat cheesecakes?" And all of a sudden the pc has got two directions to go: One, cognition, he blows some charge, you see, and he feels better about it. That's almost totally an accident from your point of view, because – I'm talking to you out of experience – you can just as easily throw him over into a complete gibbering terror.

And the reason why, in psychoanalysis, 33 1/3 percent of their patients commit suicide is because they've put their foot into the wrong bin. They have accidentally pressured the individual's awareness up to a point of intolerance, and the individual explodes. Without increasing his ability at all to become aware, they suddenly confront him with the tiger. And he goes boom!

See, there's two things he can do. One is suddenly blow some charge at this point – becomes more aware and says, "Oh-ho! I'm afraid of cheesecakes merely because the old man hit my mother over the head with some when I was two. All right, fine. That's – that's – ha-ha! Pretty good. Yeah, oh, that's – that's very good. Yeah. Yeah. Feel much better now; I don't have to be afraid of cheesecake. I can be afraid of tiepins now."

See, that's one route. That's one thing that could happen to him. But remember this other thing can happen to him, too. You're steadying him down, you're saying "Father," and so forth, and "Mother." All of a sudden, a horrified look comes into his eye and he begins to shake.

"What's the matter?"

"I don't know! I'm really just terrified!"

See, you could play hell trying to push him any further down that track, now. He got some horrible idea, "Oh, my mother is dead!" and all of a sudden he starts screaming and howling and goes into a complete dramatization and crawls up in a ball, and you call the men in the white coats.

I'm not saying you could do this accidentally, because you don't *process* this way. I'm just giving you a little bit of warning about "processing" this way: "Reaching into the deeper states of consciousness in order to discover the fears that motivate this individual." Blooey! That's from nowhere. There's no route.

Because the dwindling spiral of consciousness has brought him to ignore his problems, see? And the bigger problems are less and less and less.

Ah! Let me give you a practical example – not boxing around with nothing here. Let me give you a very practical example.

First time I binged out of me bean in recent times here and started looking around about three-hundred miles up and that sort of thing, I thought, "Hey, what do you know," you know? "Ho-woo-woo! Wait a minute, you know? And aren't these clouds high. Everything's fine," you know? And all of a sudden a problem hit me about eight miles high, see? I'd forgotten about that. This was one of the prices of freedom.

Well, it was totally unintentional getting out of me 'ead anyhow, see? And it was just a flip in that particular direction, and we were taking off some charge in another area. And I got hit in the face with a problem that I had buried beautifully! It had sod all over it. I wasn't in any gradient up to being able to confront this problem, see? "Oh, look, I'm free! Hurray! Hurray! I'm free. Everything is fine – What the hell is that?" [laughter, laughs] Interesting, see?

Another instance of this: I'd forgotten that some time ago I'd had a fear of being drawn into the sun – a reverse light vector. See, I'd forgotten this. Completely unbraced, all of a sudden there's the sun – here I come, you know? Beams screech, you know, rubber burning. What's this, you know? No gradient. See, that was just me being unwontedly brave.

Now, of course, one ordinarily retreats... The reason a person exteriorized, see, and then went back into the head and you couldn't get them out again with a can opener [laughter] – I'm giving you what exactly this mechanism is, see – without taking off the charge of why they were in their head, you took them out of their head, and they suddenly confronted the problems that they had long since dwindled down on unawareness, so they're no longer aware of these problems. They had those nicely handled. You all of a sudden bang him out of his head, he all of a sudden looks these problems square in the teeth – like, you know, little things, like "How do you keep yourself centered in a room? I don't know. I can't keep myself centered in the room. I keep going one side of the room. What's all this black stuff around here? I didn't know I had all this black stuff around." Pang! Back into his head, see?

Or, "Gee, there's my body down there and my car is caught in a traffic jam. What am I going to do?" Bang. "I'm liable to suddenly lose my car and lose my body, too. To hell with this racket!" You see? He'd forgotten that he had to retain a certain skill to run a body remotely, see?

So back into his head he goes. Now you try to get him out of there again. *Bluoooh*, no. He knows better now. Ho-ho, he knows better. He's smart now!

"Come on, just one more time out of your..."

"No! No." [laughter]

He even sometimes gives you tremendous reality being outside – just vivid, see? Everything 3-D and all set up, man. He's all set. He's all roaring to go. Something like this happens to him, you see, he confronts some of the old problems that he'd become unconscious of. Carefully, he made himself less conscious so he wouldn't be aware of this problem. He never

solved that problem; he just became unaware of it. He took that line of (quote) "solution," see? So, back into his head he goes when he confronts that problem again, only this time he now has the awareness that there was some reason. This still sticks at him. There was some reason he went into his head. He can't quite spot what it is, but there is some reason.

So now you give him the business, you see? You say to him, "All right. But you had a good reality on it while you were outside. You know, then, that you are a spirit, that you are not a body. You know all this. You've got this all..."

"Ho-ho, no. I haven't got any reality on that. Outside? When was that? When was that? I didn't do it. Not – not me! Oh, I know we thought something happened, but probably just my imagination." You ever have anything like this happen?

Well now, this is why this happens. It's the dwindling spiral of unawareness.

Now you're all of a sudden going to take this individual that you've walked down into the bowels of the ship and asked him where's the fireman, and he accommodatingly searched for two hours when he was it – you're going to take this individual, and you say, "All right, it's very nice in the crow's nest. You can see every place. Now, we're going to put you in the crow's nest." Swump-glump, into the crow's nest.

Crow's nests have their disadvantages. They reel. They are not warm. They are lonely. They are dark. When one falls out of them, one splashes. [laughter] You haven't got him in that crow's nest two minutes: He's saying, "Why, hey, look how nice it is around here!" you know? He's saying, "Gee whiz, oo-oo, I'd forgotten there was such a thing as the sea. Gosh!" you know? "And all this fresh air. Golly, I – no – no coal dust in it. Hey, what do you know!" And he's enjoying all this, and all of a sudden he's starting to look sort of haunted and he says, "Take me out of here."

And you say, "What's the matter?"

"Oh, don't bother with what's the matter; take me out of here." [laughter]

You get him back down in the stokehold; you could come down and offer him a thousand pounds cash to sign on, not back in the crow's nest, but even on the deck force, and he wouldn't have anything to do with it. What happened?

Well, actually he didn't become aware enough of what happened for him to really be aware of what happened. He came to an area of something he didn't understand. And this was alarming to him, and he saw that his position was insecure and he was very unsafe, and that he compared it to how safe he had been – if uncomfortable, down there in the bowels of the ship. So he's now – his vote is in, with a great big X on the ballot box, for "in front of furnace door, coal dust everywhere; I at least knew, by experience, that I survived there, and I *know* that it's impossible to survive in a crow's nest."

This is his total rationale. In other words, you put him into a higher level of awareness. There is no deeper subconscious for the individual to go in.

You put him in this higher level of awareness, one of the things he becomes aware of is the problems he has not handled. So this alone makes it necessary for the forward progress

of the individual to be by gradients. And you can make it, as long as you gave him a chance to sit down occasionally and admire the new view.

In the first place, he's a victim of charge – self-created, tremendously restimulated, or quiescent, masses of charge. He is not aware of these things, really, at all; but the second he becomes more aware – he starts to get aware of them – he doesn't really want anything to do with them, so he ducks out on them again. You do nothing about these things, you do nothing about this charged-up atmosphere, you do nothing to take (quote) "just take charge off " What am I talking about? I'm talking about you process this guy without tone arm action. Take charge off – get tone arm action on this individual. As he is getting tone arm action, he gets about so much tone arm action, he's moved up to a new level of awareness. Having moved up to this new level of awareness, he's able to look around, and he is perfectly comfortable where he is.

Actually, the preclear who is progressing just looks a little better and a little better and a little better. It is not a spectacular activity. Now you've got him up to a point of where you can take more charge off per unit of time. And the charge is more fundamental. That's why you have levels.

Now, actually, the charge which you can take off at one fell swoop at Level IV would practically kill somebody if you tried to do anything about it at Level 0, see? Now, as they move up the line, their problems are apparently greater. No, their problems aren't greater, they can see better. Actually, their problems are less, and they are more capable of handling them. And so it stays in better balance. They're more satisfied. But they can handle more breadth of problem than they could before. As they go up they can handle more problem; the problem is less upsetting to them. As they go down they can handle less problem, and these problems are more upsetting to them. That's just the awareness of the problem, as you go up and down.

Now, the complex individual who requires the complex solution is the guy at Level 0. There is the boy who has to have the complex solutions. His problems are terribly complex, and his solutions have to be numerous. And the potentials of the problem are dangerous in the extreme to him. And therefore the solution that is handed to him must be relatively complex.

Now, how do we get around all this? Just let me give you this in a very, very rapid rundown here. How do we get around this? You know that solving somebody's problems doesn't do anything for him, because the new solution becomes a new malady. The old solution is all he is sick from now. Everything is a cure for a cure. Cures cure cures. It's a gradient scale of curing somebody's old cures. I can tell you what fellow has been a man-o'-war's man, or something like this, by his reaction to rum. This was about the only cure he had. It was a cure for fear, and it was a cure for this and cure for that, cure for being wet. Never had any dry clothes, they just gave him a drink of rum.

Rum now turns on chills, gives him a cold, and makes him terrified. Why? It restimulates rising to the zone of these old problems, which it cured. So now you have to put him through a course of treatment to cure him of rum.

Now, what gets us away from this? It's just this: We are not giving people solutions. What is the only thing that divorces us from this in processing? How is it that we can get around this at all? Well, it's elementary how we get around it. The basic error is the most fun-

damental part of the problem that can be as-is-ed. The basic error that you want to as-is is a fundamental part of the problem, because of this chain of solutions.

You, as an auditor, are attacking it at a problems level. You are not giving the pc new solutions for his livingness; you are taking out of existence old solutions which now exist in the form of problems. In other words, you're as-ising past solvents. You're as-ising what has been solved in the past. You're taking him in the same direction up, see? See, you're backtracking the same track he came down. You're not giving him a new solution to the condition he is in. But you're taking out of his think the old solution which made him drop down and become more unaware. You're taking this out of his perimeter of existence.

In other words, you're not attacking the problem by giving the pc new solutions. You're attacking the problem by as-ising old problems. That they, in their turn, were solutions is beside the point. From an auditor's point of view, just for simplicity, simply attack the problems the fellow's had. Well, you run this gorgeously in, what, 1C, 1CM – R1CM and so on – problems, solutions: What problems has he had? What consideration – what has he done about these problems? What considerations has he had about these problems? Any such action as this – and particularly, how has he solved these problems? What solutions has he had to these things? And you start backing the guy up, and you're actually backing him through yesterday's problems.

When you start running solutions on somebody, you're running yesterday's problems. See, if you run it as a problem, you are running it below its point of awareness and it won't as-is.

I'll let you in on a little trick, here. You have been told that you must not run problems at R1C. Well, that is simply a blunt technical statement, and it's perfectly true and valid and workable.

But let's ask, "What the devil is a problem?" You're told that you can only run solutions on this person. Ah, but what's a solution? A solution is a way you don't have to confront the problem. And a problem is something you don't want to confront. By definition, what is a problem? A problem is something you don't want to confront. That's why it's a problem.

So your effort to handle it is solve it in some way, and when you solve it in the direction of becoming less aware of it or turning your back on it – when that comes in as a solution, you have now moved into less levels of awareness. So the way you as an auditor are backtracking this thing, you're actually looking at yesterday's solutions. And you start to ask the pc, "What problems have you had?" "What problems have you had?" "What problems have you had?"

He's just saying, "This I couldn't confront, that I couldn't confront, this other I couldn't confront." And so you don't get any meter, see? You don't get this.

But you say, "What solutions have you had?"

He's saying, "This problem and this problem and this problem that I could confront." Do you see that? It's the difference between running no-confront and running confront.

See, today's problem was yesterday's solution. So you inevitably are running solutions regardless of whether you call them problems or not. But if you call them "problems," then you're saying the individual couldn't confront them; if you're saying "solutions," then you're saying he could confront them. You see this?

You got to backtrack this boy's solutions, because then you're getting rid of the problems which he set up so that he couldn't confront anything. And this is how this all degenerated. So you're actually cutting in at an entirely different area. You're cutting in at the solutions the fellow has had, which of course in their turn were problems.

And therefore, processing can solve the way back up the whole track, you see? And he becomes more and more aware, he's more and more capable of confronting, so therefore these terrifying things – you know, like going out and seeing the street – these terrifying things are less and less terrifying to him. And what's the final there? He just graduates up through these various levels of awareness, up to a point of where he can confront the problems that made him start getting unaware in the first place, and he finds those, in turn, were solutions, so there he's all set. And he moves on out to freedom.

And this is the route to freedom, through becoming more aware; it's expressed on your tone arm, it's expressed on the fact that you're attacking the various solutions of the past. And this holds through even to GPMs at Class VI.

What were these things but very complex solutions? Extremely complex solutions. Well, there must have been a hell of a problem back of it, man. That's obvious! There must have been quite a problem back of all that. Well, the problem back of all that and so forth was only a problem because the individual wasn't confronting it. So he took an extraordinary solution way out called a GPM. It was a pretty wild thing to do. But there's where the areas of confront go.

Now, he got himself so thoroughly bogged down in all the charge and mass that his chances of becoming aware enough to even know what this problem was became very remote indeed. If he were suddenly to walk back and face this old problem, he'd fold up like a tent with its tent peg pulled. Crash!

Just ask him "Go ahead and face this old problem."

"Hhahh!"

You say, "Get rid of these GPMs." You got rid of the charge now, which were the solutions, and all of a sudden he suddenly turns around and confronts the problem that he had. He'll confront that portion of it that he can confront. You start handling this and work him through that and he can confront more and more of it, and then he'll finally laugh at himself.

But that's what levels are, that's why they're there. And it just behaves on this basis on the operating principle that the individual, at any given time, is at his lowest level of awareness, no matter what level he's in. And you've got to walk him up into further awareness, further comprehension, understanding, for him to be able to hold his own in the environment that he has now entered.

That's the rationale of levels, and why you bring the individual back up. That's how to process an individual. That's how you keep from stampeding an individual in some particular direction. That also explains why you occasionally turn on a manic on a pc: "Oh, it's wonderful! Every... wonderful!" And three days later the pc collapses. He was put in there too fast, too quick, with too much.

You see, you don't need tougher processes now, see? You need more adroit use of the processes you've got. And you walk an individual up this track. He might tell you he wants to become OT tomorrow, but that's a solution. What's an OT? "It's a person who's totally unaware of anything and has buttoned the problem up." You see how that would work?

So when we – when we look into this, when we look into this, we see how an individual can be made better, how an individual can recover, and we see the direction we're trying to put him; and we see that trying to put him there in a disorderly fashion and not knowing what we're doing would arrive at very little gain for the individual and a lot of loss for the auditor. If you just realize that you're simply increasing the individual's level of awareness, you're getting off the charge which debars him from confronting the problems which he had deserted – and if you look at it from that point of view, with that degree of simplicity – then it doesn't matter how complex a problem is. It doesn't matter how complex the solution is. But always remember that a problem is as complex as it presents potential solutions. And the man down there in the firehold, you'd be surprised how many solutions it takes to keep him alive and keep him going. Man, they're just fantastic.

These start to drop off as you walk the individual back up. The most complex being that you confront is the pc at his lowest level. And therefore this requires the most complex solutions.

But you bypass that as an auditor by having the key to the gates. You start getting rid of the solutions he has had, and therefore the complexity of the solutions he is now adding on reduces, reduces because the problem all the time is less and less complex. See, reduce the complexity of the problem by reducing yesterday's solutions. And this is *how* processing works, and this is what handles it and this is the direction you steer it. If you steer it in any other direction, you will have a severe loss.

But this way, if you understand it this way, then – let me add one little point here, now: The thing it takes to drive this home real good is to ask that little proposition I gave you. Ask the individual – ask some individual for an answer to something (he won't give you the answer), then take some charge off, his considerations or solutions he's had to it, and then ask him again for that datum, and he'll give you the datum. Well, how come he could give you the datum now, when he couldn't give you the datum then? He was barred from the datum before, he had retreated from the datum before; you raised his level of awareness, you got the charge off, you got him – upped his confront, upped his awareness, and he all of a sudden could give you the datum.

Nothing is more positive than this than trying to get an individual to understand an item, or something like this, in a GPM. You start this one, and the guy will sit there, "How do dogs bring about masters?" you know?

"I couldn't imagine that. What do dogs have to do with masters? Dogs don't have anything to do with masters, and so forth. Doesn't... dogs doesn't... bring masters... Oh, it doesn't make any sense to me at all! Dogs. Masters. No connection. No connection whatsoever."

You say, "What considerations have you had about it?" (In other words, what solutions have you had to this and what have you been doing about it?) And you run this for a few minutes and say, "All right, would dogs bring about masters?"

He says, "Of course, you fool! Anybody would know that." [laughs]

Well, you say, "What was that all about?" Well, what that was all about, a very simple thing. Overcharged area, too mucked up with solutions: guy couldn't think, he couldn't see, couldn't be aware in that particular area. And for you to get him anywhere at all, you had to take him through the charge.

So the road out is not by a spectacular open sesame or a wave the wand, or something like that. You take them back out through the charge they came down to avoid. What's that charge consist of? It consists of the solutions they had to other charge they couldn't avoid, they didn't want and became unaware of, see?

So the road into this universe is successive unwarenesses. And the road out is successive awareneses. But not just bare-breasting your chest to the whole universe. No, you have to find out why the individual didn't want to be aware at those points, and he didn't want to be aware because he solved it. Well, what's this solution? Well, that was yesterday's problem. Yesterday's solution, problem, solution, problem, solution – they're all the same line of cat.

He got himself into trouble by solving himself into trouble. And when he has solved himself all the way into trouble totally, he's here, and he's the fireman down in the stokehold. And therefore there are no lower levels of subconscious for you to explore; there are only upper levels of awareness.

Thank you.

Thank you.

WISDOM AS AN AUDITOR

A lecture given on 28 April 1964

Thank you.

That umbrella is the Einstein touch. I don't have to have the Einstein touch, you see, to cope with Scientology research. It's with Melbourne.

How are you today?

Audience: Fine.

What's the date?

Audience: April 28th.

Twenty-eighth. What month?

Audience: April.

What year?

Audience: AD 14.

All right. Twenty-eight April AD 14. Planet?

Audience: Earth.

Earth. Earth. This lecture is being given on Earth. All right.

I want to say a couple of words about Australia. Australia is only in one difficulty: it has yet to take any instructions or orders concerning its status or activities. I've just gone through three days of the rock crusher just trying to get one simple instruction through to Australia. Just that, see?

And I finally landed and got it through and now I'm – was unstabilized the following day. I don't know whether it got through or not. If I feel a little bit abstracted or if I look a little bit that way, you'll know why. I don't know, I think it's been two or three thousand words on the telex have been typed, some of it sent, some of it not sent.

You see, everything sent to the Australian office is picked up by the Australian government, you see, and used at its – ha! – inquiry.

Now, I wanted to gen you in on this inquiry and by the time this information gets around anyplace it will already have happened, so it's perfectly all right to tell you.

But when the opposition decides to cut a theta line, they should be advised that when you try to cut a theta line it explodes. Sooner or later it will explode. That you can be absolutely confident of with regard to all such villainous and vicious activities.

I have seen this happen time and time and time again. You always get an explosion on cutting a theta line. Guy is trying to give some truth, something like that – or it even gets worse than that, don't you see? You're trying to wish somebody a happy birthday or something like that, don't you see, and somebody villainously stops the card, you see?

Now, they've done something there, see? And the doingness of that type of thing will all of a sudden catch up with them in some mysterious and fantastic fashion. It's very – it's not really metaphysical. You can see why; because the only power there is, is on a theta line.

All other power is derived from cutting theta lines. The secret of power is just that. Power is truth. You can extend untruth in a certain direction and derive power from it for a certain time, but you're only deriving power from the amount of truth in the situation. This is why, in a war, a government can engage in war and talk to its citizens about how they must engage in war against this other power and that sort of thing. But they are at that... and you notice every war is followed by, usually, an overthrow of the government and a disillusionment of the people. We want to know why. Well, actually, there weren't that many reasons to go to war and the line they are cutting there is simply the line of friendliness and decency from people to people, see?

So somebody jumps across this line, you see, and cuts it up and then when the war is all over everybody sits down and says, "I'm not mad at the Sloveronians. Why were we fighting the Sloveronians?" You hear this after every war, you see?

You also have an overthrow of the existing regime. No regime really ever lasts through a war and they never notice this. It always emerges on the different side of it some other government. It's the most remarkable phenomenon you ever cared to see. It's obscured by the fact that the state is still there or somebody may be still king, but there will be a different government sitting there – entirely different.

What have they done? They have cut the natural ARC of being to being for their own ends and it blew them up. Now, the violence of the war is a temporary action, but this other thing carries it on for a very, very long time. That's the long continuing action. Those are the wounds that have to heal.

It's very interesting. Now, there – there it is on just cut ARC from people A to people B and whatever violence occurred – and even though it is very bad and very difficult for a while, it recoils on the people who cut the line. It inevitably recoils.

I saw one time as simple an action as this: a manuscript telling how to give a 36-hour intensive was carefully put in a safe and not issued. Well, it was put in the safe because it was valuable material and everybody all over the place was trying to find out how to do a 36-hour intensive.

This person was going consistently and continually mad trying to cope with the amount of traffic and activity resulting from randomness from everybody trying to do a 36-hour intensive without realizing that the manuscript had been carefully parked in his safe because it was so valuable. Do you understand?

It was just one – two, see? Well, now, that's a very simple – a simple type of thing. But you go into this; this is the mechanism which makes people have an almost pathetic belief in

retribution. They say the villain will get it in the end. They don't really know *how* he gets it or why he gets it, but it's this mechanism I'm talking to you about that brings about and fosters that particular belief.

You cut ARC: the cutter of the ARC will explode, sooner or later. There is going to be an explosion at that point.

Mechanics, electronics and so forth continue on down this line to a quite marked degree. You've got to cut a flow or do something with a flow before you get much of an explosion as a result of a flow, see? You don't get any commotion with regard to a flow unless you interpose something into the flow.

And that's what you as an auditor have a lot of trouble about every once in a while. You're wondering why you're having trouble with the pc and you never look at the amount of theta line which you cut by a chopped acknowledgment – not letting him complete his communication. See, the whole auditing cycle is based on this. And then the auditor wonders why he's getting his head blown off and the pc is mad at him and everybody is chopping him up and everybody is down on him, and so forth.

He's the unwitting victim of having accidentally done this through his inexpert timing of his acks and that sort of thing. That's the exact mechanism we're talking about. He has cut the natural cycling ARC with the pc inopportunistly. He hadn't let the pc originate or something of this sort, you see? He's busted it up one way or the other and he – in other words, he cut the theta line of the session (let's put it that way) and sooner or later, boom!

Well, it oddly enough always explodes on the auditor. You want to know why does it always explode on the auditor? The pc recovers but you'll see the auditor staggering around for a while longer. One of the reasons is he isn't getting any processing. And the other reason is he has unwittingly, himself, in person, cut that line. When he has cut the line and then doesn't recognize that he has cut the line, now he's really in trouble because he has no explanation for what's happening to him.

Hence, we get this drill of – for heaven's sakes, listen to your taped session and keep turning that tape back till you find the point where you first cut the line. Got a dirty needle? All right, let's take the tape back to where the *auditor* cut the line.

We're not interested in the ramifications of what happened at the point of the explosion. It's foolish to look at the point of the explosion to find out what happened at the point of the explosion, because we know what happened at the point of the explosion. The explosion is the result of a cut theta line. See? That's – so why do you keep looking at the result?

And you'll find out when you first try to train an auditor to do this, you practically will go around the bend yourself in trying to drive it home to the auditor.

"Look, I want you – we're not interested in what caused the ARC break in terms of 'you did this or that,' or something of the sort, which then resulted in the ARC break." And then the auditor goes on at some great length explaining what the ARC break happened and the pc said this and the pc said that. We're not interested in that. We're interested in the first cut of the theta line which then began to mount up to a point where the pc became aware of the fact that it had been cut and it went from there to the explosion. And you know a real, fast,

hot ARC break – do you know that it takes up to an hour and a half to work one up? I mean, the comm lag is so *great* between these two things that the auditor seldom ever recognizes at first glance that he did it to begin with.

He'll turn it back – he'll turn it back five or six inches to where the pc's rather snarly origin was chopped by the auditor and he'll say, "Well, that's it. I (of course, perfectly justified in doing so) answered the pc rather sharply and abruptly and *there* we had an ARC break."

So you'll get in these reports, "I answered the pc sharply and abruptly and then a minute or so later had a dirty needle."

Well, that's fine. He's now joined kindergarten at this art. He is just in kindergarten at this art. He's gotten the point now where he can actually recognize that it was a snarl back at the pc after the pc snarled at him which caused the meter to snarl at both of them, see?

He's gotten up that high. You'll have a little difficulty getting him up that high, but there is an awful lot further to go.

How did this get into this situation? Now, you keep reeling that tape back a few inches at a time, a few inches at a time – or feet at a time – and you all of a sudden will find back there a mistake in an acknowledgment. The whole situation is riding on that first little flub. The mistake in acknowledgment made the auditor less secure, made the pc very much less secure and the line has been cut at that point, you see? So therefore, more little mistakes result in that particular cycle and the pc is more difficult to follow and the auditor makes more mistakes. And then it gets down to this point, finally, where we get the explosion of the cut line.

Well, that may not be very violent; it may just be a dirty needle. But as far as the tape is concerned of the session, it's actually – can be as far as one and one-half hours; actual measurement in an auditing session.

An auditor can see an ARC break coming – when he is very sensitive – he can see an ARC break coming over a long period of time. Now, the only thing we're trying to make him aware of with the drill – the only thing we're trying to make him aware of – is that it was his flub, not taken care of, which let this thing keep working up.

When he does get some awareness that all is not quite well, he then doesn't take it up. He just hopes it will all go away – the black panther mechanism, you see – he just ignores it and it may go away. And he is usually very good at this. He is expert at this. It's marvelous. He has greater capacity for ignoring than is easily measurable.

And it's his favorite hope that the black panther will yawn and walk out of the room undetected by anybody. And the black panther never does. He just – he just starts lashing his tail faster and faster and he starts flexing his claws and then he starts snarling and then he starts getting a little bit more hate in the eye and then the next thing you know you can get him rocking back on those haunches, so forth, and the auditor still says, "Now, if I just pay no attention to it at all, the black panther will still go away," you see?

The black panther is now – has left the ground and is halfway through the air in the spring and the auditor says, "Now, if I just ignore this completely and pretend it isn't happening, and so forth, all will be well."

And all of a sudden there he is with a snarling, roaring ARC break on his hands. Pc slams down the cans, gets up, walks out of the room, something or other happens on the thing.

Aw, he had – he had a warning from a friend, see? He had telegrams, you see? He had wigwag signals; he had everything you could think of. They were all coming his way and he paid no attention to any of them, see? Something is wrong in the session. Well, the only thing that goes wrong in the session is somewhere the theta line has been cut. Now, that's the only thing that's wrong. You try to trace this down and get its genus and you will run into all other varieties of bypassed charge.

Now, you frankly could take somebody that has been processed or has been treated or has merely lived and simply treat this as a front-rank auditing problem. Just treat this as a front-rank auditing problem. "When has your ARC been cut?" See?

Now, the oddity of it is, is you can't keep running this as the only problem. Now, let me call to your attention that there are some unworkable processes – real unworkable processes – and they'll catch up with the auditor sooner or later, too.

One of these processes is, "Look around here and find something you can go out of ARC with." This is what we call the psychiatric process – because it's only run on psychiatrists.

Sounds marvelous, doesn't it? Sounds absolutely marvelous. Doesn't sound like there is a thing wrong with that process. It's the wildest sneaker you ever had anything to do with in your life. You might even get some tone arm action with it. And your pc will start going down, down, down, down, down, down, because you are cutting his theta line right in the room. This is really the only sure, absolutely guaranteed, silver-plated, Madison-Avenue-advertised method of knocking a pc to smithereens. "Look around here and find something you could go out of ARC with."

I don't care how else you phrase it. You understand that could be phrased as "What one of your friends wouldn't you have to talk to?" Sounds like a process, doesn't it?

"What wouldn't you have to touch to know what it was?" You get quite inventive with this type of process. "What doesn't necessarily have to be real to you?" See how innocent it sounds? It sounds very cultured. It sounds as though you really have arrived there with some, some greater reality than real, see?

And it's completely guaranteed that the pc would be very interested in running it, would continue to answer the auditing question and would go right on out the bottom. And they get paler and paler and more strained and more strained and more upset and more upset and they will finally explode.

Because you are saying, "Sit in that auditing chair and cut your ARC. Thank you." "Sit in that auditing chair and cut your ARC. Thank you." And that is really what the process consists of.

Now, I'll give you another version of it off into havingness, and you can put this down in your book. These, by the way, are GAEs – gross auditing errors – they're high crimes. High crimes. Everybody should know this. We've known it for years. If it's received as news to

you, you were deaf someplace or another along the line, see, because I'm going over old material but I'm just showing it to you in a new frame of reference.

Now, here it fits into the havingness cycle. "What don't you have to have?" Isn't that a marvelous clearing process? Obviously it educates the person into not having things. And after a while it gets him conditioned to a point where he doesn't have to have a bank and he would simply go free from the bank. Isn't that a nice rationale? Perfect rationale.

That's a psychologist process. Medical doctors, we run "What part of the body could you get along without? Thank you." [laughter] That's just known as an ARC reverse process, but you understand it's expressed in a havingness phrase.

"Look around here and find something you don't have to have. Thank you. Thank you. Hey, hey. Thank you. Hey. " [whistles] "Hey. Answer the auditing question. Look around here and find something you don't have to – hey, hey, hey. Hey! Oh, he's conked out."

"Well, wake him up. Wake him up."

"All right. All right. Now here is the auditing question. Look around here and find something you don't have to have. Thank you. Look around here and find something you don't have to have. Hey, he's conked out again.

"Hey, wake him up. Give me a hand, Joe. Wake him up."

"Hell, he's dead."

What's absolutely fantastic in this particular frame of reference is that the pc will run any of those processes, industriously and marvelously. In fact, I knew of somebody – was diagnosed as being in compulsive ARC with everybody. And somebody, to cure him of this, ran that process on him of "What could you go out of ARC with?" And I don't know what happened to the poor bloke, but you know, I haven't seen him since! And I've actually put out some little lines at one time or another, trying to get in touch with him, trying to find out what happened in this.

Everybody is covering it up like the Rue Morgue murders, see? I don't know what happened. I mean, I know he's not in Scientology anymore but I don't know anything more than that. I just caught it too late, don't you see, to do something drastic about it, you know?

It – oh, nothing physically happened to him. He just sort of drifted off one way or the other, I suppose. I suppose he's still around, but who knows?

You see how peculiar this is? Now, he would never in God's green earth have attributed any difficulty he was having to having been run on that process – to which he consented with the greatest of glee. He was simply told that he was in compulsive ARC with people and this would have to be cured so that he could audit better.

The only difference between this process and Russian roulette is Russian roulette has five empty chambers and this doesn't have any.

Now, this is all on the basis of cutting ARC and this is quite, quite a – quite a big rationale. It's a big package, all by itself. Affinity, reality and communication: cut thereof. Every time you cut it, expect an explosion. Maybe you'll be able to handle the explosion,

maybe it won't be of long duration and so forth, but every time you cut it expect an explosion. See? Don't go walking like an innocent babe, you see, straight into the black panther's cage and saying, "There's no panther here," because I'm telling you, there is a panther there, see? And he is quite visible.

Now, the way the psychologist, particularly the child psychologist – who has a lot to recommend him since he has to get in there and pitch in numerous ways, and so forth. They have them in schools trying to advise people, and so forth – the way he gets into trouble left, right and center, is he doesn't know this datum. And not knowing this datum, therefore, he cannot predict child future behavior. There's another datum he doesn't know: A thetan never gives up. He doesn't know that datum. That's a very terrible datum to know.

It cures many impulses toward tyranny. If jokers like Caligula knew the data – knew that datum – before they started to Caligulize things, I think they wouldn't have the temerity to go on Caligulizing, see, because a thetan really never gives up.

This also – this also is – is some bloke like the Cardinal of Spewjaw, or something, see? He's all of a sudden decided to cure everybody of sex. See, he is going to cure everybody in his diocese of sex. Small project. [laughter] No.

He may go down in history, but I can guarantee you he will certainly – he will certainly get buried somewhere. The thetan never gives up – on an ARC line or in any other direction.

We got a bunch of wild-eyed revolutionaries – bunch of wild-eyed revolutionaries. Let me give you a – let me give you a right and a wrong on handling a wild-eyed revolutionary. Reform him by giving him a good talking to. *Hm-mm-mm, do-oo-oh*. Shoot several of his companions. *Ho-oh*. No, sooner or later you're going to have a revolution. Sooner or later, you know? He just never really gives up.

Now, that's the wrong way to handle a revolutionary, is to de-revolutionize him. That would also apply to a conquered people. A conquered people really never gives up. That impulse may go on and on, it may sail along for ages; they really never give up as long as there is any there at all. It gets more and more subconscious or more and more unconscious or whatever else you want to phrase it as, but it's still there.

Now here is the other way: Take a revolutionary – take a revolutionary and the very least, or the very most, you can do is to simply directionalize, to some slight veering, his revolution.

You maybe can slightly alter the direction of his revolutionary tendency. See, you could maybe persuade him not to revolt against the king but to revolt against the prime minister, see? Change his vector a little bit, see?

You could say, "Well, don't revolt against the – why revolt against the state because you can't win; they've all got machine guns. A very much better activity at the present moment is revolt against its educational system and eventually overthrow it thereby."

"Oh, yeah," he'd say. "Yeah, all right. All right." That's okay, see? He'd go on in that particular direction. But understand he really has never given up revolting against the state.

In other words, you could veer to some slight degree the direction of purpose of an individual, but he really never gives up. And what fools everybody is – he *says* he gives up! He goes through all kinds of mumbo jumbo and prestidigitation to prove conclusively he's given it all up, see?

You just never saw so much window dressing. Sometimes you see in a conquered nation, and so forth, flags lining the street in all directions, you know, and everybody's standing out there saying "Viva Castro" or something like that, see? And then they don't turn out any more Bacardi rum, see, and then somehow or another the fires in the cane fields – they just don't seem to abate; they seem to get more frequent. And production doesn't turn over and machinery keeps getting jammed somewhere, and there's no... and Castro's going absolutely stark staring batty.

"Why can't this economy work? Why are all the trucks in Cuba broken down suddenly and simultaneously? I'll solve this by buying hundreds of new trucks from England."

Why, they are going to run just long enough to let somebody turn out – to pull off the distributor cap. Because, you see, the Cuban didn't revolt to be a communist. See, he revolted against Batista. And Castro tried to change his vector of revolt too far, too fast, and that was the end of that.

They became a subjugated people suddenly after their revolution, don't you see? So now he's wondering why he's having trouble! We'll rename him "Rocks-in-the-head-Castro," see? He can't have anything else but trouble now. He'll go on having trouble to the end of his days. He would have to take every person in Cuba – every single person in Cuba – and ship them complete to Venezuela and repeople Cuba a hundred percent with something else to win his revolution, because he didn't have a revolution.

There was a revolution of the Cuban people and then Castro gave them another revolution. You remember, it wasn't for months that they found out they had been a communist revolution. And everything just quit and that was the end of that.

No production. Now, everybody comes along and he says, "What is the political significance of this? Let's see. What is the political significance of this?" I can see Toynbee now. The great masterpiece of shallow thought that he would turn out on this would be marvelous.

"Let's see what – what could possibly be the significance of this? Is it true that communism turns out less production than capitalism?" "Are – are the comparative factors between this and the Spartan regime, which didn't exist on the left-hand side of the bistro..." you see? Figure, figure, figure, figure, figure, figure, figure. And the Cuban people have no willingness to go in the direction they are now going, so they will go in that direction not. And the way they don't go in that direction is take everything down in front of them and don't produce.

You see a nation which can't produce, you know that it is unwilling to do what it is doing. That's the first thing you know about it. It's unwilling to support what it's having to support. The ARC will be very poor.

Now, it doesn't matter how much communication is put into them – and Castro, as an example, puts in plenty. I understand his television broadcast lasts several hours – per day.

This is all very, very fascinating, but the communication may be there. But of course, reality isn't there at all and affinity doesn't exist – this is from his particular side – because no man could have much affinity for people if he gives them another revolution after they've won a different one.

No, the ARC is all missing from the other side. And remember that ARC has two sides: There is the ARC from B to A and there's the ARC from A to B. So you could put in a tremendous amount of C without very much A and practically no R and if you did manage to generate anything on the other side, it would be some pale shadow of the same thing. The other side would also probably develop a lot of C or a lot of no-C or something like this. But they certainly wouldn't develop any R and they certainly wouldn't develop any A.

Now, if anybody stood up there in Castro's boots who really was putting A, R and C to those people, then he would have an opportunity of seeing these people express A, R and C to some degree or another. But he'd have to stand up there without any past connotations, don't you see? He wouldn't have to be dug in, in his own past and background in order to do this.

Actually, it doesn't mean that a fellow could have no past in order to do this. The fellow – anybody, I suppose – if he just suddenly went honest, you know, just that, just come down with an outbreak of honesty, you know, break out all over with it. If it were real honesty – would probably get a response from the other particular side because the target which is presenting A, R and C to that degree would have diminished, see? Although they'd never given up against this other target, they don't have anything against this target they now have, you see? So there is ARC possible with that target.

Honesty. Honesty. Frankly, you can make a tremendous number of mistakes, but never be dishonest about your mistakes. That is the big thing to know. Don't be dishonest about your mistakes. You become unreal to the degree that you're dishonest about them.

And don't go over into the field of self-immolation, either. There's ways to commit suicide with this sort of thing, you see? But that's also a distortion of A, R and C because you are cutting out your own life in order to glorify your own mistakes.

I don't know if you ever read any Russian literature. It's really not worth reading. But Dostoevski – *The Brothers Karamazov*, and so forth – each one of Dostoevski's works has some character who is busy selling himself down the river with great violence, you know? He's explaining to everybody what a dog he is, you see, and so on. He goes on and on. He really is a dog, too. Anybody trying to rule Russia would have my sympathy.

But – not knowing much about the country, I'm a great expert on it; almost as great an expert on Russia as Boston is on slavery. They've never had to cope with it, so therefore they know everything there is to know about it.

There is nothing like complete inexperience to bring about enormous bravery. Now the North, which was very authoritative on its various racial problems – not having had any experience with them – is getting them all in the teeth. And it's the people of the North have all of a sudden – have started voting madly for these mad dog anti-ra... you know, these racist-conscious candidates, and so forth. Everybody is scared stiff because some place, I think like Wisconsin, turned out a third of its vote the other day as representing preference for ra-

cially prejudiced candidates. This is just a recoil, see? No R, so their A, R and C was very lousy. They had no R on the situation, so they had a very distorted ARC. And it all blew up in flinders the second they started to get some experience. So they go to the other side of the thing, see? Now they cut any potential ARC they might have with the whole situation and from "Give them all cake," they immediately jump over – "Shoot them all down like dogs," you see? Neither one of these things were real; there was no reality in either one of them.

See, there wasn't any particular reason to give them all cake and there's certainly no reason now to shoot them all down like dogs. You see, here's the two sides of the coin. Neither one of them had anything to do with theta. What were they talking about? Well, they didn't know then; they don't know now.

Now, there is nothing like complete, complete and utter inexperience to bring about a great deal of bravery. Also brings about many wonderful opinions. Marvelous opinions.

There's many a professor who has spent his life in beautiful seclusion who is the most wonderful expert on things he knows nothing about and has never met. It's like the Scholastics. They believed in this. Their whole method of education was based upon the principles here: You never inspected anything. You just lectured about it, see? You never go out and look at a sturgeon to find out what sturgeons look like. You just go ahead and give lectures on sturgeons which are based on, I think in their particular case, Aristotle's opinion of a sturgeon, which I think was out of a different ocean and was inaccurate to begin with. And if anybody had tried to bring in a real sturgeon to show them what it was, the person would have been instantly and immediately flunked – hands down. That would have been the end of that.

That was the system called Scholasticism – an actual system on which we get "scholastic average" and other things. But the Scholastics lasted for about 1500 years and they were the total dominant philosophy of education. And they lasted all the way across the Dark Ages, and when they finally packed up and people began to look again, we ceased to have dark ages.

I don't care if somebody like Toynbee attributes the Dark Ages to the left-hand square root of the ruddy rod or why the virgins were no longer in church and that ended the Dark Ages – that has nothing to do with it. It's the fact their system of education absolutely debarred, and their religious beliefs absolutely debarred, the inspection of anything that they were supposed to know about. It was a system of education based entirely upon noninspection. It wasn't that they neglected noninspection. It was that they *insisted* upon it. And we had the Dark Ages.

Well, we had no educated people. I imagine if you had nobody educated you'd have a dark age. It's quite elementary. If you kept every child in school so that he couldn't learn anything about the universe around him for the period that he was curious, and then you turned him loose thereafter to run the affairs of man, I imagine it would be very dark indeed. And the Scholastic was a champion at this. He became expert at this.

In other words, he was cutting the ARC of knowledge. "You are all supposed to know about rocks. Don't go look at any rocks." This was how he cut the ARC line.

If I were educating you as auditors: "All right. Now, this is the way you behave as auditors! This is what you do as auditors! And don't let me ever, under any circumstances, ever let me hear you talking to a preclear." That would sound pretty wild, wouldn't it? That would sound pretty unreal. You immediately – up to your mind comes this question: "Well, if we're never supposed to talk to a pc, if we're never supposed to hear a pc, if we're never supposed to have any touch with a pc, we're never supposed to audit a pc, then how the hell would we ever learn to become auditors?" See, that immediately enters up.

But remember, you are already talking in a zone of informed wisdom. Supposing you didn't know enough to ask that question. You'd have a picture of a dark age, wouldn't you? See, a dark age would be composed of people who didn't know enough to ask the question of "Why is our ARC being cut?" They wouldn't know their ARC is being cut. So part of the very, very intellectual individual, part of the very wise person, is a recognition of this principle of when and where is his ARC cut?

And he is wise to the degree that he can perceive this in existing situations. And this would be not necessarily his wisdom, but his ability to exercise wisdom.

I'll give you an example. You're an auditor – Class V Auditor – you know your business. You go into a factory, they're having a lot of trouble, they want you to audit staff, something like this, you know? You want – patch up somebody. You say, "What's the matter? What brings you to the conclusion that your staff or your managers or anybody else needs auditing? What brings you to that conclusion?" See, if you were a very, very smart auditor.

You'd want to look over, "What's the condition of the pc? What's expected here?" Obviously you're not being asked to audit any pcs at their own volition. You're being asked to audit some pcs at management volition.

Well, you'd either have to talk the pcs into being audited of their own volition, which is quite possible, very easy to do, as long as you are good and factual about it and don't use any of the management arguments which are not factual. They inevitably would not be factual, you see, because they're not auditors. And you're talking to these people about auditing.

Your ability to estimate the existing situation wouldn't necessarily measure how successful you were, but would certainly measure how wise you were.

And how would you – how would you exercise this as a wisdom? How would you be wise in relationship to one of this? Well, you just look at the number of ARC busts there were on both sides of what fences existed. Now, you may have preconceived the idea of thinking there was management and labor and immediately believed that you had a problem in management and labor because you read it in some textbook. See? And you might not have a problem of management and labor at all. You might have a problem of management and management. I know of a hotel in the immediate vicinity which suffers from four problems of management versus management versus management versus management. See, that's their problem. They don't have any trouble with their help. They really don't. It's a marvel that anybody works for them at all. Their help goes on and works, but every once in a while its upper strata of management gets interfered with. The head of this department or that department gets shifted, moved or sacked, see? So it's only a problem of management within management.

Well, your recognition of the thing must be – just based on looking it over carefully – of what A, what R and what C is being cut between what terminals. That'd be the whole formula on which you could have to adjudicate that situation in that factory: what A, what R, what C? Not just what ARC is being cut – that's too careless, see? What A, what R and what C is being cut amongst what terminals?

You might find out the ARC was being cut between the shop stewards and the mechanics. Now, to locate that, all you'd have to locate is maximal confusion and minimal production. Just look over all the records and find where was the maximal number of dispatches, maximal confusion and the minimal production from expected production.

This department has two-thirds of the plant employees and turns out one-sixth of what they're expected to. I'd think about that time you would decide that there was something wrong with it.

Now all you have to find out is where is the cut A, R and the cut C in that vicinity. Now, there must be two terminals there, otherwise there is no flow of A, R and C to cut. So one must be trying to flow ARC and the other must be trying to cut it; or this one is trying to flow ARC and the other one is trying to cut it; or to some degree, they are both trying to flow A, R and C and they are both thoroughly cutting it.

So one of those conditions will exist. And if you are being very wise, you would simply look that over as the condition of affairs and you would say these people are unhappy with those people. And you don't even have to do it on a formula. I tell you, that's the only thing there. You don't have to look for something else there, but you just look for that thing and you find it and then you say, "All right, I'm going to group process the shop stewards in the presence of the foremen. And then we will process foremen against shop stewards and we will get this thing..." In other words, all you do is start unblocking the ARC. You wouldn't even have to handle a case. Just take the existing situation of the real universe. Just accept the fact they're all nuts anyway. Don't bother about it in any other particular direction. This is it.

Now, if you know this other thing: do you know that all PT problems are suspended in nondelivered communications? I suppose a guy is trapped where he is today because one day he started to talk to God and it didn't get there, you know, or something of this sort – something wild of this nature occurred.

Now, let me warn you that if you tried to run this as a process, look where you'd get. "What communication has been undelivered? Thank you." "What communication has been undelivered? Thank you." The thing is selfdiscrediting because it won't run as the process. In other words, the way he came down the line, it doesn't go back out the same way.

These are simply the problems the guy has had along the line. How he has solved those problems is the clue. See, even though the genus of the problem was an undelivered communication, he then made it real rough by solving it in some way. See, he didn't give up.

We're now talking about RIC, R1CM, see? We're talking about very elementary processes. This fellow comes in, "Oh, my God, I have this terrible problem! I – I don't know whether I'm coming or going. I'm – *lovv-lovv* – awful problem." And he's holding his head in his hands, you know, and rolling from side to side. He's so worried he's almost out of his

mind. Histrionic. Has fantastic numbers of ramifications. Obviously, his whole case is sitting behind the thing and charging it up. Obviously, you're dealing with a tremendous instability to begin with. Obviously. Obviously this, obviously that. You got factors, factors, factors, factors, factors, factors here. You could add them up on IBM comptometers. But you know one thing for sure about that condition – that it exists here and now. See? This guy is in this condition here and now. This you know.

Yeah, that's rather obvious, because there he is rolling around and screaming and yowling, so he's obviously in that condition now. Let's start with certainties. Let's get our own ARC in with it, see? So what's the reality of the situation? It exists. What's the C of the situation? Well, that you can talk at him but he doesn't hear you. And what's the A of the situation? Why, you'd like to give the guy a hand. Complicated, isn't it?

That's your ARC with relationship to him. If your ARC includes "I've got to solve this fellow's problems for him; I've got to give him solutions to all of his problems," of course you're not establishing ARC with him or getting his ARC disentangled. See, you're winding him up in the soup.

Therefore, this thing called marital counseling will always wind up in the scrap bucket. You could just about counsel two characters on the marital front into amity as you could tie two cats over a clothesline by their tails and expect to kiss each other. They just won't – wont do it. You could just stand there and keep saying, "Now, now Puss, you should kiss Tom there and make up and..." There's obviously something hurting them. Even a fool would stand back after a while and say, "There's apparently something here I have not quite embraced in my analysis of the situation." There's all of the factors that are right there.

Now, let's look at the fellow now. Now, what's *his* A, R and C with his environment, see? Well, C: he isn't talking to anybody. If you ever notice a fellow in that condition, he is not talking *to* anybody; he's talking at everything. He really doesn't expect that anybody is even listening to him. He's just going on, you know?

And his R: you'll find out he contradicts himself every three minutes. You don't quite know what he is talking about, because the target of his conversation is so consistently shifting – the subject of his conversation is so shifting, so consistently and his words are "I don't know" and "I can't find out" and "I haven't," you know, "been this." It's all full of doubt, you see? There isn't any solidity there anyplace. So his R, his R is obviously shot, see? He just hasn't any reality on anything. He hasn't any grip on anything.

And his A: well, he doesn't know whether he hates everybody or they hate him. It's kind of a tossup. He's worried because everybody might or somebody might hate him and he's worried that he might unjustly hate somebody else, you see? He's in a confusion. He wouldn't know what his affinity was. His A, R and C are right down there running on the bottom.

Is there any particular button out of a theta line that you could trip that would cause this odd jam to unravel? Is there anything you could trip? Remember, it'd be a terribly unlimited process – pardon me, a terribly limited process, no unlimited process in connection with this. This is real limited. But there is something you could say to him – just the one-shot situation – "What communication haven't you been able to deliver?" Let him tell you all about it and he, to that degree, is somewhat delivering it and you will see his whole condition alter.

Interesting, isn't it? If you could get the insane to answer as much of a question as that, they'd probably unravel, same way.

It's not – it's not, you understand, a repetitive process. And it has nothing that refers to the past. It's the right-now communication you haven't been able to deliver. Because maybe this was a past question and all that sort of thing, but it's still the communication he hasn't been able to deliver right now, and he's trying so hard right now to deliver this communication that he's got himself completely snarled up on the R and the A.

I imagine people used to get that way in prayers. As a matter of fact, that's why I think certain organizations – there's no point in going on discussing their depravities, but I'd think there would be some organization or another that was – I'd think they'd sit down calculatingly to spin people in by giving them something they couldn't pray to.

I'd say that in some villainous, past, uninformed period – some barbarous age – that people would even invent something like, "Well, there's a being that's everywhere, all the time, and you're supposed to say your prayers." They'd call – you know, invent some word like prayer and say, "You're supposed to talk to this being all the time and give him the hot dope." I'd say in some dark age – not on this planet – but someplace, they'd dream up some mechanism – just spin people in. Because sooner or later somebody out of that lineup is going to say, "I am not being listened to. My communication has not been delivered."

For instance, I'm always hauling sideways the same operation as applied to Santa Claus. Santa Claus is a mythical being invented by Madison Avenue of yesteryear in order to sell merchandise. And this bird gets written to and, oddly enough, mainly gets replied – you know, replies come from him one way or the other. That's why you have department stores: to reply, see? But I always make sure that the communication always goes through reliable channels like HCO, see, and acknowledgment comes back down the line, solid, see?

And I find out that this brings a great deal of cheerfulness about it all. But, I also find out, by inspection, that the ragamuffin doll that was scribbled "*ver-vuh-um-umdmn*" on the list and that nobody could read and that didn't get delivered is all that gets talked about Christmas Day. [laughter] So you see, this thing has many sides. But it's all on the subject of just A, R and C in its interchange and delivery and cutting the theta line and that's all there is to it. That is what it is.

And you now start to walk away on thin ice from this very secure little footbridge and you're liable to go through. Now let me give you an idea, see? Let me give you an idea. I know this will come as a shock to some of you, that you shouldn't do this – but your pc, your pc is talking to you about bananas, see? The pc is talking to you about bananas and we're getting along just fine with the pc talking about bananas. But the pc accidentally, in passing, mentions watermelons – and we instantly ask him to talk about watermelons. He mentioned them; we ask him to talk about them. And then, when he is busy talking about watermelons, he happens to mention greengrocers. And the moment he mentions greengrocers, we then ask him to talk about greengrocers. Now, I know nobody present would do anything like that. We call it Q and A. You may have heard of it. Well, what exactly are you doing in relationship to A, R and C?

There's a much easier explanation of what Q and A is. Q and A is just not completing a cycle of action. That's all. You can Q and A on a pc over 500 hours of processing. You just don't complete the cycle of action laid out to be completed in the 500 hours of processing. You have Q'ed and A'ed. You don't even have to be the pc's auditor to Q and A on a pc. You can be the auditing director and mark the folder some other way, "shift off of this process which you started on last month, and this program" (not even process, see), but "shift off of this program which you started the pc on last month, now, and go on some other program, even though he's still getting tone arm action on the program" – not process, but program – "which we laid out last month, because there's something more recent." Q and A. That's all.

That's just an interrupted auditing cycle. An interrupted process cycle or an interrupted program cycle – any one of those things is just an incomplete cycle of action. And if you don't complete a cycle of action in any category – you know, the little auditing comm cycle or on up the line to the session, on up the line to the process, on up the line to the program – you fail to complete any of those, you've just Qed-and-Aed.

But what's wrong with it? Why? Why is this so important? When this fellow was talking to you about bananas – you see, trouble is, once in a blue moon you get away with it. He just accidentally was finished talking about bananas when you asked him about watermelons, so you thought that was all right because it was all right that time. But, let me tell you, that it's only one – about one chance in a hundred of it being all right. You sometimes get away with it, you see, which rather tends to trip you up. So he was finished talking about bananas. But supposing he hadn't really told you what he wanted to tell you about bananas. You cut the theta line right there in the session. Now, supposing he was just getting good on the subject of watermelons – he was just getting good on this particular subject – and he really realized that he had something to communicate on that subject, and you Qed-and-Aed and transferred him off to greengrocers. Oh, you'd have by this time two, not – let's put it banally and technically – we'd have two unfinished communication cycles, which doesn't sound like very much. No, but back of that you've got something far worse. You had an undelivered, complete communication. You have an undelivered series of communications.

In other words, you've cut this fellow's theta line. From that point on it's inevitable that you, sooner or later, will blow up as his auditor. It's just – it's just fate. Fate has intervened at this point. Kismet. You just got out your knife and started working on the tightrope you were walking, right in the middle of the chasm.

Now, you wonder why you have trouble with pcs. You wonder why a pc's needle roughs up. You wonder why some auditors rough up pcs' needles. You wonder why you see some pcs ARC break. You wonder this and you wonder that. You wouldn't wonder very long if you got ahold of a tape of that session. You wouldn't wonder very long.

You'd – cut it into the first third of the session, something like that, and you'd say, "Well, we'll pick up something here." And you hear this little note of asperity, you see, in the pc's voice. He's – he sounds a little strained. He's still enthusiastic, but it's sort of an enthusiastic strain. There's a note there that you don't quite like.

Let's go back just a little bit further than this and we find the auditor is, "Okay! Yes!" you know, "I got that," you know, and letting the pc go on and on, and then making *very sure*

that the communication was acknowl... Well, what the hell is making this auditor act *that* way? We don't take it that he just doesn't know his drills, see?

I have two different frames of reference by which to look at an auditor's auditing. One is teaching him how to do it and whether he is doing it the way he should be doing it, see? That's one frame of reference. And the other frame of reference is: What did he do that is making him do it wrong? See, that's the other frame of reference. How is he behaving in this session? And under that heading I always assume that he knows perfectly how to do it, but that something is just disturbing him. Something has gone awry. I assume that he knows all his drills, see? There's something haywire here that we are looking at, that is making him go adrift. I don't immediately then go into the subject of dressing him up on the subject of drills. I start looking for something that is gone adrift in his auditing. I'd simply... see, so you'd have to have two frames of reference. One is the frame of reference of a critique of his ability to handle preclears and the other is a critique of his ability to handle drills. See, there would be two different points of view. And you can't mix up these two points of view and train an auditor or you're sunk. Otherwise, every time the auditor mishandles a pc, you put the auditor back on doing a drill. You should be teaching him about pcs, and you are teaching him about the drill.

Hell, he knows how to do the drill! Well, why isn't he doing it? See, that's this other frame of reference. Well, he isn't doing it; like he's mucked-up somewhere or another here. On what? Handling a pc. That's where he's fouled up. He isn't fouled up on being able to say, "Good," "Thank you" and "Okay." See? That isn't where he's monkeyed up. He's monkeyed up on handling that thing sitting in the chair across from him that he knows not what of, somehow. And you hear him: "Good! Than... thank you! Thank – thank you. I – I got, I – I got the communica... I – I heard you. I – I – I heard, heard you – what you said. Now, do you – do you know that I've acknowledged you?"

And you say, "What the hell is going on here?" Well, it isn't that this fellow's drills are out. It's his pc handling is out here, somehow or another. He doesn't understand something that is going on here.

All right. So you roll back the tape a few more feet, see? Let's find this thing, see? How come he's – how come he's doing such a lousy job of auditing, is what we are asking, see? How come it's all getting so difficult? How come it's an unaudited, -auditable pc in an unauditing situation, see? So we get this tape back here, and we all of a sudden we hear it. We hear it. "Well, yes, I know. We heard all about your mother in the last session, and so forth, and we are not going to take that up now. What we're going to go on into now is your family in general, and so forth."

My God, it lay right in the R-factor. What a corny R-factor. The auditor took off from this point of view with an incomplete cycle of action on the subject that he was addressing in the last session. The pc's been thinking about it all night. Instantly and immediately the pc starts the session with a present time problem because of the R-factor, see? – an incomplete cycle of action, an incomplete communication. Definition of present time problem: an undelivered communication. See? If you really want to handle present time problems, don't ever define them any other way.

I don't care how gross or how crude or how stupid all this sounds on the subject, or how it doesn't quite seem to apply. You just keep looking at it and you will find, stupid as it is – well, for instance, we find out this fellow feels very batty, and we trace back to where he feels very batty. And he didn't shoot a sniper in World War II, see? Undelivered communication. Well, what the hell do you – you'll say, "That's a funny communication: a bullet?" Ah, but it follows the communication formula. It goes from here as cause across a distance and arrives at an effect. Do you see?

Now, if we want to understand what an overt act is, we go around to the other side of the coin and we find out it was a communication he didn't want to deliver, he delivered. See? And that's what an overt act is. And what saves your bacon in auditing is the fact that the overt act is worse than the undelivered communication in terms of aberrative value because you have now perverted the ARC theta line, you see; you've perverted the theta line by causing it to carry harm.

Now, that really mucks up a theta line. Just not delivering at all is infinitely better than delivering harmfully. I don't care what GPMs say or anything else, see? You're too prone, perhaps, on occasion, to say, "Well, we are all aberrated because of certain basic deep-seated woof-woofs, and so forth."

It's quite interesting that the deeper and further research has gone – it isn't that I have found we are less and less governed by these predetermined impulses. I have gone through phases of blaming parts of Scientology on various parts of the mind. I inevitably will come up on the other side of the stream, dripping wet but with considerable relief, looking at it and recognizing that we were still above, in our basic understandings, the aberrative influences by which the mind has previously been understood. So we are really above, in our technology, what life has been up to in digging itself in, don't you see? Our understanding is superior to the aberrative impulses.

Let me give you the idea – a very short, faster idea. For instance, Freud continuously stressed sex, see? And later on, his apologists said that if he had just talked about social implications as well as sexual implications, his work would have been more successful. No, Freud's work ceased to work when he got – they got off the subject of sex. The big libido theory of 1894 was his top, top climb. That was his summit; and anything else went down from there. That was as close as he got to the moon. And when he started walking away from that, or his apologists started walking away from that, he got into trouble and he ceased to cure people.

Why? He was as close as he could get to the GPM create series. See? He just walked in close on that perimeter, had a big cognition, laid it down as what he called his libido theory and then any time he tried to minimize this or walk away from it he was denying and invalidating GPMs. And so, therefore, it wasn't true that Freud should have mentioned social implications. No, hell, Freud should have kept right on pounding down the line of *sex*, you see, with a capital Freud. See? He should have hit it all the way, see, because he was right in there, see? He really did have his paws on something.

All right. Now, he was below – he was below the point of mental dramatization, in other words, he was interpreting the mind through a dramatization of a mind. In other words, he was dramatizing a bit when he was doing this, see?

All right. To that degree we have not been guilty of this particular line, and our materials, the further we go on this, start to stand clear and pure as a total command of understanding of livingness, life, and so forth, than before. Do you see? I mean, they separate out rather easily.

I go through some bad periods once in a while on this. I think "Oo-oh," you know? "Oh, no," you know? Not too long ago I looked with sudden horror – oh, actually about a year ago – I looked with sudden horror at the idea that the whole Tone Scale was simply based on something out of a series of implants, see? *Uhgh!* And I thought, "Oh-oh, oh-oh, oh-oh." And then it turned out they weren't there. And – so more recently I said, "Well, obviously the Tone Scale all came out of GPMs, obviously. Obviously. Heh! It's not there."

And my pc read a great deal of significance into GPMs to a point where we developed a full process one time to run GPMs. It had nothing but in – Scientology injected into the GPMs. We had to turn around and un-inject it.

In other words, we knew more about the mind than was in the mind, don't you see? So we could... it was R1C. R1C. For a while I thought we couldn't run R1C because I thought it was my solution. No, we understood more about life, do you see, than was understood by the thetan himself. Because he was not down the line on solution or anything like that, see? We understood that solution was an aberrative factor. Solution is a real aberrative factor. The GPM only brings about; it doesn't solve. You get what I mean?

So once in a while you can get real hot. And one of the difficulties we have is we understand the situation we're looking at too well. We understand it with such great pervasive thoroughness that we inject an awful lot of data into it that isn't there. In other words, it's just total screwball – the situation. It's like this. Now, we could go on and on and say the present time problem is a present time problem because it's postulate versus postulate, and so forth. Oh, yes, that's basically true of problems. That's the anatomy of problem. Oh, yes, that's why GPMs hang up. Oh, yes, all these things are very, very true.

But let's draw back to the level of ARC. Now, that's not a mild understanding. For instance, I'm talking to you today at ARC at the level of IV. I'm not talking to you about ARC at the level of 1C.

Now, I tell you, all these things are true – completely true about postulate versus postulate and it's mass versus mass and it takes an impulse versus an impulse to make a problem and because it's this and it's because it's that and because there are disagreements involved and all of this and that and so forth. All these things are true, you understand? But let's go right on upstairs in a complete purity of understanding. Philosophically, what is this thing: a problem? This thing is a problem because it's an undelivered communication.

Now, you have to be a pretty smart cookie to take a case apart knowing that, and knowing at the same thing that it's an unrunnable process. It's an undelivered communication. That's made it a problem. An overt act is not a problem. An overt act is a withdrawal from

putting out an ARC line because you know you will abuse it. It's a self-discipline. It's an abuse of ARC, so one doesn't ARC because one possibly might abuse ARC, so then one doesn't ARC. You see?

Self-discipline, here, is involved. An individual is putting an awful check and brace on himself. And this is the basic withhold. "Don't shoot anybody, see? Don't cause harm. Don't harm." I don't care what kind of GPMs are developed by the thetan coming down the line. They probably louse him up no end. You could probably get an awful lot of mileage out of doing these things sideways. But when the chips are all down and you've got them all processed out, you'll find the answer is still there the same way. You understand, this is – this is the way the critter operates. See, he doesn't want to undertake this particular communication because it is harmful, so therefore he withholds that particular communication.

All right. There's that source, then, of not communicating – there's that reason for not communicating – which is – looks a little more involved than the other reason because it includes the overt-withhold sequence. But there is this other simple one, which, of course, you understand now, is the same statement as the other one. The other was a more complex statement – it's an undelivered communication. Even O/W is an undelivered communication.

He's delivered one far too well. Pow! Oh, well. He better not deliver any more communications along this line. And he better not have delivered that one. So he'll develop a whole section of his bank out of communications he had better not deliver, so he is not delivering the communications he did deliver. "What communication did you deliver that you hadn't ought to have?" would be guaranteed to set off an automaticity.

So you look at somebody who's having a hard time with life, and he's got a lot of present time problems. And he comes in and he says, "I got this present time problem *ta-wowowow-I-tawowow*. Oh, what am I going to do?" and so forth and so on. You know one thing: that he's having an awful time. And the other thing you know, is for whatever reason – because he's breaking himself, because he might communicate, don't you see, and therefore is withholding because it will – these are all just rationales. You know two things. One, he's in that state and you know he's in that state because he hasn't delivered a communication. So you know those two things about this individual at once. Bang, bang. Simple as that.

Take off from there – remembering at the same time that there is no repetitive process: "What haven't you communicated to?" There is no process: "What don't you have to have?" There is no process: "What could you get rid of?" These are all "What could you go out of ARC with?" you see? Brutal processes that go right straight downhill.

There is only a process along the line of "What have you communicated with?" see, and so forth. Now, you get your ARC break process – that mainly depends on regretted communication. See, you're running in some other factors.

And out of this understanding you could tailor-make a lot of processes that would go into a lot of various lines. Just look at it at – offhand. "What had you ought to have communicated that you didn't have?" See? All right. "Now what had you ought to communicated that you didn't have?" All right. That is, "What did you go out of communication with?"

All right. You are going to run that process. You say it's absolutely necessary to get rid of this. Well, how are you going to get away with running that process? That process is unrunnable. Oh-ho-ho. You will have to answer it up immediately with "What did you go into communication with?" Now you've got a half-cursed, half-blessed process. You can probably get away with it. You could say, "Look around here and find something you don't have to have." "Now look around here and find something you have." See? Now you've half-cursed it and half-blessed it, so you – you understand this isn't ideal. But this is – run a sufficiently workable process so that you can run an unworkable process, so that you can simply get rid of the points he is hung up on in order to run a better process. Do you understand that?

So, you could go as far as that down into the shades of hell for the pc, and you would – after a little while, by the way, you shouldn't be too puzzled why this process doesn't run marvelously, why it doesn't run endlessly, why the pc occasionally has headaches. These things should be quite understood by you. You're simply getting some problems out of the road that – so that you can run the case. So you wouldn't go on very long along this direction before you shifted over into, "Well, what communication did you deliver?" You could run that kind of a process: "What communication did you deliver?"

Well now, he doesn't understand that. Communication, to him, appears to be a rather high order of thing, and that he delivered it means that he was all right, and so forth.

So you say, "What overt act did you commit?" And you run the same one. "What communication did you communicate that you didn't think you what – ought to have communicated?" In other words, "What communication – what delivered communication is regretted? What are you trying now at this moment not to have delivered that you did?" Do you see these ramifications?

Work these things out and you've got it made. The only difficulties that are going to happen anyplace in this universe, the only difficulties that have happened in this universe and the only difficulties that would occur even if it weren't here are simply based on this same information I am giving you.

Whether or not there are GPMs, whether or not there are not GPMs, whether there is a universe, whether there is no universe; you still have this same potential of difficulty. You see somebody in difficulty – it would be this same reason, see?

"What communication aren't you delivering because you have delivered so many lousy communications?" Do you see? Unrunnable process, but a complete understanding of the situation.

Now, what have you got to do? Well, you've got to do what you've got to do in order to get him to communicate where he should be communicating. And that may be have to be approached through the R and that may be have to be approached through the A as well as – and you may have to work it around in some way, but you're trying to multiply his ability to communicate and get the barriers of noncommunication out of the way. And if you did that, why, you'd have it made and everything would be all right and okay.

What I have been talking to you about is wisdom as an auditor. And don't ever really think you could degenerate a hundred percent to a wound-up doll and get a result. You have

to know something of what you are doing; and the pc across from you, you have to be at least aware of the fact that he does live and that he follows the laws of life and he isn't different just because he's acting different. There must be some thing that you are doing to make him act different. Perhaps those are hard lines, but that's nevertheless an understanding an auditor should have.

Thank you very much.

EFFECTIVENESS OF PROCESSING

A lecture given on 30 April 1964

Thank you. Well, this is the what?

Audience: 30th of April.

Thirtieth of April, AD 14, Saint Hill Special Briefing Course.

All right. We've had a little slowdown here recently on research the last six, seven days – I managed to get the show back on the road again – mostly due to the nonsense going on in Australia. The general situation with regard to that is they're not in any danger or anything like that, they're just being cross-advised and being generally upset. The government of Australia in the form of little pipsq... I mean this is... Anyhow, they – they have this parliament and it has very, very great – well, it's all swollen up on itself because it used to be the state of Australia used to meet there, see? And they don't realize that it doesn't anymore – but it's just the parliament of Victoria, see?

Well, these little boys have an opposition there that are quite red and they all of a sudden decided under a fellow of the name of Galbatty to investigate – investigate Scientology on account of how bad it all was, you see? And – this is the message I want to get across to you, not the state of Australia. An organization starts slipping – they stop following through standard policies, they are not on the ball here and they individuate there and they goof up someplace else. And then you all of a sudden start having trouble in their vicinity and it finally swells up to something like this inquiry you see, and that sort of thing. Just everybody has to some degree or another taken his finger off of his number and goofed up. You get the idea?

In this particular case, why, they ran some jerk down there who they knew was a security risk. He couldn't pass an E-Meter test if you'd held a gun to his head. He is just a complete bum. So they go ahead and give him high-level processing. Name is Werne. And they give this fellow a bunch of high-level processing and restimulate two or three wrong goals on him one way or the other so he goes into a complete spin. And I think he'd been in psychiatric treatment and he went back under psychiatric treatment – and then he runs over and sees Galbatty to get Galbatty to pass legislation so as to cure his GPMs and it just all went to smoke. And it had never even occurred to anybody down in Melbourne simply to handle Werne, refund his money and straighten him up. When they did refund his money, they didn't even require him to sign a release. So they went and refunded his money; he went over to the court

the same afternoon and filed a suit for a hundred and sixty thousand pounds. I mean, it takes genius, see? It just takes goof up after goof up.

Now, they've been testifying on the stand down there, nothing but Class VI material – Class V, Class VI material – *yap, yap, yap, yap, yap* – not realizing that all it is, is a fishing expedition by the – by the opposition, don't you see, to get a lot of oddities they can quote and say, "You see, Scientology is just silly." Quote all these things out of context, you see, and then go stampede other state legislatures, you see, into passing legislation against Scientology. Well, finally the opposition took its finger off of its number down there and they – a document passed into our hands on testimony – suggested testimony for witnesses. And it turns out to be the minutes of their second meeting of witnesses wherein they were arranging testimony which they should give at this free, open, public inquiry. If you want to look up the records, the Profumo witnesses are still in prison for having done this exact thing, you see? Well, all this is very interesting. The Profumo witnesses to the contrary, as soon as I got hold of this document – it's a case of what we would do about it.

Meantime there – this inquiry is costing the organization five hundred pounds a week. So every time you turn around there is a cable through from down there: "Send us five hundred pounds," you see? "Send us five hundred pounds," "Send us..." Two – two to three days later, "Send us five hundred pounds." We finally gave them a guarantee from a Swiss bank that guaranteed their bank account and the bank down there – I guess it has mostly kangaroos for customers – this bank didn't understand what this Swiss bank blocked-fund guarantee was, which was that if they – if their overdraft wasn't met, the money would simply pass into the bank to meet the overdraft. They couldn't understand this – the only bank in the world that couldn't have understood it.

So they're still at this business. I've – just a little while ago one came through: "Send us two thousand dollars at once," you see? They – they won't at any – they don't realize that this is sort of silly. While they're busy sending through these demands to get them off the hook because they can't stand up to it, the instructions going their way, you see, are just being disregarded. And the instructions were, simply: Walk into the inquiry and say we couldn't testify anymore because of collusion and fraud and produce the document and that would be that. Of course that would definitely be that. It would probably result in the resignation of the premier who ordered the inquiry.

Well, all this is very interesting. We got this evidence, got it all rigged up. I planted the howitzer, tied the opposition across the muzzle of the howitzer, showed everybody where the lanyard was. All they had to do was jerk on it slightly and said, "All right. Pull the lanyard" and that's the end of the inquiry into the situation. Everybody promptly ran away and said their – everything under the sun, but they wouldn't go near the lanyard, see?

So the attorneys down there are busy telling the staff how this document is unimportant, that it doesn't mean anything because it was known to the fellow who was running the board of inquiry!

Audience: Oh. Ooooooh!

So they all bought this, you see, that the document is valueless. But the same attorney, the same attorney – directly, immediately, and at once – has telexed through a long letter to

me, on the basis of "For God's sakes, don't! No, no, no!" Because it will unseat the incumbent government of Victoria just before the election. Finish them! While he's telling the organization that it's unimportant and means nothing. Finally I start hammering on him hard enough and he comes through with the truth. He's protecting the government of Victoria first and Scientology second. He says, "Of course, if the opposition got in because of this terrible scandal and so forth, why, they would pass material against Scientology." And he's very reasonable about this sort of thing, but I just wonder why he would tell staff down there that it is so unimportant when he tells me, "Oh, no! Don't! Please!" You know? His fingernails are chewed off clear to the third joint! You see what the situation is, see?

We have it in our power to simply give a little tug on this lanyard and that is the end of any future inquiry practically on Scientology to the end of time. Everybody would say, "Leave those people alone." Horrible!

Now, that's the existing thing. Now, they won't do it. They won't present this evidence and – I wouldn't go along with this, but they practically – not even being practical enough to go around to the incumbent and say, "Hey, bud. Why don't you meet the organization's cost for this inquiry," which was normal in any case, "and just pass a little bill sort of and say, 'That's the end of the inquiry, we didn't have anything' and we won't release it." That's using it for blackmail. You at least got that, see? No suggestion of that has come across or anything of the sort. But these cables keep coming through: "Send us two thousand dollars so we can pay this week's bills at the inquiry," see?

All right. There's a GPM "to create problems." I just wish they'd move up the track to the next GPM, which is "to destroy problems!"

Now, that's what has interrupted research here for the last six days – trying to get through, trying to get things clarified, trying to get things squared around.

Every once in a while an organization will start to skid a little bit on execution of this, following of policy that, being on the ball here, see? And then the next thing you know, why, they're in deep, dark, stumbling trouble of some kind or another. Then at that point – just to give you the rest of the lesson – when you try to straighten it out, you've got all kinds of crosscurrents going on, where everybody's got them hypnotized into believing something else and you can't get an execution at the point of trouble. So it just goes up in a balloon.

Now, the organization will be all right, it'll – it'll survive, simply for the excellent reason that they'll be forced to take some kind of a solution along this particular line. Of course, I always believe – I always believe that when somebody comes and attacks Scientology on a frontal attack and starts doing things one way or the other, if he at any time laid himself out on the carving table and said, "Carve," I would simply pick up the biggest knife! I mean, I haven't got any circuitous thinking on this particular subject. Somebody says, "Down with Scientology, shoot all Scientologists" and so forth, and "Here's a piece of evidence by which you can shoot me," my finger instantly, one split second later, would twitch! [laughter] This just is – this is terribly, I'm afraid, unsubtle. See, it's just unsubtle. But it's that situation which exists in Victoria as of this minute. All anybody would have to do, is just twitch his finger and that would be the end of inquiry and the end of really all future inquiries. And it would probably be the end of the FDA trial in Washington because rumors abound that it was Washington

money which started the inquiry in Australia in the first place. This investigation would back all the way back up and probably be the end of the E-Meter trial in Washington. But there it is – there it is.

Now, we're not going to do anything more with them. They can go ahead and work their own destiny out in their own peculiar way. It will probably all come out all right somehow or another. I just hope that we don't for years and years and years fight this confounded basketful of testimony which is nonfactual and so forth, that it won't keep appearing in other state legislatures as reasons why it should pass laws to debar Scientology. I just hope that won't happen. But it's on Melbourne's head. That's it. I have spoke.

All right. Now let's talk about... I'm just bringing you up to date, giving you, the – giving you the gen, *zip-zap*, center, rapidly. If you ever find an organization or area in Scientology – I'll give you this as a little moral lesson – which is slipping, you know, slipping one way or the other. "Well, actually, we – we don't have any classified auditors auditing anybody around here. We didn't believe in that, you see? No, the preclear, the – no, nobody keeps any logbook, you know. So nobody ever keeps any auditor's reports on sessions, you see. And we – we don't believe in, you see, this, that, the other thing." Slipping. You know what you are looking at in the future. You're looking for a complete bust.

It isn't, you see, that centrally, Scientology in its control areas or international board is always right. That isn't the case. But it is at least always uniform. And these things are built out of errors which have developed in the past. And their efforts to guide a safe course through the rocks and shoals of processing and organizational activities. When those things are all abandoned, naturally, the errors which they prevent occur. And when those occur, you get a deterioration of the situation.

All right, I don't know what to talk to you about today. You don't look like you need a good talking to. You look like you are doing all right – except you, of course! [laughter] You look like you are doing all right and so on. I could give you a bit of a talk on the HGC allowed processes, but I don't happen to have a list of them sitting in front of me.

But the whole basis that I could talk to you about and will talk to you about is simply the effectiveness of processing and effective processing. That's all. Just you, the auditor, bringing about a desirable effect on the pc. It's just that, nothing more. Nothing fancier than that.

Now, *that* is quite a subject! And it's the subject that you are grappled with in studying. And sometimes you forget you are grappled with that subject and think that you are just grappled in with bulletins or tapes or something like this. But actually, all the way along the line, you are simply handling this one single pc subject and problem which is: How do I, the auditor, produce a desirable effect upon the pc? That is the entirety of your activity.

Now of course, you, the auditor, could go into Group Auditing – that is to say the old-style Group Auditing, where you have a lot of people in chairs and they execute the commands from somebody on a platform. You could have the same problem there: How do you, standing up before a group and group auditing it, produce an effect on the pc? And also, how do you, the Auditing Supervisor, when you are running a co-audit, get an effect produced on the pcs in the co-audit which you are conducting, you see? And also this could go into how do

you, the auditor, by training alone and teaching a PE Course or something of that sort, produce an effect on the *cases* – on the cases of the people who are listening to your talks and lectures. It goes out into that ramification.

Now, it can go a little bit further. How do *you* as a Scientologist, produce an effect on somebody that you're talking to? Let's drop out the idea of an auditing action. How do you, the Scientologist, produce an effect on somebody you are talking to? You are talking to George Q. Blitz and he wots not of what you are or anything of the sort and without your giving him an ACC on the subject of Scientology – or even discussing Scientology at all – how do you produce an effect upon this gent?

Now, all of these things come under the heading of the production of an effect, don't they? Now, just production of an effect, then a production of a desirable effect, then a production of a desirable effect upon pcs or other than pcs, as subdivisions of this – so it's just the production of an effect. And if I were to teach you, just cleanly and totally, how to produce an effect on another human being, it could go into very numerous subjects.

There's the subject of armaments. You cock a gun and you pull a trigger and a bullet arrives in somebody else's skull, you produce an effect on that individual. Now, governments, lacking adroitness and so forth, really in the final last resort only produce that effect. They are producing an effect on somebody through the channels of destruction. They are trying to get compliance through threat. Now, that is a whole field and area and is exactly 50 percent of the production of an effect general subject. That's 50 percent of existence. That's the production of an effect by threat, menace, force, duress, strength – you get the idea? And that's – I'm giving you this very, very technically. This is 50 percent, exactly of the ways of producing an effect – are in that category.

Now, if we study that 50 percent, we will find that nearly all mental healing activities, sooner or later, drift into it. Psychiatry – with its prefrontal lobotomy, electric shocks, wet packs, chemical shocks, biochemical administrations of one kind or another – has drifted over into the solid-form effect. There are two reasons for this: (1) They do not realize they are trying to influence thought. They have no definition of thought. They don't even think anything is there thinking. They are trying to influence matter. Man, to them, is matter. And they are using matter to influence man. So they're actually in the field of physics, not in the field of mental healing. And it's drifted over to that direction. Every once in a while a psychiatrist will err in the direction of producing a kindly effect. It's a stray. I am not now being sarcastic. I'm just talking right straight off the record. He strays over and he says something friendly to somebody. Any of his friendly ideas toward a patient, when he exhibits them, are in the zone and area of a pitch. He knows it's a pitch and so does the patient. The ARC, you see, isn't there at all. He tries to be friendly so as to get the patient to confess more. There's always a lot of falsity involved in this sort of thing.

So, you run a danger in operating 100 percent in that remaining 50 percent, see? You're operating *wholly* in the remaining of 50 percent. The production of a beneficial effect. And operating in *that* 50 percent of the sector, you have left the other 50 percent slightly on automatic. So therefore, you occasionally drift over into it. Once in a while you drift over into it. Once in a while as an auditor you've just had too much and you explode and you tell the pc,

"To hell with you." Happens to the best of auditors. That's because he's got a 50 percent area here that he is not operating in. So occasionally it goes on automatic. You follow that?

It's almost inevitable that an auditor, sooner or later, is going to blow up at a pc. Now, let me point out to you this other fact: That an auditor, in that blowup, never has, doesn't and never will produce an improvement of case in the pc. You have to be there in the driver's seat a few times like this and watch yourself blow up under tremendous stress. Ah, this person is just too much, man – you know? Every time you turn around, why, you're – you're trying to help them out and they ARC break, see? And you try to help them out some more and they ARC break. And they ream you out and so forth. And you finally let them have it, see?

Well, what cures you of that? The best cures are at Class VI materials. No, what cures you of doing that? At Class VI there are so many examples of this – abundant examples. A pc's been ARC breaky, pc's been ARC breaky, pc's been ARC breaky – you've blown up. And then, you're red face a few sessions later to find out that you *were* running it all upside down and backwards, that there *was* bypassed charge there. See?

You don't get as much of an opportunity to get clean-cut examples of this at the lower levels, because those bypassed charges are mainly session bypassed charges. But you still run into them. And after your face has been reddened with the blush of shame a few times at realizing that you actually had skipped a GPM on the pc. You know, nothing slight – you just skipped a whole GPM! You're going back over your auditor's reports, *ta-da, ta-da, ta-da* one day, you know, and you're looking it over, "Let's see, what have we run on this fellow, and so forth. Well, we ran number 3, and then we ran number 4, and then we ran number 6, and then we ran number 7, and then we – what? ... Oh, my God! No wonder he was ARC breaky!" See? Now you know, and it never comes – emerges clearer, that you made a mistake, the pc got ARC breaky and then you blew up in his face. The reason why the pc operated that way lays there, very wide open. It's visual to the eye. And you say, "Well, I blew up for nothing?"

I had this sort of an experience – had this sort of an experience one time. Found out almost a 150 hours later that the person had been in an actual RI at a particular moment, when they had just been too insufferable for words. And I had been gnashing my teeth privately to myself about what horrible pcing this person did. Almost 200 hours later I was running down the track and the pc – and my gosh, we collided head-on with the RI that that pc had been in at that moment of that ARC break because it had been bypassed at that moment. It had been walked right on by. It hadn't been accepted on the list. But I recalled it because there had been an argument about it. After that for several sessions the pc was very ARC breaky and easily upset.

There is this whole sector over here, 50 percent, and that's wide open for an auditor to blow up in. But what does he accomplish? All he accomplishes is a mess-up. He really doesn't actually bring about any destruction. He just messes it up. Now to go on and do something is a harder task than if he hadn't moved over into that sector.

Let me give you a broad example: It's much easier to process somebody before he has had his prefrontal lobotomy than afterwards, you see? Just classify the prefrontal lobotomy over here as *in extremis* of destructive action toward the pc, you see? Well, similarly, on a much, much lighter level, it is far easier to straighten out the ARC break before you have

blown up – you the auditor – in the pc's face, one way or the other. You know, "I am not going to process you anymore, you keep talking to me like that." Even if it's that mild. You'll find yourself falling across that one, falling across that one, falling across that one – wow! You finally, out of your own self-defense – not because you have done anything to the pc, because it is causing you so much trouble – you begin to say, "Why did I ever do it?" you see? It's a kickback mechanism that operates in the final analysis, to an auditor with experience, as a disciplinary factor. All he has to do is recognize this and he sees at once what the disciplinary factor is with regard to it.

So you're actually not keeping the Auditor's Code because I tell you to. You're keeping it because if you do anything else but keep the Auditor's Code, you have made far more trouble for yourself as the auditor, with that pc, than you can easily undo. And now you're in an awful mess. It's a self-disciplinary type of activity. Now, I warn you that this big sector does exist – 50 percent – a destructive sector. So that, if left at random, every other effect produced would be destructive if you just had this thing going at random. It's like you flip a coin fifty times, why, you're going to get twenty-five heads and twenty-five tails, usually, on the average. Fifty percent, the chances are.

So, if you had an unintentional, undirected, just-any-old-way type of thing – you weren't worried about interpersonal relations, you weren't worried about anything of this sort but were just delivering random communications or cause-distance-effect lines, you might say, to the pc, then 50 percent of them would be destructive and 50 percent of them would be constructive. That just – that's the random. Supposing you didn't know anything about Scientology, do you understand? This would be the random selector.

Well, you're a specialist. You're a specialist over here in the other 50 percent. Fortunately, by the laws of life, it's this remaining 50 percent sector – the good sector, you see – is the only one which has any lasting benefit or there is any direction up or anything else. The odd part of it is, it isn't – it isn't a proposition in black and white. It isn't a proposition of putting something there or wiping something out. It isn't that fifty-fifty. It's by the definitions of "create" and "construct" which you get out of *Fundamentals of Thought*. You don't ever really destroy anything, see? It's not "take something away." You're dealing in a sector over here, then, whereby you can do something constructive by actually deleting something. But the other sector is just messing up what is already wrong. Eradication has to be 100 percent before it is effective.

If you want to know the truth of it, if you wanted a purity of destruction, you would get a not-thereness. But destruction does not go in that direction. When you rehabilitate the individual, it isn't enough to knock down the prison walls and leave them in rubble with him buried under them, see? That would be a destructive way of going about freeing an individual. "Well, we want to get Joe out of the dungeon. Good. Blow up the castle. Boom! Where is Joe?" So the action of destruction, as it's normally, commonly understood, is not an action which produces a result on a case. All it produces is mess-up.

Now, an as-ising of a situation is not looked on by you or me or anybody else, really, as destruction. It's looked on as a constructive action. Now, Joe's in the prison and we say, "*Wheeoow* – no castle!" There stands Joe. No rubble. Simple, clean. We look upon that as

beneficial. Actually, that's an ultimate in this other 50 percent. If you had an ultimate destruction, you wouldn't even have the rubble. But you'd still have Joe.

Now, if the way to handle Joe, as an individual, is to set him free – and it is – then the destructive action that you're engaged on would not be messing up what he is caught in – but it would consist of the as-ising, rather smoothly, of what he is caught in. Take a good workman to take down his jail, see? Now, the only thing Joe objects to is having it all rubblified in his vicinity. Having it so messily knocked apart that he can't find his way through it. Now he hasn't got a castle and he is not free but he's got an awful lot of shambles. And that's what he objects to. He doesn't object to being free. He doesn't object to the disappearance of his dungeon. He objects to it being done in such a way that he is battered about and surrounded by rubble.

So the effect that you're trying to produce on the pc is an infinitely simple one. You are simply trying to set the individual free by as-ising what the individual is caught in. And without destroying the individual and without leaving a lot of rubble around. And that's really all you are trying to do in the effect you are producing on the pc.

You're... frankly, it can be done in the mind. It's a relatively easy magician's trick with the mind. You go... he's surrounded by this bird cage called mother-in-law, see? And he's worried all the time about the mother-in-law, worried all about the mother-in-law, worried about the time about the mother-in-law, he can't think about his job or anything else because of his mother-in-law, *aww, aww, worry, worry, worry, worry, worry, worry!*

All right, your magic trick, as an auditor, is as-ising this cage called mother-in-law so as not to leave a lot of rubble around. Now, the way you would leave rubble around is this sort of an approach – counseling, you see: "Put your mind on something else. Assert yourself in the home." These are various types of advice, don't you see? "Assert yourself in the home. Do not permit yourself to be dominated by women." How much rubble do you think is going to start gathering along about this point, huh? In the first place, you've launched a simply other-determined and not pan-determined action. So therefore you've set up conflict between two other terminals. You've made trouble in life for somebody else. So you are going to start adding to the debris and trouble of life with such advice as, "Assert yourself around home," you see, or something like that. "Turn your attention in the other direction. Don't think about it. Learn to sit still and look at your navel and not think." These are all advices of the past that I am giving you. They're not just cracks. "Assume the Ib position." That's one of the plays Shakespeare wrote: Ib. Ibid. [laughs] I'm kidding. In other words – do something that doesn't do anything about the problem at all. I was struck by it last night. I was looking up a thesaurus, that's why it came up at this particular point. And it seems like the only play he ever wrote! [laughs, laughter]

So anyway, life, then, could be handled in a way of setting it into more violent counter-motion against itself. You could handle life by setting it into more violent counter-motions. War, for instance, is one of the chronic errors that man falls into. Let us solve the problems of the Balkans by going to war. See, this is to set terminals at other terminals. And have you ever noticed the amount of debris which accumulates when this occurs? The amount of breakage is fabulous. You can still, even this late, go up around London and you can still

see bits of debris which came out of that last big "solution." See, it's still there and it's still knocked about. And that's solving things by setting terminals at terminals or making somebody's attention go off of the subject or so forth.

Now, those are the mechanisms by which life handles its problems. *Those* are the mechanisms. And you as an auditor actually are being asked to decry, throw aside, and so forth, the standard dramatizing solutions that life is prone to. See, you're asked – you're asked as an auditor to assume a better discipline, which is a more workable discipline. In other words, let's find out what the problem is, what considerations they have had about the problem and what they have done to solve it. Because these, we find, are the building blocks of the cage. Those are the building blocks of the prison. The problem itself, what they have said the problem was or what has caused it, and solutions they have had to what they thought it was. Those are the building blocks. And after they have got through building all these things up, they have got a pretty big dungeon. They have got a big dungeon called "mother-in-law" or a big dungeon called "government." Or they've – they've got something, you see? And this thing is built up. But that is what – all the cage is built out of – not built out of another blessed thing.

Somebody had to *conceive* that there was a problem there, then had to conceive the problem was something different – we had to get an alter-is of the original problem, by the way – had to conceive the problem was different and then conceive that there were other problems. And each time they had a concept of what the problem is, they would have to solve that in numerous ways before they really have a first-class dungeon. That's how one is built.

You have to say – you have to say, "Well, I have a problem at home. I'm – I'm not happy with my home." In other words, here he is versus the home, see? He has to say, "I have this problem." Oddly enough, there doesn't have to be any prior art – nothing has to have existed before that point. He had to have had – needed no reason, because a thetan is always capable of postulation. And then he had to find a justification of some kind or another for this problem to exist, so he altered the problem a little bit. He said, "It's because of my mother-in-law. She is the problem." Well now, of course, she can't be the problem because she is not two terminals up to this point, see, she is just one. So now he has to then say it was the mother-in-law and then he has to assume that he is against her and that she is causing the difficulty. And then he has to go ahead and solve this. Now, of course, he already solved home as a problem by saying it was caused by his mother-in-law and she was the problem. That's the first solution, is the announcement of the first problem.

All right, now he has got to solve this situation one way or the other. He's got to work at it one way or the other. He's – he buys her some croquet mallets so she will take up croquet, you see, and go off and so forth or he does something or another. He makes extraordinary actions in life. Well, after a while, you can count on the fact that although his home is not happy, the problem he has set up, mother-in-law, has been solved into submergence. It's disappeared from view. He no longer can announce what the problem is but he can announce the last solutions that he had to it. And he will now find what's wrong with his life is the last solution he had to his mother-in-law. That is now the problem, see? His last solution, that he would never go home. See, it's now a problem, because he can never seem to go home. He

is now forcing himself to go home but he can't go home, you see? This is now the problem – his inability to go home. He's even forgotten why he started not to go home.

So now he starts solving this problem. He tries to make home more attractive. He tries to get himself in trouble outside of home so that he will go home. And eventually – eventually, he gets himself messed up with a – what is commonly called an affair, see? The reason he got himself mixed up in this affair is the girl always said, "You ought to go home now." See? And this – so this is now – this is now the problem. It was a solution, you see. But now it's a problem again. So he is starting to solve this sort of thing. And he goes off in a long concatenation of solutions.

Now, this fellow is walking around in circles in life by this time. He doesn't know whether he is there or went. He knows that he is unhappy. It is not just an item, "unhappiness," that causes him to be unhappy. He can actually, off his own bat, be unhappy. Everything seems to sort of dim down. He seems to sort of have his mind on something all the time, all the time. He seems a little abstracted. He can't concentrate or he does something or another.

Now, that is the prison. And he has built it up himself out of some basic and fundamental problem. Now, your art as the auditor is as-ising, not destroying. You're as-ising these bits and pieces that made up this cage. And you will find that as you as-is them they disappear. You are not, then, adding to this enormous structure which he's already got by giving him new solutions.

All right, now let me give you an example here now. Supposing your pc was totally uneducated – a very untutored, unlearned pc. And you're really trying to fish him out of the soup; and to the best of your ability and so forth. And you were running "What problem have you had?" in order to get the pc to as-is the problems they have had. I know you don't run this particular process, but let's just say you were, see? You still can do it. You could still get away with it; you won't get much tone arm. And your pc was inventing new problems to have. And you were unaware of this as an auditor and thought the pc was giving you problems the pc had had. And in actual fact, the pc was giving you new problems that he had never had. He is running a process called "Invent a new problem" and you're run... trying to run a process called "As-is your old problem." Do you see that?

Now, supposing your understanding was deficient to that degree – that you were trying to get him to as-is – as-is bank – and you didn't realize that he could very easily be making new bank. And supposing you didn't add this up. Well, your pc wouldn't improve. That would be the exact penalty right at that point. The pc might even be happy with you. The pc might even be still talking to you, pc this, pc that.

But sooner or later you are going to decide that you are off on the wrong tack, somehow or another, because this pc doesn't seem to be able to get rid of these phobias and non-senses. What process am I talking about? I am just talking about RIC, and then we add an M to it, it gives you the meter. Follow the blowdown after you have finished the cycle of action.

You after a while would decide you had better go off on a new tack. So you go off on a new tack and you'd run something else, "Touch that wall" or something like this, see. Pc isn't going to improve now. Very minor improvement. Yeah, you decide, "Well, I had better

do something else." So you do something else and you do something else. And the pc doesn't improve. Sooner or later you are going to get mad at the pc and start moving over into the destruction cycle. There is nothing calculated to make an auditor more mad with the pc than the pc not improving. Some pcs understand this very clearly and tell you with great propitiation that they are greatly improved when they are not. Do you – do you recognize that as a little deficiency of understanding of what you are supposed to do? Supposing the auditor was deficient in that little piece of understanding. The auditor isn't trying to knock out anything. The auditor happily sits there and lets new things be added to the case. Well, the only reason he'd do something else other than watch these little bits get knocked out – the only reason that he would do something else, is because he didn't understand he was supposed to knock out these little bits.

Now, another deficiency in delivering processing to the pc comes under the heading of not realizing that it is went. This probably is the most mystifying thing to the new auditor and he is always hounding a pc about the problem that has just gone. He becomes completely baffled because he sees no debris. Well, his magic consists of as-ising without debris. He has as-ised this thing. The auditor who doesn't know his business doesn't recognize that he is *blowing* things, he's as-ising things by the simple process of inspection and communication on the part of the pc. Order from the auditor. The pc inspects it. Pc looks at it. Says something to the auditor about it and it goes!

So, this fellow is something like trying to make a steak dinner out of a sliver of bacon, see? This auditor, see, he gets this little tiny sliver of bacon on the plate. And that's all he can see he is ever going to have on his plate. He gets the pc to admit that he has trouble in the office with some of the other people in the office, see. So he's got that now on the plate. That's his sliver of bacon. He starts treating it like a steak dinner, see? He is going to process this. He has got his timetable all figured out and further, "Well, I'm all set now! Got the next 75, 125 hours of processing all fixed up. I'll straighten this fellow up with regard to the office." See, all set, see? So he says, "All right now."

The fellow says – the pc is sort of "All right, what?" "Now, about your difficulties at the office..."

And the pc looks a little bit blank for a minute. "Oh, yes." He gets it back again, you see? He kind of mocks it up once more.

"Now, about your difficulties at the office, who do you detest most at the office?"

"Detest most at the office? I don't detest anybody at the office. I just always had a sort of a withhold. I just didn't like to be there, you know?"

"Well, yes, very good." Let's make this bacon out of the – beginning to look a little bit shriveled here. There's something wrong going on. "Well now, how do we approach this problem," the auditor is saying, you see, "How – how do we attack this problem?" Well, he's in the same position of the fellow fencing air. The dimensions of the problem were one-thousandth of a – of a nothing by one-thousandth of a nothing to begin with, don't you see? And it went *phfffft!* And that was the end of that.

Now, you could train an auditor if a pc uniformly always cognited. But on these little things there isn't enough horsepower in them to generate a good cognition, see? So he – the pc would say, "Oh!! I just realized I didn't like the boss! Gee, I feel much better now!"

The auditor would say, "Oh well, we don't have to have that steak dinner here. We are all set." See, unfortunately, all auditing is made out of these little slivers of bacon, see? And the auditor that really has a tough time is trying to get a piece of steak on the plate every time he has just got this bit of grease. Because it's always blowing, see? It's always blowing. It's insubstantial. The pc is sitting there and he gives him all this long song and dance about something or other and the auditor takes it all down and figures it all out and then says, "We now have the design of the situation and we know now what we are going to attack on the case." And it's blown! [laughter]

The new auditor probably has a tremendous embarrassment of never really realizing what auditing is for. Why all these TRs and these drills and why this adherence to a comm cycle? Why all this sort of thing. He never adds that in to any of this other thing. Of course, they're there to bring about the as-is.

You ask a question, you're really saying, "Here's something, we'll see if you can as-is it."

The pc says, "*Ya, ooh, oh, yeap-whamf-whamf-whamf-whamf* All right."

And the auditor is saying, "All right, it's as-ised," see?

Now, that's actually what this auditing comm cycle is all about. But people don't easily add that up to the other situation. They don't recognize what auditing is all about because it looks very, very – must be very complicated – it has made this fellow terribly sick for years. It has made him sick, unhappy, miserable, made him a complete dope, a social pariah for all these years. And at the end of thirty-five minutes or something like that – obviously something like this should take a long time, you see? At the end of thirty-five minutes it might have be – it might just have blown up. But if the auditor had estimated that it was a long, serious problem, the auditor can keep chipping away at it for the next twenty hours. Of course, he is making no progress at all on the case because he is making the pc pull back things that have went. He doesn't recognize the ease with which this basic auditing comm cycle can actually blow something. So you're always having him ask about things that have blown. Quite common.

Now, an auditor gets so fixated (this is the other side of the coin) on having them all blow easily that once in a while he runs into a brick wall of: it didn't. And it's just like stepping for the step, you see? You know, you're at the bottom of the stairs and you try to go down one more step. And it is with a terrible shock that you hit the landing with your foot, you see? A misestimation, you know? "Oh, we figured this all out and we got it all out and we ran all this thing all out and *uhhheei!* Still worried about it."

What happened? Well, what happened there is that you happened – you see, all these little symptoms of existence can fall into two categories: Those that are floating loose and fancy free and those that have got roots. So the pc's upsets and phobias are not always rooted.

Unlike Freudian assumptions, you do not have to assume that the reason he is fond of eating with his spoon rather than his fork – you do not have to assume that this grows roots clear to the center of the earth. You don't have to assume that at all. Those roots might go no deeper, you see, than a slight personal preference based on an idiosyncrasy he made up his mind with in the army. See, that's just nothing, see. Doesn't have any depth. There's no depth there. It's like trying to jump into a one-inch-deep swimming pool, see? And you try to go any deeper than that and you are in for an awful thud, because there is nothing deeper, see? So, you might say that – it isn't any precise percentage, but a large percentage of these things that worry people have no roots. They aren't deeply rooted in the ub-conscious re-conscious, you understand? They're – just don't go down to the center of the earth.

And then there are a few subjects and items, the display of which in this lifetime is just a little flag. It's just a little flag. And boy, you pick up this little flag. You think, well, it is just – just like everything else and you all of a sudden pick up this little flag, you know. You thought you were catching minnows, you know? And boy, you got a whale on the other end of it and he's anchored right to the bottom of the ocean. You move that flag and it is you that moved, not the flag. [laughter] It is a little telltale. This thing goes clear to China, see? We don't know what happened here. Every once in a while an auditor will hit one of these things which is simply a symptom of some very, very fundamental, deep-lying mass and significance in the case. And of course, it just doesn't shake.

This is about the only thing that ever gets in the road of clearing. You go along the line *pocketa-pocketa-pocketa*. Everything's fine! *Tra-da, ta-da, ta-da, tra-da, tra-da, tra-da, tra-da, tra-da!* All of a sudden, why, you're going to get rid of his lumbosis, too, see? And I'll show you exactly where you make the mistake. You take something which has no needle reaction or TA blowdown, but which is obvious and visible – but which doesn't respond on the meter – and all these little flags bear that characteristic. "Now, your lumbosis, now..." And that is just one smooth, uninterrupted rise. "Your lumbosis now. Has that gotten worse or better in the last few weeks?" Just one long, uninterrupted rise. There is not the least quiver on that needle on the subject of lumbosis and there is not the least blowdown on the part of that tone arm. And all the pc tells you – he has lumbosis and he knows he has lumbosis and he could discuss lumbosis for quite some time. Your TA just sits there and does absolutely nothing and your needle does not respond in any way, shape or form. It's an obvious manifestation. The guy *does* have lumbosis, see? This is obvious. And it does not respond on the meter. Therefore, it goes all the way to China.

And the more you talk about it, the more trouble you are going to get into. Because if you force the pc into a recognition of the reality of that condition – you pin him, instantly and at once, to his most fundamental bank. Just like that. It's very, very interesting. You could take somebody who has no manifestation about it. He is not – his wife is going to leave him tomorrow. You can't get him interested in the subject.

You see, the auditor in each one of these cases where the auditor picks up this flag that goes all the way to China – it's going to be the *auditor* who recognizes it. It's going to be the *auditor* who puts in time on it. It's going to be the *auditor* who tries to force forward the reality of the situation on the pc. It's the *auditor* who is doing it, it's the auditor who is perceiving

it, the auditor who is doing it and it is not cooperated with by the pc except to the extent that the pc will answer the auditor's questions.

In other words, you've got an unreal subject. Fellow walks in – fellow walks in and he's got a papier-mâché head, you know? You don't say, "How are you Mr. Jones? How are you feeling today? What's on your mind? What you worried about today?" or something. You would have to make this kind of a goof. "Hey, we're going to audit this papier-mâché head," see? Now, if that papier-mâché head had no rise or fall, no speeded rise, no speeded fall, no RRs, no drops, no TA blowdowns – nothing with relationship to it. Yes, that's wrong with him but it goes all the way to China. You are dealing with something there which is below any ability this pc has to perceive. You can see it. He can't. He probably looks in the mi... in the mirror every morning and sees a regular head. You have to evaluate the importance of the thing for the pc. You have to force the thing into existence. And by the time you have done that, you can actually push a case all around and mess it all up and you can bog the case down so that it won't get tone arm action. You're not giving him anything he can as-is, so he isn't going to have any victories. You are giving him something that is totally unreal to him. Why is it totally unreal? Well, it's just too deep, too fundamental, too far gone. It's – he's not about to have any recognition of it.

The main danger there is the auditor deciding what is wrong with the pc and then auditing it. That is the main sin. Now, if you – if the auditor decides what is wrong with the pc and then audits it, it very well may be what is wrong with the pc. It may sometimes be that the auditor can change this with the pc. That can happen, too, see, once in a blue moon. But the pc will never find out about it and will be rather resentful and you won't have as-ised any cage. The only cage the pc can as-is is the one he's aware of. He can't as-is any other cage. And you're dependent upon the ability of the pc to as-is. Now, if you're dependent on the pc's ability to as-is, then you had better depend on auditing what the pc can as-is. Elementary.

Now, you can force the pc into all sorts of wild, oddball, physical manifestations this way. I can just see lines of people walking into the psychoanalytic laboratories without limps, and walking out on crutches. I can just see lines of them doing it. Because they specialize in this. They arrive at this through testing. This is why we don't put very much pressure on testing. It's why – we could learn a lot from testing, but we don't really bother to, you understand?

This is where testing dead-ends. You can read deeper into the psyche than the pc can as-is. That's something to remember when you come up against tests. So therefore, little, light, shallow tests are far better than deep, deep, fundamental tests.

There might even be something to a Rorschach. See, there might even be something to it, rather than the old... it actually started as a kid's game, you know, it's the kid's inkblot game. You spill some ink on a piece of paper and fold it together and display it out and ask the other kid what it is, you see? It's a kindergarten game. And everybody got very fundamental. And they found out that you could read various deep and connotations – and you found out – they found out that various psychologically disoriented psycho-drams would occur in these things, see? And they coordinated it up empirically against a tremendous number of neurotic and insane persons. And they found out there's some coordinations in this. Then they

could lay out one of these Rorschachs in front of people and get the person's reaction to it and then they could evaluate the test. And they could say, "This is what is wrong with you."

Now, look how that operates with the one I am just talking about. The guy very often sits there and says, "That's what is wrong with me." It is beyond his ability to as-is. What you have done is restimulate him without any hope of destimulating it. You – in other words, you could force him to assume the characteristics and dimensions of this neurosis or psychosis. That operation could be put under the heading, "This is how to be nuts, taught cheap," see?

A meter has only this value – that it is at the level of reality of the pc. If it reads on the meter, it has the potential of being real to the preclear. If it does not read on the meter, either it is totally suppressed or it's unreal to the pc. That's the end and short of it. Therefore, this meter is rather beautiful to that regard, in that it can sort out things that the pc can find are real to him.

We take – we take a meter. Let's take an assessment level operation at Level IV. We say on this meter, we say, "Grandma, mother, wife, aunt," and so forth. Flinck – a little tick there and so forth. Now, if we want to be real Swami Gambola, you see, with the complete turban and the Woolworth ruby, all we would have to do is say, "We find that the realest person in your family was your aunt."

He'd say, "Oh, true, true, true." [laughter] See? That coordinates instantly and at once, you see?

"You had – you had certain interpersonal relations with your aunt."

"Oh, yes, yes, she used to talk to me all the time and so forth."

You understand, that's assessment for reality. See, you just name off his family members. One of them falls, you just say, "That's the realest person to you." Doesn't matter whether they're the maddest at him, see, or *what* the interpersonal relationship is between him and this person. We know his mind is on that person and we know that he can have a reality on that person. Therefore we know what he can as-is about his family. He can as-is sections relating to that person. And by the time he has got unpinned off of that, we could say the whole family over to him again and this time it would be Grandmama. And suddenly and mysteriously we would have a lot of things of reality about Grandmama. And he all of a sudden can as-is those. And we say all over to him again all the family names. And now we have Papa. Ah, great, because he now can as-is something about Papa, who he dramatizes all the time.

But supposing we had gone about it this way, much more intricately: "Now, you fill out this paper of your characteristics of the ideal person, the ideal villain, the – what – what novels you read most, what type of tobacco you have. Now, here is another piece of paper. What are the types of tobacco and the reading habits of each family member," and so forth. And you say, "Well, you're – you're actually dramatizing your father." [comm lag, laughter]

He'd say, "This is a disaster – horrible!" And he would go off all beaten down, see, and develop all of Papa's ills. [laughter]

See, it's just on this little simple trick of what can you do with a pc? Well, you can do with a pc what is real to the pc. You can as-is in a pc what the pc has a reality on. And having as-ised it, you have a little more cage taken apart so he can see a little bit further so you can find something new for him to have a reality on. And you can as-is that. And it's just a progressive line of taking down the cage. But you try to take down the moat while he is still in the deepest dungeon, he could very easily drown without even coming near the moat, don't you see? "I am suffering asphyxiation and I don't know why." Well, you are taking down the moat!

"Well, go on. You know all about the moat. Yes, yes. The moat's green, scummy water and so forth. Now get the idea of being – drowning in green, scummy water." And don't blame me if you find your pc sitting there stone-dead in the chair and the diagnosis is that he drowned! [laughter, laughs]

This is what is known as running somebody – we have a lot of little, careless phrases that go by, describes this – running somebody above their level of reality. These are usually very glib. But they have a tremendous fundamental truth back of all these things.

Therefore, the auditor who sits there and audits a pc in some other frame of reference than the pc – being able to recognize where the pc is and audit him on things the pc can have a reality on – the auditor who audits that way wins. The auditor who doesn't audit that way loses. That's the magic of auditing. That's the magical trick. Now, you could do almost anything with a pc – almost anything – if you know these little things, you see? I don't care what process you are running. Processes are important, because they tell you how to get to these points of reality.

Now everybody, unless he is stone-dead and long gone, everybody has some reality on some level of A, some level of R, some level of C. So we find processes which are based on A, R, and C interpret with the wildest variability with the pc, but yet hit some level of recognizability in the pc.

You say, "Who do you like?"

"Oh, I – I like Joe." Now, what does he mean when he said he liked Joe? The semantics of the situation are, is he is fond of Joe. But he isn't answering that way at all. A little bit later he is telling you he is really apathetic about Joe. He keeps reinterpreting what his emotional reactions are on the A line. Quite interesting.

"What is real in this room?" is probably one of the most nebulous questions ever asked. The auditor doesn't recognize it as a nebulous question. The pc walks over – all the performances – the question seems direct, all the performances seem very direct – the pc walks over and he picks up that wire over there, that white wire, and he says, "That is very, very, very real." I don't know what he means. But it means that he can recognize a white wire. I don't know what he means. I don't even know what he means when he says he can recognize it. But it means that – to me, for the benefit of just the process itself – that he can see it, recognize it and direct his attention to it. Great. That is all I am asking. I don't care what else he means. It is nothing to me.

See, "Look around here and find something that is really real to you." Oh, it's an interesting question. What goes on in the pc's head when he answers that question? Wow.

Now, beware of the pc when you are running processes like that, who just glibly ticks off everything (and you know he is in a bad state) but he can just tick off everything: "What is really real to me? Well, the carpet is really real to me, the roof is really real to me and the beams are really real to me and the walls are really real to me and the windows are really real to me and everything is really real to me, *wha-rrrr-rrra-mm-mmm-mmm* everything's all really real to me and everything's all..."

I'd conclude about that time that I was several stratospheres above where I ought to be running. Because one of two things will happen: Either his havingness will increase and he'll be getting tone arm action – he'll be getting quite a bit of tone arm action, if he – if he's that good on reality. Why, just the fact that he is shifting his eyeballs and looking around and getting havingness and so forth is going to shift his tone arm around, you see? This guy must be a whiz-bang. See, he is going to get tone arm action, he is going to get needle reaction. Yes, it's real, see? Needle action, a bit of tone arm action, tells him, yes, that's true: The carpet is really real to him, the beams are really real to him, the walls are really... It's reacting here on the tone arm, see, on the needle, see? That's true.

But the case that always got the auditor in trouble was the person who had 8-C completely flat. Run it off a mile a minute and never from the time they started it on would they ever get a twitch or a flick on that unless it was caused by a body motion. They suddenly jump up in the chair and sit down again and you see the needle move. See? But the action of running these things off, you know, talking about this or that one, produced no reaction on the meter and produced no tone arm reaction. No wonder they could be so glib. They're going through some kind of a circuitry response. They're not there. They have been educated into naming of objects in areas or something and they don't have anything to do with it. And they can just, you know – has nothing to do with them – *too-doo, too-doo, too-too-doo!* Not even in the universe – *ta-da-ta-da-ta-da-ta-da!* "Nothing worries me! I'm perfectly free as a bird, sitting down in the middle of this rock." [laughter]

And they haven't any recognition of location or position or anything else. They're dis-oriented. And you'll find out a great many insane people – not describing – this case I just described to you is not even an insane person, not even neurotic. You'll find a lot of people are in that condition, though. They're pretty bad – pretty bad off. You find out they have a lot of psychosomatic ills which they don't know they have. They have a headache all the time. As you're auditing the case you suddenly (quote) "turn on a somatic." Hell, you never turned on the somatic. You turned on the awareness of the existing somatic. The person is now aware that their head aches. If they thought of it a little while, their headache really ached yesterday and the day before and it's been aching for a long time. But they are up to an awareness of the fact they had a headache.

All kinds of awareness shifts take place here and you get reactions, very often, which are not the same as they are advertised. You pull a mass in on a pc one way or the other and he gets a headache, see? All right, the auditing brought in a headache and the auditing will move the headache on out again, eventually, unless it's some upside-down process like, "What

problem could you solve? Thank you. What problem could you solve? Thank you." You know, that's one of the most remarkable processes. That led us into RIC. It's many years old. And if you ask a pc that – if you ask a pc that question, "What problem could you solve? What problem could you solve? What problem could you solve? What problem could you solve?" You can very often see a mass moving in on him. "What problem could you solve?" and this is closer. "What problem could you solve?" see, and he answers and again – and it's closer.

This is very amusing, because you can turn this thing around and head it out the other direction. You just say, "Think of a problem. Think of a problem. Think of a problem. Think of a problem. Think of a problem." And it has gone over the hill and far... Now you could turn around and say, "What problem could you solve?" and it turns right back. It's quite an amusing exercise in masses. If a pc can perceive masses, he can watch this happen.

So, when you are looking at a pc and processing a pc, see the pc in regard to what the pc can see, not what you can see. But learn to look at a pc from the point of view of what the pc can see. Don't, then, bother to limit your own vision, see? But recognize that there may be a difference here. PC can see something and you can see something else. Actually it would be perfectly factual, because you're in two different locations and space is a viewpoint of dimension – you would of course see different things.

But the point is, is the pc can as-is what is real to the pc or what he can see, what he can know, what he can perceive, what he can cotton on to. And actually, he can't do any more than that. Now, after he has perceived something, unless it is one of these deep-rooted things, the chances are it's gone. And the auditor is very stupid indeed if he thinks he has got to go on auditing it after it went. Because the pc will get very upset because you are now auditing nothing. And a pc will get very upset about this after a while. "What about dogs? What about dogs? What about dogs? What about dogs?"

And finally the pc said, "Yep, yep, dogs, yeah, dogs, dogs. Been terrified of dogs," see, something like that.

He told you, you know, he is afraid of dogs. "Well, what about dogs? What about dogs? What about dogs? What about dogs? What about dogs?" I don't care. It's just a process, see – off the bat, see? "What about dogs? What about dogs? What about dogs?" See?

All right, and he eventually looks at you and sort of – "Yeah," he said, "well, that's – that's the point. What about dogs?"

Now, unless the auditor can perceive that he has now changed the pc's point of view with relationship to dogs by the process of as-ising the pc's fears and solutions to dogs – as-ised the pc's reaction to dogs – unless the auditor can also perceive that the pc has changed, in other words – then the auditor will go on trying to audit out what he has audited out. And he can park a case.

The auditor's ability to estimate, then, what he has as-ised, is part and parcel to the creation of an effect on a pc. You have got to know what you have taken care of and therefore you have to know how it is taken care of. It is taken care of by being perceived and as-ised and that is the only way it is taken care of – perceived and as-ised.

You ask the pc to look at something you know he can look at, he looks at it and he as-ises it. And that's the end product of auditing. I don't care whether you're doing Class VI or Class I – the action is the same. And that is how auditing works and that is the effect which the auditor creates on the pc. And that's how he creates the effect on the pc. That's the only way he does.

An auditor that doesn't know how auditing works and doesn't know why auditing works will commit several other sins. Amongst them is to address subjects that are not real to the pc. Another one is to run what has been run out. Another one is to – not to flatten what he has begun to as-is. These are the various crimes that the auditor can omit – can commit with his comm cycle.

So in the final analysis, an auditor who knows how auditing works and why auditing works never really gets in much of a bind. He never gets into much of an upset. I myself have had some gorgeous crashes on this particular line, as one would have with magnitude in re-search work. You work it – because in this case you are always evaluating what is wrong with the case from the viewpoint of research so that you can add up the principles involved. Don't you see? So you're always looking for this sort of thing. So, you're always wishing off on cases something that is wrong with them, in order to find out if it is. And I learned this the hard way very, very early.

But I never – I never would – would – I am perfectly willing to give up a theory. A theory to me is not very valuable. I can invent lots of theories, see. In most fields of science a theory is so precious that it has to be set in jewels and gems. And all one's work is involved – is in setting up a theory. And having set up this theory, all the rest of the work is put in on asserting that it is right. See, there isn't any further action taken with the theory than those things. That is quite common in the field of science and research. Always gone on the basis there's always lots of theories. If this one doesn't work, there's always another one.

Nevertheless, every once in a while you still will get a favorite theory. You'll get something that is very favored. You see, and you go down the line and you say, "There are this number of potentials with regard to this case," and so forth and you say, "Isn't that a nice one?" you know? "Isn't that particular one – number 3 there – isn't that nice?" you say. "That would be real, real cute, you see, if that is the right one," you know. So you start processing the pc and you favor number 3. You see, you weight number 3 heavily. The pc just sits there looking blankly at you, you know, his eyes sort of cloudy and so forth.

You feel like saying to him, "Hey, isn't this a wonderful theory? I mean, you know – what – what's – what – what's added up there about – about what I've cognited for you on – on your difficulty with spinach." You see? And – and – and so forth, and then, "Hey, hey, you know. Isn't that we – wonderful."

Sits there, his eyes cloudier. And all of a sudden, he says, "You know, that second one that you mentioned there," he says, "that – that makes some sense – with a little change, that makes some sense."

The second one? Hell, you didn't care anything about the second one, see? He goes on and embroiders number 2 and then all of a sudden you arrive at number 4, which is the correct one, don't you see, that he can as-is and has got a good reality on. "Oh yeah, that's it." You

know, and it always leaves a bad taste in your mouth, see. [laughs] He got well on the wrong process! Awful upsetting. So I know what you're up against.

You always – you always will have these interesting theories. For heaven's sakes, don't stop having them. "I know what's wrong with that guy," and so on. Remember, it isn't your brightness that is held in question. It's the pc's perceptive abilities. And the pc – it isn't real to the pc; something else is real to the pc about this sort of a thing. Well, don't try, then, to get the pc to as-is your concept of it because that isn't there to be as-ised. What is there to be as-ised is his concept of it. And he also may have a much shallower concept and sometimes surprise you by having a much deeper concept of reality than is being granted by the auditor.

So it's within these variabilities that you can bring a case out of the soup and so forth. The odd part of it is, the world is artificially and the universe is artificially divided into the constructive and the destructive. When you get way up topside, there is only the free. And you've actually escaped these two things. You can see that it – with an individual, the most constructive action that you can take with the individual would be to bring the individual into an ability, himself, to create and handle his own problems and situations, see. That is an ultimate.

Now that, of course, takes care of the other factor, because what would be the ultimate in destruction? Would be the disappearance of the traps and pitfalls that lay in his path. So you're actually not, when you come right down to it, doing a one-sided job. It only appears you are.

You go off into this other destructive action toward a pc only when he appears not to as-is properly to suit you. See? And that swings you down from your Olympian height of being able to cover all sides of action, you see? The ultimate in destruction, of course, is the – *whew!* Gone! You see? And the ultimate in construction, when you are dealing with a human being and when you are dealing with a person or a spirit and so forth, is to bring it about so you say, "*Phew*" and the individual himself can create. Those are very Olympian actions, I assure you.

And when you lose on those things, through your lack of understanding or bad luck or any other reason, why, you tend to drop down into the artificial segmentation of life into a constructive sphere and the 50 percent destructive sphere. And you start slapping back at the pc and you start creating men out of clay and you start doing all kinds of wild things. And just recognize that when you are reacting reactively to the pc, that you have dropped down from an ideal auditing action and have stepped into a nice, fat dramatization on your own part. Just get yourself by the scruff of the neck and say, "Hey, I must have slipped, because I am dramatizing," and you will bring yourself right back up scale again.

Auditing, in its most fundamental approach, is basically simple, because it evades, by undermining, all the complexities of life. You are not now trying to dream up a solution comparable to the problems this bloke has got. That's true about life, but it's not true about auditing. You are pulling the rug out from underneath his problems because you've got the answer to why they become problems in the first place.

You know how he got into the cage. Like you take a – you take an old smoothie on Sec Checking. And he can go back down the line, *pocketa-pocketa-pocketa*, find the original overt, take that thing apart and the whole chain just goes *brrrrrzzzzzzz!* And the most complicated set of problems that you ever heard of just blow right off on that particular subject. He just fishes out and so forth. Sometimes the reverse will be found. He imagined he had a problem which he didn't have or imagined he had an overt which he didn't have or something. That can be uncovered, too.

But you're pulling the string which unties the sugar sack and that's rather interesting. Otherwise it would be so complex that nobody could ever have anything to do with it. You could never do anything with it.

Auditing would have to be as complicated as life if auditing were a solution to life. And fortunately, it isn't a solution to life. It's an as-isness of the less desirable parts of existence.

Now, all you have to do is know this one approach of what you are trying to deliver to the pc and you will be able to pull it off every time, rather simply.

Thank you.

The Preclear And Getting Auditing To Work

A lecture given on 19 May 1964

[part missing]

Thank you.

What's the date?

Audience: 19th May.

Nineteen May AD 14, Saint Hill Special Briefing Course.

[part missing]

The reason why – why everybody showed up here so fast actually has to do only with one fact – is, I haven't lectured here for a couple of weeks, you see? [laughs]

Now, you're – I don't know why we called this lecture today, actually. I should be up there working on the verification of your materials and so forth which are all pretty well in hand. I think if you were going into the materials which I'm working on at the present moment, why, it would probably be a different story. But the object is not to get you wrapped up, but to wrap up the materials, so I'm doing it.

The – I haven't really anything to talk to you about today at all. But I think – I think that you probably know all there is to know about auditing. You probably have no difficulties with auditing. You probably have no difficulties with the material at all and everything is smoothed out. And you got all that taped.

Now, I think we probably ought to take up the preclear and getting a win on the preclear, applying the information to a preclear. I think that might – might be germane to the situation.

The situation is pinpointed by the fact that – I've forgotten the exact number – I think I had twenty-five provisional Class VIs issued here – what was the – twenty-four? – last week and I think that you all ought to be applauded for getting through to where you did. [applause]

The only comment I'd like to make on that is, I never saw such vicious grading in my life! I just never saw such vicious grading in my life. You had some of your papers on your fellow students down to around sixty when the grade was eighty plus, and on one noteworthy example it was down around sixty when the actual grade was ninety. It's fantastic! Fantastic.

But on a classification examination I'm not about to stand there idly twiddling my thumbs and of course I graded all the papers afterwards personally. Took me about six hours, by the way, going through every question and so forth, because all I wanted to know was just – is this auditor competent and does he know his material, you see? And even so, I didn't have to stretch any points to amount to anything. But those grades were just cut to ribbons. I never saw the like of it and so forth. And I said to myself – I said to myself, "Well, I hope this isn't a symptom of what will happen to the preclear!" Pretty ghastly.

Anyhow, you all did quite amazingly well. Your grades were right up there with the Saint Hill Co-audit Course grades on the final exam and your examination was tougher, if anything, than that. So I'm quite happy with that now.

Now, how auditing can occur is probably the greatest mystery to the person who makes it work the least. You've got a mysterious mysteriousness on any auditor who is having an awful hard time making anybody recover from something. See? He's got a mystery. And he may not know he has this mystery. He may not know he has this mystery. But he really doesn't know why auditing works, or if it does work. And he has assigned some value to the subject of auditing which is different and extraneous to the actual value of auditing, so therefore he makes enough goofs in trying to handle auditing, that auditing doesn't work. It's as simple as this, you see?

And he always looks for something more mysterious than is. He looks for something more complicated than is. And you, whenever you have a student that just can't seem to get any kind of result whatsoever, one third of the time his trouble will resolve if you simply ask him why auditing doesn't work and why it does work and get him into a big discussion about this thing.

Now you will have relieved, then, the impediment which is preventing him from perceiving. He will have been impeded from perceiving why auditing works. So a person who can't understand why auditing works has got a barricade across the line of his understanding which is a presumption that it *doesn't* work. Do you see? He is not about to understand *why* it works, because he already understands that it *doesn't* work. On some reactive basis, you see, he knows it doesn't work. So now you're going to ask him to try to understand why it does work and of course he'll hit this other one and he never will grasp it.

Do you see? He's blocked himself out from a comprehension of it. So therefore, a discussion of this simple basic, to you as an Instructor of auditors, is like diamonds – like diamonds. It'll cut through most of your more difficult students and so on. The way to use this little gimmick is – you see somebody is having a terrible time with his comm cycle. Now anybody has a little bit of trouble with a comm cycle. You take a pc, he's all rattled and he's upset, and he's this and he's that and the other thing, and he's in the middle of the – of the bank, and so on, and his comm cycle response you see is so rough quite ordinarily, that it takes a good expert to even find out, you know, which way it's going or what it's doing. You have to be an expert just to get by, see, as an auditor.

All right. So the pc, you see, he's already all rattlepated out on the subject of his comm cycle, you see. You ask him one question, he gets an answer to something else, you see? And your effort to steer him through this without ARC breaking him and so forth, as I said, that is

an expert action – an expert action. Because that is rugged. It's never quite by pattern from the pc's viewpoint. And of course, that's as it should be. So the auditor who understands this aspect of it, he doesn't have very much trouble with anything but the pc.

Now, supposing he has trouble with understanding what the comm cycle is, understanding why auditing works, and this is added to the difficulty the pc is going to introduce into it. Of course, at this moment we get an unmanageable session. We get no improvement, we get no case gain, we get nothing, you see. Why? The auditor is already incapable because of his own barricade across the line of understanding why auditing works because something is telling him that it doesn't work or there is some reason why it shouldn't work, you see, something like this. So that's already got him stopped. So therefore, he doesn't understand that it should work. Now let's put that mess on the line. Then let's get the routine difficulty that a pc introduces into the line, you see: pc gets all *waddle-gabopped*, you see, he sounds like ions going around inside of his skull, you know; he's banging from hither to hence and you ask him, "Do fish swim?" and he gets "Do they fly?", and – you know, he's – that's why he's being audited, you see. Because he's got stuff to walk through, see.

Well, that introduces the problem into the thing and by the time you get the combination of all these factors, why, you get – you get no gain, see. So, I repeat, you have to be an expert to handle the pc's comm cycle anyway. And therefore, you have to take out of line as an auditing Instructor, an auditors' Instructor, you have to take out of line those things which make it too difficult to do. And chief amongst those is: does auditing work or why doesn't auditing work and a discussion of this particular character is very, very, very heavy in its payment. You'll be quite surprised. I'm not giving you a bum tip here. This is a hot one, see, as far as study is concerned.

All right, now you take this fellow – I'll show you how you spot him, see. He's sitting there and he says, "Do – now, have you ever been up?" or whatever repetitive process he's running, you know, and the pc says, "Mm-hmm, hmm..."

"Thank you! Good. Thank you. Have you ever been up?"

And the pc says "... "Thank you. Good." It's – it's – you go, "What the hell's going on here?" See? This, this – there's no comm cycle here. What's going on, see? Or you'll get... There's so many variations of this it would be almost impossible to mimic them all. You get the auditor who says, "How many is up," or something of the sort, and the pc says, "Well, actually – actually, it's a matter of downness. I've always thought it was really a matter of downness and so forth, but when you really come down to think about it and so forth, when you really take how many is up, you count them off, and – and so forth and so forth and... But I don't really understand that. It's how many is down that is really got – got the thing important to me, you see, that – that's what really I keep dwelling on."

And the auditor says, "Thank you," just as though something has happened, you see. And he asks the same question again and he gets another evasion, see. And he never really notices that the pc never has understood or agreed with the auditing question. Now the pc hasn't got a clue as to what's going to happen here. Well, pc isn't answering the auditing question.

In other words, you can just keep adding these various flubs. You see any of them and they all come under the category: the auditor isn't answer... asking the question, getting it answered and acknowledging when the pc has completed his answer, see? And you get any variation of that – get any variation of that, then you've got an auditor who has got one over here... Of course, you show him how to do it and he says, "Oh, that's the way to do it!" and he does it perfectly. You see, you don't need any – any more action than that.

This guy can't seem to learn it. You straighten him all up on cutting the pc's responses. Now he asks one question in a 2½ hour session and lets the pc chatter the rest of the time, see. You've got him broken of one thing; he goes into another thing, you see. Now, my recommendation is not – as the auditor's Instructor – not to go into despair, but to examine – to examine this one burning question. Why doesn't auditing work? Let's get it out into the clear, see? And you all of a sudden will find some very interesting answers. You've got to be auditing on your toes to get these things and catch them as they go by, you know. You've got to watch that tone arm. He says, well, something or other, something or other, and you get a wild blowdown on the tone arm. Well, make a note over here to take that one up, too, see. And he all of a sudden will come out with some very, very interesting data. And it will be very revelatory to him, too. And after that he says, "Well, of course auditing works." You know?

Now, you say, "Go back in there again with a comm cycle," and it's *rat-atat-tat-a-ta-bang* and you won't have any trouble teaching the comm cycle, see. Got this as a side panel to auditing. Says nothing to do with taking care of the pc; this is the auditor taking care of the pc. Why do you have trouble with this, see?

All right, that's under one heading, then – this one heading. And that's "Why doesn't auditing work?" That – just put that in one big, wide, broad heading. You see somebody who's having too much trouble, can't ever get tone arm action, this way and that way as an auditor, that's – that's one thing you do with this fellow. And there happen to be two more things and that's the subject of this lecture here.

Now, in this type of interrogation, this looks very much like an auditing session, but it's not quite an auditing session. It's not quite an auditing session because you are looking for something that answers your question that only the auditing will tell you, not really the pc. Do you see, that's a little bit different. You're accumulating information so that you're steering the pc toward a cognition. And he eventually will round up the cognition. You don't preconceive the cognition, you understand, but you take tone arm blowdowns on everything he has told you, see. Every time he says – he's saying – I'll just give you a ridiculous example – every time he says it's "adult," you see, and it's "immaturity." And he keeps – every time he says, "it's – it's adult," or something, you get a blowdown. You make a note of that, "adult," over here, you see. And then he mentions this word "immaturity," and he's still discussing why auditing doesn't work, you see, and you write down "immaturity." And you finally – what's this got to do with it? See. Well, he's finished telling you everything – he's finished.

Now, let's find out what does "adult" have to do with auditing not working, you see, and what does "immaturity," of it, so on. And he's got some kind of an idea that everybody is stuck at the age of four, that he got taught in a sociology class, or something of this sort, so

therefore they're not sufficiently mature to face up to the realities of existence, you see. He's got this all packed in sideways. All of a sudden he'll get the rest of the puzzle and drag it off. What these blowdowns are, are little flags that tells you there's dynamite buried here. And you take that up and you can completely change the auditing address and aspect of an auditor's auditing with such a discussion, as an auditing Instructor. So that's well worth knowing.

But there're two other categories, so I won't say that will work with every one of these cases. And there may be two or three more categories. But I will give you as many as I know and I'm certain of.

Now, let's give you the next one, not because it's the next most important, but because it is the – it's an old one and it comes under the heading of "help." Now, unfortunately, you must not use "failed help." You mustn't use "failed" anything. That's because of the line plot of actual goals. So let's just skip this idea of "failed," don't you see? We'll just have to take up the subject of help. This is another ramification of what I've just been telling you, but it hits sometimes very close to home, indeed. There is no GPM about help, so let's – you can hit it as heavy as you want to, see. That's something above.

I can give you data of this particular character now, because knowing what is the totality content of the reactive bank, you see, I know some things are slightly senior to the content or don't impinge on the content and therefore can be cared for independently, you see, without undue restimulation. And this too – this just barely comes under the heading – "Help," just barely comes under the heading. Therefore, it's rather successful. It's rather successful. You may find help in an implant someplace, or something, but it isn't going to wrap anybody around a telegraph pole. You can take up the subject of help, you see? You can take up the subject of who he's tried to help and who's tried to help him and who he's tried to help and any confounded thing you want to take up under this subject, and you're liable to get someplace with this auditor who really can't make auditing work.

"Well, there's no use trying..." You get cognitions like this: "There's no use trying to help them because man only succeeds when he helps himself." See, "So where the hell did I get that?" you know. He's standing back and he looks at this thing and he suddenly conceives of dragging somebody out of a stone quarry, you see. And he conceives of standing up on the bank of the stone quarry looking diffidently down into the stone quarry, with the guy drowning down there, you see, and sheer walls, and thinking to himself, "Well, there's no reason to give him a hand or throw him a rope, because he really doesn't deserve help unless he can help himself," you see. The poor sod down there hasn't got anything to hold onto, nothing to stand up in.

Of course, this becomes ridiculous, even to him, see. But you'll find – you'll find that these – these odd-bit presumptions of some kind or another get wedged sideways in somebody's skull and you couldn't begin to make a dictionary of the number of them you will find. They're just innumerable. So you don't know quite what you're digging for, except you're digging for an impediment on the subject of help. Something is impeding his ability to help or be helped and that's all you're digging for. So anything that you talk about help, that he hits on, that is a sidelight to help, that gives you a tone arm motion, you then make a note of to take up independently. And you will chase this whole thing all the way down to a proper cognition

and you will therefore take care of his attitude toward pcs and auditing, you see, and all of a sudden he will start using the comm cycle. You understand that?

The whole basis of it is, is the comm cycle is too easy to use as long as the person's intention toward the pc is good and he's trying to assist the pc and so forth. So the things which make a person unable to use such a comm cycle are those things, of course, which make a person believe that he cannot assist or cannot or should not, or that it's impossible to, see? You get the – you get where you enter this? See? There's where you enter it, see?

Of course, all this works with pcs, too, this really works with pcs. This also applies to the pcs who get no tone arm action. Pcs who get no tone arm action and so forth have got one of these buttons. Well, there's a dangling spring that goes out here about a yard, see, and the button is out here, you see, and all the machinery down underneath where the spring should contact on this button, and so on, is all miswired and filled full of concrete. And you're not about to get there without a special address to the situation, see.

In other words, this person is sitting there saying, "Well, I can't be helped, anyway. Actually nobody could help anybody. If anybody did help anybody, then he would become responsible for the other person's life. And I don't want this other person to be responsible for my life because that would be a bad thing to do to them. So, therefore, if I sit here just sort of blank, why, therefore I won't incur any liability."

This is some reactive *thlthlthlthl* that's going on, see. And that's why the person isn't getting tone arm action – given good auditing. But we're taking it up, of course, here at Saint Hill from the auditor's viewpoint. That's all good preclear material.

Now, the other one which I save until last is a bit more esoteric. Now, there may be some more of these things. I wouldn't say there aren't. But I notice from a long log of experience along the line, most of the pcs I've had much to do with have come under one or another of these three categories. Now this other one – this other one is a real dog. This other one is a sneaky sneak that probably could furnish the material for a half a dozen lectures. I'll give it to you very rapidly. This is of great social importance what I'm giving you. This is something to chitter-chatter about.

Now, because it's so interesting, don't forget the other two. This is very interesting. And if I were giving this – if I were giving this – [sound of rain pouring down becomes audible] (there's a nice spring rain) – if I were giving this in a broad sort of a way at a congress or something like this, I could really embroider this thing up. I would call the beginning lecture "Life amongst the lowly." People, especially Southerners, don't recognize that's the second title to *Uncle Toms Cabin*. It's very amusing. You can ask a Southerner, "Have you ever read a book called *Life Amongst the Lowly*? Have you ever heard of this book?" And they will swear no; you can bet them a couple of pounds and they'll lose every time.

Life amongst the lowly. Why is life amongst the lowly so lowly? I'll give it to you right where I caught it – on the entrance point. This was the entrance point to this examination. It's all right for some professor to sit in his ivory tower and "ivory-towerify," and fill books with – full of what other professors in their ivory towers have "ivory-towerified." But there's no substitute for getting down and getting your paws dirty with life to know what it's all about. There is just no substitute for that. And I've rubbed elbows with an awful lot of

people at various stratas and classes, sizes, shapes and descriptions. And in rubbing elbows, one fact used to strike me as a wild bit that I never could quite reconcile. There was this weird attitude which didn't fit with what they did to people.

I'm not now saying there is such a thing as a *lower classes*. I'm talking about people who under tremendous duress, people who are being hammered and pounded by the economic mills and ground very fine indeed. People who are being hunted. Criminals on the run, don't you see. This type of person. People that – they've more or less had it, you know, from life. And those people in a group do one thing that is a common denominator to the group. It's always "Poor Dillinger, they shot him." It's always "Poor Bill, poor Joe." There's always grief and supersaccharine sympathy of some kind or another. It really isn't sentimentality – it's too gruesome. And I've listened to this – oh, a group of guys sitting on a fo'c'sle head, you know, and they're talking about "Poor old Bill," you know, "the sharks got him," you know.

And I've listened to this and in life they just knock each others' heads off, see. They're unthinkably mean to one another. But they're so supersaccharine – weird aspect, this – and it always just kind of went *clink-creak!* It didn't make any sense, you see. They'd just as soon step on Dillinger's teeth and sell them at the local pawnshop, see. See, but it's "Poor Dillinger," you know? And it's "poor you."

And this "poor you" gave me a clue to something that is confoundedly well worth knowing and it very well could open up a whole field and make a real subject of sociology. Because it gives us the mechanism by which the lowly hold the lowly down. And which they do to one another constantly and continuously and instinctively. And it's just about as vicious as keeping a cobra in the cash drawer and then inviting somebody to rob it. It's a wild mechanism.

Why is it a wild mechanism? I dare say you will occasionally hear this or you have occasionally heard this. But really, you'd have to be on the seamier side of life than most of you are accustomed to, to run into it as a habit and a way of life. The slums – the places where people have zero opportunity, that sort of thing. There is where it is most prevalent. It's the poor you. "You poor fellow."

And now let's move it up into a little bit more workable technical platform. *How you have been wronged. How he was wronged. How they were wronged.* Now, let's just move it into that technical platform. And we all of a sudden see that life amongst the lowly depends exclusively on their continued operation of just this one little gimmick, not on any other gimmick. Were looking now at the common denominator of sociology. What makes a slum a slum? Why can a fellow never get out of the slum? How come? What is this trap?

Well, it's: *how you have been wronged, how they have been wronged,* and so forth. And not to any great degree except as an example, *how I have been wronged.* That is not its dominant cord. You will hear that in there as an example, but that, is – isn't – that's just a response to the mechanism. That isn't the important point of the mechanism.

In the early days of Dianetics, we ourselves had this, you see, "How you have been wronged," see? And it is the *most acceptable* thing that you ever had anything to do with. People just licked this up left, right and center. Well, what happened to it? Well, I worked it out along another line – an entirely different line. If you can't take responsibility for your own

actions, and if you can't recognize the cause of your difficulties, then you're in a trap and you'll continue in that trap forevermore; and I became completely unwilling to hold people forever in a trap, by any reason, even that of popularity, which, of course, everybody knows is the greatest god to worship there is.

I'm thinking of Johnson's poverty programs now and the fact that he had five families sitting down on one of his – one of his farms in the most abject poverty that anybody had ever lived in. The Republicans went down and dug it up. It may have – it probably would contribute to finishing him – Johnson off as a presidential candidate.

The point is here, this war against poverty would have to include an understanding of why people in groups remain poor. This is the missing link, this piece of data I'm giving you right now – quite valuable to the auditor and very valuable sociologically. As I said, I could lecture on it a very long time and it's very interesting, but let's get down to what the truth of the matter is.

An individual must accept his own responsibility and his own ability as cause before he can run off his overts. Simple. You can't have an overt if you can't recognize yourself as cause. You can't get out of a rat race unless you can recognize your overts. That's all there is to it, see. So how do you keep somebody in a rat race? Just never let him recognize his overts. And you say, "Poor you. Look at everything that has been done to you. And you, you have never done anything, you poor fellow. Look how you have been wronged. There you were, sitting there innocently, doing nothing, and up jumped the regiment and wiped you out. You poor fellow." And all you have to do is keep up a running fire of this stuff and you effectively suppress and mask the fact that the individual himself is capable of causation.

Let's just not worry about the overt act, you're telling this individual that he was incapable of cause, and you are pointing out moments, particularly, when he was not at cause. And you are pointing out the fact that he just – things just happen to him and that he doesn't cause any of them. Which brings him into a causeless thing, which throws him into the dwindling spiral and will hold him on the floor and on the bottom of the heap, forever. And all you have to do is keep convincing him that he has been wronged and that he himself never wrongs anybody. That's all you have to do, you just keep that mechanism going and they'll stay on the bottom of the pile forever.

So life amongst the lowly is a long song of how you have been wronged. "You never had a chance." And when you get this tune played out to its bitterest end, you get a person who is bitterly finished. Because he can never get off an overt act. Now, we have to go back into what is really – completely aside from the fact that this does occur in actual GPMs and so forth – what really is obsessedness. How does a person become obsessed with a problem? This is – this is gold, man, this is solid gold to an auditor. How does a person become obsessed with a problem? How is he always dwelling on it, dwelling on it, dwelling on it, thinking on it, thinking on it, thinking on it. Why, why, why, why, why is he stuck in – how does he get stuck in this, see? Why is this – this is – this describes ninety percent of your pcs, see.

They walk in and all he can think about is Madge left me, you see – he'll bring it up, and so forth, and they say so-and-so and so-and-so and so-and-so and you think you've gotten them out of it now and

you've processed them down the line very beautifully and all of a sudden, "Madge left me." See?

You never can seem to get them off of that – you never can get the needle out of that groove, much less off the platter. They just go on. Days and days they spend – worrying, worrying, thinking, thinking, going on and on about, about this thing, see. They can't get the needle changed, you see. They can't get the platter flipped. And you, the auditor, know instinctively that you've got to change that tune before you can have anybody in front of you who's paying any attention to auditing. He's obsessed with the subject of, "Well, that all went back – I guess that was in the days before Madge left me." He had it all taped. You never get tired of personnel like you get tired of one of these personnel in a pc's bank, you know? "That was before the bank failure. Before the bank failure. No, that was after the bank failure. You know, the bank failed." [laughter]

Now, what pins them into it and what can unpin them? And this becomes very vital information. What can unpin them off of this thing. There's several systems that can be used to unpin them. We won't go into all of the systems that can be used, but chief amongst them is the O/W sequence. That is a prime mechanism that pins a person into obsessiveness. They never recognize their own overt in that sphere of existence. And not recognizing their own overt in that sphere of existence they can never unpin themselves from it.

Now let me put it very crudely. Before you get your hand cut off in a buzz saw, you've got to get yourself somehow in the vicinity of a buzz saw and you in some fashion or another have got to reach for that buzz saw. It's actually impossible for you to get your hand cut off in a band saw unless somehow or another you have, by whatever concatenation, arranged that proximity.

Now somewhere, back along the line, before the buzz saw, the individual did something or committed something that walked him on that channel up to getting his hand cut off in a buzz saw. He did something to arrive him there. That is very important. Because he will never get out of there till you've tricked the something that actually did arrive him there. It's not good enough to have him inventing reasons. It's not... guilt, you see, is just – is a – is the inversion of this. You keep inventing ideas, inventing overts. There's guys around who've – who eventually have realized that they have to get off their overts, but they don't know what they are, they haven't got an auditor, so they'll invent overts to get off. You've got to beware of this bird, too, see. That's known as a "guilt complex."

"Ten thousand Japanese killed in landslide." This fellow was sitting in Birmingham at the time. He says, "How did I do it?" That's a guilt complex in operation. So it goes into an inversion and the individual will actually start dreaming up things he didn't do in order to get out of the obsession of thought, see. He'll eventually go that far. Well, he's spun by the time he goes there on that subject.

But look-a-here: What is this – what is this constant dwelling of the mind on this action that the auditor runs into continuously in processing pcs? It's very hard not to run into this. It's the overt act that he committed, that kept him pinned into that line. And if you want to really find the overt act and monkey around with this, nicely and gently by any overt act system that we have ever had, you all of a sudden will find what he really did do – and you've

got to beware of the guilt complex of inventing things that he did do that he didn't do because this is just another alter-is, you see. You see, he can alter-is this, as well as get off his actual overt.

So therefore, you always have to verify one of these things when you're handling one of these things, on making sure that he didn't give you any untruths. You've got to get your truth answer in there on the E-Meter. In other words, you've got to ask him, "Is there anything you've told me that doesn't apply to this?" you see – or you're trying in some diplomatic way "You told me any lies, bud?" You want to get that off. Because they will.

But any one of these dwellings upon it is preceded by a basic overt act which is followed by a withhold and followed by other overt acts. And the individual is keeping himself pinned into this thing by his series of overt acts. He cannot get out of that channel of thought. He'll tell you, "I could just give anything, anything, anything – I could just – I'd – I'd just give anything not to be thinking about the service station. If – if – if I could just for five minutes not think about the service station and worry about it, you see, anything!" You'll actually run into somebody like this sometime or another, you know. "If – if I could just stop thinking about it, you know? If – if – if I could just go down to the beach or something like that..." or so forth, and *vava-vaa!*

That's a more notable example where the pc is articulating it. Sometimes you merely observe it in the pc or something. Well, what's the action? Let's get off his actual overts against the service station. His overts and withholds from the service station and *bing!* Just like magic. He stops thinking about it.

In other words, all *dwellings on a subject is associated with overts against that subject*. You follow that? That's a rule that you can carry around in your hip pocket and feel like you've got it full of diamonds. You won't recognize that you've got diamonds there until you run into this pc who is *da-da-da-da-da* – he's got present time problem, present time problem, present time problem; he comes to every session he's got a present time problem, he's got present time problem. And it's a present time problem about his domestic affairs, a present time problem about his domestic affairs, present time problem about his domestic affairs.

So you spend two hours of the two and a half hours cleaning up the present time problem about domestic affairs. It should occur to you now to ask, "Do you spend a lot of time thinking about this, outside of auditing?"

"Oh, oh, ha-ha-ha, yes, I don't think about anything else." In other words, he's really not in session. He's just continued his life over into the auditing session, see. Anybody comes up there with present time problems all the time in an auditing session, he's not free of those things outside the auditing session. And the way for you to cure this is O/W. You run any version of O/W. And we've got lots of systems of running O/W. There's some very slippery ones. There's various types and kinds of running O/W. This is quite a subject. And it well merits being a subject since it is very, very upscale and is of a greater order of magnitude than the reactive bank itself. It is something that is part and parcel of life which is senior to other types of aberration. Told you something then, didn't I? It's pretty horrible to think of.

It is senior in its power even to GPMs. In other words you could be totally free of GPMs and still be colliding with the O/W sequence. You'd still get the consequences of your overts. Now, you can carry it perhaps upstairs in auditing to a point where you no longer have the consequences of your overts and that undoubtedly is true, but I'm just telling you that there it stands and that's a pretty magnitudinous statement, just between ourselves, that it's senior to GPMs. So it's always safe to audit O/W. And it's always indicated to audit O/W. And that's one of the things, unfortunately, which auditors do very industriously, but here or there do very badly. They can make a stinking job out of O/W. Just, not to be critical, but just to be factual. It can be the most stinking, driveling job I ever heard of.

They chop up comm cycles and they do this and misread meters – and somehow or another – and then you find out, "Oh, I finally did, I got the overt."

"What was the overt?"

"Well, the auditor [pc] was thinking hostile thoughts about me while I was auditing him."

Oh, no! Oh, no! This merely showed bypassed charge in the session. He didn't get an overt off. What auditors will sometimes buy as an overt is a matter of grief to me. It really is. I look over auditors' reports and they've gotten this overt off of this pc. And the pc had been going around all the time, all the time all the time, not sending his mother candy. This is an overt act? You know, it's unbelievable. It's unbelievable. But I don't mean to downgrade you or berate you, but very often some God-awful tacit consent will come into one of these sessions where "I don't get my overts off, therefore I won't get them off you and you don't get them off me and we'll all sit here and be happy." And you know why they do that? And why they've done that? Because there's some thread of this sociological datum I've just given you, running through that session.

Ah, yes! So we carried the typhoid fever with us into Scientology. So it's a good thing to know that there's a – there's an illness known as "you've been wronged." Because it has been the source of great despair to me amongst auditors, wondering why in the name of heaven they just couldn't sit down and say, "Whatcha done, sister? Whatcha done?"

And she says, "Well, I didn't do very much."

"All right. But how much was it?" [laughter, laughs]

You know and just carry it on through in a workmanlike fashion. And that's because "wrong-itis" has entered the session, see. How you've been wronged. This is so much a part of the social world around us that it very easily slips into a session, if the auditor is not aware of this fact. So he's inclined to sympathize with the pc and he thinks it's a very openhearted, beautiful sentiment on his own part. It's just about as beautiful as a striking rattlesnake.

We always knew there was something wrong with this. You'll find it mentioned in the first book. You can only give him sympathy as the lowest level of healing. Well, more – I revise that, man, that's no level of healing, that's a method of strangulation. You get my point, now? You get what I'm talking about, here? If the auditor sets there – sits there, see, and the – he says to the pc, "All right, what have you – what have you done now? You have – you're

thinking all the time about cat fur, now what have you ever done to cats?" you see. "Well," the pc says, "well, cats caterwaul outside my window all night long and keep me awake."

"Good. We've gotten that overt act off." [laughter]

What's going on here, see? See? The auditor very, very slippily will pick up a motivator for an overt and so forth. You ask somebody... Somebody is unhappy with their auditor or something of the sort. And somebody'll pick him up and you'll say, "Look, get his overts off against the auditor." And he sits there and listens to an hour's worth of motivators and says, "Well, I fixed him up," and now the guy does cave in, see? They think one is being tough or they can be interpreted wrongly in several different ways.

The only thing I'm trying to tell you is just this – this very, very close point, is if you carry this "you poor devil, you have been wronged," into a session, you no longer audit the pc at cause. You're auditing the pc at effect and so the pc will not get better.

You buy motivators and sympathize with these motivators of all the horrible things that have happened to the pc in his lifetime – perfectly all right, you understand, for a pc to tell you how horrible life has been to him. As long as, with not too tactless a change of pace, you get in and find out all the horrible things he's done to life.

You've got to recognize that the "you are wronged" is a disease. "You poor fellow, you have been wronged. You poor fellow, you have been wronged." And any time you give somebody this kind of a response, of any kind whatsoever, you're contributing to his upset, contributing to his illness, because the only way he'll ever get out of it is return his own causation. Not how he's been wronged, how has he done some wrong to somebody. And as soon as you get the other side of that picture cleaned up, all of a sudden, bing! It's just like magic.

You see, nothing can hold onto a thetan. There is no butterfly net, there is no electronic switchboard, there is nothing can hold onto a thetan. Nothing. That is – that's the truth of the situation. There is no hobbles. There is no ropes. Nothing can really hold on to a thetan. It sounds absolutely incredible, but it's true. Well how come he gets caught? He must have grabbed hold and then forgotten he'd grabbed hold, for him to be trapped thereafter. See, there he is, holding onto the stanchion in the bus, with a third hand he didn't know he had, and with the other two hands trying to push himself off the bus and wondered how he can't get off the bus. So now he has to conclude that he is trapped on the bus. Nothing can trap him on the bus, except his own holding onto the bus. He's got to – he's got to have hold of it.

Now, what is this third hand? The third hand is his overts against the bus. That's how he can't get out of it. That's how he cannot get out of a – of an engram. That's how he can't get – really can't get out of the bank. This is – so on. He himself has overts. It might add up to something that the one that we are – you'll find out to really get somebody out of, are the banks he makes himself and has made himself Oh, man! Getting him out of those is rough. Getting him out of an implant, oh, sneeze. See, it's nothing to get him out of an implant. But how about his own actual GPMs? Oh, wow, see. It's rough, rough. See?

It's easily done today, but it's his own actual GPMs that are holding him. Not the ones that were given to him gratuitously. That's something for you to recognize. So you sit down and you tell this pc, "You poor fellow, how have you been wronged in life? Good. How else

have you been wronged? All right. Now we both recognize you have been wronged." Where do you think he's going to drift? Up or down? He's going to go down in session, man. He can't do anything else, because you're auditing him – one, you're auditing him at effect. Two, you are pulling on him the gadget that it's all done to him and he's never done anything. You are confirming this third mysterious hand that is busy holding onto this thing he's so – he's so busy, worried about and so forth. You're just burying that hand a little bit further. Because that hand is an overt, see? That's the overt act.

And you're carrying with you the whole sociological impact of life amongst the lowly. How is it a man can never get out of a slum? Well, you'll see this dramatized right straight on up into life in its solid aspects of today. You go down to Chicago, you find out there – there are various types of slums. Nothing to do with color, you can find white slums that are twice as slummy as any other kind of slums, you see, there's nothing to do with color. See, we're talking about slums. Well, the dominant aspect which you will find in that slum is "How you have been wronged," and that nobody can be at cause.

The thing is, you can't do anything about it. You look in their windows and you'll find out that lucky charms and things like this, probably occupy the greatest commerce of the whole place, see? It's all based on some kind of a wild luck, like a numbers racket, or it's based on: "Buy your lucky pixie fish," see, "today" and so forth, you know? You can't do anything about it, but maybe some goddess called lady luck, or something like that, nobody has run into lately. Actually she retired. I forgot to tell them that down in Reno. When they opened up Las Vegas she retired because she didn't like everything fixed.

Anyway, the whole score in that place is "You can't do anything about it. Nothing can be done about it," played hand in glove, counterpoint with, how you have been wronged. And we notice that federal governments which are – national governments and so forth, which are notorious for their affinity for the indigent – they just love the indigent. They won't take care of any industrious bloke that's doing a job in the society, but boy, they just love the indigent, to a point where they'd love to make them more indigent. And that is the mechanism they use in their social work. "How you have been wronged."

This is the – this is the yap used by the labor agitator, and so forth, to the workmen. "How you have been wronged." Everybody always feels worse after he's talked to one of them but never can quite figure out why. In other words, it's a black operation. Just pure and simple, a black operation. "How you have been wronged."

So when you sit there, and this fellow has actually kicked his sister downstairs and busted her skull in and you let him get off a fact that his father whipped him, "Yes, father whipped me." You don't even say, "Why did your father whip you?" no, but, "Well, father whipped me and he was always a brute."

"Oh, you poor fellow, well thank you, I guess we've got that straightened out in your life. Now what else can we find?"

"A teacher was mean to me." He doesn't say anything about those frogs in the inkwell, see. "A teacher was mean to me and everybody's mean to me."

The auditor who sits there and says, "Yes, we agree, everybody was mean. Yes, we agree, everything is fine. Oh, yes." He's saying at the same time, "You weren't at cause, you didn't do anything, it was all purposeless, there is no way you can regulate your fate, life is this way." See? Pah! What a corny tune. And that's life amongst the lowly. That's how they keep themselves lowly. That's how they get themselves stuck in. It's a series, it's not hard to understand, it's just a series of overt acts. Naturally, an individual who's guilty of overt acts does not like to be cause in that particular direction because he's held back from reaching in that direction by the fear they will perform further overt acts.

A thetan is basically afraid of committing overt acts. He doesn't really want to commit overt acts. I don't care what else is arranged anyplace. And as a result, when he does so, he tends to pull them back. He eaves himself in and there he goes.

So let's get now – I told you this was a long – a long dissertation to give you this third point, and you can very easily see how this thing could occupy not just a couple, three hours of lecture, but four or five sciences all in one fell swoop, such as labor relations and sociology and war against my not getting any votes, poverty, all of these... You could open up this subject, see. This subject becomes a big subject. But let's look at it in just the framework that we're addressing it in – is why can't some students audit and why can some students audit and why, more germane – since this is not always at the root of auditing but more germane to the pc – why do some pc's just never, never, never, never, never, never, never get any tone arm action? See?

Well, I've given you two sources and this was the third one. Now you think I'm going to tell you that they believe they have been wronged and you've got to get their overts off. No, if it were just that simple, I would have found it out a long time ago. But it isn't that simple. Remember, I told you a problem – solutions are as complex as the problem and this is pretty complex. This person has been so wronged – how a thetan can be wronged is pretty hard to do – but this person's been so wronged, that they have no longer any concept of an overt. This person cannot really handle the idea of an overt act. And that's what's wrong with that person.

Now the Christian already ran into this in the year *yup-gup*. He already ran into this and he tried to do something about it. He didn't run into this, he had another pitch in mind. But he came down the line saying, "Repent ye, repent ye, for the kingdom of heaven is at hand and you'd better repent." He was pulling an inversion. He wanted people to invert. He wanted people to admit their guilt. And it's interesting that amongst Middle Western Christians particularly, when you listen to their confessions and so forth, at Holy Roller meetings and so forth, all you hear is a long potpourri of things that they never were courageous enough to do in their whole lives. You could ask any one of them this burning question, "Are you bragging or confessing?" [laughter]

Now, there is the crux of the situation because they're getting off false overts in an effort to get off some overts. They feel that they just could say they were guilty enough of something, then somehow or another things would be better. And you've got to safeguard yourself as an auditor against a pc walking into this particular instance because they will invert and they go kind of mad on this subject. Christianity was trying to put them down a little

bit. You're looking for the honest, actual overt. The actual one. And that's what unpins him, because only the truth sets you free, see? It's the actual overts you're looking for.

And recognizing that if you don't find it, why you've committed him to a further progress of being stuck into it, see? Now you – what you want to do with this character when you run into him – and he's very frequent, he is not very unnumerous at all – I don't know what he runs but he certainly must run something like ten, twelve percent – is, you get him to define an overt act. Here's one of the gags – I'll give you a gag. You define an overt act. And then after he's got it all defined, is ask him why it isn't an overt and he'll tell you right away with the greatest automaticity you have ever heard in your life. He'll go *brrrrrrr!* Call out an overt act and he'll give you some sort of an answer and so forth, "Well, if I walked out and pushed a little child in the road and pushed him underneath an automobile, and so forth, that would be an overt act. That's an overt act, it's a – it's an act of harmfulness against some other person."

And if you weren't alert you could be pretty, pretty knuckleheaded about this and let it go at that and say, "We've got that licked." Because you haven't asked the little gee-whizzer that comes around the back door. And you're just going to, going to have your eyeballs snapped out about an inch and back into your skull a few times when you work this on your pc sometime in the future. You're going to really be upset. Even though the pc knew the – knew the gimmick, I mean he can't get around it.

"All right, you pushed this child out in the street, and so on, all right, very good. Now, why isn't that an overt act?"

Brrrrr! He'll have immediate instant explanation of why it isn't an overt act. And they don't think they can commit an overt act. Well, how are you going to get an overt act off if the person can't commit an overt act? They've committed overt acts, but they haven't committed any overt acts, so the net – net result of all this is they stay pinned into it tight, because there's no reality on this as an overt act at all. Then you've got to find something, searchingly, that they do really consider an overt, that would really be an overt act. It may be something very mild. The old effect scale tells you that it'd be something very mild on such a person. They've done something or failed to do something, and that was an overt act. And now you've got a real honest to goodness overt act, and it might be so petty, and so nothing, that it – you'd hardly categorize it as an overt act.

But it's actually real to this person because they can't answer this question, "Why isn't that an overt act?" "But it *is* an overt act." And sit there and look rather grievously about the situation, see. Didn't praise their mother's cakes. Of course, we also know that they knocked their mother down the cellar steps and broke her leg. But that wasn't an overt act, see, but didn't praise mother's cakes and that was the overt act, see. But that's a real overt act to the person. Now you can go up on a gradient scale like that. And there are numerous ways of tackling this. I'm not even trying to give you the whole embrace of how you tackle this problem. It's wide. Numerous ways you can handle this situation if you know the situation exists.

How do you walk upstairs on this thing? The individual could get off some overt acts but he wouldn't get any tone arm action and they're not real to him. He didn't do anything. You ask him how he – well, how it isn't an overt act, on a discussion basis, but not a processing basis. That's not a process. And he'll give you some very good reasons why it isn't an

overt act. You know right away that you haven't got how this is an overt act. That's that – that's that discussion level. And that's a cross-check of one kind or another which is left to your cleverness to walk around and straighten up, see.

Well, how do you finally do something about this? Well, there are probably numerous ways that something could be done about this. Fred here the other day was running – a person had found a real overt act, a real overt act, they really considered a real overt act and then Fred was auditing him – audited his justifications for having committed it. And as-is-ed all the person's justifications for having committed it, like a – an R1 type of approach, don't you see? Use justifications. Got the justifications off. Well, the thing would be getting realer and realer and realer. Unburden it, in other words. See, that was a very clever method of approach.

Now here's – here's a wide avenue of what do you do in order to bring about the reality of this. Now, it's no good to stand there and try to convince the fellow how serious it is because that's why he isn't saying it is an overt, because he's so convinced that it's so serious that he can't confront it. You find, if you went to a prison for instance, to process some blokes in a prison, one of the wildest things you'd run into is the fact that nobody there has ever committed a crime. That would be the most astonishing thing to you. And also how sorry they are for each other, that would also be a little astonishing unless you remember what I've told you here.

And also, how they've all been wronged and how society has wronged them. Let's look at where they are. They're in prison. Well, how come they're staying there? You see, you can't put a thetan in prison. Unless he's committed an overt act. Only then, the overt act, actually, would have to be against the prison or the people who were holding him in prison or prisons in general or metal or – or bars or block buildings or something like that. Otherwise you couldn't keep him in the place for a minute, you see?

So, what is this? How would you sort this out? Therefore, the criminal must be a very serious problem to the society because they lock him up all the time. But maybe he's a more serious problem to the criminal because he gets himself locked up all the time. How does he get locked up all the time? Well he commits overt acts all the time. I'm afraid this isn't a planned idea at all. I'm afraid this is totally reactive as far as life is concerned. Person commits overt acts, why, he locks himself up.

The criminals that go around and ask to be caught, alone accounts for the record of the FBI. Nothing else could account for it.

So there's the overt act-motivator sequence, see? There it starts operating. This doesn't mean, now, that everybody is guilty and everybody is this and everybody is that and everybody should be shot down in flames because they are this way. They have forgotten how to let themselves out of the trap. They've forgotten how to let themselves out of the trap. They don't know where the door is anymore. They're walking around in circles here. And they would as happily get out of the trap as anybody else. But they've lost the key and they've lost the door and that's it and that's the state you find him in. No reason standing around and saying, "Well, it's your own fault. You lost the key and you lost the door, so I guess you're locked up and there you are." No particular point in – in adopting that particular attitude either. Because that in itself is an overt, too, isn't it?

Thank you.

THE CYCLE OF ACTION: ITS INTERPRETATION ON THE E-METER

A Lecture given on 9 June 1964

Thank you. How are you?

Audience: Fine!

What's the date?

Audience: 9 June.

Nine June, 9 June AD 14. The year of the juggernaut. You look pretty good. You look numerous. [laughter]

All right. Well, today is a very important lecture, very important lecture since it applies to the young and the old, new and the strained and various other categories, and applies very, very directly and instantly to the auditing procedure rather than to techniques; and that is "The cycle of action and its interpretations on the E-Meter." This sounds authoritative enough, doesn't it? 'Tis, too. I have never seen anybody get in as much trouble with as little an item as the auditor and the cycle of action. This easily is the most confused area, field, the most misunderstood, the most maligned, the most defined upside down and backwards type of thing anybody ever had anything to do with.

Well now, just why you're having trouble with this and just why organizations are having trouble with this and just why this is such a gruesome subject is because it's all over the GPMs. And that's why you have to pay attention to it. In the first place, it ain't natural, and you Scientologists, being a cut above the naturalness of normality, of course buck against and see something slightly wrong in the whole idea of time and its forward progress. You get some inkling very early on in the field of Scientology. You say, "Well, there's something wrong with time." A lot of you talk about it. A lot of you say, "Well, if I just had more time or less time." It takes that mild a form. And on the other side of it, you begin to look at time as some kind of a weird taskmaster that you wot not of and want to do less with.

And one of the most interesting recent cognitions I've had in processing, if you don't mind my mentioning something of that line, was to find myself looking at a zero or absence of time. And I was in a very interesting state there for a while. And I took a look at this and I stared it straight in the eye, and it was about – at first I didn't know if I liked it, because if you don't have time, of course, you don't have a lot of other things. And then I took a look at this

and I was trying to find out what was making a pressure on my face, and I found out there wasn't anything making a pressure on my face. There was just a nothingness making a pressure on my face, and the pressure on my face was being made because there wasn't anything there. Do you understand? A completely negative look.

Now, I, of course, immediately invalidated this and said I know some of the end words and some this sort of thing, and I know where these things live and therefore I've just gotten one of these into restimulation and so forth. And I promptly and instantly tried to run this down and get this thing pretty well squared around, and I was unable to spot it as any kind of GPM bric-a-brac.

What I had actually done was escape the time stream. And it was a very funny sensation. Very, very peculiar. But at the same time it was more natural than being in the time stream. You get so habituated to being in the time stream that a sudden cessation of it is uncomfortable. I can remember the old story of the little girl who hit herself over the head with a hammer continuously because it felt so good when she stopped, you know? Another case, a little girl also, that had a perpetual howling migraine headache and had had it for so long that she didn't know what it was. And an auditor turned it off and she felt awfully peculiar. This was life without a migraine headache, you see? And it was something brand-new that she was not used to at all.

Now time, of course, is something that one should be able to move into, out of, up into the forward of and back into, you know? You should be able to straighten out yesterday's goofs, in other words. And at one time or another you were quite capable of doing so. And then you slipped into the time stream and have been going down the line ever since. Now, therefore, I have somewhat of a natural antipathy to the idea that time is there or that something has a beginning, a middle and an end; the beginning, the middle and the end. Because that is a – that is an authoritative action laid on by time.

Well, let me show you something here. You are processing in the physical universe through and across the agreement of the physical universe. And you are making yourself a very good show of going along with the time stream, and if you do this, you are then processing a bank which lays the time stream in with an ax, and you are trying to resolve a subject which is, to a terrible degree, cycles of action. That is to say, the bank is just cycle of action with exclamation points. And you're trying to resolve this, and unless you pay attention to this, you jam the bank. Do you follow me? You jam the bank.

In other words – well, let me say it this way: the pc – the pc has got a sliver in his finger and you don't pull the sliver out. You say, "Well, there are no slivers," and you convince him that it's actually because he has a lot of reactivity on the subject of pain and discomfort. And you sell him this bill of goods, you see? And you tell him the truth, see? You say, "Well, it's – the only reason you're experiencing this pain in your finger because of the sliver and so forth is you have some GPMs and so on, and that's the whole thing and so forth. And there you are! Now, do you feel better?" And he'll say, "No!" Well, why? Well, you just processed him a little too high. Now, maybe you could explain this to an OT, but then, of course, he wouldn't have a sliver in his finger. Or if he did, it – he could as-is it. See?

If you – probably the only thing wrong with the gropings of Mary Baker Eddy and so forth, is she was on cloud nine to the ninth, see? Well, maybe she could make some of that gap, but her articulation of it brought about the nonsense of "if you just not-is it and say it isn't there, it ain't." Let me point it out to you that it hasn't worked. That is not a broadly workable action. It has enough workability so that it retains people's interest. It's the little red flag hanging out. They say, "There's something there. We don't know quite what it is." Then they get it all mixed up with right thinking and power of prayer and living a good life and get into the wrong end of the GPMs and spin, see? Nothing more dangerous than handling something you don't know what it is, particularly anything with as much voltage as this stuff.

So therefore, you enter the wrong end of the line, don't you see? Try to go up too up-scale and you say to the fellow, "Well, you obviously don't have a sliver in your finger because actually that's a manifestation which is created by compulsions forced off on you by the idea that *blah-blah-suh* and so on, and it's actually the hundred and ninety-fifth series and..." You know. Glib, you see? He's still got a sliver in his finger.

So you say to this fellow, "All right. You shouldn't have to pay any attention to time. You shouldn't pay any attention at all to the cycle of action because the cycle of action is just laid in by the bank, and it's your reactivity and has to do with the time stream and, of course, that's all above us people. Okay, evaporate!" [laughter]

And by golly, he doesn't, you know? Well, there's no sense in feeling upset about it because he doesn't evaporate, you see?

Now particularly at lower levels, you're processing straight across this thing called a cycle of action. And boy, it's in there with an ax! The proper sequence and order of things.

The mind is a fiendishly orderly thing. Most of you think of the mind as a great confusion. It isn't. You're the one that's confused.

And the most orderly thing in the world is one of these reactive banks. It is the most precise thing. Some old lady, you know, some old lady, crotchety and so forth, been living by herself for ninety years and so on, and somebody comes down and puts a tea caddy, you know, just one sixteenth of an inch crosswise on the table. Boy! He has it! Well, that's the reactive bank. It reacts just about like that, see? It reacts terribly. You leave out a comma in it, and it just gets very upset, you see? It's a fiendish precision of the thing. And it all follows the same patterns and so forth. And it's very interesting. Your pc, he's all very *bloooahh*.

Well, actually, the pc has to come up through an ability to confront that much order. He's below the ability to confront that much order. He's in an *awful* state of confusion so he's got to come up through this state of order up to the other side of it. And one of the most dominant factors of the bank is the cycle of action – that things have a beginning, they continue and they end. And that is one of the keynotes of order. It has – really, the summation of the bank couldn't add up to anything more strenuously than that. The whole bank is put together on this basis. Things have a beginning, they continue and they end. So it's no wonder you have trouble with it.

Now, the auditor who is having trouble with it because he is below being able to face up to that much order; that's one thing. And the auditor who is having trouble with it because

he can't get back down to that much order; that would be another thing. But equally, a failure to do so would produce no gain in the pc.

Now, where the cycle of action is violated in the pc, the order of his bank is violated and therefore it doesn't as-is. It's that succinct. It's that glib a statement can be made on the subject.

The situation then is that the road out is the road through, and the road through is paralleled by the cycle of action. So the road out follows the cycle of action. And you'll find this cycle of action manifested everywhere in processing. And where the auditor chronically and violently disobeys, turns sideways from and has nothing to do with the cycle of action, he's in trouble, because he's thrown the pc below the fiendish demands of the bank. In other words, the bank parallels this degree of order. And where the auditor does not follow through that much order, why, the auditor does not get the pc through the bank because it is not parallel with the requirements of the bank. It's like trying to process somebody on his father when the difficulty is with his mother. Do you see?

So what you have to do, what you have to do – and this we have proven over a long period of time – this is quite empirical, by the way, this was never derived. This was something that just grew like Topsy along with processing. What you have to do is parallel this thing called the cycle of action. And there is no harm in your doing so. There is no detriment – there is no detriment to you for doing so, and there's certainly no detriment to the pc for going into that agreement that time and a cycle of action exist. In other words, you don't get into trouble – you get out of trouble by agreeing that it exists.

So it's for the nonce and for now it exists. So therefore, you find the cycle of action raising its head everywhere in processing. And a person who cannot approximate this cycle of action as an auditor gets his pc into continuous trouble. And it's not slight trouble. It is enormous trouble. It is just catastrophic. Because, of course, he's gone right straight up against the bank and run the bank wrong way to. Every time you don't process a pc with attention to the cycle of action, you're processing the pc against the bank. So as a result the bank will jam. And you see that manifestation with a high tone arm, with a badly acting needle and other such manifestations. A pc that is not running well has first and foremost had the cycle of action violated. That you can be absolutely certain was the case. Pc isn't running well; the first thing you can say about the pc is the cycle of action has been violated.

Now, you see, "Well, I'm not getting tone arm action on this pc." All right. The first thing we can say is the cycle of action has been violated. Of course, this is a rather broad, general statement. Unless we know what else we're talking about, it could be rather meaningless. Because it's almost, "Well, the sun isn't shining because there – it is a cloudy day," see? It's just the reverse of the coin. So that's what you know.

Now, don't let me hear of any of you back in an organization or in a private practice or something of this sort sending me a query about some pc – you can send me all the queries about pcs you want to – but don't send me a query about a pc with a blank, flat, staring look of "What's wrong with this pc" and accompany it with a hundred and seventy-five started processes, not one of them completed, and say, "Why does this pc have a high tone arm?"

I've exaggerated the hundred and seventy-five because I was too bored to count them, but I did estimate that was something like the number of processes on a case query which I just had last night. I'm not lecturing you out of that particular case because it's one of many. They come in quite routinely and regularly. So the first thing you know about a case – that's the first thing you know about a case that isn't running right, is that the cycle of action has been violated.

Now, we could go back a little earlier than this. We can say, "Why isn't the case not running right," but "Why isn't the case living right?" Well, the cycle of action is being violated.

Now, there's two ways a cycle of action can be violated. One is by – and this is true of life, not processing; true of life, not processing – one way it can be violated is too slavish an obedience to it. There one is out of agreement with the cycle of action in the first place and he is being forced by everything under the sun, moon and stars to follow this particular cycle of action and he practically gets up to the brain ventilation point, see?

He doesn't like it. The fellow who gets up and goes to a bum job, you know, that sort of thing. All of the blessings of the machine age actually lie almost exactly in that zone that I've just been talking about, you see? Well, there is because power of choice is being overthrown. Now, you must not really confuse a power of choice and a cycle of action. Now, if a cycle of action is being followed then, against the power of choice – against the power of choice, see, the person's power of choice is being overwhelmed and overthrown and he is following a cycle of action – we set up quite a conflict. Oddly enough, there is the one zone where the person's power of choice can be overthrown and he can be somewhat improved. This gives you the idea of what value the cycle of action has. It is up there with power of choice!

Well that's a very high – that's a very high point, power of choice. The person's self-determinism, the pc at cause, don't you see? This is power of choice. And we're ranking right along with it, cycle of action, because for a while cycle of action will be fought by the individual and then – here's the trick – by following a cycle of action to a point where he or she is used to it, it will then begin to as-is enough bank to compensate for the power of choice which will then return. You see the trickiness of this, see?

Therefore, you sometimes could force a pc through 8-C against his power of choice but only so long as you repeated the cycle of action. If you were doing a sloppy job of repeating the cycle of action, processing the pc against... this is not a recommendation to process a pc against his power of choice. I'm just giving you order of magnitude. If you'd continued to use the cycle of action in orderly progress of commands, the pc's power of choice would have been more freed than it would have been impeded because you would have as-ised more bank than you were piling up. So it isn't the person's power of choice that gives him reactivity. Self-determinism is something that is imprisoned in reactivity. A cycle of action is the prison.

So therefore, following and using a cycle of action will bring about nothing but a freeing of power of choice, whether the pc consents to it or not. You follow how this goes? This is very intricate. Don't ever tell me now that I recommended to you that you overwhelm the pc's power of choice. I'm just telling you that the cycle of action is comparable.

So you have the determinism of the thetan practically versus – his power of choice and his self-determinism is versus the fiendish cycle of action precision of the bank and this universe. This is the way the thing turns. It's because having started here you inevitably get to there that makes this universe a trap. If you start in at five minutes of nine, you certainly will arrive at five minutes after nine. Wherever you land in space, you are certainly going to land at five minutes after nine in time. That's for certain, isn't it?

Well look, that is an overwhelm. Whichever way you want to look at it, that's an overwhelm. You don't have to do a thing about it, and as a matter of fact there isn't anything you can do about it. You take any human being and sit them down in a chair at five minutes of nine, and no matter what they say, no matter what they do, no matter how they protest, no matter how many books they read or anything else, they are inevitably going to arrive at five minutes after nine. Now, you want to look at the biggest overwhelm there is in the universe – that's it. You want to see what the total overthrow of power of choice must be – that's it. That's the one thing you can't do anything about.

Now, going from point A in space to point B in space is something you can do something about. You can kick like billy-o. You very often get dragged to point B willy-nilly. But nevertheless you've said a – you've made an uproar about it, see? You've at least done that or kicked hell out of A or done something. Do you see? You've done something about it. So that space transfer from A to B in space is not necessarily the degree of overwhelm that time is. In fact, it's such an overwhelm that possibly one or two of you until this minute had never recognized the inevitability of arriving at five minutes after nine. It was just so natural. Well, oddly enough, there really isn't anything natural about it at all. It's the most unnatural proceeding anybody ever had anything to do with.

Therefore, that progress through time is paralleled by cycle of action, and you can approximate time with a cycle of action. It's very close to making time. It's very close to a process you might call "Make some time." And that's a very funny process. That's a very funny process. Now therefore, you can start the pc at A and move the pc through to B, and by distance confusion, he has the illusion of moving through time. Time and space are very easily interchanged, don't you see?

So sometimes you can move him from A to B and just from A to B or get him to move something from A to B, A to B, A to B, A to B – this is very elementary processing – and he all of a sudden differentiates between distance and time. Well look, that's a step in the right direction. Do you see what's got – when I say differentiates, what am I talking about but freeing his ability to see? Well, that must have something to do with power of choice. In other words, he must be able to perceive something new here. He must have a new freedom of observation or he wouldn't have a cognition.

Cognitions only come about on freed perception or freed self or renewed self-determinism or whatever else you want to put on it as a label, you see? The individual is be – is coming loose from the trap. He's that much looser from the trap than he was a moment ago when he can say, "Ah yeah! The third bar is rusty!" Well, he's so much been in the trap before he's never noticed that the third bar was rusty. Well, being able to notice that the third bar on

the window is rusty is to that degree freeing yourself from the trap. See, you're just that much less the effect of the trap. Do you see that?

I found myself the other day being haunted by a GPM. I wondered if it was out of gear or had slid loose from its moorings or something of this sort. And this was all very important because if I missed on this one, as in any of them, why, I'll wrap you around the telegraph pole. And boy, did I resent that for a while, you know? Can't privately get myself snarled up anymore. If I snarl up, it becomes a big overt, see? And I freed that, and that was the end of that. But anyway, I was taking a look at the situation – I still feel that way but not so violently – anyhow, I was taking a look at this confounded GPM that was busy floating around and so forth. I couldn't place it anyplace, and I knew it belonged somewhere and so forth, but it didn't make any sense where it was going. And I suddenly realized that *I* was restimulating *it*. [laughter] This was something new. And I sat back and I said, "Well, what do you know. *Huh-huh-huh*. Bronx cheer. Get lost, you know?" Felt tough! Felt like Vixie out here chasing an imaginary burglar that she was sure wasn't one, you know?

Anyway, I was restimulating it. It was the effect of me – I wasn't the effect of it. Interesting, interesting view. Now, what am I saying in essence there? What am I stating in essence there? I was enough freed from its overwhelm that I could perceive what was happening to it instead of what was it doing to me. Now this is – you see this typically all the time in overt act-motivator sequence. If somebody walks in off the street, all he can talk to you about is overwhelm, overwhelm, overwhelm, overwhelm, you see? You know, "Oh, life has done me in, man. It's just kicked my *oh ayouho-o!* It's lying – oh it's terrible. It's – you know, I ... Look – look, broken neck, you know. Look – look at those hemp marks all around my neck and so. Well, did me in, you know. Ruined – I'm wrecked, you know." And as I was talking to you about obliquely, it – this is quite a mechanism for holding somebody down. You just tell him all the time he's overwhelmed, you see? And tell him he never can be free and he's really had it – wronged, you know. It's a trap!

Well, a lot of you when it first came out on O/W, flinched at invading the personal privacy of an individual to this degree. You thought, "Well, that's something." And some of you were too enthusiastic. But what in essence were you actually doing there? You were just turning the tide. You were saying to this fel... we didn't care what crime he was reporting. We were trying to find something he'd done on his own free will that he then had to restrain and couldn't own. Because this is the mechanism: One does things which he then can't own up to and therefore caved in on because of it, see? He can't take responsibility for his own acts, don't you see? And O/W in its purest essence has never really been well understood since all it is, is – it's not a lesson in morality. It's not a lesson in being good. It is simply a lesson in "What power of choice have you exerted in life?" And you probably could approach the fellow's worst crime just on that gradient and that understanding. You could say, "What have you caused?" But unfortunately, with a great many pcs you get a lot of gobbledygook.

How hard it is to get the individual to admit his first overt. The first time he ever admitted an overt. Not the first overt he ever did; that's lost in antiquity. But just to get him to admit for the first time that he did something that wasn't quite nice. Well, of course, you're striking into the middle of society's effort to get him to restrain admission of this, which is a big overwhelm. And you're getting him to own up to the fact that he's been cause. Now, you

can do some interesting things with this because he owns up and says he was cause and then he immediately says he wasn't cause because it was justified. And then he comes around to a point eventually where he says it was cause because "I did it," but then it was justified. Of course, every time he says it's justified, he's saying that it's not power of choice. "Who have you shot for no reason at all?" See? Now, that auditing question would be a little bit too high but is actually the essence of the question.

The reason why you use an overt, of course, is you're going up against the social mores as the point of overwhelm. You just choose this as the point of overwhelm. So therefore at lower-level processing, you are choosing the society as the point of overwhelm when you're running O/W, and you want the individual's revolts against this overwhelm as an expression of his power of choice. Now, some point of agreement with society can be found somewhere in that, that will undo attention from society.

I'll scale it all down to lower IV processing. You could ask some question like this, "What social activity or what third dynamic activity have you gone along with?" You, oddly enough, would find that this is an auditing question which, weirdly enough, would eventually bring up overt acts. It would be quite magical. You say, "What – what social activities, what customs, what beliefs, have you gone along with?" He starts naming them off, and the next thing you know gives you an overt act! Well, that overt act is nothing more than freeing himself from the straitjacket that he's been following along the social plane.

Well, that's a fairly innocent one, but it does people a lot of good and is very good lower-level processing. O/W, agreements – not disagreements – agreements, communication, things that are real, subjective realities, these sort of things, they're all pretty terrific. You could put those into the same rationale.

But how is the individual getting free? Well, the individual is getting free to the degree that he can step back and look at it. The individual can look at the situation he is in and to that degree is free of it. When he can really look at it, he's really free of it.

Well, now let's apply all this to the sixth dynamic and we'll get a much more subtle level, much less easily perceived by the ordinary human being. And that is what I've been talking to you about: Time. Freedom from the time span and freedom from cycle of action. Now, this is so woven into the pc regardless at what level he is, that even your social addresses, you know "What social agreement have you had, what have you done to society, how have you exerted your self-determinism against society" – you know, getting him to admit himself as cause someplace or another; now all of that, by the way, is all very, very, very junior to the sixth dynamic. No matter who he's shooting, he's standing on MEST, firing across space, don't you see, and his action is measured against time. I don't care what act he's doing. I don't care what he's agreeing with. I don't care what's happening to him. If he's in this universe, that's what's going on. In other words, he's in total slavish agreement with the sixth dynamic. So when you're processing this person, if you violate that to an enormous degree, he won't know what it is that is being violated. It's being violated to such a degree that he can't tolerate it. His tolerance of that violation is terrible. Do you understand what I mean?

You're processing this individual maybe – let's take the social unit or something like that, that we're processing him about, is his family. Well, let's not even take society. Let's take his immediate family, see?

Well, "What family custom have you gone along with?" or something like this. We don't care what we're taking up. And if you violate the cycle of action on the sixth dynamic – it's clear up here at Level VI auditing, see – but if you violate it down there at Level I, it responds on the E-Meter. You violate the cycle of action.

Now, how could you violate the cycle of action? Well, you have to understand how many cycles of action there are. And there are quite a few of them. They categorize on an expanding perimeter. Let's take this as the first cycle of action is the auditing comm cycle. Why do you call it a comm cycle? Because it is a cycle of action. And that is the first one which you see badly expressed on the low-level pc on the meter. This is the first one that shows up on the meter.

You see, I don't care what you're processing this pc on. He's nowhere near Level VI, you see. He's not doing anything about time or something of this sort. You're trying to find out if the desk is real or something, you know, or if he's got an auditor. And yet this cycle of action is so insidious that it weaves itself straight into that question you're asking, and you won't be able to get away with it. It isn't something you can get away with. And that is what is so fiendish about it. It's a point in auditing that can't be violated. If it's violated, you get lack of success. That's your dirty needle.

You say to the fellow, "Well, what have you... what did you do to your father?" And he says, "Well, I uh..." And you say, "Well, we've been into all that. Tell me something about your mother." You have an instant needle manifestation, instant! It'll be right there staring you in the face.

The young and beginning auditor is always mystified why E-Meters have such nervous needles. He blames them for all sorts of things and so forth. And yet it is just this violation, continuous violation of the auditing comm cycle. And it gives him a dirty needle. And that dirty needle is expressing the jam-up of energy in the pc's bank by reason of the violation of the momentary cycle of action. That auditing comm cycle – when you violate the auditing comm cycle, it will jam up energy in the pc's mind and that registers on the needle as a little *bzzzt*. In other words, you don't have to go out and be very esoteric about this. You can grab anybody off the street, put him on a meter, say, "Well, what's your name?"

And he said, "Oh, my name, well, it's..."

"Well, I don't want that."

Dirty needle. See, you asked him a question and you didn't let him answer it, and you didn't acknowledge when he did. And right away you got a dirty needle.

This is pure tyranny and is something that many auditors shudder against, and when they are first presented with the facts of the case that *they* are making the dirty needle, you never saw so many flinches and winces in your life. They cut and run. "Oh, me? No! I couldn't be. It's just the quality of this pc." Oh, no, it's not the quality of the pc. It's that the auditor violated the auditing comm cycle and that produced a disagreement with that very powerful

being called the reactive bank. And when it produced this, to this – just to this degree, a disagreement with its mandates concerning cycles of action, Section 1, paragraph, "And whoever shalt violate this will get one awful pain in his gut. Period!" You know? Real proclamation. All right, the auditor says, "Well, all right. Now, what is your name? ... Oh, that's all right. I'm sorry. I uh – I don't need it on this form." Dirty needle, see?

The meter measures energy manifestations taking place in the pc's bank. Of course, we know the bank is something the pc is making all by himself, unassisted, but this is not a popular theory with somebody who is being subjected to very heavy psychosomatic illnesses.

You say, "Well, you're doing it all yourself," and you're liable then to have violated many more things than a cycle of action. [laughter]

His awareness, then, is not up to the point of recognition of the reality of things. In other words, you've given him eight thousand gallons of reality, and you've given him one erg of attention with which to perceive it. And I'm afraid they would have to be comparable. You'd have to have eight thousand units of reality, and you'd have to have eight thousand units of freed attention to perceive it with. Do you see? It's got to be comparable.

So you can't come along – it's a – the reverse, by the way, is true, just speaking in that line. You give somebody a hundred thousand units of attention, and you give him a thousandth of a unit of reality and he's liable to consider it unimportant. You process somebody up high enough and you say, "Now let's take this conflict between Russia and the United States, you know," and he'd say, "Yeah, well, what about it?"

"Well, it's a terrible problem."

"Well, who-huh?"

You have sort of taken him by storm, you see? You have said something is an enormous reality, but he has an enormous attention factor to put on it, don't you see? And he can't see it as an enormous reality. He can very easily be persuaded to discount its importance and think it is very unimportant. You got the idea? So you could actually get the reverse.

But when you get the amount of attention available and the amount of thing to be perceived comparable, why, then it is perceivable. But when you tip this thing wrongly, either way – well, this fellow can understand everything there is in the whole world of science and some little kid comes up to him and asks him why he can't tie a string to the end of the kite or something like this. This fellow's brains go really creak trying to get down to this point, you see, where he can explain to the kid something about this kite, you know? And he's liable to become very esoteric about it before he gets through, and he's liable to miss it completely. In other words, he's got too much freed attention on the subject in order to regard or concentrate it. You see, so this thing can be in reverse.

But when you take the pc who has one-thousandth of an erg of attention and he's being overwhelmed by a hundred billion cubits to the hundred billionth power of reality, he's got no attention to confront it with, and you violate this one little thing that you can violate. See, there aren't a lot of things you can violate. There's this one little thing you can violate: violate this cycle of action. Bang! There it is, right straight on your meter.

Now, there are fantastic numbers of things, then, that you could violate that wouldn't express itself on the meter. It would just be beyond his level of reality. You wouldn't get those expressed. But cycle of action – if you ask a question, he's supposed to answer the question and you're supposed to acknowledge the question – is a built-in mechanism that is so solid it's like putting the engine in a Rolls-Royce, you know? It's just built-in. Instant response.

You say, "What is your name? Oh, I don't need your name," – dirty needle. Do you follow this? Well, there it is in its most elementary and stupid form, see? I could make an appeal to some auditors who get dirty needles rather regularly to take it in its most elementary and stupid form and perceive it: that it is simply that they're causing a dirty needle by not following out a cycle of action. They don't even have to worry about why there's a cycle of action. If they just followed that out, they wouldn't have a dirty needle.

Let's take the next cycle of action. Next cycle of action: a process. I'm just giving you broad categories here. Let's take a process. By the way, we've been very successful – I've been very successful in teaching people this. I shouldn't be snarling about it at all because it isn't a point of loss as far as I'm concerned. As soon as I properly defined a cycle of action as something that began and continued and ended, that elementarily and so forth, people – people have been doing much, much better with it. And they're not now assigning all kinds of wild reasons to why their pc is misbehaving on a meter. But maybe this lecture will give you a little broader insight into it.

Now, the process cycle of action is not expressed on the needle. It is expressed on the tone arm. The tone arm is what is being expressed – expressing here. Your tone arm starts to move on a given subject: pigs. "Pigs?" Tone arm moves. "All right, what about pigs? Pigs?" "Pigs, they grunt." Tone arm moves. "Pigs?" "They are in sties." Tone arm moves. "Pigs?" "Farmers raise them." "Pigs?" "I don't like pork." "Pigs?" "Hey, what do you know, I was once Jewish. Hey, yeah, pigs. Yeah, what do you know!" No more tone arm action.

Well now, please plot exactly what happened here, because there is a nice example. The guy gets back and he sorts out, you'd think at first glance, cause. No, he just puts himself at cause over pigs. He eventually moves up so he's got a cause on the subject of pigs, and he's not involved with pigs, and pigs are not overwhelming him and his tone arm action ceases. No more tone arm action. Well, you've started, continued and ended a cycle of action on the subject of pigs. That's the lot.

And when you get down to looking this thing over, you find out that any subject addressed has to be continued in its address to a point where the pc's on top of it. And at that moment, the tone arm will cease to move.

Now, if the pc can get on top of it at all, the tone will move. If slightly, it will move. Well, we've got the parity here. We've got the subject which has overwhelmed the pc and we've got the pc with enough attention to regard this subject – enough attention to regard the subject potentially. That's how – that's what you mean when you say, "I audited him over his head." In other words, he never under God's green earth could have gotten on top of this subject, and it wouldn't have given tone arm action either, see?

But it just so happens that if he's potentially got, at any given instant, enough attention or power of choice or self-determinism – whatever you want to call it – to get up on top of

this subject with some processing, he will climb as long as the TA is in motion and will cease to climb the moment he has become free of it. And that is expressed on the tone arm. That's your tone arm talking.

I'll go over that again. If it's real to him at all, it will register on the tone arm. Even if slightly, it will still register on the tone arm. We're not really interested in processing things that only register on the needle. A pc has a tendency to become overwhelmed, because you very often have too slight a needle action. A Mark V is too powerful... well, actually, a needle – a needle action on the old-time Mathison was a tone arm action on the Mark V, don't you see? You'd already – the pc had to be hit with a truck to get this – the needle to move, don't you see?

It's not true, so it's – what's changed here is not your viewpoint or understanding of the subject. What's changed here is the quality of the meter you're using. And the Mark V and its equivalents, such as the Azimuth meter and so forth, give you a very, very fine point here. And if you start just following its needle, you find – will find yourself misgauging what the pc can get on top of because it will read things that he couldn't quite get on top of, don't you see? So you follow the tone arm. You don't follow the needle. The only precaution you want to take is follow the tone arm. You assess by tone arm.

You go down a long list of things to audit on this pc. You're checking off parts of his life or something like this, you want to look for one that moves that tone arm. Even if it's – only moves it 0.1, you want something that moved that tone arm while you were busy keeping your needle at Set, see? You wanted a motion there. Now, if you got that motion, the rule follows that the pc has potentially got enough attention to get on top of that overwhelm.

You have found something that is overwhelming the pc, and you have found that he potentially can get on top of it. He isn't on top of it, but he potentially can. In other words, you've found a wall that he can walk up. See, you're not – you're not sending him up the side of the Empire State Building with slippery leather shoes, see? You're giving him something he can climb. Therefore, he will process to wins, providing you don't leave him in a state of half-overwhelm with regard to this thing! Because if you leave him in a state of half-overwhelm in regard to this thing, it's got him half-overwhelmed.

You've only dug him half out, and then you go find a new subject and you dig him half out of this new subject! And then you go find a new subject and dig him half out of this subject, you've got three half-overwhelms multiplied, and they make a total overwhelmed pc. You see this?

Now, your cycle of action there is simply, basically expressed by – when you start to get the pc on top of something get him on top of it. And he will object seriously to not being brought on top of it. We're not interested in whether he objects or not at this particular moment, we're merely interested in the meter responses, and what is the meter response. Eventually, it will be a frozen meter. That meter will be frozen.

In other words, you found some subject he could have gotten on top of and you just raised him up to a point where he was still overwhelmed – you didn't flatten your tone arm action, in other words – and then you found another subject that he got half on top of. He's still overwhelmed by that one. Now you go find another subject that he could get – and get

him half on top of that one where he's still overwhelmed. You've got three overwhelms, and three overwhelms don't make a right pc, man. You never bring him out to where he can say, "Hey, there's rust on the third bar," see? That's all you're trying to do. And at the moment when he says, "There's rust on the third bar," the high probability is you've lost your tone arm action at that point.

There is a limit to which you can carry a tone arm cycle beyond its point of flatness. Here's this very vivid – that if it took you ten minutes to flatten the tone arm action out of something and you then went for two hours to see if it were flat, something is liable to become impatient around here or upset. You see? Because you've misestimated the length of time of this tone arm action.

Now, that isn't the direction that people err, however, but I'm just putting it in as a fact in passing. The direction where the error takes place is it takes them an hour to get some good tone arm action on this subject and then they drop it. *Yaaaow!*

They got it in plain view where it was in good and properly and horribly and meanly and viciously overwhelming the pc, see. Where he had it in full view, you know. You sort of got him as if you had a stroboscopic picture of the thing, you know: The tiger is halfway through the air, you see, and he's standing there wondering whether he's going to be able to grapple with the tiger or not, you see. We're just at this point of parity – who's going to win...?

Let's run another process. Let's leave another tiger jumped half through the air, see? You can only do a few of these and you'll run out of chips because you're going up against the cycle of action of the bank as well as the self-determinism of the pc. Pc's trying to win on this one and so forth – you're going up against that. But you're basically – what's causing – what makes the arm lock up, which is what we're interested in, is because you're going up against the cycle of action of the bank. In other words, you've violated the cycle of action of the bank.

An action was begun and it was not complete and he is hung in the middle of the action and that locks up the TA. And you can go down a line of auditors and just spot where this has happened, where it's happened, where it's happened, where it's happened. And some of those auditors will tell you that nothing is happening in the session. They will also tell you that nothing has happened with the pc. Ha! Ha! Ha! Well, if you're unlucky, it happened with his last auditor, and the auditor's reports were fragmentary and illegible; if you're unlucky. Could get pretty grim, in other words.

Now, the trick here is to find out when the tone arm action ceases. The trick is not even really to find out something that will move the tone arm. People bang their brains out over this: "How do we find something that moves the tone arm?" You had better find what has moved the tone arm. If you're having to ask yourself this question of, "What has moved the tone arm?" and the tone arm isn't moving and the person has been processed for a while, then you had jolly well better ask yourself the reverse question: "What has moved the tone arm?" And process out of nothing but the person's folder and auditor's reports. Don't ever start a new action on this pc.

I don't care if the tone arm action that you're flattening was noted in 1958, man, flatten it! Whatever it is that you can find that ever moved the tone arm, flatten it. And just keep this

up and you'll move him out of all these unfinished cycles of action and the bank will unjam. It's as elementary as that. Every new action that you start without completing these old actions in auditing is liable to produce a greater jam. Your job – your job is very simple to this degree, but you ask yourself very often the wrong question when you face a pc on whom you're trying to get tone arm action.

You ask yourself, "What will get tone arm action on this pc?" and you respond accordingly. And you'd love some tests of some kind or another, you'd like some of this, you'd love assessments, you'd like a new process or so on. You're at the wrong end of the business. That's the simple one, that's the simple one. You can take anybody off the street and have them sit down and pick up the meter electrodes and talk, just let them talk for a few minutes, and you're going to get tone arm action of some kind or another. This would be a very peculiar human being that you didn't note some tone arm action. "*Rattledy-rov, goff-goff, woof-woof, val-vlaow blaow-blaow-blaow,*" somewhere along the line they're going to get tone arm action. You make a note of it: That's a subject you process. The trouble with it is it doesn't look – make you look very professional and it doesn't seem to be very adroit. It's not adroit. Is a car in motion, is it stopped? I mean it's just about as much judgment involved in it as that. The guy goes, "*Rattledy-bang rattledy-bang.*" Somebody says, "Well, I really don't like to have to go down to processing a person on itsa. I really wouldn't know how to... how to untangle some – some pc without just plain itsa. I wouldn't ask them any auditing questions. I don't know how to ask them any auditing questions. I haven't got anything to ask them."

Well, I'm not going to make the mistake of saying I know all about this pc. Even when I have a sixth sense along this line, I'm not still going to make that mistake. I'm going to make the pc hand me the first thing that is real to the pc. Because I can see a lot more wrong with the pc than the pc can see wrong with himself, man. Don't ever downgrade your observation. Pick it up. Say this is very interesting, that fellow's got a gobbledygookitis. He's got his rhombolis on backwards. Don't – don't – don't downgrade your ability to look. But you don't know which of those things is real to the pc. And what will tell you, what will tell you – all these things are perfectly true – but what will tell you is that tone arm, very nicely.

And how does it tell you? Well, it tells you with just plain itsa, and that's all the test you need. That's all the test you need. This – I'm talking about just casual practice of running pcs. And he says, "*Rattle-rattle bong-bong yowp-yowp-yowp-yowp-yowp,*" or something like that, and – or he says, "Well, I never do like to talk to people. I'm very sorry, and I've always been this way. I've just never liked to talk to anybody and so forth." Well, he's running a – he's running an out of communication process, and we mustn't let him go along very long that way because that's out of agreement and that's going to run him wrong way to after a while. And we can let it go along long enough to find something to dive in on. But then we dive, see? "Well, what part of your grandmother were you in favor of?" you know, you'll find very often will produce far more tone arm action than he has been getting on parts of his grandmother that he wasn't in favor of, you see?

There are all kinds of stunts along this line. You process in the direction of ARC, of course. You don't preconceive that you know all about the case before it's opened its yeeep. And you let the – you take the easy course. See, you don't work at it so hard. What you get tone arm action on, flatten!

Well, how about unwillingness to flatten it? Ah well, I already – you've already have seen pcs recover on 8-C when they were being dragged across rooms and their fists planted against walls. In other words, this cycle of action is the only zone or area where you can overwhelm, to any degree, the preclear's power of choice. You mustn't overwhelm his power of choice in any other zone or area. See, don't evaluate for him. Don't do these other things to overwhelm his power of choice, but finish that cycle of action, brother, over your dead body does it end, you know.

When he comes into session the next day, "Well, that's – that – process we were running yesterday..." – we were getting tone arm action. It was traveling all over the dial, see – "process we were running yesterday, I don't know, I mean I had a headache and I had a headache all night and I didn't feel so good last night and I don't really think we ought to finish that process."

"All right. Good. Well, I'm sorry you felt that way and so forth. Say you felt bad and so forth. Now, exactly what agreement you had about your grandmother did we take up yesterday that made you feel that way?"

See, you don't have to finish the cycle of action with an ax. You can be pretty smooth about the whole thing. And you go right on and you run that [begins to speak very silent and slow] until we've got the tone arm down here and it is 2.75 still and the needle starts to tighten a little bit and we say, "Good. Well, that cognition you had a little while ago made you feel a lot better, didn't it?"

"Yes, as a matter of fact it did."

We end the tone arm cycle of action, you see, five minutes before we finish the test. See, we spotted where it ended. Not where we stopped processing. See, there's a lot of little tricks involved in this sort of thing. Makes you – but they're just the tricks of a sloppy auditor, see. It's how do you fit things into this cycle of action.

You goofed. You've been going all morning long and that tone arm hasn't moved a bit and that process is so flat, and you say, "You know this thing is not going to pick up any further. It hasn't got any more kick left in it. It's dead. And I've processed him all this time and so forth." I would not be beyond, "that process which we finished yesterday afternoon," I would not be beyond saying that, see? I'd say, "Well, I'm sorry we've been plugging away at this this morning here because apparently we finished that yesterday afternoon."

"Oh, we did? Oh, as a matter of fact, I had a feeling that we did! Oh, yeah! Yeah! And *rah-ruh, mmmm, mmmm, yeah.*" [laughter] He finished the cycle of action when it finished, with perfect truth. And your tone arm suddenly loosens up, and the pc's willing to talk about something else, see?

All right. Now there's the meter manifestation of a flat TA, and that's what the thing is registering and that's what the thing is supposed to do and that's where it's supposed to go and that's how you can handle it. Don't run things that don't give you TA. But if they're not giving you TA, then something must have been run that gave TA. What was it? "Oh, well, we don't have his auditor's reports because this is our first or second session in life." Well, something gave TA. Life does not keep good auditor's reports. I'd say he was in – had been in some other

practice that gave him TA. Not some esoteric zone of livingness, see, I'd say it was some other practice. I'd say it was right in here along the line of Scientology, see? See, we're culminating a long line of practices. There are plenty around, man.

Right away I'd be asking – I couldn't – couldn't get any TA motion off of this character, he could it's like crazy and I didn't get any TA motion, there was no action. There was no action on this pc. I'd say, "What the hell, what the – excuse my French, but where we go from here? What's this, what's what?" I wouldn't be asking for a brand-new wonderful process. I'd be asking this other question.

If I don't get TA action on the pc, I don't ask what *will* get TA action on the pc, I ask what has gotten TA action on the pc. And I assume immediately that it is some analogous practice; some similar practice. Right away I start watching that needle, now – and this is where you use a meter manifestation – I start watching that needle like a hawk. Maybe I'm not going to get TA, but that needle's going to give me a clue, man. I'll crank that sensitivity right on up here, 128 and so forth, and sit right on top of this thing keeping it very nicely centered and watch it like a hawk. All right. "Now what other zones of mental practice have you been near, so on and so on. Have you ever been psychoanalyzed? You ever been to a psychiatrist? Have you ever been to a psychologist? Did you ever study graphology? You ever been in the field of phrenology? Have you ever had your horoscope read, so forth?" Clunk! Horoscope. All right, all right, all right. Now we found out what gave TA action. It's a process unflat in horoscopy.

You see the rationale with which you can go, and by golly, you know, you can untangle more cases in less time if you're slippy this way than you can shake a stick at. You don't have to go upstairs and fly ten thousand feet up flat on your back in some wild pose. All you have to do is – if you don't get TA action on the pc, then all you have to do is find out what gave him TA action that wasn't completed.

You can trace that back ordinarily in his auditor reports because there's been some sort of a low-level goof, and that's your, usually, your standard action. Just go back through those auditor's reports. Choose objective-type processes as the first choice. When you've got – when you've got thirty processes that produced TA action, none of which were flat, all of which were left with lots of TA action on them, then you have to make some sort of a choice amongst all this mess as to where you pick up the threads of this case. Because it isn't necessarily the first one that will respond again, although that is the best possibility, but it isn't necessarily true.

So if you've got to make a power of choice and be right on the button every time such as in case advising – different than auditing. You're auditing, you're advising – there's a slightly different way to do it. If you were auditing, you'd simply pick up the first one and search it out and see if you could still get TA action on the first one that produced TA action, see? But if you're advising some auditor to do this, you don't have then the continuing assessment of what you're doing.

See, there's a lot – there's a big difference between sitting there in the driver's seat as the auditor, see, and banging away and – well, you could shift gears very rapidly. You find out that is a blind alley, man, you know? So therefore you can cut a little bit closer to the edge

of the road, you see? In other words, you can say, "Well now, look at there. That first process, that seems very unlikely, you see, that that would produce TA action because that process is six or seven years ago. Very unlikely. Well, let's take a – let's take a three-minute flier at it, see?" Which, because you've got the pc on the other end of the meter, you can say, "Well, how about this 'boiling eggs producing a headache?'" This meter doesn't do a thing, you see? Then you can say, "Well, I'm sorry I brought it up." See? You can go on to your next process, see?

But when you're advising auditors or advising cases and so forth, you can't do that. You have the disadvantage of the pc – you got no pc in front of you, you see? You've just got a folder or something like that, and you got the auditor's advice. So what you have to do then is play it surer. See? You play it more positively. You play it on a sure bet. You don't take a chance, in other words. You play it certain.

And you can be absolutely certain that any unfinished Objective Process which gave tone arm action will reproduce tone arm action if flattened. In other words, the Objective Process is the one that's most likely to have stuck the guy in tone arm action because it's right here in the physical universe, isn't it? And it's closest to the sixth dynamic. So therefore, tone arm actions not flattened on Objective Processes are the most likely to have been hung up, and therefore the most likely to complete their cycle of tone arm action if resumed.

Subjective processes are the least likely. In other words, you had a subjective process: "How about your father's screaming at you?" Or "From where could you scream at your father?" or something. You're playing a bet there that is just a little bit wider bet, see? You can't at all be sure that some other process didn't move in sideways on this one and knock it appetite over tin cup, see? Maybe it got covered in some other terminal run that was run the following year, see? And just in passing the pc cognited on it, and there it went as an earlier process and maybe that cycle of action finished in some other fashion or way, don't you see? Could've. So you're not quite so sure.

When you're – so when you're advising cases and so forth, you take the surer bets. You never play a doubtful one. You always give it the business, you know? You don't – you don't hand them a rifle and say, "Well, I hope this works." You don't play it that way. You handle them a mortar that any fool could handle, see? And you say, "You drop the cartridge in the barrel here, you know, and it fires." And you're – you know that mortar will fire, see?

In other words, you've got some guy who's having an awful time. You've got some auditor who's having an awful time with him, you say, "Well, run 8-C and make sure that you continue to finish every cycle of action which you begin on the pc as a command." Well, you know that's going to produce something. In other words, you just run your heavy, sure bets all the time, you know. You never – you never do any fringe effects over here. See? It's always brute certainty that you have to go on, and an auditor that will do that, and so forth, gets very soon an enviable reputation as an adviser of auditors. Of course, all he's really doing is advising the certainties and if those auditors are left to their own devices they might get themselves into trouble or out of trouble by handling a lot of fringe stuff. But they – somebody might delicately wander his way through something, you see, that he could never have been advised

through, don't you see? So when you're advising auditors to do something, always tell them exactly what's right down the middle of the highway.

Never dream up some little process which goes *wiffawackle* and you *woffawockle*, see? Your best bet in doing that is just to take the pc's folder and find somewhere in it an unfinished cycle of action and tell the auditor to complete it.

And if you're dealing with very new auditors and so forth, always remember when they come back and tell you – as they almost inevitably will that it didn't work, that they didn't do it. That's a little maxim that goes along with this which is quite interesting to know and it saves any auditor advising auditors from a broken heart more times than you could count. And the way you pull that trick is you say, "Well, exactly what did you do?"

"Well, I did just like you said."

"All right. Good. What did I say and what did you do?"

"Oh, uh – I don't know. What did you say?"

Very embarrassing moment for the guy. You see – he just [laughs] – he doesn't remember what you said, yet it didn't work. That's hard, bitter experience talking, you see? Never let yourself be boxed around into thinking that your advice is no good. Find out if it was taken. Make sure in the first place that the advice you give is very sound advice. And your best gag on any old cases around is to haul out any old fragment of a folder they've got anyplace from anywhere and find some unflat tone arm action and have that exact tone arm action flattened. That's your best advice.

Now that's, therefore, meter manifestations. Now, those are meter manifestations for Level IV. Now I'm going to give you meter manifestations additional for Level VI and how they compare at Level VI, because they are different.

You are accustomed to tone arm action requiring quite a little time to flatten. They require some time to flatten. Let's say the tone arm action on some process required two sessions to flatten, three sessions to flatten, something like this, you see. You get accustomed to that at Level IV auditing and below. You don't realize at first with Level VI that you're looking at the exact same manifestation happening in the space of ten to fifteen seconds. You're flattening the tone arm action on an item. More broadly, you flatten all the tone arm action on a GPM.

Now, when you've finished an item, there isn't anything else there because that was the basic woof and warp of what was giving all the commotion anyhow, and you can flatten an item in ten or fifteen seconds. And that's all the tone arm action there is. And there isn't any more tone arm action to be had. That's it!

Now, you actually don't even really see all the tone arm action that happens on that. In the first place, it couldn't register on the tone arm or the needle. It's blowing out there in space. It isn't necessarily blowing up against the pc. I mean, you can thank your stars that it isn't blowing up against the pc. I see these Level VI co-auditors getting – have seen the elephant, from that laugh. But it flattens quick. And that's all the tone arm action there is there. And you spend any more time monkeying with that, and do you know, you're getting tone arm

from elsewhere. Now possibly you hadn't recognized it, all of you, that you're getting tone arm action from the next bank or the next item, or you're getting tone arm action from someplace else.

And you sit there and let that pc cognite on endlessly, and *yap-yap-yap*, and finish, *ah-wah-wah-wah-wah-wah-wah*. All of a sudden you're going to get a higher and higher TA and it's going to get stickier and stickier and you're going to wonder what you're doing. Well, you finished the cycle of action, but then you started to drag in charge from something else. That's carrying that cycle of action beyond the point where it can be carried. And I warn you that it is very, very brief – ten to fifteen seconds. It can go up to a minute, but that's unlikely. That's very unlikely. For instance, I see all the tone arm action I could possibly see go out of an item – I mean, it just goes. I don't know, I say fifteen seconds – I'm being very generous. Very generous. I'm allowing for slow freight. It's gone!

Well, now, it's just as though as you came in the front door with a dirty needle and, you see, you go out the back door with a dirty needle. In other words, it's the first manifestation observed in below Level IV auditing, but it happens to be the last manifestation observed at Level VI auditing. Because you overflatten TA action and it is not present, you get an exaggeration of the dirty needle called a tocky needle – a new one on you – and this crazy, tocky needle. A pc in the bank is so sensitive to invalidation that it will turn on a crazy, sharp-edged tickety-tock that it looks – looks like a small rock slam. Not a real dirty needle, but it looks like a small rock slam. And that's sort of the Level VI dirty needle, see? Call it a tocky needle.

And you try to take more tone arm action out of an item or out of a bank than is there, or you try to find something wrong in the bank that isn't wrong, and you'll see this great big, dirty needle. Now, it's expressing *tone arm action completed*. The dirty needle expresses *tone arm action prevented from completion*. You got the difference? But this is not saying that. This is saying, "Hey, you idiot. The tone arm action is *all* finished in this area. How come you're still hanging around, bud?"

And it's just marvelous that the needle will tell you that on a meter. It's just marvelous that it will tell you that, but it will. It's just like a neon sign. It's a nice, great big reaction. It's not a little dinky reaction like a dirty needle because, of course, you're dealing with somebody whose bank is freeing up and who is much freer and in better case condition. And it's a great big exaggerated action.

Now, you can drive that needle and the longer you go the more it will tockety-bock. And you can finally drive it to a stuck needle, stuck TA. Takes quite a little while to do so – you have to be quite a genius at it, you know. But it will tickety-tock and bop and bap and tock-tock, and it's just having a ball. And you say, "I wonder what all this commotion is about?" You'd better ask this pertinent question, "Am I invalidating the correct lineup?" *Hoooooh!* Smooth, see? Just like that. Going *tock-tock bock-bock bagh-bich-bach, bich, bich, bah, bah, bah, gug, bah, baow, baow*. "Well, all right. Are there any items – any items I've left charged behind me? Did that bank – did that bank – was that really flat? Did it really join in at this point?" *Tick-tock tock, tock, bahg-bahg-bahg bigh-bagh-bagh bigh-bahg-bahg-buh*

bagh-bahg-bahg – what the hell is going on here, you know? *Whoa-whoa, whoa-whoa-whoa*. Betsy! You see? What's going on?

You say, "Am I – am I knocking about a correct lineup?" Smooth. Yeah, well then, "Give me the next item." So that's – that's where you begin the next cycle of action. So if you – when you're dealing with the thing that enforces a cycle of action upon the pc and upon life, it then objects to one being overrun. The only objection you get then is insisting there is more cycle of action than is there. If you've got the cycle of action out of something, it raises hell that you're putting one in, and what it resists is a created cycle of action. You try to create any new cycles of action on this pc that aren't there to be created and, man, it just raises the living billy-o with the bank.

Now remember, you came in the front door, and that's when you failed to complete a cycle of action that was there. Remember this is a totally overwhelmed pc. And that immediately went *bzzzt bzz bzzz bzzz bzzz bzzz* dirty needle *drzzzzzzzzzzzz*. See? Every time you said – this pc, his bank is now insisting, "There are cycles of action to be completed. At every turn, you must complete your cycle of action." See, we've got everything overwhelmed here with a cycle of action, you know. Okay.

All right. You get up to the other end of the thing. When you're undoing the thing that creates the cycle of action, the only thing that raises the devil is making a new cycle of action or extending the existing cycle of action. And then that just raises the devil with the meter.

And you can see a meter like this – now, I can tell if an item has been left charged without ever asking a question about it. Because the new item called doesn't behave right. It doesn't behave well. The thing doesn't fall right and it just doesn't go. And you say, "Well, we left some 'bring about' wrong. Is it in the first pair? The second pair? The third pair? The third pair reads. That's good." Call the third pair, "Does the one that's there – oppterm bring about the terminal?" *Bzzzt-bvoop*, falls and so forth. "All right. Let's take up this new item." And now you find it reads right.

You can get very alert to this without doing very much examination. Your items aren't reading, so you must have left something charged. Well, let's rapidly find out what we left charged, get the charge off and get back to what we're doing. All right. Now supposing – that's the best laid plans and that's what you would do, see?

Supposing now, you hadn't left anything charged. I'll give you the other thing, see? Give you the other manifestation, see? You just get a lousy read on something of this sort, and it itself has been suppressed or invalidated or you hung around too long before you said it, and you say – you say, "Oh, have I left an item charged? A little bit of a read on that. Was it the first..." *Tickety-tock, tickety-tock, boodibop-bzzzt-blurrrp-blurrrp-bloop*. "All right. Would you please give me the next item." [laughter] You understand? Handy little jimdandy meter mechanism then. God bless a meter.

Pc will get all kinds – he's always getting the idea that the bank he is running went in between two other banks earlier. He inevitably will get this kind of an idea. Why? Because the bank he is running is always the last bank in existence. So it, of course, appears to be where the present time bank was once. So therefore appears to be where – you see, where another bank was. Do you follow this? Now, he'll – always liable to get, "Well, I wonder what

this is, you know. Huhhh. We're supposed to be down here at this one, and yet actually – and you know I feel like this one should have come between a couple of other banks. Hmmm."

And he comes into session, "You know, I feel..." *tickety-tock bock, bock!* And you say, "No, it – bank – bank was in the correct position. All right. Now give me the next item on the line."

"Oh, was it? So what do you know?"

That's the end of that. You just never saw a meter cool off so fast. Turns into a gorgeous flow.

You've got your BA steps in. You've got everything in. There isn't any charge left on it, you see. You couldn't get it with an electric shock machine, see? So you say, "All right now. Let's check this, and let's make sure this is flat. Now, this thing *wah wah twah twah twah.*" *Tickety-tock bop-bop thud, bing.* That tells you right now that you have overridden the pin. It's no disgrace to have overridden the pin. It's only a disgrace if you see that manifestation, not to unload right where you are because it's invariable: it means that you're invalidating a correct lineup. It means you're taking more charge than is there. It means that you're trying to extend the cycle of action beyond its logical conclusion. And that's all the bank now objects to, at Level VI, is the cycle of action being extended beyond its end.

Now, I don't want to do the same thing with this lecture, so thank you very much.
[laughter, applause]

Communication, Overts And Responsibility

A lecture given on
16 June 1964

How are you today?

Audience: Fine, thank you, etc.

Good. This is the what?

Audience: The 16th.

The 16th of June in these stirring times. June 16, AD 14, Saint Hill Special Briefing Course.

[part missing]

Well, looks like we've got lots of people here; we'll be getting rid of them very shortly. Going out in all directions. I probably ought to start giving you some lectures of "Son, as you go forth into the world..." "Men are not evil, they're just nutty. All is not good that glitters." You know, that sort of thing.

But in these high and stirring times, it is very easy to forget the fellow who is out there slugging in at Level III, trying to get a result in an HGC or private practice on somebody who is mainly concerned with the fact that every now and then he has goose bumps, you know. And this type of approach we're liable to forget, because it is still with us and frankly there is nothing you can do for that fellow in terms of GPMs or anything like this. You just got to get down and do a ground-level job of auditing. And it's a funny thing, but people don't realize how far that ground-level type auditing carries somebody. It's quite remarkable.

I've – ran into somebody's pc who was round the grounds here some little time ago and this was the height and level of his worries. It seemed like they only had auditing on the weekends and it really wasn't quite enough auditing to take care of all the problems he was having with his wife. And if he – he thought maybe if they could just have auditing a little faster or a little bit more, then he would have a chance maybe to catch up with his problems with his wife. This was his zone and horizon. This was as far as life extended. And during a session, toward the end of a session, he could suddenly begin to get an insight into the fact that there was something could happen to him that was better than had been happening in life,

you see. And he'd just about grasped this insight and then he would go home and have some more trouble with his wife, don't you see. And this was the sort of a treadmill he was on.

It's a hard thing for a person who has been in processing and has been processed for quite a while, to look directly and straight into the teeth of this factor, that individuals are so wrapped up and involved with their immediate environment that they have no time to think of themselves or case gain or anything like that. It's just an effort to control their immediate environment.

And they're in some fabulous contest with the immediate environment. And if you could remember this as an auditor, and if you can process at this level when you are handling such people, you will have remarkable – remarkable success.

Only thing I'm trying to tell you here is that the individual – that the individual that you process that isn't going to OT – he's just going to a sigh of relief see, I mean, that's about the highest level of gain which he could attain to – this fellow is in contest with his environment. It doesn't sound like much, don't you see? It doesn't sound like any more than their problems and cases sound like, don't you see? But nevertheless it is the key, the direct and immediate key, to the case.

Now, what's his environment? Well, this is your job as an auditor to find out. That's your first job. What is this bloke's environment?

Now, we will just take off from this point: The individual is in contest with his environment. We'll just take off from that point. Now, that's a very true observation. Particularly, if we qualify that observation just a little bit further and we say that a contest is not necessarily a battle of fisticuffs.

There are various ways to react to the environment. You can react to the environment by going into catatonic schizophrenia, complete immobility. And yet, do you know that that is a method of handling the environment? If you get down to rock bottom on this thing, anything your pc is doing at these lower levels is an effort to handle the environment. It is an effort to do that.

Once umpty-skillion years ago I got swatted, and sat there very, very immobile, being right. I went on being right for quite a little while. See, by permitting myself to be immobilized, it made the other fellow wrong. It didn't – wasn't really doing anything to him, taking no action, absolutely no forward thrust of any kind whatsoever, no outward motion, no outward flow of any kind, not even a thought of an outward flow and yet that was the method of handling the environment. So the way we qualify this is... The method is not necessarily smart.

And right down to the lowest rung of the ladder – to the lowest rung of the ladder, this individual is still in contest with his environment, is still reacting toward his environment and is still seeking to handle his environment. Those things are quite true. That's true of any case, see. A thetan never gives up.

Now, these methods are not clever. They are very often downright stupid. And the frailty of these methods is so great they're – you see, they're just solutions of one kind or another – and the frailty is so great that you can very easily unsettle the solution. You see, it isn't

a good method to begin with. And just by circulating a little mental energy around it, the slightest peek underneath the edge of the rug pulls the rug out. See, it's not hard to unsettle one of these things because they're not smart. See, it isn't a clever method to begin with.

All right, so I got swatted, see? Give you an idea. All right, I got swatted, you know, good – good blast, see. So I sit there immobilized, you see, being right, see. And this made the other fellow wrong but he'd left, see. Now, if anybody – now if anybody – if anybody had come along and had said to me at that particular time, "Well, just how does this straighten this situation up?" I possibly would have said, "Well uh – mmmm – heh, it doesn't." And that would have been the end of that, see? Do you see? Very easy to unsettle these things.

Now, oddly enough the more irrational – the more irrational the solution or the handling of the situation, the more easily it is unsettled. You can unstabilize it as a solution in direct ratio to its uselessness as a solution.

Now, how in the name of common sense alienists and the witch doctor and the other blokes up and down the track have never run into this as a rule, I don't know – I don't know, it makes me ask some very searching questions. Did they want anybody to get better? It makes me ask mean questions like this, don't you see?

Because this rule here is perfectly visible. It's a very visible rule. You start fooling around with this very long and you will find out that the more irrational the solution, the easier it is to unsettle, the harder it is to maintain.

Well now, let's give you an example out of life. Let's say that this fellow has a solution of keeping the hind wheels of his car off the road as a method of safe driving. That's a good irrational solution, see – good and irrational, see. He wants to drive safely so he's going to keep the hind wheels of his car off the road. Well man, look at what he's got to do to put this solution into action, see. He's either got to run along behind it – if it's a Mini Morris or something – and hold it off the road, you see; or he's got to get a wrecking truck to follow him with the hind wheels pulled up, don't you see; or he's got to hire a helicopter, see; or he's got to put on some kid's roller skates on a platform with a building jack on top of them, you know. This thing is – this thing is crazy, see?

Well, look at the number of frailties in any solution that he gets there, see. You get an irrational solution, it is very difficult to maintain.

So the helicopter pilot has a cold, you see, and can't come that day, don't you see? Any one of these points – because we've added more points to the solution, so therefore, we have added more points of frailty to the solution and it is harder and harder to maintain.

So the rule is: The more irrational a solution is, the harder it is to maintain. And this would not be – this would not be legitimate as a comment unless it were borne out in actual practice and application. And it is borne out in actual practice and application.

The way a madman works at staying mad is absolutely fabulous. He sweats over it, man. He's in there twenty-four hours a day keeping himself good and mad, see. It's marvelous. He works at it. He'll once in a while catch himself out being slightly sane about something and you'll just see him grab for it and put it all back in the madness range, see, clank! You can

observe this in action. Now, that's – let's take a psychosis – using a dirty word, the slight – slighter manifestation of it, a neurosis, they're very hard to maintain, it's irrational.

And the only requisite to unsettle it is of course communication. If you're trying to pull a pole out from underneath a skylight to close the skylight, you had better have an adequate means of grasping the pole to give it a pull. In other words, there has got to be contact here of some kind or another.

Probably one of the reasons why they were incapable of observing this – they're mad themselves, of course – one of the reasons why the observation was never made may have been that they got all involved in trying to make the first contact – trying to get a communication through or in, in order to begin an unsettling process. And you would very easily have so much trouble with this one point, you'd just have so much trouble with this one point of trying to communicate on this subject or about this thing, that you might then entirely forget the fact that, if you could, unsettling the neurosis or psychosis or loopiness or worries of the individual was dead simple.

See, you could have so much trouble trying to talk to Joe that you'd totally lose grasp of the simplicity of what was wrong with Joe, see. So you'd skip – you'd skip that, and you'd put all of your – all of your time and energy here on this basis of trying to contact Joe, see?

Now, you could become so frantic, you see, given the fact that, "Well, he thinks there's alligators in the corners of the room," don't you see. And you know that if you could just ask him what this was – what this solved or something like this, it'd all fall down like a house of cards and the alligators would fall out of the corners of the room and that would be the end of that, see. Given that, see.

The reason you don't observe this is because you seldom get to such a person with a communication in order to disabuse him of this idea, see, and pull the props out from underneath this idea. So you could get so frantic over here trying to communicate to Joe, you could get so driven through your own skull, that you become frantic on the subject of communication.

And psychotherapy would then park on this basis of communication. And the franticness of trying to communicate would bring about more and more brutal means of communication. Until you get modern psychiatry. See?

They take an operation developed by Adolf Hitler, no less, and his very expert medicos of the Third Reich – the prefrontal lobotomy which was developed to make slaves – make farm slaves. Take undesirable nationalities who were not the super race, you know – he did eight hundred thousand of them, interesting round figure, had himself a lot of farm slave labor.

Now, how this ever got to be a psychotherapy I myself am absolutely gasping about and I pursued this one day and I asked very searching questions on how it did. And it turns out that there was a blacksmith's assistant in Bavaria. This always happens in Bavaria, if you know there are ghosts or werewolves, they always put it somewhere over there. And old American weekly, if you want to go back a half a century and look at its files everything always happened in that corner of the world. Well, this one happened there too. And it seems

like this blacksmith's assistant was standing by the forge when the forge blew up. Now, the fellow was a kind of an idiot, and the forge blew up and a crowbar about an inch in diameter and very long was driven through his skull from one temple to the other temple and completely severed his prefrontal lobes.

Now, you can go on and wait for the rest of the story just like I did. The – only rest of the story is he didn't die. He didn't suddenly become sane. This is not part of the clinical record, see? He didn't become sane, he didn't regain speech, he didn't become president, nothing happened here that was astonishing and marvelous. And that's the end of the clinical history.

And you can actually delve deep and endlessly trying to find the rest of this and how this brought about a reasoning whereby if you give somebody a prefrontal lobotomy he turns sane. And you know, that's your assumption as to why they're giving a prefrontal lobotomy. That's not the psychiatric assumption. That's an interesting view, isn't it?

A legislature will assume this in passing laws. And everybody assumes this, we usually say, "Well" immediately, "Oh, so." "So," you say to yourself, writing scripts, see, like mad, "Oh, I understand. He was a – he was an idiot and the crowbar went through his skull and immediately he was totally sane and an acceptable member of the society and that's why the..." You're writing script, boy, that's no part of the – that's no part of the clinical record at all. It isn't even *inferred* in the clinical record. So, as far as they've gotten is just this rationale: That if you cut somebody's prefrontal lobes up, he doesn't die right then. You think I'm joking, but it's true. That's where the rationale goes. I'm just giving you – I'm not berating psychiatry. Heh, who has to?

The point here is just this: that that is an anxiety of communication the like of which nobody ever thought of. See, these boys have been totally educated into believing to reach the brain. They don't know what they're talking to, that's how far back they've gotten, see. So they got to reach this fellow, so that means his brain or his thinkingness, you see? And their irrationality is simply and totally evolved around the one point of "We weren't able to contact him," so we get into this total frenzy of contact. "We finally reached him, *huh!* We finally made a result on this blankety-blank-blank-blank, see? It's against the law to shoot him, see, but we finally recorded from A to his brain B, and we produced a result. He hasn't said anything for days, *huh-huh-huh!*" You see, it's as insane a solution as insanity.

But now, this is just not for the pleasure of berating psychiatry. This is solely and totally to this point. I want to bring about to you and give – give you this clarity of understanding of this one point: That regardless of the frailty of the neurosis or psychosis, the quicksand on which it is built will very fast go away – regardless of that. The effort to communicate to the person can assume such baffling forms and shapes, can give you so many barriers, so many insurmountable barriers that you never do get around to studying what's wrong with the pc. You never do get around to there, see. You're so involved with the outworks of the castle that you never even find out what the shape of the donjon keep is. You don't get within arrow-shot of the walls actually. You're out there with the chevaux-de-frise, and you never get near it. Your communication effort is where you wind up.

So just remember that to do anything for an individual requires, as its first and primary action, communication to that individual and communication from that individual. Don't then,

because that is true, immediately assume that communication to the individual solves all. This is merely a step. It is the necessary step.

And you will find, where Scientology breaks down in the lower levels, that it breaks down in the vicinity of effort to communicate to the being. That's where it breaks down. And that's why you'll get some weird and fantastic notions of what you should do for or with somebody. That's the zone and area where those appear. An inability to communicate to the individual, an inability to get the individual to communicate, results in a frenzy of effort. Then we get the Auditor's Code being broken, we get the pc being overwhelmed, we get various actions that are not really capable of bringing about any result at all. Now, we get these things in almost a standard practice, you see.

You – in other words, the whole subject could break down right at that point. Because that's where every psychotherapy breaks down. So there's no reason why a study such as Scientology – even though it is not a psychotherapy – there is no reason why it shouldn't break down there, too.

And in the individual practitioner, there's where it breaks down. And that's what you're not able to quite get across to the HAS, the HQS, the early HCA. That's what's hard to get across. That's why you have to keep telling them, "Acknowledge, acknowledge, acknowledge. He said something, acknowledge." That's why you sweat it out keeping those parts of the comm cycle in. That's why you work on it. Because when that disappears then your ability to do anything about the case vanishes. See, so that one, that one is the point of concentration.

Now, we know the formulas of communication. We know how communication can be built up. We know about gradient scales, and we know other things in this particular line. You should know those things for what they are. They're something you're working with in order to do something with or about the individual. And you must continuously and repeatedly follow that particular channel and work along that particular channel, see. And you mustn't spoil that channel. Because the moment the channel is spoiled – such as, well, you don't give another auditing command. You've gotten one accepted and answered, maybe you even acknowledged it but then you didn't give the next auditing command, see? See.

Yet these are really goofy errors, see. But yet they happen, yet they happen. Because the individual himself in an effort to do something for other people has long since thrown in the sponge a few times on the subject of communication. "Well, you can't talk to him anyway. Well, there's no reasoning with him. Well, there's a..." Round, round, round, round, round, see?

So that actually doing something for an individual at the lower levels is dependent upon what degree of communication can be entered upon with the individual. And if you want to know what makes a level, that's what makes a level, see. It's just the gradient scale of what communication can be entered upon with the individual. And the individual who can't have much communication entered in upon, of course would be in a lower level of activity; he'd be down there in Grade 0. He hadn't been talked to yet, see? That's in actual fact what makes grades, what makes pcs, what's the difference of cases and that sort of thing.

Now, once you get this first series of shafts through very nicely, and you're reaching the individual now, the individual is responding to you, ah, well these other things are a house

of cards. First thing you've got to take up is the goofiest solutions he has for his environment. That's about the first thing you've got to find. And then we get to what you're trying to do for the individual.

What you're trying to do for the individual is alleviate his contest with his environment. Now that he is in contest with his environment, of course, barriers communication from his environment. And you'll find he will eventually solve the fact that he is being communicated to by his environment by moving you out of the environment as his auditor. That is to say you are no longer part of his normal environment. And he solves this very, very well. He says, "Well, there are human beings and there are auditors. And I won't let a human being talk to me, but I will let an auditor talk to me." See? He starts solving it at a rather early stage in his processing.

This is why any group that has ever been able to help anybody or do anything for them at all eventually assumes an ethereal, a spiritual height of some kind or another and takes on a special status in the society, see. Because the individual is in contest with his environment and if the group communicating to him were part of the environment he'd feel like he was being driven around the bend. So he just solves the whole problem by moving the group up into a very esoteric level. See, very simple.

So that you take on – to some of your pcs you take on almost holy proportions. They'll credit you with all kinds of various facilities and abilities and all of this sort of thing. What they're doing is solving this one point. They can't bear to communicate with the environment and you're communicating with them, so therefore you can't possibly be part of the environment and then they prove it to themselves by saying these other things, you see.

It's interesting that the Melbourne inquiry tracks along this way rather consistently, and so forth. And the people who are attacking the organization the hardest are actually hanging around the neck of the organization a rather supernatural atmosphere... I told Mary Sue here some months ago, the one thing that's going to come out of the Melbourne activity, we will be unnatural beings, we will be supernatural beings of some kind. And yes, it's gone further and further. Of course, as they run up overts against us – knowing very well they shouldn't be running up overts of this particular character, see – why, they're having to remove us further and further out of the real environment, you see. So the other day a very serious discussion took place in the hah! court down there on the subject of... You see, it isn't even a trial, it's just a bunch of guys shooting their face off and – at vast expense. They – they took it up, as they were – now you'd say, "Well, would a Clear be – could you see through a Clear?" you know.

You'd say, "Well, people could understand a discussion along that line." But no, no. The discussion had gone much further than that, much further than that. It's, "Why did I appear sometimes tall and sometimes short and sometimes broad and sometimes thin?" And, "Why did Clears in general appear this way?" It was no longer a question that they appeared this way, you see. That was not the case in point. It was wondering why they did. Marvelous!

Therefore, if you can reach or talk to people when other people can't, you immediately will assume some status with the person which is quite different than from any other status he has any knowledge of. He will put you into some status or another which is quite pedestaled

and quite out of this world, you might say. Because it proves itself. He's in contest with his environment. He's having trouble with his environment all over the place, and he's not having trouble with you, so therefore, you can't be part of the environment. I mean that's all there is to that, see?

He solves the problem very nicely. This is the common solution to that. Well, it isn't even worth doing anything about. That's the way the thing rides, you see? I would never pander to it or aid and abet it particularly. But at the same time if your communication line depends upon his ideas of you, I would not sit around now and use the fact that I could talk to him to clarify his opinion of me. See, I would use the time and ability to talk to him to pull the props out from underneath a few of these flimsy structures that are called neuroses or oddball ideas or something, see. That's the time I would use. I wouldn't get into an endless discussion with him about whether I were sometimes large or sometimes small, or had come to him in the middle of the night and given him an auditing command. I wouldn't – wouldn't bother. I just would not discuss it. I'd say, "Well, all right. That's fine."

I wouldn't even jump in and say, "Do you think other people come to you in the middle of the night." I'd understand what he was trying to communicate to me. He's trying to communicate to me that he was in communication with me, was not in communication with other people, so therefore I wasn't other people. That was all he was trying to communicate to me, see. I wouldn't use this as a symptom at all, or wouldn't even rack it up as part of his symptoms, see? I'd get very much more interested in those things he was in contest with. And that's what you've got to handle. That's what you've got to handle. What is he in contest with that's real to him?

Now, get your communication line in and then handle that. Now, just getting your communication line in is more of a trick than any field of mental healing, psychotherapy, spiritualism or religion has ever been able to uniformly accomplish. You see that? They can't uniformly accomplish that. Some priest walking around in circles talking about these heretics, and so forth, is simply saying, "There are some Joes around that I can't get next to. I can't communicate to them," see. His failures of communication are what weigh him down.

Now, we've pretty well solved this business of the communication to the individual. Given half a chance at all we can communicate to the individual, see. There are various... Well, we've developed many methods which we no longer talk about anymore. There's communication by mimicry. By knowing the communication formula in full, you can, of course, introduce the various factors of the communication formula into your communication with the individual. So your communication with the individual is not dependent on merely saying something to the individual, see.

You ever want to put a kid in a good humor, and so forth – he accidentally wiggles his nose, wiggle your nose and he bobs his head and you bob your head. And the next thing you know, why he's in a high old time, man. He's in a marvelous state. You haven't said a word. It's mimicry, just nothing but mimicry all the way through. Well, you can even talk to a raving madman along this particular subject line.

So you're using various parts of the communication formula as they exist in *The Creation of Human Ability* and in other places in the early works. Taking those parts apart and

understanding what those parts consist of. And then realizing that you can use any of those parts or any variation of those parts to bring about a communication with the individual. And then by using any – gradient scales – by using any communication which you've established with the individual to increase your ability to communicate with the individual, see – more and more communication, better and better, see – you can then get around to doing something for the individual.

Now, what fools you is that by your communicating with the individual, he gets better. There's some part of the environment that he's in communication with and this will of course make him better. And so this other thing has this other liability. That by doing a communication with the individual, and by building a communication, getting the individual into better communication only with you, you see, you could of course increase his ability to handle his environment and you can bring about a better state of mind in the individual. And the reason that's a fooler is you're still back there in the first step. And it's almost as much a mistake to stop there, don't you see, or to use that, as it would be to go into a frantic state trying to communicate with the individual.

In other words, say – be frantic about trying to communicate with the individual, "So, I finally communicated with him, I hit him with a club," see? "See, I finally... I communicated with him, I hit him, see." Well, it's just as – just almost as much a mistake as just saying, "Well, I've done something for him because I now communicated with him." Don't you see, you're now using communication as the end-all. It's just a channel. And what the fooler there is, he really is better, see. He's really a bit better off, don't you see?

And he is so much better off when he is with you or around you that you eventually won't believe he's still daffy around other people. And therefore, you become very hard to convince along this particular line. And you lay in a big problem for yourself here. You can no longer see that this fellow is showing any nuttiness and you say, "Well, we've cured his oddball battinesses, and so forth." Yes. He doesn't exhibit any of them around you, just around other people as before, see. You can get into an odd ridge here. Well, just recognize where you sit with relationship to the case and it solves the thing, see.

Now, here you are, communicating to this individual, see, you've got past the frantic point and you built it up and that sort of thing, and you're not going to make the mistake of saying, "I've cured him because I can now talk to him." You've got yourself merely set up to do something for the case. That's as far as you've gone. You haven't gone any further than that. And don't kid yourself that you have or you will have some singular losses in processing.

You will have some very singular losses in processing. Sooner or later you will get into some kind of a state of beautiful comfort with regard to some bird and he goes home and slaughters the whole family, see? You say, "But what happened? You – he seemed so calm!" Yeah, around you. In the first place because you could communicate it to him, you weren't part of the environment, therefore, you were some special type of being. You were in an esoteric relationship to him. You probably didn't use this on a command basis or an overwhelm. And he wasn't any saner elsewhere than he ever had been. But in your vicinity he manifested sanity.

See, a sort of a Christ manifestation occurs, you know? You appear; all is calm, see. Well, don't forget, after you disappear all goes to pieces, too, see. That can also happen. So that will happen to you and you will say, "What in the name of common sense occurred?" You end the fellow's intensive and he was just fine at the end of the intensive and a week later, you see, he shoots a cop or something. Something wild occurred here. Well, just recognize your relationship to the individual is special, and communication with the individual is not an end-all of processing. That is simply the beginning. That is all. There is nothing more to that.

So, all right.

Given communication with the individual, now what? Now what? We say, "Oh well, that was – that's been such a big psychotherapy problem, 'How do you communicate to the individual?' and that sort of thing. 'You mean you do something with it? I mean – you mean, you go some – from here?'" Yeah, there's where you start, see. Now, you start to do something for the individual, see.

Now, this requires this next piece of understanding, which I've already given you, that the individual is in contest with his environment and he is using very, very nutty solutions indeed with regard to his environment, and he is using these – he is using these nutty solutions for just one particular and continuous reason: because he's in contest with his environment and therefore his environment looks very, very dangerous to him. And that's the whole lot.

Well, how do you enter on upon all this? How do you start this? How does this occur? How do you undermine all of these nutty solutions and let them fall down? How do you go about it?

Well, of course you can't go about it at all if you don't have a communication channel. You must have a communication channel. Now go to work. You've got to find out now the dangerous things that are in his environment, the menacing things that are in his environment, and the solutions he's using to combat and contest these various things.

And in actual fact, you shouldn't really use to too great a degree problems and solutions. This is something that's very okay for the very, very beginning of the case. But you go too long along this direction, you're going to get in trouble because these are GPMs – problems-solutions. Solutions are GPMs. That's a part of the reactive bank. And that's restimulable. All of that is restimulable. And as a sober fact, that isn't the basis of his activities with his environment at all. It's not problems and his solutions to them. It's what *he does* to solve them that keeps him obsessed and pinned in against them.

You must immediately and directly assume, of course, that if an individual has a problem, he's going to do something about it. How do you know that you haven't gotten a present time problem of a pc? Now, that's the oldest one you know of. That's the oldest one you know of. How do you know that you haven't done anything for the pc? Present time problem, you're processing a present time problem, how do you know right away that you haven't handled a present time problem? There's one there – just like that. He's going to do something about it.

The pc who leans back suddenly in the session and says, "All right. Well, I understand that now, I really haven't got a problem with the dentist. I'm going to so-and-so, and so-and-so and see Dr. Jones. All right. I have that all settled now and we can go on with..." Oh, bull! You haven't settled the present time problem. You haven't handled the present time problem. And that's something auditors have known for years and years and years and years and years. That's an old, old, old one, see. If you haven't handled the PTP at the beginning of session, the pc is going to do, something about it. And that's the biggest index that you have. That is the biggest index that you have: He's going to do something about it, so there it is.

Now, the whole contest then that you are up against is to find out what is the individual continuously and perpetually doing as in his environment. And it falls under the heading of O/W. It doesn't fall under the heading of problems and solutions at all. It'd fall under the heading of O/W. Because the more he does about this thing he's obsessed about, the more he's going to get stuck in it, and the more he's going to get obsessed with it.

What brings about – what brings about undue concentration upon a subject? What brings about his absolute conviction that he has this tremendous contest with this environment? What brings about this absolute conviction? It's because he's doing something about it all the time.

How do you unpin somebody from worrying about the United Nations? Guy goes around all the time, he's worrying about the United Nations. You finally find out that the reason he wears a green hat is because the United Nations' flag is blue or something, see, something wild here. And this is the genus of all this. Well, how come he's so pinned in to the United Nations?

Well, he must be doing something, odd as it may seem, he must be doing something to the United Nations or about the United Nations every few time intervals. And it must be something real or actual. It might dwindle down to the level of a critical thought, don't you see. But he's been active in this particular direction. And you don't have to go into other lifetimes – it's this one. The real problems exist in this lifetime. You don't have to go very far adrift to unpin these things. Actually, they're so simple to unpin that it's a wonder to me that anybody had any trouble unpinning them. They're quite laughable. But the secret of it is O/W.

You see, he himself is mucking up his communication with the environment because his communication is a series of overts. So therefore, he better not communicate with his environment because it's an overt against the environment. So therefore he better have some kind of a wild solution so that he won't have to communicate with his environment. And it isn't that it all comes down to communication, it just happens to be riding on the communication channel which is what broke down his communication with his environment. See?

He can no longer recognize what part of his environment he's in communication with. He can't tell. He doesn't know what's there. He put up a screen, long time ago, against tigers, and he's never been brave enough to take the screen down since, and he's now forgotten what's behind it. But he's fighting something in that direction. He knows he has to keep fighting in that direction. He's not sure why he has to keep fighting in that direction but he just knows he has to.

And his method of fighting in that direction may take innumerable forms, such as: never looking in that direction, never looking in that direction. Oh, let's find a fellow whose head is swiveled over to the side and he has chronic arthritis of the neck, and he can't look to the left. How come his neck is swiveled over this way, see? That seems to be an odd way to carry a body. And particularly and peculiarly odd, you see, because he's even used calcium deposits to cement in the vertebrae so that he can't turn it over. How come he's doing this?

Now, if you're in communication with the individual you have the possibility of finding out. You can hunt and punch around, you eventually will find out on various channels, and so forth, that he's liable to commit some other solution, some other action. He's liable to do some other overt if he looked to the left.

I would eventually recognize that somebody who was never paying any attention to the left side of anything had something there that he was doing something to *or* about. You may even find out it's his wife. He's stuck in the marriage ceremony or something, see? That's right! You may find some weird things. May find he's got a ghost relative in the room, or may find all kinds of odd things about this fellow. But he's doing something.

Now, the reason he does low-level overts on various dynamics is because he's afraid he'll do high-level overts on the various dynamics. And his reactive bank is so manufactured that the one thing a thetan gets in trouble doing is committing overts. And the whole – well, I'd say, better than fifty percent of the reactive bank is tailor-made to force him to commit overts. See?

So here is a being whose sanity depends actually on not committing overts, who has a reactive bank which forces him to commit overts. And I think this is probably the basic mechanism of enslavement of the thetan. Pinning him down, trapping him and so on, is probably the – I would say, not positively but probably – the grander plan of the trap. See. You're just continuously a – these people, just people must – every piece of their reactivity is driving them to commit overts. And they mustn't – they just mustn't. And the broader angle is, is even if he didn't have a bank, he'd get into trouble committing overts because it violates the communication formula, and communication formula is above the reactive bank.

So this gives us two mechanisms which are above the reactive bank. One is the communication formula and the other is O/W.

Now, that puts somebody who is early on in processing in the driver's seat, because he's got two things that are superior to all the aberration the pc packs. In one fell swoop he's got all of it.

O/W is one of the frail spots of auditors. I must say that with some regret, but it is true. It's a frailty in a lot of auditors.

Well, you'd naturally get the perpetrators of any given trap spreading around a lot of propaganda about the invasion of privacy and about the this and about how it wasn't nice, and how people were entitled to hold their withholds and you get all kinds of wild propaganda going on, on this particular line, see? If people are crazy along this line in general, then you can be sure there's a lot of crazy propaganda on the same subject. So, you get men that ought to know better leaping about talking about lie detectors and all of this kind of thing.

You get a whole government rising up and seizing an organization's E-Meters, see. It's a nuttiness, see.

If you don't think they're nutty, why look at the facts of the case, you see? Well, they turn them right over to the War Department and they investigate them up at Walter Reed and they're very grateful for the thing, but they're not even sane enough to pat us on the back, you see, and give us a couple of quick bucks for the patent rights, you see? But if they've seized them, you see, this makes it somehow all right. This is craziness, see. It's craziness at work.

Where would you expect to find the most craziness? At the door to sanity. You'd find out that the greatest amount of barricade would be along that chain, that channel, see. And if you – if you look over any group of auditors, a great many of them unfortunately will fringe by, not very positively, but they'll sort of fringe by this invasion of privacy, and so forth. They won't really sit there and clean that needle. You know, they just won't sweat at it, you know?

Well, their reticence along this line comes from their fear quite naturally of breaking their communication channel with the pc. And they're afraid they'll break this communication channel so therefore, they don't press home the therapy. In other words, they preserve the communication channel but arrive at nowhere because of its preservation. So anxious to preserve it that they never do anything with it. So they, well, very often – I'm not running down all auditors – I've just noticed in training auditors that this is a point we have to get them over. And there are many right here that we've gotten over this point. But it's a point that people hit and that they have to be gotten over.

That's where it breaks down. They say, "All right. This individual is worry, worry, worry, worry, figure, figure, figure, think, think, think, think, think, obsess, obsess, obsess."

"Is he?"

I don't know. He's just *ruh-ruh-thuh-thuh-thuh* on this one subject, you know. Green horses or something, I don't know. Instructors, something else unreal, see? And the individual just goes on, on, on, on, on, on, on, over the rest of this thing, see.

And the auditor says, "All right, have you done anything." Well, obviously the guy must have done something or he wouldn't be pinned in, see. That's the part of the equation you may not – some people have not totally looked at: That in order to be pinned in on something, he must have done something to it, see. Because there isn't any way anything could get in communication with a thetan in the first place. You want to solve a problem, man, there's a nice problem for you. How does anybody ever get in communication with a thetan? Of course, it's impossible. The origination must have been original with the thetan. Why, he's invisible, you couldn't even find him, he doesn't even really natively have any location in space – nothing.

So he must have originated, and that must be the basis of the do. And that's how he gets pinned into anything. And he can get it all disguised so that it's impossible for him to understand how he's pinned in, which is – which is quite remarkable. And he tries to unpin himself with obsessive do. He's got to do, do, do, do, do, do to unpin himself. And boy, anybody will fall for this.

I catch myself by the scruff of the neck every once in a while. "Well, if I just wrote up a couple of letters, it would straighten it all out." Then, of course, I know, I'll go ahead, write a couple letters, straighten this out. This point's worrying me one way or the other, I'll write the couple letters. Then I find out I have to write another letter, see. You know, I have to write another letter to straighten that out. And then I think, well, maybe it'll be a good idea if I just wrote four or five more, you see, and straighten that out, and that particular... Then I suddenly realize what I am doing. This is why I'm worrying about it. It's because I'm writing letters about it, see? Simple, see? Realize that and all of a sudden cease to worry about it. Bang! It's gone, see.

So anybody, even when he knows the mechanism, can be caught in the same mechanism because it's the basic mechanism of entrapment. There is no more subtle mechanism of entrapment than that. That's the lot. So this is what you must realize about this thetan. That it isn't – we sit down with the thetan and we're processing him and we say, "Oh well, what have you – what have you done to an Instructor?"

And, "Well, nothing really."

Audience: God!

"I-I-I listened impertinently when he said, 'Good morning.'" See?

"All right. Good. Now, what have you done to an Instructor?" you see.

"Nothing really, nothing really, but I thought they were awfully wrong when they chopped me all up and they did this and they did that and they did the *rurur, motivator, motivator, motivator, motivator.*"

And the auditor says, "Fine," and asks the next question, not having gotten his question answered. Now, right there, in the mechanism of the session, you see, he's pinned him in tighter. He bought a motivator, he pinned him in tighter. Do you see that?

It isn't whether or not it's social or not social, it isn't anything else, it's just good sense technically, see. And they don't want to break their communication channel or their feeling of rapport, being *simpatico* with the pc, you see, by being challenging. Where as a matter of fact they'd be a far better friend of the pc, it'd be a much more honest thing: "All right. That's all very well, but now what the hell have you done to an Instructor that's got you this worried?"

"Oh, well, you put it that way, I well, well, backing out of the parking lot and hit his car the other night. Didn't tell him about it. He hasn't found out the fender's dented yet." See? Right away, bang! The guy's unpinned, see?

Because he goes through – he goes through the action of. He does something, not necessarily intentional, he does something and then he does something to justify having done this thing. And then he does something to justify what he has done. By this time he's getting pretty pinned in and he keeps on trying to do this thing. And then he eventually will be physically batting away from this thing as though he's trying to push himself off a wall, see, and the next thing he does, he does the only thing left to him – he blows. He has to leave physically, or he has to do something else physically.

Well, if he can't leave physically, he has a dwindling gradient of the things he can leave physically by not leaving physically. You know? You can leave physically, all right. But how do you leave without leaving physically?

Well, one of the ways – you could become groggy, see? You could become less alert. You could show people that it was wrong of them to have you there, see. You could show that you were pinned from leaving, you see, by developing a bad spine so that you couldn't walk. See, all kinds of wild solutions.

Now, these are the solutions that I'm talking about. The individual can't leave the universe physically so he tends to pile up all these solutions. You get married and you can't part company easily, and stay in the marriage but then leave the marriage, but not physically, see. Can't leave the marriage physically because that'd be too irresponsible, see, so you leave the marriage!

Now, if you want to see something complicated, it's the number of ways a thetan can leave without shoving off physically. And practically, psychotherapy is just a study of that. You can go down into making people sorry that they didn't let you leave, don't you see. You can make them guilty of having put you in a situation where you couldn't leave, by in your turn, appearing so nasty – that's a wild pitch, isn't it; well, they all have a wild curve on them like this, you see – by appearing so nasty to everybody when you were so happy before.

See, it's not necessarily an unimaginative set of factors, see. But the basis on which they're based is very, very simple. There's very – very little to this basis. Basis is: the individual commits an overt, intentionally or unintentionally, he commits some other overts and he goes a whole gamut of commission of actions. He never really stops committing actions but now he commits them with a negative reason. He commits them in order to get out of there. If he can't leave at all, now he has a whole bunch of solutions that go downhill from that point. I mean, you just get the wildest things. And it's really a study of assertive thereness right on down to not-thereness, and a sort of a gradient scale of these two factors involved.

And all of this – all of this being on communication channels and being like a communication channel requires communication of some kind or another to resolve. But we've got this factor of the regretted action or the regretted reach or something like this; we got this factor, and we've got the factor of the communication formula, both of them superior to the reactive bank.

Now, the reactive bank booby – traps this to some degree. Communication is mirrored in the reactive bank. There isn't any word "overt" in the reactive bank that I know of at this time. But the whole thing is just a study of overts, from beginning to end. The word "withhold" is definitely in there and it's in there so often that we must really cease to use it. Too restimulable. Too restimulated, the pc would get if you continued to use it. Substitute for it and you'll find out it actually works better, "What he didn't say." See. "What have you done?" "What haven't you said?" "What have you done?" "What haven't you thought?" "What have you done?" see. "What action have you taken?" and "What action haven't you done?" Don't you see? Just play both sides of the coin. Understand the principle rather than get the parrot rating, see.

And the word "withhold," although we have it around and although we wouldn't be able to root it out of our technology, actually couldn't – can remain in the technology but not in an auditing command. Because it restimulates the pc and you get false TA. You're moving banks around and you're getting false TA on the thing. It's just bank discharge is all you're getting. You're actually not doing anything. And it's really not bank discharge, it's tone arm action being occasioned by a GPM coming in and it eventually will freeze up.

I know that makes it sound grim but you're perfectly safe as long as you just don't use that word "withhold." It won't happen.

You can say, "What haven't you said?" You'll find out that you'll have a ball with that. That's gorgeous. You could even sort out the thing: said, thought, acted, not acted. "What action haven't you taken?" You could sort the thing out, see, and get the fellow right where he lived and by building up from that point, free him on innumerable points and knock out a whole bunch of these weird nonsenses. But of course, you realize that you can't do that easily unless you're in good communication with the individual.

Now, one of the principal factors that you bat your head against, then, in a case, is the inability of a case to admit any action or take any responsibility for action. If a case can take no responsibility of any kind for any action ever committed, that case is committed forever to the deep. There isn't anything you could ever do for that case. He's just buried in the five-mile Philippine Deep and that is the end of that.

But you understand, I've said take no responsibility for any action he has ever done. I'm not now talking about an overt act. See, don't interpret it from that line and you've got it pretty well won. But that's the lost soul. The lost soul who is being shredded between the worlds with a soundless wail is the person who can take no responsibility for any action he has ever done. And that is a statement of exactly where a case ceases to be within range of assistance.

This makes those things you can't talk to pretty irresponsible, doesn't it. Well, they are.

I can imagine a conversation, if you could achieve one, with a spider. The tremendous importance of the spider, the fantastic put-uponness of the spider, and the utter irresponsibility of every action the spider takes and undertakes, would be something that would drop your jaw. The inability to communicate goes along with the irresponsibility for actions. See, that's an index. Those two things go straight together.

As the ability to communicate drops out, responsibility for actions, as a factor, falls. As responsibility for actions, as a factor, falls, ability to communicate falls. Now, don't come around and write me a despatch sometime and ask me how to cure a stutterer.

That's a deteriorated zone of communications. It doesn't mean that there's anything fabulously in error about this individual. It does mean that there is some zone or area of an irresponsibility. Because those two factors rise and fall alongside of each other. They don't go on a scale, like the scale of justice; they go up in a pair of elevators. Responsibility for one's own actions rise, ability to communicate rises. Responsibility for one's own actions fall, communication falls. There they are. They ride side by side.

And Joe Spider out here in the garden, an examination of his responsibility for why he's in the garden and for what he's doing, and if you could get a heart-to-heart talk with him, which of course you can't because of this other factor – I won't say that you can't, maybe some of you someday will – this bird's not talking. Doesn't even make noise. But yet his concept of responsibility would be utterly fantastic.

Everything is all done. Actually, the reason he spins webs – he can actually see himself spinning webs and has very detached viewpoint, if he can see himself at all. And it's a mechanism that was laid into him by God. And he does this because of a compulsion that was handed him, you see, at this time. And the flies that get into the web are driven in there by some guardian spirit of spiders, you see, that had a battle in Valhalla with the *wahf-wahf*. And that's why they are destroyed. And the reason they are consumed is to keep the garden clean for *Jub-bub*. "Who's that?" Well, I don't know.

You find out that spider is not doing a confounded blasted thing. He doesn't spin, he doesn't eat, he doesn't do anything. He's a model of nothing. And he can't talk, see? He can't deliver any lectures on the subject of spiders. You see this? You see this as a factor?

Now, think of this – think of this when you see madman X leaping about in a padded cell, covered with his own filth and that sort of thing, and gibbering and yapping. And somebody says to you, "Well, if you really knew anything about the mind..." I don't know why they put this up, see. Well, that's the same mechanism at work in another line, see? "If you really knew anything about the mind, why, you could do something for that madman in there." Take a look at it.

Of course, they want you, if possible, to commit an overt against that madman. Then they've got you, see. But there you are looking at – here you're looking at the factor, "How mad is this man?" This is the first question you would ask, "How mad is this man?" Well, this man happens to be as mad as you can get into communication with him – as you can't get into communication with him. It's an inverse ratio, of course, in that particular instance. He can't – he can't make any sense, he doesn't pay any attention to you, and so forth. Well, he's pretty mad.

First thing you'd have to do would be to build up a communication factor across the fact of no responsibility at all. That's quite a trick. But you could build it up with mimicry, you could build it up in various ways. You could build it up by a timed hello: every day you come by and say, "Hello." That's all, just one. He'd eventually be over at the bars saying, "Hello." Might be six months, you see, but he'd eventually get at this. And providing of course that somebody else didn't do something gruesome to him in the meantime, why he would – he would eventually be able to recognize that you were different from the rest of the environment. You see, he'd work it out here somehow or another and he'd eventually start responding to you and that sort of thing.

And then, you'd have to find something that he did, something that he had done, something he really knew he'd done, something he could take responsibility for. And just expand that perimeter and you would return his sanity. There is no more complication in the basic theory than that. There aren't exceptions to this basic theory. Where the exceptions come in is how in the name of God you eventually bring this fellow about to talk to you. The gradient

you have to run in order to get this individual into communication with you. How you put it to him – how you put it to him, that you want to find out what he has taken responsibility for in his environment.

These are the factors that require genius. See, there's a bit of genius mixed up in this, man. You've got to think on your feet. This individual starts to go that way, you got to round him up and head him off and bring him back again, you see.

You say, "All right, now what part of your life did you like best? Oh, your early teens. All right, all right. Now, what did you most enjoy doing in your early teens?" See, you got it right there, see. He can answer that question. If you can find that question to ask, answer that question, up she starts going, see?

And then some nuttinesses start chipping off because his ability to observe what his environment is, and so forth, will again pick up. He's less in contest with that environment, you see? You've made an inroad on it even though he considers you a plaster angel that has descended just to assist him. Regardless of that, he has nevertheless made a crack in the environment.

So responsibility for own actions doesn't then merely mean overt actions. It just means actions of any kind. What can he do that he'd take responsibility for? The worse off an individual is the less responsibility he can take for anything. But the genius required is: Where do we hit this case to pick up its zone of responsibility? And those cases that are having a rough time... Of course, we hit them around here at a very high level with, such as, something like this, "Well, now what have you done that you know confounded cottonpicking well you shouldn't ought of been doing that you can take responsibility for?" See, that's more or less in that line. "What have you done around here that you really know you've done, Bud?"

"Ah well, *awa-wawa-wawa*." And then all of a sudden the guy will hit something and it breaks, you see. He starts to straighten out in this direction. But recognize that is a fairly high level of action. It pays you the compliment of considering you're sane – can take responsibility, but that your wheels were slipping for a while, see. That's the – but that's a high level of action.

"Have you done anything today that you know you yourself did?" Let's get this level of action now. Oh, that's another level of action, isn't it? All right. Now, there's an undercut, "Where have you been today that you know you have been?" That's done by reason of placement. Let's work up a gradient scale to where the guy decided to be someplace and was there. See, let's work it up on the basis of responsibility for placement of self, not even contest with the environment.

You see, there are various ramifications here that you can work on. There's various gradients. But this is not really the principle of this lecture. It's just this, you've got these two factors: Communication – and even though that's in the bank, the formulas of communication are superior to the reactive bank – and you've got the idea of responsibility for own action. And responsibility may or may not be part of the reactive bank; and it just wouldn't matter, if it was or wasn't. The truth of the matter is it exists as superior to the bank.

Responsibility for own actions, which is the very woof and warp of being a thetan. Can you decide to do something and do it? Can you be somewhere? Can you be out of somewhere at will? These are the abilities of a thetan. And if you can't do those things then you're slipping.

So where do you start somebody in to get those things done? And that's a very important question. So you've got two factors here which are superior to the reactive bank, which are superior to this universe and which are native to a thetan.

Now, I've always said that the overt act-motivator sequence was not necessarily true. No, it isn't necessarily true. It isn't true, but it fades out in terms of consideration higher than any other consideration. It goes higher and is still a truth after other things have become lies, before it becomes a lie. Do you understand? It's pretty high. These two factors ride right together. And it gives you all levels of processing from IV on down. And it gives you all levels of cases.

Now, how many ways you can go about doing this, how many processes you can adapt into this, how many systems as they exist in Scientology right this minute to achieve communication with the individual, how many systems exist after you get through to pull the rocks out from underneath some daffy consideration... Daffy consideration – that's obviously married up to the fact that it's the individual's doing something that is daffy, see. Those things will fall apart very easily to the degree that the individual can accept doing something.

And if you've got those two factors, however many ways there are of getting at those things, you have all these lower levels of processing, you have all these lower levels of case. And there in actual fact is no real excuse – no real excuse at all, for you to be in the dark about why you're not making progress with a case. Because whatever other factors are present, see, what other factors are present, these factors are more present.

See, it may be true that this fellow is so harassed in his marriage that he can't put his mind on anything of the... "What's he stuck in like that for?" is your first question. Not how terrible his environment is. Well, look at how he's stuck into his environment. All right, where is he stuck into his environment? Let's get a pc just talking one way or the other. We're asking him in effect, "Hey, Bud, where are you stuck in?" See, "What tank trap have you run into that you're still treading your wheels in," see, "you're skidding your treads in?" See, "Where are you?" is what we're asking.

Now, this individual is at his job, or he's at home, or he's here, or he's there, but he's being there all the time while he's elsewhere, see. He's really stuck in, you see. He's Rommel stuck in at Tobruk. He's so frightened on this front that he never has a chance to fight the war, see.

He's stuck in someplace. And just with general itsa and that sort of thing, you, very soon, very shortly, find out where this individual's stuck in. Now, the burning question is: Is what responsibility can he take in that zone or area – for his own actions in that zone or area?

Now, you frankly don't care at a lower level of case whether this individual is answering overts or unsaids or withholds or anything else. You just don't care about any of those factors. All you're interested in, really, is responsibility for own actions or responsibility for

lack of actions. What is he certain he hasn't said? That would be a very gentle entrance point. But of course you couldn't play that out question after question because it's an out of ARC process. You'd have to quickly shift on over to the other side of the picture.

You just get his responsibility for action in that zone or area and all of a sudden that house of cards will fall down. Sometimes it takes quite a little while to steer it around, steer it around, get it more real, you know, and get a better view of the situation. All of a sudden one will fall out of the hamper and you'll find out this individual is not now as obsessively worried about something as he was before.

Now, there's one thing that gets in your road as you go over this ground. And I will admit to this, that there's one thing that gets in your road. An individual can have a piece of the GPM keyed in to such a degree that it's driving him half around the bend, see. At the lower levels you'd just better leave it alone, at this particular time.

But I have done something by reading off a short list of words that possibly were authoring the condition and seeing if one read, and then telling him that was an integral part of the reactive bank that was influencing him, and it discharged at that particular moment and he ceased to become obsessively worried. That's another root on the same basis, see. But is not one that you would commonly care to practice. And probably is a little more dangerous than it is safe.

If you follow the other one around, you'll find out it'll apply very generally to all cases.

That's how you crack one of these cases, that's how you go about this sort of thing. And that's what in essence auditing is about.

One of the ways you can badger somebody into finally getting off of a certain merry-go-round is a very interesting one too. Of – I'd say there's lots of methodology about this, very interesting one too. You say to him, "All right. What have you done that you really know you have done ..." in that particular zone or area that he's worried about, see – "What have you done that you really know you've done?" in that particular zone and so forth.

And he tells you. "Wow, I know I've done this," you see. And he comes up, and you know, the glibness with which he comes up with this thing, he really has taken no responsibility for it. This is – the responsibility factor is lying there like a sleeping dog. The fellow might tell you glibly, but there's no responsibility.

The rebuttal on such a thing is to get him to explain to you for some time how he has not really done that. Can't play it too long because it's a cut comm line type of approach, don't you see. But you can actually get him to explain this. "Oh, I-I-I busted up the old man's car and ran it off a cliff, ha-ha."

"All right, very good. Well, how didn't you really do that?"

Oh, well, he'll let you in on it now. And boy, there's the most tortuous logic you ever heard of in your life as how he never really did that. He took the car, he didn't have permission. He was at the wheel of the car. He ran it down over the concrete abutment and into the arroyo. But somehow or another... No responsibility, see. It's a some kind of a solution to this

situation, you see. The responsibility factor – you'll just see it. You can sit there with your jaw dropped sometimes. He didn't really do it. He wasn't really in the car. The car just sort of whistled him over and made him sit down in the seat and... And then it's the old man's fault because the old man never had a restraining-from-the-curb thing put on the car that made the wheels turn away from the curb, don't you see. And it's actually the fault of Newton for pointing out gravity that made the car go down the arroyo, and...

It's pretty wild, pretty wild. But you get him to explain all this and all of a sudden it begins to dawn on him gently that he had something to do with this action. And you play around the perimeter of this thing, and all of a sudden it breaks and the case does a tremendous send.

The reason why you can't run straight O/W and get this tremendous send, because they're not really overts. The individual has no responsibility with them, you see? You get him to explain how he never did them, and we enter a lower level of responsibility factor. We all used to have it, "What part of that action could you have been responsible for?" or "could you be responsible for?" Don't you see, as a direct approach process. There's another indirect approach process, "How didn't you really do it?"

Little higher level, "What reasons did you have for doing that?" Get him to as – is all of these things.

And then don't let him get into a state where he's running up more, because you are the auditor and he's trying to look good to you.

A certain amount of genius is involved here on the part of the auditor. But knowing these factors and playing them one against the other and back and forth, and so forth, you could bust almost anybody out of these immediate environmental situations which have him doing such weird and wonderful things, and so forth and you had to have auditing actually below Level IV. Because you're using two principles which are senior to the mind – to all other considerations – for those lower levels, and you'll make it.

And I wish you some success when you're using it.

Thank you.

Audience: Thank you.

STUDYING: INTRODUCTION

A lecture given on 18 June 1964

Thank you.

Well, I'm glad to see you, too. What's the time? [laughter]

Female voice: June the 18th.

I'm getting so I think in terms of broader periods of time. It's quite amusing to me, but I notice the 16th took two or three days to go by and the 17th has taken two or three days to go by, and now we're on the 18th, so this is 18 June AD 14, Saint Hill Special Briefing Course.

The things are swinging along beautifully and it's quite a tribute – this is not germane to the lecture, the lecture is on something quite important, but – the lecture is about studying – but it's quite interesting that a very – a rather indirect tribute can be paid to the auditing of Saint Hill students who've been through their lower materials and come on up to the co-audit, and so forth. They have actually kept their pcs going, over a considerable quantity of by-passed charge.

That isn't said as a gag, you see? It's the truth, see. Because the top of the reactive mind, you see, the top of a GPM, is the hardest thing to find out what's in it. You haven't been over this – these humps, and you probably won't have to be, but just let me give you this in passing.

The hardest thing in the world to find are the top items of a GPM. I don't know how many potential oppterms and terminals were discarded before the actual ones were found, see. It's up – oh, I don't know, the arrangements of that bank are almost uncountable. You have, at the moment, a perfect line plot. That's why you're getting away with it. But the top of a bank, you see, the whole reactive mind would be equally hard to get to because the thetan is sitting on all that charge, you see?

Similarly, the top of a series, you see, would be the hardest thing to find the root words of, don't you see? And that is the scramble which has been going on before the thing was finally taped. It's very funny. I've got the rest of the root words of the series, you see? They just run out like hot butter, there's nothing to those. But getting those exact top ones, that was the tough one. And in putting that material in exact lineup, of course, we had momentary stumbles on the line of exactly what was this thing. Of course, you know, you could have laid off and knocked off and not done any auditing on this, you see, for a couple of years and let me have run the whole bank out, don't you see? But you were running this danger, is by the time I've run the whole bank out, I might not be interested. [laughter, laughs] Gag.

But it was a considerable tribute to the fact that there was – there was some missing elements there, perfect line plot they started with – didn't start with a perfect one, but had one within 24 hours – and the materials pretty well lined up, exactly how they went, what the patterns were, and that sort of thing. This was pretty well ironed out, but nevertheless, nevertheless, there were quantities of bypassed charge, huge quantities such as no co-audit will ever face again, you see? And the auditors in the co-audit actually were sufficiently smooth as auditors, and so forth, that their pcs just kept going along and they didn't have any big casualties or anything else.

Now, in the clumsiest look, they would have killed somebody with that much charge, see – the clumsiest look. And if their auditing had been the least bit crude, and so on, why, those people would have just been flying apart at every joint, you know. There would have been ARC breaks and rabble rouses and so forth, and max – mass exoduses and people checking out and... [laughter] You know, I mean, it'd been – it'd been horrible. Because if you can see the amount of catastrophe caused by just missing one item, and so forth, well, here they had a whole series missing. And yet they were auditing over the top of this and actually were making very nice gains and gave me yesterday afternoon a very beautiful series of reports. Everything was going along fine. [laughter]

Now, by George, that's pretty good auditing, that's pretty doggone good auditing. So I wish to give them a compliment right now, on the subject of their auditing. They must be awful good. [applause] All that's straightened out now, and I imagine in today's sessions the cases just took off like rockets. They must have gotten into the top of that other series and so forth, and it just must have run *swish!* In fact, I never saw anything connect up with such reads as the – as connecting up the missing element with what had been bypassed. That really shot the lot, rerunning it and connecting it up.

So the upshot of the situation was that I was very, very pleased with that. They're making terrific progress and everybody is very, very happy about this and very enthused about this. And I get a side note occasionally on letters going out of here and I'm not having to say, "This is it," now. "This is it" is a very, very calm statement compared to some of the statements I've heard going out of here on various lines. And there isn't, I don't think, any doubt in anybody's mind who is in the co-audit, they'll eventually make it. They may make it with only one leg or something like that, they're figuring at the present moment, [laughter] but they'll make it, they're on their way and the door is open, wide open.

All right, the situation with regard to auditing depends on another subject and that is a subject called study. If you can't learn anything, why, then you can't find out how to do anything. So just as I talked to you in the last lecture and told you that communication was not an end-all of processing but was absolutely vital if an auditor was ever going to get to a pc to do something for him, so it is true that study operates as the door, open or closed, to learning how to audit.

If an auditor can't learn anything, then of course he won't be able to audit, regardless of the attitude he has towards the human race or his wish to do something for people or his desires in any way, shape or form. These all would be barriered by just this one point – he couldn't learn anything.

So in order to teach somebody how to audit, it's necessary that they be able to learn. Now, this is terribly fundamental, awful. This is down there scraping the bottom of the barrel with regard to fundamentals, and yet all great successes are built on attention to fundamentals. Everything is built on a fundamental. Unless you can isolate these fundamentals, you of course leave your building with a – with an incomplete foundation. It's sort of sitting in the air ever afterwards unless you find the fundamental with which to proceed. You wouldn't build any skyscrapers if you didn't put down a foundation.

Well, what is the foundation? That foundation in auditing is, of course, study – the ability to learn. And failing that, why, an auditor has an awful hard time.

This next datum I am going to give you is something – is something I really don't want you to park behind the left lobe and skip, because this is going to make all the difference in the world to the future of Scientology. And that is a knowledge of this one point, this one point: That better than 50 percent of Scientology consists in the discipline of application, consists in the technology of application, consists in the know-how of application. And that's better than 50 percent of the subject – better than 50 percent.

Now, perhaps that datum is not very impressive, but let me – let me amplify this and I think you will see how that datum is impressive. You could give the entirety of the processes which have produced results in Scientology – and there are a great, big, many of them – you could give these in their entirety to a field of mental practice, carte blanche – that's just the processes, you understand, just the commands – and they wouldn't be able to do a thing with them. They wouldn't be able to get any result with them of any kind whatsoever.

They would turn out an asinine statement like the University of Chicago. It's a college. That's what we used to say about it at GW. We used to be tolerant about Chicago. Most of us wanted to go there because you only had to go a couple of years before they handed you a sheepskin and we were bored. But this outfit uttered this asinine statement: "We have tested all the techniques of Dianetics and found out it didn't work." Well, in the first place it's asinine because all the techniques of Dianetics didn't exist in published form and were not available to them to test, see? So right away, that was nonsense. For instance, I know of techniques that were released at the first Foundation in Elizabeth which have never seen the light of day; I have never seen them published or anything else.

Matter of fact, I saw three or four splinter groups suddenly start up on stuff that was merely designed to take care of one pc or something like that, and then they decided that this would apply to all pcs and so forth. There are several brands of therapy which are adrift today which simply consist of one technique developed for one pc at Elizabeth. So for any outfit – for any outfit to grandly look down its nose and say, "We have tested all the techniques of Dianetics," you know? Well, what a statement, see? They haven't got them to test. How would they even know if they had tested "all the techniques"? Right away they are irresponsible. And then to say they didn't work would also be asinine because if they had tested even sloppily, they would have gotten some result someplace, unless they were simply uttering a publicity statement to protect the vested interest.

But that is aside from the point. The point is simply this: Yes, they could have had all the techniques. They could have had them all. They didn't, but they could have. And they

could have, in their haphazard, bunged-up way, have tested these techniques and they wouldn't have worked, because they didn't have a Dianeticist in the lot of them. There was nobody there trained in the basic disciplines of Dianetics. And that was 50 percent or better of the technology which they might have gathered. Quite important, don't you see?

Now, give you another one: Reg and I, sailing around on the deep blue sea, invented a – dreamed up a course that was – had nothing to do with Scientology but had to do with business and commerce and nevertheless was a very broad application of Scientology to business and commerce. But the course was for another reason entirely and Reg thought this was a good idea, and he went ahead and he executed this course. And this course has been marvelously successful. It's running, I think, at the present time and it's doing fine, you see?

Only trouble is, everybody else is now trying to get into the act. It's a goodwill gesture. All this course is, is a nice goodwill gesture; it's trying to increase the salesmanship, and so forth, of retail merchants and their clerks, you see, so as to move more equipment and that sort of thing, see? That's what the course is designed to do. And everybody tried to get on the bandwagon, you see? There were other people started teaching this course, teaching their own courses to accomplish the same end, you see? And recently some company or another requested that Reg's course be taught to all of their staff and so forth. They get requests of this particular character.

But Reg made the broad statement there that is particularly applicable to this lecture, and so on. He says, "Well," he says, "you don't have to worry about any competition or other people giving this course. They'll start and they'll fail, and so forth, but they won't be able to duplicate the course."

Well, that's been the facts of the thing. This course could go on, they could (quote) "teach similar courses," do this, do that, do the other thing, but of course, they are always aware, if only this, that they are teaching a substitute, that they are not teaching the real one. And people are always faintly aware of the fact that they are not taking the real course in salesmanship.

Well, this in itself, you see, enters enough – even on the copyist – in the way of an overt or something like this, so that he then goes into an obsessive alter-is and the statement that Reg made was, "They can't duplicate it," becomes completely true. They can't and they won't duplicate it and that is the end of that. And that – these other courses have probably risen – I don't know what the history of this – I haven't kept up with it too well, but I think there are other courses have risen up and faded away by this time and a lot of enthusiasm has been generated in this quarter or that on duplicating this course and I think this course is still going on. Very successful. Probably one of the more delicate goodwill gestures that's been entered into by a company for a long time.

Well, of course, one of the reasons it's successful, it's somewhat oriented Scientologically. But that course wouldn't be duplicated and therefore wouldn't be tremendously successful.

Now, supposing they taught the exact same methods; that is, they used the technique or something on these other courses that are being taught which are copy courses of this course, you see? Supposing they did that, and so on. There would still be some element miss-

ing of some kind or another. That element would be the missing thing that would make the course that was being taught fail.

I don't wish to belabor that particular simile, but it is merely interesting, it is merely interesting that even there, even there on such a thing as simply teaching some salesmen how to be nice to their customers and that sort of thing, that this thing, too, fails when you move it out of its own perimeter of discipline. So even on a thing as slight as that, you see, that one fails, too; and so it goes along the line.

I don't know how much technology a university loses because every professor makes 90 percent of his salary by making the students buy his personal books. I think by the time you've rewritten James Watt, I think you've lost steam engines. And it's highly probable that there probably isn't a steam engineer in the world today that has really got the technology of steam. It has been perverted and twisted aside and misduplicated, and so on.

And I go back to some of these old boys that knew their business, and so on. One time I was covering an air meet and there was a fellow standing there – it was a bright sunshiny day and he was standing there with rubbers on and an umbrella. The umbrella wasn't unfurled, but he had that umbrella handy. It was a beautiful midsummer day, you see, and I wondered what this character was doing at an air meet – all these daredevil racing pilots and that sort of thing around; and I was covering this thing for *The Sportsman Pilot*. But I thought this was good side color, so I surreptitiously took a shot at him with my press camera and got his name.

His name was Young, and he was the second man in the world beyond the Wrights to fly. Ha-ha! He was probably one of the most famous early birds there was. My face was a little bit red, you see? He had become cautious in his old age, but in his day – I imagine his caution still didn't extend to flight – but in his day they used to fly a plane off the ground with an ambulance running along below it. [laughter] That's right! They saved more pilots that way. This was a man who was a wild man along this particular line. Well, I was very interested in talking to him; I did an article on him eventually, and he showed me his scrapbooks, and so on.

And I was particularly fascinated that there were 13 methods of flight, heavier-than-air methods of flight – 13 of them – of which the motionless wing was only one, and by the way, one of the less favored ones. And one of the reasons it was favored was because – at all or done at all is because it didn't take much mechanical ingenuity to build it. But there were twelve other methods of heavier-than-air flight-heavier-than-air; that's not ballooning or zeppelins. There's all kinds of methods of keeping aircraft aloft.

There's the principle of the rotating stick, that if you throw a stick in a certain way it'll hum – spinning, you know – it'll hum and you will see it curve straight up into the air. It'll do the darnedest ascendancy and that's just a rotating stick. There is method after method of flight of this particular character.

Because they concentrated on the one wing, it won, see? And you now have aircraft all over the world which are going along with this stiff wing out there from the fuselage, mostly because the early birds didn't have any of the wherewithal or anything else to build something

a little more esoteric or different, so it got the concentration of research and that is what we now call an airplane.

But it was interesting listening to old Mr. Young – who was designing these things back when – it was very interesting to listen to him on a tone of disappointment that they had chosen that particular one to push forward in research because it was one of the less workable and one of the less efficient.

Here was this vast body of technology, see, which had never been developed and which is lost back there in the first ten years of this century. All kinds of methods of flight; none of them ever went forward. Well, this one that was easy to do did get developed.

Well, it's very interesting that one of them emerged and went forward; that's probably the one thing one should look at. But it is customary almost in civilizations for a body of knowledge to come into being, then get grooved into a certain specialization – some piece of it, don't you see – then that piece of it poorly duplicated and the rest of the technology to be lost.

Boy, would I like to talk to James Watt on the subject of steam engines. He probably could tell you all about high-pressure boilers. See, he just didn't have the time, money, materials, to build one. But maybe there were dozens of methods of utilization of steam which have just been lost, you see?

What you're studying now is lost technology, lost technology. "Now," you say, "the civilization goes forward and wins anyway." Well, may I invite you to go almost in any direction from where you are at this moment at Saint Hill, for a distance of ten or twelve miles and try not to find the remains of civilizations which did not win. They are all over the place here – civilizations that are dead, civilizations that are missing, civilizations that no longer are with us. They are all on the basis of lost technology. They start specializing in one gimmick, there's nothing to amplify that gimmick, they finally lose the pieces of it and it vanishes. The civilization may be very well dependent upon that one gimmick; they have nothing to back it up. They lose it, in other words. Fascinating, the changes and turns and twists that these things take.

Now, you could say a lot of other things about these civilizations, but the only thing I am pointing out at the moment is they're not here. See, they're not present. We don't have them with us. And they were good civilizations as they went: the Roman-Briton civilization, the Danish civilization that was here, the Saxon civilization here – all these things terribly different – the Norman civilization that was here. They're all over the shop.

How about the Celtic civilization that existed before? Must have been quite a civilization. You read casually about wicker chariots charging through the Ashdown Forest. What's this – wicker chariots charging through the Ashdown Forest? Well, our good friend Caesar reports as such.

Well, this civilization has went. We know nothing about this civilization. It must have been pretty well advanced. And yet the scene of this battle, and so forth, is within about ten miles of Saint Hill. Well, where did that civilization go? What was it all about? That's a pretty

esoteric civilization – wicker chariots, see? Maybe some somebody forgot how to weave wicker. Who knows what happened to that civilization, see?

Now, the situation here is that technology gets lost and we have to study how it gets lost. And it's – gets lost because people can't study. That's really the only reason it gets lost. That's quite a – quite an interesting fundamental, to reduce everything down to that particular fundamental. We don't, then, go into the esoterics of "They couldn't duplicate" and "They couldn't this," but that's only why they couldn't study.

Civilizations tend to rise forward to a certain peak. And then under the stress of combat and the various elements and so forth, they start losing their technology. Well, they lose their technology simply because nobody studies the technology.

How about this fellow, the silversmith of England? England's no longer today turning out the silver it once turned out. Its silver craftsmen used to be very, very famous. And then they got a Labour government, and it put the tax up on silver to a point where British silver no longer could be sold. They might as well have stood the British silversmith up against the wall and shot him because he drifted off then into other trades and the technology became lost; and it's practically a lost technology at this moment. Now, this has only been lost in the last decade or so. You'd have to talk hard to a – to jewelry store managers and that sort of thing before you understand why it is that you can't buy silver. You can buy antique silver, you can buy yesteryear's silver; there are two or three of them still in business, and so forth.

Well, what about these fellows? There are fellows around who learned this and there are plenty of textbooks on this subject and that technology still exists but it's going to be lost. That's for sure, it's going to be lost. How about the one old craftsman who is left in the plant? You see, he knows all about that. He's surrounded by people, and all of a sudden there might be a resurgence in that. Well, everybody merely depends on him; they don't learn the craft. You see, they simply depend on him to know it. It all comes up against the dead end of not being able to learn, not being able to study.

Well, I always prided myself in being a very quick study, so I, myself, can speak from fair expertness in this particular line. But I know my own history on this and I know my own blind spots on this. When you become less worried about your mental status or something like this in the world, you can actually look at it and find out if there is anything wrong with it and dare admit that it could stand a few improvements here and there.

One of the things about study itself is that there are a great many things around that are false and you could study a lot of false things and therefore become disabused of studying because you had studied something false. This would be one of the reasons why you might cease to study. I really don't see that that has anything to do with it, except that it enters the idea of judgment of what you're studying. So if one studied without any judgment whatsoever of what he was studying or ability to evaluate what he was studying or know what he was studying, why, his ability to study would be very poor indeed. He'd just be Chinese in aspect.

Nothing wrong with the Chinese, but I remember going to school, the eighth grade, I think. I spent some months going through grammar school, all on different stations and places. And the situation that arose in the eighth grade was that nobody could get an A mark

except two Chinese who were in the school. And they had – they had learned how to study but so have parrots learned how to study if that is their study.

And they would get up and they would reel off the page number and the paragraph and everything else of the history book assignments, you see, and they'd give it to you verbatim. Most marvelous job of total duplication you ever heard of, but they would not be able to tell you what universe. And if you had – if you had varied one comma or asked for an opinion on that material studied in that way, they would have come a cropper at once, and very frequently did. They would have to remember whether it was in the middle of the book or the back of the book, as to what period that it applied to or something like this.

Most marvelous job of carbon-copy duplication that I ever saw, and it used to irk the rest of us, you see, because they would always get A-plus, and it held up such a horrible example to the teacher that the teacher would, of course, then give nothing like an A-plus to any mere knowledge of the subject, you see? So our renditions of it were quite rapidly thrown away and we usually got D. I'll never forgive them. [laughter]

But anyway, joking aside, these – this is – this is a case of perfect, perfect, complete perfect duplication without a grain of sense connected with it; and that's absolutely deadly, so that isn't how you study. Deadly! But perhaps you should be able to do that, but I would consider that a mental feat, and I don't think study has anything to do with mental feats. Study has to do with understanding.

Study has to do, basic and most formally, with just really one thing: willingness to know. That's the first little gate that has to be opened to embark upon study: willingness to know. If that gate remains closed, then you're liable to get into such things as the total verbatim, rote system; you are liable to get into all kinds of other systems, none of which will add up to any knowledge.

Now, when you recognize that in Scientology we have one thing – one thing – which is not very easy to put into texts and which may never be put into texts: the discipline of how you do it. But when you recognize that that one thing actually is difficult to transmit in – by the written word – and is very easy to transmit by example. And when I call your attention to an earlier part of this lecture, when I said that it amounted to at least 50 percent of what we were doing, and I'll point out to you that there's a frailty involved in the relay of this information that's the future success of Scientology, and that frailty is right there. It could very easily, very easily become an unworkable subject.

You could take all the GPMs in the world – what do you think would happen if you took all the GPMs and the total map of the bank and everything exactly right and gave it at this moment to psychiatry? I know what they'd do. They would immediately analyze Poe to see how many times one of these words had occurred in one of his books, and then get the fractional recurrence of and then try to explain why Poe was mad, or something like this, don't you see? This is probably what they'd do with this material. It'd be monkey tricks, you know?

I even thought vengefully one day of sending all of the whole plot to the American *Journal of Psychology* – which, by the way, would absolutely fall on its face and bound its forehead to flinders if I were to give them an article. That's one of the reasons why they're a

little bit mad at us. I have been soundly berated by them for not publishing it with them at least one of our case histories, because it would revolutionize all... You see, it can't revolutionize anything unless published in their magazine. [laughter] I've been scolded by them for this but I thought vengefully of just giving them the whole plot and let them publish it, see? And that would eliminate that. [laughter]

But the point, the point I'm making here, is that all of this technology that can be written down, and so forth, could be relayed with the same result of the University of Chicago: no result, see? Because it has this element missing from it: the discipline of how you do it.

Now, when I tell you that an auditor can get so good that a gross bypassed charge exists in a session and his auditing is sufficiently smooth that nowhere and on no student in that co-audit did it get keyed in – wow! See, this is an almost impossible auditing feat. That's walking around the edges of the lion's cage, you see, so neatly and adroitly that there didn't even have to be bars there. This is pretty terrific, see?

Well, what did that? That's auditing discipline. That's the communication formula, that's this, this is handling the meter, this is what you do with a pc and what you don't do with a pc, and so forth. This is omitting from the auditing sessions the things that Mary Sue comes down as GAEs on, on Wednesdays, on TV demos; weeding these things out, keeping that line straight – over 50 percent of it.

We must, at this particular time, then, do this rather superlatively well here at Saint Hill. Because if any serious goof existed on the part of any of those auditors in the co-audit, any such consistent GAE as we see when a person first arrives here, he would have just wound his pc up in a pile of junk because there was enough there to have jammed the pc into a pancake against the brick wall, see? There wasn't any slight bypassed charge to be triggered, see? They weren't even aware of the fact that it was there and they were auditing around it sufficiently smoothly that it didn't cave anybody in.

Well now, on the reverse side of the coin, on the reverse side of the coin, if they had had all of their materials absolutely perfect right at the outset and if their auditing discipline – their ability to audit – had been as poor as it might have been, with all the materials and technology perfect and the process being done, they would have turned their pc into a pale pink pancake up against the brick wall. Do you understand? That's the other side of the coin!

Now, if you appreciate that, you can appreciate the remark I make when I tell you that the technique is one thing but the way it is applied is what makes the car go down the road. And that thing is the most likely thing to get lost. So therefore, we're in business as long as an auditor can learn how to audit.

You see, you don't have to learn anything actually to run GPMs. You can be handed it on cards. Did you – you realize this? You could probably be handed it on cards and you could reel it off one way or the other in some kind of patter. You wouldn't even have to learn it, you know? You could just let it sort of go off water like the – goes off the ducks back, you see? You could parrot it, you see, from a – from a list or a card or something like this. You wouldn't have to be learned. You're not up against learning in that burrow. In fact, if I ever hear of an Instructor making some new student memorize a line plot so that he can run it better, I'll give him a GAE with exclamation points – the Instructor, see? That would be the most grue-

some thing. So actually, in that particular case the technology is not something you would learn. You wouldn't even learn the – what's called the technique – you wouldn't dare! It'd just kill the student; that'd be it.

If you ever have a – have a – find yourself, bird-dogged by a spy from the Federal – I don't want to be – pardon me, I'd – there are ladies present – why, just decide that he had better learn by heart – don't even pick out anything very rough, just give him one of the Helatrob line plots and tell him, well, he has to start in by learning that by heart. [laughter]

So therefore, when I am talking to you about learning, we're practically not on the subject of technology at all. We know what grade certain technology belongs in and so forth, but – I do it myself very often, write the process out rapidly below the meter, so that I can put my pencil – let's say it's a multiple question. I don't want to involve my wits, which should be involved with auditing, with remembering what question the pc is stumbling along on. I don't want to involve my wits with that, so I'll just write down the four or five commands, or whatever the thing is in rotation, and just stab the one with my pencil that is currently in action, you know; and when I come to the next one, why, I see that all is well and I look down at the paper and refresh my memory of the thing and give it to him again, don't you see?

Well, that leaves me free to audit; has nothing to do with that. In fact, there's tricks like you're running a multiple alternate question, and so forth; your positive is your index finger and the negative is the middle finger, and so forth, and just touch them with your thumb. Touch the positive question – you're on the positive question. Well, your thumb is on your index finger; negative question, your thumb is on your middle finger, and so on. You don't get mixed up that way, and you don't mix up the pc either nor do you have to sit there saying, "Now, let me see, what am I now..." you know? That's for the birds.

So frankly, aside from classifying and know where the technology goes, I wouldn't say there is anything to learn in that zone at all. You're not going to learn auditing commands. You know what type of command should be there, you're going to learn that but not the command. You're not going to learn line plots or GPMs or something like that. Well, this changes the complete complexion of, "What – what – what are we supposed to learn? Then what – what learning is he talking about?" I'm talking now about learning how to do it, how to apply it. See? That's what I'm talking about.

Well, it's quite fascinating that there's many a guy shows up, he just wants a couple of processes so that he can learn these processes, and so on, and then he thinks he's educated and he can go on his way because he knows he can apply those; and then somehow or another they never seem to work for him, and he's always missing as to why they're not working for him.

Well, what he should be learning is the subject of *auditing*. Bulletins connected with good indicators, bulletins connected with comm cycles, and this type of thing. What are the tools of the trade here? Where – what's the categories of these tools, and so on, and how are they applied and what judgment do you use in connection with them? Learn those well enough so you're relaxed about them. Now, that's something to learn. And yet, I guarantee you, that that consistently will get brushed off lightly in comparison to some gimmick or trick

or process, see? The person, in other words, will be very happy to learn what are the auditing commands for something or other but have nothing whatsoever to do with a comm cycle.

Now, a comm cycle takes some learning, man, as you know! You can't even glibly say, "Well, it *blah blah blah blah blah*, and it starts and continues and it finishes, and – and that's all there is to a comm cycle and now we know all that. All right, now what's the auditing command, you see? That's what's important."

No, that's not what's important. The auditing command won't work unless you arrive, unless it arrives with the pc. And it's got to arrive with the pc along with certain "How do you do it? How do you act like an auditor? How do you sound like an auditor?" That's the stuff, that's the stuff that gets it there.

Now, I had a recent experience which is quite amusing. I have my lighter moments and I decided that I had better make an independent study. There's no sense in getting too concentrated on any one particular point, and I was going along like a shot rocket in the direction of Class VI materials and working on them very hard and very concentrated and that sort of thing, but I didn't figure that was going to keep my mind that involved. I find – I felt I might as well take up another subject which was entirely independent, you know? Give me a nice shift of attention.

So some years ago I had incautiously and in a moment of weakness bought a course of photography. Of course, I've been at photography since I was a kid; a nice hobby, and I have a lot of fun with it, and so forth. And at one time or another, why, I've sold pictures and so on. It's just one of these hobbyist things that you fool with. I'd probably classify as an advanced amateur; one time I classified as a pro, when I was in college. Used to make a lot of money, *National Geographic* and so forth. I think there's some geography books around that still carry pictures of mine in them.

But the upshot of it is, that I decided that in view of the fact that my mind was very heavily in this direction, I might as well put it in another direction. So I took up this correspondence course in photography – the New York Institute of Photography, one of the best – and rolled up my sleeves, and found out I'd never gotten deeper than about the third lesson. So I decided I would learn a little bit about study and I would start and study this thing up and I would get myself pushed along the line and get all my lessons done like a good boy, and send it all in, lesson by lesson, you know?

Well, what do you know? What do you know? First time in my life I learned something about studying. I learned something very subjectively and very real about studying. The only reason I'm telling you this is not to amuse you particularly, but you might be able to use this. And it's just this: I began to wonder why I had stopped at the third lesson. I was tolerantly going on forward studying the remaining lessons, and so forth, but why had I stopped at the third lesson and why was I bogging here and there along the line? Because this was not going easy.

Now, of course, this is a very, very wild, occasionally very dry, very often very stupid subject, the subject of photography, because it gets into optics. Well, you want to take a picture, not study optics, you see? But optics are apparently something that people who want you

to know about photography hold very dear to their hearts and they nag you about, you see? [laughter]

And then there's the subject of chemistry, and chemistry is very interesting. There are numbers of chemicals and they have something to do with the picture appearing on the thing, but that's something you really don't know too much about. If you can walk into a darkroom and turn yourself out a good negative and a good print, who the devil wants to know anything about chemistry, don't you see? This was more or less my attitude.

But I went on studying like a good boy and passing my examinations at the end. Every booklet has an examination. And all of a sudden it dawned on me that although I'd been interested in this since I was 12 years old, I didn't know anything about it! Horrible, dark thought. I've taken pictures, I've published pictures, people have paid me good cash money on the line, my pictures have been on covers of magazines, a very slick fellow. And I don't know anything about this subject! It struck me like a thunderbolt! This is a subject I had been at, if you please, since I was 12, in this lifetime. And I suddenly realized I didn't know anything about it. And it wasn't a case of sudden amnesia or something. It was just... [laughter] "You what?" you know, and "It's – it's which?"

And I suddenly rapidly reviewed what my reactions had been and made a very careful analysis of the whole thing and exactly what had happened. I'd had a particularly great subjective reality on this. I was studying an allied subject; I was forcing all of you to study; I should know something about the subject of study. And so I had, more or less, to some degree, started out to learn something about study and I learned something right then.

The tolerance that I had toward them had brought me up to a point where I was perfectly willing to learn a few gimmicks from them, and that was the state of mind I had entered that course upon. I was perfectly willing to learn a few gimmicks from them. I realized that my arrogance on the subject has absolutely – unprintably unspeakable. My arrogance was absolutely fantastic!

But look, I've been at it since I was 12. I studied photography under some of the – some of the old boys that were kicking around at that time. Some of the government photographers and scientists up in the National Museum were patient enough to teach me about photography, I read books on the subject, read this and that, even worked in professional dark-rooms.

And the evidence was right in front of my face. Good heavens! People pay you money for pictures. I used to take pictures for Underwood and Underwood.

And I had always said that the trouble with my photography as I came on up the line – I had it all beautifully explained – the trouble with my photography as I came on up the line was they kept changing their methods. [comm lag, laughter] I had it beautifully explained. So therefore – well, actually, since I started photography, miniature cameras have come out, panchromatic film, different types of developers, flashbulbs have come out; they've changed all these things. As a matter of fact, they're changing one on me right now. I had one film made by Ilford so tame that I could turn out a fine grain negative on this stuff, and they went and changed the speed rating of the film. Now you can't get the old film, so I don't know how to do it now. I was – this was blame on my part, you see? They kept shifting materials on me.

And what had dawned on me is, what I was being struck with in these texts – because this is a good professional course, see; this is nothing for any amateur – what I was being struck with in the text was known by Mathew Brady in the American Civil War. The basics and fundamentals that I didn't know had been present in that subject since 1860! Had nothing to do with changing materials. I didn't know the first fundamental of why the picture got took in the first place!

And all of a sudden, at that moment, it dawned on me with a tremendous crash that I had been very arrogant and that I really didn't know all there was to know under the sun, moon and stars on the subject of photography; I really wasn't the world's past master on the subject of photography because I had gotten a few results in my day, but that there was something there to learn. That's what I was struck with. And boy, I buckled down and started to study.

Now, the speed of advance is very interesting: three books in three and a half years; eight books in two weeks. And one is prior to that realization and the other is post that realization. I suddenly looked at it last night and realized I was halfway through the course. Three and a half years it took me to get the first three of the fifty-some books that comprise the course.

Why was I unable to move through that? Well, I was studying something I knew all about. I could not bring myself into a relaxed frame of mind of "Here is something to study. Let's study it." No, I was studying it through this screen: "I know all about this. I know everything there is to know about it." Well, will you please tell me why the devil I was sitting there studying it, then? If I knew all about it, why was I sitting there studying it? And yet I was putting up this pretense of studying it. I was even pretending to myself I was studying it. I didn't realize that I was pretending. I thought I was really studying it, you see? I'd read it, you know, and so on. [laughter] But it was all from the viewpoint that I knew all about it. And my arrogance was such that I was perfectly willing to learn a few tricks from them, and I think that was very tolerant of me.

Now, the funny part of that is, in subsequent study and so forth, my whole viewpoint has shifted on the subject, the whole viewpoint of what I'm willing to take a picture of; and my critical standards of what's a good picture have shifted utterly. I'm even criticizing their examples of perfect pictures, see? Very critical, but very well-founded criticism.

I couldn't learn because I knew all – that I knew all about it, you see? Now, that passed from a realization that I didn't really know a thing about it; I had to get right back to fundamentals and study those fundamentals. Once I got those fundamentals in and had those fundamentals well studied, and so on, and moving along the line up there, then I got to a point where I was not only perfectly willing to learn, I was also perfectly willing to talk back. I wasn't in any slavish state about learning. I knew my fundamentals now. I could see where they applied, and so forth, and within the scope and limits of that educational course was able to talk up. In other words, I could have an opinion. I could now have an opinion, I could exert judgment.

I had no judgment on the subject before. I merely had some fixed ideas, just fixed ideas, and these fixed ideas told me that I really knew all was to know about the subject.

When I finally found out – the big breakthrough was I found out there was something there to learn – that I didn't know. It wasn't a matter of a few gimmicks. Then this reversed around the other way, and with hard study, all of a sudden made another breakthrough:

I freed my own judgment.

I'd talk to any of these birds now. [There are] texts there by some very famous photographers. Good, hard, tough slugging this thing is, but one of those guys, I'd say, "Ah, come off of it," you know? "You're talking like this, but this picture here, man, I – how come? Look, you've burned out all of the..." This would have been legitimate. He would have talked to me about it, too. I'd say, "Look-a-there. You've burned out all of the highlights. You just burned them right straight through. Why? You might even have at least remedied it in the darkroom, for heaven's sakes."

And he would have said, "Well, I didn't think anybody would notice."

I'd say, "Well, I noticed."

Critical. Not that criticism is bad, don't you see; but I developed a critical eye, did not have to slavishly say, "This is a picture by Sam Falk, *New York Times* magazine, one of the greatest exhibition photographers of all time. Therefore it is holy." See? Gone completely through that and up to a point of where, "That's an awful good picture. That guy really has a good sense of composition, terrific sense of composition. What the hell was he doing that day in the darkroom? Drunk?" See what I mean? And I could have put my point – finger on a point which I'm sure that Sam Falk himself would have agreed with.

He'd say, "That's right. I didn't even hold back the enlarger light on that burned off highlight over at the side, and it completely washes out that bird's features over there. That's right, you're right. Attracts the eye over to the side of the picture, not to the principle subject. You're right, could have been improved, could have been improved in the darkroom." He wouldn't have argued about it. Or he could have said to me, "You don't know how bad the negative is!" [laughter, laughs]

You see what I mean? Then this would have been a sensible discussion because in the meantime, by burning the midnight... dawn actually; I've been using this to go to sleep on.

But the point had come up here, where one's fixed slavishness to something was there because one really didn't understand it in the first place, so he had to have fixed opinions to safeguard himself.

"Perspective: Perspective is handled by making something dwindle into the distance. Well, there is – if I don't have something go 'dwindle into the distance,' the picture won't have perspective." You know, this kind of a slavish fixed idea on the subject of perspective. Not "There are a lot of ways to give pictures a three-dimensional effect." See, that'd do you a different point of view, see. And "Perspective is accomplished in several ways." A different viewpoint, see? Then, once you understand that, then you can look at a picture and say, "Well, that photographer had a good command of perspective," or "He didn't." See? You say, "This guy had stepped over here another couple of feet to take his picture, he probably would have had a different depth, and it would have looked a lot better," see? Because, look, here's a couple of advantages he could have taken that he didn't take.

In other words, you have a flexibility, you have a flexibility of route, so therefore you can have an opinion, not a fixed idea or a prejudice. There's a big difference between a prejudiced or a fixed idea and the ability to have an opinion.

An opinion could be based on many things. But when an opinion is based on an inability to find out what it was all about in the first place, a man looks like a fool, and he suddenly looks like a fool even to himself when he makes a breakthrough.

So that my ideas on the subject of photography were not resulting in a finished picture. That's one of the first things I suddenly recognized, you know? The lightning struck. That was not necessarily what broke me down on the line. I'd broke it down before that, but I recognized that afterwards. Well, a guy's as good as he can finish a picture. It doesn't have anything to do with anything else. It obviously can be done, so therefore, why, there it is.

And this also included overshooting the mark, which you might find interesting. Previous to this breakthrough I made and the realization that I didn't know what the devil I was doing when I took a camera. I know how to clean lenses and do all sorts of things, but I didn't know what I was doing when I picked up a camera. I mean it was just ridiculous to even think that I did. A few lucky breaks, you know, and you seem to be so hot, but what about this?

It's a bum day and you want to get a picture and if you're real shaky and you don't know your business and so forth, you say, "Well, it's a bum day. That's one day I don't get a picture." See?

Well, if you really knew your camera, you wouldn't pay any attention to the fact that it was a bum day. You'd say, "Oh, yeah. Well, all right." Bang-bang. "What do we want the effect here? Bright sunlight. Good." Bang, boom! You'd say, "That's kind of interesting; awful foggy out there. Well, let's make the fog a little bit worse, and let's get it – real spooky-looking picture," see?

If you knew your business, then you could turn the tool to your advantage, any which direction you could, see? You weren't the victim of everything that occurred. You weren't the victim of every little splinter on the road, see?

"Well, it's too bad a day. The sun's not out and – oh, we'll take that picture tomorrow or some other day when the weather is nicer," you know? Well, what's – what's this? You mean – this can – this can exist to such a big goof that you don't get a picture at all then? How do you like this?

And yet a guy would not be able, who couldn't say, "All right, let's see," pick up a camera and take a picture, see? He's supposed to get a picture. Well, he should know his subject well enough that he can get a picture. That's fairly easy. All he's got to do is put himself in the vicinity of what he's trying to take a picture of; if he knew his tools real well, if he knew his darkroom technique real well, he'd p... he'd get a picture. See, he'd get a very acceptable picture. Now, the degree of picture that you would get depends a lot on practice and that sort of thing.

So, I learned that lesson, too, in a big way, that the conditions of the activity around me did not necessarily monitor whether or not I got a result or not. "Pc nattery today, therefore we couldn't get much auditing done."

What the hell! Are you an auditor or aren't you, see? I mean that's it. Nattery pc, snattery pc – who cares? You're going in to do a session? Well, do a session. So it takes you a little bit longer to get the session wheeling. Well, get it wheeling. That's the difference, don't you see?

But these are the things I learned through this little side study, and it was – I found it, myself, very interesting to pick up a completely alien subject to what we are doing – it had been lying around for quite a while; it merely exists in the field of hobby – and find all kinds of applicable materials on the subject of study, and to find out that the first thing that barriers learning is the consideration that you know all about it. And if you want to build up a ridge on the subject of learning, man, that's it! Just consider you know all there is to know about it.

And the next thing – the next thing is, don't let your idea of what you know – this is most amusing – don't let your idea of what you know get contaminated in any way by the fact that you're not producing. You're not getting any result, see? You're not getting any result and this is quite – rather obvious to you that you're not getting a result, but this doesn't challenge for a moment the idea that you know, see? Yeah, this never causes you to question it for an instant. See, you're not getting a result; you know that you know; and the fact that you're not getting a result doesn't challenge your conviction that you know.

The other thing is the fixed – the idea of the fixed opinion. One has to have certain fixed opinions to protect the fact that he's stupid on the subject and that he can exercise no judgment of any kind whatsoever as long as he's mired down in a bunch of fixed opinions. And that afterwards, that judgment, then, depends on a freedom from fixed opinions and an actuality of a – of a good assessment. You know what you know, you know what you don't know, see? You know what you know, you know what you don't know. In other words, you're not fighting this chimerical thing. You're not protecting your nebulous reputation to yourself about how wise and how marvelous you are. You're relaxed on this subject, you see? You can say, "Well, there's one section of this I don't know anything about. Have to look into it some day." But at the same time this doesn't bring you into a feeling that you don't know what you do know.

Utilization of judgment, then, depends on a very thorough knowledge of a subject, and if you haven't got judgment on a subject, why, it's because you don't know the subject. That's just that. If you find your judgment is very often false or bad in some line, well, you must realize that this signals to you in some way or another that this – maybe you don't know all there is to know about this certain situation, see? If your judgment on it was bad, why, it must have been bad because of an absence of knowledge of the subject.

So, what it boils down to, what it boils down to is an auditor's ability to learn depends not necessarily on his saying how stupid he is, but depends certainly on a willingness to learn – just a willingness to learn. He's willing to learn, and so forth. And the biggest single barrier is a preconception that he knows that is not attended by any singular result.

For instance, let's hear a remark something like this: "Well, I – I know Scientology. I've studied Scientology a long time and I know it very well. In fact, I audit very well. Of course, I don't get very good results." Well, this is that thing – same thing in a nutshell: this – the fact that he isn't getting results – results can be gotten; he's heard of these things, he's seen

them around, and so on; results can be gotten. But this fact does not at all challenge his implicit confidence that he knows all there is to know on the subject, you see? Doesn't challenge him for an instant.

Well, of course, that's just a lack of perceptiveness. A fellow can't see. He's not capable of judgment with regard to his own skill. His judgment, then, with regard to what he's doing is at fault to that gross error. He is uttering the fact that black is white. He can't do it, yet he knows all about it. He knows all there is to know about doing it, yet he can't do it. Well, that's a silly statement, and that is the lowest ebb of judgment on any one particular subject.

You get into a – you can get into an area of examination of this sort of thing, you find out that nearly everyone is put up in some particular sectors to status. Status has an awful lot to do with this, you know? And he gets pushed up into a feeling like he has to protect his own status by a certain arrogance or pretense, even to himself He has to think well of himself, don't you see, by pretending that he knows something or appearing very clever to himself or so forth. He's really – really, you can head it under the heading of "self-esteem," one of the methods of bolstering self-esteem. Nothing particular wrong with this. I'm pointing this out in a very mild way. It's necessary that an individual feel somewhat confident in some direction. But it's also very interesting that this need for status and self-esteem evaporates in the presence of real knowledge and a real esteem takes its place. And it's that real esteem which is most impressive to self and to others because it's producing results. The – competence – there is no argument with competence, no argument with it at all.

It doesn't then really come down to a test of "What does a person know?" but it comes down to a test of "What can a person do?" And if you just adjudicate this on the basis of it's not – well, psychiatry should serve as a wonderful example to you in this, man. I hate to run these boys down because they are being kicked to pieces anyhow, but let me tell you, I have never been as surprised over things as I have been by that particular crew. It's not that I'm even terribly fascinated with what they're doing. But do you know, I read one time what an examination for a diplomate in psychiatry consisted of, and do you know, it only consisted of the date and the context and title and the place of publication of Freud's lectures! Not what was in them! Not "What could you *do* in the field of psychiatry?" But it was just that: "When was the lecture given? What was its title?" don't you see, and "What publication did it appear in?" And that's an examination for a diplomate, the highest degree in psychiatry!

Oh, some psychiatrist will come along because they're always trying to make a liar out of everybody, they come along and tell, "Oh, that's not true, that's not true, that's not true."

And you say – they're doing this down in Melbourne right now.

"Oh, that's not true, that's not true, that's not true. And well, he doesn't really know anything about psychoanalysis," and so forth.

"Well, does psychoanalysis assert that sex is the basic mainspring of life?"

"Well, yes."

"Well, does the article say this?"

"Yes."

"Well, is that true about psychoanalysis?"

"Well, yes; but, you see, Hubbard doesn't know anything about psychoanalysis."

"Well, what doesn't he know about psychoanalysis?" See?

"Oh, well, he wouldn't know anything about it, because he just wouldn't know anything about it," and so forth.

"Well, what psychoanalysis are you talking...?"

"Well, we don't know. There's various brands of psychoanalysis." [laughter]

You always would get into this kind of an argument. It's something like walking into a swamp when you – when you try to talk on this particular subject, you see? So it's not very sensible.

Well, I'm just pointing out to you that that is really pure idiocy – that's really pure idiocy.

One, could you learn anything from that lecture? And two, how have you been able to apply it? And three, if the fellow really knew about it, he'd be able to answer the next question. If he really knew up to this point, he'd be able to answer the next question: Well, what opinion do you have of it? What opinion do you have of that subject matter? See? If he really – if he really knew the subject and he'd studied that, and he really knew that and he could apply that, and so forth, then he'd have a free opinion on it. He wouldn't have to be protecting himself with his free opinions. See, it'd have nothing to do with esteem or anything else. He'd just have a free opinion on the subject, you see? In other words, he'd have judgment.

But if you fix it on "Give us the lecture and the date and where was it published and that's all you have to know about it," you know, you of course have taught the man nothing more than you could learn from a card-catalog system. Well, it doesn't have anything to do with doingness.

Well, in photography – which I've just used as a somewhat amusing sidelight to this to you – the test, of course, is whether or not you can get a picture. That seems rather obvious, doesn't it? That would be – it's different than in – well, you conclude photography now is an art, which is interesting, because it's only graduated into that field very recently. Metropolitan Museum, and so forth, has exhibits on it now as a fine art, but – didn't used to be.

Now, a critic could exist in the field of painting, merely through his knowledge of painters and paintings, and that sort of thing, and he could have opinions on the subject. These things would probably be very basic, and that's all very fine because here's a very wide, very complex field. And maybe you could have a critic in the field of photography who didn't really have to be able to produce a picture. Maybe he could just criticize pictures and maybe to a very good extent.

But the odd part of it is as you enter into a technical subject out of a purely artistic subject, this burning question comes up: How the devil would he know whether or not that was a good darkroom piece of work? He would have to be able to know what can be done in a darkroom, so he'd have to answer the question, "What is done in a darkroom? Is this better

than what is done in a darkroom or worse than what is done in a darkroom?" because you're up against this technical fact.

A technical fact intrudes here, unlike art. You can take a handful of mud and throw it at a rock and say, "That's a great painting." See? Well, maybe it does have form and design. Who would know? Because there is no real technical backup with regard to art at large. It's great, great, wide, huge subject, you see? Depending on, mostly, on whether a person is pleased or displeased with some form, color, object or significance. It basically forms an opinion anyhow.

But the second that you get into a technical fact, when you get into the technical line, well, you have to know what can be done, you have to know if it is done well, what is being done and what isn't being done, see? This, then, you would have to know pretty well before you could have much of an opinion on the subject.

In other words, there could be an art critic quite legitimately, but I don't think there could actually be a photographic critic who didn't really know his photography. See, he'd have to know his photography to be a – be a critic of it, because he'd have to know what the devil to compare it to.

And actually, there wouldn't be any auditing critic who couldn't audit. You couldn't criticize auditing if you couldn't audit. You'd have to know what could be done and what couldn't be done.

I think anybody that's been over the jumps of the co-audit here recently, and so forth, he'd be quite a critic of auditing – not on a basis of my giving an examination and finding out what he knows about auditing but just on the basis of the trial and error of just the last two or three weeks. I give you that as a very broad test, man. I don't think there ever again will be such a test, never again. Probably won't be that much bypassed charge, you see? But that's a terrific test; wasn't given to them willingly or anything of that sort, it just occurred that way. What a fantastic test! Those people must really know how to audit, see? That's the test, because under similar circumstances, you ARC break a pc on itsa – oh, you get the comparison; very simple. Ha-ha-ha, you see?

Well, God, all you have to do is drop a toothpick in R6 and you ARC break one. That must be pretty smooth. Now, I don't think there's anybody – doubts in anybody's mind in R6 that they aren't going places and that the technology in running GPMs isn't doing some fantastic things, one way or the other, for pcs, and so forth. The result is being produced; the result is being produced smoothly. It'll of course be produced much more smoothly and much more rapidly, as a matter of fact, with the top of the bank being cut into, exactly correctly. But even with that, it's producing results, see?

All right. Then that tells you that there must be an awful difference between a Level VI co-audit auditor and somebody who would ARC break a pc on itsa.

But I'm willing to make you a bet that the auditor now in Level VI co-audit, asked for an opinion of auditing, would probably give you a very honest, offhand, very certain, very firm opinion – *boppety, boppety, boppety, bop*.

You ask him something about, "Well, is that person's auditing good or bad?" or so forth. Or "Was that a proper way to do it?" and so forth. He'll give you quite an opinion, see? *Boppety, boppety, bop*. Wouldn't be any status connected with it, see? He'd just give you an honest opinion on the subject, you see? And you ask this person that can ARC break a pc on itsa for an opinion, he'd give you a couple of fixed data but he wouldn't be able to give you much of an honest opinion.

Something else that would be different, something else that would be different: I'll just bet you that a person in the Level VI Co-audit at the present moment, you gave him something to study and so forth, he could find out what was there and know what knowledge was there, without questioning whether or not it was good, bad or indifferent that he learn it or whether or not it was damaging for him to learn it or whether or not it was this or that or whether or not he knew all about it. You wouldn't run into much of that argument.

But the person who would ARC break a person on itsa: Don't challenge that arrogance, man. He knows all there is to know about it; he has known all there is to know about it from the beginning; he will notice all – knows all there is that will ever be known about it; he knows all this perfectly, and he would be deeply insulted if you even inferred there was something on the subject that he didn't know. Do you see? There would be this significant difference. If you asked him at the same time if he was willing to learn about it, well, he'd hedge. Of course, he isn't. He isn't willing to learn about it. He's on the false premise that he knows all about it. Well, you want to ask him, "Well, what are you there for? Why are you studying it then, if you know all about it?" This might shake him up.

But you only really have to shake up this point in that auditor. He isn't being bad, he's merely being arrogant. He lacks the humility of vast wisdom, and in its place he has the arrogance of "know it all," when he knows nothing. He doesn't even know what he doesn't know.

And there's the gates of study; they're right there. That's the gate of study. That's the gate you got to crack, that's the one you got to kick down before you walk any road in toward any subject. And I don't care whether that subject is auditing or photography. I think you would hold – it would hold good uniformly and straight through, and so forth.

So I've been over the jumps on a completely alien and different subject and I have found certain things held true and I compared them to the experiences I've had in trying to relay, interpret or teach Scientology, and so forth. And I've found that they held good. I've found out that they held good straight through. I can give you dozens of case histories and I can't really give you a lot of exceptions outside of this field, and I can even tell you – you say: "Well, there's the case of the fellow who can't see, and doesn't know the language," and that sort of thing. I don't know, what's the matter with him that he can't see and doesn't know the language? He must be arrogant indeed! Very, very funny, but you'll find that that would hold good, too.

If you don't believe it, talk to a field mouse some day. Talk to a field mouse about the ways of man. It might be a very entertaining conversation, if you could talk to him. And there, man, you would find arrogance. Electronics, nuclear physics – he's never heard of them but he knows all about them. [laughs]

Cause Level, OT And The Public

A lecture given on
30 June 1964

Thank you.

Well, this is the what?

Audience: 30th of June.

Thirtieth of June. What year?

Audience: AD 14.

AD 14. All right. Saint Hill Special Briefing Course. And I haven't got anything to talk to you about and you know it all anyway and the last lecture I gave, you got nineteen on the grade. Gave me a lose, man! And everything's going to pieces all over the world, Melbourne particularly. Nothing's happening in Melbourne. What could happen in Melbourne except a kangaroo stampede? [laughter, laughs] You can see them now, loping through the streets! [laughter]

My respect for Melbourne went downhill when one of their main banks didn't know what a Swiss draft was. And I thought to myself, well, I'm going to stop worrying about... Actually somebody the other day from Melbourne university went onto the inquiry stand, and testified at a vast rate and said, yes, the E-Meter did what we said it would do, and it was a good grade of galvanometer. I think he said something like, "One of the best of that type he'd tested." Must have been a horrible lose for the medicos. They couldn't get him to say anything about it except it just was a galvanometer and it worked, and it was fine and it was well-constructed, and – and there are lots of other galvanometers, not as good as that one. Shock. Shock wave must have gone through the entire profession.

Well, I did have something to talk to you about, now that I think it over very carefully. And what's wrong with you – there's something wrong with you, of course – is just this: You're so bird-dogged onto the dazzling glories of OT that you're going to leave the rest of the human race hanging in midair between the bottom rung of the ladder to OT and the ground. Because the bottom rung of OT does not sit on the ground. There's a large gap between the ground and the bottom rung. And there's another ladder there. And you try to climb the upper ladder without letting anybody climb the lower ladder, or try to get people to climb the upper ladder without letting them climb the lower ladder or showing it's there, there's go-

ing to be an awful lot of people walking around in circles thinking you're nuts or we're nuts or it doesn't work or it's too horrible or something is all wrong, and it'd be something like there's a big amusement park but they can't find the gate to get in, don't you see? There's all kinds of weird randomness and dev-t is about to develop on this one point.

Because most everybody is thinking and gets bird-dogged onto and fixated with the idea that OT starts from the ground. And OT doesn't start from the ground, it starts from the top of another ladder. So that the public at large is going to have its attention centered on the second ladder and everybody's going to be sweating and working to get them to climb this second ladder and selling this second ladder and talking to them about the second ladder and getting them all whipped up about the second ladder, don't you see? And hell, they can't find any second ladder. There isn't – can't find any ladder at all. Because their attention is not being directed to the first ladder.

And the first ladder could be called "cause level." Now you-uns has been working for many a year to get people to be causative. We've had the definition for a long time. Now, an OT is cause over matter, energy, space, time, and God help us, the whole universe, see.

Well, that's very, very intriguing to take a look at this. I don't know how anybody's mind can short-circuit to this degree, that with great ease he could vanquish the sun and the stars but is having a hell of a lot of trouble with his wife. [laughs] And there in actual fact you have it in a nutshell. You're asking him to take care of Pluto when he has an awful time pushing a cigarette lighter across his desk.

Now, if you can envision an expansion of reach from an inverse self – a not-imagined, unbelieved self, which he can't reach because it ain't, because he doesn't know – you know, this kind of thing. You know, a – he's – he actually sort of has to reach in in order to try to reach out, you get the idea? If you can imagine a reach that this is this confused that a person doesn't even know which direction to go to get it, why, you've got Level 0. And you got about ninety-nine percent of the human beings that you will have anything to do with on this planet. And you've got him right there.

For instance, they're following a pied piper right now called science. And science plays a lively tune and they play it with very glossy photographs. They play it with very good advertisements. They play it with great big, imposing universities, huge facades built out of gorgeous marble, imported from South Debuque. They've got themselves a pretty good face, see? Big stuff. People's cars go whiz-whiz down the streets and the petrol that goes into the engine will make it run at vast expense. They've got it up to a point where an engine can actually utilize – well, it utilizes over a thousandth of the potential power in a gallon of gasoline.

They've got it fixed up so they can color your health bread by certain breeds of mold, and so they can get appropriation from other breeds of mold called "Congress." You've got yourself quite a – quite a game going here. It's called science, and you yourself are not totally aware of the fact how that cuts your personal throat. Now, we're indebted to science but only in its branches of mathematics and some of its physics for the materials of Scientology. But we didn't go down the blind alley. And the blind alley is this: is man is a machine. Man is an inanimate piece of matter that somehow or other became ammoniated.

This whole facade leaves out of it the essential ingredient – the being himself. Man is an animal. Man is a thinking brain. An image comes in the eye and is reflected on a projection screen on the back of the skull which is looked at by another computing projection screen which is looked at by another computing rejection screen which is looked at by another screen which is looked at by another screen which somehow or other results in people liking Wheaties.

And if you look over scientific thought on the subject of life, you'll absolutely be flabbergasted. The fields of biology are nothing but classification sciences. There are two types of sciences, extrapolative and classification. One type of science, which is physics, mathematics, and so forth, is one which derives answers. There is another type of science as described by Roger Bacon. And when he set it up – and he set up this type of science – and he describes it by laying out botany as an example. He said you could dream up this type of science, and then he said if you wanted to put one around the subject of flowers you would go at it this way – he just used it as a passing example and that today is botany.

Classification. Classification sciences. If you know the names of eight hundred thousand gimmicks, it is a science. See, it's not a science actually at all, it's some kind of a dictionary. And when they don't know anything they name everything. See, classification sciences. And then there's classifications, and sub-classifications, and sub-sub-classifications, and sub-sub-sub-sub-sub-classifications. And they call that a science. But it's not extrapolative, it doesn't let you learn anything.

And man, to modern science, is simply a classification science. And if you don't know the right name for the nonexistent parts of the brain then you know nothing about the mind. And that's where they've got you, a Scientologist. And that's why you're downgraded and that's why you really don't know your business, because you don't know the parts of the brain and you also don't know that they add up to a subject called "the mind." You can't go around spitting out, "This is the medulla oblongata and oblagata," and so forth. Medically, you can't go around spitting out, "This is the tibia, this is the gluteus maximus," don't you see? These are classification sciences. But that word "science" of course is added there as a total falsity. It isn't a science, it's hodgepodge.

Now, I'm not degrading these people particularly, I'm just showing you where they sit, with all their glossy facade. With all their hard sell on the subject of their great knowingness, and their great authority. They are yet, in the field of the mind, merely a classification science, and they've gone off on the wrong foot, they have got the – man mixed up with the – with a steam engine or something, and they try to analyze everything that he does on the basis of a steam engine, and they try to understand the mind on the basis – and this is their big mistake – on the basis of the conservation of energy.

Somehow or another nothing is ever developed and nothing is ever destroyed. So we have – we have then this thing called conservation of energy and the field of physics being applied to man. And when you try to understand man through the viewpoint of conservation of energy, he doesn't make any sense. See? Because you have to understand him on the basis of something would have to be done to him before he could do anything to anybody else. In other words, you'd have to fill up his gas tank before he could do anything, you see? And

then, of course, because this isn't true, then the stimulus responses, which they figure out, aren't true. Do you see how it follows, then? They're going on this untrue basis that man never creates anything, you see?

You couldn't understand the mind if you didn't realize the individual himself was just an individual who was capable of creation, see? And if you try to say he can never create and this is all just conservation of energy, that energy is never created and never destroyed but just exists, you immediately have misunderstood the whole subject. You say, one, man is a machine, not an individual or living thing, he's just some kind of a machine that gets pulled together out of the ammonia and proteins, you see.

Now, if we go that one more step and say that he never manufactures anything but it's all a stimulus-response sort of a thingamagoo and you have to put energy in to get energy out, you feed a guy a pound of steak you get so many foot-pounds of work out of him, don't you see? If you figure it out that way, why, you're bound, then, if you study the subject at all, to find out that the stimulus responses which are occurring aren't occurring. Don't you see?

So then they say, well, he's totally incomprehensible and nobody can understand the subject. Well, after you've laid down two conditions – man is just a sort of a brain machine and he's no other being; we've la... we lay down that condition – and then we say he never creates anything, you see, so therefore the mind is something that is put on him – he never put it there. Then of course we come to the third conclusion – after observation we find out that now we can't understand anything about it, we come to the conclusion that it's an incomprehensible subject. So therefore we just sort of sweep aside the humanities and we say it's an unworkable, stupid field, and we will simply keep classifying it and appoint lots of authorities in it and somehow or another squeeze by.

Now, along you come as a Scientologist and you say, one – heresy – man's not a machine, he's a thetan. See, he's a – he's a being. And we will just carry it back to this point. He is a being, he is a livingness and he records and thinks. And the individual is that thing, is this living unit. And then you say – well, that sort of shoots it, don't you see? They say, "Well, what about this thing? Yeah, what made it? Ha-ha-ha-ha." Well, we say, "I'm sorry, we've taken that as our basic point of assumption because we can demonstrate it. See, we're not interested in what made it, we're just interested in what it is. And there it is." Well, he says, "You're crazy then, because it doesn't agree with this other conservation of energy principle," don't you see? Nothing is ever created, nothing is ever destroyed, some – everything just exists, you see? And everything is sort of matter existing in space and a time stream, you see – he's all messed up.

Well, he's therefore in rather violent disagreement with what you're trying to tell him. An individual is an individual. You take the body and brain off of him, he's still standing there as an individual. You put the body and brain back on, you've still got the same individual, slightly more confused, see. You could probably exteriorize him, have him three feet in back of his head looking at his body and so – and he'd say, "Wow!" you see, be totally convinced, and then yo-yo back inside again a couple of times and get very confused and then decide to have nothing to do with it because it's so far beyond his understanding of the way things should be. So – because he's devoted to this thing called science. That's his basic training.

Science has certain criteria. One of them is this thing called a conservation of energy. Energy is never created.

Well of course, now you say, this mind, where's it come from? Well, the guy's mocking it up, see? Because this being is capable of native, pure, from-nothing creation. You know? Out of whole cloth he can mock it up, see. And that's his mind. Well, now a lot of us have an awful hard reality grabbing onto that. I mean, that's a rough one. You get a GPM gnawing half of your skull off and it's – doesn't console you a bit to say – sit back and say, "Well, I'm just creating this," because it's on so many vias that you really can't believe it, you know? So you say, "It must have been done to me." You go around, "When was I implanted with this and how does it still exist?" You know, all kinds of wild little oddball things keep entering your skull. Well, if you can get into that shaky state and so forth, well, don't blame somebody else for not accepting the truth of the matter which is the fact that man mocks up his own mind.

It isn't being fed to him in big chunks. He's doing it right here, right now, this instant. All right, you'd run into immediately conservation of energy. This immediately disagrees with any way he runs his automobile. You got to put so many gallons of gas and so many gallons of – quarts of oil in the thing and it consumes it. And it'll only run while it's consuming. Well, he proves this, this is easily proven. Because you take a body and you don't feed it and it'll collapse. So that "proves" then that man is incapable of creation.

Do you see how wild that logic goes? It just shifts. Because right away you say, "Well, you see, he isn't his body." Well, they've forgotten that condition. So you have to feed a body, so a body then does act like a machine, because the person collapses if you don't feed him. Do you see how this wobbles?

So therefore it becomes incomprehensible where this thing called the mind came from, so therefore it probably doesn't exist so the best thing to do is to cut his brain out. See, it can't be a mind, which is different than his brain. Do you see why it can't be? Is because there isn't anything there but the brain that could be given or shoved at this fellow. If he eats food it turns into a brain, doesn't it? Do you see how the short-circuited logic goes through here?

So, obviously then, there must only be the brain. So when you, a Scientologist, say "mind," it is received by the classification authority – who is pretending to be a scientist – it's received by this authority as you've said "brain." See? You say "mind," he receives "brain." Now, you say, "Well, we're going to run out a section of his mind that is troubling him." He says, "It is easier to cut it out with a knife. Why run it out?" Do you see how you're at cross-purposes in any discussion here?

See, he's arrived at these conclusions because if he feel – if he follows the total dictates of what we call modern science, then he will arrive in exactly the same trash heap with regard to the humanities. See, he cannot follow their rationale – conservation of energy, nothing is ever created, you know – he can't follow that rationale and arrive with any answers with regard to man. Because he's already put himself into two untrue conditions. He said the individual sort of leaps spontaneously from the maternity ward, that's how he comes into the world, and then he never produces anything or he never creates anything. So obviously, then,

the only thing that's there is something that has to be fed that operates like a machine, don't you see?

So he makes these various errors and then gets very upset with you because you say we have some answers to the situation.

Now of course, you can go ahead and prove him wrong by getting a result on a pre-clear. And of course you're using the basis that this pre-clear is himself a thetan who is capable of creating and who is putting his mind up there all the time and who's making mental image pictures of every accident and pulling them in to his bosom. And you straighten this out, now he'll be even – perhaps even more upset. Because he's way adrift now, he cannot understand how you do it. You could go over it very carefully with him. You could say, "Well, you see, this guy has an accident, you see, and he bangs his head on the door. Well, to some degree he's still stuck on that door banging his head, you see, and he has a picture which is in – held in suspension in his mind." He says, "Well, where can this picture be in his brain? He only has brai..."

You get the idea? His mind will short – his training level short-circuits off each one of these points and caroms off it.

You're not talking about the fellow's brain, you're not talking about his forehead. You're saying this individual hit his forehead into a door and he's got a stuck picture. At the moment he did that, why, he made a picture of hitting his head into the door and he's still got this picture, so therefore he has a sensation of still being in the door. All you've got to do is get him to feel the walls where he is and he'll find out he's no longer stuck at the door and there goes that headache.

Ah, but you see how the fellow you're trying to explain it to has now gone adrift? He's gone wildly adrift, painfully so. It'll give him a headache. So he falls back onto standard healing because it fits the idea that the body is a machine and that a being is nothing but an animate brain or computer, some kind of a biological computer, and that it's incapable of creation. See, there's nobody around who took a picture of him and handed him this picture. He – so he couldn't have a picture of the door.

You'll find them berating – I mean, yeah, the fellow, "We know all about mental image pictures." I've had – I've had guys do this. This is – there's some bird that copies our stuff in international news services. Doctor Chary or Cheeky or something, I don't know what his name is – I really at that time didn't know what his name was. And some Scientologist a while ago challenged this bird because he'd just taken a good slab out of a PAB and he was barking away with this thing and writing up his column – Mr. MD writing up his column – and he was having a good time with this column, and the Scientologist said, "Well, you just took that out of a PAB." And he wrote him back a letter and said, "Of course. Yes. Naturally. Yes." I got the letter, see. Yes, he'd taken it out of our PAB. But also there was something else we didn't realize about the thing, that doctors didn't use this. And they knew this was all true, but they didn't use this. And they didn't pay any more attention to it and then he gave a whole bunch of spurious reasons why they couldn't use this and so forth, and it all added up to the fact they couldn't understand how it could happen that way, so even though they knew that it was valu-

able and did happen that way they couldn't use it because, you see, it doesn't follow their rationale of thought.

In other words, their rationale of thought is more important to them than an end result. So we get the next difference between ourselves and the humanities. The end result is more important to us than how we arrived at it. You see? We're only thinking of how to arrive at the end result in order to produce the result. In other words, we're not doodle-daddling just to be doodle-daddling. And that's very easy for them to misunderstand. The gracefulness with which you do a transorbital leukotomy might be everything with them and it'd be very, very hard for you to figure out how that could be everything with anybody.

But if you think of sports it'd become less hard to understand. There are some sports – this guy never wins a tennis game but he has marvelous serving form. His idea – his idea has nothing to do with winning tennis games, you see. His idea is to have terrific form while playing tennis. You get the idea? So their whole – their whole attention might very well be on form. It might very well be on how gracefully you follow the authorities, see? It might be this and it might be that. And the reason it would get this way is an end result has been totally denied them. And they have no end results. So they've begun to believe that there are no end results in the field of the mind. So you come along and you say an end result can occur in the field of the mind. Well, that immediately makes you an heretic.

Then you say, well, actually you have to follow along a very exact discipline to get this end result but the end result is what is important. This person's – no longer has a migraine headache at the end of this thing. All right, they say. They don't believe that. It's like leukemia. We have several cases where we've cured people of leukemia. And they inevitably prove that this isn't so by saying, "Well, he must have been misdiagnosed by the medical doctors in the first place." They say he couldn't have had leukemia. And you say, "Well, why couldn't he have had leukemia? What's the matter with you?" And they say, "Well, he couldn't have had leukemia, you see, because it's incurable." You see, that's by definition. See, that doesn't even make sense.

Well, what are they trying to do? They're trying to protect authority in an unworkable rationale that they themselves down deep know have failed. They know this thing has failed. They know it's gone. Their question is, "How long can we put up the big bluff? How long can we go on kidding ourselves? How long can we go on getting fancy appropriations for not doing our job?"

Don't tell me – don't tell me that an analyst who's been pounding his brains out for ten years and has seen patients committing suicide and going out windows, and busting up and going into insane asylums and that sort of thing, don't tell me that this guy – that any human being could be so stupid as to not be able to observe after a while that he wasn't getting results. See, he – after a while, even he would have to notice this. And you talk to these boys and they are very – they're very loathe to notice this. But even after a while they must notice it.

Then you come along. And then you come along. And you say, "Well, well, you so-and-so and so what we got to get is an end result here. What we got to get is a migraineless being. This person has chronic headaches. All right, well, let's get him over the headaches,

you see. Let's see what these headaches consist of and let's get him over that." And you go ahead and do it.

Ah, but they haven't been invited to the party. That's the next thing that's horrible, that stands as a terrible black mark against our faces. They haven't been invited to the party. Well, actually they were invited to the party but they couldn't accept the first two principles. You had to wear a tie and jacket to come to this party and they wouldn't wear a tie and a jacket so we threw them out. Do you see that? It's just as elementary as that.

When they were invited to the party they stood around and argued madly about something we already had to assume. For instance, that man was not a being dependent on a body. They couldn't assume this, so they never really came to the party, don't you see? They never got off that first launching pad. So they never started in on this line. And they never will start in on the line. And they regard you as an ogre who's going to eat them up. And if you were to listen to a small group of them sitting around in some large capital in the world right now and the subject were to come up, Scientology, it would be a note of fear. Disgust, viciousness, cross comments and a note of fear. They would be upset. Because they know their position has not been workable. And that they are not giving the service and that they are sitting in there, and here is a group that if anybody ever got wise to the whole parade would simply take over and eat them all up.

And it doesn't do any good to try to invite them to the party and say, "We'll try to keep you in business and..." or anything like this or "We'll be happy to train you," or "We're not trying to shoot you down in your tracks." It really doesn't do much good because they themselves are not aware of the genus of their own antipathies, they are not as analytical of their own situation and so forth as I have just been, you see. They merely know they're upset and they do know that this will – this will take it sooner or later.

The breakthrough will occur. And when it occurs, they're lost dogs. They'll be as dead as yesterday's newspaper, professionally. They complain bitterly about the fact that their income is being cut into very badly. And frankly, a note of pity came through the other day. "Well, the poor psychologist, after all, all they had was testing and we took that away from them."

Many of us do and will start to feel sorry for the poor sods, don't you see? And go ahead and feel sorry for them, but don't go into any snit of not comprehending what it is all about. They were invited to the party but they wouldn't wear a jacket or a tie, see. And that's just about all there was to it.

You had to accept these two things to get a workable result. One, that a being was an independent thing that could exist independently of a body, and the other was that an individual was capable of, you might say, autocreation, all by his little cotton-picking lonesome. And by doing this he develops himself a thing called a mind which has mental masses and spaces and so forth in it, and he builds himself a little private universe all of his own which he carries around not inside of his skull but plastered all over this other universe, and that is the thing which we are going for.

And the other point that we go along on, because we do have these two bases on which we work, we can then go along for a result. And we have become less and less tolerant

of resu... of lack of result, you see? Less and less tolerant of lack of results. You'll find it getting more and more recurrent. "Well, it couldn't have been too good a session, the guy still had a headache," you know? That's the thing. But you'll have somebody say, "Oh, well, you see, we got a hundred and ninety-five divisions of tone arm action. I can't understand why..." Somebody's looking and standing back there, he'll say, "Somebody's lying in their teeth," you see. The guy still had a headache. So he did audit the whole session with his little finger at an angle of a hundred and thirty-five degrees to the horizontal tabletop, you see. At the end of the session the guy still had a headache, you see. That's an incontrovertible fact to us.

Well, we find it hard to understand that a profession or an activity could exist where that would not even be any part of the situation. Because a situation which has gotten as many failures in the field of the mind and thinkingness and so forth as the present occupants of the throne of course lose to view the completed cycle of action. They've not completed the cycle of action ever so they're sort of habitually never complete it so they never look at the result. And they will tell you the elegance with which they did the operation, you see.

Now, I've had these boys brag to me about the elegance with which they did the electric shock. You see, it was, "Well, the records were all kept." I've had a mad-eyed psychiatrist telling me this, you know, and remembering that I myself being an auditor could handle him if he got more violent, you see? [laughter] "Yes, but the records were all kept. Look at the records! Looook at the records!"

"Well, what – what about the records? What do they prove?"

"Well, you should keep records!"

"Well, we keep records. Well, what – what – what about these records? What – you ever examine these records? See if they ever told you anything?"

"Well, they're nice records. Look it. There are columns and they're kept here and..."

You think I'm gagging you, but I'm not. I'm giving you almost an exact duplicate of this confounded interview. One of the foremost psychiatrists in the United States. Big name. And he finally said to me – I kept asking him this nasty, stinking, niggling auditing question, see? "Have you ever learned anything from these records?" And he finally tossed one off sideways to me, if I've told you about this before, but I haven't ever thought you would believe the degree. Finally, he answered the question, "Yes, we found out that if we hadn't treated them they'd have been gone from here six weeks earlier than if we had treated them. Yes, we found that out. But aren't they beautiful records?" And the guy – it had just gone right over his head, and so forth. He'd just said if you'd kept your cotton-picking hands off of all of these patients, if you hadn't done a doggone thing for any of them, the average, they'd have gotten out six weeks before they had gotten out. In other words, that all the treatment had ever done was cost the state per patient an average of six weeks more food, clothing and shelter. In other words, he'd extended the madness. And it didn't seem to have any bearing on the situation.

The end – that – it's pretty loopy. So you get into that much loopiness, you don't want to have too much to do with it and so you never really take time to try to understand it. And I'm actually asking you now to understand it. How could it exist otherwise than the individual

says a man is a machine, he's a sort of a biological monstrosity, that has a bunch of cells clicking against a bunch of cells and you remove a cell and you have a cell missing, and therefore there's a part of this man is now missing, you see. And he's a sort of an ambulant biological computing machine, that's what he is. And he's just an animal and a product of something that sprang spontaneously.

Of course, he asks us to accept something more wild than we're asking him to accept, see? This is a real wild one, you know, that a cell suddenly sprang by spontaneous combustion from a sea of ammonia. Well man, look at the conditions he's laid down. He's made it necessary to have a sea of ammonia. This is the same thing like the Virgin Mary, you know. [laughter] We at least are – we at least are innocent of these second dynamic implications and other things. [laughter] We just say the guy's there, see? And we are also saying we're not going to worry where he came from, he's just there. This is the way this thing is, you know? And then he says he's incapable of making up anything so he must have gotten his mind somewhere, which gives you immediate inflow and the real reason why he can't solve problems of the mind.

See, he falls immediately into this fact that it must have been presented to him by w... by the Hot Boy Mind Biscuit Company or something, you see. Another guy, the guy starts out with a – with a motivator, not an overt, see. He says natively, then, man is an inflow mechanism, and he gives you the exact reason why he can't make him well. Because he's got man's malady misdefined. The mechanism he says works on an inflow basis and he says this with a straight face. He's never made it work, see, nobody's ever gotten better working on this inflow basis for any real length of time. He never really solved the problems of the mind. See, he's also got these problems of the mind confused with problems of the body. And he's pretty confused in all various directions.

But you see, he says then that a man is an inflow mechanism. Well actually, man is an outflow mechanism, if you're going to have any inflows or outflows at all. And you'd solve the guy's problems on the basis of outflow. You wouldn't solve them on the basis of inflow.

Now, if you want to prove this – this is all susceptible to considerable proof – if you want to prove this very nicely all you've got to do is run somebody on, "Think of a motivator. Thank you. Think of a motivator. Thank you. Think of a motivator. Thank you," and watch your TA. Your TA will at first rise – it'll first stay fairly stable without doing anything and then it'll eventually start to rise and then it will go up and then it will stick. And there it will stick. And you could run him for a long time now with no TA action, with the individual paralleling... the experience of the individual during this processing would be that of becoming fuzzier and fuzzier and worse and worse and natterier and natterier and feeling worse and worse and then sicker and sicker. And he'd wind up – after a while he'd feel like he was stuffed full of cotton wool and it had been impregnated with some very, very odorous substance of some kind or another. He'd really feel funny.

Well, that's following it out. That's following out the (quote) "scientific explanation of man." We carry out the ne plus ultra, he's a machine, he has gotten everything from exterior to himself, so therefore you would then process what has been done to the individual, and you

would wind yourself up then with a failed case. You see, if you follow their rationale you could not help but wind up with a failed case.

We have an entirely different rationale. The individual is independent of a body and he is capable of mocking things up. He's capable of mocking things up. And his basic error was an outflow not an inflow. And his basic action is an outflow action and what got him in trouble was outflowing, and then he has learned not to outflow so he has eventually begun to inflow only. And that's how he worked himself up into this state of thinking he can only inflow. Because what got him in trouble was outflowing.

That seems fairly obvious to me, I hope it appears obvious to you. By their rationale, then, they could have wound up with nothing but the conclusion that an individual would have to inflow in order to be cured. And your own personal experience, which you could conduct, would demonstrate to you that an individual would only recover if you recovered his ability to outflow. And you know that. But that's how we arrive at it and that's the two sides of the coin. But we win with an end result and they don't win with an end result, so therefore their premises would eventually be discarded by the society.

But at the state society is in, they're very, very willing to believe an inflow basis, they're all trained into this scientific rationale to a marked degree. Their religious training makes – causes them to believe that they *have* a soul and they keep it in their vest pocket or something and it has nothing to do with the individual. They're supposed to protect it or be good to it or purify it or do something like this. But it's something over there.

Religion really does not recognize as the individual is, a soul. This is not made plain. But it's easy for Scientologists to think they do mean that because they haven't made it plain. We have, they haven't. They used to say, "You will go to heaven, you will go to hell." That's more or less been dropped out of it, but even then they were saying, "Your soul will go to heaven." And you read the later writings, it's all "Your soul should go to heaven," and so forth, and "Your soul will be condemned forever," and all that sort of thing.

So even those birds, you see, were not much on the groove. But frankly, frankly, we belong in inheriting anything in the direct channel of religion. We really do not belong – and this is not propaganda purposes – we don't belong in the direct line of science, we don't even think scientifically, see – if scientific thinking is based on these other premises of conservation of energy and that sort of thing. We're not in that line.

And frankly, it is only recently that science tried to take a bite on the subject of the mind. It's very, very recent. They only had custody of this thing called a mind for a very short period of time, less than a century, really. Isn't that interesting? In other words, they're very Johnny-come-lately and they interrupted the fact that religion took care of the field of the mind very nicely, all down through the eons. It was all a religious activity, you see, and then there it is.

But in space opera, why, science very often takes over the field of the mind. There they very often do. And then you get all kinds of oddball things being done to beings and so forth in the name of science. They don't – haven't ever really taken it over with much comprehension. They can do far more damaging actions, they can do lots more damaging actions than this current scientific civilization has been able to do.

But the point I'm getting around to here is just that your inheritance goes back very, very far in the field of religion. And what we do to achieve our end result is directly and violently contrary to the scientific concepts of the way things are.

And now, with the public being taught consistently and continuously, along (quote) "scientific principles" of man is a machine and all you've got to do is stuff him and he operates. If you don't believe this, that they're under a heavy hammer and pound, just watch a TV program sometime when you have nothing to do. Watch those ads. If you just stuff something in, a good result occurs. See, that's the whole – the whole song is played on that violin with great virtuosity. If you just stuff something in, something beneficial will occur.

Well, that's the first ladder that you've got to jump with the individual. And you're not going to get him even in praying distance of the bottom rung of the ladder to OT unless you've got him out of "if you just stuff something in, something beneficial would occur." And if you can't break that one, then you will never get him to OT. You'll never get him to the bottom rung of the ladder.

Now, what I'm talking about here is not something I'd like to have true or anything like that. It happens to have confronted us here in the last few weeks with violence.

Now, there practically nobody who comes to Saint Hill who is, oddly enough, very low on cause. They're not terribly low on causativeness. I'll tell you why. They came to Saint Hill, see. Do you see that? Well, there was that much outflow involved, don't you see? Well, now the guy in the Central Organization that couldn't get up enough energy to come to Saint Hill, then you'd say, well, that fellow must be a bit below the cause level of the person who did come to Saint Hill, see? Because the person did outflow, see.

All right. Now, maybe someday you'll have the experience that Julia just had and that I have had many times and that you possibly have had many times, too. You get out in the jungle, the human jungle, after having been around a Scientology group or organization, and you can stand it really just about so long. And you'll cut and run, and go back to the group. It's just too much.

It's their level of causation that's what gets your nerves. It isn't that they don't talk your language. It's their noncommunication. It's the fact that they don't seem to connect with anything.

I always kick myself, it's the – it's the things you miss and don't get. It's the fish that got away, you see? Photographers have it. It's the picture you didn't get. I just – I've just gotten a picture I didn't get. You know? I don't know what happened to this other picture, but it isn't on the films I just took. And the very fact that there is one picture there which is right next to it, which is absolutely bug-eyed, it's impossible that anybody ever took that picture, see? The other one that I didn't get, you see, that is the perfect picture and that's missing. So a very nice set of pictures is rather muddled up in my mind by that there was one that should have been there, don't you see what I mean there?

One's always mourning about these nonextant things, the fish that got away, the picture you didn't get, the this, the that, the other thing. And similarly, in the field of human endeavor one can always look back at moments when something happened and he didn't make a

record of it or he didn't get it, and so forth, and he mourns. And I mourn this because I was at a cocktail party on the *Queen Elizabeth*. And I would just love at this moment – I had a tape recorder down in my room. It was all set for 7½, and I didn't take it! All I had to have was a thing over my shoulder and just have thrown the clip on the thing and we would have had the whole thing. I could turn it on right now and it'd be a perfect example. You would howl, you'd practically roll on the floor. There was not one statement made in that cocktail party that was ever received by another member of the cocktail party. There was not one remark ever received and no remark made, concerned or was intended for anybody but the person making it. It's the wildest series of pinpointed introversions you ever saw, passing as a social communication point. Craziest thing I... All non sequitur, nothing has anything to do with anything. The emanated remarks, if they appeared to emanate, really weren't emanating remarks. They concerned the individual, on a nonemanation basis, don't you see? He's speaking of... Crazy.

Well, those people were rich, they were able to go on a vacation trip. They weren't – they weren't as bad off as the people who stayed home. Now, we have our faults as individuals. But we're so much better than what's walking out in the street, man, there's frankly no comparison, see? We may be bad off, but wow! I don't mean to be snide about it but there it is. It's a fact.

You're going to get those people out there up to the bottom rung of OT? No. No, there's another ladder and they got to climb this other ladder. And it is the ladder of raising one's cause level. You could also call it an outflow level, you could also call it a reach level. But you've got to – you've got to get them up to the recognition of the world around them. I mean, the world immediately around them. The capability of recognizing the immediate vicinity. I mean, immediate vicinity, too, man.

In other words, the first barrier you've got to crack is the total introversion to a slight extroversion. In other words, from a total introversion. You know, nothing exists, "Here I am walking in this unreal zone and of course it's all all right because nothing is here anyway and I'm not here either and I don't exist either." And your expanding perimeter, the first few grades, is entirely breaking through those various barriers just to the environment. And this is laid on us as a restriction for OT, not because I say so and not because you can't audit or any other derogatory reason, it's just that the poor guy who is sitting there cannot as-is an item.

He – it – see, it's laid on us for a very good reason, not a social reason. It's simply that he has to have the ability to cause slightly before he can cause an item to as-is. In other words, his reach has got to be good enough so that he can at least reach causatively in the direction of the item he's trying to as-is. And if the individual cannot do that, he can't as-is the item. And it wouldn't matter if you had him dead-on and square in the center of exactly what he was supposed to be running and it was in perfect sequence – you would say, "*spatter-guff cuff-cuff*," and not a blessed, blasted thing would happen on that E-Meter. You understand?

Now, to give you the degree that this is true, some of the Level VI co-audit, a small percentage of them, but some of these were what we call, what you'll hear more of, is Type B when they first started in. Now, you understand that these people were not really low on cause. I'm trying to give you an idea of how high you have to be on cause. See, these people had to have a lot of processing. These people had to have this. I'm not downgrading them. If

they were put in the right item, exactly dead-on, with all rudiments in, you would get an as-isness. You understand? But the rest of the people, the other percentage, in the co-audit could be put just a little bit crosswise to this item and it'd as-is. See, it could be a little bit out of sequence. It could be two down from where you were supposed to go and yet you'd see the meter go. You understand?

Well now, look, we're talking about pretty good people. Now, what do you think about – not the guy out in some group someplace – but what do you think about this bird on the street? What do you think about the bird in the house that can't go out on the street? You could put him in the right place at the right time and say, "*blog-a-blog wog-wog*," and not a blessed, blasted thing would happen, because his level of causation is too poor.

And if you did throw him into a GPM and tell him to as-is it, he wouldn't do anything to the GPM but it'd sure chew hell out of him. Nothing would happen to the bank, but it's plenty that would happen to the pc. Do you see the reverse curve?

Well now, that's a condition, then, necessary to running Level VI. And that hasn't been forced on us by anything but the observation of the facts. The facts are just that. Level of causation.

Now, you can take somebody who is tired, and I'll be talking more about this, but you can take a Type A who can usually as-is most anything and sometimes you'll get a meter pack up. Meter just packs up. Suddenly nothing is as-ising. He's sitting dead-on what he should be sitting on and it's packed up. You won't get any meter action at all.

If you go into this you usually find out, well, he didn't have any breakfast or something like that, is he hasn't eaten and he's running himself down and he's – so the body is doing a sort of a sp... dry-sponge effect on him as a thetan, you see. And he may be too tired. And that's usually the common denominator. That's the more important. He's just tired.

You could take anybody who ran well on GPMs and run him at 3 o'clock in the morning, and the probabilities of his being able to as-is a GPM would be very slight indeed. You could take a Type A pc and run him from midnight, let us say, till six, and I absolutely guarantee that some hour of that run the meter is going to pack up. And it will lock up the prettiest you ever saw in your life, on the right goal, in the right sequence, on the right item, and no back charge, and absolutely nothing wrong with the case at all. And that meter will pack up. It's simply exhaustion. The only thing you can get the meter to read on, "Well, what's the matter, are you tired?" and you'll get a read. And that's the only read you're going to get.

Now, what's this first ladder? It's raising the cause level of the individual to a point where he can as-is something. Well, that must be a very tiny gradient because if the individual cannot as-is his personal problems, he cannot as-is his constant worry about something or other, he can't do this, he can't do that, well, you better jolly well not expect this individual to be as-ising an item in a GPM. Ha-ha-ha, and he won't be able to do it, that I guarantee. Now, if you look at it the other way to and say, "Well, that's simple, then. Really all you'd have to do is find the GPM that he is worried about and run it."

Ah look, I'm showing you already that the GPM that is there, is ready to run, wouldn't fire. What do you think will happen to one that is out of sequence? So this barriered a very

beautiful idea I had, which was a very lovely idea. It was a lovely idea and it stayed in the idea stage because it only works on me. If I find myself thinking too hard about something, I can always skip down through the end words and pick out the one that's gotten into restim and let it blow down. This is a little bit heroic. And I thought, how marvelous! All you'd have to do at Level IV is just assess the end words, you see. You remember me telling you? Well, it doesn't work. All that happens is the pc packs up. You get about one end word back and that is the end of that meter, man. It's finished. Gone.

Well, so that was a beautiful dream that didn't come ac... off. But what's wrong with it is what you'll be facing from here on. You'll go right on facing this point. So there's no use talking about, "Well, there's those lower-grade levels, and so anybody can run those, you see. What we want to run is these big upper-grade levels, you see, and really get it done in a hurry. And therefore we don't have to know anything about this earlier auditing."

Well, I'll tell you, in an awful lot – the majority of the cases that you tackle, your later abilities, your – on the higher levels of auditing will stand you in no good stead at all except make you a smoother auditor, perhaps, on the lower levels. You wait.

You'll get Joe Blow in there and you'll be all set and rolling up your sleeves and all ready to go and all you got to do is go on down the bank and you'll find yourself trying to climb the second ladder when you should have been on the first one. So after you've had some signal failures on trying to do this and the pc is getting more and more headachy and more and more upset – and more and more this and more and more that, so on, you will eventually go back and start climbing the first ladder. And it will be with great satisfaction you find out that you have not lost your ability to get pcs to climb that ladder providing you know what ladder they're climbing. And it's simply the ladder of cause, that's all, the ability to cause.

And where a person's cause level is too low a person cannot as-is his bank. And where a person can't as-is his bank by looking at it or examining it or cogniting on it he of course gets no disappearance of what's worrying him because he's the effect of his bank and he's the effect of it very strenuously. And so your whole task, no matter what processes you use, is to put the pc at cause. And get him more and more at cause. And now you put your wits to it and try to figure out various ways of doing this, you can undoubtedly come up with lots of applications of old materials you might never have dreamed of before – certain ways to run this or that or the other thing, you see.

And certain ramifications of old O/W suddenly start showing up and kicking you in the head that you never really suspected before. Because if you're running O/W today, you're simply running it to raise somebody's cause level. That's all.

Of course, it's the biggest barrier there is to his cause level because he's done something he regrets. And furthermore he's not telling anybody about it. Well, so that's very destructive to his cause level but that today is not why you're running O/W. Here you're just running O/W just to get certainty on having done and get as-iness of doneness. That's about all there is to that. You're not even looking for crimes, don't you see?

And you'll find out, by the way, that – and I'll go into this in a later lecture – but you'll find out that it's highly probable that very few of your pcs have ever answered the auditing question, because you want to find out what the guy did and he's looking for an explanation.

You want to find out what he did and he's looking for an explanation for what happened to him. See?

And then some pc will go plunging madly trying to hit some happy chance that he will hit the explanation for what has happened to him by telling you a bunch of things he's not sure happened at all. Don't you see? And he'll start yo-yoing around. Whereas all you want is the answer to your auditing question. Just what have you done. Not what have you done bad or what have you done that is antisocial or what have you done that explains the fact that you've got sciatica, see, none of – none of these things, none of these things. You're just asking him what he's done.

Well of course, a pretty legitimate answer to that is "I've eaten breakfast." But somebody gives you an explanation on it, you know, like, "Well, I ate breakfast and that is probably why..." He's not running it, see. He's trying to find an answer to. And there are various ways that people can avoid running O/W and they're startling in the numbers of variations which they have. And you as the auditor, all you have to do is police and make sure the person is certain that he did do that. That's all you have to police on the subject and make sure that that is policed. Because they very often get pretty dazed. And they'll give you alter-ises and they can actually make themselves worse.

Where you've ever had any trouble with running O/W the individual was giving you alter-ises. He was giving you – he was trying to find the answer that explained what had happened to him and in doing so he was dreaming up fictitious events he was not sure of. And then of course O/W doesn't work because like any other process if it isn't run it doesn't work.

But there's an enormous amount of ceiling, an almost unlimited ceiling, to just, "What have you done?" You can say, "What have you done? What have you not done?" and you know, "What have you said? What have you not said?" or "What have you done and what have you not said?" or "What haven't you said?" You could get all kinds of various combinations. You could run it as itsa and you could run it as this and that and the other thing, you see. Terrific ramifications. You get into the objective side of it, you can convert 8-C with a little bit of an expert touch, you see, so that the individual is reaching and is touching and is sure of that, don't you see?

You can get numerous objective and subjective approaches here, all of which raise cause level. And the – you could say then the object of all lower level processing up to Level VI is to raise the cause level of the individual. And you can even draw a series of concentric circles around the individual in the center which represent the degree he can cause or reach. So the individual has just a spot in the middle of it, originally can reach nothing. Everything reaches him.

Well, you've got to convert this and the way to convert it is not to run out what has reached him but to go on trying to reach, trying to get this individual's reach extended. And eventually you get out to this first very small circle around the individual, and that is, well, his body, himself, you see? His body. Now, he might be able to reach something that is a few feet away. You'll find out that distance has a great deal to do with this. Then you get into very unreal estimations of distance. The individual could – reached from London to Cape Town but not to the settee on the other side of the room, you see? You get – they get very weird

concepts of reach and distance. These things are inverting and upsetting. And he'll eventually get out to wider and wider perimeters.

This is cause level. When you've raised the individual's cause level up, the individual will be able to as-is things.

Of course, then you get what – a whole index of what can – not only the distance and the character of things that can be reached but you also get what the individual is capable of as-ising in his mind. He can as-is a light lock that happened a minute ago, see? Or he can as-is a PT problem that was worrying him yesterday. Or he could as-is a PT problem that worried him twenty years ago. See, not any longer important and doesn't apply, so he can as-is it, see? You get the idea? And you eventually build that up and you'll have an individual who can reach the second ladder. He can reach the bottom rung of the second ladder.

But unless you walk up that first ladder you don't ever get to the second ladder. That the society is so gauged and organized and constructed that it would bow down to this nonsense that they're currently calling human sciences tells you it must – the common denominator of introversion on the first must be pretty fantastic, must be pretty confoundedly fantastic; if what sells them is the type of TV ad that you see, must be pretty fantastic, see? The individual's ability to reach must be pretty confoundedly low, staggeringly so.

Now, if then they bow down as I said before to a scientific rationale which justifies their inability to cause anything, then what sort of society are you looking at here? Well, don't then go around and beat your head against the wall and cry crocodile tears because the society doesn't understand you and doesn't appreciate you. Why, look, for heaven's sakes, it doesn't even know it exists! You're trying to get – you're trying to get appreciation from a hidden rock that even if you found it and got it in plain sight wouldn't ever say "Thank you," don't you see? Your basic error, if you have any in your relationship to the society around you, is to do a comparable basis and say, "It's as alive as I am." And of course, it isn't.

You could say, "I underst... its understanding of life is comparable to mine," and of course it isn't. And therefore you can feel very bad when somebody stands up and says all Scientologists are bums. It's interesting, the other day, that the American Medical Association took its finger off its button, if it has one, and it said that all questionable activities – not – this is not a direct quote, but something on the order of – all questionable activities in the United States are now hiding under the name of Scientologist. I think it's a fantastic admission for an organization like that to make. They're calling themselves Scientologists so they can get away with it.

Now, you look at the rationale back of that, it betrays immediately and at once what they are really sort of spooked about and think about, and what they're – what they're worried about. They've stopped saying Scientologists are bad, don't you see. They're just saying that other people use it as a mask. And that some pretty bad things can go on. They'll be explaining to everybody, "There's nothing wrong with Scientology, it's just that other people can use it, you see, as a cover and that's why it has to be wiped out," don't you see? But they don't even know what they're trying to wipe out, you see, and they don't even know where it's located, really. They don't know what it's all about. And people who are in that state wipe themselves out faster than they shoot the enemy.

A bunch of very introverted troops are more of a menace to themselves than they are to the enemy. I remember a bunch of – a bunch of scared Johnny-come-lately got up on Guadalcanal, and I was bunking with their captain. And he was in a fine state. He was in a fine state. He came back, he was several shades of green. Because they'd gotten up into this jungle and a coconut or something had dropped and they'd just gotten off the boat, you see, a bunch of boot recruits, when they were pushing them in at the last minute, you know. And a coconut had dropped or something like that and everybody let go with everything he had. His whole company started firing. Not at anything. There wasn't anything to and of course the – only they were there. And he fortunately didn't get any casualties out of it but he wondered how in the name of common sense he escaped having the whole company wiped out by itself. And that was their first foray behind Japanese lines. He talked to them quite a while and for several days before he let them go again, you see?

Anyway, the – they're far more of a menace to themselves, and they will eventually start passing rules and restrictions. You can watch it. And running each other down. For instance, they've just written a book, *Law, Liberty, and Psychiatry*, I think it is, something like that, which is written by a psychiatrist and a psychoanalyst. And it's well authenticated. And it just tears up psychiatry and throws it away. It says much more vicious things about psychiatry than I have ever said. And it proves conclusively that the nation had better get rid of psychiatry, right now, before it loses all the freedom and liberty which it has left. And this is published by the Macmillan Company, one of the biggest and most reputable publishers, and it is going around madly. In other words, their own high levels of authority.

When you see people losing, they introvert, and if they're already introverted, why, they will – they will lose fast. So they aren't any real great menace. The only thing that is a great menace in this regard is not the fact that we've got opponents. If we don't have opponents, not real ones – the only thing we've got that can mess us up, really, is ourselves, in not realizing that an individual has got a ladder to climb before he gets onto the upper ladder. And you go around selling everybody on the beautiful idea that he's got to go to OT and all he's got to do is run some goals and GPMs, and that's all he's got to do and everything will be all fine and copacetic, then we're going to lay an awful lot of eggs, we're going to have a lot of failures, we're going to have a lot of mess on our hands and so forth.

What you've got to do is tell him, fast, furious, hot and heavy, is "What you've got to do is raise your cause level." That's a sufficient target all in itself, let alone OT, see? "Be able to cause things in your environment. Simple. These people are bothering you. Well, do things that bother them. We don't care what you do." [laughter] You see? We don't care how you explain this. Don't you see? And you'll find the public at large would be able to understand that, oddly enough, and to that degree their cause level is raised. See?

Well, you keep pushing them up the line this way, you got it made. But the idea is that we can't go on selling an upper strata that cannot be attained, without ourselves then losing heavily. What we've got to do is sell the first ladder that can be obtained and hit that real heavy and do it very, very well and be able to handle it very, very well. And all that consists of is just making the individual more causative. Bringing him up a bit higher along the line so that we start in just as we did in days of yore. We said, well, we'd bring the individual up to a point where he can handle his own problems. We're not interested in handling the problem for

the individual, we're interested – how many times have you said this, you see – we're interested in bringing the individual up to a point where he can handle his own problems. Well, you just better hit that chord with both paws and both feet, see? Because that is a road out. That is the only road out for such people. So there's where – there's where your future comprehension and understanding of these things lies and where your future success lies.

Now of course, you can say at the same time this individual's a Keyed-Out Clear because this wonderful technical fact does stay in our favor is actually the only thing that will key out a GPM without paying any attention to it whatsoever is some version of O/W. It's senior to GPMs. So you can make a Keyed-Out Clear. And you can key the fellow all the way out, and by that time his cause level is raised so high that he can of course enter the bank at the proper place and as-is it. Then he's ready for OT. Of course, you can cut in and go OT before that – well before that. But that's still a theoretical target even if it's one that you're not going to attain particularly for the individual before he switches to the other route.

But here's the point: The point is that you do have a technology which wildly enough is senior to the bank itself, which is doable all the way south and without which the individual can never come up the point of as-ising what is really troubling him, which is the bank. And this is a very fortuitous set of circumstances. But it brings before our eye that the individual, to get on the first ladder, has got to have done something. And you can't have people around who haven't done anything at all, ever, who can as-is. These people will not be able to as-is. So your immediate and direct test of whether or not an individual can as-is is: has he ever done anything?

You'll get an introversion where an individual isn't withholding anything. He never done anything or with the things he has done, he'll give you vicious horrible crimes that he has done of one kind or another. Trouble is, we don't know they're true or not and he doesn't know whether he did them or not. What you've got to do is find something he knows he's done and raise him from there. It isn't the quality of the deed, it's just whether or not he has done it.

You've got this technology? There's a lot of this technology, it fits objectively, it fits subjectively, it works on anything that can be processed all the way down the line, and if you stress Keyed-Out Clear, raise your cause level, get yourself up to a point where you can handle your immediate perimeter before you take on Pluto, you'll find that this is very easy to make this bridge. And the public at large will be able to make the bridge and follow through. In spite of the fact that they're already crippled by a philosophy which says they aren't even there, you can still get over that bridge and come forward and win in the long run. And that's the first ladder that's got to be climbed before you throw somebody into the bank and say, "Go on and swim."

You, once in a while, are going to run into a pc that when you say, "Give me the first two items, the first item of the bank," you're going to get it and it's going to blow down, and everything's going fine, and the pc, because you're a good auditor, is going to run like a well-oiled dream and that is going to spoil your whole concept of it because you've just accidentally gotten ahold of a Type A. It was sitting there ready to be plucked. See? And you're going to forget that this person had ninety-nine others that you could have chosen, none of whom

would have been able to do it. That little win will tend to throw you off of that program. Just remember I cautioned you when you get the next person and you throw him into the top of the bank and he instantly goes to the hospital. He didn't do anything to it but it sure did plenty to him. The bank could cause, but he couldn't.

Now, there's the road out. And there is the easy road out for you as an auditor. There's the easy road out for an organization. There's the easy public approach road out. This is the drum you should beat on the public.

Yes, you can say we can make OTs, we can do this, we can do that, or you can say anything you please along these lines, but the one you pound, pound, pound, is you say, "Raise your cause level. Raise your cause level. And when I see what you can do in your immediate perimeter, then we will start talking about taking on the moon and quartering it." See? "Keyed-Out Clear. Why don't you become a Keyed-Out Clear? That's a very, very desirable goal. Let's work in that particular direction," don't you see? In other words, that's the one you pound, that's the one you pound, that's the one you sell. And then people will make it. Otherwise you're going to hand them a big lose.

And after this tremendously, fantastic, fortunate breakthrough which we've made in Scientology at this time and so on – as far as I'm concerned, it's the only breakthrough that's been made in the field of the mind – why, let's not lose just because we neglect this little slight point that we try to put people on ladder two before they start even vaguely to locate ladder one, much less climb it.

Thank you.

O/W MODERNIZED AND REVIEWED

A lecture given on
2 July 1964

Thank you.

All right. What have we got here? Have we got a date?

Audience: Second of July.

Second of July. There is a date. All right.

[part missing]

And this is the subject of O/W Modernized and Reviewed.

Now this lecture is given into the teeth of the fact that it is notorious that very few Scientologists would ever inquire very deeply as to just exactly "*what* was did." This is given into the teeth of that knowledge. And there's a good reason for that: In order to do something for somebody, you have to have a communication line to that person.

Communication lines depend upon reality and communication and affinity. And where an individual is too demanding, the affinity tends to break down slightly. And the Scientologist is very afraid of breaking that affinity line with his pc and so he doesn't want to break that affinity line with his pc so he never, then, gets to the second stage of processing.

Processing goes in two stages: One is to get into communication with that or which you are trying to process. That's number one. And number two is do something for them. And there's many – many a pc will go around raving about his auditor, whose auditor has not done anything for the pc. All that has happened is a tremendous communication line has been established with the pc. And this is so new and so novel and so strange to the pc that he then considers that something miraculous has occurred. Well, yes, something miraculous has occurred, but in this particular instance the auditor has totally neglected *why* he formed that communication line in the first place.

He formed the communication line in the first place to do something for the pc. And he very often mistakes the fact that he has formed a communication line and the reaction on the pc for having formed one with having done something for the pc.

There are two stages here – is

- 1) form a communication line and
- 2) do something for the pc.

Those are two distinct stages. That is something like walking up to the bus and driving off. Do you see? There's two stages: You walk up to the bus and then you drive off. If you don't drive off, you never go anyplace.

So many an auditor bogs down at this one point of walking up to the bus which is putting in a communication line with the pc, and then they never go anyplace. Do you see that? And where auditing broadly breaks down, and you say, "Well, Mamie Glutz had lumbosis and" – we're going to have to make a list of Scientology diseases; that's one of them – "Mamie Glutz has lumbosis and she loves her auditor but she's still got lumbosis."

Now, exactly, what has happened is the auditor has formed his communication line to the pc – has actually done this heroic thing of getting in communication with the pc – and that is very tricky and that is no small shakes. That's something: to be able to communicate to a human being who has never been communicated to before. This is quite remarkable. And that is such a remarkable feat that it appears to be the end-all of Scientology to some. But you see, that's just walking up to the bus. Now we've got to go someplace.

Now, how do we go someplace? Well, actually, any upset that the individual has is so poised; it is so delicately balanced; it is so difficult to maintain. You know, you look at this fellow. He's in a wheelchair, you know? And you say to yourself, "How is he keeping himself in a wheelchair?" And you think, "Well, it'd be very difficult to get him out of that wheelchair." Oh, no, no! It's very difficult to stay in that wheelchair. That is what's difficult. Unless you learn this reverse look, you'll have trouble with psychosomatics and things like this, particularly battinesses more than psychosomatics. Psychosomatics are not a good example. A battiness of some kind or another is a much better example because they surrender so easily.

This individual is very sure that "horses sleep in beds." Now, you don't look at what it takes to maintain that. That is based on such slippery logic that the least little cogwheel goes adrift in it, it'll collapse. In other words, it's very hard to remain batty. It's not difficult to get well but it's hard to remain batty. A fellow has to work at it. You'll see an odd look coming into somebody's eyes, sometime or another, when you're getting right close to, and you'll see a pc suddenly start veering sideways from you when you start approaching too closely to a piece of battiness.

Let's supposing that having formed a communication line, we merely and only did this – we just did this and we didn't worry about these vast complications and this terrific sea of aberration. We didn't do anything like that. We just said, "Now, what are you doing that's sensible?" and "Why is it sensible?" And you know, a guy's case will just fall to pieces right in front of your eyes. This is a zone to which I invite your attention because it's untrodden. It's virgin. It's native. It's the bush in a completely unspoiled condition.

You see, this communication line is only valuable to the degree that you can walk around in your big muddy feet in the midst of all this morass. And if your communication line is very good and very smooth, and if your auditing discipline is perfect so that – you see, your auditing discipline is perfect so you don't upset this communication line – then you can walk around in this wild jungle that he calls his ideas.

And if you just made a foray of no more importance and no more breadth than "What are you doing that's sensible?" and "Why is it sensible?" and kept your communication line up the while and kept your affinity up with the pc the while – did it with perfect discipline – you would see more aberration fall to pieces per square inch than you ever thought could exist. See? Now, that's what I mean when I'm saying to you *do something for the pc*.

See, I tell you, "Audit well. Get perfect discipline. Get your comm cycle in. Don't ARC break the pc. Let the cycles of action complete." Don't you see? All of that. Well, that is simply an entrance to the... You see, the discipline of Scientology makes it possible to do this. And one of the reasons why other fields of the mind never got anyplace and never could get near anybody because they couldn't communicate to anybody, see?

So that discipline is important. That is the ladder which goes up to the door. And if you can't get to the door, you can't do anything. You see? So there's two stages here, two stages. And you're busy completing communication cycles and so forth. And I will admit sometimes I get impatient with you, you see, because I'm merely trying to teach you how to communicate to somebody so that you can do something for him, you see? And I sometimes believe that your whole attention gets tremendously absorbed in merely communicating with somebody – see, that – and use that as an end-all. See, and I get a little upset.

Because it's something on the order of – well, let's say you're trying to make an actor, you see? It's something like this, and you get him all set on the subject of makeup, you know, but he keeps standing in the wings made-up and thinks he's acting and he isn't. He's standing in the wings, see?

So this perfect discipline of which we speak: The perfect communication cycle; the perfect auditor presence; perfect meter reading; all of these various things are just to get you in a state where you can do something for somebody. And because this is so new, strange and novel, and is so unheard of in this universe, it looks so startling that you can say, "Well, that's auditing, that's processing, that's it. That's the end product."

Man, that's no more the end product than a can of dog food, see? I mean, it's still there in the can. It's supposed to be eaten, you know? It's the difference between reading a recipe book and dining.

So when you're real slow picking up the discipline, when you're – when you're real slow picking up keeping in a communication cycle, when you're poky on this subject and so forth, you see, you just – still nine miles from the ball, you know? You're not even attending yet. See?

So what you want to be able to do is audit perfectly. By that we mean keep in a communication cycle: be able to approach the pc; be able to talk to the pc; be able to maintain the ARC; get the pc to give you answers to your questions; be able to read a meter; get the reactions; be able to do this; be able to do that; all of those little things, you see? They've all got to be awfully good because it's very difficult to get a communication line in to somebody anyway. And they all have to be present and they all have to be perfect. But if they're all present and they're all perfect, *then we can start to process somebody*. Then we can start to process somebody. And all of that looks so beneficial that you could mistake it for processing.

Now, I'm giving you some kind of an entrance point here of – if all of your cycles were perfect, if you were able to sit there and confront that pc and meter that pc and keep your auditing reports and do all these other multiple various things and keep a pleasant smile on your face and not chop his communication and – if you can do those various things, now let's find out what do you do. Because there is something you do with those things.

Well, at Level VI this is very easy. You run GPMs. But that's doing something for somebody. And try to run GPMs sometimes without all these other factors near perfect. It's not possible. But let's take it down to a lower level. What could you do for somebody if you were a perfect auditor from the basis of your auditing technique and presence and handling somebody? Now, what could you do? That's the burning question: What could you do?

Now, we used to have this all on backwards. We used to try to teach people what they could do for somebody but they could never get in communication with him to do it. See, so therefore you had failures in processing.

Well, the most elementary procedure – the most elementary procedure, "What are you doing that you think is sensible?" and "Why is it sensible?" That's a perfectly elementary procedure and the guy would all of a sudden gawp at you.

And he'd say, "Oh, no!" you know? Because these things are very difficult to maintain as an insensibility. You have to work hard to have something in crosswise. "Horses sleep in beds."

All right, you say, "Well, what are you doing – what do you think is sensible?" or "What are you doing that's sensible?" or anything of this sort.

And the fellow says, "Well, I think horses sleep in beds. That's sensible."

"All right, now why is that sensible?"

"Well... that's nuts!" See?

You actually wouldn't have to do anything more than that, see? See? Now, one of the things that's horrible about all this is it's so easy to do but you keep looking for some magic. Well, your magic was getting into communication with the person. The rest of it is very easy to do. All you had to do is remain in communication with the person while you're doing this and realize that these huge boulders that he's got in his skull are poised with the most fantastically delicate balance on little pinheads, see, little pinpoint balance. And all you have to do is go *phoooh*, like that, and this thing goes *Brrooomm*, crash! Now, if you're not in communication with this person, he takes it as an accusative action; he tries to justify thinking that way; he tries to make himself look good to you; he tries to put on a public front of some kind or another sitting in the pc's chair; he tries to hold up his status. And any time I see a bunch of pcs around jumping happily to something else because it's "Only sane people can run on that," you see, "and crazy ones run on something else."

Well, everybody immediately will have the same computation, so they never have to be run on the crazy one. I right away know their auditors are not in communication with them and that auditing discipline itself has broken down because the pc is trying to justify himself

and trying to hold – uphold his own status. So he must be defending himself against the auditor. So the auditor couldn't possibly be in communication with him, could he?

So right back – we're right back to the fundamental of, "Why didn't the auditor get into communication with the pc in the first place?" Well, you get into communication with the pc in the first place by doing the proper Scientology discipline. That is not any trick. It is – goes off one, two, three, four. You sit down and you start the session and you start talking to somebody and you start handling the pc and you start handling his problems, and that sort of thing; and you do it by completing your communication cycles and not cutting his communication and by this and by that – the very things you're taught in the TRs. And you'll find you're in communication with the person. And where you fail and why he maintains his status is you've gotten into communication with the person and then you've never done anything for the person.

Unless having gotten into communication you now do something for the person, you lose, of course, your communication line, because the R-factor breaks down. He doesn't think you're so good and you go out of communication with the person. Do you understand? You can get into communication with the person, then not do anything for the person; the R-factor of why you are in communication with the person can break down and break down with you. You say, "Well, here I am in communication with the person. What am I supposed to do now?" You'll go out of communication with the person and you've somehow taken a little circular trip which was in toward the person and then away from the person, see?

All right, that having happened, now the person will be in sort of defensive and status and wonder why he's being processed and – you see, he could wonder all these questions.

It takes a process now. Now you've got to do something for the person and it takes a process. But it takes an understanding of what a process is. And a process is simply a combination of mental mechanisms which by – which when inspected will pass away. All auditing is negative gain, you never add anything to the case. All auditing is subtractive, you're as-ising things on the case and that's all you're doing. So you say, "All right, what do you think is sensible?"

The guy says, "Horses sleep in beds. Ah – ! Hey, that isn't sensible." Cognition. Total duration of process, see, was that.

You actually will get a – probably get a big blowdown or something like that on your E-meter – be a huge blowdown on your E-meter. Now, you try to get more tone arm action out of the fact that "horses sleep in beds." You don't get there. You flattened the process.

So it requires a sensitivity to know when the process is flat. You can over-audit and under-audit. You can try to run that tone arm action out of things which have no tone arm action left in them and you can walk off and leave things which have a ton of tone arm action left in them. You can do one or the other of these things. But this requires observation of the pc, and it only answers this question: Have you done anything for the pc? Once more, you only have to answer that question: Have you done something for the pc?

Well, if you've done something for the pc, you are not likely to get any more tone arm action out of it. Now, this is – becomes elementary, you see? We're breaking this down into 1)

and 2). So, 1) there's the auditing discipline, and 2) there's doing something for the pc. If you've done something for the pc, you've gotten the tone arm action out of it. It isn't that you really even do anything for the pc by having the tone... getting the tone arm action out of it, you see? That's simply an indicator of whether you're doing anything or not. This becomes – I'm beating a dead horse to death, now, don't you see, because this is not – it's not that complicated. That's – it's less complicated than anybody imagines.

You say to the pc, "What's sensible?"

"Well," he says, "Oh, well, so – well, yes psychiatry and psychoanalysis and congressmen and elections and governments. They're all sensible and something is sensible, and something else is sensible, and so on and so on, and they're all sensible." Well, let's observe the pc. Have you done anything for the pc yet? Well, the funny part of it is that your tone arm is going to be moving during this period. See, we haven't done anything, really, for the pc yet. And he goes on and he says, "Well, my old teacher was sensible. My old teacher used to tell me, well, I'd never succeed in the world, and he was right. And he was sensible."

And you're still getting tone arm action, see? "And he was – I don't know."

"Was he sensible or wasn't he sensible?"

"I don't know. You know, I have done some things in life. You don't suppose I could be failing all the time because he was so sure I would? *Uhghh*, this doesn't make any sense. You know, I think that man was a blithering ass! I think he was a complete fool. How would he know that I would never succeed in life? He's silly. I don't think he was sensible. No, we'll forget about that being sensible. Well, that – that wasn't sensible. That – you know, that's why I failed in life! Because he was so sure I would. And I always thought he was so sensi... Well, I'll be a son of a gun!"

Right about that moment your TA action goes *bzzp, bzzp, zzp, thup-bup* there's no more TA action, see?

Now you, knucklehead, not having noticed... I should be polite, I laid down a maxim "Always be polite to somebody who is trying to learn something," you see? You don't notice this one answer has come your way. You have done something for him. So now you start beating up the brush to do something for him. This is very bad timing, don't you see?

Now, you could go on with the process in some other way and some other field or some other channel, but you've handled something and you've done something. And if you keep him working on that one thing that he has now – you've now done something for him on, your TA action will disappear and your pc will get resentful. And not only will your TA action disappear, but you'll lose your comm line.

Now, let's try to press him. "What about this old teacher?" see? He's already had the cognition, see? Wow! See, "What about this old teacher? When did you know him? Did you have any overts against him?" and so forth. Notice your TA. TA is not moving. You're now restimulating the pc. You've gotten your key-out – destimulation factor has occurred right before your eyes. You've done something for the pc.

Now, hear me now, it's just a matter of. "Have you done anything for the pc or not?" And on any given subject, when you have done something for the pc, your TA action in that zone and area will cease. If there's any TA action to be gained in that area while you are doing something for the pc, you will get tone arm action. But sooner or later it is going to run up to having done something for the pc, see? Your TA action is about to do something for the pc, you see? That tells you that something there that can be done for the pc, and your TA action will go on toward the point where you have done something for the pc, and now this is past tense. Now, you're going to get more TA action on his dear, old teacher. In a pig's eye you are! That is a went proposition, now. So! It requires of the auditor discipline to keep in his communication line. He's got to stay in communication with his pc. Those cycles have got to be perfect. He can't be distracting the pc's attention onto the TA. "I'm not getting any tone arm action now." That's not staying in communication with the pc, see? Has nothing much to do with it. You're distracting the pc from his own zones and areas. So don't keep his attention out of session, you know? Keep him going on this; keep that communication line in. And the next requirement is do something for the pc: do something productive; use the communication line. Now that you've got the telephone in your hands, for God sakes, talk! See? There's nothing quite as silly as receiving a transatlantic telephone call where the other person then doesn't talk.

They phoned you – I got one not – not a month or two ago, and the person actually at the other end of the line stood there with the live phone in their hand with nothing to say. Undoubtedly, they had something to say but they just couldn't think of it at the time it finally got through.

And many an auditor who isn't getting a result with a pc is sitting there with the telephone in his hand not saying anything, see? He's got all the lines in, "Hello, hello. Are you there?"

"Oh, yes, I'm here," bright and cheerful.

"Oh – oh." See? Now, too much astonishment to say anything to the pc, see? So we go back to putting a communication line in, see? Best thing to do is to call back central and find out if we really do have a call to the pc, see? Find out if it was the correct number after all. Call up the rate operator and find out how much it's costing.

Do you see? You see, you can walk right up – you can walk right up to this crucial point and then die on the vine. You can start getting tone arm action on the pc and then never press it home. This thing all of a sudden there's – big drop. He says something about – you said – well, just – let's take this weird little process: "What's sensible?" see?

And he says, "Well, the most sensible person I ever knew was my old instructor."

Wiff. You know, you've got some tone arm. You make a note over here. "Instructor," it gave a tone arm action, and so on and so on. And "What's the question again? Sensible. Sensible. What does sensible mean? Is *sensible* a sensible word?" And so forth. No tone arm action there, you see?

And you say, "(Well, look, there was a bit of a tone arm motion there when he said 'the old instructor.')

You said something about this old instructor being sensible."

"Oh, yeah! Oh, terrifically sensible man." More TA, see?

"Well, have you adopted any of his views or anything like that?"

"Oh, yes, my whole life has been monitoring by the views," you see? See, big TA going on. And we'll go on this way and all of a sudden he's – he knew the pc was going to fail. Pc suddenly gets that in crosswise, you see? You'll see a big reaction and then the more reaction, more reaction and then all of a sudden the pc suddenly cognites, "Maybe that's why I'm failing all the time. I am *blaug-ow-ow-oh*," see? "Yeah! That guy is a fool. I didn't – he wasn't sensible at all. Ha! What do you know about that!" See? Big TA action occurs right before that moment. And if you're riding right up on your toes, you won't expect another whisper to come out of that old man. You won't ask for another whisper to come out of it, nothing. That's gone. That is dead. That's as dead as yesterday's newspaper.

You see, that's where the tone arm leads you into this. And if I was trying to teach you, totally mechanically, I'd say you go ahead and make sure there is nothing flat in there, but actually your communication line is at risk all the time you're trying to find out if anything else is in that. Your communication line is at risk. You're liable to get – unplug the whole switchboard.

"Well, hell, I told you! I had the cognition, you know? I told you already! I have – how many times do I have to...?"

See, there goes your communication line, you see? And after awhile, you'll get the point. You'll say, "Look, we're pulling switches out of the switchboard here. We're messing things up." And come off of it.

Actually, if you're very, very clever, you'll run a process that cyclically produces this sort of thing by a general question so that you don't make that particular goof. You don't have to make the piece of judgment, which I just gave you, all the time, see?

It took me a long time – and really, it took me as an auditor a long time – to learn when to give up on somebody. You know, learn when to give up on a subject. And I finally got clever and tuned my antenna up on a Martian wavelength and got it up to a point where that thing was flat. I could see that was flat, see? And where, if I pursued it any further, I would now get into trouble: Where I had done something for the pc and, in trying to do anything further along that particular line, would put my communication line at risk. And I got to a point where I could judge that just like that, you know? Pc happy, tone arm increasing every session, everything going along swingingly.

But let me tell you that it is a very interesting point. It'd be something I would be very happy to be able to teach you. But I'm afraid it's something that you learn on the basis of observation. Now, in Level VI you're learning that; there is nothing deader than a dead item. When it has give up its ghost, there is no more tone arm action there. If there is any more cognition in it, any more read in it, yes, yes, you could get it out. But you develop a sensitivity after a while as an auditor. You know when it has given up its ghost. And you know that just mentioning it or referring to it one more time is practically fatal. Your pc just feels like he's being ground into the dirt. See, just one more mention of that item and you've had it, see?

And you'll start to get a tick-tocky needle, and other undesirable phenomena sets in, and if you keep it up – "Yeah, well, I'm not sure whether the item has read or not. I didn't have my eye on the meter at the time." (Calling pc's attention to the meter, always, if you want ARC breaks.) "I didn't have my eye on the meter and I don't really know whether it read or not. And, of course, I must – I must have seen it read before I can go on, but maybe I missed it." That's the – one of the most marvelous ARC breaky situations that I could possibly set up, and yet it's one of the commonest ones.

Now let's take this same situation. There was only so much charge, see, on this old instructor or something like that. See, there is only that much charge on it. You've got it! He wasn't an item. He was a lock of some kind or another. But boy, you blew it. You've seen it blow; you've seen the pc change before your very eyes. Now that's the time to unload; that's the time to swing off that freight train and hit the gravel and grab another one. Not necessarily change the process but certainly don't press that guy any further in the direction of what has just given TA.

You could now ask him – but there's ways of asking auditing questions that are part of a communication line. There is a way of dismissing everything you have been talking about while asking the same question as you did before. You know? Sort of like, "Well all right, we've taken care of that. You've gotten all of that. Good. Good, I'm glad we've got – we've finished off with that. All right, now let's get back to the original process now. What's sensible?"

You get an idea? There is a thing an auditor can do. He doesn't have to say all those things I just said, but that is the way he is building the atmosphere. You know, he acknowledges on the idea, "Oh, that old tutor you had. Yeah. All right, well, we got that, good. We got that. Let's..." so on. You even do a little business here about crossing it all off, you know? And, "All right, now we're getting back in the original process. Okay."

Here, you see? Now, we say same auditing question, we say, "What's sensible?" But he obviously knows that it's now being addressed to some entirely different zone of the mind and as such you shift that. You're still doing something for the pc. You follow this?

So there's getting up to the bus and then there's getting in it and going someplace. And you could become a past master at auditing discipline and motions and so forth – and actually have to be a past master at it anyhow before you can carry on the rest of it – never carry it another sixteenth of an inch, have a lot of pcs that absolutely loved you and swore by you who went right on having lumbosis. And you would say, "What in the name of heaven has happened to me? What terrible catastrophe am I looking at here?"

Well, everything is fine, except you're not doing anything for the pc. You got right up to there and got on the bus but you never drove off anyplace and you never did anything. That's the whole secret of auditing. It's in two sections.

Of course, Level VI, you do it so fast that you hardly get a chance to you call this, and boom it goes, and that's the end of it. And of course, there it's predicted where the charge is going to be, and you know what's going to fire and all that sort of thing. So you say, "Well, this is something different." No, it isn't any different at all. Cleverer auditing is below – is below IV. See, you've got to be clever. There's ways of asking auditing questions, which is

the same question, which could make the pc believe implicitly that his answer had not been accepted.

I'm sure we've all had at one time or another this trouble. We've repeated the auditing question and the pc thinks his cognition has been invalidated. So then, to prove to him that his cognition has not been invalidated, we preserve our communication line by wildly changing a process that is not flat as a general process. And that is one of the most flagrant examples and that is the most general reason why auditors run lots of processes. They haven't mastered the trick of convincing the pc that his cognition has been accepted and that they're all done with that particular zone or area of the process and that the process that is being run is now expected to go into some other zone or area. Direction of attention this comes under.

You can do some pretty wild things with direction of attention. You can exaggerate this up like mad. Pc says, "Oh, oh, yes! Yes. Yes, yes, yes. See, you're asking me sensible. Oh, yeah. Textbooks. Yeah. Ho-ho-ho-ho-ho!" Big blowdown, see?

And you say, "What's with textbooks?"

"Oh, well, good God, you know, they pretend they're sensible and nobody can make any sense out of them at all. Ha-ha!"

Gone, that TA now is gone. You understand it, that's as far as you're permitted to pursue it. You've now done something for the pc. It isn't manifested in any degree that you will notice right there at that moment. But how do you now convince the pc that your next same auditing question is not actually going to be addressed to textbooks? Well, there are crude mechanisms for doing it.

"All right. We've taken care of textbooks. Now, in some other zone or area, what's sensible?" That's doing it with an axe. "We got your communication. We consider that that particular zone or area is complete and we're not asking you to do anything more in that zone or area because you've already gotten the tone arm action out of *that*. Now, asking exactly the same auditing question, but addressing it to some *other* zone or area of the mind, what's sensible?" See, this is the message which you're putting across in the middle of your communication line.

Now, you can make – you could do some weird, weird, weird things with cases. You – it's quite, quite unbelievable what you can do with a case, steering him around in this particular zone on some general process. Now, this is not running an alternate process; this is really not running itsa. This is merely a finished method of handing a process to a pc: Is run him to cognition; run him to cognition. And that's actually not new. It's running the pc to cognition, but it's on the same thing.

And nearly everybody has understood "running to cognition" – change the process when the pc has cognited. Well, that is very far from true. You change the sub-subject of the process on the cognition. You don't change the process.

Your process can be far too specific. It can be a sub-process. "Right around the vicinity of this rug, you see, have you ever made a footprint?" See? Well, it's so circumscribed as an auditing question that it's really a subquestion anyhow. So what you really want to run on a pc is a broad question which you've already established, and running to cognition is knocking

off these sub-cognitions on it. Now, you take something as broad as "What's sensible?" Ooooh, that's broad.

Now, of course, "Putting footprints on this rug, see, that's sensible. I don't know why it's sensible," he suddenly says, "but it doesn't seem to be any reason at all why I should put footprints... Do you know, I see a rug of this particular type and I always have to put a footprint on it. That's real crazy. That's real crazy. I think that's Wadsworth, or somebody, 'Footprints on the sands of time,' yeah. It already – yeah. Yes, I learned the poem when I had scarlet fever. Yeah. Yeah, there was a rug in the room the same as the rug in this room. Oh, that's what that's all about."

"All right, good." You've had your blowdown. "All right, that – that's fine. Now, aside from that and footprints and that sort of thing, which we've got, and so forth. What's sensible?"

See, that's just parking it. That's how to really, smartly run by cognition. You can be smarter than a tack if you pursue this particular course. But I'm warning you that that particular approach requires some sensitivity on the part of the auditor. He has to ask himself this question continually: "What have I done for the pc?"

I used to run an auditing session until I had done something for the pc. You take a short-attention pc, particularly. The session was exactly as long as it took me to do something for the pc. And horribly enough, some of those sessions would go four or five hours, and I had thought they would run as long as fifteen minutes. But that's because we never got into the communication cycle necessary to do something for the pc. And it'd take maybe that long to establish a communication line before we could start to ask the pc what's cooking. See?

You'll sometimes start asking an alternate question of a pc, back and forth, and notice that the answers are dodgy. These are dodgy answers. Well, merely and completely recognize out of that dodginess just one thing: that your communication line to the pc has failed in some particular way.

I'll give you an example. You start to process a child – you start to process a child on the idea of "What problems do you have?" You're going to you're going to process this child, you see? And the child is sitting there very dodgily answering this question. And they appear to be very reluctant to answer the question. You realize that this reluctance isn't really any withhold or anything, it's just that the child cannot talk to you. Then you suddenly realize that the process you should have started in on was "What could you say to me?"

You maybe process the child on something very fundamental, like "What problems do you have?" and get no place because you aren't doing anything for the pc; so therefore, you get minimum tone arm action and so forth. Well, you haven't established a communication line to the pc. You shift your gears and ask something that has nothing to do – well, the child has been sick, let us say, and the child feels badly and there's a lot of things wrong with this child. And you shift off onto a process such as "What could you say to me?" and "What would you rather not say to me?" And the – you say, "Well, there's lots of mechanisms in this such as withholds coming off and all that sort of thing." But the surprising thing about it is you now have tone arm action, you now have a session running because you're getting in your

communication line. At the same time, you're incidentally getting off a few withholds, which is doing something for the pc, too, at the same time you're getting in a communication line.

A process like that tends to confuse you. You see why it'd be confusing? Because it's putting in the communication line and it's doing something for the pc at the same time.

Well, there are a great many of these processes in Scientology which get in the communication line and do something for the pc at the same time. So, therefore, this breakdown of getting into communication with the pc and then doing something for the pc becomes obscured because you're doing them both at once. And then you begin to become confirmed in the idea that getting in the communication line is what's doing something for the pc. See, so the whole subject now gets lost all over again. Even though you do, then, use a combination that accomplishes both at once, don't lose sight of the fact that there are two actions and you won't make very many mistakes along this line.

Now, all of this is really a prelude to O/W because O/W is just about the greatest, handy-jim-dandy little communication wrecker that an auditor ever had very much to do with. And an auditor loses the ARC he has with the pc a time or two and he becomes very timid. And he starts asking, "Do you have any overts? Have you committed any overts?"

And the pc says, "Yes. Well, I thought people were mean to me, and it was really an overt to think that against myself."

And the auditor says, "Well, he got off a big overt," and so forth. And they will go on this way and on this way and on this way and on this way, a sort of a motivatorish, critical think, you know? And the auditor never tags it and never nails it and never does anything about it and never corrects it; and nothing happens with the pc and the communication line doesn't improve because the pc is actually running a falsity. And it just winds up in a pile of garbage. You see, we really never get anyplace. So we're really adventuring on something that is very, very intricate when we're adventuring on O/W.

It's not a simple mechanism, because although handled rightly, it would put in the communication line at the same time it was doing something for the pc. The auditor protects his communication line to the pc – he protects his communication line to the pc by not asking anything embarrassing. And he permits his pc to sit there with withholds in the session half-ARC broke with the communication line flying out the window. And he never presses home to find one of these things out. He can even get a read on the meter that exists and never really ask for it because he doesn't want to risk his communication line. So this makes O/W dicey.

Now, another thing that made it dicey in the old days is the fact that *withhold* occurs in the bank. And you should not use the word *withhold*.

Of course, withhold is an out of ARC condition and it's an out of ARC process and, actually, cannot be run solo. You can take an out of ARC process and run it in combinations with an ARC process. You can say, "What have you done? What have you not done?" You could say, "What have you said? What have you not said?" You could say, "What have you thought? What have you not thought?" or something like that. But again, *thought* is a risky one because that also occurs in the bank. But done, fortunately, really doesn't occur in the bank.

Now, I've told you that O/W is senior to the bank. Now, this might lead you to believe that once you'd got the bank gone you'd still have O/W. No, this is not the case. It is senior in that it will key out the bank.

Now, let's look at this a little more intimately and find why it keys out the bank: Because the whole common denominator of the bank would be "done." That's the common denominator of the whole reactive bank. In other words, a high order of lock. And anybody who knows the constituency of the bank could look those things over and he'd certainly say, "Heh-heh! Yeah, that's true." It's just a high order of lock, don't you see?

So it's a lock on all parts of reactivity. Now, when we specify what things have been done to, we err, because we might run into another piece of the bank, you see? So the generalized statement, or a common or the proper name of somebody, is quite allowable.

We find our pc has a present time problem with Oswald. Perfectly proper to say "What have you done to Oswald?" We're not running into any bank because he hasn't got Oswald as part of the basic reactive mind. "Men," that might be different. That might be too close in. But this guy, Oswald; what have we done to Oswald?

Now, we'd find, weirdly enough, that the communication line to Oswald will have been interrupted because of an overt to Oswald, so therefore, one couldn't communicate to Oswald.

A present time problem is also produced by failing to complete a communication. There is really one for the book. That's something I don't think I've told you. I've known it for a long time but I just think I've omitted mentioning it. I might have, I might have mentioned it, but I doubt it. A present time problem can be created by a failure to complete a communication cycle. This is so much the case that if your pc, coming into session, were asked – you were to ask your pc coming into session, "Is there any communication you haven't completed?" the pc would rattle off several and the pc would not register on present time problem. This is another method of handling PTPs. They tend to vanish under this.

Now, you're not trying to erase the PTPs anyway. All you're trying to do with these PTPs is get them out of the road so that you can audit somebody. You never erase, in rudiments, anyway. Actually, you never erase in anything below Level VI, now. So your action here is a destimulative action and that question all by itself will adequately destimulate the pc so the pc can be audited. You'll find it very seldom that you will fail to get around a present time problem with that question. Of course, the problem can still be there but the pressure is gone on it.

Now, "I got PTPs," the pc says.

You say, "Well, what communication have you failed to complete or haven't you completed with regard to these?"

And the pc says, "*Brrow, brrow, brrrow, brrow, brrrow, brrow,*" and that's the end, and you don't get none that will register on PTP. That would be a common experience.

Now, the reason he has PTPs with these people and hasn't completed the communication is because he's got overts. So we get the secondary consideration on PTPs. You never

have a PTP with anything you don't have an overt on. Of course that's primary, really. Your PTPs stem from overts. If you have an overt against a telephone pole, you will have a PTP with a telephone pole, see, something like this. Psychosomatics go back to PTPs which go back to overts. So you can actually run out psychosomatics on this but it's a rather adventurous undertaking. You're liable to get the pc into more than you can easily get him out of. But you can, in *extremis*, handle a psychosomatic illness on the basis that it must be a present time problem. See? The guy has got lumbosis. All right. There, then, you immediately – you have two approaches.

The least adventurous of these approaches, and the swiftest one to handle, is the guy has got lumbosis of the – of the blumjum. And you say, "Well, what communication haven't you completed to or about the blumjum?"

"Oh, well, that's simple. I had an appointment at the hospital, and *waf-waf-saf-saf-naf*, and I had an appointment there. And I was supposed to go to the drugstore and then get some stuff, and so forth. And I actually, I was telling my Aunt Maisy the other day about the blumjum was a very obstructive mechanism as far as I was concerned. And I didn't finish the letter and – what? The somatic is gone. What happened?" The pc is liable to be very startled at this point because they are apparently not talking about anything that had anything to do with doing something for the blumjum. That's what I mean by it's very, very difficult to keep lumbosis around. It is. It takes a lot of doing.

So we have these two approaches, not just one. The unfinished cycle of communication to or about the "it"; the unfinished cycle of communication to or about the object that you're trying to handle, which is a PTP. Guy has a present time problem with Internal Revenue. Well, we don't much care about wondering and settling this problem but we certainly want him less obsessively concerned with it. So let's do something to get rid of this problem.

All right, the easiest pitch is an unfinished cycle of communication, and the second one is a done.

And let me call to your attention, you have now followed out the exact one-two that I gave you for the auditor to a pc. See, this is the way the mind stacks up.

Now, it's quite sensational just getting a communication line straightened out to something. This is quite sensational. It doesn't really finish off everything there is to finish off. It is merely sensational. So the best thing to ask a pc who has a PTP – the best thing to ask this pc to get rid of his PTP is "What cycle of communication have you failed to complete with regard to this?" "To it" or "about it?"

See, he's given you a present time problem. "Present time problem with my wife."

"All right. What cycle of communication have you failed to complete or have you not completed (better wording) to your wife or about your wife? Hm?" And it all sort of goes *bzz-bzz-bzz*, and an awful lot of the time this problem evaporates as a problem. But you haven't taken very much care of this problem yet because you've approximated the one-two of the auditor, you see? You've really not done anything about the problem. You've just eased it off. See? You've gotten in there so that you could do something about it.

But you will very often find out quite magically that for the purposes of destimulation and getting on with the session on what you were doing yesterday, and so forth, that it's quite adequate. And you'll very often find that in the field of psychosomatic auditing that it's quite adequate.

The severity of the illness has *nothing whatsoever* to do with the ease or difficulty of its release. These two things are not comparable. You'll find some guy with some sniffing, little sinus condition that merely nags him, that takes a thousand hours of itsa before it finally surrenders. And this other bird has got a busted back and can't even move his feet, and you might cure the whole thing up in five minutes. Don't ever measure – don't ever measure the length of auditing by the violence of the condition because they are not necessarily in keeping one after the other; they're not.

So anyway, there's your first chance just with an auditor. An auditor can sometimes sit down and audit a pc for a few minutes. He just gets in his communication line, you see? The other fellow finds out there's somebody he can talk to, the auditor, with his good discipline and everything. And all of a sudden, the guy feels wonderful, see? And he says, "Well, it's all settled now."

And the auditor says, "Wait a minute that can't be. I didn't do anything, you know?" Well, that's true, but as far as this guy is concerned it's all settled. He's found one human being out of the whole sun, moon or stars he could talk to and this was enough to momentarily key him out and make him feel better. Perfectly adequate action. And then you go around waiting for this miracle to happen again, don't you see? Well the miracle, maybe, won't happen for many a pc because, of course, what the missing thing was is you didn't do anything for this first pc and you knew it. So you get lazy and you expect to go on through auditing not doing anything for people and have them feel marvelous.

I think that's the one-shot Clear and so on. You see, if that existed, we'd all be out of work. So you can bless your stars it doesn't.

But you occasionally get this type of a reaction. You'll get somebody reading, just reading a book on Scientology and all of a sudden going well all over the place, you see? Well, that's because somebody understands them or somebody knows what it's all about or somebody has put his finger on what the score is with life. And just the fact that this data could exist all of a sudden gives a guy a resurgence and he gets out of his sick bed. This has happened many, many times. But that's just the first step, see? That's the communication step.

Now, this other step, when it doesn't occur automatically, you want to be able to do something about it. You don't go around expecting the accident to happen all the time, you see? So you ask this – let me take it up in the most elementary session form possible, terribly elementary session form and that is, "Do you have a present time problem?"

"Oh, well, yeah. Oh, yo – boy, do I have a – oh, oh, man! Ha-ha. You should ask."

"All right, well, is there any communication you have not completed with regard to those problems?"

"Oh, *brr, brrzz, brzzzz, brzzzz, brzzz, brzzz, brzzz, brzzz, brrzzz, brzzz.*" Problem is all gone.

You say, "What magic! How marvelous!" All right. That's fine. That's fine, but remember what you have just done is the lick and the promise. See, you have not gone any more fundamentally into it than that.

Now supposing you were in the horrible condition of having said, "What communication have you failed to complete about those present time problems?"

And the pc says, "Oh, well, none of that would do any good. Nothing. One couldn't, you know? That's it." Now what do you do? Your favorite card trick has laid an egg. Now where do we go?

Well, there's number two. You see, you should realize that up to this point you haven't done number two. You haven't done anything for the pc so this second one is "done." You see, "doing something" is mostly "done." See, they rhyme; they go together very nicely.

Now, why? Because it's the highest common lock of the whole reactive mind. If he has a present time problem with something, he has overts against it. And if you really want to do something about these things now, you had better get off those overts. And if this has been getting in your way consistently and continuously, you'd jolly well better get off of those overts. You better get them off of that case, man, because they are big and they are flagrant and they are mad.

If your card trick won't work of "What communication have you failed to complete?" (I keep saying "failed to complete." You should never use "fail" as an auditing command, it's an old habit. "What communication have you not completed?" or "haven't you completed?") You got the other one – the other one. Now that's doing something for a pc. And there's such a vast difference between the amount of skill required between saying to somebody "What communication hasn't been completed?" See, *brrrr-dada, da, da*. It doesn't upset him; it's not embarrassing, there's no social status challenged here. You're improving his communication so your communication with him improves. It requires nothing of your auditing discipline. See, that's the lazy, long sleep. Why? Because it's really just step one again.

Now you're going to have to "done." And man, that takes auditing – that takes some auditing. I know of seventeen different ways that you might have to approach a case in order to get off its series of overts to actually throw out of the existence all of the pc's upset about it. And you might have to use every single one of them.

There are lots of them. There's overts in chains; there is the subject of recurring withholds; there's the subject of the recurring overt; there's the subject of the – getting the basic-basic of something; the formulation of the proper question to ask so that – this can get pretty complicated. We've had all that technology here over a period of time. A lot of you are here who have been here before, and so forth, have sweat it out. But it's very valuable technology.

Some individual keeps telling you that he threw mud at a car when he was sixteen, and this is an overt. And he gives you this overt and he gives you this overt and he gives you this overt, nothing happens. But he keeps telling you this overt. Well, now, you have to know what is happening here and know what to do about it. Otherwise, he'll just keep on giving you the overt. This is part of a chain of overts. This is what's known as a recurring overt.

And the trouble with it is, is you're nowhere near its basic. And now you have to be able to codify the question necessary to get the basic of the chain and you have to be able to audit this sort of thing by chains. And this can become very interesting indeed. And then you have to be prepared to find no overt as the bottom of the chain. And that is one of the more mysterious things. The guy has *always* believed that he had an overt there and none was there. There's that phenomenon which can hold a chain in. Another is – there's plenty to know about this.

But man is basically good despite his reactive bank. The reactive bank is only composed to make a man commit overt, which is against his better nature. If he commits these overt, therefore, he'll trap himself because he won't go on communicating, having committed them. So it's the perfect trap. You do not want to talk to people you have wronged. I very – I'm very shy of letting anybody wrong me, not because they will do me any damage, because they can sure cut themselves up. They commit an overt act, don't you see, and then they will try to withhold and sever the communication line for fear that they will commit another overt act. That actually is the fundamental think of man.

After awhile he goes out of control and he just starts dramatizing. And then you have the murderer and the thief and the rest of the fellow who has no responsibility or anything. He's actually left the human race at this – by this time. But along some line, that individual will still have a sensibility: He will still be sensible in his responsibility in some zone or quarter. And, in handling such a person, an auditor has to be terrifically good. He has to find some zone in that person's existence that that person could commit an overt on.

Oh, the person has slain cities full of people, don't you see, and he's done this and he's done that. Put any – put any crime on the book; this person has done this crime without the least qualms. Ah, well, the auditor contest there is to find *what!* You see, he's totally out of communication with everything, that's why he can commit the crimes. He's gone. He's just dramatizing. He's not even there, he's *woof!* All right. You've got to find, as an auditor, some zone he can still commit an overt against. What overt would be real to this individual? And you'll find *some* little corner of his existence is still an overt.

Now, there's other ways to build up overt in an individual. You say, "All right. What have you done? What have you done?" And the individual will give you perhaps something which is a rather banal statement. You can ask him, "Well, why was it all right to do that?" And he will give you a lot of justifications and so forth. There's that approach.

Now "What terrible, vicious, mean thing..." This is another thing, you see? Just "done" is just "done." You know, "What have you done?"

"Well, I've eaten breakfast." That's a perfectly adequate answer to the question, see?

But "What mean vicious thing have you done?" Now, this would be another branch that we call overt. See, just "What have you done?" that can be used – that can be used all by itself as an auditing question. "What have you done?" But you wouldn't, really, except if you were – educated your pc into answering the question under some special connotation, you really wouldn't get nothing but overt, you see? But it's perfectly valid to do that – to get such answers and so forth. The only modification which you require are "What are you absolutely sure you have done?"

Now, let me tell you why that is vitally necessary that you understand these two branches of "done." One of – "What have you done that is socially reprehensible that will prevent you from communicating and doing something else?" That's what we call an overt. And the other one is just having taken an action in the direction of. That's just "done" see? It means just that. It means having taken an action in the direction of, see, nothing, no significance with regard to it at all.

Now if we run just plain "done" on the individual, we could be totally knuckleheaded as an auditor and not guide the individual in any way, and he would immediately start doing something else. Now, what would he start doing? He would start looking for the explanation. He's running a process – you're running – you're saying, "What have you done? What have you done? What have you done?" And the pc is no longer running that process. Now, hear me now. This is the big liability of this "done." The pc now starts looking for an explanation for what has happened to him. And he's now running the process "Explain what has happened – maybe this will explain what has happened to me."

You might as well be asking, "Explain what has happened to you. Explain what has happened to you. Explain what has happened to you." That's the process he's running. He's running "Explain what has happened to you," but you're running "What have you done?" Now, unless you're aware of the fact that almost any pc under the sun will convert the process "done" to "Explain what has happened to you," you will never be able to run a pure "done" on a pc. If you don't know this, then you can't run "done" on a pc. He'll convert it. He starts looking for the explanation, and he will start inventing things he has not done in order to get rid of the consequences which he is experiencing. He's trying to find a good enough overt to explain what is occurring in his life.

Now there, there is your considerable difference in these processes. And what an auditor has trouble with there, then – we'll recapitulate very rapidly – an auditor then has trouble differentiating between communicating with the pc and doing something for a pc. And then when he gets into running "done," he doesn't want to sacrifice his communication line in order to press home any nasty personal little facts, you see? So he never really presses home his question. And the next action is he runs into the square brick wall of the pc doesn't run the process. The pc runs "Explain what has happened."

Well, a fellow is subject to continuous headaches. So he will actually, in a desperate condition, start giving you fictitious deeds – fictitious deeds. He'll very often go on to the far backtrack to give you a fictitious deed. You always want to beware of that because you know at once that this happens, that the individual has done this to you. "I shot fifteen Praetorian guards in Rome." *Ah-ugh-hoo-oh*, no, no, no, no, that is not an answer to the auditing question because the auditing question is, understand, "What do you jolly-well, damn-well know you've done?" But what auditor is going to sacrifice his communication line by cutting up a pc down in – shooting him down in flames to that degree? No, you'll listen to a couple of these, but all right, steer it back to where it belongs because he's looking for an explanation.

He isn't trying to find what he'd done. All you want is "What are you certain you've done, bud?" That's all the answer you want. "What are you – what are you real certain – what do you know, absolutely, that you have done?"

You could work a gradient scale up from "I know I've eaten breakfast. In fact, I know that sometime during the last year I've eaten. Yes, what have I done? What am I absolutely certain I know? I know I've spent some money. I know I must have spent some money in the last few days. I don't really have any exact recollection of any money, but I have less money now than then, so therefore I must have spent some money in the last few days."

"All right. Well, do you know you've spent some money in the last few days?"

"Well that – ." This is an actual auditing sequence, you see? "Do you know you've spent some money in the last few?"

"Well, I must have because I have less money now."

"Well, that is, you're just computing that you spent some money in the last few days. Do you know that you spent any money in the last few days? Come on. What – where did you spend some money in the last few days?"

"Oh, my God, you ask me a question like that, I *o-o-o-oh-ooo. Hum-m-mm-m-m. Hmmmm. Done. Hum-m-m. Ha-ha-ha. Sixpence. I spent a sixpence for a lolly.*"

"All right. Good enough. Here's the next question. What have you done?"

"Well, well, well, let's see. What have I done? What have I done? Let's see. Let's see." Starts squeezing his head a little bit. "What have I done – so on. Well, I was a headsman once that worked up in the Tower and I missed Ann Boleyn's head and hit her with the flat of the head with an axe." You know what he's – what he's figured out? He tried to answer the question, he got a headache, so he tried to explain why he had the headache, so he reaches back into the past and he gets some uncertain piece of something. So he tries to offer you something that is enough overt to give him that much headache. And that's why it's very difficult.

Now, you'll find that people who answer the question that way – the test is do they ever get well? No, they have an awful time. They have a pretty bad time.

Now, it isn't, actually, whether they did do it or didn't do it. It's their degree of certainty on having done it. See? And I can very easily go 500 years ago back into France and give you the name, rank and serial number of a lot of things, see? And I can give these things to you, but after I've run a few of them, I start running into "Let's see, was her name Mary? or was it Marie? or was it...? And did that happen at Agincourt? or was that at Poitiers?" And next thing you know I'm in a fog. And if I go on this way very long, I'll start wondering whether I even was alive yesterday because I haven't entered it from a zone of certainty. See? I've entered it from a zone of dim recollection or something like this, you know?

So "done" is built up on a gradient of certainty, not built up on a gradient of explanations of what is happening to the pc or has happened to the pc. You might even convert the question so that it's "What are you quite positive that you have done?" You want to be careful about saying "absolutely certain."

See, it's no criticism of the pc or even the pc's memory, but that pc is actually trying to explain something or they wouldn't be shooting back on the backtrack trying to give you an explanation. See, that's the thing you've got to watch. That's the thing you've got to be awful careful of because they're going to dig themselves in in an awful hurry.

So, again, you wouldn't be doing anything for the pc by running "done." So, again, it comes under the heading of doing something for the pc. Well, there's a lot of things you could do with a pc without doing anything for the pc. There's a lot of phenomena that you can achieve without achieving anything for the pc. You can turn on some very, very handsome somatics at one time or another on a pc without turning them off, too.

So, anyway, you've got a problem here in doing something for the pc because you're liable to be doing A and the pc is doing B. And then you go on doing A while the pc is doing B, and then somewhere down the line you wind up in a hell of a mess. And you say, "Well, what happened?" Well, the pc never did what you said, so you didn't do anything for the pc. There was in actual fact no barrier to your willingness to do something for the pc but there must have been a tremendous barrier to your understanding of what was going on. That you could ask A and the pc answered B, in itself showed the auditor observation was very poor. So, therefore, the auditor wasn't in communication with the pc so again the communication factor was out so once more we weren't doing anything for the pc.

Now this is where the thing adds up. Now, if you're going to communicate with the pc – if you're going to communicate with the pc – it's to the end of doing something for the pc. Now, if your communication with the pc is good, you'll wind up then in a position to do something. But having gotten in a position to do something, for heaven's sake, now do something. See? Don't halfway do something or partially do something. This isn't difficult, what I'm talking to you about. It's just putting things in their right boxes in their right compartments.

Don't ever think, because the pc likes you and everything is going along fine and you get along together so well, that you're doing something for the pc. No, you're communicating well to the pc. So, in communicating very well to the pc, you now have an opportunity to do something for the pc. But then your own communication channel to the pc could go out, and you could be asking the pc A and be getting answers for B. And then, again, you wouldn't do anything for the pc if there was a second place where it can break down.

Now, you're just – the gist of the situation then is that O/W is liable to be the most productive zone or area for big recovery on the part of the pc, providing the auditor knows how to steer it, and *will* steer it, and isn't being too tender about it. There's dozens of ways to run this sort of thing. You can get in there and you can say, "All right. What big overt have you committed in this lifetime?" That was to take O/W from the version of *overt*, you know, so on.

All right. "What overt have you committed? What big overt have you committed in this lifetime?" Think, think, think, think, think, think, think, think, think. "Well, I upset Joe. Yes, yes, that was about the biggest overt in this lifetime. I really upset Joe."

"All right. Fine." You think you've gotten someplace now. Of course, you haven't gotten anyplace: Your tone arm hasn't moved; there's been no cognition; there's been nothing like this. This thing is in a situation where there can be set up in a dozen different ways. You haven't gotten anyplace yet but you've gotten a big overt.

Now, you think perhaps that his having told you, now, should somehow or another magically discharge this thing. No, why should it magically discharge it? He hasn't answered

the auditing question for one thing. He doesn't think it *was* an overt. "What *big overt* have you committed in this lifetime?"

"Well, this horrible thing I did to Joe." And he tells you what it is, rather proudly. And you say, "Well, O/W doesn't work because nothing happened." Man, you didn't even get your big toenail wet on the side of the Pacific. The sixty-four dollar question now is, "Well, why wasn't it an overt?"

"Oh, well, it wasn't an overt, because Joe is a heel and because of this and because of that, and so forth. And he deserved it, and it's the common thing to do in those circumstances; everybody expected me to do it. And, of course, it was natural that I would because I have a reactive bank and it forced me to do it." [laughter] And a guy can go on for some time on the justification of this overt. And you'll start to get tone arm action, tone arm action, tone arm action. Now, you're watching the increase of responsibility along certain zones or lines. And this person has not flattened the process because he has not come up to a cognition or a recognition of anything yet, but he's sure working on it. And that tone arm is a-moving and it's a-moving and it's a-moving and so forth, and we're going along on this. "And after all, Joe really was a heel. And he wrote me a nasty letter once which was a *greh-tajub-a rub* and it was absolutely inevitable and impossible that I would have done anything else but this because everybody expected me to do this, don't you see? And if I hadn't done this, it would have committed an overt against a great many other people." "Now, on this overt against Joe, is it really an overt after all?" and so on.

All of a sudden a – the guy is liable to get this little sensation of the glee of insanity, or something like that, as far as it goes. I'm not kidding you. It's a sort of glee of insanity that starts coming off the surface, and so forth. And some little corner of him is taking a look at this thing, "You know," he says, "that there was some part of that that was an overt, mostly against myself, of course, because..." [laughter]

And a guy will actually worry that and worry that and worry that. Now I'm not – I'm not prepared to tell you how many hours he could go on worrying this, producing tone arm action all the way. I don't know. It might be a twenty-five hour intensive on one overt, don't you see? Until you get the thing worn down and eventually, all of a sudden, he says, "Well, even though it could have been explained, you know, that was a hell of a thing to do to Joe. I shouldn't have done that to Joe. I'd completely forgotten. I'd completely forgotten. I had it completely in my choice whether I did it or didn't do it. And I did it. *Whoo!* Yes. Yeah, I committed an overt against Joe. Yeah." Boom! *Pswwww*. You see it blow. And you won't get another scrap of TA out of that whole thing.

You got one "done," see, one "done" off the pc. See, there are numerous ways to handle these things. Now, while you have him going through all of this, and so forth particularly as his being a Scientologist, he may know all the ropes, keep him guided into this channel and keep him going right on down the line and keep your communication channel, and so forth, open to the pc during this period of time. That's all a trick; that's all takes some doing. But in the final analysis you will have done something for the pc, *for* the pc, not to him.

Now, there is – there is the auditing of O/W. Now, a lot of this lecture, I apparently have not been talking to you much about the process of O/W, I've been talking to you about

the version and guises of auditing. But unless these things are understood in their proper relationship, one to another, you will never run any O/W and never get any overts off anybody and really never get any withholds off anybody. You know? You have to know the technology, you have to know how to audit and you have to, yourself, be in communication with the pc to know how to handle this situation.

Now, all the way along the line of what I've been talking to you about, you are raising the cause level of the pc. All the way along the line you are raising the cause level of the pc. You do these things, fairly slippily, fairly expertly; you're raising the cause level of the pc. And he's walking right up and he'll be able to as-is more and more. Your pc will be changing under your eyes; your pc doesn't come into session with so many PTPs; your pc is much more able to get the show on the road. The pc is this and the pc is that. And you're seeing this – this thing progress, don't you see? Now, you could go into "done" in numerous other categories. I'd swear, I don't know, if you piled up all the bulletins on the subject of O/W and running withholds and chains and all of this kind of thing; man, if you stacked those all up together, you wouldn't be able to hardly look over the desk. There's lots of technology. You don't need all that technology perhaps, but it's very nice to have it. If you're going to be very expert along these lines, why, there it is. Because the mind is quite funny in the various ways that it works.

Very often you get a tremendous failure in this particular field in trying to direct somebody to do something in this field. They don't understand some of these ramifications I've been pointing out to you. I've asked somebody – a girl is lying dying in a hospital for no apparent reason or something of this sort. And somebody asks me frantically, frantically! They'll say, you know, over a long distance line or something of this sort, "What can we *do* to bring this girl back to *life*?" and so forth. And frankly, it's not with any hope at all that I tell them what they can do, because I know that ordinarily they won't consider it heroic enough. I'd tell them the exact fact of what to do. In such a case as that, the exact thing to do was find out what her family doesn't know about. That actually was enough – they were in sufficient communication with the girl in this particular case – that was enough to have gotten her out of that bed and back on her feet again.

It wasn't that I knew anything she had done, but I just knew from the sudden discussion of it that having retreated from home to this and then gone to that point and then suddenly gone to a hospital with a exclamation point and fireworks and lying there dying from no apparent reasons or causes and so forth, that obviously there was a withhold there. And that would have taken enough off the edge of it, don't you see? Because I knew that any situation like that, no matter how heroic it appears, must have been terribly hard to maintain. That – situation like that is so unnatural, you see? Well, look at how hard somebody'd have to work at it to put it all together this way. And it's just like any other complex situation, you touch one corner of the house of cards and down it'll come. Well, that's the good point to touch.

Some stranger saying to the person, you know, "What doesn't your family know about?"

The girl might have opened up, "Well, they don't know I had this affair with Bill," and so forth, "and that I'm enceinte." And then all of a sudden it felt much better, don't you see? And says, "What am I lying here dying for?" you know, and got out of bed. [laughter]

Because people – people look at the heroicness of the condition, they always add it up that it must be an heroic comparable action, and it's not. It might be very complex, the reasons they're there, but the very complexity makes it untenably hard to hold on to. No! It – a mad-man down here in an asylum, he has a hell of a time. Poor fellow must work day and night, staying in there. He just must work overtime! You can see him, "Now I will be ferocious," you know? The point of entrance on the thing. It's just, actually, the same points I've been talking to you about. You get into communication with him and you ask him what's sensible, see, or you ask him what he's done or ask him what he's withholding. And you'll just see it crack up in front of your eyes.

And that's actually the magic of the world of auditing. That's the magic that can be done with auditing. And you get the long grind situation. It looks like a long grind to you, because you say, "What have you done?"

"I've murdered the local vicar." [laughter]

And you're stopped right there; where do you go from there? You have no responsibility, you have no nothing, and so forth. So, recently, we have developed ways of handling these "no-responsibility." It's actually a new development, and compartmented them out so they're much more easily handled.

Well, I wish you lots of luck with it, but when I ask you to get some withholds off somebody or get some overts off somebody or raise somebody's cause level, now, at least, you know what I am talking about.

Thank you.

Male voice: Thank you.

DISSEMINATION

A lecture given on 7 July 1964

Thank you.

Have to look you over, see what's happening to you. Got to keep check on you. Isn't everybody that can read off seventy or eighty cases in the breath of an eye.

What's the date?

Audience: Seventh of July.

Seven July AD 14, Saint Hill Special Briefing Course and a lecture on something I haven't found out what yet.

Little piece of news here first. It's quite interesting Scientology in its impact and its effectiveness – fantastic effectiveness at lower levels. Only trouble is as we who are accustomed to it are so seldom – well, you might say, driven to a total simplicity that we don't always see its effectiveness at a lower level, you know? We say, well, absolutely this thing has to be far more complex in order to do something for somebody. And well, let's do something a little more skilled, let's get some auditing in at a good professional level, you see, and so forth.

And as you might have heard and which you saw the evidence of, I went to a circus on the invitation of its management and photographed the various acts in the circus itself, and so forth. And these photographs, by the way, I'm not quite sure what their disposition is, but they've already been swept into the torrent of publications and publicity, and I had to part with about thirty of them, with shaking hands for fear of what might happen to them for reproduction in a paper on the south coast. A one-time reproduction, and of course, those are transparencies so they have to come back to me, but of course, they're the only copy there is, you know, and all that somebody would have to do is, taking them out of the cover glasses, is slightly scratch one and that would be the end of that as a picture, you see?

But already, why, they've started into the torrents of publicity and last night, by the way, we gave a smashing show, absolutely smashing. The circus, you know, is noted for showmanship. And so we out-showmanned the circus. Always count on Ron, you know. [laughter] And we didn't take that little screen you saw them on, you see? I took – and there are also nearly a hundred additional pictures that we had. And we hung up a twelve by twelve white sheet that we had to sew up with our own little fist, for a screen, making a twelve by twelve screen.

Now, twelve by twelve doesn't sound very large to you at first glance but that is an awfully big screen. That's actually the vertical, I think, is slightly greater than the Technirama

or something screens. I don't know what those are but it certainly looks so. And this hung on uprights in the ring last night, over at the side of the ring, of course made an elephant as big as an elephant. And it made a performer anything up to five or ten times his normal size. And Reg's beautiful Rollei projector there, and boy, it threw that picture out in that dark tent like mad. We gave them a party actually, having shot all their pictures and everything, why, we ordered a bunch of beer to be delivered up there by Tyler's and so forth. And after their show was all over, you see, why, we gave them a show, see?

And it was terrifically acceptable to them but actually, show or no show, drinks or no drinks, these people had been becoming more and more and more friendly. We practically own the circus. [laughter] And even the animals smiling, you know? The elephant man there, he's got quite a sense of humor. He keeps putting an elephant over on top of me every time I start shooting his act. Elephant will sweep in right dead close to where I'm sitting, you know. The other night, why, he popped a whip in front of my face. I don't know, not more than an inch or two away from my cheek. You know? Of course, they're experts at this sort of thing. See if I'd blink. And I just grinned at him, you know?

But this has been, actually, a very amusing experience in numerous lines. And these people of course are quite accustomed to high-class black and white photography and – because that's professional theater photography it's some – one of the glossiest of photographic fields. So anyway, this beautiful bunch of transparencies and so forth – thrown up there on the other edge of the ring, you see, elephants as big as elephants and so forth, and boy, these people really enjoyed themselves, you know, naturally, as a picture of their own acts and that sort of thing. And we really gave them a good time.

But the point is – little numerous – numerous little things happened. One of them you'd be very interested in – couple of weeks ago, when we first started this – it isn't I haven't been working on this for two weeks, but – totally, don't you see, but we've managed to get a couple of evenings off and go and – about three, by the way – and go tearing up there, you know, and wherever the circus is playing. It's playing in this radius and it's within about a forty-five minute drive of us or something like that at any given night. You see, even though it's changing locations. And they had just been through an awful jump because the grounds they had, had suddenly been denied them and the council had found that the man who was loaning the grounds – renting the grounds to the circus had a clause in his rental of the grounds from the council that he must not sublet it. So the council forbade the circus appearing on its own grounds. And at two o'clock on a Sunday dawning, why they were out there with flashlights and the chief of police and the mayor and everybody else looking over ground – for new ground to put the circus on.

Well, this made a bit of a ripple – so they attracted a fantastic quantity of press. And here was a council turning down a circus in an area but actually they did them a tremendous favor. They put this circus up on top of a knoll, and you come down on one of these MI type highways from about three, four different directions and over there, miles, visible for miles, is this big top sitting up there on top of this knoll, see? And boy, they had that thing stuffed to the rafters yesterday. You couldn't actually hear yourself think much less even hear a camera click or anything like that, with the kids and the cheers and hurrahs. And you talk about enthusiasm, man, it was there!

But anyhow, you'd have thought this crowd would be pretty dogged-out with all this experience and they weren't a bit, were they? They just, right on their toes and so forth. And they gave us a big send-off. But the elephant man, couple or three weeks ago, when we first started this, right away got ahold of me just before his act – and he was in the elephant tent there, a bull tent – and he said, "You know," he said, "I have a terrific swelling on my knee." And rolled up his trouser leg to show us. And it was. It was huge! Thing was as big as a softball. And he used to be a tumbler and it's Ivor Rosair, he's one of the last remaining members of a Rosair family. The circuses go by families and it's very traditional, and so forth.

And this Sir Robert Bailey's – well, that's Sir Robert Fossett's Circus, is the name of it and it's run by Captain Bailey Fossett. And the place is absolutely drowned in Fossetts. Everywhere you look there's Fossetts. A couple of girls last night – I was busy shooting some shots of one kind or another and I'd pass by. Of course, they double in brass, you see, a little circus and you'll see this girl up in all of the aura of a performer doing a death-defying stunt – and no kidding, it is! It's good. Their acts are terrific, you see? Nothing corny about them. The next thing you know, why, she's down there selling ice cream, you know? And everybody turns to, to knock the big top down, including the manager and the owner, you know – just everybody. And they put it all up again and take it all down and everybody has got his part, you know? Terrific circus organization.

But anyway, this fellow says that he had this terrific swelling on his knee and it was worrying him a great deal, and I don't know quite where he got the idea, since we hadn't introduced ourselves in any way, where we quite got – where he quite got the idea that I could do anything about this, you know? But he was leaning on me pretty heavy to do something about this – the demand was definitely there. [laughter] So I showed him – I showed him how to do a Touch Assist on it, told him to remember to touch both knees and I didn't give him a "look at it," I just gave him "feel that," you see? And now, "just feel your finger on one knee and then feel your finger on the other knee and you do that."

He says, "Well, at night," he says, "I can't even go to sleep, uh – it – it hurts so bad." And he's been to hospital, he's had specialists and medicos on it, and so forth. And I think they were going to remove all the ligaments in his brain at one time or something of the sort. [laughter]

And anyway, he's pretty – pretty pressury on the thing. So I told him how to do it and I said, "Make sure you do that and you don't have to do it very long and just do it every night before you go to sleep. Sit down on the edge of the bed and do this," you see. Well, I didn't expect he would, because the cue had already sounded. And the elephants had heard the cue but he was so interested talking to me about his knee that he had missed his own cue and the elephants more or less picked him up, you know, and took him along. So there he was, going along there, restoring the bandage and getting his pants leg down and so forth and the elephants shoving him on, you know, toward the big top.

So we thought, well, that's the last of that. You very often give somebody how to do a Touch Assist and they forget about it, you know and they think something or other. We pulled up there yesterday – of course, we've gotten very friendly with Ivor since – and we pulled up there yesterday and who's there but Ivor, see, he's all dressed up, he's ready to go on. And this

guy, by the way, is one of the biggest elephant trainers and that sort of thing in England. And he was out there, and he was talking very cheerfully and so forth and he said, "Say!" he said, "I want to show you something," you know? And he pressed his pants together against his knee, right knee, left knee, same size. Swelling gone. "Yeah," he said, "I've been doing it." He said, "Yeah, of course, why not?" He said, "Either you're crazy or I'm crazy!" he says, "but it works!" [laughter]

So last night – last night, after the show, why, I was developing a practice on business consultation and on personal problems. And I've got a practice moving around the country, two or three different locations a week and so forth, at this very minute. And somebody who says he can't find anybody to process or get any results with Scientology and so forth, sometimes puzzles me. Puzzles me. Because actually, I've never been able to lift me head anyplace in the world without developing a practice. I don't even ask for a practice and I've got one, you know? I've got an old sign, I have to show you some day. I think it says, "Esha mak hlopi isangoma," which means something on the order of "the white witch doctor." And it gives my name, in script, and then says that I'm a white witch doctor in, I'm not sure, it's one of the Bantu tongues; I think it's probably Zulu.

And so anyway, I had a nice practice there. But I'm careful not to work at it, you know? I actually have to be very careful not to work at it. You turn around and the next thing you know, you got four or five guys standing outside the door and they've got something going on. And then they actually don't ask for anything very heroic. They don't expect any results and they're absolutely flabbergasted. You do something for them, just do something for them. That's the primary note. Somebody asks you for help, why, do something for them you know, tell them something.

Fellow was saying to me last night that he got fainting fits. And he says, "You just show up at the door and they're all disappeared now," he says, "but I was having fainting fits just before you came." I was talking to him in the arena after the show. And I say, "Well, all right, I..." What can you do for somebody with a fainting fit, you know? Well, I'd just got through giving the show and so forth, and my wits were not in a very grooved-in condition, you know, I'd just given an extemporaneous performance on the circus, to circus performers, you know? And you don't think that isn't tough, try it sometime! And of course, the lantern slide went out as a medium of entertainment some years ago, you know? And to suddenly whip up all this old technology, you see and dream it up and talk to circus people about the circus, you know, you don't know whether you're talking to a pedestal or a drum, you know? You have to call all their names, you know, as pictures of them appear, maybe you got them wrong or backwards, you know; you got no list. And it's a bit of a – bit of pressure. All of a sudden somebody says to you, "I have fainting fits," you know? [laughter]

So, Ronnie just into the other harness, you know, zip-zip – presto chango. "Well, now, I think if you'll look back on it, you'll find some – that you've done something that you thought you shouldn't have done every time just before you'll have one of these fits." And he wanders around about this, thinking about this. And of course, what did I give him, you see? Obviously there must be some O/W mixed up in it. That's just one off the cuff, you know? And he thought that over for a while, and he wasn't quite sure about this and so forth and he hadn't digested it yet. Now, he'll go off and he'll figure that one out, see? And he'll at least

have something to do. Don't you see, when he has a fainting fit, he'll say, "I wonder what I've done that I feel guilty about." And he'll think, "Oh, yes. Oh, yes. You know, I stepped on this," and he'll get rid of a couple of overts. And that's just – it doesn't matter whether that was the fainting fit or not, the fainting fit will tend to change at that moment, see? After he's done this two or three times he might also cease to have fainting fits, don't you see?

But the point is, this is a – this is a hunt-and-punch type of practice. You know, it's just off the cuff. And you better develop a facility of how to do that. Somebody finds out you're a Scientologist and that you're in this field and that sort of thing. And I don't go... The funny part of it is I don't know how you handle it, but I personally never – I never tell anybody anything. I just never tell anybody anything.

Of course, I have the slight advantage occasionally, I have a press agent circulating around unbeknownst to me, you know, driving in a practice on me, and so forth, like Reg probably was. And I don't know that Reg was doing this. But he might have been doing it. Naw, he's – has nothing to do with it. Because it happens to me anyplace I go. And as far as these fellows were concerned, why, I was just a photographer that was taking pictures and I proved it to them with the show, see? Must be a pro, look at the show, you know?

Very funny part about it, the only person that was really rattled at the circus was a young photographer up there from one of the local papers. He blew in there with his flash gun and Jap camera. And they all carry a little Yashimat or something like this, camera, flash gun. He blew in there and he says, "Uh – you from the press?"

And I said, "No." I said, "American *Magazine* features," you know? [laughter] And it's true enough you know.

"Oh!" he says. "The English small circus. Hm." You know, bored you know, like that and he say – I introduced myself. And he said, "What are you shooting there?" And he looks and he sees it's a Rollei, and he's shooting a Japanese version of it, see? Well, that's a little point – and he says something about, "What are you shooting there?"

And I said, "Well, I don't have any black and white, I'm shooting only color."

"Oh." Eyes go round – absolutely black tent, you see, impossible to shoot color. And he says, "There are a couple of other photographers around there – been around – a lot of photographers around this act." Of course, that was Reg and Bonwick standing over there, [laughter] my cameras ready, so forth. And I said, "Yes." I said, "We're a team working on it," you know? So he starts to ask me for what are the pictures in the place, you know, and I pointed out this picture and that picture to him and he went and took them.

My respect for him went up, however – the comedy horse got loose amongst a whole mass of children. The comedy horse, that – two men occupy it you know, and it's up there in the stands, and these kids are absolutely mobbing this comedy horse, you know? And I slid around and jumped up on a bench to get a shot of this, and just before I fired with a telephoto – which stacked it all up, you see – just before I fired with a telephoto there was a flash on it. I don't know how this boy got a picture. I don't know how he dematerialized on one side of the ring and rematerialized on the other side of the ring, but he rematerialized right in the midst of these kids and right in the midst of the comedy horse. I don't know how he ever got a

picture of it – he must have been far too close up, or he was running a hundred-degree-wide wide-angle camera, but there he was and he came tearing out of there and he waved his hand to me. He says, "I got it, I got it!" and off – he's gone, he had another appointment, somebody was having a fire someplace he had to shoot, you know? [laughter]

But my respect for him went up. I hadn't ever seen anybody dematerialize and rematerialize. Press boys are very good at that, you know, they have to be very quick, they have to be very quick on the draw. It's an odd skill. And if you don't believe it, sometime just pack a camera down the street and spot some pictures. And you'll find out you're usually spotting the pictures twenty minutes after you've seen them at first and then you cut the comm lag down. Actually, this type of thing needs drills, like we have in Scientology.

But putting a practice together has always been a mystery to me, how anybody could miss. It isn't because I'm me or because of my name, because very often I will appear in some entirely different guise, you know? Like I'm a motorcycle enthusiast or something like that – I got a practice, you know? I'm a photographer – I've got a practice, you know? It doesn't matter how I pull the mask over me face, it's – I wind up with a practice. And one that could be, just with a small amount of pressure, built right straight on up, don't you see? Maybe it's because everybody is trying to build a practice the hard way. Somebody says, "I've got a headache," and you say, "My auditing rates are so-and-so," and they say, "What's auditing?" you know? I'd say that would be the wrong way to go about it. I'd say that what you do is just on a hunt-and-punch basis get a half-a-dozen cases here or there and so forth – do something here or there and so forth, and you probably build it up to a practice that you could charge money for.

You see, having a practice, and a practice that you can charge some money for and a practice that you could charge a lot of money for are just a gradient scale. That's all it is. And if you don't start the one practice, you'll never get into the other two.

I've been almost ashamed of myself, someday – sometimes, after I've been in an area for a while, the amounts of money – the amounts of money that get pushed in my direction – rather fantastic sums of money. They start going up to the degree that I won't, you know, go into professional practice. You know, they start putting the pressure on it, you know. And every now and then I had to raise my rates from two hundred and fifty dollars an hour – that's too little. Two hundred and fifty dollars an hour is too little. And those rates were put on my auditing for only – for one reason and that was to stop – not have to audit, see? At five hundred dollars an hour, that's fairly safe. You only get an occasional once-in-a-blue-moon bid on something like that. But two hundred and fifty dollars an hour, that's too cheap.

But of course, now, we're talking about me and my – in conjunction with my name. Well, what would I, operating as nobody at all, just an anonymity or obviously somebody involved with some other profession, well, how fast would it build up to that? Actually, it'd build up to the same figure. There's no difference. Because I'd get the same practice, start in the same way, move up in the same gradients. The only thing an auditor would really have to solve is what does he do for an income while he's building a practice? And if he hasn't got a bunch of cash in the bank to relax on or something during this period of time well, what does he do for income during that period of time, that's all. Because there's going to be a lag period

of time there, depending on how clever he is and how fast he's off the mark, and so forth. There's going to be a short period there when he isn't making any money. And a period could probably go, with me, from a week, to somebody else – three, four, five months, you see? And some auditors play it backwards. They set out and use what capital they've got, until they get a practice, see? But they never really start their practice, don't you see. They just live on what money they've got, until the practice suddenly mysteriously materializes someplace or other.

Well, that isn't the way you do it, you actually shouldn't lean on any capital, you get yourself a bit of sort of income, if you're starting in in an area or something like that, that puts you in communication and contact with people. Jobs and having something to do and that sort of thing – very useful in getting you in contact with people. Not in any little small office. If I had to work in a small office and I was trying to build a practice, I certainly would not depend on the small office in which to build a practice. I would go out and join some social clubs. I would join some very numerous social clubs, you know, something that's got *lots* of people in it, you know? Motorcycle racing clubs or debating societies or cooking school – I'd do something desperate. I'd just get in touch with people. And I'd give a few people a little advice.

But usually you don't have to give them any advice, they come and ask you for advice. They just listen to you talk, that's all. And you seem to know your business. You'd be surprised how Scientology communicates across a space that has nothing to do with processing. It's the most amazing thing you ever had anything to do with. There was a Navy captain, who was – had been flying back and forth on NATO business and I happened to get into – this was some years ago, into the bottom of a... They used to have these Stratocruisers that had a huge bar, that – in the lower part of the body, and so forth. And they used to fly back and forth across the Atlantic – old fan jobs. The days of the Atlantic barons and so forth. These were what they called the pilots of those old fan jobs. Took them seventeen hours to cross the Atlantic or something like that.

Anyway, I was sitting down there with this Navy captain, and he was pumping me about something or other or hammering or pounding about something or other, and I was trying to talk to him on the subject of business reorganization or something like this. It was very banal. All of a sudden a guy sitting on the circular seat that was several feet away from me, he all of a sudden says to me, "Um. Say," he says, leaning over, "do you have some kind of a philosophy of life or something of the sort?" He said, "You seem to know what you're talking about." He said – you know, he was very puzzled. He was very puzzled. He wasn't hearing words that were different, you see, but he was hearing thoughts that made sense. Of course, he had no business overhearing this conversation anyhow, you see? But we weren't even talking about Scientology and here was this bird over there. And I said, "Yes, as a matter fact, that's Scientology." "Oh?" He says, "Scientology?" Of course, I just handed him a Central Organization card and told him to write in for a book or something like that. He was very interested, he put it in his pocket and so on.

I never fail to get on an aircraft without changing the life of at least one person on it. It's almost impossible. I'd have to be sound asleep or under sedatives, you know? I find – and my point of view is why I don't pay any attention to dissemination or that – the amount of attention I should pay to dissemination, perhaps, because it's not a point I have any trouble

with, you see? Of course, I'd be terribly interested in this point, if I had a lot of trouble with it – and I don't. And I imagine a lot of Scientologists find this a lack, and are upset a little bit about it. That's why I'm talking to you about it now, see?

But it's not a problem with me and it's not a problem with me because I don't make it a problem. I'm actually not particularly worried about it.

Name and reputation have nothing much to do with it, and so on, nothing. They can even know you as famous in some other line, and you're still there, you see? You don't have to build a name for yourself, you know, it's balderdash. Because a lot of people in the world know my name – just in conjunction with writing, and that sort of thing. But I've found very routinely, I could call myself Joe Blitz, and it just wouldn't make a bit of difference. It's what you can do that counts, don't you see? It's somebody trying to break into the field of writing – let's get an analogy going on it – somebody can break into the field of writing and he always says, "Well, if I had a good name, you see, of course, I could immediately get past the editor, you know? And the editor would buy my stuff. And it's because I don't have a name," and that sort of thing. Well, I don't know, all of my life I've been signing things Joe Blitz, you know? Rene Lafayette. Ken Martin. Kurt von Raachen, you see? Names. All kinds of names. Winchester Remington Colt. [laughter]

And those things don't go to an editor as, "L. Ron Hubbard is now sending you a manuscript which is written by a pseudonym Winchester Remington Colt," see? It isn't even identifiable as manuscript form. It goes in, they buy it. The only time I have any trouble is give it to an agent or something like that, and he buries it underneath a bunch of other manuscripts, and nobody reads it. About the only trouble I ever had in the old days. I stopped using agents. They have usefulness and they have uselessness. They're liable to do you in. They're liable to send a bunch of stories that you've given the agent to sell around to the editor that's already had them, you see? And then he wonders what on earth is coming off. Then he wonders if the stories you're sending him haven't been rejected by somebody else, don't you see? And he gets all confused. So I found it was far better just to write "Winchester Remington Colt." Sometimes you have trouble cashing the checks. Once in a while you have to send the check back to the accounting department and say, "Please make this out to L. Ron Hubbard, so I can get it in my bank account."

But name – practically nothing whatsoever to do with it. Name is mostly valuable to the editor. Well, a science fiction story signed "L. Ron Hubbard" can usually kick a science fiction circulation up something on the order of twenty to eighty thousands, additional copies, you see, on the stands. Can be counted on to do so. So he's interested in that, you see? And sounds as if I wrote nothing but science fiction. But one of the reasons they pay you high rates in some publication fields and so forth is just because you kick their circulation up, see? And then you can bargain. Now, there's a name, there's a name, but that's what? That's not whether or not you got a story sold, that's just whether or not you got – whether or not you got more money for it.

And you can stand around and argue with those guys and they finally cry and moan. You'd think you were taking their last knucklebone out of them in a painful way, you know? And "Yeah, my God, man, I can't pay you ten cents a word, I can't do it, it shoots my budget.

That – that ruins my budget for the next three months!" And I usually look at them and yawn cavernously and then say, "Well, why don't you get another budget?" The guy breaks down and says, "Well, all right." And the only reason he would be in that position is he wants to kick his circulation. He isn't telling me what happened. I know very well what happened. He's under the gun from the managing editor. The managing editor says, "Son, I hate to call it to your attention, because body odor and other things of this character and halitosis are not things that are discussed very personally or out in the open, but your circulation has dropped lately. You have circulation falling."

Well, the guy says, "How do I get my circulation up?" Obviously the only way he can get his circulation up is reach for a fast name that'll sell some more issues, that's familiar to the public or something like this. He can do something spectacular with the subject matter, don't you see? "Pope's sex life revealed," you know? [laughter]

But frankly, frankly, that is not – that's not really – that's part of it, but it's not as reliable – that's not as reliable as maybe putting a photograph by Steichen or something on the front page, don't you see and the public sees this thing, and this thing is going to be full of these things or you know, something like this. Or, here is a new novel by Pearl Buck, you know, something like this. Bang, you know, and his circulation goes *brrrrmmm!* See? And then he is now permitted to drink cocktails at the cocktail party three steps closer to the managing editor, you see, in their order of rank. And his circulation is back up.

So that's his problem, how well known you are is his problem. And it regulates to some degree, but only to some degree, how much money you'll get. But that's all it regulates. It doesn't regulate how much volume you do. Quite the contrary, you very often find that a famous name bars volume, in the field of the arts, but wouldn't necessarily in processing. I was just giving you an example, "You've shot my budget to pieces for the next three months."

I had some fellow come around to me one time and said, "You mean you would have sold us – you would have sold us some – some articles?"

And I said, "Yes, I would have sold you some articles."

He said, "My God." He said, "I – I never thought – I – I just – just never dreamed that – that – that you would. So we never ask you." You run into that situation once in a blue moon, see. "I – I just never dreamed that you would process me, you know?" So a name can stand as a liability – can stand as a big liability. Everybody knows you wouldn't process them because they're so unimportant and you're so important, you see?

They can see you some time, getting the janitor to put down his mop pail and you stand him back against the corner of the thing and you're standing there running a reach and withdraw process on him, they would get over the idea that you would – were very selective and erudite about who you processed or when you processed. But the idea here is simply that you can go at it; I'm sure you could invent ways to go at it wrong and that you don't have to try very hard to go at it right. That's the whole idea, you see? You probably have to work at it accumulating a practice or getting your name up in Scientology. Now, some of you, many of you, don't have the problems of gaining a practice, but always sooner or later a Scientologist – whether he's working in an organization or no matter where he's working – runs into this problem of, accumulation of a practice. He very often doesn't know what to do with it.

Central Organization, the wrong thing to do with it is to pick it up and do it. You know, carry on an outside practice. That is actually the wrong way to go about it. For about eight reasons, it's the wrong way to go about it. You become suspect from your fellow staff members and everybody thinks you must be scanting your job, if you're processing outside, and so forth. Well, you can always make some handy, jim-dandy arrangement with the Director of Processing or somebody in the organization, don't you see, yeah, you bring people in and process them and so forth, and you know that practice area so you know who can stand traffic and who can't stand traffic. Pour your practice on into the Central Organization. Just make sure, however, that your neck isn't way out so that some kid that just came out of the Academy and had a near-failing grade isn't suddenly given the pc who is looking to you for help, don't you see?

But you could make all kinds of wild arrangements in an organization and it'd be a very knuckleheaded Assoc Sec who wouldn't listen to them. He'd have to be awful knuckle-headed. You say, "I've got kind of – there's five or six people around that I process at occasionally, is it all right if I keep this up?"

"Well, do you do it for nothing?"

"No, they give me some money." And you say, "Well, why don't you – you know – I don't want to be making this money outside the organization," and that sort of thing, "because this is nonsense, this is probably cutting the organization's throat."

Well, work something out, see. Work something out. And these people got to be processed, why, process them on organization time. He probably even could work it out so that they wouldn't even be charged full organizational rates. You get the idea? These things are very flexible. Far more flexible than you could imagine. The idea is of course, after you've accumulated the trust of somebody, you don't want to see that trust betrayed. And you want to follow this thing through, well, bring some hammer and pound and pressure to bear to make sure that it gets followed through.

Now, if you go on the idea that life is just a dream, and that we pass through life on a little light cloud and really nothing is ever any work and so forth, I don't think you're talking about a human being, I think you're talking about a rock – a boulder or something like this. You're not talking about a human being. Anything is trouble, man, just it's – anything is trouble. You start doing something, you're in trouble. You know? There is no easy way to do anything, see? You keep looking for the easy way to do it, you're a fool. There is no easy way to do things.

There are some ways that are not as hard as others. And you look over what it takes to maintain yourself in the realm and rank of professional competence in any particular field and you'll just be amazed. Somehow or another, not in... I – it took me about fifty hours to shoot these circus pictures. Fifty working hours. And that includes all visits, all transport, all assembly of this and that, and so forth. And I had to somehow or other take this out of my Scientology working day. I won't say that my Scientology working day hasn't suffered somewhat in the last couple of weeks, because you can't take fifty hours of work out of somebody's work week without something else not getting done, you see? But nevertheless, in view of the fact

that my working day is seven days a week and so forth, I figure out I have stacked myself up a bit of backlog, don't you see, so forth. But there's – I'm just giving you an idea here.

I haven't been working on this exclusively, far from it. A matter of fact, during the same period of time I've probably saved the bacon of Central Organizations, doubled their income, handled this line, handled that line, done an awful lot of other things, too, don't you see?

But let's just look at this other thing, just from a standpoint of professional competence. I don't know if you think it's any work, as far as physical labor is concerned, to pack a somewhat heavy camera and throw yourself into all kinds of wild corkscrew attitudes, and wrapping yourself around – around – around tent poles and that sort of thing, and leaping out of the way of – two or three times I've been saved from hospitalization and so forth, basically trying to keep from getting in the road of the performers and so forth.

But even then, be so intent on a picture or something like that that a ring boy would grab me by the shoulder just in the nick of time to get me out of the road. I almost got run over by the pony carts. I'd never get – live that down, don't you see? It wasn't that it'd hurt, it was inappropriate. See, it was *déclassé*. Bitten by a lion, well yes, you could live up to that type of injury, but not being run over by a Shetland pony cart. [laughter] And yet I'm sure that it would have hurt just as much.

But up, down, back and forth and an empty camera and pegging back over, and so forth, and this, that and the other thing and talking to this one and that one and corkscrewing into this position and that position and here, there and up and down and back and forth and around and so forth. Why, if – there really aren't very many people who work that hard. That's why they don't get pictures. You see? I mean, the difference is somebody else wouldn't work that hard.

So well, he's then not a – he can't come up to pro standards. Why? He won't work that hard. Simple. It's hard work. See? You don't have to look on it as hard work, but it's certainly active, don't you see? And you'll find this obtains in any field.

One of the reasons I went about studying photography is a parallel line for you. I don't need any excuse or apology for having done so, but restudying photography after all these years, I'm about to rewrite all your courses from the word go, so the best thing to do is to take a full course in another extra field, don't you see – that has nothing whatsoever to do with what we're doing – and how does that put together, and what trouble does a student run into and all the rest of this sort of thing.

I'm coming on down the line, finishing this up, having lagged it for three years, having had no reason to do it. Now, finishing it up in about an eighth the time anybody is supposed to, practically every mail is coming back here with one of its examination papers in it, don't you see? And of course, will be finished up in record time. Then I'll know how a course like that should be run, know what a student objects to in a course, know how to study it, what the shortcomings of it are, know all this sort of thing. And nevertheless this is again, hard work. You can't just limply sit there and say, "Well, isn't it interesting that cameras have lens covers, you know, isn't it interesting." No, brother, you have to say, "If you use a camera, and there's several different ways you can use shutters on a camera, and one of them is to remove the lens

cap, isn't that interesting? That's the oldest shutter there is. What do you know about that?" you see? You have to invest some of yourself in it. Even if only to that degree.

Then you say – then you say, "Well, you know, if I ever found myself..." a little imagination, see, "if I ever found myself out there and my shutter went busted wide open or I couldn't get the camera to speed and I didn't know what the speed was, I could probably stop the aperture way down and put some kind of lens cap over the front of the thing and lift the lens cap and get the exposure. As long as I could have a second or a half a second in which to accomplish this operation, I could probably get the picture, you see? Makes a good basic photographer out of you. You know, a lens cap goes over the front of the thing; it was used by old-time photographers in order to get the exposure when they didn't have any shutters. That's the datum in the course, see?

All right, what are you going to do with that datum? Well, it's – if it's just a running river of data that doesn't have anything to do with anybody and doesn't apply to anything, you haven't invested any of yourself in it, see? You've got to say, "Well, what is this datum? What can I do with this datum? What's it about this?"

For instance, I was reading about composition of portrait lighting. Portrait lighting – wow, you say, what's a – kind of a subject is this? Well, it's a staggering subject, it's a sufficiently staggering subject in the first place that hardly anybody ever shoots a portrait, and that of all the samples gotten from all of the portrait photographers in England not one of them passed muster here a few weeks ago – a few months ago.

I looked over all of their samples. They hadn't made the grade. They weren't up to Sunset Boulevard or Park Avenue photography standards and this was the whole field, you understand? They've lagged a little bit behind. Now, it's very odd to find an English professional lagging behind in any particular field, but that's because the public makes no demand on him, you see? But this is a field that is one of these fantastic fields. I mean, the portrait photographer that can take a real portrait, you know? He almost can name his price, you see. The best paid fields are portrait and fashion.

So you sure know something about lighting. Well, one of the reasons why nobody ever gets any portraits, they don't know anything about the lighting. This is one of the wildest subjects I think I ever tangled with. I didn't know there was that much to it, see? So, well, naturally, if you're going to take somebody's picture, a picture of somebody's face, you've got to have some light on it, you know? That's the simple statement.

Well, it's just about as a simple a statement as describing the entirety of atomic physics as something that is used to make atomic bombs. Now, we've described the whole field of atomic physics, don't you see, in that brief statement. Well, it doesn't describe it. Because this is a wild subject. I was involved with it last night for a short time. I'm studying this course just before I go to sleep. And all of a sudden realized everything they were talking about in this particular section had no application to any portrait I would ever take. I wouldn't take a black-and-white portrait if I could possibly avoid it. I wouldn't shoot a black-and-white picture if I could avoid it.

This is the day of color. And the thing to do is be in the vanguard, not in the rear guard. And black and white is a terrifically complex technique, but who'd ever buy a black-

and-white portrait of themselves if they could get a color portrait of themselves just as easy? That – the prices that you get for portraits, you might as well give him one. See, it isn't the finishing or the materials that make the portrait sitting expensive or inexpensive, it's what the traffic will bear. That's how the – that's how the thing is calculated on its pricing. What will the traffic bear? Well, what the traffic bears is greatly superior to anything that color materials would cost you.

This is a fantastic – a fantastic area, and I suddenly realized everything they're describing here in the way of studio equipment and that sort of thing would have to be converted. Because there is no field of color portrait photography. Left me in the middle of the lesson going "Uh?" you know? Then I realized I've got to go ahead and learn black-and-white color portrait lighting in order to know how to convert it. Well, it didn't say to do any of that in the text, did it? They didn't tell you to invest anything of yourself in this subject. It says you're just supposed to put the fill here, supposed to put the main light here, you're going to put the hair light there, and you're going to put the – a small spot over here in order to bring up the hands and you're going to put a headscreens over here in order to take out the ungainly large ear of the person. That's all you have to know. And "Well, all right, *aar-riigg-hhtt, ara-ara-ara-eah*, and we get down and we'll pass the examination *nyah-nyah*."

One day you would have been setting up and you suddenly would have realized, "Wait a minute, I'm shooting color. I don't shoot black and white. What am I doing with thirty-five hundred Kelvin? What am I doing with a photoflood 2?" Well, you're not doing anything with a photoflood 2 because the day they make what is laughingly called indoor color film into a color film, I want to hear about it. Because I don't think the day has arrived. There are two brands of color film. They're what's called "outdoor" color film or "sunlight" color film and there's "indoor" color film or "tungsten" color film. And tungsten color film has a certain adequacy, I'm sure, and some photographers try to shoot inside color film by putting a blue lens cap on their – or a little blue lens on their filter and make it do somehow.

But I notice oddly enough they don't get color pictures and I always thought the point in taking pictures was to get a picture. I know that's naive. But all I'm making here, not to drag you off into those ramifications, is it here required the tremendous investment of self in the study of the thing. What was I going to do with this material I was studying? I wake up in the middle of this thing... Of course, I'm happy as a clam to know all about these areas and angles and I'm very happy to know all about black-and-white lighting and so forth. But none of this can be done with the equipment which is advised, because the equipment which is advised is all – would turn your color film into nothing but red fire. And you would have nothing on that color film. The kind of color film I shoot and the day I study a course and change my color film just because they haven't given me the answer, of course, hasn't arrived. See, because color film is something you can't make work anyway. You've got a color film that's working for you, man, don't move off of it.

Well, what happens to portrait lighting? What happens? Well, you can't use any of those types of lights. You have to use the basic setup, but how do you figure out a basic setup? The thirty-five-hundred-Kelvin red light would just make a ruddy mass of red mush on your color film, you see? We can't do anything with it. There are no strobe lights burning fifty-six-hundred-Kelvin daylight color. There are no strobe lights that you could compose

with, see? But I dimly remember sometime somebody or other in a photographic magazine, *Modern Photography*, something like that, that somebody had put out something that had a bulb in it and also had a strobe in it, so that you could compose with the bulb and then when you fired with the strobe you would get the daylight. That sounds awfully roundabout, don't you see, and it might look different, but this was the line I was suddenly shoved off into, a technical problem miles wide. How do you solve that technical problem? Well, you better know all there is to know on the subject which you're studying – not go galloping off into the wild blue yonder just because you have a technical problem not specifically covered. Let's find out the subject we are studying, before we go galloping off. This was no reason then why I should put down portrait lighting as a text, you see, and start maundering and spinning practically on the subject. Well, all right, this is the way you light a portrait, but I'll be taking color portraits. Even if I take a black and white, don't you see, I will first take it in color. I wouldn't shoot a black-and-white negative. Not now. I'm learning better. You take a color negative and convert it to a black-and-white negative, by a secondary step.

Well, what do you do? Well, your best operating procedure is jolly well study what you're studying. You know, not leap out of the airplane with no parachute. Now, when you've got some command of that, why, maybe the dawn will rise and the bells will tinkle-tonk, you see, and you will suddenly have a brilliant clue, because you may not be up against that problem after all. It may be a simple problem. When you finally get through, you may finally discover that there are such things as masking disks of some kind or another that fit, and that you could even convert a photoflood. Or you may find some various other things.

But even though knowing full well you were studying something that is inapplicable to what you will be doing, the best thing to do is to – as far as a formal subject is concerned or the formal study of the subject – is to go on and find out all you can about it from it.

So I'd say the system that you would be operating with is first invest a little bit of yourself in the study. And having done that, study what you're studying even when you find it doesn't apply. If it's there to study, study it, see. And even though you say, well, it doesn't apply to my peculiar, particular problem, well, finish studying it if you're in training, you see. Finish studying it. Even though it doesn't apply to your particular problem. Don't go getting impatient with it and so forth, because you're liable to find out that its principles as you go around the corner, suddenly in some way do apply. But you actually at that stage don't know enough about it to really know whether they apply or not. You may only think they don't apply.

You may be under a misapprehension. Well, the way to get around all that is to go ahead and study what you're studying. Even though it is apparently not applicable to what you are going to apply it to. And then, after you have completed all that, make your adaptations.

So you've got three steps here. Put a little bit of yourself in it. You know, "How am I going to use this stuff?" you see? "How does this apply to me? It says here that a woggaroo is nine feet taller than a whizzabung." Well, that's an interesting datum. What's it got to do with you? What's it got to do with a pc? What's it got to do with anything?

Study actually does you no good whatsoever unless you ask questions like that. All of a sudden you say, "Oh, he means a – he means a hoolagaroo. Oh, uh – oh well, of course,

that's nine feet. Why does he remark on it?" Well, that's just being curious about it, you see? All right, well let's back it up just a little bit and you'll say, "Well, how would I use this datum in handling a case?" See, how would *I* – you that's reading that – how would *I* use this datum in handling a case? How would I apply it? What does it have to do with anything I would be doing? See? That's what I mean, put a little bit of yourself in it, see? What does this have to do with anything I am or will be doing? And you'll be quite electrified sometime that a statement that doesn't have anything to do with the price of fish all of a sudden becomes very intimate and very germane. From just a meaningless string of words, it turns into a very meaningful statement indeed.

One of the reasons why – one of the reasons why people have an awful hard time studying things like engineering, and so forth, is they're not involved with engineering. Students in universities are not involved with engineering; students in medical schools are not involved with healing; people in mental-treatment skills of yesteryear are not involved with mental treatment at the time that they are studying it. So, of course, they come out at the other end with a total unreality on the whole cockeyed thing.

This lays an interesting foundation, don't you see? Because and – why this is bad – the only thing that's bad about this, see, you're not in that position, you are using it. But your – what's bad about this – what's very poor – is that your nonapplication then never brings up what would I do with it, see?

I'll give you the lousiest course, the most horrible course I ever took. I stayed in Washington one hot summer to finish off an awful lot of engineering courses, and so forth, that I needed for credit, you know? People stand around and they say I haven't got any degrees, I haven't got any of this and so forth – they ought to been there that summer, man. I'd much rather been out flying airplanes, because I was having a ball flying airplanes. Instead of that I had to sit in this horrible – they didn't have any air conditioning in Washington and Washington is cool at 95, in most summers, you know? Sitting down there at GW, sweating over this stuff. And one of the courses was materials of construction. I could have cheerfully have choked the guy who ever wrote that textbook. He had the organization facility of an army officer. And my God, brick and concrete, brick and concrete and pebbles and aggregate and the streak characteristic of marble and the tension of steel – were all in the same paragraph. You just couldn't sort it out. Nothing – nothing was ever over here grouped. You didn't start in something, "We are now going to talk about bricks. There are big bricks and little bricks. Bricks are made out of clay," see. "And you take clay and you put them on a paddle and shove them in an oven and you bake them at umphthy-umph degrees for umphthy-umph hours, and when you bring them out, you can sell them for money and they're called bricks," see?

Nothing like this. This book – this textbook, I think, cost about twenty dollars or something like that, of those precious dollars of those days that really bought something, you know? With twenty dollars of today I think you can get a lolly for it. Anyhow, this cockeyed book was about two-and-a-half or three inches thick. And he hadn't classified anything like that. No, bricks and steel and pebbles and marble. And – and every sentence was another dis-related datum. You talk about a walking zone of GPM confusion – this was the worst I ever heard of.

Every sentence, in every paragraph, related to different subjects – and contained many subjects – but every sentence in the paragraph was something which was isolated and different from the paragraph. And with the thermometer bouncing around a hundred, you know, sitting in a roaring hot classroom, you see, trying to walk my way through this – that's why I almost kill reporters who say, "What degrees do you have?" It's just that one. Anyhow, I wasn't using any bricks, see? It wasn't actually how confused the text was – and it was a horrible textbook – the usual gag of the textbook written by the professor, you know, when there are better texts.

I wasn't using any bricks. I wasn't about to do anything with marble. I wasn't about to do anything with Aggregate and I didn't care what the tensile strength of steel was. I wasn't going to steal any. This stuff was blah – who cared? Well, I'd be interested in it right now. I'd be interested in quite a bit of that material now. Well, we're building quite a few buildings around here, and they're built out of various thises and they're built out of thatas, you know, and it'd be very interesting to know what this stuff was and what its genus was and that sort of thing. But I'd now be reading it from a different viewpoint, wouldn't I? I'd be reading it from the viewpoint of "Well, I don't know does this have any application to anything we're doing around here? All right, here's a datum that says, 'Bricks when they're put on a paddle are flipped and pancaked and after that you have *groozergruffs* in them.' That have anything to do with what we're doing? Oh! *Groozergruffs*. I don't know, that must be that – that must be that weird scoop that has the maker's name in it. Hey, what do you know! I think I'll go out and pull that on Mr. Jenner, you know?" You know, look very wise and say, "Be sure you get the *groozergruffs* right side up, you know?"

But I'd probably know what that was for, you know, it's so they won't slip sideways after they're laid or something, you know? I'd probably have some interest in them. But only if I'd invested something of myself in it. Of course, there was nothing to invest in it at that particular time, because I (1) had no slightest intentions of ever doing anything in the field of engineering and (2) wasn't doing any engineering and (3) it had been removed academically as far as possible from the realm of practicality. It couldn't have gotten any further without a spaceship and left the planet, you see?

Well, that makes then a very unreal, a very poor professional. You'd have a very poor professional. Well, it comes from the basis – he must invest some of himself in it. He's got to do it, in other words. I don't know, I could probably sit up there and read that photography course from cover to cover all the way through. True, there's a lot of these things I'm not doing. I'm not suddenly taking a lesson, and so forth, but I am using it. I was clever enough last night – a couple of them, the proprietors of the circus, asked me why I hadn't taken their picture. There was some inference that I should have taken their picture. Well, true enough. And I told them that portraiture was entirely different than candid shooting an act. I could speak with some authority. I'd been studying the living daylights out of it, you see. I said it'd take considerable more equipment, I said it'd take a lot more time and I'd have to catch you some day and I'll come up some day with some equipment and we'll shoot your pictures. And I said, but this is a different field. And they were very impressed with it, but I was on solid ground.

Yeah. I could have laid me a gorgeous egg, you see, because those people would tend to be seen full face and full in close. They're not performers, don't you see? The only thing

you could shoot of them would be a portrait. The only thing that would be worth shooting would be a portrait, don't you see. They aren't doing anything, there is no action they're involved in, except owning and being themselves. So what can you shoot of them but a portrait?

Well, then it'd have to be a sort of a study, wouldn't it? It would depend on its characteristics for their character, or their – their attitude. This portrait would sort of have to reflect this fact, it'd have to tell a little bit of the story. What could you do with it? Well, that's what you could do with it. But right away, when I came back, I was reading there last night before I got me forty winks and I was reading this ... How the hell would you walk into a circus, eighteen pounds of snoots and sixteen – a snoot is something you use in photography, not in their zoo – and big spots with barn doors and headscreens and backscreens and benches – and this is minimal studio photography equipment. I looked this over; how would you go about getting a portrait of these people?

You haven't even got two hundred and twenty volts to work with, see – you haven't even got the voltage. They run on four-forty. I suppose you could take an ordinary bulb and screw it into a reflector, but you wouldn't know how hot that was or what the light was after you've done that. And portraiture requires a fixed setup of fixed and known areas. How would you go about this? And I suddenly got the peculiar notion of how would you go about putting together a portable portrait studio? What would you have to have in order to do this? Wow! It left me completely adrift. I haven't got it licked at all, see? But there's no lack of interest in the subject. I had two people, two very good looking people, standing in front of me, you know? "Well, why haven't you taken our pictures?" you know?

I had to think fast. I had to say, "Well, portraiture. Ha! That's very specialized field of photography. You realize that we've been shooting in the field of action, candid, here, color. But portraiture, that's another field. Takes a long time." Ha! I could speak with authority. Yeah, it does take a long time. I get back and I got a very, very renewed interest. I've been going over portrait lessons and so forth and that sort of thing and I got a very renewed interest in this whole field. What is this, see? All of a sudden some reality dawns on me. I'm not opening up a shop, you see, with a thirty-foot back studio.

It's very funny, you know, you get sold in this course. Every one of these boys is a specialist. They're terrific authorities in the field, they're good boys, you know, good practical men – writing these texts and so forth. And every one of them assumes that you're going to be their kind of photographer, you know? So he gives you all the pressure. This is what you've got to do and this is what you should have and this is the kind of a camera you *will* be using, you see, and it's all intent. And you're from this field of photography to that field of photography, the other field of photography – and you never knew there were so many fields of photography. And when you wind up, you wonder *what* you are, you know? You're not quite sure! You're going to – are you a fashion photographer, are you a this? Actually kind of wind up a mixed bag. We're not going to open up any studio down there on the street and hang out a little sign saying, "Your lifelike portrait finished in five minutes," or something like this, you're not going to do anything stupid like that.

Well, how are you ever going to take any portraits? What are you going to do, have your wife falling all over these light stands in the middle of your... I got enough things to fall

over! You ever notice, in my office, and so forth? People keep bringing me things and giving me things. I have things to test and every once in a while every two or three months, we get very heroic and we move out the tigers and we move out these various things and we find places to put them and all this sort of thing. All we need is to add large spots, small spots, fills, mains, backscreens. This is all we need, you know, just to make life unbearable.

I can hear Suzie now. She's very good at it, but I think she'd blow up. She wouldn't be able to get to a dining room table or bring me a Coke or anything, see? What do you do? Apparently nobody has really solved this one. But probably they have, see? And somewhere down along the line somebody is all of a sudden going to talk... Because I notice there's a future lesson someplace says "Home portraiture." Odd thing for a lesson to be about for professional photographers. He must be talking about some kind of photography you do going around driving around in a car and setting up a – portrait stuff or portable portraiture. Maybe there's a whole book on the subject, see? There's no particular reason to just give up and throw in the sponge, because it can't be done, don't you see? And there is no portable equipment and you know, bog down at this point. You've invested some of yourself in it, you see, and now you've run into this fantastic problem that is undoable. No, well, let's go on and study the thing out to its bitter end, see? And somewhere along that line you're going to find a doability. You'll know more about it from which to evolve your solution.

Solutions are not actually evolved from inspiration. Solutions are evolved from observation and inspection and data. That's what you get solutions from. Observation, inspection, data. Familiarity.

You've got an object, it's object A. I don't care what this object is and you got a problem with relationship to this object. I don't care what it is. This could be a handy, jim-dandy clock that is made in Switzerland and tells how many freckles you'll have in August, you know? It doesn't matter what this thing is. Familiarity is a tremendous factor in this, as you know. So you just touch it and not touch it and touch it and not touch it, for a while. Scientolology has a lot of simple facets, you know?

All of a sudden you say, "Oh, that's what you do with it," you know? You get the idea. "That's what you do with it." Familiarity. Observation. It runs off the barriers which prevent you from observing it – run off on this Reach and Withdraw stuff. But more importantly, you've got – you've got all kinds of data and other things, you can look the thing over. Of course, you can go to another crime of "We will study it for the next five or ten years before we do anything about it." That is equally a crime, don't you see? That's nonsense. That's overstudying. That is not solving it by studying it. Huh-huh. Which I think that some of the boys in some of the fields which preceded us were quite guilty of.

"Well, we will study your case for two years and at the end of that time, we'll find out whether or not we can do anything for you. During that period of time we will charge you sixty dollars a week for your sittings. What's your paycheck, sixty-five? Well, actually, sixty-two-fifty is our charge." Bunch of fakes.

You know that criticism or critique of psychoanalysis, you're probably familiar with the old paper from way back when. That really landed harpoons into those poor psychiatrists down there. "He doesn't know anything about psychoanalysis. He's crazy. He doesn't know

anything. He's *wah-wah-wah...*" They were presented with this thing, this paper, see, on the stand. They just went mad! Boy, that thing must have sunk into them like harpoons fired into whales, you know? Because every line of it is dead-on and dead-true. But it's the very things they don't want anybody to know, you see? And so out of the whole field of Scientology, all psychiatry could pick on was a critique of psychoanalysis.

In other words, they didn't pick on Scientology. They just picked on Scientology's opinion of them. And that was all they found fault with, and it short-circuited their whole... You understand what happened? We wrote a criticism of psychoanalysis, so we wouldn't make similar errors. So when they were dragged up as witnesses by the Laborites down there, and so forth and when they were all squared around, why, they were really going to throw harpoons into us, see. They were going to really fix our clocks and so forth, when as a matter of fact although they did give some other extraneous testimony to this, their attention and all the excitement and heat went on, on our criticism of them, see? They were just trapped, right there, with that. And actually never got off to first base about saying how bad it is. Only thing they could say is, "They don't know anything about psychoanalysis. It's not true, see?" Of course, every line of it is true. And so all they harpooned was our harpooning of them. And I tell you, driving harpoons into harpoons after they have sunk into your midriff is not a good defensive mechanism.

So, the upshot of this is that familiarity, knowledge, and so forth, can be overdone. Some – I've heard of somebody going to school till he's – for eighteen or twenty years to learn how to thread needles or something like that – an overstudy situation. But that would again be because the study must not be developing any familiarity. I should think the thing would short-circuit itself out, if there was a subject there to be studied and if any familiarity could be gained with it. So the shortness of study depends on familiarity acquired. That's why university education takes so long. They don't acquire familiarity with what they're studying.

In many zones they don't, a few of them they do, they take flashlights and go around at night, around in parks, to shine them in cars to study sociology and that gives them familiarity. As a matter of fact, I've often thought it was too familiar. But there are some fields where they do do some looking.

Now, in then a course of approach to the world of gaining understanding, of gaining knowledge, of gaining things, you actually have a necessity to be in contact, to be in touch with, to not fall out of touch with. And as long as you can maintain your familiarity line or channels or approaches or something like this, you will find that your competence will increase. It is only when you crawl off into an ivory tower and so forth – one of the reasons why you find me tearing off into the wild blue horizon whenever I get an opportunity every few years and suddenly hitting some other subject matter, and so forth, is just that. You can become too concentrated on one line of subject matter, you fall out of contact with a line of subject matter which is the basic line of subject matter which we have, which is people. And you can fall out of that, you can get so withdrawn into that, that you never meet any people.

You can overdo this by getting so involved and so in contact with them that it stops being a familiarity, it seems to be a horrible bore. You can overdo this very easily. That is to say, you can throw yourself out into the sticks somewhere and you're not in contact with any-

body who knows anything or does anything and you don't actually operate to improve the situation, don't you see? You don't get anybody in that area studying anything and so forth. And you just keep contacting raw meat and associating with nothing but raw meat, after a while you get kind of overwhelmed. Because it's awful raw.

But if you withdraw to a point where you're in contact with no raw meat whatsoever, you tend to go out of contact with your basic material: how do people operate? Who are people? What do they do? How do they look? How do they feel? How do they act? And then you're liable to get a specialized idea of what raw material is or how it operates or how it should operate or something like this. You're liable to get an odd opinion of it.

So you ought to go look at it once in a while. And you ought to go look and see how people operate and so forth. See if you're getting unreal in any particular line and so forth. Well, I obviously find I'm not getting very unreal. I go out and I apply Scientology I at the very highest. I apply it just as I've told you to apply it; I go out and be pleasant and smile, don't even hang up a shingle or a sign and so forth, and I get a practice. I got one growing and believe me that if I went on contacting that area and those people – and I very probably will – over a period of time without my doing another blasted thing about it, except being nice to them, and when they have a problem give them a piece of advice or tell them something to do or do something for them – the next confounded thing you know, these people are built right on up along the line. They want to know more about this. They want to know more about what's going on.

And so what do you do? You route them into some texts. You give them some books, you tell them to read this or read that or read something of the sort. You don't even have to strain at it, don't you see? You give them a card. Say, "If you order a book from this area for five bob, why, it'll tell you all about it, see?" Something like that. It isn't even difficult, see. It requires no strain. Well, you go on this way and if you are not running it backwards and interfering with yourself, you wind up at the other end with a practice. You just can't help yourself. It's whether or not you can keep yourself busy during this interim period, that is – would be the problem. Wouldn't be the problem – the problem isn't to develop a practice, the problem is to have a little bit of time in which to let a practice develop, don't you see? Buying a little bit of time, the economic world, you buy time with dollars and pounds and rands and things of that sort.

But anyway, there's the – the problem involved in the world is familiarity with the world and the people of the world and so forth, and these people are very far from mean, vicious and ornery bums. There are some that are blinder than others. And you can normally find out that your – what you know and what you're doing works and it's wise and it brings with it a great deal of comfort and straightens a lot of things out and so forth. And then you sort of know that you're doing right and going right and all is well and all of this sort of thing works out. I'd say, as far as developing a practice is concerned, the problem is simply to get over the period of the coffee and cakes while one is forcing itself on you. See? So, if you try to force a practice on yourself or try to speed this up or razzle-dazzle it in some particular line or – you're liable to goof it up, don't you see. You're liable to violate its time factor. See?

You're going to work at it, you know, you're going – you got to keep working at it all the time, but you can't force its development. You can't say this has got to be developed seven times as fast as it is developing or something like this. "Because I need more money next Tuesday" or something like that. That's how you get in the road. But you normally develop a practice anyway.

I'm quite intrigued with this little adventure – a very small adventure, only I've had them many times. I'm not really a creature of ivory towers. This is why we have Scientology. Familiarity with existence. And it – I get into a rebellious frame of mind every once in a while. I don't want to sit at the desk any longer, you know, and be snowed under with the despatches and all this sort of thing, it appears to me to be profitless, something like that. I lose touch with whether or not it's worthwhile, you see? And I go out and in the space of a couple of weeks, of a few visits to a particular area, doing an entirely different thing and without any reason for anybody to be nice to me at all, why, I get – what we're doing works, it's desperately needed, the little light touch that you can hand out, just off the cuff and so forth, makes a better, happier world in the environment you enter. Very magical.

Matter of fact, I feel myself just a little bit overwhelmed because I don't know anything I work less hard on than Scientology in that particular area, see? I worked on Scientology hard at home, but in that area I carefully didn't work on Scientology. And all of a sudden, why, there it comes. Next thing you know, I probably wouldn't be able to do anything about it at all. Why, there is probably the practice – I won't exaggerate – of the whole circus world walking in my direction. There it is. I can do something else for them, and so forth, but gradually, if I keep associating with that zone or area, that's going to walk in more and more.

It happened to me once before in England. I had movie actresses and things like that walking in on my direction. I cut it off. I channeled it off very hard in another direction because it was getting in my research road and so forth. Well, I hope I won't have to cut this one off, because it's too pleasant. It's too pleasant. After all, if you – you can suddenly appear for just a few brief hours in an area and have people asking you all about it and the next thing you know face the problem of "What am I going to do with this practice while not trying to acquire one?" Well then, there's hope for any Scientologist that walks out into the world and doesn't try to push it too fast or too soon or too quick and does his job somewhat competently.

Thank you.

STUDYING: DATA ASSIMILATION

A lecture given on 9 July 1964

How are you today?

Audience: Fine.

What's the date?

Audience: Nine July.

Nine July. Nine July AD 14.

All right. Now, what are you weakest in?

Female voice: Auditing.

Auditing. Yeah. Frankly, I haven't anything to talk to you about because you're all doing so well. It's I who am lagging, you see? But I've given you quite a few lectures about study and how to get through it and how to do this and how to do that and there's very little that can be added to what I have told you, but I better add that very little.

In trying to – in trying to assimilate a piece of information, these are the points to watch and these are the points that trip you. Nomenclature.

Nomenclature: what does a word mean? And that's what trips you basically, because then you cannot read a sentence with that word in it and know what the sentence says. So nomenclature is a major stumbling block in any study.

Now, there are no vast, well worked-up glossaries in Scientology, but there is a glossary on Class VI material, and part of nomenclature is the recognition of what the definition is. It's one thing just to have the definition and it's another thing to have an idea of what the definition means.

Now, you get yourself a thing like a GPM. All right, let's take that as nomenclature. "GPM" means Goals Problem Mass. Unless you combine such a thing with an observation and work on the clay table, and so forth, even the nomenclature is relatively meaningless. It is a thing, in other words. There is something called a GPM. It's not an idea. It is a GPM. Now, there are – there's one or two pcs around (not necessarily in the course) who are stumbling all over the place on a GPM, because they are in disagreement with that piece of nomenclature. And they are saying, "Well, it doesn't have mass, it's just Ron's idea that it has mass, see, and it doesn't have mass. So therefore, of course, there is no such thing as a GPM."

Well now, trying to audit somebody on something of which there is no such thing as, is just a little bit difficult. Now, if you're running GPMs correctly, the mass simply expresses itself as heat and pressure. It does not express itself as a visio. You never see it unless you've made a mistake. When you've made a mistake you'll see it. You get an end word in the wrong situation and you can see this long parade of mass going out there. Well, there must be something wrong with it to see the mass.

So here is the oddity about this – the GPM. It's true it's a goal's matched items, one against the other, and very matched and held in midair, from which it gets problem, although that isn't too good a word because "problem" is an end word also and "mass" is also an end word. So, that nomenclature is adapted to the subject at a time when not all is known about it, so it can be described and worked with, don't you see?

Now, we move on a little bit further and we find out there probably could have been better nomenclature, but by this time everybody knows this as a "this" and you would get a total catastrophe if you went and shifted the thing, and we can't go on referring to it as "the thing." [laughter] So we go on calling it a GPM. Well now, of course, GPM means "Goals Problem Mass," but that's not important. It's not important what the "G" means or the "P" means or the "M" means. This is a symbol that stands for something. Well, what is this thing. So, if you're simply content to say, "Well, a GPM is a thing and it has this form and construction," and work with it on a clay table, all of a sudden you begin to understand what it is.

Now, you're in a never-never land that has never been explored. There is no language to adequately represent any of these parts of the mind. If you used any terminology that is used by the psychiatrist, you don't know what you're getting into. You, frankly, have no clue what you're getting into because he's way out, man. And when he uses a word to describe something, there may be innuendoes in relationship to that word that would, if we then used it, would impart a totally incorrect zone or area and would make somebody think he knew what you were talking about, when you hadn't a – he hadn't a clue what you were talking about. So, you've crossed up your terminology with some other field that meant something else.

Well, the reason you can't cross it up: it has a different purpose – that other field – it has a different target and it has an entirely different basis of operation. Their – well, their purpose is to make people quiet, to give you how wildly different this is. You want to get upset when you see a very quiet pc, man. His idea of treatment is based on the common denominator, as far as he's concerned, that men are animals that rose spontaneously from a sea of amonia and he wots not of and all thinking is done by the brain, and so forth.

So, this is a different – completely different – zone or area. And it has not produced results, so we needn't pay any attention to it. We don't care how loudly somebody beats the drum and says, "This is authority." Those people are the authorities who can get the results and those are the authorities. A painter is somebody who can paint a picture. An "authority on painting" has been Hobson-Jobsoned over into somebody who can criticize a picture. Well, anybody can criticize a picture, so I guess any child, then, is an authority on painting. So that the thing doesn't hold up when you take it from a critical viewpoint, you see?

No, an authority is the fellow who can do it. And the world in apathy and failure, driving out in various lines and directions where they have been unable to do anything, have elected authorities on subjects that can't do them. So, therefore you would become all crossed up with fields that have failed. And that would enter, all by itself, an ingredient of failure into Scientology.

So, we have to leave their technology alone. We have to leave their nomenclature strictly alone. We cannot talk about "ids" and "egos." We can't really talk about the unconscious – which, by the way, is another end word in GPMs. [laughter]

We can't discuss, in other words, what we are doing in terms of what they were doing, because they didn't do anything. And we would immediately come a cropper and we would be in very bad shape indeed. So we have to have technology named in a certain way as to convey a meaning. And we are the people who can get results in the field of the mind, so therefore we are the authorities.

So therefore, we don't have to pay any attention to anybody else who sets himself up an authority, because any raving madman could go down here at the crossroads and say, "I know all about grapes," see? "I am the world's greatest authority on grapes." And any raving madman could do this, you see? He could just go on screaming, "I am the world's greatest authority on grapes!"

Well, he could get a few other madmen who would come around and say, "You're the world's greatest authority on grapes."

Nobody ever would think of asking this madman, perhaps, the question, "Have you ever eaten a grape, seen a grape, raised a grape, or done anything with a grape?" and of course, if the answers were all "No" to those questions, then of course, it would be quite obvious that he was a raving madman.

And that's the psychiatrist, you see? He has never seen a mind, he never created one, he never changed one and he never brought about any results in this particular field. And the only thing he can brag about is being a bit destructive on the subject. And he's screaming that he's an authority, so therefore, somehow or another, you should borrow his nomenclature.

Now, any one of you, sooner or later, is going to run into this down at some crossroads, "Why don't you use standard terminology?"

Well, the answer to it is, "*Whose* standard terminology?" It would have to be the terminology of a person who could produce a result, before it could be said to be even terminology.

So man has had not much understanding of this particular field and has even gone into an inversion, where he has elected to have the nomenclature of the field standardized by people who know nothing about it. Now, that's a wildest inversion that anybody could ever dream of. Not only is there no terminology, but there is a great deal of false terminology. That terminology is false. And you start to lead down that line, you're going to be in trouble. Somebody's going to say to you sooner or later, "Why don't you use standard nomenclature, why don't you do this and why don't you do that?"

Well, my rebuttal on it, of course, is always very savage. When somebody starts in on me like this, I have no idea that they're trying to be helpful. I never make that mistake, so I just cut them up and serve them for dinner. And it's something on this particular – particular line, I would answer, "Well, why haven't you developed anything that could be used?"

So Doctor Spinbin is standing there, "Well, why don't you use standard terminology so that somebody can understand you?"

"Why the hell haven't you invented any?"

"What do you mean?"

"Well, why don't you know something about the mind? What do you stand around being such a fake for?"

"Well, really! I have a degree!" "I know that. That degree doesn't mean anything. Take one of these patients out of one of these rooms that you've got down here. Bring him out here and heal him. I want to see it!"

"Well, you can't do anything like that."

"Therefore you're a fake. To hell with you!"

This is my idea of a polite conversation with one of those guys. [laughter] I hate fakes. And it's interesting that the only mud they can throw at us is that we're somehow fakes. See, "The overt doth speak loudly in accusation." Shakespeare rewritten. [laughter]

Now, therefore you can't help but have trouble with terminology – nomenclature. I've had trouble with it, don't think I haven't. How do I dream up some word that will describe something, that can be found, can be examined and does exist, that will not conflict with some other school of nomenclature, which has failed? How do I move into that perimeter? Oh, we could probably do a much better job, but part of the trouble is you.

You accept certain lines and start using them in your common communication and then the last thing in the world that I could do is pull them away from you and say, "Well, actually a better word is so-and-so, what little Scientology terminology you know, is now dead and nonexistent. We're going to substitute a brand-new terminology," and you would be upset. Right?

So, terminology has to deal with this factor of evolution in use. We not only have evolved it and they've wobbled a little bit on their meanings occasionally, but then they get into use and they get fixed on the printed page. They get into bulletins and they get into your certificates, and so forth. Certify an HCA, well, he's supposed to know what a reactive mind is. Great.

So the next day we're going to call it something else; we've immediately wiped out part of his education, haven't we? And we've made it hard for him to communicate with anybody who is trained later. If we want dissonance, why, we're going to get it in a very large cacophony if we go knocking apart the terminology we have developed. So we have to safeguard the terminology we've developed. So therefore, when we learn more about the subject, you see, the word may become unreal, but we're still using it.

So, the only thing we can do is actually elect those things which are the most important in the mind and keep that terminology as standard as possible. First try to evolve it as cleverly as possible, so that it won't conflict – first try to evolve it cleverly, so it won't conflict and bring about a misunderstanding in some older activity. And then we've got to carry it forward as a standardized item and then not go changing it all over the place just about the time everybody learns what it is. So, there's a certain necessity here to maintain a constant on nomenclature and terminology. And the word "GPM" will never, never be changed. It's in too much, too long, too often, don't you see? And even though "Goals" – end word; "Problem" – end word; "Mass" – end word. But it becomes just "GPM." Well, it could become "XYZ" – it wouldn't matter much.

Now, another responsibility is not develop too many of them, not to – not to go whole hog on the subject, not to try to name everything in sight some new peculiar name that nobody would ever get around the end of. The vocabulary of Scientology is probably about 472 major words, which is a small enough technical vocabulary. The medical vocabulary is something on the order of 20 to 40 thousand, somewhere in that range – of very peculiar words that don't mean a thing.

So, your task in learning "Scientologese" is relatively short, relatively brief compared to other technical fields.

Now, you could complain about any technical field on the subject of its nomenclature and its nomenclature is just, very often, five times as silly, if you look at it that way, as Scientology is inapplicable. Some of these specialized fields are really marvelous. But if you have a bent for it, if you have a knack for it and are amused by these nomenclatures and terminologies and special languages, you might say, you can have a lot of fun with some of these.

I know I recently have been hobnobbing in the world of the circus. Well, fortunately I know a little of the circus terminology, but from an American circus viewpoint. And I don't know that this holds good in the English circus, you see? Well, you daren't use – I'll show you now the upper class of terminologies.

They're all "snob": These languages are all snob languages, including Scientology, see? The boy that comes out of his HCA class, you see, and he throws off a couple of words; there's two or three who understand what he's talking about, and so forth, and they chin-chin together, see? They – it's like the lodge has just passed the password, see? Other people stand around with their jaws dropped and say they are listening to the upper elite. Well, to that degree they are, you see? Somebody has a superior understanding. But this is a signal system and actually, I couldn't take that away from the subject if I had to. If I didn't invent it, you would.

Give you – in the circus world if you use carnival – the carnival, you see, is pretty downscale. To the circus, a carnival is almost beneath contempt. These things are quite definitely fixed on the social strata. So you daren't use carnival terminology, of which I know of about four or five hundred words in carnivalesque. You daren't use that in referring to the same identical objects and actions in the circus world and the circus world has maybe seven-eight hundred, a thousand words, you see, for these same things. It's – you've seen the same thing, there, you run into it in Low Dutch and High Dutch, in languages and so on.

So you have to be very careful about some of these. But quite the reverse, you can tell a real organist – this is in the world of music. You can tell a great concert pianist by the awe with which he speaks the word "Steinway" and with which he speaks of his instrument and with which he speaks of his scores and so on. You can tell him. He acts the part of a snob in his longtailed coat and his flowing gestures and his poseurs with his hands over the keyboard and all that sort of thing. You know this boy for what he is, you see? He is a classical pianist, a classical concert pianist.

Now, his terminology is quite staggering. If he and a symphony orchestra conductor were to start a conversation in your immediate vicinity you would be snowballed. You'd never know that many musical terms taken into or out of Italian and other – and German and that sort of thing, could exist. And it would, frankly, be over the head of most of the very men in the symphony orchestra. They would say, "God, listen to that," you know?

But the field of the organ does a complete reverse. Now an organ is an instrument which a piano is not. An organ is a percussion instrument, only to the degree that you turn on a percussion key and beyond that, you can get music out of it. But a piano, of course, is solely and only a percussion instrument. This is according to modern classification, see? They classify it as a percussion instrument.

Well, it's a pretty trick percussion instrument and you have to be very virtuosity on it, but an organ will also – you can throw a key on an organ and make it sound like a piano. You can also make it sound like a clavichord. You can make it sound like almost anything. And I've been hobnobbing recently with pro organists. Real pros, you know? Theater organists, circus organists, guys like this, you know? And I actually – my hair's been standing on end. These boys rank in their field just as high as the concert pianist ranks in his field – in fact a bit higher. Because you've got to grow – you've got to be like Vishnu, before you can play an organ, you know? Eight arms. And their terminology would absolutely bowl you over.

There's two fields of terminology and when you get to be a *real* pro in the field of the organ, where you're an organ designer as well as performer, you know, real upscale, you actually shift gears on terminology and the organ terminology with which you're familiar is the organ terminology which is referred to by the musician, the normal musician. But when you go up scale, you go into a new field of terminology. So there's two fields of terminology in the field of the organ.

And the real pro and the real snob in that particular field does a volte-vis – complete volte-vis when he leaves the field of mere music into the field of playing an organ and designing them. Second we get into that field, we're in another pasture. It doesn't even look or smell the same thing. And that is so rarefied that when I first heard those boys talking, and so forth, I wotnotted anything they were saying, you know? It was just like listening to the Hottentots jabbering about the next feast of roebuck – I didn't have a clue.

Well, I finally got hep to it, and did a bit of organ work and designing and that sort of thing and hobnobbing with these birds and I still don't have but a small edge on their terminology and they're always startling me. But I've gotten to a point now where I know what they're talking about, you know?

Well, for instance, the organist at Saint Paul's Cathedral who probably would be – probably the top-top-top amongst mere organists, you see, in England, refers to the "pedal-board," see, those are that board that you walk on, you know? Well, he calls that a "pedal-board." When you get into the real snobs that is no longer a pedal-board – that's "firewood." [laughter]

Now, the top organist at Saint Paul's undoubtedly refers to "notes" and "pipes" and "footages" and the real snob calls them "noises." They're "noises," and he says this with a complete – complete straight face. So, the first time I heard this I thought they were gagging, you see? And every time I've heard one of these things I've made the repeated mistake – which I am now beginning to recover from doing – of laughing like mad, you see, [laughter] thus displaying my great ignorance of the whole subject. I've gotten so I can chatter back and forth on it now.

What the hell was it that I heard the other evening? I think it was a "Blackpool snarl." "This organ was capable of a – was capable of a good, solid 'Blackpool snarl.'" I think I've probably got the word "snarl" wrong, but it was – it was capable of making a "terrible, clashing dissonance which would reverberate," see, and that was the way it was described, see? You catch up with it after a while.

I'm getting there though. I'm getting there, I'm getting there. I'm getting up to a point where I've now developed something that I don't think they've thought of yet with regard to firewood. And I can play a piece on firewood that they haven't thought could be played on firewood, so I'm practicing this very hard and the next time I'm going to get even – I'm going to throw them. [laughs]

But the point is, as you enter into the inner sanctum of any profession, you quite normally leave the purely snob language and get into a "slanguage." Lord knows what a medical doctor calls tonsils while he is dining with other medical doctors, see? But he probably calls them something else. His terminology shifts, then, from the very formal with enormous, forced formality that almost has worship mixed up with it, you see, and shifts, then, as his familiarity increases with his subject into something that sounds more like slang.

And we have not bothered, then, to go through the country of pomposity to reach the world of slang; we've just short-circuited the whole thing. This is true what I tell you about nomenclature; as nomenclature really gets up amongst the knowing, it is never serious. It is a very unserious subject. The things which great electronic engineers that can whip you out a rocket for the moon – wiring circuit or connection – probably what they call it is not what is taught in college, you see? They've got this stuff and it's a *rattledybang*, it's almost jive talking moved upstairs into the profession, you know? It's pretty wild.

Well, we've taken a straight road. Since none existed, we haven't really developed a secondary language. We're in our secondary language. So that is another way that the thing has been narrowed down. We could develop a highly pompous, formal nomenclature; a vocabulary, perhaps, of two or three thousand words, and expect you all to learn it verbatim and be able to discuss it with great solemnity – only to have you eventually evolve a much less lengthy vocabulary which is in the field of slang. We've taken the step at one jump. So, our

language does not sound dignified, see? Our nomenclature is not pompous since there was no reason to enter this other extraneous step into it.

Now, anybody then who is talking to you about not using proper psychoanalytic nomenclature probably himself is the veriest tyro in the field of psychoanalysis, see? He – he's just a – well, if he graduated well and kept his nose clean he'd become a neophyte, you know, or he wouldn't be expressing this reverence for nomenclature, because it's symptomatic of the stage where you are simply memorizing without knowing. After a boy gets to know something, and so forth, he normally shortens his nomenclature quite markedly and rapidly.

And of course, what an organist has to know who is up in the field of engineering and design, and so forth – this circus organist, Kit Francis, for instance, hasn't any "stop." Well, actually the stops on his organ do not agree, I'm sure, with what it says on the stops and he's pulled out most of the stops – he's thrown them away. When he had the organ rebuilt, he threw them away. What he did was just get the noise combinations from the generators and he put a stop on each variable noise combination of the generators, knowing how they hooked up and he knows that if he throws bing-bing – and why, he's got then these two noises come out of the generator. They will combine and they'll sound in a certain way. He's setting it up by electronic sound; electronic combinations of sound. So he's even done away with all of the izzards and piccolos and diapasons and nothing says anything, you know? There it is. It's just...

As a matter of fact, the other day I saw him throw a 64-foot pipe together out of an upper scale. There weren't any even 32-foot pipes in the thing, but he just got a couple of things that would then sound like they built down and he threw those in. And the next thing you know, why, he had Saint Paul's Cathedral going at a very mad rate, but that organ doesn't happen to have any such stops. So, he doesn't even refer to noises by their traditional names anymore, see?

In other words, when a guy gets to know his business he generally throws away – when he really knows his business – he throws away the nomenclature he doesn't need. He gives it the yo heave and he quite commonly, amongst his brethren who are in the know and part of a lodge, develops a short-circuited slang-type nomenclature to describe what he is.

Well, knowing some of these things, and so forth, I've tried very hard to reduce the nomenclature of Scientology as far as possible and keep it only in the realm of slang where it would have evolved to anyhow. And that would save you a lot of trouble.

But if you went back over the years and found the name of everything that had been named, you would probably arrive with a much larger vocabulary than 472. But a lot of those things have been given the yo heave. But a lot of old-time auditors would still know what they were. You talk about a DEDEX – most any Johnny-come-lately would look at you with his eyes "What's that?" you know? Well, actually it was a DEDEX, that's what it was.

Now, the dependence of knowledge upon nomenclature is extraordinary, and as a matter of fact, almost never appreciated by teachers or students. They are trying to talk and use a language they don't know. And this can get so bad that they think the subject is incomprehensible or that they are incapable of understanding it, when as a matter of fact this is not what is wrong at all. It's just that they haven't grasped the meaning of some of these symbols that are

being used to designate. And they haven't got an instantaneous grasp of these meanings. They've got a "fumble grasp" of them. That is, if they thought for a while they might possibly be able to remember what an engram is, see? Now that's the grasp of it.

So they read a sentence and it says, "Of course, there may be an engram in the middle of the GPM." That's not necessarily true, but it's certainly true of implant GPM. And they have to think, "There might be an engram – an engram – an engram... I don't quite – know quite what that means, so I'll just learn this much of it. There might be something in the middle of a GPM." And they go on into the next paragraph and this has made an impression on them, that there's something they don't know about a GPM and that's what carries on into the next paragraph.

And as they go on studying past these points of uncomprehended nomenclature, they begin to stack up an opinion that they "Don't know about it." And it isn't "it" that they don't know about. To get a persistent thing, you see, you'd have to have a lie, and the lie is that it isn't the subject they are having trouble with, it is simply the nomenclature they are having trouble with. They don't know about the nomenclature so they, however, wind up with an opinion that they don't know the subject or that there is something very incomprehensible about this subject. No, it isn't the subject at all, they just don't know their nomenclature.

Now, it may start back someplace in HCA, see, or HPA class and one day, why, somebody jumped up and he said, "Well, that's a lock," and the individual... you know, he said, "Well, you see, that's not important, because it's just a lock, you see?"

And the person says, "Just a lock – a – lock-lock-lock – what's a lock?" And then he was interrupted before he could think the thought through and remember what a lock was. So this, in actual fact, stays there as a little basic incomprehension of nomenclature and that'll hang up on the track and he will develop an automatic comm lag around this word "lock."

He'll get up to a point where he's reading a sentence here at Saint Hill and it says, "You want to check this out, because it might be just a lock." And again that hunted feeling comes over him, you see, and now he thinks he doesn't know much about checkouts because he will misassign, the other being out of sight. So, his opinion now is that he doesn't know much about checkouts. No, he didn't know a word in a sentence discussing checkouts.

You see how important nomenclature is? But a comprehension of the nomenclature which is used is primary to the study of anything.

Now, for instance, I'm studying a parallel course to get insights into study of Scientology. And a very, very smart thing – an extremely smart thing to do – is to take a page of material and look over it for words you don't know – words that don't instantly react to you.

Circle each one of those words or make a list of each one of those words and look up and study their definitions or ask people and get definitions for them. Find out exactly what those words mean. Don't tackle the subject of the page. Just tackle the nomenclature of the page. Get that nomenclature slick as a whistle, tackle the subject, you'll find out the subject was very easy. All the thing was trying to tell you is that if you went ahead and ran a service facsimile which didn't give TA action on exploration, why, the pc would get loused up because you were running without TA action. And this is all this whole thing is devoted to.

But one runs across this thing: "Service facsimile – *ohhh!* What's that?" Another word: "*Ohhh!* What's that?" you see, and "What's that?" and "What's that?" Well, if you want to put yourself in a total mystery, go ahead and study pages you don't know the words on. Then you can put yourself into a gorgeous mystery.

Now, this language is so common to your instructors, it's so common to people around here and their "snob action" – which we have – don't doubt about that, see, and will continue to have, because it is an index of status and competence, will cause them to explain these things to a student with a bit of a sneer.

And they're liable to cure you of asking, "What is a service facsimile?" because you will hear in the answer that comes back to you at least the tone for, "Well, you idiot! Why don't you look it up in your bulletin, you know? Fancy anybody not knowing that!" see? This is sort of reflected in the atmosphere you get back when you ask these things. And that, again, makes you feel stupid for not knowing. Well, actually nothing can be done to minimize this latter.

Why, I could say, "Always answer a student's questions politely," and you'd probably only build up a covert hostility. [laughter] They'd answer the questions politely and flunk all tests for 24 hours, you see. Something wild is liable to go awry when you start to put the brakes on some natural action.

So, the only point I'm making here is: Don't let yourself be put off because somebody thinks you're stupid because you don't know it. You're not stupid because you don't know it, you're simply uninformed. Well, if you're uninformed, don't get so status happy of thinking that you must appear bright in order to be thought well of, when it has nothing to do with it. You're here to learn and anybody is studying anything, is studying it, I suppose, to learn it, not to acquire – he may acquire status through having learned it, but he doesn't acquire status by pretending he knows it when he doesn't. As a matter of fact he acquires himself quite a headache.

So, the point is, in spite of any rebuff that you get, or of difficulty digging into some book to find out what it means, you actually put yourself in a soup at once, the moment that you leave one word in a sentence behind you, you do not know the meaning of. One unknown piece of nomenclature left behind you can absolutely ruin your comprehension of the whole thing you're studying. Now, if you want to speed up your grasp of the situation, apparently do it the slow way. This obviously is a slow way to do it, isn't it? But it's not the slow way to do it because it snowballs.

You'll get faster and faster and faster, whereas if you don't do it this way you will get slower and slower and slower. So, never leave a word behind you in a study that you don't know the meaning of. And when you hear me use a word in a lecture – and I try to minimize nomenclature, actually, in lectures – when you hear me use a word in a lecture that you don't know the meaning of, for God's sakes, write it down in your notes and right after the lecture find out what it is. "What is that word?" see? It's something that has passed you by.

Well, it's that which you don't understand, not the mind, not Scientology, not the theories and practice of Scientology. The stumbling block, first and foremost, is simply nomenclature.

Now, nomenclature will be there regardless of any reform undertaken, because, in the first place, we are examining things which are not hitherto known. So they have to have a name. Now somebody uninformed may try to tell you that some of these things were known but that's merely his misinformation talking. He doesn't know what you were talking about so he thinks it was previously known. He will try, for instance, to compare an "id" and a "thetan," see? And he says, "Well, Freud described all that. He said, 'id,' and an id was – something, and..." Well, probably a person saying this to you really doesn't know what Freud said was an "id," see? His nomenclature failure is prior to his misunderstanding where you are, see?

So, if you want to wind yourself up in a ball and become very confused and get a lot of slow passes and go slower and slower and slower and slower, just start leaving words behind you you don't know what they are. You get halfway down the page, all of a sudden there's a word you've never seen before. Just say, "Well, I'll catch that later," and go on. Why don't you just say, "Well, I'll cut my throat right now and add several weeks onto my course progress?" Because that's just what that'll do. You cannot help but wind up at the end of that page.

Now, the next thing is the subject matter itself, arrangement and understanding of Now, this is your second one. Now, it's all right to name something and get a definition for something, but *what* is being named? And if you were very, very clever, you would worry it and worry it and snarl at it and walk around the circles of any piece of subject matter; now we're talking about the – a thing, see? We're talking about – we're not talking about the name of the thing, we're talking about the thing. You'd walk around any one of those pieces of subject matter until you had a good comprehension of what that was all about. "What the devil are we talking about?" see?

I'll give you an idea: You say, "Well, a person has a bad opinion of another person because they have an overt against that person." All right, there is a thing, you see? That is the – a mechanism that surrounds the overt-motivator sequence. That's one of the phenomena. Joe is mad at Bill and if you search a little bit, you'll find out he's mad at Bill because he's done something to Bill. Joe has done something to Bill. Now this is contrary to the explanation everybody makes in life, so it is very easily read this way, see? Because life is that way you can get this thing – *scoong!* – wrong way to, in your skull, see?

So "'Joe is mad at Bill, because Bill has done something to Joe.' Yes, I understand that." Well, you missed the whole point. Thereafter, if you've done that, you will really never then understand how to pull an overt or why you must do so. See, that has just gone up in smoke, see? Very important mechanism! "Joe is mad at Bill because Joe has done something to Bill." All right, that is the thing.

Now, several things can get in the road of the acceptance of this thing and first and foremost is, it isn't usual or ordinarily thought of this way and that gets in your road by misinterpretation. You think you've read something you haven't read, see? Because it's so usual for it to be the other way you think you've read it the other way. Or it is so widely accepted the other way that it is simply unbelievable.

So there's the next thing that gets in your road, is the unbelievability of it. You say, "Well, that couldn't possibly be true." Now, for heaven's sakes, make sure when you come to

the unbelievability of something that you know what you're unbelieving. Now, that's important – that's important. Let's know what we're unbelieving.

Now, to know what we're unbelieving we have to take the first step again – the nomenclature, you see? Did I get the word right? Now, the thing, the mechanism – phenomenon here, have I got that right? And you'll find in about ninety percent of the cases that a reexamination at this "unbelieve" step – you are unbelieving the wrong thing. You weren't unbelieving what was there. You were unbelieving something else, see?

So, when you run into a total "*gawp*," see – you know, you say, "That couldn't be, you know? Wha-wha? I – that – that couldn't be. I – no, that couldn't be!" see? And instead of going out and jumping in the lake or something like this or taking cyanide, the thing to do is to check over nomenclature and the description of the thing itself. Now, if you check those two over, you'll find out you probably had something in crosswise and that this "unbelievable" was not unbelievable at all but is quite – quite easily seen. That's about ninety percent of the time.

The other ten percent of the time you just can't see how that works that way. Go back and check your nomenclature, check what the thing was that you're not believing, and so forth. Get down to this other thing, you still can't see how it's that way – set yourself up some examples of how it's not that way and how it is that way.

Now, this is the – really the first place where you really have to apply it to you and life, where it becomes an abs... a complete must. You must apply it to you, you must apply it to life. "Does this thing exist in life or doesn't it? Has it existed in my life or has it existed in anybody else's life that I know of? Is there any incident here that demonstrates this phenomena?"

And you'll start looking at it and you'll find out that the reason it wouldn't go that way is normally a button got in its road or something like that. You know, you didn't dare believe that it was this way; something like that – just an examination of it, trying to, "How does it apply to me? How does it apply to life? Has it ever applied to life? Did anybody ever see this thing?", you see, and "Do I know of any incident or anything of the sort which would exemplify this thing?" Why, the other ten percent that I've been talking about here, that will tend to evaporate, too and you'll say, "Ah, yes, now we got it."

Now, this procedure followed actually gives you a terribly firm grip on what you know. And careful study is not necessarily either thorough or brilliant or wise or anything else. It's merely careful. And if you work right along at it on the subject of being careful with it and what you're careful about is – as you're going down the page *pocketa-pocketa-pocketa*, you all of a sudden see this word "boojum" see? "What the hell is that?"

Now, I'll show you how you can be stupid: that's to go on. Read the next word to it in the hopes that somehow or other the explanation will all drop out into your lap. Gloss over that word, you've done yourself in. "What's this word 'boojum'?" Boy, you better find out right now. You might glance at the rest of the sentence: "Does there – a parenthetical description what 'boojum' is in it as you sometimes – occur? Or a – there's nothing there. It's evidently a word I'm supposed to know. It's not a new word, because it's not explained in this paragraph, so it's a word I know..."

Boy, you go any further than that, you've just hung yourself up in a nice little brass mystery and there you'll be: going around with a lamp looking into the dark corners and wondering what you're being mystified about. And then you'll think you're mystified about the subject, you're mystified about anything – it's tracing back to this time you read this paragraph and you didn't understand a word in it so, of course, then it didn't communicate.

By not understanding the word you inhibit any communication. You've inhibited communication between what you're studying and yourself. You've also inhibited your communication between yourself and other auditors and you also, oddly enough, have inhibited your communication with yourself and a pc, because this is something in a pc that you will not thereafter recognize because you don't know what it is.

Now, following down some sort of a – of a routine like this in study, you'll find out that you can study. It's all right for somebody to come around and say, "Well, you can't study and you just don't apply yourself," and that sort of thing and they're – they've done this to people in school – they've done it to me; they used to do it to me in school; they used to say, "You don't know how to study."

And I used to say, "Gee, that's very interesting, you – I don't know how to study," and I accepted this – that I didn't know how to study. And I don't know that I made much of a ruckus about it, but I did manage to finally find out that this was not accompanied by any method of study.

In other words, you were saying – somebody was saying to you, "You don't know how to hang up a skyhook, and therefore you're very stupid indeed, because you don't know how to hang up a skyhook." And it's sort of like catching snipes, same kind of a gag, see? You're supposed to stand out in the woods for hours holding a sack while they drive them in on you. Actually they're home having some coffee, and you're standing in the damp woods for hours, you see? It's just that crude a gag.

They say, "You don't know how to study." Well, what pretentious people! They don't know how to study either, see? There is no – there's no subject called "study." If there was a subject called "study," they'd start teaching it to you in kindergarten. They would certainly start teaching it to you before you were into the – your high schools and that sort of thing. They'd say, "This is how to study."

I've run across various systems, but they're not in the formal textbooks. I've seen them in – remember the Pete Smith specialties from way back when that used to show on the screen, and so forth, gag, one-reel comedies and so forth? Well, I've seen methods of remembering things, and methods of knowing things, and so forth, come up in that form. But I've never seen it on a textbook basis.

I myself developed a method – a (quote) "a method of study" in defense and I remember vividly applying this in the field of history; it's just not going onto the next paragraph unless I could shut my eyes and rattle off the last paragraph, see? It didn't increase my knowledge of history. I actually get along better just by reading a history textbook. At the end of the line when I finish off the history textbook and somebody asks me for dates, I look in the book. I find that is the best method by which to do this.

The only other method of study that I ever developed for myself in school might be of some interest and that was just to get every book on the subject I could get hold of and read all of them and not try to concentrate on any of them, you see?

I think one of the most stellar grades I ever got and bragged about all over the place, and so forth, and called upon to give lectures on every hand, made me feel a little guilty. I was taking American history and I simply got hold of every textbook I could find on the subject of American history and read them all, including Woodrow Wilson's five-volume history of the United States, you see? That's one of those things that you put on a bookshelf to hold it down in case of an earthquake. [laughter]

And I read all these textbooks, but I don't think I ever told the professor that because I was allergic to its very, very bad prose, that I had never read that class's textbook. I'd never read the class's textbook. I'd read all the other textbooks I could lay my hands on, but I couldn't stand its prose. Its prose was horrible, and I – it was sort of socialistically weirdly put together and it was pedantic in the extreme.

It wasn't that it was full of difficult words. As a matter of fact the fellow was sort of underplaying – the places where he should have used a good, big, pompous word, you know, why, he'd put some offbeat word, and so forth. He didn't know how to write, see, and so I didn't read the school's textbook, but I read all the other textbooks and I got – oh, I don't know – A pluses and gave lectures on history for them and got gold stars and silver cups and all this sort of thing as being a terrific student. Well, actually it was just to the degree that I just covered everything in sight. And I find out that's fairly reliable as a method – fairly reliable when there isn't any training available, you know, like an American school.

When there's absolutely no training available, why, what you want to do is just get ahold of every book on the subject in sight and then just read them all from cover to cover, see, making very sure – I would now and do and always did – that you didn't cross over words you didn't know. Get yourself a great big dictionary and get yourself some kind of an anthology or something that went along with it and look up a word you didn't know and find out what that was related to and then get that word real good and then go sailing on your way.

It wouldn't matter if you read a book in five hours, you see. It wouldn't matter how fast you read the book or didn't read the book. That's in absence of formal knowable training on any subject. That's a very good method – excellent method as a matter of fact because you wind up at the end of the thing – you've seen this word so often, you've looked it up so often, you eventually know what it is, you know?

You say, "There again is the 'Rembrandt Profile.' Now, what the hell does it mean, a 'Rembrandt Profile'? Well, a 'Rembrandt Profile' is actually – well, I guess it must have been something painted by Rembrandt, but they must mean something here. I'll turn back over here – I saw a mention of it over here. Here's a description of the thing: Yeah, well, so on and so on and so on and so... Ohh, oh I get it! It's the main light is not showing on the front of the face. Oh, good. Yeah, it's just the fill shows on the thing. Ahh, that's good, yeah. I got that now. All right."

Sail along the line, and so forth, and finally, why, forgot all about that, you see, but chapters later we run into a "Rembrandt Profile," see? "A what? Oh, something about a fill.

Yes. Well, I know where I can find it. I'll go back – ah, yes, yes. Main light back of the person, fill in the front of the person. Yeah. Main – face mainly in shadow. Yeah, I got it. Nothing to it." All right, running down the line chapters later, in another textbook on the subject. "When shooting a Rembrandt Profile so on, so on, so on, so on... 'Oh, that's how you do! You add a spotlight to it also. Okay." You see, the word no longer operated as an impasse to your study.

Looking up words and meanings and so forth, is sort of the erosive course of the river and it eventually grinds away on the banks until it has a good, strong flowing stream, you see?

Actually, I don't think there are bright students and dull students. I don't think this at all. I don't think so, because I've never seen any real coordination between knowledge of the subject and the brightness and dullness of a student. But there is a careful student and a careless student.

Now, a student can be very fast and still be very careful. It hasn't even too much to do with speed. But he knows when he's whipped. That's about the only thing he knows. He's reading down this paragraph and all of a sudden he wakes up to the fact he hasn't the foggiest clue what the devil he's talking about – what he's reading about so he goes back and finds out where he got tangled up. Ah, well, here was a word and here was a phenomenon he didn't know anything about.

Now, if he's a careful student he puts it all away until he finds out what that word and what that phenomena is and exactly what that is and he gets that straight. He may cruise around in the thing just a little bit further to find out if it's defined in that particular publication, see? But he's looking for the definition – he's not any longer doing it.

Now, there's a careful student. And his brightness on the subject is dependent upon the degree he does this. It isn't dependent on any native talent or anything else. It isn't even dependent on his buttons.

And in Scientology, because of the tremendous amount of breadth of study we are doing and because we are studying what we study with, why then, it's necessary to have some command of the subject of study. It becomes absolutely imperative in our field to know something about how to study and it's no longer walking up to some poor luckless student and saying, "Well, the trouble with you is, you don't know how to study," then walking off, you see? Or saying about some other student, "Well, he's just stupid. That's all, you see? That explains it all, see?" Frankly, it doesn't explain a doggone thing.

We've talked – we hear about the lightning-quick student. We hear about the very, very fast, fast, fast student and we hear about the very, very, very, very slow student. And we hear about the grind and we hear about the brilliant student and honest, those classifications have no more validity than the field of psychiatry. Why? Because they have never produced uniform fast study. They're apparently merely excuses and justifications of something. They're an effort to classify on something nobody's cracked. So, why should we talk about dull students and slow students and brilliant students, and so forth?

There are certain phenomena in study which are worth commenting upon and one of those is the oddball who can memorize almost at a glance and who can go back and spit out

the memorized words. I've known Chinese students that got anybody whipped I ever – in the Anglo-Saxon world or in the Western world – anything whipped on this line. I know Chinese students who could go ahead and give you pages of mathematical formulas and things of this character and descriptions of it, and so forth. About the wildest thing you ever listened to and they'd come to school the next morning with their lessons and *ka-wow!* You ask them, "All right, now let's go into the slope formula."

"Well, the slope formula is so-and-so and so-and-so and so-and-so *kow-kow, pow-pow, kow-wow.*" It's all there, see?

You say, "Wow!" Don't say instantly, "Well, then this is the very man we need to build the dam," because building dams has very little to do with study of that particular kind or character. We don't even know if he could solve the problems on the page, but he sure could remember them. Now, that's a test mainly of memory.

Now, if you want to be sure of this person, in examining this person you'll find immediately what's going wrong here. Immediately you'll find what's going wrong. There's a way of examining this person that would only be fair to the instructor and to the student alike.

Take any oddball word that occurred in the first paragraph you have just got back so glibbishly and ask for a definition of that word (the definition is not given on the subject matter which the person is doing). And if you want to see a hunted, horrified look come into anybody's face – it's the perfect memory repeat, see? And you've thrown an ax into it because you've asked for something which isn't memory.

You've asked for the definition of a certain word. And if this person – now look at this – if this person could give you this whole paragraph and tell you all about it but couldn't define a word in it, that person must be in total mystery about that.

So the missing ingredient is understanding. And then naturally the missing ingredient, application, will show up soon afterwards. Do you see how that would work?

In other words, this very, very fast study falls down exactly as the slow study would fall down. In other words, everybody caves in on this same point uniformly. Now, if somebody comes up and he takes this same thing and he stumbles all over the place and he tries to get it out and he spits it out, and so forth, the examiner could ask him, too, the same word. "What's the definition of that word?"

And he'd say, "...Well, I don't know." Puts him in the same boat as the fast study, doesn't it?

So, the direction and end purpose of study is understanding and, of course, you – with an unknown word in the middle of it, and an unknown phenomenon in the middle of it – you're not going to get understanding at all. You're going to get disbelief, noncomprehension. You're going to get mystery. You're going to get, of course, also nonapplication.

Now, if we examine study a little bit further, the main complaint about study is that it does not immediately and at once result in good, clean, clear application. This is one of the primary scolds about modern education – primary criticisms – is if you educate an engineer – or it was – you educate an engineer and you don't dare send him out to build a bridge, see?

Well, that's in the field of application or practice of application. But if this man can't go out and build a bridge after he's been taught to build a bridge, the familiarity ingredient, of course, is missing.

But even so, if somebody had borne down on him like mad for the definition of every word that he was stumbling across in the direction of bridge building, he should be able to go out and unroll his sextant and transit and get to work. He should; he should. He's now got the horrible task of acquiring his familiarity, but he wouldn't be doing it across the barrier of a misunderstanding of his terminology and a misunderstanding of his tools and he theoretically could do it.

I found myself doing it the other day. I just had a textbook command of a certain problem on this line – parallel line – I'm studying. I just had a textbook command of the thing; nothing but and I saw it, saw it happened and applied the textbook and it resolved, bang! And I had about something on the order of maybe two or three seconds to do the whole thing. Because something was happening and I had to straighten it out fast, see? Just textbook. It worked – it worked perfectly.

So therefore, you could and should be able to take a purely textbook thing – if it was a valid textbook and a valid subject – and apply it directly without familiarity. Now, think of what a whiz you would be, however, if you also had the familiarity at the same time. And that's why we study auditing while auditing, see?

But if this other ingredient of careful study is missing, the nomenclature is missing, you can't make the boat. It just won't make the boat.

I studied – been studying this parallel subject very hard because it is a bearcat on the subject of terminology, too. It's terminology that you'd think anybody that had been around photography very long would be very familiar with. He couldn't help but be familiar with it – oh, no, no, no, no. Not when you're studying text after text after text after text after text!

Well, if you were taking some little course that didn't have much to do with the price of fish, that didn't intend to make a pro out of you along any line and "This is, see, this is how you develop pictures" – the Eastman book for the home beginner, you know? I've read those by the ton. No, that hasn't got anything to do with it. It says, "Hammer, pound, hit 'em with the grape, you know – no holds barred. Now we charge with the bayonets. You take the metabisulphite and pour it into the yattapin," and you say, "You take the *what?*" you know.

And then you're busy in the very next lesson studying a completely disrelated field of the same subject, "Make sure that you adjust the headsreen."

"The what? Where the hell did this come from? I've never met it before around here anyplace. A headsreen, a headsreen. Now, what is a headsreen?" Scatter, scatter, flutter, flutter, look in the dictionary, and so forth. "What do you know? It isn't in the dictionary. It's so common they don't have to define it. But I don't know it. No worry now about how stupid this makes me, you see? Flutter, flutter, bing-bang. Finally figure it out by context and by illustration. There was a picture of all of the photographic material needed. A headsreen? Obviously a headsreen was what you hold back a corner of the main light force so as to get a

prominent ear to be less prominent. Obvious, isn't it? Headscreen! Who would have dreamed it, man?" A nonsensical but very usual piece of equipment.

The guy writing the textbook, being so familiar with his subject, would make the same statement that you would make, you see? You say, "Well, you set your E-Meter down on the table first, of course." You have said it almost sarcastically, you see? "Well, you set your E-Meter down on the table, of course, before you start auditing." If you want to be really sarcastic, you'd make such a remark, you see?

This guy, this bloke, this expert on portraits to end all experts on portraits says, "Well, of course, you adjust the headscreens to hold back that. That's the way you subdue the light." He just says this parenthetically, you see? "This is how you make less prominent, undesirable features on a subject in portraiture. You hold back the light on them."

"What do you hold back the light with?"

Get the same answer out of the textbook. "Oh, don't be an ass."

"Yeah, but what do you hold back the light with, you know?"

"You hold it back with a headscreens, of course, you idiot!"

"What's a headscreens? What is a headscreens? What is this thing?"

"Put it over the piece... Put it over the lens of the camera so it doesn't show the fellow's head?"

So, this has been – it's been very amusing, because I can look at a subject, you see, from an oblique – look at the same study problems that you run into. And I've been analyzing these problems and putting them together. What I've been talking to you about and what I've talked to you about in recent things has been the views I've had on this as worked out and as I know they apply in our own field. And I think you've been making some progress as a result.

But there are just these points about study and you expected there would be probably a lot more complex points about study, but there are no more complex points about study than I have just given you.

Now, of course, if you didn't read or write English there would be a further study on nomenclature. But remember it would just be a further study on nomenclature. So, it even falls into that particular field. Now, the person who can't talk at all, or let us say, an animal trying to arrive at this particular line – he's totally out of communication, he hasn't got the vocal chords, he can't be educated in the first place. You say, "Well, that's a totally lost field." Well, I'm – I'm not completely willing to lose that field utterly because I've already raised animals in tone to a remarkable degree and I've already met dogs that could talk, see?

Yeah, I met a dog one time – he used to say "Hungry" every time he wanted chow. He managed it somehow. He used some Hollywood scheme of how you breathe from the diaphragm, you know? But he could say it clear as could be – that he was hungry. Startled people almost to death because they'd say, "Well, that's funny. The dog probably makes a grunt, you know? And this mistress that's taught him and so forth is just being too too for words." And then they'd hear this dog and this dog would say "Hungry" and they'd go "Ahhhh!" And I was talking to an elephant the other day that wanted his picture taken, as I told you and I've

run into animals that know their cues much better than their trainers and have to pull the trainer through the act somehow and make him look good. [laughter]

So I don't know what the barriers to communication are. I have a greater insight into the fifth dynamic lately than I have had before and I have found that they're – you can go a lot deeper into the fifth dynamic. In fact, I've pretty well got an idea of what GPMs, and so forth, certain animals and insects and so forth get stuck in. And just about how they go into that particular zone or area and how they go out the bottom. I've had a little – quite a little bit more insight into this.

But anyway, that being as it may, the point is that the communication of the nomenclature of the language – of the ability to talk or communicate – would be the first barrier, don't you see? And so it remains into – the fellow who does know English, who can read, who sits there and so forth – it's still his first barrier. But, of course, he is so high on this level of communication he is contemptuous of these little inability to communicate and so neglects them. And neglecting them, then of course, he comes an awful cropper when he gets into the field of study. And that is about the first place where he really falls down.

There are many ways you could make a person fail in studying, but mostly it would be in denying them an insight into the necessity of understanding the communication symbols used. That would be a big failure in delivering the field of study.

We never published a dictionary as such. There are several manuscripts of dictionaries around but they unfortunately all depend on my re-editing from beginning to end and they just go fantastic quantities of words and it is just those extra twelve hours on top of the forty-eight in the twenty-four – to get such a job completed. It's a very rough rough beef. And I particularly would not want to attempt the job until I felt it was pretty wrapped up, so it's just about now it would be wrapped up. But I did have definitions of the various words at Level VI, and so forth, codified which I'm sure has been issued and – so that you could look those things up and know what the score was on that.

But despite the lack of a glossy dictionary, you nevertheless can look up these words and they are known and people all over the place know what they are here, and there really isn't much excuse going to one. So it takes you a half an hour to learn what this word is. Boy, that's a half an hour that won't get multiplied and added on to the end of your course, when you're busy floundering around wondering why you just can't seem to get to first base on that particular quarter.

Well, I hope what I've told you today will be of some use to you.

Thank you very much.

BANK ANATOMY

A Lecture given on 14 July 1964

Thank you! Very sorry to keep you waiting. It's not my fault. It's Reg's clock (laugh). That's correct. It said... it's wrong, so... I'll have to turn on the clock in me head. What's the date?

Audience: 14 July.

14 July, the 14th – We have a new student, stand up and take a bow – Tom Morgan. And somebody we have seen before, retreading – Jean Jacques Scalance.

Alright! I'll have to make up for it by being very interesting having bored you to death sitting there ten or fifteen minutes with nothing to do. Well, I think I'm just going to give you right off the cuff, all of you right now, a rundown on exactly what the track and bank looks like and here at the lower levels particularly restimulated and particularly the newcomer on the thing, why the best thing to do is to turn it off is to just run on through Class VI. That's the best way to turn all that restimulation off. And... [laughter] and, when you're Class VI, go right on through to OT. That turns all the restimulation off [laughs].

Now, let's just give you a very rapid fire lecture, and Reg will be cursing in his beard because he'd want a camera on this particularly, but I will do it all again with Fillips and Furbelows. Very interesting doing things with Furbelows [laughs], and here's the way it sits.

There's a thing called the reactive mind. The total composition of the reactive mind consists of the following factors: Are we away? [laughs] Alright, it has locks, it has secondaries, it has engrams. Got that? Alright, in addition to those locks, secondaries, and engrams, one of the most notable facts that it has, which comes to view once you start, is implants, implant GPMs and then various forms and varieties and that sort of thing, and they make little black masses that are quite interesting to collide with, and they can be run on almost anybody, and actually comprise, the implant GPM comprises Class V. Old Dianetics dealt with the locks, secondaries, and engrams and Class V deals with these implants and their various ramifications.

Implants are interesting in that they very often have engrams in the midst of them. You run half an implant and somebody slips off the post and something like that, he's got an engram and somebody getting him back on the post. You know, that kind of thing. In other words, there's all of that still exists in the mind and that... those, those implants go along with dating, you can date implants very easily, go along with other whole track phenomena. And, there's two branches then to the whole track phenomena which belongs at Class V, and one of those is implants and the other one is engrams. And, various types of engrams go back all the way along the track and there's some rather unbelievable time spans involved in all this.

It goes very, very long. It... You can get dates of trillions to the one thousand three hundredth power. That is a date which you would spend the rest of your life writing. That – it's just, ciphers that go on and on and on. I'm exaggerating when I say the rest of your life, but it would just go on and on and on and on.

Now, because people have been implanted, and because implants exist, and so forth, then it is very easy for someone to get confused about what is called an actual GPM and the actual reactive bank because he immediately conceives that it has been done to him, and is all mixed up on the situation, and he is very likely to believe that a – an implant and a GPM are the same thing.

Now, if you want to become very ill, several methods of becoming ill will be covered in today's lecture, if you want to become very ill, indeed, why just start going around and saying that actual GPMs are – are implants. If that's – if you want to get sick, that is the best way I know of to go about it, and if you want your pc to get good and sick, why have your pc start arguing around about this without you suddenly chipping in and saying, "now, when was the first time you considered this?" You know, and just run it out as a series of considerations right now, and he'll come off of this wild kick because he's going to make himself terribly ill if he says that actual GPMs are simply implants. Now, we are not interested in whether they were implanted or not implanted, I'm just telling you one marvelous method of getting sick. You understand? I'm not saying even what they are. I'm just saying that's a nice way of getting sick.

Now, therefore, we get down to Class VI, and we've covered everything else now except, of course, the fact that what you're auditing up to Class IV is the destimulation of the things you erase at Class V and VI. You want to know what these Classes are all about. What Classes I to IV are devoted to: auditing which destimulates those things which are erased at Classes V and VI. You understand? Therefore, there are only two erasure Classes and those are V and VI, and there are four destimulation Classes. So, that you never try to erase anything, actually it's quite incidental but you really do get erasures accidentally of little odd bits on Classes I to IV. There is a small amount of erasure that does take place, but the moment that the auditor tries to erase something, while auditing in those Classes with their processes, he is in immediate trouble. I'll give you an of idea how this is. I'll show you the difference of Classes.

You say to somebody, you say, "You say you don't feel well, alright, what's the matter?" "Oh, you got a headache, alright, well now, recall the first time you ever tried to get this headache cared for." "Recall an earlier time you tried to get the headache cared for," is a more exact command, because he won't give you the first time, the first time. And, he gives you something, and gives you something, and gives you something, and all of a sudden his headache disappears. Well now, you've, you've destimulated. You've destimulated.

Where's the headache? Well it actually isn't out there lurking, waiting to pounce again, but if it comes back slightly nobody should be very surprised, because having done this exercise, of asking him for his considerations about headaches, or what he's done for headaches, or how headaches have been handled by him, and so forth, or what he's done to a headache. We don't care what we ask him or how we asked him for these considerations.

Don't get this mixed up with O/W. I just heard crosswise in your head that you had. No, it's any recall process, see, which would lead to a banishment of a headache no matter what you did, and then you found out that he had banged his head on the corner of a kitchen sink at the age of five. He got rid of his headache slightly, see, so then you decided to really find out where this headache came from and you found out that he was banging his head on the corner of the kitchen sink and then you said, "Well now alright, about banging your head on the corner of the kitchen sink when you were five, how did the room look at that time?" "What was said at that time?", and boy, he's got that headache back with exclamation points. You understand?

Now, you've destimulated that same incident when you simply asked him for some considerations. You destimulated in general, the whole subject of headaches, but then you have come back and try to erase this. You see? Now you're gonna go through and scrub out what you have assigned the cause of the headache to be. You're going to erase that thing and he's going to get a nice headache back. Now the funny part of it is, you could go on through and erase it only to find out that it really wasn't when he banged head on the kitchen sink at the age of five. It was when he fell out of the perambulator at the age of three. So, you have now erased that and this would all be better, and then you could find out that it wasn't that at all, but in his last life time he was really shot in the head when he kicked the bucket. So, that puts you back into the last immediate past death. Now we're gonna run all this out from one end to the other. I see some of you have been over this road... and there would be an astonishing return of, of perception and he would feel pretty good about this, and so forth.

But, either you did a terribly even nice smooth job of auditing the whole way, and you could keep running this back... Now, let me point out to you, that the second you went into that past death you moved into Class V. It was at that precise instant. It was perfectly alright to handle banging his head on the corner of the sink in this life time, you're, you're a perfectly good auditor, but you moved out of Classes I to IV even on what little you can erase in those Classes. See, you've moved out of that. You've gone on to whole track. One more life time than this one and you're on whole track and you're in Class V. That's the way we classify it these days. Don't you see?

You got no business being there these days because of this interesting fact. It is absolutely factual that an auditor, smoothly auditing, can go back and erase enough of those engrams, we did it in Dianetics, enough of those engrams to make that headache go away and be good and the fellow not bothered with it at all further more. This is perfectly true but the number of incidents, I'm putting you all into focus with regard to the reactive mind, the number of those incidents which added up to a headache, may well be in the billions, which is why we departed from Dianetic into Scientology technology. And that's the exact reason why there is a bridge between Dianetics into Scientology.

Whatever else anybody wants to assign to it, whether historical reasons, or anything else, that is the great big milestone on the road. The discovery that there could have been billions of engrams on the track, each one of them capable of causing a headache. And to get rid of all of those engrams in times and terms of auditing, in view of the fact that man is only here for seventy years at a crack, to get rid of all those in a pc was not feasible. It wasn't that the technology was not do-able, as a matter of fact, we recently improved the technology. You

could run an engram now by plotting it's time, and spotting it's duration, and boy, if you got those two right, pictures turn up all in 3-D. This poor guy he's never had a picture before in his life, see. You do that engram technique that we developed here a year or so ago, I got, I finally got whipped out, and so on, and boy, he's got visio and he's got the lot, see. All you have to do is do an accurate spotting of the time of the engram, find it's exact duration, and move him up some place toward the beginning of the thing and on go the lights, see, and you're away.

So, the big problem of erasing engrams, the pc had no visio or sonic, that was dealt with and there is such a technology, but it still doesn't solve this other auditing factor. The auditing factor is, is billions of incidents exist on the person's track which could cause a headache, see. Let's say you've got a chronic headache, well also in running this you find out he also has a chronic foot ache and it has more billions, you see, so all of this becomes infeasible. It is not doable simply because the auditor hasn't got enough time to handle that many incidents. It is not, now, that they could not be handled, you understand. But he hasn't got enough time to do it. You could take this technology of erasing engrams and take ninety-eight percent of your pcs and go ahead and run engrams on those pcs with this technology and they would very soon begin to fly.

But that is an erasure technique, and to achieve any finite end within the lifetime of the pc and yourself, due to the quantity involved, becomes impractical. That's why! And, that's why the shift in Dianetics and Scientology and that's why these other approaches. That's erasure! So, erasure from I to IV, it is not that it couldn't be done, it's that you haven't got time to do it, and you can do more for the pc by destimulation that you're simply keying these things out. In other words, park them over in their proper area without paying too much attention to them. In other words, the indirect approach to these billions of engrams was simply to destimulate the pc on the subject of keying them in, in this lifetime, and you find, quite remarkably, that this is highly workable. Destimulation as opposed to erasure.

Now, there is then the dividing line, between I to IV and V to VI... V and VI, is those early ones are, simply because you can turn off somebody's headache and then if you don't try to erase anything, that's what I've been trying to teach you here, if you don't try to erase anything, if you don't push him back into the bank and you don't crowd him back into it with some nonsense or gobbledegook of some kind or another. "Well, I didn't get that, would you go over it again. That was a what? Well, I didn't quite understand this, oh, it's a... well, it's alright." But the auditor is just being too something or other.

He's concentrating the pc's attention on the backtrack, see, and he says, "Oh well, that happened when you were five, alright. What did you say you put your head up against? Oh, your head hit – hit – hit a sink, alright. What sink? Where were you living at that time?". Well, you've done the exact approach that has long since been designed on how to get somebody into an engram. And if... of course, he'd go into the engram at that time, and your job is actually to destimulate, not erase. You see that? Now, oddly enough, you can still destimulate after you've done all this.

You just pick this session. Now, you've obviously made locks on the incident and this session. Don't you see? So, you just ask him, "When was the first time we started to talk about

it in this session?", "What considerations have you had about it in this session?" You go all over it again, and magically, if you audited that very smoothly and destimulated this session, why all of that would fly back into the background again, and once more, he would be rid of it.

So, we have two distinct classes of auditing and we have two distinct things which are handled, and therefore all auditing between I and IV is the handling of locks, especially the lock known as a key-in. I won't bother to go into nomenclature in this lecture. If you don't know those words, look them up.

So, it's handling locks. So, I to IV isn't handling the raw meat of life, and we have omitted number V because it now isn't necessary, and this brings us vis-a-vis staring into the lion's feted breath. That's VI. So, what you're doing now is a transition from sweetness and light of one I to IV.

The spring sunlight pattering on the freshly born leaves, pan pipes trilling in the distance. The full volume Ride of the Valkyries, with no transition, done in a dark cave with red bloods and spots.

And if this is something of a shock to your steady factors, well, fine. I would be very happy if it were possible to put you through the two or three years of training necessary to come up the whole gradient.

So, it's not necessary to come up to those whole years, so the thing to do is just brace yourself for a shock, take it on the chin, and plow on. You understand? So, actually all of your auditing up to IV is destimulation, handling the little key-ins and locks, "My momma spanked me and I considered at that time, that I hated women", you know. "Ah gee, somehow I feel suddenly better about, about...". That's not what it's about, see. Do a military drum doing muffled drums, and he's going off to the executioner's block.

The somatics with confront required – pretty tall, pretty tall. Big jump, big jump for a pc. Big jump for an auditor. I just want to show you there's a section missing in the training and tech, but it is possible for you to make that jump and it is possible for the pc to make that jump, without an awful lot of stuff, providing you do I to IV well, and that's the area that you got to do well. Now, what have you got to do in I to IV? In I to IV you just got to raise his cause level so when he eventually begins to confront the real raw meat of the reactive mind, he can as-is it. If he can't confront it, he can't as-is it. If his willingness factor is too low, his cause factor is too low. If his cause factor is too low, he can't look out enough from where he is to as-is anything in front of him. We've had other lectures on this particular subject. That is not new ground.

So, your thing to do there is just raise up his cause level – then throw him to the lions. Alright! It's something like the Russians trained their troops for World War II. They took this fellow and they showed him how to handle a sub-machine gun, heel strip it, put it back together again, fire it, and then sent him to the front lines. That was his total military training, see. And then his survive became soldiers. [laughter] So, this is heroic, see. No effort being made at all to do anything very gradient about this, and this brings us right down, with no more gradient than that, to the reactive bank basic.

The basic raw meat of a reactive bank is the GPM. And the GPM is caused of masses and significances, as you will find in other materials, and has certain forms and sizes, and my lecture mainly concerns it's patterns, here today.

Now, there are people around that tell you, "Naw, Ron must be wrong, I've never seen any mass in GPMs – oops, well...mass...GPM...[mutters]... so I wonder why I'm so hot". Well if you're running straight down instead of the center of a GPM and you're running dead on, which you can do now, of course you never see anything. The second you begin to see anything, you must realize something has been skipped. The only time anybody ever sees anything, there's something wrong. You jumped a GPM. Well all of a sudden you're gonna have visio. You jumped an item. Well, you're gonna have nice visio on the item you jumped because it's not going to be behind you, or ahead of you, or to the left, or the right, or someplace. Do you see this?

Now, in the final analysis, a GPM is composed of mass and significance, and it's located, and so forth, but you don't have to worry about it being too thoroughly – about it being timed because it really doesn't matter what time it's timed because it is timed. And one of the reasons why it's very difficult to find the top of the bank or the bottom of the bank and so forth, and that sort of thing, is because it is time itself. So you try to find the top of the bank and well, that would be the part which was made last. Yes, how can there be a last when this is the thing which has made it first and the last.

In other words, the characteristics which you normally assign to objects in their position, location, and age, these characteristics are gone when you get into GPMs. Now, you can say, yes it runs in this order. Oh yes, it does and you'd better run it in that order and you can say, well it starts here and it goes there, and so forth. Well that's simply, sort of on the basis, it's easiest to start here and go there. Don't you see? Because there was no start and there was no stop. But, there is a significance of starting and stopping in it, and if it weren't for any GPMs, there wouldn't be any significance of starting and stopping. How do you like that? See?

The thing exists in space, but the GPM is what makes the space for itself to exist in, see. It has age, but it, itself, makes it's own age [chuckles]. So, therefore we say, this is the first end word. Well, we have said that this is the first thing about the thing that makes a first, you see. It wouldn't necessarily be a first engram. See, there couldn't be a first end word, really. This is why the wits are... is very difficult to grasp at first glance because you see everybody trying to grasp it is tremendously influenced by it, and the considerations people have of things are caused by these considerations and significances which are in the GPMs. You see? It's a snake eating up his own tail. It's that kind of a problem. The snake ate himself up and disappeared. Well, that's really what happens when you run a GPM.

Now if... the consideration then, the consideration of time, the consideration of space, energy, all the various things of which a GPM is composed are contained as significances in a GPM. Very, very puzzling. So, somebody trying to understand life sitting down on a mountain top some place in lower Jesus or some place – Jerusalem, excuse me, and he's contemplating his navel or something, and trying to get the hot dope, he gives you all sorts of things. If he starts to get close to the truth, then the things he utters appear to be idiocies, see. If he

gets close to the truth. Like, there really is no universe – Mary Baker Eddy. There is no universe. All is infinite mind. Isn't it true? It's very, very, very true but that doesn't prevent Christian Science from being the leading religious faith you find on the rosters of insane asylums. See, it's a truth which isn't quite true enough to save the bacon of the person's faith.

Truth must be truth. It must be all the way truth. Now, anybody who is studying slowly, and so forth, gets caught up in this factor: That you can't go part way to truth. The most suicidal activity that you can engage upon, is to go part way to the truth. You've got to go all the way to the truth. There are no half truths. About the most dangerous thing you can have anything to do with is a half truth. There are... people have understood this, that a little knowledge is dangerous. Well, that's actually not very well applied, that's not even very well stated, and it certainly isn't the same sense of what I'm saying here. No truth can be half way approached. If you got that far and didn't go any further, you would fall flat on your face and be in quite a mess. If you set out to shoot the moon, there is nothing sillier than going into perihelion around it for the rest of your life [chuckles]. You've got to land on the moon. There is no substitute for totality with regard to truth. In other words, you've got to know all of it.

And this is – this I'm trying to field a philosophy. The Bugdeammerbum... the famous witch doctor from lower Scrambula, he puts his foot on this line and he says, "There really is no time" and he doesn't go any further than that. He teaches everybody, there really is no time. He's put himself and everybody around him with one foot on the banana peel and the other in the grave, see. He hasn't told them why there is no time, see. He hasn't told them anything, and all he'll do is – everybody goes around saying, well there is no time, so it doesn't matter, but yet, echoing in around in their skull is the fact that it's true, there is no time. That is a truth, but it is so little of the truth. Without somebody going the whole way, it actually becomes quite dangerous. The whole race would then simply go in apathy and that would be the end of it.

And that is what has happened in almost all philosophies that I have ever heard of. See, they get some corner of some truth and then they don't walk down that road and they go no further than this. You see? And they sit around on mountain tops regarding their navels and they do weird odd ball things, and they wonder why they're not getting any better if they know so much. Well, the reason they're not getting any better, even though they know so much, is because they started on the road to truth and they never made the passage and they're something like a ship-wrecked ship. They're high and dry on that reef and they're never gonna go any further. But having gone that distance, it wrecked them. Now this in itself is soul chilling.

This pronounces something quite interesting to you. You can say, well we started into Scientology. Yeah, you started on a road toward truth, didn't you? The only fatal thing you can do, if you know this about your pcs, and you know it about those around you, and you know it about some of them fallen by the wayside, you instinctively feel it.

Having started, ceasing to go is one of the most fatal things they could do. Now you look at this with some sadness because it's actually a very fatal action. But let me call to your attention something else. It isn't that Scientology got you started on the road to truth. You started on the road long time before. You've been on that road – when you sat down in the

amphitheater, when you sat down in the amphitheater in Greece and listened to somebody saying philosophically, yippity-yappishly, that something is the end of the road and Kronos actually devours his own children and therefore the whole universe is circular and whatever else is being said. You started on the road to truth and you can speculate along this particular direction: what is the truth in this matter? What is the true composition of this universe? What is my true identity? Who am I? What do I consist of? Where do I come from? Of course, nearly everybody has asked that question of himself since he's a little child. You started on the road to truth. That's dangerous, unless you walk the whole road.

That road's got to be walked because the character of the GPMs themselves admit of no halfway measures. You key in of one of these GPMs, and you key in a series of GPMs, you get them all roiled up and then you don't do anything about them, you're in the soup. They contain the end all of all explanations. Contained in the GPMs are the explanation of the universe in which we live. Their identity, everything everything is composed of. The impetus. All of these very things.

In other words, the philosopher busy philosophizing and having himself a ball on the subject and coming up to some conclusion. Let's take Einstein. Einstein was walking on this road. He had finally gotten up to a point where he was trying to integrate life into his other equations and he was groping, groping, groping and he left one of the most remarkable, he left one of the most thoroughly remarkable messes for ages forward to figure out that you ever cared to have anything to do with. When he died he had a bunch of consultations. In other words, he was going towards the everything of everything. In other words, he was going towards something that explains everything, and he hadn't arrived any closer than a bunch of symbols. Having figured out his various equivalents of constants, and speeds of light, matter, energy, space, and time, having figured these out, he was trying to squeeze life into this somehow or other, and he left an awful hodgepodge of figures which everybody worships back where he was, Princeton I think it was... And they're busy trying to do something with this now and it's all very complex and it's all very something or other. In fact, everybody around there is half way spinning, what the devil were these last equations that Einstein wrote. He was just trying to integrate life with the universe. That's, everybody would say, an over-simplification. No, it isn't, that's a more truthful statement. That's closer to the truth than they are. He was just trying to integrate life and the universe and that and that. That's all.

The old Encyclopedia Britannica says in order to understand space and time, you had better understand the mind because it's very often, very possible, that space and time are simply generated by the mind, how do we know. Interesting. That's in the 1890 edition of Encyclopedia Britannica. Marvelous insight. Very well put. I noticed it hasn't been followed by anybody else. You notice that science today says the mind is so in error, it is so inaccurate, is so this, that it is just nothing in mechanics at all, but mass is all and the mind is nothing, see. The universe is everything, and the material things in existence are this and then he is just a spontaneous combustion from mud, and this is all he is, and he's just a lousy bum, and you talk to one of these boys and their whole orientation is in this direction. He will say, "Oh a computer, oh well a computer never makes a mistake. This is the run, it puts out all these marvelous things, look at these marvelous things. Human mind, *agh*, human being *agh*..." [mutters]. Yeah, listen to these boys. I've tried once in a while, timidly for me, to say, "Who

feeds the data to this computer?", "What feeds the data to this computer, and get an answer out of it and who inspects that answer after it has been printed but the mind, the being, the person, the individual." *Yak-yak-yak*, they can't get this point at all, see. In other words they've got now, the cake is more important than the baker, see. You've got an end-all cake that's self-generated and sprang spontaneously from the cook pot, but no baker. The cake is greater than the baker. Don't you see?

So, in studying R6, the first thing we have to recognize with vividness, is that we're dealing with the baker, not the cake. We're dealing with the thing that makes it, not the thing that is made. We've got to recognize that, and that'll explain a great many failures auditors have when they begin to approach R6 and it's auditing techniques. They pay all their attention to the mass, the GPM, the significance, and to hell with the pc. Well in actual fact, if you don't pay attention to the pc and his reaction by keeping in a good auditing comm cycle, by doing good ARC break assessments when you got by-passed charge, by first and foremost taking care of the pc, by making absolutely certain the pc doesn't have any PTPs at the time he's being audited, making sure of all these little points, keeping that pc in good communication, handling that very nicely, making sure that all the items read, the pc is satisfied that they have read, that the pc is cheerful and happy about this, then you've just got an end-all cake, and you got no baker. And it's the baker you're trying to handle and it's the baker you'll be left with after the cake has been et. So, you take good care of the baker. So a few pieces of cake get chipped up. Well that's not very important as long as you take care of the baker.

An individual is an individual and now you find this inherent in early Scientology teachings where it was taught more instinctively than factually, you see. It was taught more on a basis of general knowingness. I knew how these things were. You'll find that the being, the individual, had generated the universe and part of that universe is the GPM, and the GPM in it's generation then restrained him and compelled him to covertly go on making the rest of the universe unbeknownst to himself, and compelled him by his own generation to go on making it, the GPM, see. So you're not quite sure when you first look at this thing which way is which. Is the cart drawing the horse or the horse drawing the cart, you know. When you first look at it you will say, "Wow – science, modern science has said, well, it's all cake, and there's no baker", see.

Well let's take it up a little bit further. The first trouble you're going to have and that is, is the course – is, is, is the cart being drawn by the horse or is the horse being drawn by the cart, or who is running what, and as the pc begins to look at this he actually can accept intellectually, he's making this thing that is smacking his face in but he can't put any part of it into actual subjective reality. So it's a point you don't force down his throat. It will eventually begin to dawn on him. He gets to be further and further on a gradient of cause over the GPM in spite of the fact that cause itself is an end word.

The point is here, he gets to be, actually, more and more cause over this GPM. See, everytime you're falling across a real significant significance or something that is absolutely necessary to do anything about anything with you're also colliding, madly, with GPMs. You understand? You're colliding with the meaningfulness of a GPM in some way, shape, or form, in any human action, and in any part of or action about this universe. It really doesn't matter

much what corner you approach of livingness or life in view of the fact that livingness and life is created by the individual through the GPM.

He creates the GPM and it creates it, but he's long since forgotten he created the GPM. "It looks to me like," you see, he would say, "it looks to me like the cake, you know, is creatin' the rest of the kitchen." [chuckle] Why, he will then not be able to very intelligently grasp the fact that every time he tries to address any corner of existence, he starts to feel strange or peculiar. Well naturally, any corner of existence is already capped with a GPM because if it wasn't, it wouldn't be there.

So, all of a sudden a guy is just thinking a thought, see, thinking a thought at random. Alright, that is either a lock on a root word or a lock on an end word, see. One or the other. It's a lock on a root word or a lock on an end word. That's it. I don't care what thought you just thought, if you thought any at all, so you mustn't get into some weird – you mustn't get into some weird odd-ball contest of trying not to think in some way, in such a way as not to res-timulate a GPM. That doesn't happen to be possible.

There's no particular reason for you... I already went over this rolley-coaster here a few weeks ago, it was a relatively short time ago, I had to decide what this was all about and I had to get down and work it all out very carefully, and I did, you see, and that's the conclusion I came to: That he built a universe through the formation of a GPM and he couldn't think any thought to amount to anything. But didn't amount to anything, he couldn't think any thought that could impinge on one, one way or the other. I made an actual test. It wasn't intentional. It's with causation. I was telling you about cause level and I had this struggle about trying to form a communication about cause level, and I said, "Well I don't..." I knew that cause and so on, was an end word in a GPM. We'll get on to what end words are, and so forth, in just a moment.

Well, I knew that it was an end word and therefore I tried to get around it by saying causation. Erase the causation of a pc. And I tried to get around it also by using causativeness, to increase the causativeness of a being. And by the time I'd carefully written the bulletin, which you have, carefully scouting this on causation and causativeness, I was sick as a pup. It wasn't that I was restraining anything, or anything, I was simply mis-wording an end word. So I went back, I went back and scrubbed all that and simply put cause down there well knowing that it was an end word.

You don't want to keep repeating an end word at somebody when you're giving them auditing commands. You can get out to an outer perimeter lock. And that's what you want to keep repeating, like "done". Well, that's very nice – done, done, that's good. "What have you done?". That's good. Withhold – no, that's a root word because every time you say withhold you're going to key-in directly and immediately some other portion. You're gonna key-in somebody faster than you're easing him up. Don't you see? So, it's best in an auditing command to use an indirect action. But in the discussion of communication of anything, if you try to escape the significance of an end word or the significance of a root word, if you try to escape these things and not mention them, all you do is suppress them and the final result is, is you're practically around the bend. So, the best answer is, the hell with it. Say them. Do them.

Not with a repetitive auditing command. Not in a constant hammer pound of an auditing command.

But a careful review shows that you can't escape this particular thing and it shows, that when you're trying to be technical, that a departure from the exact statement is liable to make you sicker than an approach to the exact statement. Then that says where you sit and where you think. Now the number of root words and end words which you hear battered about every day, laid end to end, would be longer than the Queen Elizabeth's passage from New York to London. Every cocktail party on there, all they do is bat about large numbers of root words and end words.

Now, the worse off a person is, in actual fact, the more he will talk in root words and end words. Sanity, if it is anything at all, would be the gradient scale of destimulated root words and end words, and insanity, would be the command value of the root words and end words over the individual. Not their restimulation, but their command value – that would be insanity. If root words and end words have a disproportionate command value over the individual, you can say he's insane. Now that's... That's interesting, too, because insane, of course, is an end word. But you have to step outside the basic considerations.

But quite in addition to adding both the universe and personalities and reactions and so forth, the individual is still quite capable of independent thought. And the reason you have Dianetics and Scientology is totally attributable to the fact that I've been walking, to a very marked degree, outside the perimeter of reactive thought while considering these various things. Now that's very interesting. We got some place, you see, and didn't get detoured into it even though we were dealing with and very often using it.

Now take the very step with which you work – ARC. Affinity is an end word – Reality is an end word – Communication is an end word. There are three end words in a row, all the way down early on the track and, theoretically, it should make everybody sick as pups because it's so early. You know, you destimulate the charge of them. Now, you're living right in the middle of the fourth lightning if you live in this universe and you're actually further from it in Scientology than you are if you were out digging a ditch somewhere because, believe me, that foreman when he comes down the line is going to speak nothing but root words and end words. He's going to be pretty batty on the subject.

This little jazz musician, "Is that something!" "Boy, that's nowhere!" All in expletives. But they're... you get the idea? There's a vast difference here. They're dead on dramatizing. They're completely unwitting. It would be quite another thing for you, a Scientologist, to be dead on wittingly. I know when I'm using root words and when I'm using end words to a very, very marked degree. If I hadn't been aware of one before, if I ponder one too hard, I'll get warm. When I notice that I'm getting rather warm, I say, "Well what do you know, I wonder if that's a root word, I wonder if that's an end word?" "Alright, it's a root word. What do you know, must be a root word because it wouldn't add up any other way."

I found out that the resistance to and the flinch from these things is what does the damage, not the use. That's a very subtle point for you to know in Class VI. Very subtle, so get that point down very well. It's the flinch from, you see. It's the suppression of; it causes you to feel dizzy and woggy and sick at your stomach. And invalidation of, is what causes

pain. Invalidation, of course, too, is an end word, but that causes pain. If you want to make somebody hurt like crazy just get him to get down, and say that it isn't true that there is a goal of something or other, something or other, which is a real goal, you see; or say it isn't true there is such an end word, and he's getting real excited about it, and the next confounded thing you know, he'll feel like he's being sawed up by a butcher's powered beef saw. What happened? Well, the liabilities then are the liabilities of contest with and dramatization of.

Contest with, is your greatest liability as a student. Even though you're afraid of something you're still in contest with it. It is that, and you are you. Afraid to do these things. Walking the chalk line about them. Being careful in consideration of them and those sort of things. Well that's, that's where the damage comes. Then you say, "Oh brother that's nowhere, that's really nowhere", you know. "That's no.... I wonder what the hell I'm thinking nowhere for, you know, what's all this nowhere. Tah, must be an end word. Ah, it's nowhere". You know, get the, get the delicate shift here, see.

Alright, so you're gonna keep saying nowhere and make yourself sick at the stomach and so forth and restimulate the end word "nowhere". Alright, that isn't going to worry you until you suddenly realize you are saying "nowhere" and to that degree dramatizing the thing, and then say you mustn't because it is an end word. Now, you get that subtle one? Because that's where you go over Niagara Falls in a barrel. It's right at that point, see. You say, "Well, I shouldn't be saying that because...". Don't you see?

Now, I've taken a new look at all this. So, you find out after a conversation with somebody or other that you're absolutely reeling. You've been talking about these things and the room goes out of plumb, and so forth. So it does. So what? Now, you really want to make it go out of plumb? "Well I mustn't really discuss this anymore". Well, you've knocked it all out of plumb with your locks. You see that?

Now, you find yourself dramatizing these things every once in a while but it's only a sin not to eventually catch yourself. I don't expect you not to dramatize them. They're only still here, so you're dramatizing something about space and matter, that's for sure, and time is passing, so you must be dramatizing collectively, something about time.

Alright! Well, let's figure this little other tiny nuance. You all of a sudden find that you're sitting there saying, "Tsk, problems, problems, problems, problems, now wait a minute, I must have an end word or something in restimulation", see. Even though it's next week before you find that out, see, and then not make the mistake of saying, "Well, I mustn't say problems any more to myself", see. Because the recognition of it is enough. You don't have to prevent the future, because that's an end word, too. [laughs] So the gist of the situation is that you're surrounded with these things and all you've done to date, until you collide with them in study, is simply dramatize them.

Now what's happening to you is you're finding out what you've been dramatizing. Your face, every once in a while, will be rather red on this subject. I, myself, pushed myself away from an auditing session. Just very mildly pushed myself from an auditing session and walked around the room for a little while once, and I came back and I sat down and I went over... there wasn't anything wrong. I was getting reads, everything was just fine. And I went over everything under the sun, moon, and stars that I could go over, and tried to compare eve-

rything that I had done and everything I hadn't done and I was looking for this and that and all of a sudden it occurred to me, I wonder what I'm trying to do here. Why am I reviewing everything that has happened here, you see. And then it suddenly struck me that the next goal up that I was about to run was "To create problems". I had simply been sitting there fearing problems. I laughed at myself and ran the next pair. That was the next one coming up. And I was – I was creating problems *like mad*. [laughter] You know what I mean? You can't actually expect not to do it. If you didn't do it, you wouldn't be part of the universe. Don't you see?

Your advance, is to some degree measured by your recognition of what you, yourself, are doing. And a real recognition comes about when you realize that you're making these things up and of course about that time they will cease to. Now there's a trap in all this of the tremendous quantitiveness of them. There appear to be so many that you become exhausted. The figures on this are variable. There's a slight variation in these figures but the best figures I have is 268 Roots and 268 end words. That makes it square. There are 18 RIs in a GPM – proper line plot – 268 root words in one series and 268 end words, or 268 serieses. Now if you multiply this one times the other, you'll find then, there are in excess of 23,000 GPMs.

Now that, of course, is so staggering, there's such an astonishing number that it makes you feel rather quivery on a subject of, "I've got to audit all these out and it's taking us a session, or in some cases it's taking us two sessions to run out a GPM, and we're doing turn about type auditing and I actually am only getting three sessions a week and I'm running one and one half GPMs a week and there are 23,000 of them to run out. So I can expect to be OT, of course, at the end of, something on the order of 33,000 weeks, or something like this. And 33,000 weeks divided by 52 gives you the nu... Oh my God!"

Well, of course, it's not the way it goes. This would be good pedantic mathematics but it doesn't happen to be an accurate situation. Once you've got your plot well oiled in, you're spending less and less time in trying to find your way down the bank. Don't you see? Once you've got... ninety percent of this work, by the way... well I'm not quite... yes, I'd say ninety percent of the work has been done on the organization of this. The consecutive adjacent goals and the consecutive adjacent end words are, are still in a state of polish. They're mostly known, don't you see, but they could be wiggled or wobbled to be here or be there, or be something of the sort, don't you see, but the trick was to get the pattern. Of course, the biggest trick was to find out it was there at all. But to get the pattern of this thing took me over a year and a half of some of the wildest most troublesome stuff I have ever been through. Very gruesome.

I look now on an auditor who can't find a few synonyms. He's got one, he's got one, "to spit," you know. He can't find the next goal which is "to expectorate." I rather look at this as being rather poor because the next goal "to spit" is to, of course – this is not a proper root word – the next goal "to spit" would of course be "to expectorate," see. It's to spit cats, the next goal is to expectorate cats, you see, and the next goal to it would be to spitee cats. Very imaginative. You've got "to run" is next to "to gallop", you see. To travel fast, to speed. They're just all tied together, the same word. Same word, and it's got to be checked out and the best thing to do this with is one of these New Rodell Word Finders. They're only available in the United States and they're very, very fancy. They've had a lot of college professors working on the thing and they were nicely keyed-in and they practically laid the bank out in

this thing unwittingly and unknowingly and you look up a list of synonyms, brother it will find the next door cousin in most of the cases.

What gives you trouble is you sometimes have prepositions and conjunctions in the goal. Usually just prepositions and you have to bend your wits around a little bit. You get a goal like – this is not a proper one but I'll just give you a form – "to run away from cats", see.

So what is the basic, the basic rundown here is the pattern. The pattern has been found and that is the most important part of any of this, is the pattern, because, you see, there could have been trillions of patterns possible. The bank is so charged. It is so full of locks that almost anything runs, almost anything reads. It's the woof and warp of life. You can walk your way through to what is the central pattern of all this, – forms auditing research papers which if stacked up here on this platform, would reach from the very far end of that platform to a height of about two feet, or three feet, all the way over to the other end of the platform. Just single sheets of paper, notes and records of running possible combinations. And it is actually quite agonizing to run these things backwards and upside down and wreck yourself like a fire drill. So, it's very difficult to find this pattern. You're being punished all the time for trying to find the right pattern. Don't you see?

There is no half way road to truth. Don't you see? A GPM, of which you have all of the items, which is properly worded, and so forth, runs like hot butter, providing you haven't skipped too many, or something. That's, that's that easy. But the GPM of which you have one word missing, or one preposition missing, runs with pure agony, see. This is no good. You have to be dead on. We're getting us to a point where we could be dead on, but it's very difficult, and that bridge has been very well crossed and we're very glad to be back. The listing the auditors are being asked to do at the present moment is just sign the adjacent consecutive GPM wording, see, that he's got there.

Now, they don't vary. Everybody has the same pattern. They all start in the same place and they all end in the same place and they all have the same wording. Some people have some holes in the track, however, where ages past they have tried to chew up a GPM and get free. And there'll be little holes, where just half of a GPM here and there is badly chewed up, and your most greatest liability there is running into an ARC break that occurred maybe thirteen trillion years ago. The greatest liability is the ARC break with the bank thirteen thousand years ago.

You all of a sudden are running down the track – this is rather rare but I'm just telling you what the score is – you get half way through this thing, the GPM, everything's running fine and all of a sudden it's all running bad and you wonder what's going on and you trace it up and the guy is looking at this or that and he can see things and he's upset about something or other and you find out that thirteen trillion years ago in an enthusiastic ambitious moment he decided to – he found this one – to bite this one in half, and tried to do something about it and chew it up and of course, he had the wrong goal and the wrong items.

Sometimes you get a read on an ARC break assessment – wrong goal, wrong item and you find out it was in yesteryear they were a wrong goal, wrong item. It had nothing to do with your auditing. It was some little self auditing this boy had done thirteen trillion years ago or more. You got the idea? You occasionally run into this. So, you've been trying to buck

these things for a long time. Of course, in several thousand of them there's maybe one half of one GPM chewed up, so this doesn't compose much of a problem but you can run into them.

So people have been at it and trying to do things about these things for a long time. They haven't gotten any place, they've gotten themselves stuck in trying to list something without a meter and without auditing discipline and without knowing the pattern, and so forth. They just pull in a lot of end words on themselves and they've been unhappy ever since. The most recent incident I know of was about 139 years ago, sitting on the side of Mount Per-nasus, cussin' these dam things. Messed them all up, pulled them all out of sequence, just cus-sin' them. Finally saw that there were these masses so I couldn't see the escape from the masses, so I couldn't properly exteriorize. I started cussin' them.

You'll find out this sort of thing has occurred. A person, of course, gets into this state. He doesn't know what these are, he doesn't know what they're all about. He doesn't know what they're composed of and he's already been bit two or three times when he's collided with these things so he doesn't want to know too much about them. Well, he has to know them dead right before they are completely painless and safe to live with. You have to go the whole road to truth.

Now, they are very, very simple in essence, the whole pattern is extremely simple. I can tell you in a very brief space of time. I'll write it down here. A Root word... let's, let's, let's be happy about the thing, the end word, although it sometimes doesn't sound very normal, is always a noun and a root word is always a verb of some kind or another. So, we've got something like this. We've got a complete GPM and this is what you know as own goal and that sort of thing. Let's go over this. And, it's "to eat cats." Let's, let's get this now. To Eat Cats. We notice here that we are on the end of this thing – cats – and that is an end word, and because that is an end word, there are going to be 268, or thereabouts, GPMs all ending in Cats in a row. You may not be at the beginning of it, you may not be at the end of it but you know that they're all in a row. There's 268 root words which end in cats and they're all consecutive and in sequence, see. We got, to eat cats – to dine on cats, you see – to consume cats – to digest cats, it'll probably be your next type of thing. Just a tiny bit of shift, you see, goes from eat to digest, and there's gonna be three like to digest cats, you see.

But they're all gonna be cats, cats, cats, cats and it's gonna be out there for 268 GPMs. Now a GPM consists of 18 RIs. Those RIs in 2 rows of 9 in each row and they begin with the goal as an RI at the bottom and they run on to the top. And I'm not gonna bother to tell you the line plot right now, but the line plot is posted in the theory room. 18 RIs in this line plot and one of the main difficulties you get into, is the line plot is itself and the end words are themselves and the root words are themselves and they don't much cross. So, if you had in the line plot "edible cats," which we don't have, you see, but if you had in the basic line plot "edible (blanks)," see, you would then get, "to eat cats" would read as a goal, because it reads off the line plot as a lock.

But it would check out as a lock if you're smart and clever and work hard and ask several times. Most of the reasons you fail to check is you – you fail on checking, you don't ask the second time, you don't ask what it is and you don't ask where it is. Ask if you've missed anything – you don't add that to your checkouts and that's when you miss on a checkout and

then you find out there's four hundred and sixty-five dozen reasons why you shouldn't have run that GPM that you were busy running, but you, you just didn't ask the question. So, of course, now the pc's in trouble and so forth. It wasn't consecutive, it was improperly worded.

"Is this an actual goal?", you ask; you get a read. Well if you get a read once, the pc might have just breathed, you see, hard or he might have had a heat wave hitting at that particular moment, or something like that. So, one read, oh puff. One read, phooey. You don't buy anything on one read. The question is, can you make it read again. Then you say, "Is this a correctly worded actual GPM?" Sometimes you got some knuckle-headed pc that insists, well you found out once, why should you be asking again. You find out that all of your repeat questions, and so forth, are being suppressed. So, you just have to handle that as an auditing problem. He's got duplication, or something like that, stuck as an end word. Don't you see? He doesn't want any duplication in his vicinity.

So, what's this, what's this cats? That's a... an end word, that's an end word. There are approximately, apparently, 268 of these things and they go plus-minus. And it would be something like – cats and catlessnesses – or something like that, see, or it would be something opposite to cats. We don't much care what's opposite to cats. It's what is opposite to cats that would appear on the end plot. But it's something that's definitely opposed – not, not dogs, you understand. Dogs as a beingness is opposed to cats. No, this is, this is the end word. But it would be an absence of cats. Don't you see? The end word isn't "an absence of cats," but that's what the end word would mean and you would express something like – catlessness – or something, you see. It's the opposite and... but what makes it difficult, is that it's only the end words which go positive-negative and that gets very confusing and that's very upsetting, but they go plus-minus in groups.

Now if you have something to do with positions or locations, and so forth, this just runs on endlessly. You've got all kinds of pluses and minuses with regard to, to positions and locations. And since the most assessable, accessible end words that you will collide with on a pc, the most... the best end words you collide with on a pc, are according to what I've seen anyway, is HERE. H-E-R-E – not plural, but H-E-R-E – and that, of course, has just above it – THERE – which is the opposite to HERE. Don't you see? And those are your pair of actuals, and go this way.

Now, there's these 268 of these end words and they go to the middle of track and then the sequence of plus and minus reverses on the word – NOW – which is in the middle of track. Here's the beginning of track, up this end, if you wanna have this end. It's at this end, and NOW is in the middle of the track and the PRESENT is at the furthest end of the track. Now the present just beyond it has the ABSENT. That makes life more interesting. You'd never find anything. HERE has several more toward PT but they all have to do with this kind of thing, you see. Most of them do... have to do with this kind of thing, they're plus and minus. But, what I'm trying to show you is, that the middle of track of NOW has got an earlier on one side and a later on the other side of it, so it's actually used twice as a positive, which switches the order, which switches the order of positive-negative. So that BEFORE pair to this NOW, the earlier half of the end word series. Just don't consider anything but this end word, see.

The earlier half of this end word series has the negative further away from the top of the bank. The negative is further away from the top of the bank, and the positive is nearer the top of the bank, by one, you see. But the NOW, up here to here, the negative... this causes tremendous grief, that's why I didn't find it at first... the negative is closer to the top of the bank than the positive. The positive is further away from the top of the bank. You understand? In other words, they do a switch because the center end word uses a double. It's double used positive. NOW, you see, has two negatives. So, if you work that out, you'll see that's very simple, that's very simple if you just write down plus as the middle of the track and then minus closer to PT and then a minus further from PT and then alternate pluses and minuses both directions. Then you'll find out that, of course, the first half of the track is opposite the other half of the track as far as the plus-minuses are concerned. You got that? Alright!

That is the way the end words lie and what's difficult about it, particularly difficult about it, is the fact that the track is really basically circular. But, you'll find out that there is a thing which answers up to being the top of the bank and you can get the pc into a lot of trouble if you run the "quote" beginning of the bank before you run this end of the bank. You understand me now? But there really isn't any. You got it? For some particular reason when time was finally plowed into it, and so forth, why HERE operates as top, or first thing to run. NOW, of course, operates as the middle of the bank. Something you won't get to until you're half done, and the PRESENT is the last thing you will run out. And, of course, those three things tend to lock up on each other which keep the bank with you all the time. Adroit, isn't it? And, of course, you don't find these negatives because of the obvious. See, you found HERE so, of course, you don't have THERE, see. Then you get things like EVERYWHERE and ELSEWHERE, see. That's another pair. So, it's pretty hard to navigate through these end words if you don't know the pattern.

But that is the pattern of these end words and it's – it's pretty easy to do. It's a positive-negative proposition. There is no numerical repeats. It doesn't go twenty-one earlier as the negative, or so forth, that trick isn't there. It's just... it's common just as I've given it to you. It's rather ordinary. You could sketch it out on a piece of paper. There's just middle of the track and the negative on each side of that plus word, comes on out to the ends and, of course, there's half of 268 end words this way from NOW and half of them the other way from NOW. So, it's elementary. Then they they tend to curve around and lock up and it makes the track look truncated at Goals because Goals, that's the big obsessive one, see. And it makes the track look truncated at that point, and the track will answer up as truncated and is runnable at that point but it isn't necessary to run it that way, see.

It doesn't really matter a cotton pickin', confounded, doggone where you run any of this as long as you don't run it blind. In other words you say, "We're running the fifteenth end word in sequence from the top of the bank" and telling the pc that it *is* the top of the bank will turn on a somatic because you've misplaced it. Don't you see? Because that restimulates placement and you get the somatic from placement. Don't you see? But if you just sawed into it and then you found out how many end words there were above it, and you said, "Well, we're running the fifteenth end word", the pc would say, "Alright" and you go on and run it and you do run it. You got the idea? It's nice to run it all in order but if you can't run it all in

order, don't run it blind. Know what you're missing, see. Know what you're missing in order to run it.

So anyway, the net gain of that is, that is the pattern of the end words and then these are the root words – TO EAT – EAT here we call the second word, just for lack of something because it's needed in the line plot as the second word, and the TO is just gratuitous, but TO EAT, you see, TO EAT is the root, what we call the root. And we did say root word. Who cares whether we use "word" or not, see. That's the root and there's 268 of these roots and you get one end word, it's got 268 roots. *Pocketa-pocketa-pocketa-pocketa*, 268 roots. And they all go in the same order and they have the same sequence of roots and they're in the same consecutive order for every end word. So if you've got CATS, you got these same 268 words for CATS. If you've got DOGS it's the same 268 words in that same exact order for dogs, don't you see.

This makes all kinds of interesting mathematical computations and so forth. You can take any random end word almost and add these root words to it and it sounds very, very significant indeed. You see that? So, there's always this same sequence of roots. Always the same, and that is the same 268, see. The only thing that changes then in essence – a series is this 268 roots with one end word, and the only thing that really changes in GPMs then, since the line plot is the same for every GPM, all 23,000 plus, or whatever the figure is, well, the only thing that ever changes in the GPM is the end word, and that only changes every 268 roots. So, it's a sort of slow freight, see, slow shift.

Now, the line plot is the independent items which fit TO EAT CATS. Now we've gotten it down to TO EAT CATS and that itself is a little bunch of mass and significance which is composed of 18 separate items, two columns of 9 each which are in opposition to each other and bring each other about. And those 18 items, each one ALWAYS has the same form and it changes just with the goal you are using. So if you had – just as a – an incorrect example, but nevertheless an example of it, you have EDIBLE BLANKS, see, why in the line plot, why this simply transposes into EDIBLE CATS. If you had an end word, ELSEWHERE, it would be EDIBLE ELSEWHERE'S. It would become plural if it's not already plural as an end word. The plurals are all taken care of in this. It's not difficult. So you have EDIBLE ELSEWHERE'S, see. And this line plot simply repeats in every one of the 23,000 GPMs.

It's just a substitution, you know, of what goal it does have itself and it's always the same, and it's always in the same sequence, and it always comes together that way, and it brings each other about, and locks each other in. And that line plot is so composed as to lock together GPM A and GPM B. In other words, GPM B is expressed in GPM A's bottom pair and in GPM B the bottom items of GPM A are expressed in it's top pair. In other words, these are nicely intermingling.

So we have an item at the top and an item at the bottom which directly refer to the adjacent GPM, see. So that's what keeps it, keeps it gripped together, see. And then those end words in sequence, they don't really grip together beyond shutting off from one and getting the idea, the next one and approaching it, and that's where they grip together. It's a sort of travel thing, see. A guy decides for GPM after GPM, "well we're gonna leave here now, we're gonna shove off, we're gonna skip it, we're gonna get out of here, we're gonna depart; yeah, I

better, I better, I better scam", and so forth and then eventually, magnitudinously thinks of the next one and it's first GPMs are just getting the idea there might be another one and considering this for a while and pondering and looking at it for a while, and deciding he would do something toward it and then approaching it and then getting near it and then eventually walking around, and arriving at it. You get the idea? And eventually he's there and there might be some trick interlocked between them, but... I wouldn't rule it out totally, but I haven't found one. I've just found these two adjacent GPMs go smoothly together. That is entirely, the total pattern of the bank. There is nothing more in the reactive bank than that.

These things run by the discipline of Scientology and you have to take very good care of the baker because the baker's making all this, and you never have to run out 23,000 GPMs for the excellent reason, sooner or later he's going to cognite he's doing it, and that's the end of it.

He can give you a false cognition that he's doing it and still have his head knocked off by the masses. He can sit back and decide to decide he's doing it, you see, so therefore, it'll all go away. Won't do him any good. It happens when it happens, not before. And actually it's a pretty long, gruesome, arduous run and it's run today by platen. It can be run easily by platen. Nothing to it. Just cut pieces of cardboard with the pattern of the GPM written on the tops of the cardboard and just fill in one word. Cut them out with a razor blade. And a platen is an L-shaped hole. Nine L-shaped holes in series, with the... your bottom part of the hole is what you write your data in. You just put them on an 8 x 13 sheet of paper and you don't even have to write all items. You go *pocketa-pocketa-pocketa*. When you first start in, you better write out the items.

But there's the, there's the whole composition of the track, there's the GPM, the auditing technology which runs it. It's very, very smooth auditing and draws it to an exact drain of charge of each one of these things in turn and the charge goes away very fast. Usually in one or two big reads and you position it one way or the other and eventually, why, you get in your X step. It's very rapid and frankly, running with a platen and so forth, you can dispense with one of these things about one a minute. If you got up to one a minute, and so forth, that's 23,000 minutes to OT, at the absolute outside because you never get to the 23,000 minutes. Sooner or later the guy's gonna say, well the hell with that, I'm making it all up. At that point he's gotta fly out of his body and straighten up the auditing room chairs by taking him out of his state.

But don't let anybody get away with the idea, "Well I realize I'm causing all these... caught, caught... things and..." you'll see that, by the way, that'll be very frequent. I know, I know people. So anyhow. Know them and love them, live with them, and straighten them out for the various reasons, but they do have their foibles, and they will crowd it [garbled]. They will push it, they will get anxious.

Alright! And that is the total composition of the bank. And there isn't anything else in the bank that you need to worry about because there isn't anything else in the bank because all engrams, locks, secondaries, and this is why we don't run them, implants and all other such bric-a-bracs, theta traps, all the rest of these things. Of course, they're all sitting as locks on

the GPMs. Now you say, well we can expect to go on and find the GPMs, they're sitting on locks someplace. Yes, they're sitting... they're all locks, on a thing called a thetan.

Thank you very much.

ORGANIZATIONAL OPERATION

A lecture given on 15 July 1964

Thank you.

See, I didn't even propitiate you by starting it early today. That's what's known as being strong willed.

What's the date?

Audience: 15th of July.

Fifteenth of July AD 14, Saint Hill Special Briefing Course and a lecture on Wednesday. And that's partially because I have an appointment tomorrow afternoon and partially because I want you to hear yesterday's tape again before you're examined on it. And before you hear that tape tomorrow afternoon, particularly people who have just started on this, you understand, you go get that glossary bulletin and tomorrow afternoon, why, you burn some time on that glossary of Class VI terms so that there's no slightest quibble in your head about what these various words mean. Got it? And burn that, and then you'll find mysteriously that the lecture emerges clean and clear and isn't confusing at all. You already got enough in lecturing on that material in terms of restimulation not to add, you see, the other liabilities that could be connected with it, do you see? So, get your – get your nomenclature down before you rehear that tape.

All right. That's besides the point. I haven't anything to talk to you about today. I don't know why I had a Wednesday lecture. There isn't anything to talk about anyhow.

There were some things one could talk about offhand that I've been dealing with lately which are somewhat amusing; and amongst them is organizational operation and has to do with personnel operation and it has to do with a lot of things of that particular lineup. And it also has to do with the fact that you as a Scientologist very often find yourself in the sphere and realm of business activities and promotions. Whether you like it or not, your practice very often carries you into this perimeter.

Now, along at the Level of I, advice – and particularly the Level 0 – advice is part and parcel of your stock in trade. Now you say don't evaluate for the preclear. Who's a preclear? You understand? Who's a preclear? Now, your perimeter of action goes out wider than simply sitting down and processing somebody. And if you go on and think of a Scientologist as somebody who only audits, then you have a very limited view of Scientology. Scientology is the science of life, and life is composed of lots of factors. And amongst these factors are the economic woof and warp which makes the trap and cage that keeps civilizations interiorized into themselves. Amongst these various factors of life are the other dynamic relationships besides the first. There are, after all, eight dynamics.

Now, we take one individual and he is being processed and we tell him what to think about a process – of course, we've had it. That's evaluation. But advice is not evaluation – I mean, it's not auditing evaluation. Now, because that is part of your auditing discipline, you very probably eschew it when you get into the other perimeters. But it's very difficult to audit a group and it's very difficult to audit mankind.

Now, the best way to approach the problem, of course, is the auditing of individuals, because a group is simply a collection of individuals and the basic building block of a group, as the communist and socialist has totally overlooked, is the individual. There is no such thing as "the masses." The reason they go in for the masses – it's a GPM end word. It doesn't mean people at all. It means MEST, so they make that exact mistake and they say then people are MEST because they go in for the masses, don't you see? Very simple how they make this particular mistake.

But there are eight dynamics. There are definitely eight dynamics and when you move off the first dynamic with regard to the pc – his eight dynamics now, you see – when you move off that first dynamic with regard to the pc, you're into the remaining dynamics. And, of course, second dynamic isn't just sex. That's the creation of forms, bodies, that sort of thing and that includes the family. And you will find the roughest, roughest, roughest points in interpersonal relationships between this fellow's first dynamic and other, and so forth, that occurs in the second dynamic.

A person can be ripped to pieces very easily because it's so intimate to the first dynamic, you see. The second dynamic is very close there and it's not close simply because it is – been named number two. It is – it is very close.

Now, of course, the next thing adjacent to the individual beyond that is the group. The individual joins a group and you have a group as something which is a collection of individuals. Now, this collection of individuals is again a more stressful thing than the remaining dynamics, once more, closer – and the loyalty to a group, the conflict of this group with other groups... In this you have, of course, business, you have social activities which are of much less importance to the individual in this particular type of society, or even in a socialist society, than business.

In fact, the toughest dynamic to have anything to do with in Russia today is the business third dynamic and that's because their basic premise is – is: "There ain't no business know-how because you can't make a profit, you bum." That's their, I think, their more educated view of the subject. They're a bunch of people that haven't even got their shoes on with regard to this sort of thing. See, they're all running around barefoot on the tacks.

So, they found out that some of their tractor factory boys were trying to expedite à la Henry J. Kaiser. Well, of course these birds had to expedite for the excellent reason that they would be shot up against a wall or something of the sort if they didn't meet their quota of tractors. So, they knew which side their vodka was going to be pouring in on and they promptly – and which way their lifeblood was going to be pouring out of – so they probably got ahold of some Horatio Alger, Jr., textbook or something on the subject, and they heard of expediting. And they said, "Gee, that's a good idea – expediting." The way you expedite is to pay a bonus or give a favor for getting the stuff you want in order to run the place.

They thought this was a marvelous idea – in other words, the introduction of the reward system which is unheard of. You're not supposed to get any rewards in the communist system. That's why it doesn't work, you see? They've – they've taken 50 percent of Pavlov. If you ring the bell and beat the dog, why, that's as far as they got in the textbook. If they'd gone down the rest of the paragraph they'd found out that you also had to feed the dog to train him to the other half of the reaction. And that's not missing in Pavlov but it's missing in their handling of people, see? The reward factor.

For instance, they can't get anybody to produce in Cuba. Well, everybody's trying to produce in Cuba just for one reason – they're going to get shot if they don't produce. You know, viva the state, you see? And therefore they're supposed to produce. These thoughts just don't even go together, see? The state is commonly thought of by somebody as a nonproduction type unit to such an extent that a government, trying to produce something – it can spend more money trying to produce something it could have bought at Woolworth's... It's marvelous.

If General Motors or somebody exclusively was producing the space program, for instance, you'd find out it would fit well within their automotive manufacturing budget and nobody would ever hear about it. But the government get ahold of it, see, wow, see. One rocket – one rocket, oh, man, that's – huh – oh, that'll be a 100 million dollars, that's per rocket, you know? It's typical, see?

So, people don't think easily in terms of government and production, see? But in these socialist, communist states they've got these two factors jammed together. And then they've neglected the other half of Pavlov: the reward system.

Now, the dog – the dog trained and reacted the way he was because when you showed him a circle and gave him food, he's being rewarded for seeing a circle, see? And he could only be driven crazy because he was being rewarded when he saw the circle. They think he was being driven crazy because he was punished when he saw the square. The way they were driving him psychotic – you know, they drive a dog psychotic. This was the high peak of Pavlovian act. They could actually create psychosis in a dog and have been doing it in Russia ever since.

And what they would do is show a dog a – this experiment's run both ways – but they'd show a dog a circle on a screen, a projected circle, you see, and give him some pork chops or something, you see, and he'd get all educated to the idea that when he saw a circle, he was going to be fed. And then they'd throw a square on the screen and beat him.

And the point I'm trying to make here is that the square finally equated to the dog, "I am now going to be beaten," see? And then they would continue to use these symbols in association and reduce the circle till it was more squarish, and make the square so that it was more circlish, and when these two things moved into a merger, then the dog couldn't tell whether he was going to be fed or going to be beaten and so he would go crazy. And he'd develop a real, first class psychosis. And of course, this destroyed his stable data – it gave him a stable data and then it destroyed it, see? And then it substituted the wrong stable data for each other, see, so that he couldn't then tell the difference and he got into a total identification of eating and being beaten and so he couldn't tell the difference, so he'd go screaming mad. And the dogs

would howl and scream and so forth and go nuts and have to have prefrontal lobotomies. That's the only effective treatment for psychosis, you know. That's the only effective one. It's just to cut out the brain because that's, of course, what people think with. Everybody knows that. Joke.

All right, now, look at – look at this. There's a reward factor there, see? Everybody adjudicated it on the basis – and the adjudication was that it was the – mostly beatings, you see? But there was a reward factor there.

And that reward factor, destruction of, was more contributive to the psychosis than the punishment. That's something that you – that because it's a softer, quieter thing, it is something that people overlook. It's the carrot. See. It's not a study in punishment – not a study in crime and punishment. It's a study of rewards. So that in Cuba, it's all very well to try Pavlovian... By the way, Pavlov was whistled up at the Kremlin by Stalin – this is not rumor I'm telling you; this is the truth – he was whistled up to the Kremlin by Stalin about 19 – , I don't know when it was, think about 28, and he was put in a room and (I hope it didn't have a bell in it and a square screen, but...) and he was told – I should say invited, I should be sarcastic about it and say invited – and to write everything he knew about dogs that could be applied to human beings. And he turned out about a 400 page manuscript which is – anybody knows – nobody has ever seen outside the Kremlin. And it is the textbook on which communism goes forward. Quite interesting, isn't it?

And so their love-hate cycles and a lot of things become immediately explained. You'll find out they'll go on a big pitch of love, love, love, you know, and how wonderful the United States is and how wonderful this outfit – "Oh, I love you all. We are going to write big treaties and let's all be buddies and have another drink of vodka," and then the next thing you know it, the calendar loses a few sheets and it's "Hate, hate, hate, kill them. You mustn't do this; you must take your U-2 planes out of our soup and..." you know? "And we hate you and you ought to all go die and you're capitalists and warmongers," and so forth and then a few more pages of the calendar falls off and so forth and it's "Love, love, love – we love you," and so on.

And of course, the type of fairy that they employ in the State Department, of course, is completely unable to cope with either love or hate and he, of course, has never figured it out. It's in any textbook of anybody who knows anything about communism. But he never figured it out. So he always falls for the love cycles and resists the hate cycles, you see? Proper thing to do is just to start a love cycle, you see, when they start a hate cycle and drive them nuts. See, they'd go mad. They wouldn't know what to do. A handleable situation on the third dynamic – all you'd have to know is their textbook.

You had to know what they're trying to do and then reverse the effect and of course then you could create an effect on it and the West wouldn't be backing up and losing wars. And for a long time, you know, I expected the North Korean flag to be flying over the White House. After all, there were half a dozen soldiers there and they could all shoot guns and seemed like at any moment they were going to effect a landing on the western coast and march on the White House. At least that's the thing it looked. Here was the most powerfully

armed nation on Earth, you see, being backed up by a few rifles, you know? That was the silliest thing anybody ever saw.

Well, how was such a thing as that engineered? Well, it's engineered by psychological warfare. It's engineered by mental tricks of one kind or another. They had everybody hypnotized into believing that they could fly bombers out of Chinese and Manchurian bases and bomb South Korea but nobody must touch that, and Truman was so hypnotized into believing this... It was just propaganda, you see? Wasn't any reason why anybody couldn't do it. Nobody would have gone to war. China was in no state to go to war with anybody. MacArthur said, "I've got to be able to attack those bases," so Truman sacked him instantly. You want to know the power of the mind and power of propaganda – here was the president of the United States busily fighting the war for Russia, see? That's the way wars are fought. They are fought mentally these days. Of course, a war isn't a war at all anymore. It'd be a twenty minute *sfugh*, see? So, nobody can fight a war so this only leaves the significance.

Now, you see there are two things – there are two things in a GPM that give you trouble, and naturally you can say, well, one of these things is a product of the other thing, it's just an idea of it and all this sort of thing. You can rationalize it out of existence if you want to. But the truth of the matter is that they do exist and you do experience them, and that's significance and mass. And when a person is driven out of mass he has to go into significance. This is your figure-figure type, see? He can never do anything or handle anything, touch anything or reach anything, but boy can he think. He thinks himself in lots of triangles and squares and battle royals, you see? This is – who was the character that was always so very, very timid but yet was going around dreaming up – some comic strip character...

Audience: Walter Mitty.

Hm?

Audience: Walter Mitty.

Aw yeah, Mitty. That's the boy. And this is a Mitty, you know. He can figure-figure and dream-dream, you know, but – and so on. He has a ball. But if you ever had put a – well, actually – a lit firecracker in his hand, even a small one, you see, why, he would have turned gray overnight, you know? Well, he's fallen away from mass and force and he only has one refuge – idea. Now, they actually go – he has the refuge of ideas, don't you see. That's called an unbalanced character. He's all ideas and no do. He can think, yes. See. But do, no. See, he can't handle mass.

Now, there's the other side of the thing which is equally unbalanced and people think that this is the only side there is, and that is that a person is very beefy and very brawny, but can't think, you know? And we hear of this character all the time. The football hero who can't pass any of his subjects, you know? And I know of one. I saw him come in here one time. He was bringing to me – in a new organ, a new Wurlitzer. And he carried it in the front door, and Bonwick was – Bonwick was sort of tagging along behind not carrying very much weight and this boy just packed this Wurlitzer organ in through the front door. He never even cracked or damaged – he set it down very easily and gently, don't you see? Very, very interesting. And he's a little bit on the dull side.

So, you very often see this but it is not necessarily the case, you see. That is not necessarily – because somebody can handle mass well does not mean he can't think. But you do see it overbalanced occasionally that the individual handles mass very well, and so forth, and yet can't think at all. So you see, these two factors of mass and significance do go together in the field of the mind and can become overbalanced so that a person can only think but can't handle mass or a person can only handle mass and can't think. And there is no reason why a person can't handle mass and can think, see? That's the ideal combination. You very often find this one to be the case.

Similarly, an occupational activity where an individual is only handling mass and doesn't have to think will bring him to a point where he has a little difficulty thinking. You see, you could occupationally move yourself into this perimeter, too. And the sedentary worker who does nothing but think eventually gets to believe that he can't have much to do with mass and mustn't handle mass, don't you see?

So, he can sort of professionally move himself into these things, not only by aberration but by practice and activity, see? He can sort of live that way. He's saying all the time, "Well, I have to sit up here in the office and do all these contracts so the workmen will have something to move. And there they are down there running those Caterpillars and big earth movers, and so forth, and I've got to keep those things moving and I sit up here in the office..." And eventually he'll get the idea that he mustn't. Well, actually, he really – if he was going to keep the business running – he really couldn't go down there and also run those earth movers and so forth from the seats, you see? That would be too much of a split of attention; and that is the limitations of the society in which we live.

It's a doozy of a society for making you concentrate and specialize in something. Which means that it gives you an awful lot of things that it tells you you mustn't confront. And basically it is only telling yourself that there are certain things you mustn't handle and confront that moves you into any groove and lets you find yourself up some blind alley someplace.

Now, getting back to what we were talking about, in Cuba there, all they'd have to do is tell all the Cubans – all the Cuban guys, you see – that if they met their quotas, they'd all get a brand-new pair of high-heeled shoes or a wild-colored sport shirt and tell the girls they'd have a good-looking dress if they met their quota, see? All of a sudden they'd have production; because there's the reward side of the system, you see. See, the reward side of the system is actually more workable and functional than the punishment side of the system. Now, punishment, if it's strenuous enough and tough enough and certain enough, can occasionally seem to accomplish something.

I think a classic example that always sticks in my mind, when I looked at the Citadel de Christophe of Cap Haitien in Haiti and that thing was built over a period of years by Christophe, the great emperor of Haiti – and he was a tough boy. And they couldn't move a stone up the hill. There'd be a hundred man standing there – this is a fantastic structure; it's in the very best French siege-craft tradition, and so forth. He surrendered. It's still full of powder and shot, by the way, and he surrendered it. He merely became dispirited. And he went up there; he was feeling kind of bad and he was retreating before the oncoming forces, don't you

see, and he just sort of said, "Well, I can't hold out; the hell with it." The whole place full of powder and shot and he just threw in his chips.

It didn't matter how many stones had been put up there. It was, after all, the attitude of the man which surrendered the place, not the assault, and he didn't think it was worthwhile to go on living. He felt there was no reward in living anymore so he surrendered the whole citadel. He just gave it up, that's it. Blew his brains out and that was the end of it.

That was a very impressive structure and his method of building that is a classic. He'd have a hundred men trying to move one of these heavy stones up the hill and they couldn't move it, so he'd turn around to his guards and he'd say, "Shoot every tenth man." And they would. And he'd tell the remaining ninety, "Move that stone up the hill." And they would. See? Enough punishment, enough threat and so forth.

But then this has what? This is denying the person the reward of having a body and going on living and breathing. So, it's again not punishment but the denial of a reward. See, when you get it right down to that fundamental, it's the denial of life. You're not going to take life away from him; you're just going to deny him the rewards that life give him, whatever rewards they are.

And it's very funny that a slave or something like this will still hang on to life. He'll still go on living up to a point – under duress and so forth. But he's being rewarded to some degree all the time.

When the individual is no longer rewarded and when the individual is not in any way handled from a standpoint of reward and there's no reward figured into the setup of his existence, because if he's not getting anything out of it – an Americanization of this approach and that's a very crude materialistic, because rewards are many things, see – but if he wasn't getting anything out of it, why, he wouldn't play that game, see?

Now, that's a crude materialistic rendition of this which more or less gets this idea into trouble. The truth of the matter is there are many rewards and so on. There's the – just the satisfaction of having done your job okay, you see? That's a reward. It doesn't have to have somebody come up... Now unions and that sort of thing go on the basis that reward is totally and only a paycheck, so they're raising hob with the societies at this particular time, you see, on reward of a paycheck.

I could get seven strikes started for every one they've got started right now using the same principles I'm talking about now in reverse. I would show them how there were certain things, rewards, which they probably could obtain from the work of being postman and postal workers which they were not obtaining. I could think of a brand-new series of rewards, you see, because I'm dealing with a basic equation, not how many bucks they got and what's the cost of living and how many pounds, shillings and pence this all amounts to. No, let's go on it on a fundamental. Let's say the reward is the thing which they're – the line which they would most easily travel. All right, very good.

Let's figure out some reasons for postmen to strike using it reverse. We'd wind up with some very interesting answers. We'd get such things as, well, large business houses and so forth aren't sufficiently respectful to the postman and they never thank him for the mail. See?

So, you could – you could actually – let's put it – let's put this on this little, tiny basis. Now, you'd be surprised what a stir that would make amongst postmen.

I mean let's just take it to an almost ridiculous tininess, you see, and insist that part of their conditions of work and so forth, that they only delivered mail to people who thanked them for bringing it. You'd be surprised how many guys would sort of go overboard sideways for you on that one, see? Had nothing to do with pay; had nothing to do with anything, you see? All right, now let's just start adding to that and add some sensible ones, you see; add some sensible ones and so forth. And let's have the post office authorities, and so forth, providing better looking uniforms, easily carried packs, don't you see, have them providing more status for the postmen, better working quarters – did you ever see the back end of one of these post offices? You could start adding this up, don't you see, on the basis of status – this is the way you'd figure it out, you see – status, and respect, you see, and acknowledgment. You start figuring it out in these particular directions and so forth, you got a ball now.

Postmen will walk around, drive around and so forth – shouldn't be working six days a week. They should go on different types of shifts. And you would find, however, that it isn't necessarily true that all strikes must occur on the basis of more pay and less work.

Now, I could as easily get a strike started on these bases for not being permitted to work enough, see? It's actually a dirty trick to play on a bunch of workmen – the idea that they are being overworked – because that's the sympathy line and that would be a very, very bad thing to pull on a group of workmen because it's a no-confront. Now, let's see where this no-confront leads.

You say this is a very wandering sort of lecture I'm giving you. No, I'm not. I've taken you up as far as the third dynamic. Well, people don't get much further.

You, someday, will get further up into the fourth – the fourth versus another fourth. Well, you say, "Yeah, this planet is the fourth dynamic – all men on this planet, that's the fourth dynamic." Yes, that's what I said, too, see. So, fourth versus a fourth. You, as operating as a Scientologist, you're going to see this. What's going to happen? What's going to happen when one race of beings comes in collision with another race of beings? I'm not trying to go space opera on you; I'm just being sensible about this, I mean... Well, you say, "Well there must be some kind of an idea here where we're dropping back into groups." No, because culture would be so different – even body form, communication factors, technology, beliefs, ideas of what they should be doing and what was right and what was wrong and what was moral and immoral – would be so wildly different that you wouldn't even have a man, you see? He might even have a man's shape but he wouldn't be a man.

If you were to listen to a rocket jockey's morals and what's right and what's wrong for a rocket jockey from some other civilization, and listen to this for a while, your hair would stand on end. Now, we compare this to an airline pilot's ideas of what's right and what's wrong on this planet, and we've got two widely, screamingly different approaches. We've got two cultures here. See, they're entirely different. What are the rights of one; what's the rights of the other? In other words, we've got too great a disparity.

And we get up into the fifth dynamic, we've got the plant world and I don't notice the plant world talking to man very much. Man sometimes talks to it, but it doesn't say much. And animals have very little to say and so forth. They aren't allowed to vote.

Now we get up into the sixth dynamic and we have MEST and it doesn't talk at all. It never has anything to say. Some people hear voices coming out of it occasionally, but it really, in actual fact, hasn't got anything to say for itself. If you melt it up and put it in a crucible, why, it sizzles but it doesn't say "no," you see. Its resistances are plotted in terms of retaining its form or refusing to attain a form or refusing to condense or expand. It's just the resistances, don't you see?

Now, we get up into the seventh, as far as man is concerned today, he is so out of communication even with himself on the seventh dynamic that we frankly don't have to worry about that one at all in our present coverage.

And when we go into the idea of supreme beings or gods or big thetans or something like that, well, we've just taken the whole curve all the way around and the only thing we've got on this planet today is just pure nuttiness on this subject, see – the theory of the big thetan, see. Actually, the big thetan theory is simply one of the GPMs and it – there's end words that have to do with gods and things like this, you see. And there's one of the root words – several of the root words – have to do with worship and so forth and it's just goofiness, see? There isn't anybody – there isn't anybody, any big thetan around who's permeating everything, that just because you say, "Now, please give me cake and ice cream for my supper tonight," is going to suddenly go into a brown study and wonder how to get you cake and ice cream tonight, see. There just is no such being.

And if you're in trouble, you'd better not go out and think that some big thetan someplace is going to be interested, even if he existed, in some ant who couldn't bother – if he couldn't get his antennae out of a crack of a rock. Believe me, he isn't going to give a second's thought to this. It would scare you within – to gray hairs if he did; all of a sudden huge hand scoops out of somewhere and... Probably you'd die from shock if it occurred. [laughter] Plot it yourself on your own attitude toward insects. You sometimes help an insect but mostly it's sort of amusing and – usually the devil with it.

And you get into this idea of the big thetan and all that sort of thing. You're not into the field of religion; you're just into the field of the GPMs again. That doesn't mean that there couldn't be big thetans. That doesn't mean that there couldn't be godlike beings. But let me assure you, that man's idea of them is so laughable as to cause you to roll on the floor for a half an hour and hold in your sides.

I think one of the best commentaries on this – Mark Twain did some very interesting commentaries on it – and I think Ingersoll was the great atheist. He had a lot to say about it. The only thing I find very amusing about Mark Twain – the second that you begin to read about god and holiness, you're just reading one of the longest parades of end words and root words I think I have ever laid my eyes on. His essays on this subject are just absolutely planted. If they're just – they just run consecutively, you see – end word, end word, end word, root words, root words, root words, end words, you see? And gets quite interesting because he must have been keyed in like crazy on that particular subject. He was mostly mad at it and

making fun of it. He wasn't taking really a very rational view of it. Some of the things he had to say were quite amusing.

But it... the people say, "Well, Ron is against God." No, Ron is against people making a fool out of God, if God exists. I think if there's any god around who single-handedly built this universe, he's probably so plowed into it by this time that it's probably it's him that needs help, not us. [laughter] And you could find – you could probably found a whole church on the basis of "help God, he needs your help," you know?

But you see how interiorized people are on this particular dynamic or scope of action which is the superior life being, you see, is all that it's the dynamic of. And there are always going to be superior life beings around so that it is a dynamic and a definite dynamic, and it's been muddied up by GPMs, but it's definitely there, don't you see? There is something there, but it's simply in a psychotic state. Look how interiorized it is if everybody thinks *it* is going to help *them*. They say God, well therefore they worship it – it's somehow or other going to do something for them, and so forth.

Well, I want to show you the common denominator all the way up the line on all of this is simply understanding and communication. And where you run into difficulty – where you run into difficulty on any dynamic including the first difficulty of the first dynamic, which is the inability to know self, you see, from that period right on up dynamic after dynamic, the only reason you have trouble inside a dynamic, or one dynamic with another dynamic, is communication factor, and the less communication is feasible the more trouble you actually would have in doing something with it, not necessarily the more trouble you would have with it, because it might be so out of communication, you're unaware of it. But the breakdown is in the field of communication and then once communication has been established – understanding.

Now, the rocket jockey from some other technology appearing here, if he could speak our language, compared with what an airline pilot here would think was right and wrong and what he should do about his job, even though he spoke English, this rocket jockey would not be understood by most. Do you see? He'd not be understood by most. He would say, "Well, the pilot of a plane is expendable." That's his first duty: to be expendable. And you'd say, "Well what's the matter, I thought he was supposed to protect the equipment." Oh, he wouldn't protect equipment. That's very cheap, see. And right away you'd sort of hang up. "Well, where does he get the idea that he's – that his first duty is to be expendable? Must be a very dangerous business and they've hypnotized him into believing something or other about it so there'd be any rocket jockeys at all." But you just... you understand, I'm not trying to give you an answer to that, I'm just trying to say you'd be figuring, you see. You would be in a non-comprehension even if you had the understand. See, you'd have the affinity and reality would therefore breakdown.

So, you have the English culture and the German culture. The language is different so they had basic difficulties in talking to each other, but even the slight difference of the cultures was such that even when they spoke the same language they still didn't understand each other well enough to do anything but go to war. And they periodically been going to war for a very long time. See. And they'll go to war again. Germans sitting over there saying, "We've

got to get them damned Englishers," and so forth, and... Sunday Times pictorial up here, it's stuck in 1914, man. Every few issues, why, here's this 1914-18 war cropping back up again, and so forth.

You go out and try to sell Germans to Englishmen and you're not going to make much progress. The only reason they're standing there politely is because the English believe that every man should have his say. This fools a lot of people. They believe this implicitly. It isn't necessarily true because he says it, but certainly every man should be permitted to say it and so forth. You can often get into trouble by interrupting an Englishman before he's finished talking. He thinks you're ungentlemanly. That is really more important than what's being discussed. That's right.

German doesn't operate that way. I'm just giving you the idea. The German's approach even to communication is entirely different. If a corporal in the army is three days superior in rank – you know, he got his corporalship three days before the next corporal – and he is speaking and the other corporal even looks like he's going to change his expression, see they just chop him to pieces. And if the junior corporal is talking, it doesn't matter where he has progressed to, the fact that he is the junior corporal makes him fair game to be cut off at once – loudly, harshly and instantly.

Whereas in England, you'd see the Lord of the Manor sitting there patiently, patiently, man, while the fifth gardener is telling him all about his marital affairs and how he is in trouble down in the cottage. So he'd just sit there and listen to it all the way through till the man is finished talking. He's liable now to say something rather rude and curt to him, but he has heard him. You understand?

The German superiority is the right not to hear. "I'm your superior so I don't have to listen to you." See?

All right. Let's take those two little things and look at the number of wars. The reason I don't throw America into that particular thing is because America is so muddled up with Germans and so muddled up with English, and so forth, that it is about as easy to trace the antecedents of – as one of these dogs you see running down the street of East Grinstead. [laughter] Can't do it, see. But you have two races here which are – have a definite similarity. They carry back to some degree. They're mixed, of course, in many ways. But they have developed different cultures and there have been a number of wars and they've been very savage wars. And they were all about nothing.

The British no more would have let – knocked off that war with Hitler than anything, see? They just wouldn't have knocked it out. The only thing Hitler wanted, as far as I can tell from the historical records, is try to knock the war off, see? He was holding up, holding up, holding up trying not to fight that war on this front. He was thinking, "Boy if I could just not fight this war I could lick the Russians," see. And he couldn't get anybody to listen to him. See. And the English on their side says, "Well, we have no idea whatsoever what the devil Hitler's trying to do, but we know one thing – Germans." See?

Now, the British didn't even feel bad about any of the various atrocities that Hitler was involved in. You try to trace why and there is no good reason. It's kept historians busy for a long time trying to figure out exactly what is the causes of this war. Well, that's why so many

words have been written on it. They're not isolatable, see, as little pinpoint causes of this, that, or the other thing. No, there's these basic causes of no communication and the basic causes of no understanding.

Of course, our sympathies in this, of course, go with the British. I fought by their side throughout that war and so forth, but I just – using these as two rather pure examples. And here they sit within a stone's throw of each other.

You don't drive a Jaguar very, very fast, see – you don't drive a Jaguar fast into the southeast. You find yourself almost instantly on a boat and you're almost instantly off the boat. There's not enough water there to get your feet very wet, and then, if you kept on driving that Jaguar for just a few minutes, see, you would find yourself in Germany. I mean, there is no distance involved. You could hitchhike it, you see? It's not the distance between Rhode Island and Delaware, see. There's no distance involved from here over to Germany and yet hardly anybody goes over to Germany. You think it's a long way away. It is not a long way away.

In a racing car, and so forth, Suzie and I had an awful hard time trying to get the brakes on. We did! We got the brakes on in time to stop in Germany, and so forth. We might have gone right on through into the Balkans, too, because these are all rather postage stamp. And we did insult the whole duchy of Luxembourg. It was touch and go for a few minutes one time down in Luxembourg whether or not we would be let out of the country or arrested on sight or something of the sort, because we'd insulted the whole Grand Duchy of Luxembourg at one fell swoop with – so much so that I even feel guilty sometimes listening to their Radio Luxembourg down there enjoying its program. I should write through and ask for a royal pardon or something. But I'd just gotten – I'd just gotten myself oriented in Luxembourg and I was stopped, see, and the guard – the guard asked me all about it and I started answering the questions about entering Luxembourg and he told me I was leaving Luxembourg and I wouldn't believe it because I hadn't gotten into Luxembourg yet, see? So, of course, he had a wonderful case staring him in the face of illegal entry. It must be illegal entry. The man doesn't even know he's leaving Luxembourg! [laughter] Very confusing.

Anyway, you look over this situation: what then causes, on each one of these dynamics, trouble? We're not wondering what causes them to be different dynamics, you see, but what causes – what causes the trouble. You've got dynamic one. What causes the dynamic one? Fellow's out of communication with himself and his own bank and can't understand himself. All right, that's trouble on unit one.

On unit two he's gotten all out of communic... I mean on dynamic two – on dynamic two he's gotten all out of communication with the second dynamic and he doesn't understand the second dynamic.

Third dynamic; He's gotten all out of communication on the – subject of the third dynamic and he doesn't understand the third dynamic.

On the fourth dynamic he's gotten all out of communication, very out of communication, with all other fourth dynamics. And he doesn't understand the point of where most people hearing me say something about it say, "Well, of course, he used to write science fiction, naturally." You know, they wouldn't even – here's this universe expanding to infinity as far as

everybody's concerned and man pronounces this idiocy that we are the only race and technology alive in it anywhere. You even read in the field of science fiction, how all life spread out from Earth. Oh, come off of it. I was so amused about this I once wrote – read a story about this marvelous civilization that these fellows were exploring and that they were mining, and so forth, and they were simply mining the liver of a worm in a larger apple, but the – just to sort of sneer at them, see, the vast importance of this civilization, you see. The highest peak of its space travel eventually was able to mine the liver of a worm in an apple in a larger civilization, see?

Now, no other fourth exists! Well, how out of communication can you get? You'll find the similar situation if you go out and look very hard today into some back desert some place or another. You're going to find some tribe some place or some bushman some place or some Pygmy some place or something like that who won't believe that any other races exist. They won't believe that such a thing exists as white men, and that you're telling them fancy stories because you say there are white men. They're liable to get very nasty to you when you insist you're just another race and not a god. They'll instantly put you on another dynamic like they put Columbus – much to their dismay eventually. Motors often act like gods but seldom are.

Now, you get into this and there's just a total breakdown on the subject of communication so, of course, there's no understanding even attempted on the subject. But we do have this little thread of science fiction literature that runs through the society that attempts it but it's mostly full of menace. And science fiction editors are to a point if an author sends them a story which has to do with invasion from the men from Mars, they will reject it instantly just because it is a story of an invasion. They're so tired of these stories, in other words, a cliché. It's no longer an original story.

We must assume that if there is another culture we would be at war with it. Hey, there's a wild assumption. If another culture existed we would be at war with it and they would be attacking us. Well, that's a wild stable datum to have. You haven't met the other culture. You don't know anything about their intentions at all. But the instant assumption is that it would be they're angry at you and ready to attack you and eat you all up. I think that's a fascinating point of no communication, see – they can't communicate with them at all – and no understanding and then also that no understanding would be necessary because, of course, we'd just fight them. These are interesting assumptions.

Now we get out into the fifth and you're talking to dogs and that's fairly easy. And dogs are often trying to talk to you and cats try to talk to you and you talk to cats, and people run off at the mouth most remarkably talking to animals. And animals do fine though as long as you talk to them. They expect you to communicate and they're very happy about it and they actually lack vocal chords more than they lack ideas to say back, see?

And Vixie out here, she's gotten up to a point of where she's trying hard to... I don't know where – she must have some... these Welsh dogs must have been unthinkably careless. She must have some cat in her ancestry, you know, because she purrs, little corgi dwarf, you know, and she purrs. She's gotten so she purrs. That's her effort to communicate with me, see. She doesn't purr to anybody else that I've ever listened to. Maybe she's doing it now, but she tries to purr. Sounds very funny to hear a dog purring. But she's picked up to the fact I talk to

her so she tries to talk back, don't you see, trying to make a communication. Well, there's a lot of understanding there, don't you see? So here is an understanding that really is not dependent on communication because the communication exists only in the crudest form of contact and awareness. It doesn't exist in the form of significance and meaning to amount to anything, you see? So understanding in that particular case can exist, you see?

Understanding can exist independent of the significant communication. That's an interesting thing. So you don't always have to have perfect communication, see, as long as you've got understanding. Your reality and affinity will go on right on up without the significance of the communication expressing itself at all and that continues on out through the fifth dynamic. And we automatically assume that certain things in the fifth dynamic and so forth – but we can look around and we can see them functioning between certain parts and kinds of men and the fifth dynamic, but if we look into the fifth dynamic we find out it internally is consistently and continually at war with itself. There's creepers up choking trees and there's wasps having a ball with caterpillars and there's warfare so there's not much mutual understanding inside the fifth dynamic.

And just because man can speak to the fifth dynamic often puts him into some odd state of high affinity – perfectly all right – of high affinity, don't you see – this isn't what makes it odd – high understanding, you see, high reality and so forth with regard to other parts of the fifth dynamic. Because you see, man has also made himself part of the fifth dynamic, and he has a feeling in this direction.

Every once in a while you'll notice some being or another who has gone completely overboard on this thing and they'll only talk about the gorgeousness of the birds and bees and how nice and sweet it is and how sweet everything is and how nice nature is and how beastly man is. This person must have rocks in his head. I don't have to hate nature because it's vicious but believe me it's not very theetie-weetie. All you have to do sometime is wound a shark in a pack of sharks and you're not watching very much. Just because this shark is bleeding even slightly causes him to be attacked by his own brother sharks, you see?

And nature can go completely daffy inside of one of its own little subdivisions on the fifth dynamic and can be intensely noncommunicative and nonunderstanding inside of one of those little subdivisions of the fifth dynamic. That's a pretty wild one. That's a wild one. You don't have to hate it for it. You don't have to be in awe because of it but you should have at least the sense to recognize what you're looking at.

You go out here and you see these beautiful vines. Well, here at Saint Hill, if I let these beautiful vines – when I first came here somebody had been talking about these beautiful vines just about long enough and they practically – well, if it had been left gone another three or four years this... I don't know what the totality of trees and so forth here are at Saint Hill, there are quite a few of them, and I'd say about 75 percent of them would have been dead if they'd been let go another three-four years. Somebody had been careless enough to let ivy grow around the trees and two or three of the big firs up here at the top of the hill, and so forth, are gone. But boy, that ivy. It isn't just parasitic and that sort of thing, it has murder in its eye, man. It grows big ropes of stuff and it goes right around in the exact method necessary to shut off all the circulation of a tree, you see? And the next thing you know it just chokes all

the circulation of the tree and the tree dies. Pretty! So, I guess somebody thought it was so pretty that they'd better not do anything about it or something of that sort. But it would have been the end of all the trees here.

You go around and you look at things like this in nature and you recognize that it is at war. Now, the scientist who then makes a whole total crash out of one philosophy – "The law of the tooth and claw, the law of the jungle is the only law which governs," so forth – ought to come around sometime or another and get off of his ivory tower and look out in the real world and find out that it isn't uniformly anything. See, it isn't uniformly bad, see? See, he could find – he could learn a lot if he'd just look. You'll find all sorts of wild things. You'll find that there are many assistive factors and there are many points of high communication between two different branches and high points of understanding.

You point to obvious ones – the scientists' remarks such as, I think, the hippos get their ticks picked off by tick birds or something like this and there's various things like this. And they say that's symbiosis and so forth. No, it isn't. I don't think hippos need ticks picked off particularly by tick birds – probably doesn't do them any harm at all. And they probably – I don't think probably tick birds are very efficient at it. I've seen various types of fish and so forth that clean the teeth of other fish and all kinds of things like this and I've noticed they very often don't do a good job, you know? You see, you got to look a little closer and you find out that it isn't all that practical. It must be something about a hippopotamus sort of finds life more interesting with tick birds crawling around on him, you know?

There isn't just that one crude reward. There's probably some other rewards involved. You find a lot of these things. You start looking for them; you find the rewards of livingness are many and they are picked up on various lines. But you get too concentrated on how bad it all is and, of course, there doesn't appear to be any reward of living and that's why people commit suicide when they commit suicide: there's no more reward to living. Not life is too dreadful to live; there's no reward in it anymore. And now they go on down to a point of where they add up all the punishment factors, too, and that's enough to tip it over and they could blow their brains out or something of this sort, don't you see? This is almost a secondary consideration – I assure you, almost a secondary consideration.

What men will go through to hang on to a body is so astonishing that I am very often gawping at the subject, see. Well, they'd go through modern medicine. Can I say more? Wildest stuff you ever had anything to do with. In the old days, it's much simpler; they said, well there's nothing we can do for it. And he kicked the bucket and goes and picks up another body, see? But what they'll go through today to go on living. Well, there's a reward in life; there's a reward in all of this.

Now, when we add this up as a Scientologist, we aren't just and solely and only in the field of processing. We're in the field of advice. We're in the field of looking over the situation on these various dynamics. We're looking over these various things. And what you're looking for – what you're looking for then is the reward and punishment balances. But that doesn't really lead you to an immediate conclusion for this reason: that you'll find it's as far out as the communication is out or – or the understanding is out. And you can treat these things as slightly separate. Some communication of one form or another has to be there. But

understanding is not totally dependent on the communication. Understanding can exist for other reasons rather than communication. You might have divined what is going on with that person and understood it therefore, see? So you didn't have to have much communication about it, see? You didn't have to have much information on the subject.

Now, if you're trying to settle up or square around somebody in life or set him right, the easiest way to do it is by processing him. I assure you that that is the easiest way to do it because you're going to get a failure on most of your advices when they're directed at one individual. Nevertheless, I don't say don't do it. You very often find out it's necessary to give somebody some advice so he can get some processing. Quite often you have to approach this with advice first, and you mustn't leave that out of your bunch of tricks here because it's very vital even on the first dynamic. Well, how about it – before you start processing somebody, you really are saying, "I advise you to get some processing." So actually advice comes first, if even in that ridiculous form, you see.

You say, "Well, the best thing for you to do, Mr. Jones, you keep talking about this lumbosis you got – if I were you Mr. Jones, if I'm going to do anything for you at all, in fact, not only if I were you but you better – I'd sort of square it up and I'd check into a hotel for the next week or so while you're being processed. And don't have anything more to do with those problems for that period of time and then approach it with a fresh look afterwards."

Well, that's a very limited piece of advice but it's certainly advice, isn't it? Well you should never feel yourself constrained about issuing such advice. Realize however, that their problems – to them – are very, very complex and therefore require a very complex solution. Sometimes you have to issue a little more complicated advice than you would ordinarily issue to get it understood. Sometimes it has to be very complicated.

"Yes, I know your business is going to suffer. What you do is write your brother a letter who is out in Des Moines, Iowa, and you have him come in and you train him on the job here for ten days in order to get this, so that you can have this week off and then you so-and-so."

You get the idea, see? You sometimes give them this terrifically involved piece of advice and they will take it. Then it seems that you're acknowledging how complicated their lives are.

Well, the first dynamic, we understand that pretty well, but advice definitely fits in it. And then, why, as soon as you move up into the other dynamics and you are unable by various reasons to carry out a program of processing on each individual, let us say on the second dynamic – you face that very often – or the third dynamic. You can't, at this moment – wouldn't at this moment be able to do anything but advise the Republican convention. You couldn't process them all, don't you see. You could advise them to have some processing, maybe run some Group Processing on them. That might work and is a very – a very workable activity in actual fact. But you'll find yourself seldom with both sides of the third dynamic under your control or understood or in communication. You could talk to the British, you see, but not to the Germans, don't you see? See, that'd be that – you'd be that monosided about it.

So therefore, in settling any third dynamic activity you do have Group Processing, you should use such tools and so forth but you'll find yourself more and more operating in the

field of advice and I assure you in two or three years if there was any communication with other life in space, the first one that they would think of talking to probably would be a Scientist. So that, again, we were on the advice side of the picture and it's advice, advice, advice. And advice is, after all, instruction isn't it? And there's no real difference in what I'm saying between advice and instruction.

So when you depart from the first dynamic you then have instruction as your dominant activity. You have advice, in other words. But advice easily slides over into the "this is it" of instruction, see?

So training, instilling cultural patterns, figuring out how it ought to be and squaring it up that way becomes very much a part of a Scientist's livingness. Couldn't be otherwise. So he has these two things: he has advice and he has processing. When you move off the individual or when you move away from being able to collect the group together and process it collectively – when you move away from that building block, the individual – you're sure dealing with much better ground if you're dealing in the field of advice, see. And if that advice is just casual advice, it's still advice, you see? Now, when it becomes less casual and more directed, that becomes instruction. And on seven of the dynamics, those that are not the first dynamic, you'll find out that's the one which you basically use. Well, in view of the fact they aren't all seven highly operative, why, it doesn't give you a ratio of seven to one, see. But it does give you an overbalanced ratio, that you're apt to use advice and instruction more often, really, than processing. New look, see? Because there's more of it, if you were being totally active in the handling of the society, that you certainly would be using advice and instruction far more frequently than processing; far, far more frequently.

So the conduct and practice of Scientology is slightly more advice and instruction than it is processing. But before you have any, any right whatsoever to advise anybody, you certainly better be able to do something in the field of processing, right? So, actually it starts with being a good auditor and not evaluating for your pc and telling him what to think about what he's just dreamed up.

Now, evaluation is really – pc says he doesn't know what kind of an answer you'd expect on this so you tell him the right answer and you say, "All right, you answered the question." It's answering his auditing questions for him that you're shying off for there, telling him what to think about the auditing question or something like this. But evaluation has nothing to do with instruction.

We use the word evaluation roughly and not technically – I would say to – well – I just evaluate day after day, hour after hour as long as I'm in communication with people. They expect to give me – they expect to give me – well, they expect me to give them some kind of an answer to their situation, so I do. I don't mess around with it.

Fellow says, "What will I do about my wife?" See, "What will I do about my wife?"

"Well, how's she been acting lately?" So-and-so and so-and-so and so-and-so. You instantly realize that it's not a processing problem. In the first place you can't do anything in this particular team. There couldn't be any co-audit possible on this team. We wouldn't get all unreal about the situation then and say, "Well, she better be audited and you better go into a co-audit on it." Well, my God, the girl is climbing a wall and nobody can keep her down for

three minutes and she's gone totally loopy over some other guy somewhere or another and she's racing off and gone till 2:00 a.m. every morning, you know. That's this sort of thing and it's completely out of control, see?

Well, maybe they could have been processed years ago, see, but nothing you can do about it far as processing is concerned. Well, see, you better just get into the advice business right away.

"What I do about it?"

"Well, let her go away with the other man, of course."

And take a bunch of responsibility for – worry about taking responsibility for her actions! Actually you're being irresponsible if you – supposed to be the person who knows and are informed about life and livingness and that sort of thing – sit there with a dumb look on your face. Now you're being irresponsible. Guy wants to know what to do. All right, tell him what to do, see? First thing you think of, well, let's see if we could get you some processing, get her some processing, that's obviously the best answer, see. And you figure out is this possible in any way even by any stretch of the imagination or even by an heroic action, is this possible? Well, you find out, this isn't possible and so forth and isn't feasible.

Don't also be a fool and say, "Well, of course, if all I've – I've got all this, I've got all my auditing time all taken care of here for the next ten and a half weeks. Somehow or another I'll fit this fellow into my schedule," and so forth. You're just being a fool; you're being irresponsible. You know you won't get around to processing this guy. You got more pcs than you can shake a stick at. Something like that. You *won't* get around to processing this guy. Let's be real.

All right, the thing to do is say, well, that's advice: "Oh, the thing I'd do if I were you I'd just let her go. You say she's running off every night and that sort of thing. Well, I'll tell you – I'll tell you what. Here's a – here's a piece of paper here that you have typed and get her signature on, it'll keep you from getting into any trouble. It says, 'I, having been unfaithful to my husband, so forth, hereby grant him divorce and full custody of the children without further upset.' And get it – here it is. All right, get it typed and see if she can sign."

So you know this will catalyze something, man, because you've put the end product of what this girl is heading for right in front of her face. Now, she's either going to jump one way or the other way, isn't she? See. You catalyze the situation and maybe the guy who's asking you for the advice is hell to live with, remember that. And maybe the other guy is a real dream, see. You don't know about this, see.

So you just give, you just give as close as you can give to a solution which is practical on all dynamics that you can think of in the next two or three seconds. [laughter] You understand? Don't go taking these things under advisement. So, all right, within the reality of that – of the data you've got – then give the best solution that you can give which fits all the way around without pretending that you're not on his side but also not exclusively being on his side. Do you understand? You actually – there's a big trick in this. I'll give you the trick in giving advice: is the advice you give should not be partisan.

Now, this is the other thing I'm trying to arrive in talking about the dynamics so long that maybe overstressed it. You only get in trouble when you get partisan, when you cease to be pan-determined, because that brings you down into self-determinism and brings you down into one-sided specialization and moves you right on downstairs into all the specializations and economic traps there are. You cease to be pan-determined in the advice you give.

You say, "Well, I'm not going to process this or that or the other thing or this type of individual because I don't like him." You've already become specialized. You should never make a limit on what kind of a person you'll process in actual fact, see? If you don't enjoy processing this kind of person, well, also don't be masochistic. But don't say, well, "I'm never going to process any blondes, see, because I'm liable to get in trouble with blondes," and figure it all out, see. That's for the birds, see. That's silly – to get an end-all category, see. And similarly, it's very silly to give partisan advice.

But remember this, it is also unacceptable to give advice which isn't partisan. And that's where the most of the argument comes against the savants. They put the pose of detachment and disinterest in with it, and you mustn't do that either. Don't go around – this is really the way to exteriorize out of everything and become zero-determined in all directions – is just pretend you're never part of anything and never interested in anything, you see?

But somebody comes up to you and they want you to get real mad at their mother-in-law. They're asking you for a bunch of advice. Well, you don't have to get mad at their mother-in-law. This is what I'm saying, see? You don't have to get mad at the men from Mars to advise Earthmen how to handle the men from Mars, you understand. You don't have to get mad or partisan or upset about some other side in order to issue advice about it. But neither do you have to sit around and say, "Well, I'm really no part of this conflict. I'm just an agitated, I mean a detached individual. I'm being calm, yeah, and I'm being *da-da-da-bluuuh*." Delete that from your histrionics.

Just look at the guy interestedly and say, "Oh, there are men from Mars in Washington, yeah, they need advice over there. Oh, yeah. And you're wondering what to do and so forth. Well, instantly see if you can't set up a communications network. See if there isn't some common exchange of communication and make that your sole concentration. See, see if we can't set up some kind of a communication thing."

"Well," he says, "it's impossible. They're just flying around in the air and we haven't got any radio."

"All right... Abandon the city."

Well, the guy says, "That's more like it; we'll abandon the city." He's off, see? [laughter] That's the other piece of advice he'd take.

All right. Now, look at this. You say, "Well, see if we can't arrange a co-audit between you and your wife," you see. You look this over. That's communication. And then estimate the degree of no understanding that will occur and advise accordingly. If he can't do that, then estimate the degree of no understanding that will occur or the understanding – estimate the understanding that can occur and advise it. Advise something on that basis. You say, well if they're flying around overhead, and this guy says he can't get into communication with it

anyway, and they probably tried something in this direction, they're all scared stiff. Realize there are some other factors you haven't been told always in giving advice. You've never been told all. You don't really know very much about the situation. Don't make a – be a fool to think you have.

Where you make mistakes in giving advice is to think you know about it and have the perfect solution. One: you don't know all about it ever and two: you can't give them the perfect solution and they probably aren't going to take it. They'll take as much of it as they can apply. So, the best thing to do is give them something they can apply right now and do. See, what will they take off of you?

"Oh, well, I've been talking to – I've been talking to the Scientologist up in Fairfax and he says we ought to abandon the city."

"Oh, is that what he says! Well, let's get the city abandoned."

And at least they're doing something, see? And the Martians say, "Well, they aren't going to fight us because they're running. Look at them run. They're scared of us. Hey, you see, we've been scared of them; they're scared of us. Maybe we ought to try to get into communication with them." Maybe a communication factor would get established after all, see.

See, what's the best advice you can give them that will be taken. That's the equation you're operating by. What's the best advice you can give them that will be taken – that *will be taken!* Now you can give them the perfect solution that won't be taken. But what's the solution that will be taken? Well, let's find out. And you sometimes have to plow around for a while to find out what advice will be taken.

The fellow says, "Oh, I just can't stand it anymore, Ron. Yeah, I just have asthma. I wheeze and so on. I can't take off any time for processing and that sort of thing and you say you've got too much of a schedule to process me anyway, and there isn't any way I can do this anyway because I, after all, have an awful hard time in processing and so forth and so on. But I really got to do something about this *eooh* – this asthma, and so forth, and I don't know, and so forth."

"Well, you ever been down to lower altitudes?", you're at high altitudes, see. If you're in a high altitude, figure out it must be high altitude. Just give him change. Change his environment. That's one of your first old-time rules and so forth. But give him a piece of advice he takes. So you say, "Well, how about, how about getting some blankets and sleeping warmly and getting some..."

"Well, I can't do that because you see I'm too agitated." And so on.

He's refusing all this. All of a sudden you finally work your way down some channel and you say, "Why don't you go down to a lower altitude."

He says, "Yes, I'll go to a lower altitude," and so on.

"Yeah," you say, "all right." Put the pressure in right at that point, see. "All right, you go right down to a lower altitude and you'll feel better at once," and so forth. Put the hope factor in, see? "Go down to the lower altitude. You'll undoubtedly feel better at once. Very good. Fine, fine."

He writes you back couple of weeks later and he appears, "Yeah, I went down to vacation and I'm feeling fine now and no asthma." See.

The point I'm trying to make with you here, what I'm trying to teach you is handle it! See, handle it!

And you don't have to say, "Well, I can't process him for 8,645 hours so therefore I can't help him out." Oh, hell no. You got a lot of more strings to your bow. You've got advice.

What's advice? Anything you can deal off the cuff that he'll accept and do that is more beneficial to him than what he's doing – more beneficial to him than he's doing right now, that's for sure. If he doesn't change the way he's going, he's going to crash. That's usually the moment they're asking for advice; it's just before they go over the cliff, you know? So it's all usually over-the-cliff type of advice you have to give him. Don't sit down and give him a five hour lecture on his problems or something like this. Find out what he'll accept. Hunt and punch around. Generally in giving advice you can develop a sensitivity – you can get that sensitivity pretty good. And you notice this guy has got a reservation about what you're saying, well, you gave him the wrong piece of advice, see. Why, shift your gears.

"Now, a lot of you – you have some reservation about doing this with regard to your boss. What's the matter?"

"Well, you see, I – I really don't go to work anymore. That's why I can't do it." "All right, fine, fine. Well, what's – what is your trouble then? Maybe I didn't understand you completely and so forth."

"Well, I – I want to handle him so I can get back to work."

Oh – he didn't tell you in the first place, see. He didn't give you all the data. There, you are – you're being foolish if you ever assume you're ever given all of the data or that all the data that's given you is true. You're actually being a fool if you work on this premise that every word that you're told is the gospel truth and you've become partisan and so forth. That is what gets wrong with giving advice. You become instantly partisan; you believe everything you're told is true; you take sides against the mythical person. You always will, to some slight degree, emotionally. You'll say, "Well, she did, my God!" You know. Of course, we're not listening to what he did.

And the situation is that you don't want to give a wild piece of advice that will wind up as a total destruction on all fronts. But don't mind giving slightly destructive advice either, see. Don't mind – don't give the type of advice of, well, the best thing to do is shoot her. Don't give the type of device of something or other. Just from as far as you can tell at this particular instant this seems to be a workable, feasible thing and so forth. She wants to go off with the other man. Well, let her go.

"Oh, I never thought of that."

"Well, you know, if she did go, you know, you could sue him for a loss of her services."

"Well, you know, I give her eleven – eleven pounds a week right now and I think a maid only costs me about six pounds a week, I think I'd make money on the deal." [laughter]

You say, "All right, then, the best advice is get her to sign this paper and so forth." Gives him something to do; takes his mind off his trouble.

You're answering out of your experiential line. Don't mind doing that either. Don't be self-conscious about it is what I'm trying to say. So, you all of a sudden feel like a pontifical ass saying these things, pontificating to this degree and so forth. Well, laugh at yourself if you want to but don't cease to give advice because of that, see. Give them something. Handle it! That's the thing. And the way you handle it is try to bring about auditing. If you can't bring about auditing, try to bring about communication; if you can't bring about communication and so forth, why, bring about understanding. But, of course, the communication and understanding are all under the heading of advice. If you can't audit them, advise them.

And it just doesn't matter what you advise them. Because you're people of good heart and you'll listen to this and you'll say, "And you say your mother-in-law has been living with you for the last thirteen years and now won't let you sleep anymore in your wife's bedroom. Your mother-in-law won't let you sleep anymore in your wife's bedroom. You want to know what to do about this. Huh?" Well, you're just stonied, see. What you're stonied by is that a situation like this can exist. [laughter] You're not stonied about what advice to give him, you see. [laughter] You're just slightly stunned, see.

Well, the upshot of the thing is that you can deal one off the cuff and you say, "The old lady's been living with you for thirteen years, and now she says so-and-so and so-and-so. What's your house like?" You know, you've got a clue now what to do.

"Oh, there's only two bedrooms."

"Hers and you and your wife... Where are you going to sleep then? You have to sleep in the living room. You got a big back yard or something like that? Or you got anything like that? Oh, why don't you – what – what do you – let's see – what's your – what's your business – what's your business? You're a commercial artist. Why don't you tell them you got to have a studio out in the back yard. Immediately start building yourself a studio out in the back yard. They'll try anything they can to get you back in the house again."

The guy say, "That's a good idea – a studio out in the back yard with a door opening on the alley. Yeah, that's a good idea!" [laughter]

In short, it doesn't much matter what you advise him, see. But the system of your advice – the system of your advice would be in the direction of handling something. So, you don't let a lot of human problems walk into your perimeter and sort of drop, see. Guy's coming to you for help. All right. Give him help. And help isn't just what processing you can give him or actually what formal training you can give him. You can also give him advice and as a very informal type of information, don't you see. And that's yours.

You'll find you'll do it very often; you'll find out you do very well if you pursue that. And you'll find out that the world has very badly fallen apart one from another; and you'll find out the dynamics are very badly separated from one from another; and you'll find out there's enough warfare going around to please most anybody. You'll find out that life amongst the wogs is pretty confounded grim as a matter of fact. I was looking at it recently and I couldn't believe the number of catastrophes which I found per square cubit of thetan – see, of enturbu-

lated thetan. I just couldn't believe it. It's fantastic. You can't audit all of it that comes your way, but you can advise it and you can handle it. And you're only really doing your job as addition to other things as an auditor if people who come to you with trouble and people who are having trouble in life and so forth, if you don't try to help them handle their situation. And just go ahead and try to handle it. Help them handle it and give them some advice as to what to do and so forth. It's all part of it.

And you'll find out that they very normally don't do what you told them to do, but you find out that you got them to thinking in some forward line and they will do something else along the line, but you will have catalyzed the situation in the direction of a better smoothness or solution. Life will become smoother in that particular quarter. If you would simply and only acted as a catalyst in your immediate environment, you would be doing your job in that particular field and area. That's all, that's all you expect out of it. See.

The guy comes back two weeks later, "I got a better idea after I left you," and so forth. "I built a house in the back yard for her and she's going to live in it now and so I got the idea." But he knows that you helped him. It doesn't matter whether he says your idea worked. You're not listening for that.

So, there is an entirely different field that an auditor works in all the time he is auditing and if you feel forbidden to do it because of the Auditor's Code, remember that's evaluation with relationship to a session and has nothing to do with giving people advice. And you give people advice all the time. And you'll find out that anytime somebody comes to you and tells you their troubles, if you give them something to do about it, it's practical, you tell them about a Touch Assist ... I don't care what you tell them in advice, you see, give them something practical, give them something they can do and that sort of thing and you'll find out that you're just aces up and your life will start running very, very smoothly indeed. And you'll listen to lots less problems because he actually will tell you only up to the time you give him some advice or something of that sort, don't you see. You've shortened the amount of upset, in other words, of people telling you endlessly their troubles and only their troubles and so forth.

One of two things will happen: they either solve their troubles or they don't want them solved and so won't keep handing them to you. See. But you have again done something about it. And the fact that you are helping people handle their environment in your immediate vicinity does put you kingpin and aces up and you're actually occupying a role that whether I said you would or whether anybody tailor-made you to do so or not, that you very certainly will – are occupying and will increasingly occupy as you go forward in life and Scientology rolls along.

Thank you very much.

CAMPAIGN TO HANDLE PSYCHOSOMATIC ILLS

A lecture given on 28 July 1964

Thank you. All right, this is the what of the what?

Audience: Twenty-eighth of July.

Twenty-eight July. What year?

Audience: AD 14.

AD 14. Hello.

Audience: Hello.

Now that you're here, welcome.

[part missing]

All right, you're about to hear today, not necessarily the opening gun, but certainly the first official opening gun, on a shot that's going to rocket around the world, that's for sure. And that is the campaign to take over and handle all psychosomatic medical healing in the world. The American Medical Association for some time has been asking for this and so we're going to give it to them.

There will be a textbook on this subject. A popular type, small textbook, which I have just now begun to design, and have it into its writing factors. I've got these various points which are extremely germane to the problem at large and exactly how it goes across and exactly how it fits in and how it can't be challenged in the field of physical healing.

Now, healing is nobody's monopoly. But if it becomes anybody's monopoly, it will be he who can heal who will be the authority. The person who is able to do this should be the boss of it. In other words, if you, an auditor, can heal and Juglug the big, bad man from Witchdoctorville, with all of his sterling knives and his sterilized nurses – excuse me, that's a mental slip – and he can't do anything about it, why then it's yours, isn't it? It's not his, you see? Now, that isn't some rule that somebody lays down. That happens to be the way the world works.

All right, there's a fellow diddling around and monkey-businessing with a piece of carpentry. You know, hitting his fingers with the hammer and bending the nails and splintering the boards and dulling the chisels and dropping everything and so forth. And a carpenter comes along and he picks up the hammer and he straightens the nails out and he knocks the

boards back together again the way they should be and he fixes up the job and makes it look very, very neat. And anybody who wants any carpentry done, do they call the bum or the carpenter?

That's obvious that that's the way the world works, see? He who can do the job, does the job. And he who can do the job should be the authority for that job. Right? All right, I want to make one point very, very clear instantly and at once: that you know nothing, absolutely nothing, about osteopathy, mending up femoral arteries, pushing eyeballs back into the skull, chipping bones, plastic surgery. You don't know anything about these things. I want to make that point very clear to you. You just couldn't do this if somebody held a gun on you.

It's very interesting. Somebody's lying there with a compound fracture of the tibia – you don't know anything about putting a compound fracture together. You could put a splint on it from your first-aid book or something like that, but from that point on you'd be pretty powerless. Isn't that correct? I'm not being sarcastic.

Audience: Yes.

All right, let's keep that point firmly in mind because it means this: It means when there is an acute injury or illness, acute illness – this word "acute," don't hang up on it, it means immediate, right now, you know? It doesn't mean exaggerated or something like that. Medically, it sim... it means simply, you know, right now and rather temporary. "Acute" means temporary, really, it's – it comes up to a point and so forth.

Now, an acute illness then is one where you get a cold and you get well from the cold and while you have the cold that is an acute illness, correct? When you got a broken leg, something like that, why, you're acutely injured, don't you see? That's not using it in quite the right context, but you – I'm trying to show you where the medical thing is. Because the leg isn't going to be broken forever – the leg's going to be mended, see? You're going to heal; going to get well from it. When you've got – when you've run into a lamppost and so forth and you've got three busted ribs, why, you are acutely injured, don't you see?

All right. Now, if you have illness of an acute, temporary nature or injury of an acute, temporary (using the same word – "acute") nature, that's the job for a medico. You see, he may do it well, he may do it poorly. That's not the point. But he's the authority in that particular field. Nobody can do it better than he can, see? See, he might – he might be stumbling about it but he's still – nobody can do it better than he can. You've got a femoral artery that is pumping lifeblood, and if anybody's going to stop it at all it's going to be a medico, right? That's where he's trained. So in that field there, the medico is the authority and we should actually grant him that beingness.

Somebody comes down with cholera. All right, he's got cholera. Who is the authority in this field? All right, this person is physically sick. Whistle up the medicos. Maybe they've developed something over in the Pasteur Institute or something of the sort that you – that will check cholera. Maybe something has happened. He certainly will know the nature of the disease and know that it's cholera and not a bellyache. Do you see? All right, grant him that authority.

Now, where he errs is trying to take in terrain broader than his sphere of authority. And there he makes a serious error. Because he's a completely lost dog when you get on to the last two brands of illness. There are two other things which happen in illness. Now, I'm not even trying to give you the medical terms of these things, I'm just trying to give you English words that are very understandable. But there's the precipitation of the illness or the cause of the illness. What – precipitation – what brings it about. What precipitates it. What causes it or what occurs before the person gets ill that makes them then be ill. Do you follow that?

Now, he's only faintly into that. He says, "If you have too much weight you may sooner or later have heart trouble." Don't you see? So he's just faintly into that, but he doesn't even really know that. See? He's faintly into that field. That's the precipitation of an illness.

Actually, the medical term for this is *predisposition*. A person is predisposed to an illness. Something predisposes this illness. The little kid goes out and gets his feet wet and gets a cold. Well, what got his feet wet? See? The rain. See? So this predisposes the child to a cold. But not all children get colds just because they got wet feet. But nevertheless it's predisposition. It doesn't even say that it's going to happen. It isn't bound to happen after this predisposition. But it may occur.

Now, the medico is only slightly into that field – only slightly. He speaks of "preventive medicine." Actually, this is really not in the field of medicine at all, but is in the field of public health and there are very few public health men that are medical doctors. Once in a while medical doctors get into the field of public health, but they're usually engineers and they've been to engineering school and they're public health engineers. And they're the people that see after the water supply and knock off the overpopulation of rats down at the dock and all that kind of thing, don't you see? They're trying to handle bits in the society which bring about illness.

See, if you – if you don't safeguard the water supply, it'll get contaminated. If you don't safeguard the water supply, why, it's liable to go wrong and nobody's going to know about it until half the city is dead, you see? If you don't keep the rats down, down on the docks and that sort of thing, why some ship with a bubonic plague infected rat (some Russian ship, in other words) ties up alongside the dock, why – that, by the way, is more than just a crack at Russia or something of the sort. It's absolutely true that the public health authorities go stark, staring mad on the subject of trying to get the Russians to de-raticize their ships. Oh, man! And Russian ships are just as determined, "They're our rats. They're comrade rats!" [laughter]

And they tie them up outside the breakwater very often and they won't even land their cargoes or come near and they try to give the whole harbor – they won't permit anybody aboard to de-raticize them and so on. They act like somebody's doing something horrible to them. They probably think the public health men are FBI agents in disguise or something like this, you know? They're completely mad.

The breeding area, the first waves by the way of – I always think this is amusing – the first waves of rodents in the world came from Russia. It's the steppes – was the genus area of all the rats you notice around. I think that's terribly funny and nobody's ever made any capital out of it. But the Russian today is still trying to hold on to his rats. And the public health men

are out there and frankly there isn't a doctor amongst them. They're just engineers and so forth, and they go out and shoot the ship full of cyanide and every once in a while try to also de-raticize some poor stowaway or refugee that has been trying to escape from the iron curtain, just to escape into the hands of some public health service, you know? Crash. Of course, they're deader than mackerels. They bring them out stiff as boards, you know? Stowed away underneath the lifeboats and by the time the cyanide gas hits them, that's the end of it. Pretty grim.

All right, that's predisposition. That's handling the predisposing causes of disease. There are many of these, many of these. The reason garbage is collected in the cities, and so forth, is all under this heading.

Nobody cares that it doesn't look good and nobody cares that it doesn't smell nice. What it got down to is they found out if you had garbage in the streets and an epidemic started, the population had had it. It was, of course, this very thing I'm talking about which wiped out 50 percent of the population of England at one fell swoop here a few hundred years ago. They've still got pits around where they just buried bodies. And when that was over, England was no longer an agricultural nation. And she never has been since. She took to herding and she took to wool and it changed her whole economy. One bunch of rats walking down the side of a ship, down a mooring line, changed the history of England.

So this, of course then, is quite important and a great deal of attention is paid to this particular thing, but it's usually in along physical lines. It's physical, you see? They have to do with germs and water and climatic conditions and not permitting workers, for instance, to work on certain projects (like radium – radium, luminous-dial watch painting, don't you see) and making everybody come in through the society for tuberculosis x-rays and various campaigns of this sort. You've seen these things, they run all the time, all the time. Well, that's about as far as the society has gone. And that is not the medical doctor, actually, in operation. That is the civic authority trying to prevent epidemics of tuberculosis, trying to prevent epidemics of various kinds and illnesses of various kinds, you see?

Now, let's take after. Now, you see you've got a fore – before; now there's an after. And now, what have we got now? We've got predisposition and then we've got an acute illness of some kind or another. That's two – two things. Now we've got a third thing. And this third thing is *prolongation*. Marvelous long word: prolongation. Perpetuation. They speak of perpetuating factors. They speak of the perpetuation of an illness. But that's the area that we will refer to as prolongation. The illness is prolonged.

Now, what makes a prolonged illness prolonged? Merely that it goes beyond the expected term. So any illness that goes beyond the expected term – and that's a very precise definition – any illness that goes beyond an expected term would fall into this category of a prolonged illness and into the general class of prolongation. You understand that now?

All right. Now therefore, what have we summated here? What have we summated here, before we go on talking about the prolongation? Let's take a look here. And here we have, over here, the situation of – let's say, this is time plotted forward, this way. And these are three periods of time. Indeterminate and we couldn't care less about what period of time

this is as long as – for the benefit of man, we'll speak about it as a lifetime or something like this, you see. But in this particular instance, it would be the period of illness.

Now – but that still is not descriptive enough. You'll see why in a minute, because the period of illness can vary, you see? So we've got this period of time here and then we've got this period of time. The first one here is predisposition. This is the period of predisposition. That's predisposition. That's the period of it. All right, now this is the period of illness; acute stage. And this is the illness, you see, and this is acute. Simple as that. Illness, acute. Acute stage. See? And by the way, that is pretty standard. The guy's got a broken leg, they say six weeks, see, before he can – something or other. You see, that's fairly standardized.

They say, "If you have a cold it'll take three or four days to get over it," don't you see? "If you've got the measles it'll take a certain period of time," you see? You got the idea? So that is well established in the field of medicine, because it is their sphere. I bring to your attention they couldn't tell you when illness began to generate – beyond them, don't you see? They couldn't; they had no means of any kind of establishing the point at which the person began to predispose toward an illness. Do you see? So this period is completely – this period of predisposition is completely indeterminate in the field of medicine. They have no means of any kind of determining it if they cannot establish it as a disease contact. "He went down to Soho," you'll find them doing this all the time, "He went down to Soho and had some bad fish and that gave him ptomaine poisoning."

All right, that's great. But actually, their statement, "He went down to Soho," does not concern them at all. And they don't know if it's true and they don't know if it's false and they don't know what. He might have got this at home. And you'll hear them going around this point of time of when the illness began to be predisposed, you see? When was he predisposed to the illness? What was the point of disposition?

Well, actually they could maunder around about this for some time. It actually was predisposed when he got the idea two or three years ago that he ought to go down to Soho occasionally and eat fish. But this takes it immediately out of the field of medicine. It's no longer in the field of medicine. Field of medicine begins with imbibing the germ. One germ, down the hatch, see? Now, if they could establish that point they've got it, you see? Then that becomes predictable. They can establish this. They can say that if you get yourself a lot of staphylococcus, why, you're going to have an infection. Do you see this? They then predispose their illness from the point of contact and therefore they could be fairly safe in the field of material healing.

So predisposition in the medical world begins with an indeterminate point where the fellow might have contacted a germ or something of that sort. For instance an injury: the fellow got drunk at a pub and drove too fast and had an accident. So they'll go back as far as saying, "Well, he got drunk at a pub." And they'll say that's – that's predisposition, don't you see, that's predisposition of injury, see? They don't go any further than that, because that's – I mean, point out what's the common denominator here. Even a germ is physical, see? The alcohol that he imbibed at the pub is a physical thing. So they're only occupied with the physical predispositions of illness. And that is the field of medicine in the field of predisposition – is physical. Physical predisposition. You understand, even a germ is physical. See, it has mass

and so forth. It's a physical thing. You get enough of them together and they will dance on the head of a pin very nicely. See?

The alcohol at the pub – see, that's physical. It goes *glug-glug*, see? It has fumes. It's recognizable. You can put your hand on it. You can get shortchanged over it. See? You see that?

Male voice: Yeah.

So they're physical here, real physical.

Now, in the field of illness of an acute variety, this again is a physical illness in which the medical doctor is interested. Physical. You're running a high temperature, see? The leg bends in the wrong direction, see? The skull when fractured left a detectable depression. The measles bug bit and now in two weeks this person should be out of the woods or something like this, see? That should be all over, but the bug is – they've even gotten it down to where it's a virus. See, it's a different kind of smaller bug. But it's still physical and all of these things in illness must be reduced in the field of medicine – and quite rightly, because that's the observable fact – are reduced down to physical illness from physical causes. It's not only that it's a physical illness, it also has physical causes. That's very important. It's a physical illness with physical causes. Remember, on your predisposition I've just told you that you've had – you've had this – predisposition was physical.

In other words, that what began it. The *glug-glug* in the pub, see, that began it. The bug bit, that's what began it. The mosquito went *bzzzzzzn, nnoww-boomp!* Malaria, see? He's got it all figured out, see? So therefore it's a physical illness. Now, let's take up this next long line. I'm beating this to death with you because what I'm actually giving you is not something of interest; I'm giving you something that you going to be using for a long time. And if you don't understand this right on the ball, you're going to be a complete patsy in trying to discuss it with a medical doctor. And that's who you'll be discussing it with. And you may even occasionally be discussing it with a legislative body or a judge. You understand?

So get this down, see. Write it down there in small balls of fire just back of the inside of the skull. Because this is how we make the breakthrough. This is our dissemination breakthrough I'm describing to you. And I'm describing you the elements that make this possible. The frame of mind and the belief of the people associated with this – I'm describing those to you. These things are observable. These things are believed. These things are carried forward very, very hard in the society, and the laws of the society relating to healing are based on what I am showing you at this minute.

Now, prolongation is this next period. Now, this is all very neat. The fellow got well and it all stopped here. And this is why I am – didn't keep talking about prolongation; because you have now run most of the gamut of the medical profession. If he had one operation too many, if they shouldn't have operated, they might have prolonged the illness. The improper treatment, improper care, might have prolonged the illness. And their whole idea on the subject of a prolonged illness would be whether it was treated soon enough, whether it was treated properly and whether or not it developed complications during the period of acute illness. That's what they assign any prolongation to, see?

But they've had it as soon as they get into that field. They've had it. If an illness enters this stage, it's only within very finite limits that they can control it. He had measles and developed complications and went blind or something. And you'll see medical doctors, they all sort of stand with their hands in a reverent attitude: "It's all in the hands of God now. Who could have told that that would have happened," see? That's – that's their attitude toward it. This is the area of total apathy.

What happens after this little boy has had measles for a couple of weeks and all the other little boys that have measles are up there bouncing about and they're all full of snap and ginger, and it's even got to a point where their mother isn't even being nice to them now, saying, "Oh, Willie, go out and play," you know? What happens? So this little boy – and he's had the measles and he didn't get well. He's lethargic. He's sleepy. He's kind of stupid.

They put this under the head of "aftereffects." But in this particular lineup that is unusual. And at that moment it steps on the banana peel and goes out from underneath. In other words, improper treatment or the absence of treatment and so forth would prolong the illness. Yes, yes, the doctor has that in the field of prolongation. And that's as far as he goes into prolongation. He gives no further thought to this, really. He'll tell you, "Well, you should take a rest."

He gives it that much attention and he knows these three factors which I've been talking to you about exist. He knows these factors exist. These factors. And he knows best that a person becomes predisposed to an illness by, let us say, contact with infected persons, by irrational imbibing of alcohol and running his car into a lamppost. You understand? That's how he gets there. Injury, illness is predisposed by physical contact by physical means. That's his educational line. And the illness during a certain period is called an acute illness. He refers to it as acute, not meaning that it is desperate, but simply meaning that it is at – it's going over its temporary peak.

Now let's move this over into the field of Scientology. You'd say the cycle of action of an illness, according to a medical doctor, would be from the period of its first physical contact to the expected recovery. And any illness that follows that cycle of action is well within the medical doctor's control – that is, if he knows what the treatment of it is – it's well within the medical doctor's control. He can do something about it. This he understands. It's that – just that one cycle of action, from the moment of physical contact sliding right on over into the point of expected recovery. Johnny has measles, he expects Johnny in a couple of weeks to be up, popping about merry as a cricket, see? Now, that is his cycle of action.

Now, his cycle of action complicates into just one little additional stage. Sometimes complications occur by reason of absence or poor – absence of or poor healing. In other words, he assigns prolongation to healing. The fact that an illness is prolonged, extended, moved out into the future – he said, "Well, it was absence of treatment or it was improperly treated or something occurred or some complication occurred." Once more, physically. But at this stage he rather tends to wash his hands of it. He's not quite sure what to do about this. He'll carry on with it. You'll see every once in a while these boys go into a desperate fit in a hospital. I think they did it with MacArthur – General MacArthur. The expected recovery was not there, see? MacArthur reached this period and complications set in. So you'll see them

every once in a while do this. They'll go into a hectic fury of new operations. And you'll see operation following operation following operation and they've got him back in the operating room carving out the tibia, see? You understand?

You've seen instances of this. They – at this point, when the individual was first ill of whatever it is, if it was surgical treatment that they were going to engage upon, they said, "Well, that's very easy, you remove the *splena* or something, and then they normally, why, it's expected the person recovers quite nicely. That's expected."

Yeah, but they removed the *splena* and the guy didn't recover. In other words, they've arrived at this point, they've mispredicted in some fashion or other and they've arrived at this point up here without the expected result. And they say, "What I do now?" Well, the poor bloke is in a desperate state because once you've prescribed the treatment and that has run its course, or you've done the operation that's supposed to produce the desired result and that has run its course, you've just run out of textbooks.

Now, you'll see a little addenda occasionally, in the text, and it'll say, "In case – in case the patient turns green, it's because the gallbladder was also infected," see? You'll see once in a while a little notation in the text, but that's about as far as it goes. It doesn't tell you how the operation is going to fail. So this leaves him up riding on his own and here is his point of experience and his point of hope and that sort of thing: it – these things just have to be thrown on the operating table again. So he does another operation, you see? And then that didn't work either; his expected point of recovery didn't come about so he now has to do another operation, do you see? And then he does another operation and unfortunately by this time the patient, under that much operative shock, kicks the bucket. And he's never really noticed that he was fighting shock and mental reaction all the time anyway.

To him, he doesn't even have a word for shock, except a physical thing. Shock to him is a physical thing. It's something happens to the nerves, that's what shock is. A person is startled, or medically... if you – if they try to explain to you what operative shock is, what operational or what they call "postoperative shock" or something of this sort, well, they try to explain it in terms of "Well, the anesthetic must have been too much or it's some physical thing occurred here," see? But he's out of his element. He's gone out of his element. He not only can't prevent operative shock, he can't do anything much about it. The blood lakes in the center of the body, all sorts of weird things occur. The arteries no longer pump blood properly, and they leak and everything starts going to pieces like a punctured carnival balloon, see? What is this? Well, he tries to describe it physically.

Now, his route then is a physical address to the situation from the beginning to the end. So when you speak of illness, how does this register on the medical doctor to whom you are speaking? You say illness and you say healing – you say these two words and the medical doctor at once, instantly and at once, translates this into physical address. That's his basis of understanding.

Well, let's give the bloke some credit for this: Most of them, those certainly that have had experience and are not trying to hold a public front and trying to shake down a government for a whole bunch of shekels that they are going to waste, know they are up against it when they hit this word *psychosomatic*.

Now, *psychosomatic* is the most abused, misunderstood, turned-upside-down term that anybody ever cared to have anything to do with. Psychosomatic: It means, actually, purely, but not in general usage "the psyche experiencing or in pain," or "the psyche suffering." Do you see that – what they're trying to say? But of course psychology has gotten rid of the psyche very nicely by saying, "Well, we don't use the word anymore and as a matter of fact we don't even know what it means." That's in their own texts. Calling themselves at the same time psychologists, which is quite remarkable because that's based on psyche. *Psyche* is – means "a thetan." It's the Greek word for a thetan. Stop and think about that. It's the spirit. It's the being himself. Not badly misunderstood in the days of Greece, but misapplied since.

So when you say psychosomatic healing, this translates in some wild way to the doctor that you're going way out. He knows that this sort of thing exists. Now, how he comes to believe that it exists, how he comes to believe that there is psychosomatic illness, and how he comes to believe that there's psychosomatic healing, is more than I know, since it has never been proven or demonstrated in the entire history of medicine. Field of hypnosis; yes, yes, quite weird. Fellow has a headache, you hypnotize him, say, "You haven't got a headache," it disappears. Nobody did anything physical to this man. Let's look at where we depart. See, we depart at that exact point where there is no physical contact. Where there is no physical contact, we depart into a realm the medical doctor really knows exists.

Now, what fault does he find with this field? Well, he finds the fault with this field only this: That it encroaches upon his field. He finds the fault that he doesn't understand it and it encroaches upon his field. He doesn't know what it is and yet it's in his road. But I will tell you that the arguments which they use are quite real.

I'll give you an almost verbatim quote from a medical doctor explaining that a psychosomatic practitioner was very dangerous. "The chiropractor," he says, "adjusts the spine. Of course, what these things are," he explains glibly, "are slipped disks." This is an oversimplification if I ever heard one because there's not just disks in that spine, there's about twelve neurons that go down that spine and any one of those can get crowded and perhaps maybe it's all slipped disks which are crowding the neuron, but in actual fact there's a lot of wild things going on. You talk about a spine – of all the complicated pieces of engineering, a spine has got them all beat, see? And a stress analysis study on the spine makes it impossible for one to exist, see? It's got communication cables running through it and everything else, while supporting the body and the head in an erect state. It's quite interesting.

But he says, "The chiropractor fixes up these slipped disks and in six patients this was all right, but the seventh patient has tuberculosis of one of the vertebrae, and the chiropractor adjusts the spine and the patient becomes a paralytic for the remainder of his life. Therefore a chiropractor's dangerous." This is a direct quote, now. The man who said this was just out of medical school so he had the fresh dope.

Their objection to psychosomatic healing only stems from the fact that the psychosomatic healer very often overreaches himself and enters the field of physical healing in which he is not trained and prohibits treatment of physical illness when it exists. And that is the entire argument of the medical doctor against the psychosomatic healer. He has no real other

argument. He's got an argument of an economic nature, of course. The fellows might take some money away from him and so forth. But this is his – this is his professional objection.

In other words, the psychosomatic fellow carries too far. He carries over too far into this sort of thing and gets out of his own field and gets into the field of medicine and then throws that aside because he's not trained and doesn't recognize anything in that field. Do you see that? That's his sole objection, so put that down with an underscore, because it's the sole objection. He has no real other objection, except the psychosomatic practitioner attempts to handle things and thus inhibit the proper handling of things which would surrender to physical healing. And that's his sole argument. He hasn't got any other arguments.

But he recognizes, he recognizes something else: That when he gets into the field of healing by the psyche he is in a never-never land he knows nothing of. And part of his argument in this direction – well, a British trained doctor, for instance, has been given six careless hours of instruction in psychiatry. That's as close as he ever came to it. In some hospital, some drafty hospital, standing around, amongst the insane, gibbering and screaming, why he's given six long hours of precise instruction on the subject of this and thus Parliament gives him the right to treat the insane – on six hours of instruction. Now, that's pretty grim.

What do you think of some bloke that has been trained in Scientology for six hours? [laughter] It would be with contempt, wouldn't it? But give the medical doctor his due – he recognizes his limitations. He knows he doesn't know anything about it.

But he thinks when you speak of healing that you're speaking of physical things. But if you point out to him very carefully that you are speaking of healing by mental means or mental aspects of healing, he instantly gets a very strange look in his eye because he's somewhere else now. You've taken him out of the safe area of "He took a drink at the pub, the drink made him drunk, it upset his perceptions, he drove his car into a lamppost, and that's why he's lying here with three cracked vertebrae in his neck," see? "Now, we have bound him up in plaster and we've given him some sedatives and we've shot him full of B1, and in the course of four or five weeks he will be all right – we hope." That's healing.

Now, you have these same things. But they are not physical. They are not the same physical actions. Now unfortunately, an auditor, or fortunately, an auditor really can't do anything with somebody who's running a temperature of 104. I don't know if you've ever tried to process somebody with a temperature of 104 and try to get anyplace with this bloke. His present time problem is so howling, his ability to as-is things is so poor, he's so far down the Tone Scale that you practically can't have a process sufficiently simple to undercut his illness. It's almost impossible to get that far down the Tone Scale. You can make maybe Reach and Withdraw from the pillow. But quite ordinarily, because the processing of this person is at a much higher grade, auditors quite commonly don't ever bother to take it down to these lower grades but try to finish off something or get at the source of the thing or something. And they lay a terrific egg. It's something I won't do. Somebody's running a high temperature, I will try to put them into communication at some very, very low level. And if I don't get an immediate and direct response, I simply leave it alone.

In other words, if I can't make my E-Meter howl and sing and needle bang both sides at once and the pc suddenly go, "Oh, that's why!" you know, big cognition and so on, well, if

I can't cut in on that at some low level of auditing I just leave it alone. A good way to fail is to try to process an acutely ill person. The reason why is the PTP will inhibit a case advance. And the other reason why is the person has gone far below his common, ordinary or average grade. You see that? He's way down below his ordinary tone level. He's not living now at the same level he was living at. He's very hard to reach, he's hard to get in communication with, you'd have to treat him as though he was a kid or something to get anything at all and he has a hard time as-is-ing things and so forth. But he's got this howling present time problem.

If you've ever processed a pc for twenty-five hours with a present time problem without happily helping out the PTP or straightening out the PTP on the pc, then you had a stuck graph. That graph didn't move. It didn't go up one iota. And he's more prone to an ARC break while being distracted by a present time problem, so if you also ARC broke him, the graph went down. And that is prognosis of treating people who are acutely ill: very bad. The word *prognosis* is just expecting what will happen – predicting what will happen, see?

Some guy says, "I have a – I – I – I just – I just got this – this – this awful cold, and I'm coughing and wheezing." Well, I've done something for colds, I'll try to do something for it – at a very, very light, light, light level. The cold at once doesn't start to clear up, why I tell him to go take a rest. See, because I know what I'm up against.

Now, you would be very wise in your pcs to whistle yourself up a type of doctor who gives insurance examinations and if somebody wants some auditing from you, so forth, tell them, "Go – good, go on and get a physical examination." The doctor sends him back and he says, "This guy's got acute lumbosis; a howling case of acute lumbosis." What's your course of action? All right, he's got a howling case of acute lumbosis. You going to get anyplace processing him? No.

Yes, you could probably fool along with it. Yes, you could do something to it and so forth. But you're – you're taking the long road. This person's actually physically ill, you understand? It isn't the person has migraine headaches, everybody knows this is a psychosomatic illness. The doctor isn't going to even label that. He says he's come back here with acute lumbosis which, as you know, is a peculiarly medical illness.

What you going to do? See, this person ought to be in a hospital, man. You say, "All right, Doc, put him in a hospital. Could – " I'd say, "could you do anything for him?"

"Well, yes, we'd have to feed him up on *sum-whum* and we have to do a *bum-sum*."

"All right, good. How long will he be in the hospital?"

"Oh, we'll have to have him in the hospital a couple, three weeks."

You say, "All right, put him in the hospital. Good." Very relaxed, cooperative attitude. Not from any fear of you, but this bird, if anybody can get him over this phase of illness by change of environment by sending him to the hospital or by some other means – fine. That's three weeks we're not going to have to process a pc going uphill the whole way while he's sitting in the chair coughing and sneezing and shivering and shaking and taking his pills every fifteen minutes. You follow my re... line of reasoning

So that's three weeks of auditing you haven't wasted. And whether you can do something for it or not do something for it. The medico says he's got acute lumbosis.

"Is there any cure for acute lumbosis?"

"Oh, yes, we give him – we give him whizzle sticks to *wuff-wuff* on, you know?"

And you say, "Well great, great, great, go ahead by all means, give him whizzle sticks to *wuff-wuff* on." Expected prognosis, three weeks. Good. Fine. "Thank you, doctor."

I'm not telling you this because it's insidious, which it is. This is simply very good sense. Very good sense. You'll have a lot of – lot more wins in auditing if somebody's around that'll take over acutely ill patients or something like this, why fine. Fine. By all means. By all means.

Now, that doesn't say – the guy broke his leg, it doesn't say that you shouldn't drop up at the hospital and give him the Touch Assists necessary to have him recover in two weeks instead of six, by removing the trauma by giving him the Touch Assist, don't you see. That doesn't say you shouldn't do that. This medico says he's got acute lumbosis. "All right," you say, "good." You don't have to know what acute lumbosis is, beyond this fact: Has it got any prognosis? – and that's the question you have to ask – is there any prediction by which we can get this point, this point – the end point of the illness. Does this end point?

"No," he says, "Well," he says, "tuberculosis of the spine," he says, "the fellow's had it."

"Well, what should happen?"

"Well, he should go to a sanitarium."

"Well, what's – what's the – what's the prediction?" That's what you're looking for, see. "What's – what's this point of recovery?" See?

"Well, there isn't any."

You say, "Well, there isn't any particular reason to treat him either, is there?"

He'll agree with it, "Yeah, that's right. Relatives feel better if you do."

"Well, I wish you'd make it plain to this fellow's mother what the score is, doctor. Let them make up their mind what they're going to do about it. But there's no point of – no – no point of end for this illness."

Don't try to shove it down his throat and give him big sales talk on how you're going to get point of end on that illness because in the first place you're not talking the same language and you're not talking in the same field. So it's utterly pointless for you to say, "Well, I can process this person and get this person over this," and we'll get to talking about this in a minute. It's pointless. It's stupid of you to do so. I don't know why you stand around and yammer at him. You're not talking about the same kind of healing he's talking about, and you can't help but get into a disagreement with the bloke.

He says, "You're going to stand over this guy with hot packs and you're going to give him the shot in the gluteus maximus that's going to get him well?" That's – this is the way it's

translating in his head, see? "I just told you that I can't do this and produce a result, and you're going to stand around there with these hot packs and the mustard baths, and you're going to get him well and that? Well, I know it's impossible. So therefore you're a fake. You're a – you're a dunce."

You see, that's his whole attitude. It's just the attitude of outrage. And your attitude will be outrage: "What do you mean – what do you mean I can't process this guy and get a – and get a few things straightened out in his skull plate and get him up on his feet? What the hell's wrong with you, you silly boob? Of course I can..."

Well, you're not talking the same language, so of course you're going to get in an awful argument. You're talking in the field of psychosomatic healing. And he's talking in the field of physical healing. That's like a Martian talking to an Earthman about a pretty girl. I don't know what's a pretty girl to a Martian, see, and he sure wouldn't know what a pretty girl would be to an Earthman. We just wouldn't be talking the same language.

He'd say, "What I really like, what I really like – those lovely claws." And you say, "Claws?" And you say, "The – the – wh..."

And he says, "These beautiful sweeping antenna." You say, "Well, I like nice hair, too." And he says, "Hair! *Oooohh!*" [laughter]

So you don't yammer around like that with one of these boys. He says, "Well, the guy's got tuberculosis and no expected physical recovery." I would go as far as to correct one if he was being too mean to me, I'd say, "Well, you're absolutely right, there is no expected *physical* means of recovery – there's no means of *physical* recovery," you see. I might go that far. But I wouldn't just play dead dog with my paws waving in the air, don't you see. But I'd say, "No, well, I agree that there's no physical – no physical treatment possible for that, is there? Well, then it doesn't matter then whether we really hospitalize him or not, does it?"

"That's right."

"All right. I wish you'd write the family and write me a report to that effect, would you?"

He will. Hell give you a nice factual report. And if you're very clever and you're rather polite, and if you get down these points I'll be teaching you on the subject of these various aspects of this very broad field of healing and the difference between the physical address to healing and – the difference between that and the mental address to healing – if you get these points all down, you'll be pretty slippery. And he'd probably write you in medical terms that will break your skull. Well, go write him back, when you give him a report, well write him back a report with Scientological terms that would break his skull. Don't give him any idea that these are understandable to him. Of course, his Latin wasn't understandable to you, either. I know, I've received some lately. "The *dippajalus* went *glubla booglegum*." You talk about terminology, man.

Of course, these are the names of things with them, and they're the names of significances and so forth with us. So that even the field of terminology has this vast difference between them. Do you get what I'm talking about?

The guy says to you then, "He's going to kick the bucket, and we can't do anything for him." That's not the time for you to stand and look at him and balefully, and say, "Well, with processing, why, I can do something for him." He knows very well that you're saying "With physical healing I can do something for him" – this is the way it translates, so you're just calling him a no-good practitioner. He knows it's impossible, you say it's going to be – you're going to do it, so he knows then you're a bum. See? Just like you'd know he was a bum if he was pretending he could do something in the field of psychosomatics. I'd laugh at his face. As a matter of fact, that's why I laugh in his face. Because he pretends in this field today. And he shouldn't pretend. But addressed as an individual in straight vis-à-vis, and even addressed on an association basis, these guys say, "Psychosomatic medicine, that's right, we don't know very much about it. New field." [laughter] But that's what you're into when you're into the field of prolongation.

Now much more subtly, you're into the field of psychosomatics. Why didn't the guy recover? And this is where your argument with the medical doctor will take on a very interesting note with him. "Why didn't he recover? What is this factor of prolongation of the illness? What is this factor of prolongation? What made this occur?"

And you say, "Well, in actual fact, that belongs in the field of psychosomatic healing. That's where that belongs – an unexpected prolongation."

The old girl had some illness about two years ago and she's never recovered. She got a cold about two years ago and she's still got a cold. The doctor's just given this up, see? He's reached this point. You got it? He's reached that point. The expected point of recovery up here where illness acute is ending, and the person didn't end cycle. Bah! "Now what do I do?" Well, he's got nothing he can do. And there's your wide-open door.

You say, "All right. The reason you can't do anything, of course, is this goes off into the field of psychosomatic healing. And that, doctor, is a very specialized field. You have to be an expert in that field, and you have to be terrifically well trained," which is all very true. "You have to know your business. There's probably some mental condition which is holding the illness in place."

And the doctor will say with a beautiful oversimplification, "Oh, there is some more reason the person doesn't want to get well."

And I wouldn't put up with that or even be a good fellow about it, I'd say, "Well, you could put it that way, I suppose. Actually, it's more complicated than that, doctor."

Oh, he'd agree with that, yes. "Oh, I see, it's more complicated."

He'll be giving you all the patients whose illness has gone back and beyond the expected term of recovery; the people who have moved through this illness acute part of this band, have reached the end of this and have gone right on being sick. Prolongation – right on being sick from there on that he cannot do anything about. And that's got him buffaloed, because it is something that is running forward that he can't stop. It has exceeded his cycle of action so therefore he has become the effect of it. His cycle of action didn't end.

Little Willie had measles. Two weeks, he should be up and merry as a cricket. Two weeks go by, three weeks go by, four weeks go by and little Willie is not merry as a cricket.

Now he has entered this field of prolongation. He's up against this problem of prolonged illness. Not that it's merely a long illness – don't get that in crosswise. It's going on too long. It's going on beyond the time it should have stopped. Why? And of course, the answer is in our hands. See, the answer is directly and immediately in our hands. There are psychosomatic elements – psychosomatic elements that's entered into this case. He can't do anything about it. The immediate response, if you could do something about it, or even say you could do something about it, he'd give you about a third of his patients. They're the ones that worry him and don't pay him. He's not doing anything for them, man. They make him feel like a complete fraud. It's those that make him feel like a fraud. Those he can't do anything for. And that drives him right on down Tone Scale. And if he had any help in that direction he would take it that fast. And if you're the expert in psychosomatic healing, in the severest definition of the word – healing by the psyche – medical doctor will say, "Well, why do you suppose this is?"

"Well, I'll tell you, the reason the broken leg there is going on – going on, doctor, is the person for some reason or other has fallen out of communication with the area. The circulation is very bad in that area. He doesn't want anything to do with the area. He actually can inhibit the responses to the area, mentally. He can inhibit blood flow to the area. And if you shift his attention around a little bit on that he might cease to do it, and he'd get – this broken leg would get well, doctor."

Don't try to explain it all the way to him, of course. "I am simply – I'm oversimplifying it. It's more complicated than that," which it is. "I'm just trying to give you a sort of an idea of what, you know, you might see wrong. Just like I can't understand what you did in there with the – with the mallet and so forth, well, I don't expect you understand what I would be doing with the psyche. You see, us specialists have our own compartments. But it's just that he won't have anything to do with the bust, where it's broken there. And we could probably get him to have something to do with that. We'd go into the matter, do an analysis of the thing, straighten it out, figure out what's wrong. And we would get the thing squared around."

Well of course, you yourself have come to realize the complications of the Touch Assist. Well, how many factors are involved in one of these little Touch Assists that we toss off at Level I, you see? What is this Touch Assist all involved with, man? Well, it's involved with GPMs in the first place. There's root words "to reach," and root words "to withdraw." [laughter] All kinds of things, you see, involved with this thing. We call it very simply a Touch Assist. Actually, one leg will become sympathetic with the other leg. And if you put his attention on the opposite member – you must never give a Touch Assist on just one side of the body; you must give it on both sides of the body – and you find that the opposite side of the body has gotten a block up on the right side of the body. You find these various things where you're working. Just in the process of working Touch Assists on people you'll discover something very interesting.

A swelling will reduce, reduce, reduce, and then cease to reduce. And then very brightly you say, "Oh well, I remember Ron says you had to do it to the other hand," you know? "Well, we'll do it to the other hand is what we'll do." "What the hell! It went on reducing," see? It was somehow or other locked up against the opposing member of the body the – on the opposite side. And you can't help but observe these things, and you say, "What's going

– what's going on here?" And you give a few of these things and pretty soon you'll find out that the bird really didn't have a backache, he had a headache, you know? And then if you were stupid you shifted off to the headache. Of course, if you'd gone on treating the backache he would have gotten the backache back, too.

You have to study things called shock patterns. You have to study – a person is hit in the leg and the shock of being hit in the leg in the engram actually traveled up to the top of his head. And he's still got a picture of the shock, you see, and he's still holding the shock from going up his leg. So as you process him, naturally, you run this engram. And he actually isn't actively doing this, he's merely got the picture of doing this and the picture starts to discharge. And the shock wave that should have gone all the way through and did go all the way through – but he wouldn't have anything to do with it because he'd already decided to stop it, you see – that he didn't, of course, put him into apathy about it. He's still got a picture of all of this, and all his emotional expression. You've got the whole pattern of the actual shock wave that went through his body when he was hit in the foot.

Naturally, you do a Touch Assist on the foot, the guy will sooner or later, if this was a very bad blow in the foot, he'll have a headache somewhere during that period of the Touch Assist. The pattern of the shock waves and so forth run out because, of course, they all occurred. Time didn't stop, he's too deep into his GPMs. Just because he said, "I'm going to stop that pain right at the ball of my foot," well, let's look it over. Did he? No, he didn't. But he put a stop in the engram that's stopping the pain at the ball of his foot, and there's where he's held in the incident. So, you start doing a Touch Assist, you take his attention off of that, you discharge that part of the incident, naturally the shock wave, which actually did occur sometime in the past, then traces on through the remainder of its pattern. And it goes on and runs out. If you run the Touch Assist too long, you put him back at the beginning of the engram again. And it'll run all the way through again.

Touch Assist is a very laborious proposition if you were to run everything out all the way with a Touch Assist, see? And yet it's very safe to do. But if you knew everything there was to know about a Touch Assist and tried to communicate it to a medical doctor – is the only point I'm trying to make to you – while you're standing on either side of this bird's bed, I think he'd be there for some hours. So the best way to do it is just say, "Well, of course, this is in the field of psychosomatic healing and so forth, and just like I don't know what you did on the operating table with that to begin with, not that you didn't do it all right, of course you wouldn't know what I would be doing to adjust his psyche. And these are both specialized areas and they're very complicated. Just let me simplify it to a point of saying, well, the fellow's fallen out of communication with that member of his body. We maybe have to restore it, maybe there's some ancient trauma there, there may be – may be something there that doesn't quite meet the eye. But we're not trying to get you to understand all this, doctor, because we're not treating you, we're interested in the patient. And we'll see if we can't end this cycle of action on this illness so that it really does reach its end period."

Aw, hell, if you could do that he'd think you were a magician, see? He'd look on you with some awe. You understand what you're doing. Now, you're going to learn this well, because all Scientologists are very interested in this particular line and this is a line that back in Dianetics had more pcs per square inch than you could shake a stick at. And this is what peo-

ple at Level I are always complaining about. And if you're a very slippery auditor in this particular direction, man, you've got it made all the way through. So you might as well enter the field of psychosomatic healing and work with it.

It isn't a matter of "it's a good way to get patients or make money" and so forth – it's a way that we ourselves have been avoiding. I'd never worked out exactly where we belonged in this particular field. Well, let me point out to you that we do not belong here in the field of physical precipitation of the illness. See, the predisposition, physical predisposition of the illness – that we don't belong in. Physical, see. We don't belong in this period of the acute illness; definitely not in that period. Definitely, definitely not in that period. Guy's got a roaring temperature, we're going to process him – got rocks in your head, man!

If he didn't respond to a little communication and touching the pillow and so forth, leave it alone. You're just going to make him worse. Don't try to process a very ill pc. That goes way back when. It's very reasonable. Why? It isn't that you could eventually do something for him, that isn't the point. If you went on on the subject of what has he done for this illness, perhaps you would break through. But actually every question he's answering, he is so distracted. If there's any possibility that in two or three days this person will feel better, well, let's leave it for two or three days till he feels better and then let's straighten it all out. See what I mean? You don't belong in this period of illness, acute.

And as far as prolongation of the illness is concerned, when an illness is prolonged by medical treatment, such as insanity commonly is with electric shock – that insanity is being prolonged because there is the medical doctor trying to enter the field of mental treatment, which he described more or less as treating the insane. We don't care whether we're in that field or not. But he's again got a physical idea that the brain is deranged in some way and he's got to do something physical to meet this physical condition, don't you see? And he just misreads this across the boards. He has no right to be in that field at all. And the psychiatrist, of course, is somebody that the medical doctor really doesn't want anything to do with.

The psychiatrist is in the terrible minority. He could even be neglected as a factor in the community. All the psychiatrists in South Africa could be – have been gathered in my small office in Johannesburg. You see, what are these mobs of psychiatrists that we're all talking about now? You'd have had to stack them in there kind of tight, and they'd have all been standing up, but they could have been packed into my office.

The medical doctor's the boy. He knows the psychiatrist is a failure. The psychiatrist is a failure because he never solved the problem of prolongation for the medical doctor. It isn't that psychiatrists can't cure illness – insanity or not cure ill – insanity – an illness he calls insanity. It's not that the psychiatrist can't handle his own field of insanity. No, that – the medical doctors: "Ah, well, that guy's raving, picking bugs off himself, go lock him up in a cell someplace, just get rid of the problem. Get it out of sight of the community and so forth." The psychiatrist more or less follows this tradition.

But it's that the psychiatrist couldn't come in and take Mamie Glutz who was sick for five weeks when she should have been sick for two weeks and say, "Now Mamie, what cooks? How come you're sick for these additional three weeks? What's worrying you, kid?"

The illness is actually now not an acute period. It's died down. It simply didn't end. See, she's still sort of bedridden. She's still lethargic. She isn't up and about and at it. How come?

All right, the psychiatrist did not solve that point for the medical doctor, so therefore the medical doctor has no great love for the psychiatrist and would feed him to the lions at the least excuse. And actually, if you made your position completely clear, and if the Scientologist and Scientology at large made its position completely clear to the medical doctor, and if it agreed to this degree: that somebody's bleeding from a femoral artery is no time for psychosomatic healing; that's for the – the time for somebody with the tourniquet (if it's even possible to apply it) and that you needn't go around trying to treat an obvious physical damage such as a bashed skull with a bone sticking out of it, with a Touch Assist – all you have to do is to agree with that point and then your viewpoint becomes totally real both to you and the medical doctor, see? Do you follow?

And all you've got to do for the medical doctor, as a service, because this over here has another whole chapter with regard to it – predisposition: How do people come – become predisposed to illnesses? You actually know quite a bit about that. You could even go back here and find the point where the fellow made the postulate to have the illness. See, you can do all kinds of wild things on this side of it. But it's no help to the medical doctor.

As a matter of fact, if you knocked out all the predisposition, he'd starve to death. [laughter] That's no real help, and he – that wouldn't be real to him at all. But this is real to him, he has his hands on this every day: There isn't a day when he's industriously in the office, on taking calls and so forth, that he doesn't run into this prolongation in some fashion or another.

There's this old lady who is still nagging him. She came to him to get cured of these lumps and she's still got these lumps. And well, he operated on the lumps and he did this and he did that and he finally just got sick and tired of her because she's still got lumps, see? And she's complaining about it and she's yammering and she does show up on his roll books, and so forth. She even pays him money. He'd rather not have the money. He'd rather not have anything to do with this old babe. He's starting to get cross with her, as a matter of fact, and he's getting upset with her and so forth because he can't help her. And yet he's a medical doctor so somehow or another he's got himself into a position where he has to listen to all this, you see? He's supposed to do something about it; makes him feel like a failure and a fake. There's a certain percentage of the practice of every medical doctor is in that condition.

I'm not saying that you should take over that section of the practice. No, no. I should say you should take over the field and take authority in the field of "psyche-somatic" healing. Psychosomatic healing. Psyche – healing with the spirit and the mind.

It, by the way – just as a slight historical note on the end of this here before I end this lecture – happens to be the oldest kind of healing there is, oddly enough. Magic and so forth all traces along this line. Putting the – painting a stone with the symptoms of a headache or something like this, and then busting the stone or something like this, and very often the fellow's headache would disappear. Treatment by symbological means and all of this sort of thing. It's an old, old, old tradition. You actually are the old-timer, in actual fact, and the medical doctor is the newcomer.

When Ug was down there alongside the river with a busted leg, the first thought his companions had around him was that an evil spirit must have struck him down and they all cut and run for the hills and they left him sitting there with his broken leg, see? And pretty soon some specialist amongst them, some specialist amongst them would go down – would develop, and he would say, "Well, evil spirits. All right. He must have been struck by an evil spirit. All right." And he would go down and cast the various spells necessary to knock out the evil spirit or something like that, and what do you know, sometimes Ug didn't die. After all, somebody had come back to see what happened to him.

No matter how faint, in other words, their means were and no matter how unreal they were, no matter how effective or ineffective; and remember, they've very often been effective. Actually there are records that show that the healing done by the Amur tribes' medicine men and the shamans and so forth – they got a higher rate of healing in certain illnesses and so forth than has – is commonly achieved in the Western world, you see? So they're not really bum. But they've gone up and down along the line and so on, and you are in the oldest tradition. You're in the oldest tradition. Of course, naturally it's the oldest tradition, because it's the tradition of the spirit. And therefore there is a great basic truth sweeping behind your tradition that – that's all there is there. And you're saying that can heal, see? That's what you're saying.

And the medical doctor's saying, well, he can't do anything, there really isn't one there and there's nobody around, there's nobody doing anything about it. And you've got to shift the parts around. If you shift the parts around and you're lucky, why, they'll go back together again and it will all be all right.

But you are in the older tradition. And there's no reason why you should not take over. This is just one small section of it. And of course you have areas also whereby the individual is predisposed to feeling crazy and feeling pretty batty and downhearted and depressed, and then this didn't go away for quite a while so you did something about it. Well, don't get your own cycle of this mixed up with the medico's physical cycle of this, you see? And prolongation is where you belong, because that's what worries the world today. That – if you want to do any psychosomatic treatment, why then, the proper course would be to get the individual examined by the medical doctor to find out if he's acutely ill and if anything can be done for that acute illness which is rather easy to do and which comes to a positive end. Do you see?

And then, if you've ruled that out and so forth, why, you pick it up from there – whether you've ruled it out or ruled it in, see? At that point you pick up the case and fix him up so that he doesn't keep on getting these spells or something of the sort. That's psychosomatic healing, you see?

It's a very, very broad field, and we are so broad that we very often fail to realize that there is a field we don't have. We are too cocky in our total ownership of everything and there's a field which we really don't own and that is the field of keeping the artery from pumping when it is severed, and that isn't part of our field, you see? Ah, yes, we can go up along the line and say, "Well, all right, Operating Thetan came along, he could fix that up." Well yes, he could mock up a new body for the guy. Do you see, it could – it can go that extreme.

But in the field of the workaday world of the little guy going to work and coming back again and that sort of thing, when he breaks his leg, he wants his leg put back together again

fairly straight, he hopes. And there are some people in the society who do that. And we want to know why this guy broke his leg, well, all right, we could inquire why. But we are really not vitally interested and the medical doctor's not vitally interested until that leg, which was broken, failed to heal at the expected period of time. And when that occurred, then that door is wide open to us with a crash, because we are actually the only hope anybody has from that point on. Ninety percent of the broken legs heal, *whir-pop*. And the rest of them, the guy just goes on limping and limping and he has pains and he has ghost pains in it and he doesn't know what it's all about.

So now I'm not talking about the field of general Scientology practice in this lecture, let me make that clean to you, too. I'm not talking about the *whole* field of Scientology. I'm talking about just a little particularized field of Scientology that we could call psychosomatic healing. And that's where we belong in the field of psychosomatic healing, that's where we could be of service in the field of psychosomatic healing and that's where we would be accepted – in the field of prolongation of the illness.

Thank you very much.

PSYCHOSOMATIC: ITS MEANING IN SCIENTOLOGY

A lecture given on 30 July 1964

Thank you. Thank you. All right, this is the what?

Audience: 30th of July.

Thirtieth of July.

Male voice: AD 14.

AD 14. Thank you. All right, Saint Hill Special Briefing Course.

Well, we're going to have – I'm of a – of divided opinion here with regard to what I should talk about today. I was talking about psychosomatic healing and so forth, and we were all set to do something that was energetic and proper and line ourselves up with healing and try to and so forth. And I saw the snide looks on most of your faces when I was talking about that. [laughter]

It is possible to win over a medico. It is possible to win one over. I just got through winning a couple over, see, showing them where this started and end, and the argument was very convincing to them and psychosomatic healing could be very interesting – very small but interesting section of this and we have some new breakthroughs on the subject and so forth.

But I don't think really that the idea of undertaking it in very close cooperation with the medical profession would be very successful. That's my candid opinion because I looked over my case histories on the subject of their treatment, and their treatment lays in too many what they call "psychic traumas."

Psychic trauma to them is something they don't know what it is, but it's a word they use. Don't go looking for a meaning because they really have no meaning for it.

So you're going up against a problem here, if you deal with the medico, of a person who monkeys. He doesn't have any very precise answers, when he immediately gets out of the field of the broken leg, when he gets out of the field of putting on a tourniquet or some other type of action and he gets into a field where he himself does not have very good answers and so he monkeys. And they will do some very interesting and wild things. They will get some kind of a suspicion that there might be a growth in somebody's chest and start removing tissue. And they'll do exploratories and they will do all kinds of wild things. They will go into a tumor and take a small slice of it and so forth, thus activating it and aggravating it so that now the person practically is dying whereas before they weren't bad off. In other words there's a

lot of monkey business. And I say that very advisedly, I'm not merely – I could think of much more high school words than monkey business, but I think it rather fits, so forth.

Man descended from monkeys and those that didn't descend much became doctors. Bitter, huh? I – this caused me – this caused me to take a very sharp look, caused me to take a very sharp look at a possible cooperation. And it left it very much in question because time after time after time after time, I have treated iatrogenic difficulties.

Now, that's a nice upstairs word, and you should learn that word. Iatrogenic – it means "doctor-caused." It's an illness caused by the doctor. In the whole field of psychiatry you have practically nothing but iatrogenic psychosis today. If a person has been unlucky enough to get into an institution, the person is so traumatized, in other words, so bunged about, so shocked and so batted around that, one, any establishment of communication between a person in the realm of a helper, you see, or the person in the role of somebody who's going to help him or treat him is of course immediately broken down. It's almost shattered. That the person just mentions he's going to help a psychotic who has been institutionalized is usually enough to produce a complete break of affinity. And it's just out the window, right now. Gone.

Because their idea of help, I don't think that the common ordinary garden-variety legislator, senator or representative or some other chap – chap is there because the other one is deleted – is censored. He passes these vast laws. "Vast laws. You know, you've got to pass laws." And so he doesn't know anything about what he's passing laws about. So he sets up some kind of machinery where anybody that stumbles across a pebble in the street is at once put on some kind of an underground railway that disappears from public view and you go *swoooo*, and you wind up in an institution. I mean, it's the wildest piece of legislative balderdash that has ever existed.

There is nothing in the Constitution that says you have to be sane to be a citizen. Call that to your attention, that's the Constitution of the United States. You don't have to be sane to be a citizen. And yet these boys have moved it over to a point where if you are pronounced insane you're no longer a citizen and have no civil rights of any kind whatsoever.

So anybody can pronounce anybody insane by the legislative action; it doesn't even take a doctor. And then the next thing you know, why, the fellow is inside, and the moment he's inside he has no civil rights. So this then opens itself wide open to political balderdash, hanky-panky. Political hanky-panky, you don't like somebody...

They did it down to somebody down in the southern part of the United States. The governor of a state, not too long ago. I think he sacked the whole staff of the hospital and walked out. They had forgotten that he still had authority to sack the staff of the hospital. But they tried to railroad him, you see, and this becomes a political mechanism.

Anyone whose ideas are antipathetic to us fascists or us communists or us something-or-others must-rule-all. Anybody who says – up and says, "You know, I don't think that's right. I – I think we ought to keep the Constitution so..." "Oh, he's insane!" and so forth, and they got this machinery all set up and in he goes, and he has no more political rights, you see.

Now you think I'm exaggerating, but I'm not exaggerating. I think you've had a few lessons in this before. I've told you – it – I get letters every once in a while, "Dear Ron, For

years I thought you were just fooling when you talked about something or other, but the other day I went down to the local clinic, and you've been understating the case." You see?

All right, this legislative machinery sweeps over and places in the hands of the anointed practitioner the right and power to operate in the field of the mind as well as in the field of physical illness, and the right to railroad this bloke in and so on. And here in England about the total training a GP has in the field of the mind is a six-hour lecture in a drafty hall in some insane asylum which he doesn't even have to attend to get his examinations. That's his basic training in the field of the mind.

So they have the idea, because the legislators have passed Legislation giving them total power in this field in most Commonwealth countries, in England and United States, and they have the idea they know something about the mind. And to them of course, even by their definition, the mind is the brain. And yet because of the mix-up that words can be subjected to, why, they therefore say if you're operating in the mind you're trying to do something with the brain. And they're very confused people because in the first place they have not been trained. I underscore that, they have not been trained. They have no training in this field at all.

They have no training because, one, there has never been any textbooks in this field which produced effective release of neurosis or psychosis or psychosomatic illness. That's one of the reasons they've never been trained. Which is an understandable reason and forgivable. But to pretend then they've been trained when they're usually quite aware of the fact there's no data in this field, that to me is – borders in the realm of – well, let's use a mild phrase – fraud. And the second reason they've never been trained in this field is that they themselves don't have to be trained in this field. Any GP – General Practitioner – has the full power to treat any and all mental illnesses of any kind granted to him by the various legislatures and parliaments of the Western world.

So one, he hasn't got anything to know, and two, he doesn't have to know anything about it. So this makes a beautiful monopoly, which is manipulable politically, is very remunerative in various ways and he can go to town. The fellow called a psychiatrist is not licensed to practice psychiatry. There is no license to practice psychiatry. You have a perfect right to call yourself a psychiatrist, it has no legal definition of any kind *whatsoever*. It practically does not have even the legal definition that Scientology does. Scientology has a better right to it because Scientology's at least copyrighted and trademarked.

The word "psychiatry" has no actual legal definition. And there is no bill on any legislative books anywhere which says a psychiatrist can practice in the field of the mind. That leaves them completely out on the limb. They have to be a medical doctor, they have to be a medical doctor, in order to practice in the field of the mind. And any medical doctor can practice in the field of the mind. They do not have to be trained to practice in this field, and therefore a fellow who calls himself a psychiatrist only operates in the field of the mind legally so long as he is an MD in good standing. This is something you should realize. There's this whole field, then, called psychiatry, which has no existence in legal fact. Isn't that very interesting. There are no laws licensing psychiatry. There are no psychiatrists who are licensed.

Your certificate as HCA has far, far, far more validity than any psychiatric certificate ever issued. They do not have any certificate signed by Freud, Jung, Adler or any of them.

See? Pavlov, so on. There'd be two ways of training or certifying somebody, is the person who develops the information always has a right to validate whether or not a student who has studied that information can use it in some effective way.

You see, now that is the oldest, by the way, the oldest method of validating anyone's training. That is the oldest. University substitutes for that. This person has been here and read the textbooks of the guy. And actually university certificate or diploma and so forth does not have the same validity that the – a certificate or diploma issued by a person who was an expert in his field directly teaching the student. That has validity. The other is just a detour. You understand that? All the university can say is this fellow's been here and has read the textbooks of Joe Blitz. So therefore he's a doctor of something or other.

No, I'm afraid that doesn't hold very well. So that even holds many types of training in severe question. But I'm not trying to beat a drum in that particular direction, I'm just giving it to you the psychiatrist does not have a certificate which has anything like the validity of your lowest certificate of most of you sitting here, is HCA, HPA. He's got nothing like that.

For instance, as close as he comes to anything of the sort, is he becomes a diplomate or something like that through having thoroughly studied and passed examinations on the writings of Freud. In other words, he's been through everything that they have of Freud's and he can give you chapter and verse and date of everything Freud has written and said. And having passed that examination then some unauthorized body says he's a diplomate and therefore is valid in the practice of Freud's work.

Well, that's all very well. If this were a group of students of Sigmund Freud who were doing this, that would be different, you see. If that were a group which was perpetuating his work. But it is not. It is simply some body of blokes that set themselves up independent of Freud. And none of these people were ever trained by Freud. And he set up no such activity and none of the Freudian analysts originally set up such an activity, so actually today Freudian analysis is not practiced.

There practically is no practice of Freudian analysis. They practice things like Horney and other squirrel offbeat things and so forth. And perhaps Freud could produce a finite result in the field of the mind. And I know, having been trained to some degree by Commander Thompson, who was trained by Freud, I know very well that Commander Thompson could do some very wild things. He'd do such things as train cats and things like this. It was pretty, pretty wild.

I know that doesn't sound like much, but you really have to have a command of the mind to train a cat. And he had a cat he called Psycho. And this cat would do most anything, on command. And it was quite wild, quite fantastic. And the way he trained the cat was directly from knowledge of the mind. He'd wait until the cat did something and then reward it. Now, of course here was a basic student also of Pavlov at work, you see. They'd forgotten the other half of Pavlov's work: What you must do is punish only, they think. But he would – he'd just use straight reward. He'd wait for the cat to do something, like jump up on a chair. And then he would say the command word and reward the cat. And he eventually had the cat so the cat would – you – he'd say, "Jump up on the chair," and the cat would jump up on a chair. And this really made everybody blink. And the cat could do a lot of these silly little tricks.

But there was just an applied piece of the field of the mind, do you see? Directly. He for instance told me things which I have never since found in any of the written works. It's quite interesting, these little bits of missing information which go to make up the body of data which becomes a practice are mostly, I think to a large extent, missing. Because they're the word-of-mouth things you pick up around the joint, you know?

He taught me things about association that I don't find – I find association is something else in the Freudian texts. But association, the concatenation of association whereby a person is actually able to arrive at some conclusion. I say concatenation, I really mean a string of things. And the association by libido theory of course is short-circuited onto the second dynamic, so that the person has certain things he associates with certain things which then these certain things being the woof and warp of his neurosis and psychosis – then his neurosis or psychosis is recognizable by what he has associated with what, you understand? Word association tests, in other words, and so forth.

Now, some of this has survived through Freudian lines and they do talk about it, but not to the extent that Thompson talked about it. He talked about other things. He talked about a diagnosis of the actual incident through not just listening for five hundred hours to the patient, you see, but actually finding out what he associated with what. And this required a very active and imaginative practitioner. But you could see that a practice of this character whereby you sort of have to get an idea of what's wrong with the bloke, and then you have to look around and find things for him to pick up and ask him what comes to his mind instantly, you see, and you would arrive with this trauma.

Now, Freud didn't have in mind four or five years of an hour per week, you see, he didn't have this in mind, this wasn't his idea of a treatment. But this other is so imaginative, you see. We look at this fellow and we say, "That is a sort of type who has a fetish on – he's a fetishist" – keeps things or attaches wild significances to things – "been terribly dominated, probably his mother." You know, this is the practitioner, he's figuring it all out, see? "And he looks like that. Let's see, he looks arrested maybe at the age of three or four. All right, now, when I say – now when I say 'mother', what comes to your mind, now? Yeah." And the guy says something, you see, and he says "biscuits" or something you know. And the guy says, "Mm-mm, mm-mm," and then he – you know. Then he says some other word. And the next thing you know he's got a moment of punishment or mental conflict at the age of three, maybe, or something like that, when the fellow had an ARC break with his family, you see. And has been in protest ever since against the situation, was pretending to be ill or something of the sort.

In other words, it was all on the back of the practitioner. Well, this moved off from the practitioner being very, very bright and very smart and very alert, moved over into an entirely different aspect of if he goes on long enough maybe we will find out something. And you find out that a person who is very, very dull depends utterly upon simply amassing data to arrive at an answer. If he amasses enough data, he may find out. Actually, it never happens exactly that way. When you amass enough data, I assure you, you get lost in the data.

There's a danger in amassing too much data. I'm going through a phase like that in my study of study right now. I've just got through amassing too much data on a highly inde... of a

highly antipathetic bit of the subject I'm studying and so forth, and I say good heavens, what wouldn't I give for some practical right now. Too much data. I'm getting confused, you know? Just jammed in with a sledgehammer. Too much data. No way to practice the data. No way to apply it. If you could just apply some of the data, you know, why, you'd feel better about it, you see.

Well anyway, Freud's operational basis may or may not be practiced. I wouldn't even know what it was, you see, very clearly. But probably I would have a much better idea than Doctor Sparkbreaker of the Bide-a-Wee Insane Asylum. In fact, I would have a much better idea than he would. Because my communication line only came through one via. And his communication line – oh, brother! See?

The only point I'm making here is technology, technology is very dicey stuff. The more vias it goes through, why, the more errors it becomes subject to. You... that's why you like to have me around when you're studying Scientology. You think, "Well, if it gets too rough and you get too confused, why, maybe he will pick up my despatch and so forth and give me the gen." As a matter of fact, I feed you a lot of gen back along other ways, too. Your Instructors are always at me and Mary Sue is always at me and Reg is always at me and so forth, about this, that and the other thing and so forth, and I lay it down. Tell them which is straight and which is not straight. You get it straight in these lectures, of course.

Now, the number of vias which go on to a line are proportional to the number of errors which are introduced into it. Interpretations. Some bloke didn't quite understand what the phrase was so he relayed that along as something else and then this caroms against something else and the next thing you know you have a whole new body of study called Freudian Analysis. And it today is a brand-new body of study.

For instance, I've collided with a bitter argument with a Freudian analyst, Johnny-come-lately, circa 50s, you know, a *bitter, bitter* argument on the subject of what transference was. And the critique of psychoanalysis and so on, one of our little booklets there, they're violent on that subject. All I've given them in there was what I was given to be true by Commander Thompson, see? But now they've got a different psychoanalysis, you see, so even a person who is announcing the original psychoanalysis is wrong and doesn't know what transference is, you see. We owe quite a bit to that particular field, but nothing to the body of knowledge or practitioners called psychoanalysts or psychoanalysis today. You should make that very, very clear. We owe something to Freud and nothing whatsoever to the existing bodies that call themselves psychoanalysis, see.

Now, that's as close as these boys have gotten to any wisdom on this particular subject and it has become perverted. So their right to practice in this field is very questionable. Now, the right to practice is based upon the ability to do. And if you ever permit that to be dropped out of Scientology, you will have a great deal of trouble from thereon. The ability to do regulates the right to practice. That's open and shut.

The right to practice does not depend upon a legislator, see. In the first place he's some hayseed that has been hauled off of his seeder by a couple of the local political bosses because he's such a sterling gent. And they shove him in the direction of the local legislature. And I'm saying "local" legislatures because most of these laws are made in the little state legislatures

and the little state parliaments. They're not made at – in Congress. One must say that with great awe: "Coonngress." Much less "the Preeeesident." These boys are not the fellows who make these laws. They're made – little pipsqueak state legislators where they make them clean their boots before they walk into the anteroom, you know? These are real corny, these little legislatures, you know.

My God, I had a state representative in Arizona one time trying to get plaudits from me on the fact that they had just read into law the Ten Commandments and that was now to be the law of Arizona. Oh, after all, my God.

Imagine it! They were actually trying to scrap all the laws of Arizona and in its place put in the Ten Commandments, you see. It was thereafter going to be Paradise. Well, of course, their owners or their keepers, the moneyed fellows in the society who headed them toward the legislature and controlled them more or less got some wind of this and pulled them off of it, so they all agreed that it should be this way and made that into a law.

But these birds can be stampeded. They can be stampeded by almost anybody. They're not a high-caliber intellect in the first place, they're probably all right growing their seed corn or they probably were all right in the hardware business, you know, or iron mongery. But when it comes to this sort of thing, government is never granted the dignity here in the West that it deserves; government is a specialized skill. It is a science and an art. And these fellows are not very hot on that line.

So the way they govern is just people rush into them and tell them how bad it all is over there, see. It's government by "how bad it all is." Now this has gotten so prevalent that it's even in practice this way in Congress so that if enough people rush in and say how bad it all is – specialized interests, you see – they can stampede these legislators into doing something catastrophic in the way of a new bill. And this has gone further and has become highly commercialized. So you have promoters. Promoters for a new government department. He wants a few, a few more million to play around with and a few thousand employees to boss around and give him importance. He will then find how-bad-it-all-ises in the society, rush these into the legislature and get then a big appropriation by which he can found his new department.

After he's founded his new department he couldn't care less. That's why you see the ebb and flow of attacks on Scientology. These – Scientology is simply used as a how-bad-it-all-is. They rush in with unfounded and completely false representations into these legislatures, some promoter does, you see, some bird who wants his new department to help to get himself a new three or four billion quick bucks, you see. His wife is just fresh out of Cadillacs. That crude, see?

So he finds out, well, we'll paint it up one way or the other, and this is never tried, you see. This is all done in the office of the majority leader or sminority leader or something like that. And they go in and they make some kind of a dicker and they get this fellow all stampeded about how we actually are driving stakes through people's chest in the dark of the moon or something like this. It's never subjected to any contest, don't you see. And this fellow, next thing you know, he's out there saying, "Kill all the Scientologists! And *de-de-daaaa!*"

And so next thing you know, why, some bill slides through, "Mental Health bill with a five billion dollar appropriation was granted today to Joe Schmutz – no, we mean the FDA," see. And then this guy Joe Schmutz, or whatever his name is, he couldn't care less about what Scientology is doing because he had no sincerity to begin with, you see? So all of a sudden it's all dropped like a hot potato and nothing more happens about it. And probably the whole Melbourne mess is just the medical department down there actually trying to get themselves a few quick pounds. That's right. This is – this is actually not even a cynical view of it. I mean, that's the way it's done.

So they've gone stampeding in there and they told this Galbatty it – no wonder the fellow's crazy, with a name like that. [laughter] They told this boy, "It's terrible, it's awful. How bad it all is. The Scientologists are ruining everybody, while us psychiatrists are only killing people in windrows. But we won't mention that. But anyway, if we just had a big appropriation we could prevent these things, you see." And that's the little rider that the public never hears about, see. Oh, they get a big hoopla, they get it all going, and so forth, and everybody having found out how bad it all is, why, somebody appropriates a few hundred thousand quid. In a case like that, a thousand quid would absolutely buy the mayor, you know? It's not big money like it is in Congress. When they play this in the Congress of the United States, you see, it's worth billions. When they play it in the state legislature you'd be absolutely fascinated how small change it is there – a few thousand.

And – so all of a sudden, why, having started this tremendous campaign about how bad Scientologists are, and so they could make their quick bucks, you see, why, they – all of a sudden nothing else happens. Of course, they get the money and they buy the wife the Cadillac, and that's it. See, they're not interested in doing their job, they're just interested in getting some cash. Now, if you hit somebody with enough bad news – this is your important technical datum – if you hit somebody with enough bad news, force or duress, you can make him give you something. That happens to be a mental mechanism. Nobody ever really looks at this as a mental mechanism, but it is a mental mechanism. That's all it is. If you hit somebody hard enough – and that would mean a blow or bad news, or you know, a blow in the field of mass and bad news in the field of significance – if you hit somebody hard enough, you can make him give you something. Blackmail is based on this. Government is based on this. Taxation is based on this.

You think those soldiers standing around with bayonets are just to fight the enemy, you're goofy. Because they're not there to fight the enemy, they're to keep the citizenry impressed so they'll keep coughing up those tax bucks, you know. Actually the dollar bill that isn't backed up with a bayonet is worthless. Hasn't anything else to back it up. It's got to be backed up with a bayonet. And that's all on the basis of – you can make somebody give you something, see?

Now, there's – there could be more to this mental law, and there probably is more to this mental law, but we're not interested in the whole mental law here. We're just interested in what law they are using. That is the law which is being used and it happens to be quite factual. So you rush up to somebody with enough bad news and you can shake him down for something.

I'll give you an idea of this. "Is seepage troubling your loved ones?" This is an ad of a mortuary. [laughter] "Is seepage troubling your loved ones?" Wild, isn't it? Now, do you know how much they get for any of – for some of those sealed boxes that they put out there, those metal caskets, and then their – what they call a vault, and so forth? Wow! You talk about going bankrupt. The way to go bankrupt is to get the old man to kick the bucket. You'll go bankrupt fast. Not because of the depreciation of his income but the cost of the funeral.

So they can sell everybody then sealed – water-sealed, watertight caskets and water-sealed, watertight vaults which cost a great deal of money, don't you see? See, well, that's a piece of bad news, and they hit somebody with this piece of bad news and they can shake them down for several thousand dollars, you see, then, for some pieces of concrete and tin work. And that is an operating law. It operates in the field of commerce to this way, to some degree, but more aptly in the field of government and certainly in the field of healing.

Now the doctor, the medical doctor, knows practically nothing else as "method of how to get along commercially in life." And he's always coming up with a new disease campaign of some kind or another. Now, the funny part of it is his money does not come in the public appropriation front from curing anything, his money comes entirely from scaring people with how bad it is.

Now, I'm well datafied on this because a pal of mine had had quite a case history book on the front of this. He used to sit around and talk to me by the hour. And the old – the old boy used to tell me about a surgeon – a surgeon who would rush up to someone – the guy had a specialty in appendectomies, you see – and he'd rush up to the relatives or he'd rush up to the person, you know, see, in a terrific rush, and say, "He won't last the day!" You know? "Appendicitis." Fellow's got some kind of a bellyache, he ate too much turkey or something, you know. "He isn't going to last the day. Dying. Gone. Emergency operation, must operate," see, bang, bang. "Oh, yes, go ahead."

"Well, these operations are very expensive."

"Oh, that's – spare no expense."

So he'd double and treble his price for the appendectomy, see, in this particular line. He'd go down and whip out an old kitchen knife or something and go to work. And then, this guy, having brought out the appendix – quite normally they're healthy appendix, you see – would take them and hold them together and squirt them full of air so as to make them four and five times the size, you see. And there they are, all covered with blood and terrifically swollen, and if any relatives were waiting in the anteroom, he'd keep his gory gown on, you see, with blood splashed all over the place, and he'd take these things with the air blown up in them and *rush* into the anteroom, *shake these things* in front of their faces, you see, and say, "We got to it just in time! They were about to burst!" And of course these people are terribly grateful and pay his outrageous bill at once. Method of collection, see. "Thank God you were there, doctor, thank God, yes. How much did you say the op... twelve hundred dollars?"

"Oh, well, we got there at once!"

"Oh well, twelve hundred dollars, yes sir, there you are."

They use this as operation. So Scientology, Scientology is used to shake down appropriations for new psychiatric services. Those – new psychiatric policing, new psychiatric this, new medical this, new medical that. It's just one of the things that is used. You wonder why is this good press or bad press and so on, it has nothing whatsoever to do with press. It has to do with who wants a current appropriation.

Now, you notice that the FDA has no further interest now and wish to God they'd never started this suit against E-Meters in the United States. They sit around with their head in their hands because it's causing them trouble. It's causing the election campaign trouble, it's causing a lot of other trouble. Barry Goldwater's getting very interested in this one. We've – this is one of the shots that's going to be fired in the campaign.

Now, this was very embarrassing that some dumb promoter over at the FDA, and so forth, suddenly starts to beat the drum on how awful E-Meters are, don't you see? Because they don't want to bring the thing to trial. They'll get it to trial, they'll lose it like that. Now, if they lose it they'll set a precedent. They'll also get a counter-suit against the United States government for about a quarter of a million, half a million bucks, you see. Then this brings about another suit against the American Medical Association for having driven the FDA into such a state of frenzy, see? So they don't want to bring it to trial.

They've already used it, it's a dead dog and it's one they shouldn't have used. They recognize this now. It'll work this way similarly down in Victoria.

There'll be repercussions both ways to, but there's too much vested interest in doing this in Victoria. I could not make a breakthrough or convince anybody down there they ought to wind this thing up. Everybody just calmly resisted the idea of it. Well, it was too valuable to one and all.

Well, we see the opposition didn't get in and folded up by the wayside, which we very possibly strongly influenced. But the conservatives got in again. But the conservatives are in for a new shock when they get things arranged down there. I'm going to throw a new brickbat into their vicinity and just work the game backwards on these fellows. "You see what happened to the Laborites when they attacked Scientology, now you be good to us. Now, we want *you* to introduce some legislation or we'll defeat you at the coming election, as we defeated the Laborite."

In other words, we'll take full credit for the Laborite defeat. We'll tell everybody, "Well, you see, they – look, they lost." I'd have a little notice up – got to play these things a little tougher than a lot of people have guts to do so. I'd put a little notice up in the window, and it'll be an open letter to Mr. Galbatty, "I told you you shouldn't have done it," you know, that kind of a letter. "You shouldn't have done it. We very seldom enter the realm of politics, but when we do we're very effective, as you noticed in losing your last election." Very funny.

For instance, our biggest contender up here on the council that was raising the devil with our Town and County Planning Commission now happens to be in a beautiful state of having lost the election. He was the bird who started the "death lessons" thing, and so forth. And we finally moved him out of office.

Now, so these things can be manipulated from the other side, too. But this is a mental law – this is a mental law that you should pay some attention to because it's the basic law which is used usually in government, extortion, blackmail, medicine, any one of these things. If you understand that, how that law operates and so forth, then you'll understand why and what and usually think up a very nice defense and handle things much better. Because you'll understand who is doing what and why, you see? Why are they raising this much fuss?

Now, this works also this way: You're in a situation where so-and-so and so-and-so, you're in practice. Now, this law is just not worked by governments, this law is also worked by patients. "I had a this and I had a that and last night I could hardly pant and so forth and I'm dying today and so forth and therefore you have got to give me something," see.

Now, you could just discombobulate somebody terribly knowing that law, you could discombobulate somebody horribly, if when they came in and started telling you how bad it all is, ask them what they wanted from you. Be more bald than this. "What am I expected to give you?"

Now, the person quite – of course quite innocently may simply be dramatizing at some vast extent, don't you see. But you won't get perhaps a sensible answer. But you will sure change the course of what they're doing. Now, when you can shift somebody who is in a near state of hysteria about something or other, when you can shift their attention you can manipulate and handle the mind. It's obvious that you can manipulate and handle the mind because you can shift and change their attention.

I had an old pal of mine tell me one time that if you – if you get a – if you can make people laugh when they're crying and cry when they're laughing, then you would know something about the human mind. Interesting statement, a rather – a wider statement than one would believe, but a rather challenging statement. If somebody's crying, can you make them laugh?

If somebody's laughing, can you make them cry? Yes, this shows then you would – you would know the buttons, right? If you would know the push buttons of the mind – but knowing the mind isn't necessarily manipulating the mind. That's where that definition falls down.

But here is a point of mental manipulation. "What are you after?" "What am I expected to give you?" And you'll see them shift gears. They will shift gears with exclamation points. Because you've hit on the other end of the mechanism which they may unconsciously be applying. They may not be consciously applying this mechanism at all. They really may not want anything from you, you see. But by misidentification have you identified with something else from which they do want something.

But this really shifts gears. If you used this, for instance, as a Director of Training or Director of Processing and so on in a Central Organization, you'd have a ball. Registrar, and so forth, it's a wonderful post on which to use this particular mechanism. "All right, what are we expected to give you?" see. How bad every – you all are and how bad everything is and how bad it is, "All right, well, what am I expect..." no matter what's all bad, do you see. If it's getting in your hair, if you just give this as the response. It's not the expected response, but it is the actual response that fits on the other end of it.

See, they don't expect this response, but it is the actual response. And you'll get a discombobulation which is zzzz! It's fabulous, the amount of effect that is produced by that shift of – sudden shift of attention, and so forth.

"And my father beat me and my mother beat me and everybody beat me, and so forth, and everybody hit me..." and you're not auditing this guy, you see. "And so forth, and they forbade me to come down here and they're going to have – so forth, and they tell me the police are going to come down and mop you all up, and they tell me that so on and so on and they – so on, and it's all bad, and so forth."

"What am I expected to give you?"

It generally will be something. And it just turns it all off, bing, you see? And it's quite interesting. That's not for use in processing session, of course. [laughter, laughs]

Now, let's see what all this has to do with psychosomatic healing. All right, it has something to do with psychosomatic healing, it means the medical profession means something else by their term psychosomatic healing than you mean by psychosomatic healing. Because they think it's the mind influence on the body that is psychosomatic condition. Mind influence on the body. But this is different, because what do they mean by "mind"? Now, what does the word psychosomatic mean? Let's go down to – let's go down to cases here and I'll give you what I started to tell you today.

Psycho, named after *psyche*, or the soul – you know, that's little Psyche that was shot with the – by arrows, you know? This is Raphael's little doll, see? All right, it's the Greek symbol for soul. And you might as well put thetan, see, in the place of it. I mean, it translates that clearly, see? It's the same word, no difference as – in our field, see. Soma, body. Don't look for any more complication than that. Soma, body. Body, soma. I mean, that's all. I mean, that's all that soma means. It doesn't mean anything complicated; it's a very straightforward word. And then -atic of course is just your suffix, which means the action or condition of.

All right, now look, look at this: *psycho*, *soma*. A proper definition – now, understand me here – a proper definition of "psychosomatic" would be a thetan's influence on the body. You got that? That would be a proper definition and is our definition. That's our definition. Therefore it should probably be called "psychesomatic." Get the "o" out of there, which has very poor connotations, see. It's more comprehensible if you said "psychesomatic," see? *Psyche*, thetan, *soma*, body, see? And because it comes ahead of it on the cause-distance-effect formula, why you'd have psyche influencing the body. Simple.

All right, now, somebody somewhere along the line translated *Psyche* into mind. Now, that's the first downgrade. A thetan becomes identified as the mind. In other words, he doesn't know who he is anymore but he becomes these masses and that sort of thing, and he is this massy automatic piece of machinery called a mind, you see. So we've already lost the thetan and we have a mind. So then that would deteriorate into this definition: *mind influence on body*. If *psycho* – *psyche* – *psycho*, as it's used, has deteriorated to become mind, why, then it's mind influence on soma, body, see? So that would be "mental influences on the body" is what the word would mean.

All right, now, if we further deteriorated the word *psyche*, to mean "brain, and nervous system," which is where medicine lives, we would have the influence of the nervous system upon the body – influence of the brain and nervous system (brain merely being part of the nervous system), influence of the nervous system on the body. This is something like saying "the influence of telephone switchboards on the government." See, there's nobody on these lines making any calls, the switchboard now is somehow or another conducting all of its business all by itself.

If you can imagine a society in which the switchboard is looked upon and the telephone lines are looked upon as the causative action in the society, you can see – can you get that concept? We're having a depression because all the switchboards are reluctant. That sounds pretty *ding-ding-ding*, here comes the wagon, to me. Doesn't it to you? We are down then in the realm of the medical definition, which is the *psyche*, by which they mean brain and nervous system, influence upon soma, body.

They've gone the complete identification because of course the brain and the nervous system are part of the body, part and parcel, so they now are down to "body's influence on body." Body's influence on body. So now this is a total identification, they haven't anything influencing anything, so there's therefore no cure for it. So they've solved it. That's what they'll tell you, there's no cure for it!

Of course, they haven't got anything causing anything either. So they should call it "somasomatics." Because *psyche* has left. And they have absolutely no right to use the word *psycho* in their term "medical healing." Now, when they treat psychosomatics, they think in terms of cutting up a few nerves or filling somebody full of a few shots that feed up the neurons or make the synapses snap better. They do something wild in this to handle the nerve or channel or brain fiber or something like this, which is then supposed to handle the body, but it is the body, so where are we? We've busily arrived nowhere. So the field then has become lost. Now the field's a lost field.

Basically then a better term would be spiritual healing or spiritual influence on the body or spiritual illness, if you want to put it on the downgrade. Do you see that? See? This is the subject which you are then addressing when you address the fact that Mamie Glutz has got a stomachache, and that's because she had a fight with her boyfriend last night. Mamie Glutz had a fight with her boyfriend last night, Mamie Glutz has got a stomachache today. You come along and you say, "Mamie, what's wrong." And she says, "Oooh, I've got a terrible present time problem, got an awful stomachache. Got a terrible present time problem."

You say, "What happened?"

"Oh, I had a little de... terrible things. I had an awful fight with my boyfriend last night."

"All right, what didn't you communicate to your boyfriend last night? What incomplete communication existed last night?"

"Well, so-and-so and I didn't tell him so-and-so on and I didn't so-and-so and I didn't tell him so-and-so and didn't tell him so-and-so and didn't tell him so-and-so and I didn't tell him so-and-so."

"All right, Mamie, how do you feel now?"

"I feel fine, thank you very much."

There're actual case histories. You express it as an auditor: We handled the pc's present time problem, he felt better. And you actually are accustomed to somebody's having his wits scrambled and therefore having a bellyache or having his foot hurt or having the end of his nose hurt, you see? You operate very easily in that operating climate, see? And that is so familiar to you as an auditor that you don't realize that it's a totally unknown concept to the society at large. Isn't that interesting

They no more connect last night's fight with the boyfriend, with the stomachache they had today than the man in the moon. And this is such a brand-new idea to them that in the field of preclear education did you say, "Did you know – did you know that your various mental difficulties or conflicts or your collisions with life in the field of getting your job done or so forth is affecting your body?"

"Well, I know I'm not getting enough exercise. I have to sit at a desk too much."

All right, don't interrupt him, because you made a sort of progress.

"Is there any other way it could have ... ?"

"Well, I don't know. They tell me a fellow gets ulcers if he goes on worrying. I sure worry a lot."

"All right, do you have ulcers?"

"No, but I might have them." [laughter]

See, he knows it's basically true. But you could actually bring him up to a realization of this by a process. You could process a person to a realization of the source of his ills. But this is a slow way to do it, because he'll recognize it fastest by education. But I'm just giving it to you. It's there to be found. It isn't there because I say it's there; it's there to be found. In other words, you could say to somebody, "Tell me a time when you had a nervous upset and felt worse afterwards." You say that's a leading question. No, that wouldn't be a leading question normally, it wouldn't upset anything, if there wasn't something there to be found, see?

So the fellow says, "Oh, *Ooooooh*. Never thought of it that way before, but I – there probably is one. *Uhhh-uhhh-uh* – oh, yes. Hey, what do you know, I was sick for over a year and a half after my wife divorced me. You know, I think I was sick because I was so upset. How about that? Huh! Well, what do you know! Felt very degraded. Hm! You're trying to tell me that if I wanted to be healthy I shouldn't be mentally upset."

You say, "No, no, I'm not trying to tell you anything, trying to let you find out something. Is there any other time in your life when you were ill following a mental upset?"

And he'll locate three or four and he'll make a lot of big case gain and he'll go up in smoke. It'll be long comm lag stuff, you know. It might be almost the session comm lag. Might be next day he answers the question, see.

But that's because he's gone so far down from being a spirit. See, he now is thinking of himself as an animal or a neuron or a brain.

So it's no wonder that the society at large has fallen into these traps and has gone this low on the Tone Scale with regard to thetan-caused illnesses, thetan-caused healings. See, so the... everybody's in that condition out there in the street, see. They don't ... But they'll snap to this. Then they'll all of a sudden brush that away and they come up the Tone Scale quite a ways and they suddenly say, "Oh, yeah, yeah, yeah, yeah, yeah." At first they go around being very careful not to have any mental disturbances, you see, because it might make them physically ill. They get over that in an awful hurry. They get to a point, "All right! So I have a mental disturbance. I can process it out." Then they finally get up to a point, way up to the point of OT, "So I have a mental disturbance." See? Don't have to do something as a result of it.

But normally in the middle band you have to do something about it. You get – you get yourself in a big wingding one way or the other and you find yourself thinking and cursing obsessively about something or other and you're going around and around and around and around and around and around. And you suddenly say, "Whoa, whoa, whoa! Hold it, hold it, boy, here, hold it, hold it, hold it!" This is the mark, actually, of a Scientologist who's crossed over from – well over from being raw meat. "There's something I'm thinking that has something to do with why I'm thinking. And there's some incident that caused this. And it's possibly an overt." [laughter] "Now, what overt have I done lately? *Uhh!* Oh, my God! That's what it is. Okay." Faces up to the responsibility of his own acts, in other words. Instantly, there goes this.

Well, the body operates this way so thoroughly, how somebody could not notice it is the puzzle. See? See, these guys – this guy goes down the street spinning, you see, he's going round and round, "My God, *uhhh-uhh-uhhhuhhh-uhhhh-uhhhh,*" you know. And – he hasn't traced it to the fact that he just was told by the bank manager that he was a thousand pounds overdrawn because of the wife's draw-outs, you know? He hasn't connected with that. He's told this, he gets it as a terrific shock, he goes down the street, "I feel bad." A total mystery. "I wonder why I feel bad?" [laughter] And he'll suddenly tell his friends, he tells his friends the truth but he never looks at it himself. "I had an awful shock this morning, I feel pretty bad. I had an awful shock this morning. Told – the bank manager told me a thousand pounds overdraft." So he'll tell all his friends this, but it doesn't do anything for him. Because he doesn't know what he's said. That's correct.

You'll hear a great many truths spoken by people that do nothing for them. Because they don't mean anything to them. They never listen to themselves talk. [laughter] They're always cursing people who don't listen. They should curse themselves, they never hear themselves speak.

But there is the upshot of where the society exists right now. Then there's the upshot of a deterioration – a deterioration of recognition of a condition known as "thetan" – spirit. And as that has declined in word (meaning) so it has declined and become degraded in the physical universe.

I'll trace it again for you very rapidly. *Psyche*, thetan. Soma, body. See? Psychosomatic. Bang. Thetan causing a sensation on the body is what the inference is there. Not only a thetan can do something bad to a body or a thetan can do something good to a body, but a thetan can cause the body to feel some way. And there is actually the way we use it. We use

"somatic" with the greatest of abandon. You know, just – well "somatic" to us is a highly identified thing. A fellow feels hot, he could even say "hot," he has a somatic, you see. It's just somatic, he had a somatic.

You don't ordinarily go so far as to say you feel good, so you've got a somatic of feeling good. Wouldn't be very true, because it'd be you who felt good. All right, now that's from "psychesomatic," *psyche*, *thetan*, somatic, body, condition or influence, down to *psycho*, by which was meant "mind" – influence on the body, and Freud went quite upscale from the normal run and woof and warp of the society when he actually talked about the mind influencing the body. But he had the wildest idea of what a mind was. It looked like some awful old cave with wild men running around inside of it. This is a wild thing. I was going to build it up one time as a stage set and everybody sort of discouraged me, I guess they couldn't confront how awful it was. You know, he has the censor and he has this and he's got – that's the most populated – he's got the id and the ego. Well, this is a talking mass. The mind influence on the body.

And by which they mean mostly sickness caused by the mind. Body – bodily sickness caused by the mind. And there's where the Freudian lives, you see, and his aspects of treatment. And that's why you can't quite talk to him, because he really means something else. When you talk to him about a thetan, he's liable to think of the censor. And just on the other side of the censor is this fellow going around in a wild costume, you see, he's got a lion skin on and he's got a big arrow in his hand, you know, he looks like a big ape. And then the censor's job is to say, "No, no, no, no, no, no." He's got four or five thetans in this – in this darn thing, you know.

So actually, a psychoanalyst didn't quite know what you're talking about when you talk about thetan, see. That'd be a bad thing to him, see? Because it's something that prowls and that you've got to repress. And he wouldn't think your aims and goals were good either. "You're going to free one of these things? Hm, over my dead body, brother, ooohh!" [laughter]

You see, at that stage the middle ground of mind influencing the body, they've lost touch with the fact that they themselves are a thetan. See? And this mind is already an extraneous otherness. They don't have any responsibility for this thing, it's a lost thing, it's just random. And you might not be able to do anything about the mind. But it sure influences the body and perhaps if you could remove a psychic trauma from this mind, by which they mean a memory of a pain or experience or a shock or a mental conflict, and they're not as clear-cut as it – we were in Dianetics, by what they mean by trauma. We said an engram, we meant a moment of pain and unconsciousness imprinted and remembered in the mind, see. They had no such *rrrrp!* definition, see. Trauma, "Well, that means, oh, *wah-da-wah-wah-wah*, maybe." See? I wouldn't even try to define it because they'd never really have given it a definition.

So you see where the middle ground of this definition is: *psycho*, mind, *somatic*, body influence, you see, but mainly illness. Somatic has now become to mean "bodily illness, influence on." So it's a mind causing a bodily influence.

All right. Now, let's take it – take the elevator and go downstairs into the sub-sub-basement, and we get the final meaning of the word where it exists today, which is *psycho*,

meaning "brain" or "nerve channels." Same relationship to a living being as a telephone switchboard would have to its living operator. But this is a *psyche*, or a *psycho*, and that – that influences itself a somatic, soma. So it is the part of the body influences part of the body, and you're right into the field of medicine now whereby if you've got a broken leg it'll give you a headache. Now they can understand it. Broken leg gives you a headache, yes, for sure. Because it's the body influencing the body and we have no more actual psychosomatic word, no more condition, no more explanation. We have to get in there with axes, we have to get in there with paring knives, we have to get in there with drills, we have to get in there with drugs, we have to get in there with shock, we have to get in there with something or other that'll influence the brain, we will have to influence those nerve channels and we'll have to string them up like taffy or we'll have to do something with them in order to manipulate that.

So please, after I – broken this down for you, don't go around in a confusion as to why medicine practices psychiatry. There's nothing else there to practice. See? There's nothing else present. There's just that brain and there's just those neurons.

And they think you're batty, because they're like the fellow who's in the bottom of a coal mine and he's told about the sun. And he's been in this coal mine all of his life, he was born in this coal mine. And it doesn't have any shaft up to the top. It's not only one mile deep, but he's in the channels which are one mile away from the – from the stope which is one mile deep. He knows you're crazy. You talk about the sun. You say, "Hey, boy, there's a sun up there someplace, you know, there's something causing this, you know, there's something going on. There's something going on up there, and if you walk down this channel here, you walk down this – this tunnel here, this shaft, and look up, why, you'll see *light*."

"Haa!" the fellow says, "Ha-ha-ha! Ahh!" He'll turn around to some fellow working and he'll say, "There was some nut in here the other day that said he walked ... Ha-ha-ha-ha-ha! Christ! He's crazy, should be locked up." And that's his attitude, see. It's a dead similarity, because the guy is, of course, under his ton of coal. He's got GPMs pushed down on his head till he thinks that all is mass, you see. And never the twain shall matter.

This boy is a total, depressed degrade. In other words, the thetan has run its course. See, it's down now to a totality of no presence. It no longer exists. Follow that?

Well, that gives you in essence the whole cycle of healing and so forth. Now, we step back in in the area of Dianetics and step back into "mind" – and this was not all we were interested in – mind influencing body. We were more interested in healing in that field than we are now. But it was mind influencing body. And we were up pretty high scale in that, because we knew that there was an eradication of this thing called mind. See, it wasn't then the causative agent. See, we had it not as a total causation. It wasn't the thing which was causing everything, see? It was something – something to do something about. There was that dim feeling there might be something there.

Well, we made a breakthrough upstairs on this thing, it was simply Scientology became Scientology out of Dianetics, because we no longer had this particular concept and we had to recognize now that there was something there doing something which was not the mind. And that was Scientology. That was the entrance point of Scientology. We had to call it something so we called it a "thetan" and further investigation and examination demonstrated

what this was that we're dealing with the human spirit, and after about a year's worry and work and practice and research, one way or another, why, I found out this thing was totally separable from the body. And actually separable from the mind. And would turn somebody who was spinning into total sanity for matters of minutes, just by these actions and exteriorization drills or research drills. Exteriorization is something that occurs in the normal course of processing. And – but it can be forced for experimental purposes. I can tell you half a dozen ways to exteriorize people and demonstrate it for yourself and for their subjective reality.

But they get enmeshed again and embroiled in this thing called the *body*, they get embroiled in this thing called the mind again, and so forth, and they lose the subjective reality very often and even doubt that they have ever been outside. The guy down – goes back into the coal mine and he sits down, "I wonder if I ever did see the sun?" you know? After you've persuaded somebody to look at the thing.

Now, there's then the entire cycle of deterioration of *psyche* to what's medically called psychosomatic. And you'll find that the various schools cut in at various levels on this scale I have just given you, the scale being from thetan to mind to brain versus the body. But in all of these things there is some idea that something is influencing the body and making it ill. That is the common idea to all of us, that something is influencing the body and making it ill. And that is the common denominator to all of these.

Now, nobody has been able to expertly knock out one of these illnesses, so man's belief in psychosomatic healing is touching and pathetic. Because nobody could do it. Freud himself probably was able to do it. Some other few in his immediate vicinity were possibly able to do it. But they had more command of things than they are communicating or than they ever communicated if they were effective in it.

However, in using these things, and in sometimes working in this field, I have relieved some psychosomatic conditions. But it was too accidental for my engineering-educated and oriented mind for me to say that I had done certainly anything very certain about it. I've probably had a better percentage of recovery than is quite normal, maybe a 30 or 40 percent or something like this. Fairly high. But not predictable. Predictable in no way at all. Because I didn't – couldn't isolate the elements with which I was working. So this made it very difficult for me even to get the idea that there was a thing called psychosomatic healing. You follow that?

So, that man has carried through the tradition is quite interesting. And that it has run the gamut to the extent that it has run is horrifying. Now, we have lost it to the degree that if you cut up somebody's neurons and somebody's brain, why, then somehow or another he will get healed. But the only thing they really cure him of is living.

But there is this field and there is its scope and extent, and where we practice is in the area, just the upper area, of *psyche*, meaning mind, versus soma, body. And we're practicing in the upper area of that – that's in ordinary practice – in the – in the – in the realization that there is something there beside the mind but that it is the mind that is influencing it and that there is a something there that can influence the mind, so we are practicing in a third stage.

We're practicing the *psyche*, influencing the mind, influencing the soma. So you are therefore very advanced beyond the basic tradition of psychosomatic medicine.

You've got a *psyche*, thetan, influencing the *psycho*, mind, influencing the soma, body. And the Scientologist is actually treating this in three stages. And it has never been treated in three stages before by anyone. The early spiritual healers always addressed thetan to soma direct – direct instantly. Well, that's too big a gap for the normal being who is in trouble, and therefore he had no success to amount to anything. He'd have enough success to keep him hopeful and keep him going but not enough predictable success. Spiritual healing, which is spirit healing the body. Well, you're not really in the field of spiritual healing, because you're getting the thetan to do something about the mind, which is doing something to the body. Your recognition is, you realize the mind is doing something to the body, see, some remained – retained memory has held a somatic in place or has done something here, has held a pain or an experience in place. Well, however this has happened that the mind is doing something to the body, which is causing its illness.

That we realize that it predisposes this body to illness. Something is going on in the mind that predisposes the body to illness. We are the masters of predisposition. That field is totally ours. Nobody ever dreamed of it before, you see. This is how the accident gets predisposed, see. You don't have to – this is how the guy gets to the pub. See, we examine the predisposition of why he went to the pub, not the predisposition of the accident by pouring the alcohol down the hatch that then gave him an accident, see? We go ahead of this. And we're the only people who do.

Now, here's your next stage: We recognize that the thetan can influence the mind and make it stop influencing the body and knock out that cornerstone to get over to what we would call a real psychesomatic healing. And what had been omitted was the center point which is the thetan knocks out the bridge of pain or upset to the body. And we have found the thing that the thetan can influence. He can influence the mind. He may not be able to influence the body directly, but he can influence the mind, which is influencing the body, and then he can get up to a point where even he recognizes that he is himself creating the mind. But that's too much to ask of him. But we can have the thetan influence the mind, influence the body. And therefore this is a brand-new concept, this is something which is entirely different and very startling in this particular field. This is undreamed of. It's never even been articulated before, you see? So there is where we fit in this particular line.

And although you've been doing it and I've been doing it and so forth, we haven't said in that many stages how that was and how that fitted into the tradition of psychosomatic healing, and what our relationship was in that field. And therefore we are something brand-new and we are something quite startling and so forth. Because we have found a route by where we can make an effect on the body from the psyche down and we can knock out and detach the body, detach the mind, free the thetan.

So our vector is in reverse. Overall vector in Scientology is in reverse to all these healing vectors, which is mind to body. Our vector is let's do something with the body so it isn't troubling the thetan. Let's do something to the body so it isn't running up psychic traumas which then troubles the thetan. And reversewise, let's fix up the thetan so he can fix up the

mind so he can do something to the body. So that knocks out the illness in the body or the upset in the body, which then takes it again out of the mind, which makes the thetan feel better. And we're always on a three, one, two, three; one, two, three up; or one, two, three down. This makes us brand-new, very novel and very effective.

Thank you.

A SUMMARY OF STUDY

A lecture given on 4 August 1964

Thank you.

This is the what of what?

Audience: August 4th, AD 14.

August the 4th, AD 14. A memorable day, because it's the day after bank holiday parade and nobody has pneumonia from the usual rain that they have on bank holiday. Very memorable day.

Saint Hill Special Briefing Course, August the 4th, AD 14.

All right. You seem to have hit a few records here lately, in your examination grades. Your examination grades on lectures and so forth, are coming up, up, up, up and I'm very proud of you with this. Thank you very much.

Aside from your own brightness on the subject, some of this is attributable to the fact that I've been talking about and teaching you something about study, and I think you have learned quite a bit about study in the last many weeks; and that is the subject of this lecture.

I want to give you, in this lecture before it gets cold, a brief summary – no matter how rough and ragged and no matter how well worked out later – of the things I have learned about study. And I break my record by lecturing from a note. But I don't want this to go too far before I make it a matter of lecture and record because I found out it was already getting dim in me skull. And I keep very little information in my skull lately, and that I do put in sometimes tends to get dim because it gets lost. So I didn't want that to happen and I want to give you this information about study.

Now, there's not been a technology of study or a technology of education. Now, that sounds like a very far-fetched, fantastic statement, but it's true – it's true. There was a school technology, and – sort of – but it didn't have too much to do with education. You see, there was the technology of how you go to school and how you get taught in school and how you teach children to go to school and how you go through grades and how you get examined and how you go through the college and so forth. There was an awful lot of this school technology. And you should differentiate between a school technology and an educational technology – it's the first thing I'd ask you to do – because education very seldom, in its final touches, has anything to do with a school.

The engineer who goes out reports to the job and he's been beautifully taught along various ways on how to do the calculus curve of mensuration on how much gravel there is in an irregular pile. And by getting the calculus curve of several sections of this pile measured

and formulized very carefully, he is then able, in looking at this barge and measuring it up, to finally tell how much gravel there is in this barge.

This actually happened – happened in Cavite before the war, many years before the war. This young engineer had just gotten out of school and he did just that. He went down and he calculated the amount of gravel in the barge by calculus. And it was very arduous.

And he'd been sent down by the chief engineer of the yard to find out if they had enough gravel. And he didn't come back for most of the afternoon. So finally, the chief engineer got very, very curious about this and he went down there to find out where this young new engineer was and what he was doing and whether or not the sharks had gotten him or something. And he found him down there just putting the finishing touches on it, and he gave him – the young engineer gave the chief engineer – with great triumph, the fact that he had 150.7-9 cubic yards of gravel on hand. He had pages of calculations. And the yard foreman, a Filipino, standing near at hand, looked very sourly at the young engineer and he said: "Is that what you were doing?" And before the chief engineer could even get in there and find out what it was all about he said: "You see those white paint marks on the front and the back of the barge? Well, they tell you how much gravel is in the barge!"

I've had a wonderful example of how pedantic schooling can be as opposed to education. I read a dissertation last night on the subject of slides. The preparation of lantern slides. And boy, this was the most intricate calculations of how close you had to be to a screen and how – the density of the lantern slide had to be in order for you to get a proper lecture hall projection. And these went on and on, and if I hadn't myself had experience in this particular line, I would have taken all this quite seriously. But it was somebody – I guess his pen just got to going and he couldn't stop it. Because what you do if you have dim lantern slides is get a brighter lamp. You don't move a projector backward and forward in the hall and calculate the superreflectiveness of the screen and all that sort of thing. Now, with great experience then – and it is considerable experience, you see, I know slides and densities and that sort of thing, by experience – I knew that this data I was being fed so laboriously had very, very little importance. See, it was interesting. You know, it was interesting that anybody would write that much on the subject.

But Reg and I and Bonwick at a circus not too long ago, with a mismatched voltage line and common bed sheeting hung up between two circus poles, enlarged a picture four to five diameters above anything ever intended for either the picture or the projector. Everybody was delighted; they looked beautiful. We had a twelve-by-twelve screen of bed sheeting which even had puckers in it. There was only one slide that it made look odd – one slide out of about two hundred – and it just happened to fall, this pucker did, in a young man's face and it just fell wrong. Not a critical proposition at all.

You take any old density of slide and show it in – throw it into a projector, then, with enough lamp – and you put up a sheet that will reflect and you've got yourself just about the finest lantern slide show you ever wanted to see and there isn't anybody going to say a word about it. Two pages of text out of how you calculate the density of a lantern slide – not a critical problem.

So, education would take into effect, as opposed to schooling, the relative importance of the data being taught. That's very, very important. The relative importance of the data be-

ing taught, by which, one would say, the relative applicability of the data being taught – the applicability. Now, schooling, as opposed to education, has in actual fact no thought, no real thought of applicability, no such thought.

It is just as important to the pedantic or scholastic school of education, this technology, that "Pliny, in the year umpty-ump-dash-ump, did hereinto aforesaid with semicolons, discover that there were sturgeons." Now, what you going to do with that datum? Yet a man's whole career could have been wiped out, you see, by an inability to have vociferated this fact. This is under "fishing," heading of "ichthyology," see; fishing, fishes. Guy goes down to the bureau of fisheries, see? On his final examination paper he was asked, "Who and what and when discovered sturgeons?" You can just see him now – young fellow in the bureau of fisheries out there off the north coast of Norway, blowing about forty degrees below zero trying to count the number of herring boats out there he's going to have to rescue in the next twenty-four hours, using this datum about Pliny. You can just see this now. Inapplicable!

So, there's a sort of a pomposity that goes along in the field of schooling that has no real basis in education. You'll find this in the arts. You will find people who really think they are artistic and really know something about art, who are simply capable of rattling off a number of pictures. "There's this picture and that picture, and there's the other picture and so forth and it was painted – it was painted by Jules Drool, you know, and in 1710." See?

You say, "What did Jules Drool paint it with, bud? What did he use?"

"Oh, uh – ha-ha. I think it's an oil." But he knows it's 1710, see? And he knows it was Jules Drool, and he knows the name of the painting is *Shameful Morning* or something.

But you ask this bird – you ask this bird, you say, "What did he paint it with?"

"Oh, I think it was – uh, I think it's an oil. I-I think it's an oil. I-I-I think it's an oil. It's an oil."

He ain't got the point. It's very valuable to know what they were painting with when. See? That's quite valuable. You can use that. Well, you'd – just a crudest possible use – you see something that is painted with ICI Best House Paint, as represented of having been painted in 1510, you know that's wrong, because they didn't make peanut-oil-emulsion paint in... I mean, that's crude, see? But you can see that it does have some applicability in the detection of authenticity. What did he paint it with? That's very – that's a good applicable datum, you see?

I'll give you a parallel datum like this. I was tearing apart encyclopedias yesterday to find out if anybody else had ever mentioned a certain art form. I could find it no place but I did find in the dictionary that "doré" meant "gold colored." I thought that was very interesting because the name I was looking for as an art form was a doré-type and so I didn't know which way I was going on this thing. I thought it was probably a man's name, probably interfered with – with Gustave Doré, you know, and his etchings. No, it wasn't after a man's name and so the thing has never survived as a name, because it wasn't a man, you see? It was simply a goldish form of art reproduction. So they called it a doré-type and the name is so esoteric that it has only survived in the super-super-professional lines. If a guy was really on the ball and he delved into everything, he'd know there had been such a thing as a doré-type, see? But oth-

erwise, he wouldn't know anything about it. Everybody knows what, for instance, a daguerreotype is, see? Nothing like that. But what was a doré-type?

Well, that becomes important in examining the development of picture display, the display of pictures and so forth. So there was a type which did a strange piece of picture display. Well, you should be able to run such things back. Beyond that, in actual fact, whether it was Mr. Wall or Mr. Pall who invented it when – has nothing much to do with it. But how it was done, you see, at such and such a time – oh, that would have quite a bit to do with it, see?

So, when you're dealing with education you have to be very careful not to lean over into the significance. Don't lean over into the significance exclusive of the mass. That is a very interesting datum. Now, when you get into significance versus mass, you get into action; and action could be defined as significance versus mass, of some kind or another. That's rather drawing a longbow, you understand, but the reason one engages in action or doingness and so forth, is he has some kind of an idea of accomplishing something or making something or avoiding something or... He has – there's a significance there, you know? There's an idea about it. Even though – even when we look at a lot of particles flying around in the air and we say: "That's a confusion," we've added significance to the mass, don't you see? Do you see that?

But in education when the significance is never added to the mass but stands in pristine purity all by itself, you tend to get a jammed curriculum – no doingness. Let's get down to earth about it, you see? I've just given you an example of it – I've just given you an example of it, of who – who invented what, see? And now we say, "And there was a great deal of conflict between these two men at that particular time. One of them – one of them had a greater idea of the destiny of his development than the other one did." Oh, what's this got to do with anything? It's a disrelated datum, don't you see? It's just a significance. It hadn't anything to do with the doingness or the action, had nothing to do with the mass that you are now confronting. All it does is throw you a curve, you get the idea?

So, school is expert at throwing curves until one begins to wonder whether or not school ever has education in mind. So, you could have a school technology which would teach, which would never really educate, never really train anyone. You see that? But it could be marvelous. You could fill your whole university through courses of *The work of Thomas Hardy*. You could have *The Plight of Miners in Roman Times on the Cornwall Coast*. You could have *The Number of Synonyms and Antonyms used by Hunters and Huntresses in the 16th Century*. You could have courses which flunk people because they referred to the wrong word, they used the wrong word in connection with the wrong group of animals, you see? You know, like you have "a covey of quail," you see, and "a covey of foxes," you know, that kind of thing, see? Very pedantic!

But what is the basic error here? The basic error – I'll come back to it now – the basic error is simply failing to add the mass or doingness to the significance, see, failing to add the mass or the doingness to the significance. You say, "This fellow was a good painter. He painted and he painted and he painted and he painted and he painted. Well, he painted a lot." You could say this in 90,000 different ways. "He drove seven – his first seven wives batty by the fact he never paid any attention to anything but his painting." Well, it's good curiosa but it is not an educational datum. It's just curiosa. What did he paint, see?

Your student then must be taken into consideration. Your student is trying to get to be a painter. And I'm afraid they've spent so much time teaching them on how many wives the painters have had, or haven't had, that their idea of painting is to get married and divorced or to become a walking catalog.

Well, of course, if you're a judge, if you're going to be a professional judge or a professional critic, not a painter but one of these birds, naturally you want to be practically a walking catalog, see? You want to overwhelm everybody. It's good one-upmanship, you know? You walk through looking at things this way – this way. "Yes, this man over here, he's copied – he's copied Hans Verboten." [laughter] "Yes, that's a very obscure painter of the 1416." See, you want to know things like that, you know, if you're going to be that.

But to be a painter – and that's why you'd almost never turn a member of the arts out of a university. That is almost impossible. It's unheard of, and... to teach short story. They ruin more writers! Well, it's of interest how they do this, and they detach the significance and the action. They separate these two things so it becomes a pure significance without any action or mass connected with it. And when you have done this you have then sort of wound a guy up in a no-confront of the subject and you've introverted him. And the way a student becomes introverted is to give him too much significance and too little doingness and too little mass.

That's still knocking you for a loop. You keep looking at me with your heads tipped over here and I want to know what's so incomprehensible about it? No, it's slipping somewhere.

I don't know how to state it, really, any more plainly than I'm stating it. If you're going to teach a fellow about roller balls, give him a roller ball! Is this – is this difficult, see?

Don't teach him the history of roller balls! Am I making more sense?

Audience: Yes.

All right. Does it – does that make sense? It doesn't?

Audience: Yes, yes.

So, when you have detached the significance from the action and separated these two things apart, you can have schooling but you can't have education. And that's basically how it's done.

If you want to wind up with a whole bunch of do-less graduates, if you want to wind up with a whole bunch of painters who can't paint, a whole bunch of doctors who can't doc, [laughter] engineers who can't eng, then by George, you're going to just – all you have to do is take the doingness and the mass connected with the subject and park that over here as something you really don't want to have much to do with and go into the total significance of it all. And then you make a highly impractical person. And this is the only way it's done. There aren't a number of other ways to do this. You wind it up hard enough and he never does go out of school, he never does leave school; he becomes a professor.

Now, I've learned that for a person to teach who cannot do, is a terrible mistake. Let's get right down to earth here, in Scientology. If our Instructors couldn't audit – *guahhhh!* What goes on? If our Instructors couldn't audit, what catastrophe would we face in all educational lines? Supposing they all knew the history of auditing and then supposing they could give you

chapter and verse of everything ever written on the subject and tell you exactly where to find this and tell you how many pages it had; supposing they could do that – but they couldn't audit. This would be somewhat catastrophic. And any trouble that an Instructor has in teaching has a little bit of something to do with something he doesn't confront about the doingness or the mass of the subject. You got the idea?

So, this Instructor finds that he really doesn't like to teach geometry or something like that. Well, he can't do anything with geometry. Do you see? He's got a blind spot in this particular direction.

Now, this became so notable from my inspection and study of study that I was practically struck dumb on the subject. It goes to this degree: that a person who is simply writing the reports of people who can do is too far removed for the execution of a good textbook. A person writing reports of people who can do, no matter what people this person consulted, is too far removed from the doingness and mass to make a studiable, good textbook.

That is remarkable.

Now, you understand all this background I am giving you here on this particular subject – came about when I realized that if we were going on upstairs and we knew something about the mind, that we had to wrap up another subject which is entirely separate to the subject we were trying to wrap up. This is our inheriting the dropped balls of yesterday. They didn't wrap up the subject of education, so we have to wrap up the subject of education, you see, in order to educate; just for our own practical application, see? Well, they didn't do it. They got a lot of money for it, they were paid to do it and they didn't do it, see? So you feel the same crossness that you would feel at the switchman that you had down there on the railroad tracks and he drew his pay to throw the switch and he didn't, you know? And the *Twentieth Century Limited* went off the rails, see? And you say, "That *blas, of blah, blah, blah, blah* – that was his job and he didn't do it," see? Same way, same way. Here we are. We've got a difficult subject to confront because one is studying what one is, and we should have had the whole subject of education beautifully wrapped up. But instead of that, it's just muddied up. There are many preconceptions in this line.

So, I recognized that it was necessary – even though we had made great inroads on this – I recognized that it was necessary that I get a new viewpoint on this subject. Therefore I picked up an analogous, or a similar line of study, in that it's a practical subject – if you know certain things and you do certain things, you get a certain result, see? That type of a practical subject – and yet one that sort of borders over into the field of the arts, don't you see, so that you have to have some judgment and taste and so forth. And I picked up this subject – one, because it was available, two, because I had some interest in it – but basically because it did show a fairly decent pattern of what an auditor would do.

In other words, he has certain theories and actions which he's supposed to perform which, when applied, will produce a certain result if he uses judgment and good taste. Now, you'd – it isn't the same thing: auditing and photography are very long from the same thing. But auditing does have this in common with photography, that when you do certain things, and you do them right, you then wind up with a result, with a certain result. But if you do these things a bit wrong, you don't wind up with a result, you see? But also, if you do these

things and you do them without using good sense, see, you also don't wind up with a result, see? It's a comparable action.

So I picked up this particular field and took a full, blasting, exclamation point, professional course on this from the word "izzard" straight on through. Now this was all sandwiched in during the last few months of everything else I've had to do. And I learned, however, a great deal about it just by experiencing subjectively something that was off the subject of what we are doing, something that I had a dilettante knowledge of and so forth. And as I showed you the other day, I think it was starting to come up with a professional result. So then therefore, the course was well studied and did lead to a finite result at the other end of things.

I've gone past the point now of just studying it and I can actually develop those points and portions of it necessary to produce the better result, don't you see? It's gone over that borderline. For instance, it's all right to do this and that and the other thing and you do that exactly by the textbook. But if you're terribly good by the textbook, why, you can then give it that extra frill over here that makes it come out on top, don't you see? In other words, you can use the textbook so well that you can think while you're doing it. Do you see that? Now, that is what I have been going through.

And I noticed a great many points very early that would never have struck me if I were not working in a completely new field of study. This is not a field, by the way, that I was absolutely new to. I've actually been trained in darkrooms and that sort of thing from a practical viewpoint. So, from another viewpoint here – that I got an idea of – that actually just practical training isn't enough. You can't just give the guy the tools and say, "All right. Well, dabble around with it and go to work on the *Daily Express* and watch the birds rushing in and out of the darkroom at the *Daily Express* and if you do that long enough, why, you will become a good photographer." That's not true! I have fabulous evidence that this is not true. The evidence lies before you every morning when you glance at the paper. What they commonly call a news photograph is so bad and oddly enough most of those boys are untrained. The top-notchers that you see around, the real headliners and that sort of thing, oddly enough, are trained.

It isn't, then, a gift that they suddenly pick up, see? It isn't this vast talent – fellow sees a camera – "Oh!" you see, and this huge streak of light goes through his skull of that brilliant inspiration and he clicks the shutter and then he has pictures all over the front of everything. It doesn't work that way. And he can go through all of the menial jobs he wants to in the field of photography, cleaning plates and all the rest of those things, through to the last bitter end of the thing and he will never become a top-notch photographer. They're doing it all the time because this is the way the newspapers get the young men to come in and work in their dark-rooms. They tell them this and that's not true.

Top-notch photographers of England are most severely trained photographers you ever had anything to do with. They are just a little bit too severely trained, if anything. But they're hot. You get Tony Armstrong-Jones, my God! If you ever saw a man use standard photography, this guy uses it with a capital "S" with an exclamation point. He can't even take a picture of his own new baby without setting up the exact textbook lighting for a baby picture, see? He doesn't even get thrown by the event of being a father, you see? He goes and gets the exact

lamps and he sets them up at the exact angle and he fixes them up this way. He got a fluke picture by doing this – it's just one of those flukes. You run into them all the time – you take advantage of them. Nevertheless, his lighting was absolutely textbook. This guy is a headliner, see? He's taken design photography now, and in the – in the big *Sunday Times Magazine* Section – he had an article in there a couple of Sundays ago and I know he just laughed like mad when he published that lead picture in there. He's standing outside of a building, he gets the perfect architectural texture – he's been elected to the Design Council and so forth – he takes – stands outside the building, he gets the perfect texture of the brick, perfect texture of glass, perfect texture of everything, and shoots the inside of the building like daylight. And I know what he did. He said, "Nobody will notice it but a pro, but let them figure out how I did it," see?

He knew the public would just be interested in it sort of as a picture and so forth. But I'm sure that it was in the back of his mind, "Let somebody figure out how I did this," see? I don't know how he did it. I know how I would have done it but you don't shoot from the outside of a building in glaring sunlight and get the total detail of the inside of the building without doing cutouts or something and this is no cutout. How did he do it, see? And I know he sort of laughed to himself because he's put together, of course, two brands of very standard lighting. Knows his subject cold, you see? So he – but he uses it in this peculiar way with color film to get this fantastic result. You never stand outside of a building, see it in perfect detail and look into the room inside and see it in perfect detail at the same level of light. And then you don't shoot this in color. No latitude to the film.

But a pro can be counted on to do things like that. But when you break him right on down, why can he do things like that? He knows all the right ways to do it and therefore he knows how to fail at doing what he's doing and then he can think that extra step, see? He knows his equipment and so when he can think that one more step, that makes him a champion.

The leading glamour photographer of England is a fellow named Tom Hustler. They're always calling in Tom Hustler to shoot some star or something of the sort. They rave about his pictures. Well, it's quite amazing, because Tom Hustler never took anything in his life except a standard professional photograph. He never took anything. He doesn't even add that extra. He is so standard that he's painful to look at if you're a pro, see? The hair light is always exactly where the hair light is supposed to be – that light that you see in portraits that gives the little gleam to the person's hair, see? His main light, the big one, and the fill, they're always in exactly the right position. His background is always exact. It's just a technically perfect photograph, do you see? There isn't anybody else in England taking them.

Lancere, the great theater photographer, I am told – I am told – their great theater photographer. I saw some pictures by this character the other day, he's about as standard as a pig lost in the swamp, see? And the pictures look it – they're faulty. And his lighting is not standard and he doesn't know what to do with the lighting. I think he's got baby picture lighting he's lighting stars with or something of the sort. He's just not a pro. You see? Shows up – bang! People look at the picture; and you show them one that is perfectly lighted, you say, "How about this one," you see?

They say, "Oh! That's a beautiful picture," you see? And you show the next one and it's got a technical imperfection in it and they, well, they don't like that so well. They can't tell you why, this is a common guy off the street, see? Now, photography has got the common denominator of the public taste. What does the public want to see and what does the public like to see?

So now, we have a new subject in photography – this is another reason I chose it – brand new subject. Just a little over a century old. About 1810 – 1810 somebody said, "You know, I get a poiple shadow on a piece of paper when I paint it with some funny chemicals" and there it all began. Color photography is so far from new that they were actually projecting color photographs on the screen for the edification of audiences – not hand-colored or anything – as the same time as Mr. Brady. But, that's all new. That's a Johnny-come-lately subject, isn't it? It's not really had time to pick up too much snob. It's not had time to get lost.

So, to make my point, when you give it all mass and doingness and no significance, you also fail. In other words, you can send this fellow up as a darkroom assistant to the *Daily Mail*, have him packing cameras for somebody or other, and have him standing in there at Lancere's adjusting lights for half a lifetime without his ever really becoming a pro.

So, professionalism has to do with the significance and the doingness and the mass. It has to do with all of those things. You can't have all doingness and no significance, and you can't have total significance and no doingness and wind up with a final result in the way of a student. Education, then, would consist of a balanced activity which would treat with equal importance the significance and the doingness of a subject. You would treat these things equally. Now, this is not a new thought – it's not a new thought. It's been with us for some time.

But it was terribly confirmed to me on an inspection of what is standard photography today and having been over the jumps and being almost finished with this course and ready for my finals, I thought I had better just make all these notes of it and so forth. But one of the things that stuck me in the eye all the way through the line is the pro, the real pro, was the fellow who knew the significance and had experience in the doingness and the handling of the mass. And that was a real pro; a real professional.

Now, you say, "Well, what about this fellow who comes busting out of the middle of nowhere and he all of a sudden develops this whole fantastic panorama of new material?" No, you were looking at a pro. You didn't look at anybody who suddenly busted out of nowhere uninformed and so forth. But his education might easily – because it wasn't being taught anyplace – the significance was backed up by a great deal of additional hard study, see? You still had the study there, see? He studied like mad.

Let's take somebody like the fellow who projected the first color pictures. I bet you he could have given you the number and book of practically every photograph that had been taken in the history of photography, which went back of him only about 20-30 years. He must have known them, see? He must have known them all. Then you go back into it a little bit further, you'll probably find out he was a chemist by training, see?

Professionalism, then, doesn't leap full-armed from the breath of somebody's hope. Professionalism is sweated for. And also, professionals are distinguished by the fact that they work hard.

Dilettantism is supposed to mean "good at many things," but actually I would rather extend its meaning a little bit to saying that "unprofessional at everything," because part of professionalism is hard work. You, really – to pick up all the significance of a subject and to put that into a doingness action and so forth, rough, rough, rough.

Now, that all sounds very interesting but there is another factor involved in it: Is, you don't have to have done everything that was done in order to be a pro and that is a very hopeful thing. And I learned that the hard way. You don't have to have made a piece of photographic film in order to become grounded in making photographic film, see? That's lucky for you, you don't have to make a human mind in order to fix one up. That's carrying the point a little broad but you actually don't have to have run Standard Operating Procedure of July of 1950, in order to call yourself a professional auditor. If you did that, why great – great, see? Fine. But you take someone who's being trained in 1964, to ask him to do that would be silly.

Right now, to – this stage of study, for me to go and get some chemicals of some kind or another and some old horses' hooves and boil them up, and – so as to have some gelatin and put these things all together so as to make one of the original forms of wet plate, and expose it wet in one of my cameras – which was the way they did it, you see and so forth, well, it'd just come out at the other end. I – what would I say out of this? "Well, I've done it." So what? I'm not going to do it. Not again. That would wreck the camera, of course. Do you see what I mean? That can be overstressed. Now, we get to the overstresses.

The doingness can be terribly overstressed. I've already showed you significance can be terribly overstressed. "Pliny did write on the – ye old wax tablet, which he wrote on with a stylus, which that day had a dull point, because his slave had a headache, that sturgeons..." See, you can go crazy on this subject, see, of significance. You can go nuts. You can wildly overestimate what a student has to know. You can also underestimate it.

But the wildest shot, when they get to formal schooling, is to shoot the moon with this thing. Just go overboard with it, just go crazy with it – make – drive everybody around the bend with it, see? It's sort of a method of forbidding somebody the subject, see? See? "If you can't tell us all the papers of Sigmund Freud, you can never be a diplomate in psychiatry." It's a fact, the total examination for the highest rank of psychiatry is simply the title, the date written and the place of publication of each one of Freud's papers. I know I exaggerate and a psychiatrist, if he were here right now, would say, "Oh, how you – *rowr-rowr-rowr-rowr-rowr-rowr*," you know? He'd sound like Vixie out here when you kick her. [laughter] But he'd be lying in his teeth, because that's his diplomate examination. I know – I knew a psychiatrist, nursed him through a psychotic break, because he was taking it. [laughter]

And I don't think you can get much closer to the examination without, in actual fact, taking it yourself. And that was what was driving him around the bend. He was preparing for that exam that way and he took the exam that way and that was it. It was very funny watching him prepare for the exam, he'd keep rolling up on a ball, sucking his thumb; rolling up in a ball, you know, in the fetal position on the couch so he could study this. It was very funny. I

never did tell him, "You know, brother, I think you're keyed in." [laughter] But overweighted significance is a way of defeating a student, way overweighted.

Now, you can err to the degree that you're giving him a subject which he's never going to do. Now, let's take it over into Scientology. You're giving him all the data, necessary to run Standard Operating Procedure of July, Elizabeth, New Jersey and so forth. And the mistake is to give him all of it. He's never going to use it.

All you want to know, you – all you want to give him is enough so he can identify it. If he collides with this thing again, he said, "Hey, that's Standard Operating Procedure of July," you know, "back there, Elizabeth." "Early days, Elizabeth," is about all you want to get through there. "Yeah, that sort of thing. Finger snap, yeah." Something like that. "Oh, yes. They did that, early days." Have some dim idea where this thing fits, you see? That's about all you want to get across to him. He's not going to do it, see? So therefore, if he's not going to do it, you've got to strip the significance off of it. You got the idea? That's the way these are kept in balance. If the guy isn't going to do it, take the significance off of it. See, you've got to keep these things in balance. If he's going to do it, pour it to him, man!

Let's take an esoteric process like bromoil. Well, they didn't use to have panchromatic film, so it drove them mad. They didn't use to have a film that responded to color, so it drove them absolutely stark, staring mad trying to get a tree light enough so that it looked like a tree, you know? When they made a picture of a tree, they had an awful time with this sort of thing. So they did this fantastic process, like photolithography. I won't burden you with any of the details, because – ohh – horrible! It makes me shudder to remember it. Nobody's ever going to do a bromoil, unless he's a doodle-daddle type of darkroom bug, you know? See, he's got to be a real darkroom bug, because there's much simpler methods of producing the same result, do you see?

Well, some old-time photographer that is a real purist and so forth, in New York, would listen to that statement and he'd say, "I don't know that you'll never do a bromoil. You can't be sure, you know. I myself have done bromoils and so forth. Only took me thirty days one time to do one bromoil print." That's about the length of time, see? Oh! Cruel! And right when I was coming down the home stretch with my course I had a half a textbook on how you did bromoil prints. A half a textbook! It is there in its most painful excruciating detail, but not, incidentally, in such a way that you could really do one by referring to the text. It goes like this, the order of action, which is another point down here which I'll get to – the order of action is all wrong in it. That is to say, "Now make sure that you lay this wet picture," you see, "this wet print out on the back of the tray that will fit it, or glass, and make sure that you lay it out and pin it all down carefully. Now, before you do that, make sure that you have the other print ready, because you're going to need it in a second." Oh, no, see? You're on what I know as order of. You've got down to this line, and you're slavishly going down the line mentally doing the action, you see, and then you find out you've made a mistake, see? He tells you now that there was another action you should have done before the action he tells you to do, see? *Zzzzzzzzz!* And you have a feeling like you've made a terrible mistake.

But bromoil is there in its most excruciating detail and has not been done seriously for a number of years. You could probably win a salon exhibit with a bromoil print. You probably could today. Judges would stand there and they'd look at it and they'd say, "What's this?"

They're quite beautiful. "Uhh, what's this? My God! A bromoil, you know? Gee, you know? Give him first technical prize." That's about all you'd get for it, see? "Somebody has actually done a bromoil print – wow!" See? And they'd say, "Gee," you know? They themselves would know what this involved – being trained people, see? Public would go by, look on down at the rest of the pictures; wouldn't stop any eyes.

But it would have meant about thirty days, or something like that, of pure, dripping sweat. But to be taught how to do it, down to the last comma, down to the last bit of temperature, down to every mistake that you could make in doing this thing which you're never going to do, absolutely takes the cake right off the top of the oven. Wow! See? There is all this doingness which is never going to be matched with a doingness, you see? So all this significance is then built up with an undone never-will-be-done doingness, so it all becomes significance.

So, the doingness all but moves over here into the significance department, don't you see? And it doesn't just unbalance it; it winds you up with some ghastly headaches, I know. I say, "Well, I've got to get through this to get to the end of this course or I don't get any diploma. Got to make it. 'So you take a stipple brush.' Now, let me read that again. 'You...'" Ghastly, you know? You're never going to take a stipple brush. You couldn't care less.

So they couldn't make prints in 1890! All right. Great! We don't happen to be having that trouble today. Like asking you to study the aspects – you are studying to some slight degree, but they are very useful – but studying some of the aspect of a "pc lists that were made in 1950" – they weren't published – but what could – you know, no meters, see – so what could the auditor detect without any meter? What would the pc do that would indicate this, see? And then giving it to you in total, painful detail. All you're going to do is read your tone arm, see? But giving you this other in total painful detail, "You sit there and you audit with your fingers on their pulse," you see, and now give you the *whole* rundown of the Japanese or Chinese system of pulse counting by pressure because that's the more complex system.

That was actually what I used, the Chinese system of pulse counting, trying to get up on it – how... oh, you'd be surprised, man – you sit there today – you were absolutely at the beginning of road nowhere in the – just about 14-15 years ago, there was no way to tell what the reaction of the pc was; there was no way to tell what a hot subject was; there was no way to look into anybody's mind; there was no way to record it, if you did. Just a nowhere view, see? Grim.

But now, for you to be taught, who are never going to do it, how you detect a tone arm response without any meter because of the various physiological manifestations of the pc, the motion of the chest – very important, see, the change of breath, coloration; eye coloration. There is a whole subject of how do you know if a process is flat by the eye coloration. Very interesting subject! How would you like to learn the several thousand words that were written on this subject?

All you have to know, if you were taught this, is that there was such a subject. You see? You could very easily learn there was such a subject and there is the subject, which is what makes the E-Meter important, see? This other subject is so complex that the E-Meter solves this other subject, which is "How do you tell what's going on in the pc?" And that subject had many ramifications, see? And if a process is really getting to a pc, his eye color will

change, you see? Or his pulse will smooth out, you know? That's about all you have to know. The rest of this is bric-a-brac.

All right, somebody can spend his whole life, whole life working in the field and realm of bric-a-brac and have a good time. There are fellows who study the history of bromoil – not do it – study the history of it – as almost a full-time hobby or profession or something, see? So, you can get these incredible significances built up in a subject which actually don't amplify the doingness or the expected action of the student. Then this is giving him doingness which becomes a significance.

So we get to the next point of the line which is the conversion of doingnesses to only significances. And if a subject does very much of this, you've just about had it. If you convert all the doingnesses of a subject over into significance – that's how you do it, is you take some subject which is not going to be performed and you describe it far beyond any necessity. Then you've got a conversion, see? Now, if you can go the reverse, you can say the significance is convertible over to the doingness. And you have just had an example of that – the fellow is never going to make a bromoil, so you make him make a bromoil. See, it's properly merely a significance today; it's just properly a significance. There was a thing called a bromoil print. Fine, it existed, see? What it was, was it depended on the same principle now used in photolithography. Gelatin holds water and water repels oil, see? Uses these various principles. Interesting to know, see? You can cover it in a paragraph or two, see?

Now, if we go too far on this particular line, by making some person do some ancient, old act, which he is never again going to do, we've taken something that should have just remained there as a significance and we have pushed it over into a doingness action. And it again upsets the student most ghastly. I'm sure he would have – I'm sure it'd be cute to grind some wheat with a millstone, you see? It could be a hobby, don't you see? It could be very nice, but there would have to be some good reason why you were doing it. Do you see? A good reason why you were doing it, see? And if it's just that you want to see how they did it primitively, well, maybe that's a good enough reason, see? But that's if you want to do it. Did you notice the choice of words? To make a student do it is a fantastic error. Silly! And his reaction to your effort to teach him is an ARC break. He can't figure out why the devil he's doing this in the first place.

So we come to the conclusion that the doingness and the mass of a subject are the current, applicable and useful doingnesses and masses of the subject and those are what should be taught – hard. They're applicable – the applicable doingnesses and masses. In other words, the student should be taught what the student is going to be doing. And the significances that should be taught to the student are – don't compare to what I just told you. The significances are enough background so as not to get – and this is something they've all missed, and this is how an engineer gets to be forty years old and goes old hat – is enough significance so that he doesn't get stuck in the mechanical doingness he's been taught – and you've got to give him enough significance. In other words, that's a little bit more significance than you would expect to give him. And that's why you give him the history of it, to show that it was developed and give him some sketch of its development. And that's why you show him how the thing evolved and what the doingnesses of it were.

So you see, it becomes asinine to make him do these old things. You're just trying to show him that there were some other doingsnesses, don't you see? And you're making him conversant with the principles with which he's operating and if he's sufficiently conversant with those, then the doingsness and the other action which he is being taught don't become obsolete because he can think, see? And that's the difference between a pro – that's the difference between a "pro" and a "practical man." It shows up quite additionally, is a pro always does it by the textbook, with a difference; always does it by the textbook, a bit better. And when the thing shifts, it doesn't look like a shift to him, it looks like simply the same thing with its face slightly shifted. Do you see? It doesn't look all that brassy new.

Now, you'll hear people around – you've just shifted how you do a repetitive command – and you will have people around that tell you, "We've changed all of Scientology." Well, they had learned the practical action – they'd learned the doingsness of giving a practi... a repetitive command, but they had no theory over here of why they were doing this, or what was – what one was trying to accomplish with this, such as flatten the mental comm lag, do you see, that the guy's going through, or anything like that, flatten the process. They just knew this thing of a steady grind, so the second you changed one comma in it, they thought you'd changed all of Scientology, don't you see? But the guy who has grounding on the subject and who knows what processes are and what they're supposed to do, he would say, "Yeah, well, that – that..." He'd give it the proper significance, you see? He'd say, "Well, ah – that's an out... slightly out of ARC, so it should be shifted slightly, see? That knocks the pc a little bit out of ARC. But this other wording, that's very clever. That doesn't knock the pc. See, that doesn't give him a 'no ARC,' you see?" Yeah, nothing changed, see, to him. Everything looked calm, normal, so forth.

Now, a professional then is able to advance and a practical man quite commonly cannot advance. A theoretician, then, would be well taught, but seldom educated. Somebody who is just dealing in theory and nothing but theory, and so forth, could be absolutely beautifully taught, he could be wonderfully schooled, but he would not be educated in that subject because he would have had the doingsness missing in that subject. His doingsness would have been gone. He's just an expert on the painters of the nineteenth century, that's all. He knows the theory of all of their paintings – just the theory. It's not being done anymore, nobody ever expects to do it again.

But you'll find odd bits of the society and culture get parked like this and he can become important, just because millionaires these days are trying madly to save their cash with art. Art and land increase in value. So, there's guys walking into salons today who know nothing about art, but have just got that 100,000 bucks that they want to get deposited fast before inflation eats it up and they feel if they bought a big, nice, good, solid piece of art, that would be known into the future, then of course, it's worth a 100,000 now, but when money inflates, it'll be worth 200,000. Like land, it would have increased its value with the inflation, so therefore it's like gold, you see?

So he walks into the gallery and he looks at this painting, "Huh! It's a girl holding a what?" That's the total knowledge he has of any of this, so he's got experts and the expert can't paint, but he can tell him the real from the false, something like that. But if that guy himself had no doingsness of detection or doingsness of anything else, his opinion wouldn't be worth

anything either. He wouldn't be able to see and he'd be able to palm off everything. But you've got quite a culture – winds up in some very odd spots and you occasionally look into some of these spots and you'll think you have a total theoretician or something like that, that you've got a totality and you may very well have.

But there's nothing sadder than an expert on steam-driven road equipment. I imagine there is one in England today. He's an expert, the last practical expert on the subject of steam-driven road repair equipment. Did you ever see any of these things in textbooks? They're steam engines that have rollers, and they go up and down the roads and – in the days before the internal combustion engine. He's the last – he was the world's – he was a good practical man. He never had any theory of any kind on the subject of steam, or propulsion or anything else, but he's awful practical on the subject of these things, you see? He was all doingness and no thought. Well, he antiquated. He became antique. He became unemployable, actually.

So, when you break up this balance in an education, then you haven't educated the bloke and you haven't safeguarded his future. A fellow is betrayed, then, to the degree that he is not educated and only schooled; and that is most of the protest of the young: that they are being schooled, not educated. They're not being fitted for life.

I'll give you an idea how far adrift it can go. I asked my kids the other day to write something, write their names, sign their names. And boy! Of all the tongue-between-the-teeth actions, you know! Oh, that was grim! They had no signatures. I came down on their teacher like a ton of bricks, you see? They've done – do lots of – lots of exercises in the field of writing, they couldn't sign their own name. Marvelous example, don't you see? Yet I'm sure that they've been very busy making circles and very busy making slant exercises and very busy doing other things and very busy doing everything but write. And somewhere or another, if you wanted to know what was wrong with that and why that occurred, somewhere or other the doingness moved into the field of theory or significance, see? The doingness moved, became just a significance. But it isn't a doingness, don't you see? I mean, writing words has very little to do with traveling ovals, as they call them and so forth, see? So, you can just go just so far with traveling ovals and you get no – there's no doingness there.

So the guy is actually in motion, but it isn't an educational doingness. And that's where an Instructor could make his mistake, you see? Because people are busy or active or acting, then he thinks they are *doing*. It all depends on what they are doing. If they're not doing something that is immediately going to add up to an action applicable by them in life to the accomplishment of a result, they're in the field of significance. And they react like they are in the field of significance. They become very stultified and bored and protesting and annoyed. See, they themselves have recognized that they've exceeded the doingness, that this doingness has nothing whatsoever to do with what they'll be doing. So they fall back then, and they just treat it as a significance because it's purposeless. It doesn't go anyplace, you see? Nothing's happening so it might as well just be a significance and therefore all the motion is no motion at all. So, all the motion being no motion, really, they get this funny, bored, you know, feeling, like, you know, they're not moving. Here they see all the motion, but they're not moving. And actually it's a significance, which has some motion in it and it doesn't have anything to do with going anywhere. And they get this funny sensation – it actually develops a physiological

sensation. It's being up against something, but not being able to move through it. Funny, funny sensation. It's identifiable.

Well, those fundamentally are the basic balances of proper education. Whatever else you want to say about it, those are the basic balances. There are a lot of very specific things, there are a lot of odd and very sharp and very true and very positive and very practical aspects of all this. But education is the – should be the activity of relaying an idea or an action from one being to another, in such a way as not to stultify or inhibit the use thereof. And that's about all it is. You could add to it that it permits, then, the other fellow to think on this subject and develop. He should be able to think on the subject and develop on the subject.

In other words, he takes this idea that you've given him, and it applies only to murals. You've given him enough background and so forth, and you've told him this applied to murals. And one day he's looking at a miniature and he says, "For heaven's sakes, that also applies – for this particular job that I'm doing – that other principle applies to the miniature."

I'll give you one, I can think of one right offhand. A photomural should never be painted until it is actually assembled on a wall, if you're going to paint a photomural, see? Well, I can think of an association that a guy would get in his skull, if he was having any trouble doing miniatures. Supposing for some wild reason or another somebody came up and wanted him to do a miniature on ivory. Well, this is feasible, you can do it. So, if he knew photomurals, and he knew a lot of other work, and he knew lantern slides and so forth and then also he knows how to go back and find how to make an emulsion (you know, one of the basic emulsions that – make it out of egg white or something) he knows what textbook to find it in. He'd probably whop all this together and then he would also know that you certainly better not paint it until you'd totally finished it, see, and in other words, the information is loose in the guy's head. It's flexible, he can use it, see? It isn't jammed into his head crosswise so that it just associates just with one thing, see?

Don't give it – don't – education shouldn't give people the technology in such a way that the technology is not useful to them. They've got to be able to think with it. You've got to remember that when you teach this engineer in a university all there is to know about nuclear physics, that in just about a dozen years, through the investment of national governments and other things – and particularly since it's very destructive, we know that national governments will invest, very heavily. And we know that this field is going to change. And we're going to teach him all there is to know on the subject. Well, we could make just a technician out of him for common, ordinary, garden-variety actions of reading meters; or we could teach him current technology or current theory as a biblical fact; or we could teach him in such a way that he could think in the subject. And of them, the only fair thing to do is teach him in such a way as he could think in the subject because it's an advancing subject, and he won't become an antique in a dozen years, see? If we did anything else, he would become antique because this thing – after all, governments are in there shoveling the money into atomic development and so forth, left, right and center. They've got guys on pure mathematics and they've got guys on this and guys on that.

And they're – I don't care how they say they're – but I always get suspicious. They say they're "abandoning the production units of Uranium 235," and then the following sentence is added onto this. We take it – yes, they're abandoning the manufacture of 235, we'll buy that.

Now, the "because" is what you – what you wince on. "Because there's already sufficient quantities of it to answer all possible needs for the next 500 years," see? There's that "because." The first sentence, all right. All right. So they're going to abandon this development. But their "because"? Maybe so, but we don't really think so. They've discovered something else, brother. They've discovered something that makes U-235, you know, look like last season's high-button shoes. And of course they're not about to let it out.

Every time somebody discovers one of these secrets, or the secretary of state, or somebody like that, of the United States gets on a plane hurriedly in order to tell the last atomic secrets to Khrushchev. I don't think that's his job, but that's what he's been doing lately – this bird, he goes ramming across and around and about and screaming about this and screaming about that. No. There isn't any of these secrets that have been stolen such as the Fuchs and that sort of thing, as damaging as they were, that didn't excite the government into a fantastic internal convulsion on the subject of "Develop something new, something better, something that hasn't been stolen yet." And their best prevention of espionage is not political because that they're sour at. Their best prevention of espionage is just being newer.

So, I imagine the poor kid being educated right up now in Birmingham on the subject of atomic physics is probably already 10, 15 years behind the mark. He'll probably get out and he will look very bright and he will say, "All right, now we take the *riga-bongs*," and so forth.

And the fellows on the place say, "The what? Oh yes, yes. We remember that. We – it's – we... that's historical."

That was his last course, see, was in *riga-bongs*, you know? Oooh! "Well, what are you fellows doing?"

"Oh well, we haven't time now, but there's a pile of textbooks over in the corner. Those are our more recent notes."

Well, education, then, to fit this fellow for life would have to fit him for this operating atmosphere. It would have to fit him to think. At the same time they'd have to teach him that disciplines are disciplines and actions are actions but at the same time they'd have to teach him to think with these actions and advance these actions and carry them out to a finite and final conclusion. They'd have to do these things. Well, that's quite a trick, to teach somebody, on the one hand, that this is an exacting discipline, and on the other hand that you should have a loose and flexible attitude toward it. Quite a trick, isn't it?

Well, you recognize what the strain is. You're trying to make a practical person who applies it to a result, who can give it that extra fillip, you know, that extra little zing that pushes it on through. He can think on his feet, in other words, and – so that he won't antique. Give him all this so he won't antique. Well, that's quite a trick.

Actually, that is being demanded of Scientology as in nowhere else. And anybody studying in Scientology is under considerable stress and strain because of these various factors. You have a madly advancing subject, which is advancing beyond the expectancy that it was – its expectancy keeps rising, don't you see? And which is already taking off from the – from the basis of having exceeded all former expectancies. See, and now it is still advancing and its expectancy level is rising, see, consistently. I mean, more and more is developed that broadens the view more and more, see?

And so therefore education in Scientology becomes a much touchier proposition than in any other analogous subject and it's very rough. It's very rough. That is why I undertook to find out what are these various balances and what do you do and so forth. And how do you bring somebody up to a point where he can study this thing without too much casualty and upset.

And what are the touchy points, then, of education? And of course, education is a subject that has not been worked out. By definition – there isn't even a definition, you see, such as I just gave you a moment ago. They don't operate in a school with a definition. Well, that's wonderful because what trouble do you get into if you read a paragraph beyond something that you haven't got the definition of? You get into trouble, promptly, instantly and immediately, catastrophic trouble. Well, education's been in trouble ever since it started to do something which it never defined. That's the basic thing wrong with education, see?

Let's call somebody who is being educated different than somebody who is being taught. Let's make that shading of difference here. And then let's get the technology of schooling and understand that the technology of schooling somebody does exist and that man has had that for quite a while, but it doesn't necessarily have too much to do with the technology of educating him, which has been relatively undeveloped. So just because one is going to school is no reason one is getting educated, see?

But there's terrific technology wrapped up around school. And that the success of any taught subject is to the degree that it keeps its significance sensibly balanced with its action and the masses associated with it. And that's a sensibly balanced subject. And the odd whip-around can occur here that actually a person can think he's engaged in a doingness when actually he's engaged in a significance because the doingness is never going to be applied, see? And he can actually be engaged in a significance which is really a doingness, on the other side of the fence, naturally. If it balances one way, it'll for sure balance the other way. He can be engaged in a – in a significance of the action of contemplation. And it's as silly as that, don't you see? It's too silly to require very much stress.

What is the significance of an action? Well, if an individual was terribly significant about everything under the sun, moon and stars, you could, of course, work up significance into some kind of an educational subject. Don't you see? So the significance itself would lean over and become a doingness. Sounds silly, but it's true.

I'm now talking about the "expert on art of the nineteenth century," see? And there are fellows who make a terribly good living, which is the achievement of a final result of education. After all, I don't care how much communism we've got amongst us, you know? The guy is making a living by simply being a walking dictionary, see. Memory expert on something or other – he's somebody or other. He knows all the formulas there are to be known on the subject of paint. He never mixed any paint, he wouldn't know what to do if you showed him a paint can, he actually abhors the smell of it – it makes him quite sick. But he can sit there in a little cubicle and be an expert on the subject of paint. So his, of course, has become – his significance has become his doingness. Perfectly allowable. The society has that.

So, somebody writes him a letter and they say, "Dear Expert Jones: We are working with the formula of rosin and – uh – su... and – uh – amber, and we are trying very hard to develop the – so on. Could you please give us the background music to this here paint?"

And he says, "Well, that paint was originally used on the Tyrrhenian Sea and uh – so forth and their amber was different than anybody else's amber," and he goes on and on and on.

At the other end of – the guy, the practical bird, takes a look. "Hey, no wonder it won't paint! Their amber was different. There's a different type of amber – that's Russian amber and Russian amber, it has an awful lot of beeswax in it," or something, you know, whatever it is. "Ha! This paint requires wax." So we dump some wax in. All right, now it paints things. See?

But this bird didn't have any idea of applying this to anything. If he said enough on the subject then somebody who was doing the subject, you know, could make some sense out of it. So there are experts.

There's guys like Einstein. He sat around and did a wonderful... he had a total doingness that was of significance. He figured and figured and figured and figured and figured and he figured everybody into a hole. But he sure stimulated guys. More mathematicians were made trying to understand Einstein than any other single man that ever worked. The joke of it is, there might be nothing in his work at all. It's sort of idiotic to say that – somebody comes along and tells you that the speed of light is c , and it's never any different. What's he talking about? What light? Well, now, I don't even think he says it's the light between 3,600 angstroms and 5,600 angstroms. I don't think he got that definite. He just said, "The speed of light." Well, that's great. Does he mean light as we normally see light? Well, light, in actual fact is simply the light vibration that you see, don't you see? By definition, that's light. Well, then he must have meant that light, visible light. Well, great. I'm glad he did because when it goes through a prism, it no longer travels at c .

Well, what do you say? It could no longer travel at c for this excellent reason: It emerges from the prism at different speeds. Otherwise you would never have a spectrum.

Oh yes. But now, you're only talking about wavelength and you're only talking about the amplitude of the wavelength and that sort of thing and that's why it turns the corner. No, I'm afraid that that can't be true either. It must be at a different speed because if you've ever watched soldiers in an evolution, the fellow on the outside is going faster than the fellow on the inside. Have you ever noticed that? Well, light, to bend and fan into a dispersal when it goes through a prism, must be handling something that has to do with speed.

But because everybody has gone stone-blind on this because Einstein has said quite the contrary, don't you see, now they've got to have some weird idea, and actually it might interest you to know that they have finally abolished light. I thought that was mighty nice of them. They've now got it worked out that color is only something that is manufactured by the eye to relay to the brain and doesn't exist in actual fact anywhere. That's actually told to you – that's being taught me right now. I think it's a wonderful idea. But if the guy hadn't read a psychology textbook before he wrote that textbook, I would be happier about it. There's something wrong with all of this, for this excellent reason, is, a vibration is a vibration. I don't know why you have to get psychology into it. That's the influence of Locke and Hume, you see? These old birds.

"If there was a sound..." Descartes, yeah? "If there – is there sound in the forest if there is nobody there to hear it?" [laughter] Well, what do they want to chase themselves up those blind alleys for, man? Because they're very easily answered. They are confusing the role of a thetan because they haven't got him. And of course, he's the wild, missing variable in all of their equations.

So, all right. So the thetan builds the universe. Now of course, he can experience it. You can experience what you can build, so therefore there would be such a thing as light. It all depends on how you're looking at it, and from what mental science you are looking at it, as to whether or not you make pronouncements concerning it one way or the other. But you might get an idiocy that would go something like this: "Now, light doesn't exist because you aren't. Now, if you were, then light couldn't. Because, you see, if light really does come through the pupil of the eye and excite the brain into various sensations known as color and so forth – but if these things do not exist in actual fact, then of course nothing is behaving outside of your skull at all. Nothing is happening outside of your skull." You are saying such things as, "A cook can never eat the cake he bakes." See, this is the plea for total introversion. You follow me, don't you?

Therefore, if we've got to have an argument about "If the tree falls, is there a sound if nobody's there?" If we're going to have an argument of that character, then let's have some real arguments like "Can a cook bake a cake and eat it?" See?

But you'd have to go upstairs into the role of a being in this universe, or a thetan. You'd have to come off the kick of the "Big Thetan" idea, see? You follow me? "The Big Thetan built light, and you can only experience light and you don't have anything else to do with light except experiencing light, therefore you're a total effect, brother. Lie down." See? You get how these tricks are worked?

Well, in education and so forth, you'll find out that it's very safe to advance from a basic premise or a basic assumption, and to make it very clear what basic assumption you are advancing from, and then not try to spread this assumption over into a thousand different things.

They have assumed, in physics, the conservation of energy. Well, let them talk about that loud and clear and then let them not talk about the organization of mass. Because they've merely started from the conservation of energy. They haven't said anything about mass. But now they try to drag in mass by saying mass is merely a bunch of energy. Why did they do that? Because their basic assumption is the conservation of energy. "Energy can neither be made nor destroyed, by anybody, particularly you." See, that's the basic assumption of physics. So this naturally is energy, see?

Now, it's not the conservation of space, it's not the conservation of time and it's not the conservation of mass. So now everything, then, has to become energy because they've started out with their basic assumption. Therefore they themselves become blind to where their subject took off, and therefore where it'll err. It's going to depart, see? The second something comes up which is not energy, it's going to exceed the basics of finite physics and that's all that's wrong with that because they didn't start with anything but energy, don't you see? So, they're not going to go anyplace but energy.

We're in a very safe relationship to this. We start with the being: you, a thetan. We can prove that you, a being as a thetan, exists. We can prove that, and we can back you out of your skull and you can stand without a body. So you're not a body. That's very simple. We don't do this very often and don't require you to do it as one of your class exercises because it makes people sick and unhappy. But it does happen and it does work. All right, so we start out with the basic building block of the universe: a thetan. Now, we're on fairly solid ground there, but of course having done that we are now exceeding all former basic assumptions which start subjects.

Now, in trying to communicate this idea, then, we collide with all preconceptions. We collide with everything in the background of people, we collide with all of their upsets in the past, with practically everything under the sun. We can only go, then, in the direction of processing. We can't go in the direction much of the theory and philosophy of the universe because the only way we will really win is in the direction of processing, handling and doing something with the unit because the unit is not educatable at a degraded state. See, that's elementary. So, unfortunately then, we have to know about all there is to know and know it better than anybody has ever had to know anything before, particularly about education because we can't teach anybody to do it.

You're tackling a very tough subject. It's a very easy subject. You're tackling essentially a very tough subject, in Scientology, which has been made as easy as possible. And my efforts have been devoted to, in the last few months, in studying study, to make it even easier.

Now, I haven't told you very much in this lecture that you can use, but I've told you something that you might have some inspective relationships with, you know?

Well let's say, a whole school system of a country miseducated all the youth of this country with malice aforethought. They would get to a point where they couldn't receive a datum. So, they're in a war, and, the enemy – the enemy sends them a despatch and says, "We are going to attack tomorrow morning," but they can't receive a datum. They've got it that plain and clear, see, and they are all in bed, and they all get shot down in flames and that's the end of the country, see? It gets down to the *reductio ad absurdum* of not being able to observe anything, not be able to perceive anything, not be able to understand anything and have no ARC with anything, which looks to me like a sort of a "thetan death" situation.

So, it looks to me like there is a great deal of comparison between miseducation and aberration. And it also looks to me that a great deal of work could be put in on this field from a standpoint of deaberrating people at the lower levels. I'll give you an example, just offhand: "Tell me –" this would not be a repetitive process – but, "Tell me a word that you have not understood in this life." And then you make the guy go ahead and clarify it. I think you'd get some of the most interesting resurgences. I think some of the many of the personal problems of the individual would blow up in smoke.

But here, just on this other subject of study – of studying the subject of study – one walks forth with a brand-new avenue of lower-level disentanglement and lower-level therapy lines which look quite promising; they look quite promising. But what I'm mainly interested in is you, a Scientology pro training people, have to know something about this subject. I'm

interested in your education right now as you exist. And I'm trying to make it as easy as possible on you and teach you something about it.

Thank you very much.

STUDY: GRADIENTS AND NOMENCLATURE

A lecture given on 6 August 1964

Well, what's the date?

Audience: Sixth of August AD 14.

What?

Audience: Sixth of August.

It is the 6th of March.

Audience: Sixth of August.

Somebody back there says it's the 6th of March. It's the 6th of August AD 14, Saint Hill Special Briefing Course. And we have another lecture today on study.

Now probably, just to get off in high gear here, so the taxi cabs won't run up too big a bill out there this evening – just to get off into high gear, let me tell you at first that, of course, no field of study including Scientology texts of earlier times includes these principles.

So this is a very adventurous thing I'm doing because it can rebound on a critical, you see, at Scientology texts because they are not written this way. They are written in an effort to make people understand what you're talking about but they do not go according to these principles and future Scientology texts, on the other hand, will go according to these principles. And you will see this suddenly entering and coming over the horizon. However, you have at this time only a bulletin or two which represent this. You probably have noticed of recent times that the more recent bulletins are much easier to study and that is a direct result of this study of study. Leave it to me to study study.

But it's very interesting that your grades on examination, since I have been talking to you about studying, have increased from five percent in the nineties – five percent of the class in the nineties – to sixty percent of the class in the nineties. That's one of these astonishing leaps, you see? It is too astonishing to – well, it would be totally unlooked for. Now, you are already being trained above the level of modern education, that is to say modern education as she is taught. One shouldn't be grammatical about low-grade things, you see? I've been amusing myself lately by making grammar agree with the disrespectfulness with which something should be regarded. That's very interesting – the mood with which you use grammar, you see? And you do that, too, you say, "She ain't a-gonna come." Meaning, of course, that you had a highly disrespectful attitude towards what she said about it, don't you see? A lot of unex-

plored nuances in language and that sort of thing which are quite amusing. But of course, that's just amusing.

In the field of study to improve the ability of a student to learn by altering the character and methodology of teaching is the exact aim here. Now, this is quite an interesting aim: that is, just to alter the ability of the student to study and to learn and improve it by simply altering the teaching methodology. Now, you see now, that in itself is rather adventurous, because you say, "Well, I could make the subject easier to read," or something like that, but how about changing the subjective reaction of the student to the subject by the method of teaching which is employed? So, you see how far we have reached here. We are now handling in this subject the subjective reaction of the student to the subject by the method we use in teaching it. So, if you want to see some pan-determinism at work, that's it, don't you see?

Now, study normally would simply be, you told somebody something and he was supposed to study it, you see; and if he didn't like it, why, you reported him to the headmaster, you see? That was how we achieved subjective reality on the student. In universities it's done by mechanisms of expulsion, a grade system whereby if somebody doesn't make a grade he is expelled.

This lightly goes on – he's not permitted to go into the next grade. You see that very commonly, but this goes up to a point where somebody is expelled. Now, that was how they tried to give the student subjective reality on the subject he was studying by, of course, punishment. How else would you expect, don't you see, the thing to conduct itself in the physical universe?

So actually, beyond an effort to present the facts and say a subject was there and then provide a school technology which made the individual guilty if he didn't know it, the whole subject of study and training had not really much advanced beyond that point. That was about the high tide of study.

Now, quite accidentally someone with intuition or insight – some professor, some teacher someplace, in some school – would depart from this rationale. He would depart from this method of teaching and he would try to invite the understanding and the interest and the participation of the student; and such people were very rare and people really tried, students really fought to get into their classes. And that was about as far as it had advanced.

Now, when we recognize that education is not very successful we have made an enormous stride forward. Now, the educational authorities who are responsible for the education of children and adults refuse to recognize this fact and so they really don't really try to improve it.

But when you are down against a practical subject such as Scientology where you have trained this auditor as best you could and then you see him sit down – you have an element there which is missing in most educational technologies. They teach the engineer to build a bridge but then nobody in that university is forced to sit down and watch him build a bridge, much less go across the bridge he has built. So you see, they do not in actual fact get a very good look at whether their educational methods are successful or not. We teach somebody ancient Greek. There is nothing wrong with learning ancient Greek but the teacher then

never really is a witness of the student speaking to the ancient Greeks, see? He doesn't pay too much attention to this.

So therefore, in studying study, I avoided all those fields where observation of the student was not easily attained, the actual doingness of the student was not easily viewed. That ruled out a field for the study of study, you see? So immediately engineering technology, we could learn nothing from that because, of course, nobody ever sits around and watches whether or not the engineer builds the bridge, you see? So it had to be something as intimate as Scientology, which is, the Instructor teaches the student how to audit a case and then, oddly enough, is able at that very minute to have him turn around and audit the case, see? So this, of course, has a tendency to force progress and advance upon us and we are able then to make a further advance because we have an instantaneous inspection of the results of our study.

So, perhaps one of the reasons why the civilization has not made considerable progress in this line is because very few subjects are in this category, whereby the subject instructed is not instantly practiced before the professor. Do you see that? So that therefore gives us – gives us you might say the driver's seat in this subject where – of study – because we can see instantly with no comm lag at all. We don't find out whether or not this fellow turned out to be a great and famous barrister, don't you see, twenty years hence. We don't find that out, but we find out whether this person became an auditor before the day is out. Can the person use this principle? Well, we walk right over into the auditing section and there is the same auditor that we've just had in practical and we've just taught him something in practical and there he sits, you see? There he sits with his bare face showing. Right there! And when the Practical Supervisor also does auditing supervision, he continues to work very, very hard to put his practical across to a point where he sees it all of a sudden in a session. You see? So, we probably have a closer look than anyone else.

Now, there's a great zone of tolerance in most studies. They expect the student to be very amateurish. Let's say we're teaching a craft like silversmithing; now, we don't expect he is going to heat up any silver without burning his fingers, see? So we get a big gradient win: He heated up some silver without burning his fingers, see? Well, that's all very well and that's fine but we don't expect him to make a tea service that is going to please the general manager of the British Silver Trust in his first few weeks of silversmithing. We sort of would expect that fellow to go out and hang around silversmithing and improve his design and work with a master and gradually get there and when he is about fifty, why, turn out some cracking marvel of a piece, you see, that the general manager of British Tea Services, Limited, or something of the sort, would approve of and buy and use as a standard design, you see? There's always this comm lag.

But there was a field, not to stretch it too far, there was a field where instant inspection was feasible and so that field lent itself peculiarly to study on the subject of study which would be analogous to Scientology and that was the field of photography. Now, when you tell a student to take a picture of a tree and he goes out and takes a picture of a tree, you in very short order are going to see a picture of a tree. And if it is upside down and if he has cut it in half and if he didn't hold his camera level and if he had camera shake, all of these things are immediately and distinctly visible. Furthermore, we have a direct and exact result of a combi-

nation of actions which, of course, is important. Can he put a sandwich on a tray? Well, all right, he can put a sandwich on a tray, but that's not a very complex action. Can he make a sandwich and put it on a tray? See? All right, well can he make the bread, you see, and make the filler and make the sandwich and make the tray and put it on the tray? You see how this field – you could suddenly start broadening, see, out a subject.

Well, I'm afraid that we're in – very close in – to that kind of a subject in Scientology. It's a subject of complex actions. It's not a subject of simple actions. No matter how hopefully a person in a co-audit when he first comes in – I'm talking about a HAS co-audit – believes, no matter how touchingly he believes that all it is, is he has to sit there and nod, he very, very soon becomes aware that he is engaged in a complex action. He is expected to say something and this probably strikes him with the greatest of shock when he finally realizes he is expected to say something and that it is up to him to get the person he's auditing to say something.

Now, we've got a double complexity: he not only himself has to say something but the person he is auditing has to have something said to him which will cause the person he is auditing to say something. Do you follow this through? Then he's got to hear this and then he has got to acknowledge it. Well, he probably finally masters this, off a canned piece of paper or something of the sort, and he finally masters this and he feels very triumphant, only to discover that the person who sits opposite him in the co-audit, as it changes around, is not the same case. He gets different pcs and these pcs have different cases and this is pretty grim, because we knew all we had to say to somebody was, "Well, how is your mother-in-law getting along." and we had a good session going. But this next fellow hasn't got a mother-in-law, [laughter] so that is a total stumbling block and you would be amazed how big a stumbling block that might look. Now he has to enter the technology, if he's told that he has to do something with problems, he has to enter the technology of problems. What the devil is a problem? In order to talk to somebody about problems, or dream up things about problems for the fellow to talk about, we have to know something about problems. Now, he's away into the significance of the mind, added to the actions which he is performing.

Now, the normal way we go about this is to get him to perform the simple actions and then add the complexities to them one after the other, on the basis that the person would become confused if given too much too fast.

So, we have a new discovery which we have made, long since, called gradient scales which applies in the field of study and that you teach somebody on a gradient. Well, what is meant by "teaching somebody on a gradient"? Well, a gradient of course refers to a grade which is sort of an uphill looking sort of picture, don't you see? It's a little bit more so each successive step. What we mean by a gradient: It gets steeper or it gets more complex or it takes in more the further you go.

Well, that's a gradient and as long as we attack a gradient – as long as we attack the subject on a gradient of complexity, we give him this cycle. We move along into more and more numerous actions, but we try to teach him each action that we're going to add to – we're going to add to this action – so we're going to teach him that action so well that it doesn't worry him. And then our next action that we teach him – this has its own complexity, but it's

done in combination with this first action. But if the first action is still worrying him and he hasn't got that down, then our next action is going to throw him.

When you see somebody getting confused, then he hasn't gotten down the more fundamental action he should have gotten down before he advanced into more complex action. It isn't that he doesn't understand the more complex action – he's not even confronting that action; he's still confronting this more basic action. See, he hasn't learned that basic action.

Well now, the only place you can err in this area is trying to start in too high on the gradient and you can make that mistake and you can make that mistake with the greatest of ease. It's the easiest mistake to make because nothing else is done in the modern university except make this mistake. They don't educate – they make that mistake.

Modern education is really the art and science of making the mistake of too steep, too quick, before anybody has learned anything about it.

For instance, I've seen German taught with ferocity and velocity and the next thing you know, we were learning all about Schiller, whoever the hell he was. "What's Schiller, where are we? How come?"

"Well, that's just in the lesson text. See, that's the fourth week's lesson text."

"Yeah, wait a minute. What happened to the alphabet?" Nobody can read a German alphabet in the – that's used only to English Alphabets. You can't read one of those Gothic Alphabets. It's just gobbledygook! Looks like bird tracks! [laughter] Well, all right, you're going to teach somebody about the nuances of Schiller, are you? When it doesn't even look like words on a page! He's not yet convinced there are words on the page, you see? He thinks the printer spilled some ink. He thinks his book has been damaged. Nobody bothers to teach him the German alphabet. Where was he supposed to learn it? We look in vain for where he was supposed to learn the German alphabet, because it's not any part of the syllabus of that course. Ah, but it's German 1; where the hell is German 0? Well, they must assume that that must have been in your last life.

So, you can make with the greatest of ease the mistake of entering a gradient too high.

A multimillion pound activity was carried on in Africa teaching a number of tribes down there "Soil Erosion: The Techniques of Preserving Soil and Preventing Erosion." Parliament up here was just appropriating money, along with peanuts, and so forth. It was back in the days when we were all comrades. And they were appropriating money for these groundnuts – peanuts to you Americans – which never grew and nobody could do anything with them after they'd grown them because there was other things they did it with, see? Same time they were pouring this *flood* of money, as a support program to groundnuts – they got into soil preservation and preventing soil erosion. And they poured the money into this and they poured people down there and they had people in an airlift going down to Central Africa to solve these staggering and fantastic problems they were having in trying to teach these natives how to not erode soil. And the native was taking this in just about the way oil takes in water. I'm sure he was being polite and gentlemanly about listening but brother, he was really paying no attention.

And it took a Scientologist in the middle of the program to straighten it out. He did it with gradients which we already knew about. He just decided that the government had cut in too late. The native didn't have any reason to not erode soil. Well, there was all of Africa full of soil – how come we were preserving it? It seemed to be the most bountiful substance he ever had anything to do with. And this dropped back to the fact that he had no idea of future. So this Scientologist sat down patiently and ran around and wrote them up something that they used in the program and one has never heard about it since, so it must have been very successful. No more billions are being promoted in that direction anyway.

Just this: That you had to teach the native that there was such a thing as the future and that his future welfare of his children and tribe depended to a large degree on his still having pastures to graze and areas to grow things in. And they taught them this very carefully and considerable enthusiasm greeted soil erosion.

Now, you very often make a mistake in a Comm Course when you find a new student comes into that Comm Course and you are teaching him this and you're teaching him that and you're teaching him this drill and you're teaching him that drill and he doesn't know how to sit in a chair, man. Now, you could go more fundamentally than this – you could go more fundamental – maybe he didn't know why he was there. Maybe he came in by mistake. Maybe he still has some weird idea about how come he's there. Now you're teaching him a Comm Course.

Well, you're not teaching a Comm Course to anybody that's there, so our basic gradient on education is to get somebody there. That sounds too simple but almost every elementary teacher in the world is making that mistake today. They are teaching children who aren't there. And you'll find the most marvelous increases in IQ and learning rate take place under that very, very funny simplicity and most of their big educational strides made with Scientology are simply based on that one little tiny factor of getting the student there.

Well now, they don't know what they're doing, some of these teachers. They think they're doing something esoteric or wonderful when they tell the student class – when they tell the class each morning to "Look at the front wall, look at the back wall and look at the ceiling and look at the floor." Maybe they're doing it "because Ron said so," but it seems to work and this seems to have a great deal of workability and the children all appear to have an enormous increase in intelligence even though this is only used for five or ten minutes each morning.

Well, that's quite marvelous if it's only used for five or ten minutes each morning because the process obviously isn't run long enough to even get into the zone of having to be flattened. Nothing is going to happen here to a case to amount to anything. What they haven't noticed before is that the children weren't there to be taught and of course they look more intelligent if they are there. Try and run an IQ test on somebody who is not sitting at the desk taking one.

So, actually this is completely aside from the ramifications of havingness and other factors that would be involved in this – that first step is just to get somebody there. That's the first step. Now, maybe in a Central Organization somebody up in the Academy may be saying to himself, "Well, the Letter Registrar already got the person here. Getting the person here is

the duty of the Letter Registrar. The person came in to take the course, didn't he? Well, the Letter Registrar was supposed to have written him letters, so obviously, then, the person is there." I've already had this explained to me. Do you see the rationale? No, they've got a body in class. They've got a body in class. Now, why the person is actually there? They don't know that.

Well, the fads hit this course. Yeah, once in a blue moon we'll have a new fad – not once in a blue moon either – everybody will get on a fad thing. For a while, a year or two ago, I've forgotten exactly when it was, "the problem they solved by coming to Saint Hill" was in vogue and for a while, why, everybody was just making marvelous TA and gorgeous case gains and so forth – "the problem they solved by coming to Saint Hill." "What did coming to Saint Hill solve as a problem for you?" See? And then they would run this out and they'd square it up and it's marvelous, and so forth. And I don't believe I ever thought about it very much, but my laughter on this situation would be based on this very elementary fact: That they weren't really running a Problems Process at all, see? They were simply making the person aware of the fact that they had arrived at Saint Hill.

So, we don't do that anymore because we've got a little checksheet which goes in and out and is sometimes skipped and sometimes put back in again, which has to do with getting the person to go around and spot the locations of everything around here, see? We take care of it with a little checksheet. They're supposed to get this and supposed to get that and they're supposed to look over this and supposed to that, don't you see? So, there is a Touch Assist familiarity, so that – that wipes out two things: the vast mystery of where they have arrived at and the fact that they have arrived.

So, your first gradient in education is to get somebody there. It doesn't much matter how you solve it. I have shown you here – get the little kids in school to spot the ceiling and spot the teacher and spot the floor and so forth. You've got them there now and they respond by appearing to be far more intelligent than they were before, so you say, "Well, look at the tremendous IQ gain this gives." No, nobody is smart where he is not.

All right, so there – there is the idea of education by gradient and the – repeat – the mistake you can make in education by gradient is a big mistake and that is: failure to undercut the gradient, failure to get simple enough, failure to get the primary action. You must get the starting action that the person can be made sure of so that he can then go on to another action and become sure of that and go on to another action that he becomes sure of, you see?

Well, now if you haven't ever gotten a low enough or simple enough first action for the person to become sure of, then the person advancing into the next zone finds that very, very complex and starts to feel sort of spiny and then the instructor starts going mad trying to explain to this student what this is all about – this step two, see? Well, he has never gotten to step one and from there on his education is a complete mish-mash. And if you want to unscramble anybody's difficulties with training, and so forth, then you will just have to find the gradient that they overlooked or skipped or missed, after which they entered into a confusion.

And this would be very easy to find on an E-Meter, extremely easy on an E-Meter and that is simply: the E-Meter would register an early moment of confusion about study or training and it would register it repeatedly, that is two or three times if it's never been resolved. It

would only go *flick*, or something like that if it had existed and then been resolved, you see? There would just be the residual charge left on the time track. But if it's repetitively reading, if it reads several times and seems to read very strongly as he discusses it – gives you in other words tone arm action – why, then you know that it has never been resolved to this day.

Now, the difficulties that men have with their minds are those which have ridden forward with them into the present. Those are the difficulties that have to be treated and handled – the difficulties which they have had in the past which have ridden forward to them into the present. You can always get a registry on a difficulty somebody has had in the past simply because it is pictured on the time track as having had a difficulty. But if it is not riding forward with him into the present, you are simply using auditing to contact it again and it will blow. It won't restimulate particularly, it usually just blows.

For instance, if you have had somebody get a deep, a very heavy surge, let me put it this way – if you get somebody got a – get a heavy surge on a meter in a session, you can actually put them back into that moment of the session when they got the surge and you will get some ghost of that surge. That's not riding forward with them in the present time. You actually took them back into the past to find the surge. But you can get that surge back again because what you did was get the impression it made on the session. You didn't get the original reading – that blew. But then the fact that it did do this in the session is still a matter of record which can be picked up.

So therefore, accordingly, you could go back into the time track of an individual and you could get an emotional reaction for everything a person had ever been emotional about. Or you could get heavy reactions – it isn't that the reactions are necessarily heavy or soft – but you could get reactions about what a person has been emotional about that he is still emotional about.

Now, get the slight difference here. One is simply the impression on the time track of having been emotional. Well, you'll get a – you'll get a needle read on that. And the other one is a moment on the time track when he has been emotional that he is still emotional about. The thing has never been cleared up, in other words. And the difference between those two reactions is one will fade instantly, the first one – he has simply been emotional about something; he is not still emotional about that thing, that's long since gone, you will simply get the *whooh* on the needle – that needle's going to move, just contacting the earliest point or the point when it occurred, see, you are going to get a needle reaction.

But the other thing that you're going to run into, if it is still current, it will repeat. It doesn't blow through just being contacted – it now repeats and you can get more repeat. Well, that means it has ridden forward in time and has never been resolved.

I just make this point to you. As an auditor you are only interested in those things which the individual has never resolved. You're not interested in just those things which he didn't resolve. You get the shadow of a difference between? He didn't resolve it, so what? He never did find out how to get along with his commanding officer, but – he never did – but it's not riding forward in time with him. It isn't even capable of being restimulated, therefore it will read once and go *bvop* and it flattens; see, it's right now, it's out. Now, you could revivify him or regress him to that moment in time and start running him through incidents which are

not in restimulation and oddly enough you could get some built up that would go into restimulation.

As an auditor you have considerable power over the mind, you see, you can do some interesting things with it. So, there's two reactions here that you are interested in: There's the reaction that simply was there and isn't bothering the fellow – it hasn't ridden forward in time with him, but you can get him back to it and it reacts on the meter; and the other action is one that has not only been active at the time but is active now without any difficulty whatsoever. You don't have to go back in time to find this thing. It's going to react right away and the only meter difference that you will see between those two reactions is that one, the one which is still with him and is riding forward in time with him, and so forth, that one is repetitively reading. It will read and it will read again and it will read and it will read again, you see?

When you are checking out things you have to make sure that you've got something that will repeat. One of the main faults that you make in R6 is that you do not ever ask for the repeat read. Well, I wouldn't give you two nickels and a collar button, anytime, ever, for a one-read checkout – *achto!* Now, do you see why? Is maybe you checked it earlier and it read. Well, when you check it again, you might get the earlier read, you might get the moment in the session when it read before. Do you understand?

So you are only interested in a read that will repeat itself. Reads that don't repeat themselves have either blown, or they haven't ridden forward in time, anyhow, so the devil with them.

If you can't get something to read twice, skip it. If you can make it read twice, realize that it's riding forward with the pc and is therefore worrying him. Still worrying him to this day.

Now, all of this is necessary technology, as elementary as that may be, that's necessary technology to an understanding of how you would locate somebody's early confusions with regard to an educational subject. Because of course he was confused; he was confused every time he attacked a new point on the gradient, but he unconfused afterwards. The meter will still register those moments of first confusion, but they will register as only onces, so they're not important.

This, then, I have to tell you so that you can see and evaluate the observation. And then you get used to this and then you get some subjective reality on it, you realize what I am telling you is true. "Yes! Oh, he was very confused the first time he looked at the letter 'A.' He didn't know what that was – that was – yeah." Well, you get a read – one shot, see? You get a small read there on the needle, the needle moved.

"What about the confusion about the alphabet?"

"Yeah, the letter 'A'."

Whoom! – the needle moves and you say, "All right, now about the letter 'A'," and there is no motion. He isn't still confused about "A."

But let's take this bird now and we say, "What about the letter 'A'?" and it goes *whoompf!* Now it's done it once. "What about 'A!'?" *Whoompf!* "Well, how about – how about – can you tell me something more about being disturbed about this formation of the

letter 'A?' *Whoompf!* Now, you suddenly realize this bird can't write, see? You just – from your various observations of the pc, you've suddenly remembered having observed this, see? You didn't need the observation until that moment, but this guy can't write. Well, you want to clean up his writing. Well, let's find out what underlay that confusion.

Now, ARC must have preceded all misemotion and bad reactions. You don't have a bad reaction unless there has been ARC in the first place. There's got to have been ARC with something in order to make a bad action occur. You've heard me say that often enough. Well, all right, how about this – how about this confusion? Do you address the confusion in itself? No, it's just sort of an out-of-ARC subject. It's never the confusion that the person is supposed to be in, by himself and the Instructor and that's why education breaks down.

Now, let's go over that again. It's not the confusion that the student is trying to learn and the Instructor is trying to teach him. If they are having any difficulty with that at all, then that's a guarantee that it isn't the right confusion. You can just chalk that up with a great big red mark. Student can't learn it – you follow me? We're talking now about a heavy reaction here, not just a little old light brush-over – the student can't learn it, and the Instructor can't get it through the student's head.

Now, what are we looking at? We are looking at a lower point on the gradient which was skipped, getting back to what we were talking about in the first place. Here's this point on the gradient that he didn't master and then went on to the next point. With that next point he had enough confusion to cause him to be overwhelmed and he never did get that point. And when you look it over on the meter, that's the point you're going to get. You're not going to get the original point – you're going to get the next point on the gradient.

So, one of the sneakers that made this very difficult to solve was the fact that the thing the student is apparently having trouble with is never the thing the student is having trouble with. And you can save yourself a great many Instructor hours if you recognize that and get a good grasp on that, in actual fact. Now this, of course, follows the pattern of the mind, doesn't it? If the pc knows what is worrying him and if he is worrying then – if he's worrying – then that isn't what he's worried about. See, we know that. If you know all about what's wrong with you, that isn't what's wrong with you, brother, because of course, that would as-is and cease to be wrong with you. That's elementary, see?

So, this applied to education gives us this other weird look – that this same set of data applies in the field of training. And what the student is *very* confused about and *unable* to move forward into and what the Instructor *can't seem to teach* this student is not then the right point of address for instruction. That must then immediately, just by that adjudication, that must be the wrong point of address. And the Instructor just pulls off of that and takes a better, longer look at this situation. See, that's elementary, see?

Let me give you an example – this becomes – this is terribly elementary, very, very simple stuff. You can very easily overlook it: one, very easily not credit that this has got this much jolt in it. I know an Instructor in a slight state of shock at some of the results that he's suddenly getting applying some of this material, you see, on a student. "And did you know...?" You know, that sort of thing – didn't realize it was that strong. A Theory Instructor is checking out a student on a bulletin and gets to paragraph three and decides the student

can't pass it. But the student has been having such a dreadful time that the Theory Instructor decides that this student had better have a little bit of instruction. He's not going to give him a pass on this but he just – quite ordinary – he's just tired of having him foul up on this particular point. The student there can't ever seem to get beyond this point, see? So he says, "Now-now-look, look-look-look-now. Can you get the idea that *bla-bla-bla-bla*," and he takes up, you see, the third paragraph. And the student gets all foggy, and the Instructor says, "Now, just a minute. Let's see, how can I put this a little simpler? How can I put it a little easier?" See, the Instructor actually is reaching in the right direction, but he's still staying on what the student is supposed to be confused about, that's the mistake he's making. "But how can I get this a little simpler? Now, how can I get it a little lower on the gradient?" Now this student can't get it and the Instructor can't teach him.

Now, the first thing you should know at once is that we're one or more steps beyond what the student was really confused about. Now, it goes this elementary; you then go back and find what word in the second paragraph – which obviously has been handsomely passed – the student didn't understand. And it may not be a Scientology word at all. It may be some common English word, just like that. And all of a sudden, why, the student says, "Oh."

You see, this is not prior in time just because it's the earlier paragraph in the bulletin, it just happens that bulletins happen to be written more or less on a gradient. That's why you get the apparenacy of the earlier moment then.

But they've actually gotten to this point then and they didn't grasp the lower point of the gradient, so the upper point of the gradient is just *bvuuurrrr!* And the moment they get into this upper point of the gradient it's, "God!" You know? And the walls are getting closer and there's little bright spots appearing in front of their eyes and they feel sort of headachy. It's physiological.

It's no wonder the French over there – of course in a harder time, during Napoleonic times we could have said, "Who cares how many Frenchmen get killed?" do you see – but today we shouldn't have that calloused attitude and we ought to do something about the French educational system because they drive more students to suicide than you could easily count. They're *specialists*, specialists at making students commit suicide. The American university leads in as a close second. They just disgrace the fellow and send him down to skid row, if he errs. If they've made the mistake of too fast a gradient, then they condemn the fellow. Crazy! You get how severe this is.

This gets into – here is another salient point, I should not just interject in here, but I should give you full blast, is: Study can produce a physiological reaction and it can produce some pleasant ones and it can produce some confoundedly unpleasant ones. You can have some of the wildest physical reactions just from the fact of study that you care to have anything to do with. And this isn't just studying Scientology, man, this is studying how to paint barns – and it's not for nothing some student will be sitting there at his drawing board or something like that and he'll be getting more and more – he'll be getting more and more and more and more spinny, and he feels sort of weird and he's making himself spots in front of the eyes. And he's making himself sick trying to study any further. And of course, if he's being pressured forward against time, for a final examination, he cannot sit back and go for a walk

in the park, he can't do anything like that. He's got to sit there and wrap the towel around his head, don't you see, and swill up the coffee and of course he's just keying himself in like mad, he's tearing himself to pieces, and so forth. It's no wonder.

Well, what is the trouble with him at that moment when all this happens? Well, the trouble with him is not what he is studying, it's what he has failed to study, just before. This is always his hang-up. When you get a physiological reaction you've got a skip on the gradient, that you can be absolutely certain of. You've skipped the gradient. You are all of a sudden going into something or other, and you are studying how to lay sticks of wood across a path in order to subdivide the thing and measure it up to be concreted or the number of grains of potassium bichromate that you're supposed to pour in if it is a British manufacturer as opposed to American manufacturer and you say, "*What's this?*"

Now, it isn't just a missing datum. Don't get that idea, see? It isn't a missing datum. It's something on the subject of the mixture of chemicals or – see, it can be an analogous – it can be an allied subject where a more fundamental datum is or exists on... See, the gradient was skipped on an allied subject, see – or it was just the paragraph ahead of this in the text. See, it's not always the paragraph ahead of this in the text.

Sometimes the fellow all these years has wondered, "How do you really measure something when it's of irregular shape?" you see? And, "*How-h-ow-ha-h-o-w?*" And then all of a sudden he's got this thrown in his teeth, you see? "Well you measure out this concrete walk and you so forth and so forth and now the calculus which is superannuated on this subject, is so on..." and he's trying to understand the calculus – he's trying to understand the calculus – and trying to understand the cal – .

There's nothing wrong with the calculus. He doesn't know how to measure a walk – and he's been keyed in by some sentence that went right along with what he thinks he's worried about. It's right there next door – only it's a blank.

And you know, the whole subject goes blank? The whole surrounding area goes blank. It's like you shoot the top off one skyscraper and the whole town disappears. I mean it's that peculiar a phenomenon, see? You say, "Well, how could that whole page disappear?" You know, or "How could that whole textbook disappear?" If a student is having very heavy going he will have words vanish off the page.

I just had an experience a very, very short time ago; I was trying to look up a word in the dictionary that was included on a page which I was having a hard time coming to grips with, and you know, the word had disappeared out of the column and I said, "Come off it now, it couldn't possibly be missing out of this column. It must be in this dictionary!" And – specialized dictionary, and so forth, and I just sort of gritted my teeth and concentrated me eyeballs on it and, by George, it was right there. And, you know, it hadn't been in the column a moment before? [laughter]

In this particular instance, I however, know what I don't quite understand, I know what I have skipped doing and I've got to go ahead and do something about it, because it's just getting more and more and more into my road. I do not know so that I can bark them off, the complementary absorbing colors by rote. I can't tell you every color combination which ab-

sorbs every component of white light, except one, you see? That sounds very complex, doesn't it? It is! But it's this kind of an action.

But going on and studying beyond this point, which I went ahead and did, because I just didn't sit down and figure out a color wheel and get it all down within an inch of its life – it's lost back there. See? I crowded on past it. Now, somewhere in the vicinity of that is a non-comprehend. I have got that bit of noncomprehend pretty well spotted but that isn't what I'm studying now and that isn't what I'm having trouble with. I'm actually running into a point where things are disappearing off a page, much less headaches. But just going beyond this, beyond this – well, there's something back in that area. It is very easy and so on, but nobody has made one of these wheels; there isn't an illustration of one which gives it by complementary colors in this textbook. And there are no wheels that give you primary colors in terms of what absorbs "not them" from white light, see? What absorbs "not them." No list of what doesn't absorb them, so that would sort of have to be compiled and I'd have to sit down and draw this whole thing, I'd have to memorize all of these points of the thing and then I know I would have it straight.

And about that time when I started to do this, something would fly up and hit me in the teeth like, "What the hell is cyan?" see? "What's this cyan? What shade is cyan? I always thought cyan was blue, obviously it is not blue. I have all my life been told by medical examiners that when you fed somebody cyanide they turn blue and..." See, here is a big bunch of confusion going on here and there is probably some foolish word like that kicking around in that area someplace, so I'll just have to go back and look over this area, because I know when it began, you see? That is I know the point that occurred before it began.

See, you can get clever enough to spot where are you at. And all you have to ask yourself or all you have to ask a student, "Where weren't you having trouble? Now where are you having trouble? Good. It's at the end of where you weren't having trouble." See, that's very simple, isn't it? So the formula is that you find out where the student wasn't having trouble with the subject and that meant that he had gone that far on the gradient successfully. And then find out where he began having trouble and you pick it up right at the tag end of where he wasn't having trouble and it lies in that immediate area. You can actually circumscribe it within a few words. I mean, you can do it that precisely. You can pinpoint. You'll have the half a paragraph that it's in or you'll have – sometimes you can get it down to the half a sentence that it is in and then you start plowing it out. But don't expect the student to be able to tell you exactly what it is that he is having trouble with, because that's why he is having trouble with it.

So, instruction would consist of guiding a student along a gradient of known data. It wouldn't be inventing new solutions to the student's confusions. You start inventing new solutions to a student's confusion, you're just going to get in more and more trouble. Why? Because you are already giving him – he has already got something he doesn't comprehend, now you're going to give him an incomprehensible that solves it.

Good instruction is a system of backtracking. A student will go forward – you can almost leave that on automaticity. He will go forward like a shot bear. *Zarroom!* He'll go into a subject. And all of a sudden you'll hear these – you'll hear this loud scream and the paws are

smoking, you see? Then you hear a thud you know? And then you feel the atmosphere around you shake. There's something happened.

Well, exactly what did happen? Well, he went right over the top of one point on the gradient, thought he understood it, didn't understand it, went into the next point of the gradient and ran into a brick wall. So the trouble with him is, it wasn't the next point on the gradient, the trouble with him was that last point on the gradient that he thought he understood, but didn't. So therefore, it becomes very difficult with a student sometimes to spot this, because he's so positive that he understood that last point. Yet the evidence that he didn't is sitting in front of your eyes: He's having trouble with the next point.

See, this fellow says, "Oh, I learned how to sit in a chair, I learned how to sit in a chair." You're teaching a Comm Course, see? "I learned how to sit in a chair. I know all about that. It's sitting in a chair and looking at somebody in front of me that is absolutely impossible! That's terrible! I can't do it anymore!"

You say, "Well, let's see." Here – here's... In the absence of this technology, one's reaction might have been, "Well, let's see, how can I fix up a drill here to get him to look at that student?" Now, you see how that would lay an egg and extend his training? See? "Now, how can I figure out something whereby he can confront this bird?" *Nah-nah-nah-nah-nah* – this is not – you are at the wrong point of the gradient, see?

Here's just a practical application. You say, "Well now, it's about sitting in a chair, see, that was – wasn't that the drill you had immediately before you had the drill of confronting the pc? Wasn't that the drill, huh, wasn't that the drill?"

"Well, there was a little thing that came in between there," he suddenly remembers.

"What was that?"

"Well, that was sit in the chair comfortably and of course that's impossible."

"Oh, oh, there was something else in this thing."

"Yeah, well, anybody can sit in a chair, actually you can force yourself to sit in a chair for hours."

"Well, how do you go about sitting in a chair?"

"Well, you sit in the chair and you bring your heels together, you understand? And if you bring your heels together hard enough and press them in, you can press the calves of your legs out against the outer sides of the chair and you can keep yourself awake and erect."

What the hell is all this?

See, knowing the principle of undercut on the gradient, you see, you would find that out. But if you didn't know the principle you would just keep knocking your brains out, trying to train this person how to confront another human being. And they haven't – they actually wouldn't have any trouble confronting somebody else except they are trying to confront two things at once. They are confronting keeping their heels together and they're... See, they haven't learned how to do that and now they're trying to confront something else at the same time. Their attention is split and they are starting to get very headachy. And then you find out

there's something wild about it they haven't understood, like: "Well, why do you audit in a chair?"

"Why? How should you audit?"

"Well, couldn't you audit lying in a bed? I get very tired auditing." You see?

All kinds of wild little things come up. You don't pay very much attention to what they've got to do. You don't try to solve those things. But these considerations have got to get into the fresh air. Now, all of a sudden we've got this fellow – he suddenly looks this over: "Oh, you mean you just sit in a chair? Oh, you – oh, wait a minute, that takes some doing! Oh! What do you mean, just sit in a chair? *Just* sit in a chair! No, you can't just sit in a chair! Impossible!"

"All right. Now, just tell me what's impossible about it." You don't even have to be an auditor to instruct, see? I mean you don't have to do a lot of clever auditing: "What's so impossible about it? What's impossible about it?"

"Keeping your back two-and-a-half inches from the back of the chair, and so forth, is impossible because you have to keep – well, actually, you have to keep measuring if it's two-and-a-half inches, don't you?" [laughter]

It's pretty hard to believe until it has happened to you, but the whole next paragraph after the sentence which contained the word one didn't understand, can just disappear right out of this world. It can do the wildest piece of disappearing anybody ever saw. It just vanishes. Almost a white piece of blank page and try to check the student out on this and you can check him out on the whole bulletin, but, by George, there's no paragraph there; no subject matter there of any kind whatsoever. You run that back, you'll find out there's something just prior to that collision they didn't understand. And if they didn't understand that with great violence then you must realize that it's just before that; and you start running some student back, I don't know quite where you're going to wind up. Well, I wouldn't try to wind up outside this lifetime, but I don't know quite where you would wind up. Become interesting what would go on.

Now, there's the primary mechanism of study. A study is a con... a study – I almost used a five-dollar word – I will use a five-dollar word – is a concatenation of certainties. It's a string of certainties. And these are a string of confidences and competences. There are many, many ways to promote these feelings of competence and confidence, and so forth, but the best way to do it is just a head-on thing of just making sure – not that the student walks slowly, but to make sure that the student walks certainly. Don't hold somebody back because you're not sure he's walking certainly.

The other point is, is *always* let a student get into trouble before you help him out. Don't ever help out a student before he's in trouble. This guy is doing his Comm Course drills right straight through to the bitter end, he does them like a little wound up doll, everything is beautiful and smooth and so forth, well, what are you trying to do – find something to train? I mean, what are you going to do, rack this guy over until you can find something – till you create something that can be wrong? Or why would you – why would you do anything with

it? See, I'm just making the point: Why would you do anything with this? Your participation is not invited there by any difficulty. You see, why worry?

And that is one of the reasons why study uniformly spread across a group is a mistake. See? Students run into trouble that the Instructor doesn't detect and other students aren't running into trouble and they just try to make a medium average of trouble for the whole course, the whole class, you see? Well, the way to do is to let a student run into all the brick walls he wants to run into and the only thing you've got to be alert for is *a student who has run into a brick wall*. Now, when he has run into the brick wall, recognize that he has hit a gradient, hit a stage or a point beyond where he didn't understand something; that elementary.

And the next must is: Don't ever take up with him what he doesn't understand. It's a waste of trouble – waste of time. He doesn't know what he doesn't understand. Always cut it back. "What were you studying immediately ahead of this?" Same formula I gave you before, "What moment there weren't you in trouble?"

"Oh, I wasn't in trouble over this and that, and so forth, that was all easy."

"All right, what moment did you get into trouble on it?"

"Oh well, it's – *oh-oh-oh* – terrible and terrible and terrible, *oh-oh-oh-oh-oh...*"

"All right."

Now, you've made a bracket there, haven't you, you've got parentheses; you've got the point of no trouble and you've got the point of trouble and now you must recognize that in the dead center, between, you will find the real trouble. Now, the clever Instructor, knowing this, could spot it right on out. Actually he doesn't have to be terribly clever, but it's a matter of "All right, you say you were doing fine with this bulletin right up to this," and we finally spot it.

I would even go so far, if I were having a lot of trouble, to slam the guy on the meter. Meters are made to be used. And I'd say, "Now, you're doing all right on this first paragraph, you're doing all right on the next paragraph and you say you ran into trouble here about paragraph five. Well, let me look at paragraph five; yeah, there is a typographical error there in paragraph five. That's perfectly correct, there is one. Now, let's see, you had number four – number four, you didn't have any trouble with number four, paragraph four here, which starts so-and-so and so-and-so; you say you didn't have any trouble with that?"

"No, no, I didn't have a bit of trouble with that."

"All right, now let's see, let's get down toward the end of paragraph four – paragraph four here; now, will you please listen to this sentence: 'So-and-so, so-and-so, so-and-so...' *clang!* What is the meaning of the word 'disability'?"

"Oh, well, Christ! Nobody could define 'disability'!" [laughter]

You got the idea? It isn't even that any big mental quirk sits behind it. No vast amount of case has to be taken into it. He just doesn't dig this word, man! Why he doesn't dig it, we don't even care, but he doesn't.

Now, what's very interesting is this is one of the first points of research, 1947, is the influence of a mislearned word on a life and that was the point of research. I'd picked up some of this from Commander Thompson on association of words and there are numerous other things about this, but I had jumped to an unreasonable assumption about this. As far as I was concerned it was relatively provable or unprovable, but it was relatively nowhere. They talked about association, they talked about this, they talked about that. Then I assumed, "Then it must be that a word will make somebody sick." Well, what could be wrong with a word?

So I started tracing backwards and getting people to redefine words and that sort of thing. I won't say I had any remarkable luck because there was no auditing technology that went along with it, but believe me people were sure interested. I wasn't using any method of testing at that particular moment that would have given me what the result was if it was.

I lost a lot of people I was working with. I know that's a direct result. That is to say, they walked out and went back to work, and so forth, and didn't turn up in my office anymore. But that still didn't demonstrate very much for that period, because it wasn't well followed up. I didn't have somebody on a telephone to call them all up and say, "Well, why didn't you come back the next week?" You know? But those that I did contact on the thing, "Oh, I feel fine now," or "You know, it's really something else that's worrying me these days, it's the fact that I haven't got a job in Mexico," or something, you know? Certainly what was worrying them ceased to worry them, that was about the only thing I established out of it.

Now, we find GPMs and the tremendous mass and significance mixed up with those and we must assume then, that all significances expressed as symbols – words, that is all significances expressed as words, which of course are a symbol of a significance – are locks on the GPMs. We know what's at the middle of this hurricane now. Now, we walk back and we take a look at this thing and we are going to find out that any word that you handle which is not in the GPMs is in actual fact to some degree a lock on the GPMs.

And if not on actual GPMs, certainly on implants. They got the best of all worlds covered. Very heavy locks, capable of producing a considerable amount of commotion in somebody's skull piece. Your skull bone could throb for quite a time. See? So when you get a – when you get yourself a – when you get yourself a good look at this, you recognize then that this is a symbological effort and one of the first reactions is simply become afraid of all words; then the next immediate action after that is to – well, to say, "To hell with it," and become very stupidly adventurous about it; then eventually fall back into something sensible, like don't stand around and chant a known end word at somebody's face for half an hour. Not that you will do much to them, they might be stuck elsewhere on the track, but you certainly louse yourself up. [laughs]

So, when we – when we examine this broad subject of teaching somebody something, we are examining the subject of relaying data to a person, which he can receive and understand in such a way that he will be able to use the data – the definition I gave you the other day just stated to fit in with this exact rationale that we are discussing now – and of course all of those are being done with words – words, motions, actions or examples. But there's some words mixed up in this.

So, when you get words on a bulletin, when you get words on an Instructor's comm line, when your words are going over to one of your students, well, don't be so sensitive about the Scientology vocabulary because, listen, you can make as much catastrophe in not naming a distinctly different part as you can in naming one too complexly.

I ran into an example of this in this parallel course of study: "Basic lighting" and "basic profile lighting" and I got toward the end of the book on portrait lighting with which I'd had terrible trouble. All the way through I was just running into trouble on this thing, trouble – trouble and somehow or another getting through and getting it crosswise and getting it straightened out, and so forth. And I found out the sin there was that they had called two distinctly different things with the same word, "basic." And I was called upon, I said, "Now wait a minute" I said to myself, "before I take this exam, I better review what I've got here. The – let's see, there's three types of lighting, and one of them is Rembrandt and one of them is butterfly and one of them is... I can't think of it! Now let's see, let's go over this again," and then I remembered that all the way through I had sort of dimly been... this is just different patterns, positions in which you put lights, not to hang you up on those things. Fancy names, aren't they? Rembrandt and butterfly: makes a butterfly because when the nose comes down it leaves a little shadow underneath the nose and you could imagine it to be a butterfly, see? [laughter] And when the photographic lighting makes a little shadow underneath the nose, why the pro calls it butterfly lighting. And Rembrandt is the face plane nearest the camera is less lighted than the face planes further from the camera but not line lighting – but this one is less lighted. It's very pretty – very pretty lighting, but those are – there are not very many – there are not very many ways you can put lights together. Here's these two; and what's the other one? What's the other one? I can't think of it, what's the other one, you know? Oh, well, I'll go back and study it over again, so I study it very, very carefully, study it all the way through, study it, study it, look it over, now I've got it all, I've gone back, good. "Now, there's three kinds of lighting there. Wait – Rembrandt and butterfly and... where did it go?" I look down into me head, have I got a 'ole in me skull these days? And finally I said, "There's something very funny going on here," because I didn't quite know anything like at that moment, because I was studying study, I didn't know the power that a messed-up definition could have, you know? And I went back and I looked and I finally found what it was.

It's – there's a whole school of lighting, a whole system of lighting, known as basic lighting. It's just elementary lighting. You've got two lights and you shine one on the front of the being and you shine the other one on the side. *That's all!* And the ways you do that and the way his head is turned or shoulders are turned, while you're doing that, gives you this whole school of lighting. There's nothing fancy about it. The other two are the fancy lightings, but this one, which you simply – almost says, "Turn light on the subject," I couldn't get and that was because under butterfly lighting there is a type of lighting, called "basic profile lighting," which everybody realizes is a butterfly lighting, but all professional photographers call "basic profile." So, under butterfly lighting we have a kind of lighting called basic profile, but over here, under this other, this whole class of lighting is called basic lighting. And because they hadn't sufficiently had a differentiation in their nomenclature, they didn't have enough terms in other words – louse up, total confusion, see?

Well, that was the Instructors' confusion that was the people who were teaching you's confusion, because you obviously were going to fall into that trap. They just dug a pit, put a stake at the bottom of it and covered it up with leaves, man.

And you've got one right now. Now, prepare for a little line charge. You've got an insufficiency of nomenclature. I know you'd never dream you had, but if you figure how many things there are in the mind that you – that you already have, you realize there's not much nomenclature for it. When you realize the few little things in the mind that the medicos had and the *vast* array of nomenclature; we've got a tremendous number of parts and things in the mind and not much nomenclature. And actually we don't have enough nomenclature and that would be the last sin in the world you'd think you would accuse Dianetics and Scientology of, but it's true. And you will agree with me in just about a split instant.

There is a thing called an ARC break assessment and there's a bypassed charge assessment and hardly one of you monkeys have ever been able to tell the two apart or do either one of them. And I've lately watched you falling and falling in more pits and walk into more bear traps on this one subject than you can shake a stick at. Because a bypassed charge assessment is not an assessment. It's an auditing by list and the name of it should be "Auditing by Bypassed Charge Lists" or "Auditing by List for Bypassed Charge." It's not an assessment.

Now, you've begun to believe, you see, that an assessment is something that doesn't have anything to do with auditing and that's true. An ARC break assessment has nothing to do with auditing. You simply sit there and you reel it off, with your pc usually gritting his teeth to powder. And you finally see your meter react and you indicate the bypassed charge and you don't answer and you don't acknowledge and you jolly well had better not. If you value his sanity or yours on R6 material, you just sit there, man, and you reel this thing off and you find the bypassed charge and you indicate it right now. It's usually done in the middle of an ARC break.

If you audit a person in an ARC break you will put him into a sad effect. So of course it can't be auditing! But unfortunately we have instantly, immediately afterwards, called a thing a bypassed charge assessment by which you take the same list but treat it differently and the person is not ARC broke when you have done it, so that is auditing.

And this has been a source of enormous confusion to one and all, apparently. Why? Because both terms have the word "assessment" in them. So it's an inadequacy of nomenclature. There's a missing word, you follow?

All right, so that's all the trouble you are having with regard to it. There isn't – the trouble isn't any worse than that, see? You can see that you could audit – auditing by list has to do with cleaning up each question, after all that's the Joburg and that's these things and you just read the question until it's clean. Read it and get it answered till it's clean and you go to the next one and you read it and answer until it's clean. Auditing by list. You can take the R6 list and you can do this with it.

So, we had the same list, which gave a confusion and we had the same word attached to a process which gave a confusion, and so forth. So it's very, very hard, oddly enough now, to get auditors to *do this*. Well, that's funny, that it gets hard to get auditors to do this. Therefore, it must have a subtractive or a detractive action in excess of merely being misdefined.

They couldn't do it; Auditing Supervisors were walking around in circles, "Now, look! Please do an ARC break assessment on this pc, because he is blowing," and so forth. Come back, here is the fellow busy auditing by list, you know, doing a bypassed charge assessment, you know, cleaning up everything, listening to the pc, you know and so forth, all this sort of thing, you know? "No, no, no!" You know? "Read the thing down the list and when you find the charge, and so forth, why, indicate it to the pc and that's all there is to this."

"Oh-oh, I see."

So, in other words, a term can be confused by being used for two different distinct purposes. You could enter confusion then with not enough nomenclature. As a matter of fact it's probably, in the field of the mind, has been a more serious sin than too much nomenclature.

Because the things were named in identification with one another. Do you follow me now? You've got this type of response? So of course, that will very shortly, as soon as I get around to pushing out a bulletin, that will very shortly become, of course: ARC break assessment is done so-and-so and so-and-so and not auditing; and then there's Auditing by List for Bypassed Charge and that becomes a completely different action. Now, you'll find out that's teachable.

So, we've covered now two things here and these two things are: If you take a person up the gradient too steeply he will get lost at some step always because he is confused about the prior step and he will blame the step he is lost in, while being stuck, in actual fact, in the step he really didn't get out of – , and that's what makes it a masked area and which makes it upset; and that the responsibility for the subjective reaction of the student in a very large measure lies with the Instructor. Boy, that is a new departure, see? The student's attitude, and so forth, is really today with Scientology and what I am teaching you here, right in the hands of the Instructor.

If you want to, you can almost produce the mental reaction you want to at will. You could blow a student off a course. It would work both ways – I'm not saying you'd do this, but this fellow is on course and you blow him off the course. You just with malice aforethought say, "Well, all right, we're going to blow him off the course."

One of the ways to do it is say, "All right, now this is two people sitting in the chair there; they are actually both preclears and they are actually both at the same time auditors and there is no particular difference between the word 'auditor' and the word 'pc,' and so forth, and they really don't mean anything different at all. All right, very good. You got that straight now? Good." You won't have him there in about 24 hours, if he's green grass off the street. See what I mean? You could overtly produce that reaction.

All right, now some guy is blowing and just as he leaves and you say, "What word was it that I didn't get there?" You will find out he'll stop moving, because you've already got part of the charge, see, just by indicating it's wrong with the words. All right, he'll stop exiting, in other words. "Now let's trace it back. At what moment did you get confused?"

"Well, it was in the last half-hour."

"Good, what happened in the first half-hour?" see?

"Oh, well, it was that word."

"Very good. All right, thank you very much."

"Oh, is that what that means?"

"Yes."

In other words, there's handling of the guy stays or the guy goes. There's the Instructor creating that effect or result with just the method of teaching he is using. Pretty sneaky, huh? You can get further along this line – there's more to learn on this particular subject but that is – but those things stand out like a beacon. The earlier gradient – the earlier part of the gradient – is the one he's fallen down on.

Now, we get to the other section of it is – it is really always a word or phrase. Now, of course a word or phrase can be inadequate. I've got one going right now. I – nobody has bothered to tell me why they use a yellow filter in a certain combination and in all the illustrations here sits this yellow filter. What is it doing there? What does it have to do with something? I don't know. I haven't been told. I've not been demanded – it's not been demanded of me: Why is a yellow filter there? But yet, that is serving as just a little bit break there. I know there is something about this I don't know.

So, you see the sentence could be inexplicit or it could omit the data or accidentally deprive somebody of the information. A typographical error will do this. The word "cat" is missing in the sentence: "The dog chased a." All right, now we say to the student, "Now, all right, let's tell us what that action is." Well, he's confused. Well, you certainly don't have to go very far afield to find out what he's confused about.

So, the fault actually could be with the text, as well as with the student, if the text is not explicit by reason of typographical error or by some other reason, and so forth, the information is not relayed to him in an explicit form, so then he gets confused. So, it isn't always his fault that he is confused, don't you see?

You can sometimes take a hold of the text he's been studying and just take one glance at it and all of a sudden see that two paragraphs have been omitted out of it. They are the paragraphs that define somebody. You see, somebody made a mimeograph copy and didn't copy two paragraphs, you know? This corny. You see that all words in an auditing session are defined, except "auditor" and "pc." This is liable to bring about a certain amount of confusion.

So, the upshot of the thing is that your confusion is not necessarily the fault of the text, it's not necessarily the fault of the student. We're not trying to fix blame in this particular line. We're just showing you that there was something not understood. It might also have been the fault of his first grade teacher, see? She never told him what some little word like "reciprocity" meant, or something like this. And we've got – we've got ourselves, then, a good look at this. It's treated on the basis of "these are the factors which you must observe as an Instructor." Now, you can put those things together. You can see why he didn't attain the gradient or you can ask him why he didn't. You can locate the point where he didn't move from one point of the gradient to the next point, you can isolate why he did this.

We can see that nomenclature and other things could be responsible for this. Lack of definition could be responsible for this. We can see lack can be responsible for it as well as an

existing thing can be responsible for it. And we see also that the individual would not have really a clue about what he was confused about or he wouldn't be confused and we see that the Instructor who is doing the best job of instruction is actually never trying to solve the problem of what the student is confused about. We see the good Instructor would never do that. Why? He's already one gradient late, so he just gets more confused than the student, because he can't understand why the student can't understand, see?

It says, "Cats are sometimes white."

"Yes, but I don't know why they are white, and so forth. Actually didn't – didn't Ben Franklin say something like that? I'm not sure whether Ben – I – uh – where – what is this – where-where-su-sa-su-dah..."

"Well you see, cats – well, did you ever see a cat? Did you ever have a cat? Uh-uh-uh-do-do-do you – do you know anything about cats?"

"Uh – let's-uh – let's go get a dictionary and look up a picture of cats." It's all a waste of time because it happens to be in the earlier paragraph where it said "feline." See, he doesn't know what that is, see? He didn't know that applied to cats, but he hung up on this earlier one.

So the apparenacy of his confusion is almost never the confusion he is actually in. An Instructor knowing this won't have any real difficulty answering the foolish questions he is asked, and so forth, because he just never bothers with them.

He wants to know what's going over the top. But somebody asks the Instructor the definition of something: "Yes, yes," he says, "a *caterwump* is a – *ba* – and that's all."

Okay?

Audience: Okay.

Good enough, thank you.

STUDY: EVALUATION OF INFORMATION

A lecture given on 11 August 1964

I'm sorry to keep you waiting today. We were testing out the walkie-talkies we will not use on London Airport. Imagine, using walkie-talkies on London Airport, you know, with the radio control tower. We have a rig up so that we can handle photographic flash lamps at a distance with a little walkie-talkie – very tricky. And we're getting very cunning. And the – I can just hear it now though: "Impact pictures coming in for a landing on the north runway. What is our aperture, please?" [laughter, laughs] Very funny.

The difference between professional and amateur photography is a chasm wide and you have to go at it in particular wild ways on the professional front. It requires permission of nobody less than the Ministry of Aviation and that sort of thing, in order to move, practically, in the vicinity of aircraft in England, and so on. Have to produce credentials, you know, like a deck of cards and all that sort of thing, so forth. The ministry has granted us permission to go up and shoot the incoming landing of a hypothetical student, you see, so that all of your views of the airport and what you saw of England, and so forth, that's what I'm going up and shoot, in two or three weeks, just for fun. So those snapshots you took that didn't come out, I can give you some copies. [laughter] That's snide, you know? I'm showing you the proper Scientology attitude toward a learning or beginning Scientologist, you see?

All right, what's the date?

Audience: August 11th.

August the 11th, AD 14, Saint Hill Special Briefing Course.

Okay. And we're going to resume our lectures on the subject of study and the more I talk about study the better your grades get, and so this is very fine. This is one of the most successful lines of lectures I think I've ever engaged upon – most productive of cata... cataclysmic and colossal results – really fabulous. So that I have not sweat through – "You take the sodium bichloride and you put it into the bichromate and you get bisulfite, because it precipitates negatives," you know, and so on...

I remind you that about late spring I decided to study study and find out what study was all about and so on and go on along this particular line – and – now, talking about study, your grades keep going up the more I talk about study. Well, that's very interesting, because I'm not restimulating you; study doesn't happen to be an end word. There is an end word, however, called *knowledge* and this will bang your head off occasionally. But it is not directly

connected with words and so forth, and isn't the basic reason why people have any difficulty at all with study.

All right. There is no particular reason then that knowledge should get in your road because the *casus belli* (as the hootch dancer said) is a very, very deep-seated thing called "words." Now, you may even think there is an end word called "words," or something of the sort. But of course, all GPMs are composed of words. They're actually not composed of English words; they're composed of significances which are connected to masses. These masses are very capable of pushing somebody's head off. And where you have precise significances – and it's quite interesting how precise these significances are – where you have very precise significances, you don't get too much upset. In other words, don't look at it the other way to; don't look at it on the basis that if you avoid end words a hundred percent you will make it, see? That's actually the incorrect look; it's the locks which do you in. The offbeats, do you see?

Now, you really shouldn't be terribly concerned of – about this as a Scientologist. The electrician gets used to handling 10,000 volts, the circus performer thinks that it's quite nothing to pat lions on the nose – I call to your attention that the public at large look at an electrician handling some voltage lines, or something like that, and they're horrified, see? And you look at a lion trainer in a cage – they hate to be called lion tamers because those lions are never tame; a tame lion is the last thing you want around, you see? So they want good, savage lions. Patting those on the nose and so forth, the public looks and they say 'Aaghhh!' But as a matter of fact, they would feel rather uncomfortable if they didn't have some big cats around to snap whips at, you know? I mean the lion trainer would. This is the life he lives. And the public at large, not being initiated into this, of course, is horrified and properly stunned by the lion trainer's association with the big cats in the cage.

Clyde Beatty, for instance, used to fight forty lions and tigers simultaneously, mixed. And I should imagine that he lay off of that for a few days, why he would have felt very, very poor, you know, he would have felt bored and life would have seemed uninteresting to him.

Now, there are many other professions and many other activities, and so forth. You wonder how in the name of God a dentist can stand there pulling teeth day after day after day. Fantastic, but he can. You wonder how a surgeon can stand there cutting out guts and throwing the offal in the garbage can hour after hour, you see? Year after year. How come? What are all these things? Well, these things are what is known as professional familiarities. And if you get familiar enough with a particular subject, it may look terribly dangerous and upsetting to somebody else, but is not really dangerous or upsetting to you. This is quite remarkable. In any particular field or activity one is apt to become quite superhuman.

That is what's being demanded of you in Scientology. I'm not talking about whether you get better or whether you become Clear or OT or anything else; I'm just talking on a very down-to-earth, rock-bottom sort of an approach. GPM words are the lions, the high voltage, the various other professional danger points with which you live in Scientology: the words, the words of the GPMs and that sort of thing.

Now, you take these words and you go out and throw them in the teeth of the public out here, see? You can actually watch somebody turn green if you stood and chanted at him a

root connection of some kind or another, just wove it into your conversation four or five places, and so forth, kept telling him that he is – he just wants to be wrong, you see? He wants to wrong things, and so forth. Just keep going at it, you know, you – "Wrong this and wrong that" and keep pounding it into him and all of a sudden he'll start "*Yeah-ah-ah.*" Well, he goes – walks out someplace and falls on his head – true! And he's liable to get quite ill and that sort of thing.

All right, well, he's just not used to lions, do you see? He couldn't even trace it back to why he feels so ill; he knows nothing about this. Well, this is a rather happy area to be a professional in; because life is – consists of livingness, and livingness has a lot to do with the mind. In fact there wouldn't even be anything here to live in, or any living to do, unless a mind was around, you see?

So the business – the business of being in the business of the mind, and so forth, has liabilities. But it has, of course, a great many things that are very good. And when you start fooling around with GPMs, you know very well you can knock your head off – you know very well that this is not something to lightly fool with. You know very well what they can do to somebody. You see somebody around on crutches gimping around, he's got arthritis – arthritis exclamation point, you see, and so on. What's the matter with him? Well, he's just all wound up in a GPM someplace; that's really all that is wrong with him. If even – even if it's an engram, why, it's held in place with a GPM. That's the way he lives, that's what's going on with...

All right, why is this couple having an awful hard time maritally? Well, they've just got a couple of end words crossed up one way or the other; one is riding one hobby horse and one is riding the other one, you know, and that sort of thing. Well, if you tried to explain it to them that it was an end word that was doing this sort of thing – you could probably slip it off of them on a meter, if you didn't try to explain it to them. This – well, just let's take a couple of hypothetical end words: let's say that he was "conservative," you see, and she had an end word "wild." Now, these two end words won't mix and they are both in high-blown howl, you see, on this subject. So he's being conservative and she's being wild.

All right, never the twain shall meet. So the upshot is that they're going to lead a very unhappy life. Now, you could probably, without their ever finding anything out about it really, pick up that it was "conservative" on the meter; probably get his considerations about being conservative, have this end word blow. You could take ahold of her, you could probably pick up "wild" on the meter, particularly if you had the total prearranged list of end words, you could probably key it out, get her considerations on this, and so forth. They'd walk out of there perfectly happy with each other and a miracle would have been performed. They would never be able to trace it even back to a word. Their ability to recognize what has happened to them – even that is far below their familiarity level. They have no familiarity with this thing, you see?

You've heard people go around and say: "Well, it doesn't matter, sticks and stones may break my bones, but words can never..." Oh yeah? [laughter]

Now, the liability – the professional liability of the Scientologist – is the fact that he's dealing with significances and he's dealing with masses; and you connect the right or slightly

wrong mass with the right or slightly wrong significance and you get this mismatched one way or the other and you get catastrophe, and that's the way life – she is lived.

And you want to know about "What is human behavior? What are the basics – elements of existence? What makes matter stay here?" The con... physicist out there, he is busy studying conservation of matter – or conservation of energy rather – he's busy studying conservation of energy – conservation of energy. He is just going on with this, on with this, on with this. Oh, he's just riding an end word, man. And he's riding himself into the ground. Sooner or later – why he's going to strike "to kill all energy" or something of this sort and – as his interpretation of a GPM and build an atom bomb – something like this. He's got to do something, you see, in this particular line. He gets – he becomes obsessed along the line.

There are GPMs that have to do with pictures. I am very well aware of the fact that there's a whole series of GPMs that I haven't run, that have to do with pictures. And since I became aware of this, they don't have anything to do with me skull. You know, they don't knock my head off at all. Once in a while I find myself studying something and they have said "pictures" about five or six times too many in the paragraph and I find I have a tiny headache begin to grow on me, and I say "Oh." Look at the paragraph: "Oh!" you know, gone. The – this – this situation, then, that could have wrecked empires – one end word crosswise, you see, could have wrecked an empire – to you becomes a minor discomfort. You find you have a bellyache and you – something like this – and you've been processing somebody or doing something – you find that you have a bit of a stomachache and you wonder what – "What's the stomachache?" you know? Afterwards you notice you got a stomachache. You suddenly realize you've been invalidating an end word. That's the quickest way in the world to get yourself a stomachache.

You think, "Maybe there is an end word 'women'?" Well now, if you invalidate that you're probably all right because there isn't one; GPMs predate the idea of men and women, but there is one "bodies." And supposing you've got one "bodies," don't you see? And you invalidate the idea of bodies, well, you're going to have yourself a nice stomachache. You say there is no end word "bodies," when there is an end word "bodies," and of course, about that time – it sometimes takes minutes or even a half an hour or two, for this to begin to sneak up on you. "What was going on, what was going on?" you say to yourself. "Well, let's see, about a half an hour ago I was studying about bodies, I said they didn't exist. *Tuh-huh!* Well, I now know there is one end word anyway called 'bodies!'" Total reaction.

Somebody else's reaction: "Oh my God! Call Doctor Cutwin! Ohhh! I've got to have an operation on me esophagus or me stomach, or something of the sort. I've got to have something drastic done to me, because look how drastic – in what drastic condition I am in!" Don't you see? And an incomprehensibility way down below any level of knowingness on this thing, they become the total effect of these things.

For instance, we just upset numerous Scientologists down in Australia because we had to fight back against the Laborite Party. The Laborite Party was the one who proposed the bill to outlaw Scientology in the state of Victoria. So I decided that they had lived too long and they don't come to the inquiry very much anymore. They as a matter of fact found out that Scientologists could cause them to come within an ace of losing all the seats they had. I wrote

out a little pamphlet and I've carefully put in it the exact proper end words. [laughter] This was circulated – this was circulated – they came within an ace of losing their lives in this election and that was it. But of course, some Scientologists down there who were afraid to shoot at somebody and who weren't in the know, and so forth, continued to write me on my Standing Order Number 1 line: "That was a terrible thing to do." They didn't know anything about the end word, that was – see, they are not trained up to this – not oriented in this area yet, "That was a terrible thing to do, because you really shouldn't put entheta, you see, on a theta line, like a nice Scientology magazine." And it's all – and they're sort of protesting, you know, that this pamphlet that came out and was generally issued in Australia against the Laborite Party – was issued at all.

They don't realize what they're protesting against. Some of those end words hit *them*; they aren't trained, they aren't in the know, and so, of course, it made them feel kind of queasy and they want to know who wrote it. Well, I haven't told them yet, I wrote it. But it produced the exact effect that it was supposed to produce, which, "to drive those dogs back in their kennels," and it did exactly that. They are much less enthusiastic these days. As a matter of fact, they are becoming sorrier and sorrier that they ever started this inquiry and that is the proper effect to produce on somebody who is attacking you is just make them very, very sorry that they attack you. That's the proper way to handle it in this universe, see?

United States government is getting into that frame of mind now on the E-Meter case, see? They are beginning to sit around and wonder why in the name of God they ever lost their wits to such a degree as to start this thing in the first place, because they can't prepare a case, because none of their facts are correct and their charges are all wrong and they're silly, but if they let this case go to court, they let themselves in for a recovery of damages that may run into the millions. They're now in trouble. Well, how do you make people in trouble? Well, you just make them sorry they done it, that's all.

Now, the psychiatrist and psychologist and so forth, are very busy in the world today on the field of motivational research, what they call motivational research; very interesting subject. I recommend to every Scientologist and particularly people who are engaged in promotion activities, something – in organizations, to read a book called *Hidden Persuaders*. Now, that is a very interesting book. Although it tries to make mock of the idea of "hidden persuaders," and so forth, down in between the lines it gives you a very thorough dissertation on the techniques now being used by modern advertising agencies and other people engaged in reaching the public. And they hire these days psychiatrists and so forth, to do motivational research and find out a bunch of goofy facts. Well, most of their facts are goofy because they don't know why people are. They don't know what make people tick and that sort of thing.

But if a Scientologist reads that, particularly a Saint Hiller and particularly somebody who is moving around in the vicinity of Class VI, see, he reads that – now just reinterpret that whole thing. They've laid a foundation, they've got a beautiful piece of music, they've got no words to the music, don't you see? They've got a marvelous idea that maybe they can influence and affect people one way or the other but they don't know what words to put to the tune. They're still groping around in their Freudian analysis and trying to motivate soap by getting a libido complex going on the age of three, see? They're trying to restimulate something one way or the other in order to sell their soap. And they haven't got the buttons, let me

put it this way, you see. They're playing a piano without any keys. They're still making noise on it. I don't know how they're managing it but one way or the other they're making noise on it.

Now actually, that is one of the highest paid activities in the world today – is the world of advertising and merchandising. That is the high – one of the highest paid activities in the world today. They are pouring out a terrific avalanche of money into the pockets of psychiatrists and so forth these days in order to find out what makes people tick. Of course, they're not on basic – really basic research. They're still flying around in kindergarten stuff, don't you see? But here these fellows are, trying to reach the public, trying to sell products and so forth and they have turned to the psychiatrist and psychologist in order to give them the answers. Well, they turned the wrong way and like any other boot soldier in an awkward squad, why, they'll probably get booted for it. They lose money on this every once in a while and they make mistakes.

But you start adding that up – if you really know the mind – and you wonder then that anybody would ever have any difficulty with dissemination.

Now, this material, of course, is a debased – I mean, this type of use is a debased use of this information. It would debase your knowledge of the field of the mind just to use it to sell somebody some preserved piglets or something, see? This is silly, see? This is something like using a Mercedes car to crack walnuts. This situation, then, is not – not recommended to you as an activity.

I'm simply pointing out some minor activity that's going on in the world today that is absorbing a great deal of money from the manufacturers – that has a bang – tremendous bang from each magazine. You turn on the TV set, you are looking at motivational research. You turn – open a magazine, you're looking at motivational research. You open up a newspaper and read its ads, you're looking at motivational research. You can look at an election, you realize those candidates in that election are running by motivational research. As a matter of fact, Eisenhower won the campaign in the United States when he was elected president because of the work of an advertising agency in the field of motivational research and they found that the country was starved for a father image, so they set him up for a father image and of course he got elected. Actually he was a pretty good father image, if fathers do nothing but read Western stories. But they set this boy up in that fashion.

Now, that's the way the world is moving. Now, if you want to know – if you want to know how to live calmly in the midst of a tremendous confusion all you really have to know is the answers – the basic answers; and if you know the basic answers, these things ninety percent of the time don't worry you and the other ten percent of the time you can do something about them. Do you follow me?

Knowledge is something that is achieved – end word or no end word – it is something achieved through study.

Now, the whole subject of words booby-traps a person's effort to find out what's going on, to find out what the world consists of. Words – it's a boobytrapped line: significance. What is this? How do you find out about anything? Well, you're going to find out something about something these days with words. Information is going to be relayed with words; you're

going to find out about things with words and those words are booby-trapped. They match up the GPMs – the woof and warp of the mind. They've got the mind pushbuttoned.

Now, the mind is terrifically push-buttoned so that if you are reading: "The cat was black," and feel queer or feel repelled by this statement, "The cat is black," if you don't know what you're doing, you simply are repelled by the subject of studying "cats," or of studying or acquiring knowledge about "cats," or anything of that sort of thing, see? In other words, you've got a barriered line, because you read the statement, "The cat is black," you feel odd, therefore you say, "I mustn't study about cats," see? Actually, it has nothing to do with cats; it's the word "black" happens to be an end word.

You nearly always find yourself assigning to the wrong part of a sentence or the wrong part of the study material the reason why you can't study it, because the other is something one isn't confronting and one doesn't feel he can confront, so therefore he disperses and confronts something else.

Now, that is the basic principle you should know about knowledge and study: One, that even if you are simply looking at a tree to find out something about the tree, you are studying a tree. I don't care how briefly this is done, study isn't something being used here in connection with being very, very thoughtful and thorough, and so forth. You look over this tree to see what kind of a tree it is. Well, in that brief instance you've studied the tree, don't you see? In other words, you observed it to find something else out about it.

Now, you can pick up observation from the printed page; that's a secondhand observation but it nevertheless is the route on which almost all knowledge travels, since if you, individually, were called upon to re-evolve all the knowledge there was from the beginning of the world until now, all by your little ol' lonesome, you'd wind up stupid in this lifetime. I don't mean to be harsh, that's true. If you were called upon personally and individually to evolve all knowledge there was about anything, in one lifetime, you would get so little way upon that route – you understand, that's without having any other person relay anything to you, without having at your fingertips any works, texts, any reference books of any kind. That you were just going to have to do it all on your little ol' lonesome by thinking it up and evolving it, and so forth, and you were going to evolve all the knowledge and you weren't going to have any receipt of information from any other secondhand observation. In other words, you want to learn about volcanoes, well, you have to go and find a volcano. You would get so little done on this project that you would die stupid, I can assure you of that. Or you would be a ruddy fool and believe that you knew everything there was to know about the one room that you had been in that whole lifetime. Do you follow me?

So there is a value to secondhand knowledge. Now, firsthand knowledge, of course, is acquired by direct observation and experience. But even to achieve direct observation and experience, it is really much better to have the fruits of other observations and experience with which to profit and only in that way can you maintain and carry forward a culture of any magnitude.

Illiterate cultures do not survive and they are not very high. The natives of the tribe of the *Bugga-Bugga Booga-Boogas* down in *Lower Bugga-Wugga Booga-Woog* are mostly no longer with us or they are around waving red flags today and revolting against their central

government. They're having a bad time. Well, the British Tommy that went down there with his Snider or his Lee-Enfield and brought them higher education in the first place – was only occasionally followed by anybody who taught them anything. And they didn't learn fast. Their literacy was not up to absorbing culture rapidly. So, of course, they can be victimized by anybody who comes along.

Once the line is open, if literacy doesn't follow and if secondhand observation is not available to a people, they stultify, they die, they go to pieces, they degrade. They are struck by this tremendous volume of exterior culture. They've been very happily down amongst the *bong-bong* trees, you know, dancing up and down amongst the *bong-bong* trees and the highest level of their interest, and so forth, was their own back yard. They could tell you all about *bong-bong* trees and they could tell you all about you mustn't step in *bug-bug* bushes, because you step on a thump-thump snake and this was their direct observation.

The second they're hit with things – particularly the abstract ideas of organization – the abstract ideas of political philosophy – the abstract ideas of, really, engineering – things of this material nature where knowledge is moving in close to the MEST, you see, where the significance is immediately, directly applicable to the manipulation of matter – when they move in on that, of course, their culture fails. They are not able to turn out Lee-Enfield rifles. They are not able to organize themselves into a proper democratic civilization, no matter how many lend-lease payments are thrust into the paws of their greedy politicians. They can be victimized, they can be turned into slaves and they can be degraded.

What's happened? Well, they've been overwhelmed and presented with this tremendous cultural image. Here's this great, shiny civilization, you see? It's full of Cadillac cars and jet planes and electric razors and all kinds of wild things; and they look at this material animated world; they see people have conquered their environment to the point where they can live at leisure and where they can do various things and where some girl can – with a few push buttons can control 125 horses as the most usual thing that she ever did in her life. You understand? In other words, she can drive a car.

All right, all of these miracles all of a sudden hit these illiterate fellows, see, all these things! They don't know the words, see? They see the tune, but they can't sing it. And they go into just overwhelm – boom! They just cave right in, see? They just back right up.

Somebody who is fully trained in Moscow has also been trained: "Your brethren at home are pretty uneducated and if you push this button and that button and that button, they will respond and all of a sudden bring down the house and then we will be able to seize the whole place and get all the jute we need."

I mean, the ethical and spiritual nature of communism is very interesting, you know? They're out of jute, so they put their political mechanisms into – run to get them some jute. Their interest in South Africa is simply and entirely the fact that they need diamonds and they want gold. I mean it's very spiritual. They love mankind for what they can get out of him and the way they play their violin is just about as cold-blooded as anybody ever did, see? But it's mainly based on the fact that people don't know the words.

And you look at a communist array of vocabulary, you look at a communist vocabulary, it's very interesting vocabulary, it's very tricky. Their technology – their political tech-

nology – is worked out to one of the finest hair splits you ever heard of. Boy, they know how to talk to this one, they know how to talk to that one and they know how to argue with somebody else and they know how to put together this and they know the parliamentary control of a small meeting. And they're taught to do this and they're taught to do that and they know how to shuffle the motion down to the bottom of the pile so it never gets heard and only the motion which they want heard is heard. They're just taught this very carefully, you see? Technology – technology – they're all taught this with words. They weren't in on the 1917 Revolution. They got the whole technology right straight on up the line by being taught it, by it being relayed to them with words, much as I'm relaying to you information and ideas with words. But it's all secondhand, it's all hearsay and for those boys it really works. They are taking the world.

I see people standing around with their hands in their pockets in these Western governments, and so forth, not knowing what is going on, and it's something like a big, strong bull being chewed to pieces by a pack of small dogs. And this bull – he knows that a small dog can't do anything to him and so he's tried to ignore him – he tries to go on – he tries to do this. The next thing you know, he's going to be down with his throat cut. Well, he doesn't understand what they're up to and he's above knowing. Something like this, you see? All kinds of attitudes mix into this. He's deficient in knowledge of communist technology, so therefore he is being defeated by communist technology. It's very, very interesting that this technology is relayed by word of mouth. It's taught. It's not by direct observation, but it's material that can be put into direct observation by the communist – trained communist here and there.

The world today is being overwhelmed on the basis of illiteracy; the illiterate people of the world are being overwhelmed. It's always this, see? It's the fellow who doesn't know, it's those who do not understand, it's those who haven't got it taped who get knocked into the wastebasket. The death of a civilization is based upon its accumulated not-understandings – not-knowings – its ignorings – its failure to grasp the situation. It can also drift back into too many yesterday's clichés like: "Well, the barbarians always come down on the northern frontier and go home at harvest time," you know? And one time they didn't go home at harvest time and that was the end of Rome, see?

Rome at that time was illiterate on the subject of illiteracy: the barbarian. They didn't realize that their people had become very effete. Part of their information was missing: that a people who wishes to be free must not just know about the latest wine. They've got to know pretty well across the boards about most everything in sight. They've got to keep on the ball, they've got to keep on the qui vive, they've got to be right up there and alert.

The day that marks your death is the day that you sit back and decide you know everything there is to know about everything there is around you, so there is no reason for you to observe anything anymore.

Now, between the two points then of "no observation necessary because I know everything," you see, and "no observation possible because I don't know any of the words," there is a mean which makes life livable. You get what these two extremes are now? One is: "I know there is everything to know. I know everything there is to know – I needn't observe anything. I needn't really experience or do or look at anything because I know all there is to know." Now, that would be the end product of a dying civilization or a dying individual. And on the

other extreme we have the: "Don't know any of the words, don't know anything, don't understand anything that's happening in my vicinity," and so forth, and that's a very fast route to death, demise and decay, see?

So the thing to do is to know the words and to stay alert. That's the motto one reads out of this thing. And you'll find out there's always some new technology being boiled up someplace. Well, be curious enough to find out about it, see? Stay alert. Never become complacent about what you know and you'll go right on surviving very nicely.

Now, this is particularly true of somebody who gets up to a point of eminence or prominence, somebody who moves up to a point where he is superior to the ordinary or more average individual in his vicinity – he tends to become very complacent. A fellow is living in the vicinity of the natives of Uggabugga and he can read and they can't. Well, he feels very superior, so he really doesn't even bother to read. Do you see? Now, if Scientology faces any danger, it is that danger of stultifying because they no longer believe they have to observe, no longer have to apply, no longer have to get on the ball.

Now, you want to know what's the difference between the successful individual and the unsuccessful individual: It is just that one can understand and do and the other one doesn't understand or doesn't... There are two ways of not understanding, as I've just told you. One is to suppose you know all about it so you don't have to observe; that's one method of not understanding. And the other is just not know the words, you see? Those two extremes are there. So, the individual doesn't understand and he goes off into a – in other words, he doesn't understand, so he quits trying – or he understands all there is, he thinks, and so doesn't bother to observe. Now, those two actions there amalgamate into a fellow who – either one of them – who is going to fail. This individual is going to go by the boards.

Now, who won't go by the boards, then? Well, it's somebody who can observe and understand and do – a person who can observe and understand and do.

Now, in view of the fact that the greatest body of observation is actually secondhand observation, realize that that is perfectly valid observation, when coupled with understanding – but that is particularly and peculiarly liable to having to be understood. Now, the less direct the observation then, the greater the understanding has to be. In other words, your understanding has to increase to the degree that you're not directly observing. Understanding has to increase in the degree that the observation is indirect. If your observation of a tree is indirect, you'd better jolly well understand about that tree, pretty confounded well. As a matter of fact, much better, oddly enough, than if you were standing there looking at it.

Now, understanding then is a substitute for mass and you have the answer to understanding in ARC. Understanding adds up to ARC. In study, understanding is a substitute for mass. Now, let's go over that again: If you haven't got a tree to observe and you are being told about a tree, then you'd better jolly well understand what you're being told, otherwise you're going to misobserve the tree. Now, if you don't understand what you are being told about the tree or you don't understand how the information is being relayed to you about the tree, you will wind up not understanding a tree and have been denied that mass, because the information received on a via. Do you follow this?

This is very complex material I'm giving you here, but is quite useful. If you can't – if you haven't got a tree to look at, then you jolly well – if you are trying to study about trees on a second relay, then you damn well better understand that second relay.

Now, there are two things to understand about what you're being told or what you are reading or what your secondhand observation is. See, secondhand observation can be after the fact because of time, too, you understand that? You say: "There must have been a tree here, because here is a stump," you know? "And there's going to be a tree here, because here is a sprout." Do you see that? That your understanding also can go forward and backward in time and it can be direct or indirect in terms of view. So understanding can be direct or indirect in terms of view. You can be there looking at the tree or somebody can be telling you about the tree. So there's two – there's actually several different understandings all in a packet.

Now, that's not to our purpose, right now, to examine how many types and brands of understanding there are, but I'm just warning you on this fact with regard to study and this is the only point I'm really trying to make to you. The other is just window dressing and cake frosting. It's interesting, the whole subject is very interesting, but it's this: If you are not observing something directly, if you are *reading* about trees – you got that? – you're not observing it directly, then your understanding has to be superior to the understanding which would be required in a direct observation. You've got to be more – you've got to understand it better, otherwise you're going to lose yourself a tree.

Now, this is quite interesting, because the difficulties of secondhand information are innumerable. You've got four men trying to describe an elephant, four blindfolded men that have felt all over an elephant and they're trying to describe this elephant or whatever that old saw was, don't you see? And the wise men that give you all the dope of what an elephant is all about, you know? And they didn't observe the elephant because they were blindfolded and they gave the most wild dissertations on what this elephant was. So now, let's realize that part of our understanding when we are engaged in secondhand observation – which is to say study on a via or something – we are engaged upon this – then our understanding must include an evaluation of the reliability of the information we are being given. You follow that? Our understanding must include the understanding of whether this is good dope or bad dope, whether this is the straight data or this is – got a – data with a curve. In other words, we have to be capable of evaluating the truth of the relayed observation. Understanding then, must include that.

And there is where the bulk of sentient beings – I won't just say man, because there are other sentient beings – fall down, and there is where they get crosswise, there is where they really have a time.

Well, I'll give you a marvelous example: There are people walking all over the place today and so on and so on and they think that everything in the field of the mind is all cared for. "See, when a little child is three years old, why he got – he got excited about something or other, he's been sick and that's why he's in the insane asylum and doctors understand all about this and everybody understands it and so forth and *yah, yah, yah*, the problem's all cared for." Well, we're in that state of the civilization where they say they're not only saying, "we know," they're also saying, "somebody else knows, and we don't have to know." Hey-

hey, what's this? What's – what kind of apathy is this? "We don't even have to know anymore. It's all right that somebody else someplace knows, that there are some authorities someplace on this subject."

I quote Eisenhower. He always depended on having an authority. The best source of information was always an authority on the subject and he never did anything without – he consulted an authority and it went along with this that he didn't have to know a blessed thing about anything.

There was never even a communication signal corps unit to keep him advised on moments of national crisis or anything else, when he was out playing golf or anything. There was no information lines ever run through this man. He got his national policies out of *Newsweek*. He did! He'd gotten to a point of where the expert was a newspaper reporter. Well, I admit newspaper reporters are pretty good and they all think that if left up to them, they can straighten everything out in a minute, but it seems rather interesting to have newspaper reporter policy being the dominant policy of a nation. They might really be trying to sell soap, you see? It might be motivational research entering in here, you know. You couldn't really trust that piece of information.

So, part of your understanding is what you're understanding – the falsity or correctness of your data sources – or what you're trying to understand.

So, study has as part of it, comprehension of the accuracy of your source of information and you've got to have some idea of that. And that's an experiential line itself. You say, "Well, this fellow tells me what he believes to be true and if he no longer believes it to be true or if he finds something else is true, why, he will tell me." Something like that.

You say, "All right. Well, that's that source of information and that's a good source of information. There's this other source of information, if he tells me something, why, he's just confoundedly certain that he's got to shove it down my throat in some particular line. It might be right and it might be wrong, but he will continue to tell me just because he has to be right." Something like this, you see?

Since I've just gotten through three textbooks – three textbooks written by a professor at Columbia University who never had color film in his hands in his life, I'm sure, who was writing on color photography... I had to study these and I had to know my business. I was going to be examined on this. I shot more color film than this man ever heard of. But here was a case where I had to study something to get a grade. I understood that. See, I understood the fact that I had to study this in order to get a grade. You get the subtlety then of the study that went on.

Also began to be understood this guy loved to show off. He loved to show off; he would introduce some ninety-dollar word of a technical nature, which wasn't included in any dictionary, into the middle of a sentence where it didn't have to be. Oh, boy, if that doesn't throw you. Now, right in the middle of that sentence you've got a word like "colored couplers." He says, I quote, "We are now going to introduce a new term, 'colored couplers,' which I will explain later." He never explained it. You look up in the photographic dictionary. "What is this thing: a 'colored coupler'?" And you can't find it. It's not in there. You look everywhere and you can't find it. What are you supposed to do? Just lie down and die at this

point? No, your understanding has to embrace the fact that the silly ass didn't know what he was talking about, if nobody can define it. Well, maybe someplace somebody's going to define it but it includes *you don't have to know what it is in order to continue*.

Now, that is also a very interesting thing to do, because you go past one of these points of understanding and you know you're going to have trouble; but part of study is to know the technology of study and to know if you start developing a headache in the next half page it's because you didn't understand that word. Do you understand?

In other words, your understanding of understanding can get very subtle indeed. You can get very, very tricky. You are reading about the engineering works of the early Egyptians, which have been written by a modern engineer who is also a lecturer at Massachusetts Institute of Technology and should have been flunked for English. He can't write – maybe he can build bridges, but he can't write. (If he's teaching at MIT, he probably can't build bridges either.) But anyhow, there he is and you want to learn something about the bridge building of the early Egyptians, see, and this thing is strewn with words that have to do with stresses and strains of various kind and torsional – *gahhh!* And then when he really wishes to be clear, he all of a sudden gives you four paragraphs of solid integral calculus, without giving you what any of the letters he's using in the integral calculus refer to.

I've got a book on color reproduction upstairs, written by some Englishman that did this. It's marvelous. You get simultaneous equations, of all things in calculus, and this is supposed to explain something. Of course, what I did was not worry about the fact that I didn't understand it. I just laughed in his face via his textbook. In other words, I wasn't so *obsessed* on the line that I couldn't skip it and I was sufficiently informed on the subject of study that I knew if I ran into a liability of having skipped it, I knew what the liability would be, see, so I could go back and run it out if it got in my road. In other words, I could walk through this bunch of bayonets. Do you understand?

Audience: Yeah.

Well, you could get that clever about study, see?

All right, well, that's actually going to high school before you get to kindergarten, really, on the subject of study, but I'm showing you about where it extends to. You can get clever enough to read an MIT lecturer's dissertation in full panoply of engineering terms on the bridges of the ancient Egyptians without actually looking up a single blasted one of his confounded technical terms and survive right on to the end of the dissertation and, what do you know? Know something about the bridges! Now you're clever.

The latest editions of the *Encyclopaedia Britannica* require this as a fine art, because all they're doing is showing off to the people of the profession. They've been so criticized by landscape architects for their articles on landscape architecture, that they now have written a professional piece on landscape architecture. Nobody can understand it but a landscape architect. Well, a landscape architect isn't ever going to look it up in the *Encyclopaedia Britannica*. [laughter] And that applies to nearly all of their very professional dissertations. That's why I... They've changed their style.

The modern style is to become incomprehensible and to say, "Somebody else knows about it," and then try to impress it and leave it all skipped and then, you know, say, "Well, if you're not an expert you're nothing – and there are experts around, so we're all perfectly..." It's all kind of a mishmash – decadence is what you're really looking at.

Now, I use an old 1890 edition. You read about landscape architecture in the old 1890 edition and it knew it was written for some fool that didn't know their nomenclature, see? You can find out what you want to know; but later editions, you can't. Soon that 1890 edition will become so antique, why, it won't be of any use anymore and then I won't have any encyclopedia left, see?

I'll have to do something desperate by that time, by – I don't know, substitute for it with some vast library of stuff. Oh – oh, yes. I know. Quentin's getting a whole bunch of textbooks and I'll keep collecting those. I've just solved it. He's getting all kinds of textbooks: *The Boy's Book of Electronics*, you know? The Boy's Book of something or other. You open these things up, it's actually "Integral Calculus Made Easy for 6-Year-Olds," you know. [laughter] Actually, they're way over his head. I don't know how anybody did that, but he does all right with these things. Crazy business! Yes, they're – they've got a penchant going that it's all right to make it easy for children to understand it, so I can collect a child's library and I'll be all set. That's what I'll do. Maybe the children can't understand it, but I will be able to.

Anyway, sources of information all add up, then, to comprehensibility and words form the woof and warp of any professional or technical area. Specialized words are used for specialized observations. Now, we move off into the field of specialized observations, as a specialist, which is perfectly fine. But where you are lightly tapping some field for just a moment's understanding and you collide with specialist vocabulary, you are lost at once.

Now, it gives you an idea at once of the very unserious student of Scientology. One of the first things he does is complain about the nomenclature. Well frankly, we have less nomenclature than we're entitled to as a specialized field. Because nobody understood anything about the mind, how could they have any vocabulary about it? And they didn't have any vocabulary about it and if we'd used their lousy vocabulary, we would have misunderstood everything, because those words meant other things.

So actually, this bird stands around and starts complaining about our vocabulary. Now we know at once that he's not a serious student of Scientology. That's the first thing we know about this person: he's not a serious student of it. He's a dilettante; he wants to hang around the edges and pick up a few scraps. You recognize the brute now? He wants a few scraps. He really doesn't want it, because you've got to sweat for nomenclature, because the nomenclature is carrying with it a specialized understanding and unless you've got that specialized understanding, you will never get the technology.

Now, there's the difference between knowing about something and being a pro. There's a vast difference. And there's many a chap today walking around who is pretending to know a great deal about something who oddly enough isn't even vaguely educated in that particular field, and so forth. But it's sort of a "thing" to be a sort of a dilettante – that's a modern trend.

For instance, what's a medical doctor but a dilettante in the field of the mind? Really very much so! He's just – he's superficial – nobody. The effrontery of them! Six hours of lecture, they get up here on some hospital alongside of the Thames, as I have mentioned before; and this is their entire education on the field of the mind. But because they have a general practitioner's license it gives them *carte blanche* in the field of the mind. It sounds crazy, but it is true. That's what it is. So, the society at large is not – has gotten so dispersed that it doesn't mind calling somebody an authority who doesn't know anything about it at all. Because that is the authority on the field of the mind – he was taught for six hours.

This is their skeleton in their closet, by the way. This is why they raised the devil with us for so many years about how well we were trained, and so forth, and we actually – in any given week an Academy student anywhere in the world was learning more about the mind, in that week per hours of invested time, than a medical doctor got in his entire career. In one week!

Now, the effrontery of these boobs in trying to tell us that we were untrained in the field of the mind and so forth. No, no, we are not untrained in the field of the mind, we are practically the only people who are trained in the field of the mind. Now, there are other fields that are trained in the field of meat or neurones or something like this, as in psychology or brain surgery or something. But they are trained in the field of meat, they are not trained in the field of the mind. I'll give them that they are specialists on meat, all right! Somebody gets a bullet in his skull and so forth, they can probably do something about it. Well, all right, don't – let's not though pretend, because we can take a bullet out of somebody's skull, that we now know about the mind, because in the first place it didn't go into his mind – it went into his skull. Now, this was a slight difference, you see, in nomenclature.

Now, what I'm trying to bring home to you here, is there are various grades at which a subject can be approached. You can approach it as a dilettante: "Oh well, I know all about painting. Yes, yes, I had a course in art appreciation in junior high school, one whole semester. And the teacher stood up and showed us pieces of lithography on a piece of cardboard and – I got so I could call Rembrandt nearly every time. I got very clever at art appreciation, so I know a great deal about art." Well, that must have consisted of what? One or two or three hours a week, for maybe – I don't know – what's a semester? Sixteen weeks, something like that. Which made a total – he looked at pictures for fifty or sixty hours and now he's an art specialist. Well, of course, that's better than somebody out in the street that never heard of them; not much, but it's better. But it gives somebody the interesting idea that he now knows something about it, when he doesn't know a ruddy thing about it. It gives him a curious and very dangerous attitude to his own future knowledge. It gives him a false understanding. He now thinks he knows something about it. No, he knows the nomenclature of pictures. He doesn't know anything about art, he's never been taught anything about art. Nomenclature of pictures was what he would know.

It isn't really the amount of time invested that gives you this, although I've been mentioning time. It is more the seriousness with which it is approached. How much do you want to know about this? Do you want to know enough about this so you can talk about it? As would be very common on a Park Avenue debutante, don't you see? She could discuss art – how cute! At her coming-out party, if somebody happened to say, "You look like a

Madonna," why she would know they weren't necessarily talking religion, you see? [laughter] See, art, see?

All right, now let's move a little bit further into the field of art. Now, how seriously do they wish to approach this subject? Do they wish to understand something about this subject so that they just won't appear to be a dummy or do they want to understand enough about it so as to do something with it? Do they want to know how to use art to decorate a home? That is to say, how do you choose and match and hang pictures, and – you know, what do you do with these pictures, you know?

We could go, not necessarily further in that direction, but along another path: A guy wants to know about art because of the threatened inflation of the world, see? Threatened inflation. You can buy land and you can – which isn't very movable – and you can buy gold, if you can get your hands on it and you're not an American citizen, and it will grow in price as the money of the community inflates. Or you can buy art. And art today is big business amongst people who know nothing about it as an artistic activity but as a financial investment. And you would be amazed how big this business is. Well, does he want to know enough about art so that he knows whether or not the experts are cheating him? That's how far that fellow would want to go, see? He'd have to know enough about art to know who knew about art, so that he couldn't be tripped up in the field of art. Otherwise he'd lose his shirt, you see?

Or do you want to know enough about art to move over into the field and maybe teach people art appreciation. Let's go a little bit further; we'd have to know a little bit more about art, wouldn't we? Now we're getting the lower grade instructional levels. Or do we want to know enough about art so that maybe, if we were very good, we could sit down with a piece of charcoal and a piece of paper and draw a vase with a narcissus in it? Now, we say, "We've started back at the beginning again," because any kid in kindergarten is trying to draw a vase with a narcissus in it. We're back to the area of doingness.

I'll call to your attention that that little kid in kindergarten almost never connects. It's wildly wonderful what comes up that is supposed to be a vase and so forth, but they have what is called an "artistic talent" or they have this or they have that and nothing is more easily destroyed because it isn't based on knowledge or understanding. This knack will leave him. It will fly out from underneath his fingers if he does happen to draw something. Very easy to trip him up. A thetan is very naturally creative, but he's actually handling certain media that he doesn't know much about.

Now, you go into this again; you take yourself up a piece of black charcoal; you take yourself a white piece of paper and you set yourself down to draw a vase. Now your education begins. You know that if you change the position of your paper and the position of your head while you are doing that, you have changed the proportion of the vase. Well, now that takes some knowing, doesn't it? In other words, if you look at a vase close and then draw it for a while, you'll be drawing a big top, let us say, and then you sit back to relax and do the bottom and you've now got a small bottom; big top and a small bottom and it doesn't look right. But it looked all right to you. Well, your education on the subject of art began at that point: "You 'old your 'ead still. That something has to do with the point I view from and the

distance I view to, has something to do with what I'm doing over here on this sheet of paper." Yeah, all right. Now you are heading for the long run, and you actually at that moment have begun the path of becoming a pro. Now, even if you did it for fun, you would still be on the path of becoming a pro.

What's the next thing you're liable to learn on the thing? Well, you're liable to learn that if you draw one for one, it's dead easy, but if you try a reduction or an increase in size, that is if you draw size for size, if you draw the vase on your piece of paper the same size as the vase you see on the table, this is pretty lousy easy. But how do you make a one for one? Well, you mustn't change the relationship of the paper or tablet to the table. It's easy as that, you see?

Now, most people can't draw still lifes for very interesting technical reasons: they are trying to do a reduction. They are trying to draw a big vase while looking at a little one, or draw a little vase while looking at a big one; and as they shift, they swivel their eyeball from the big vase to the drawn vase, they don't get a one for one size. See, they look at a big vase and try to do a little vase and of course they can't get the proportion because the size is already wrong and this throws them. They don't know the easy route out, they don't know that, "My God! That requires all kinds of wild mechanical and mathematical actions to take a big vase and to do a little miniature vase of this big – oh man!" Now, you are getting "creak, creak," see? Ah, dead easy. You set a vase over there and you get your paper here, and you get – so the paper looks now the same size as the vase – and you take out your charcoal and you draw the vase lines which you see there, the same size as you see here, you keep your head where it belongs and you keep your tablet where it belongs and you keep your vase where it belongs and you go *scroomp-scroomp*, put in a couple of highlights, *scroomp*. And if you're not shaking with palsy, you will wind up with a nice sketch of a vase.

I'm just showing you, there's these little pieces of technology, don't you see? Well, you're now on the route to being a pro. So, you might say that study which winds up only in understanding is not without value and is a large part of the cultural pattern which a society has. Study with no activity, let me put it that way. You don't intend to do anything about it, you're not going to do anything about it, that's just cute, that's interesting, isn't that nice? A tremendous quantity of the culture in which you live is understood to that degree and it's nice to know those things – if you've got to know a lot of those things. For instance, you don't know how to – have to know *how* to prepare or do the action of preparing an automobile, in order to know about automobiles, see? But you jolly well better know something about the action of repairing automobiles before you start paying somebody to repair the automobiles. In other words, you're at a point of regulated doingness, don't you see? Your understanding of it is sufficient so that you won't get gypped buying a "Mona Lisa," because Joe just bought it yesterday, see?

Now, therefore – therefore, your understanding – widely in life can embrace a *great* many things which you never intend to do. There's nothing wrong with that. But don't make a habit of that, see? Don't make a habit of that. If you're going down some line, go down some line, see? Don't stand around, for instance... Don't let some student – let me talk about Scientology for a minute – don't let somebody who walks into your PE, and so forth, keep standing around the edges of it. You'll find out they'll go hold meetings and they will talk endlessly

about Scientology, see? They couldn't define an engram if you held a pistol on them, but they'll talk endlessly about Scientology, see? In fact, there are groups all over the place that do pract... that do nothing else. They never audit, they never go into action of any kind whatsoever. Their command of the subject is merely an interest. Now, this is perfectly all right, perfectly all right, but don't leave them in a state of believing that they now know the subject.

That would be the cruel thing to do to them. They don't. They don't and they get confused to the degree that they think, now, if they do so-and-so and such-and-such, why, then this somehow or another fixes them all up, so they know all about it.

Now, it's at that point that a person's education starts to break down, because these people have dropped into what trap? It's just that one trap: "They know all about it, see, so life can go on." Well, they don't know all about it, they don't know your level of understanding of it. My God! You've been grinding away at it and slamming away at it and delving in it and getting comprehensions of it, and so forth, and you know how much there is there to know, man!

This character is saying, "Well, I..." so on. Well, if you followed through some of his logic, you would be fascinated. See, if you followed through some of his think and some of his statements and some of his doings on this subject, if he did do anything on this subject, you would practically cave in with laughter at times, because it's so far away from anything you could imagine anybody interpreting anything like that as. It's just a gone proposition.

Somebody will say, "Well, I settled the dog, and I was using Scientology processing, and so forth. You know, I beat him." How the hell did we get over there, see? It's that goofy. But to let that person go on believing now, that he knows all about it, so therefore does not have to address it directly and seriously in order to achieve any doingness level in it, would be a very, very cruel thing to do to this person because he'd just have nothing but a failure. Here's this broad subject which is there, which if he did it at all properly, would give him results and he could go someplace and he could do something with this, do you see? But to have him sit there and think he knows all about it when he doesn't know anything about it, of course, is letting him fall into this other category.

Also, to put him in the position where he thinks he can't know anything about it because it's so vast and so difficult and – also is equally cruel, because you've artificially created the two reasons for the demise of an individual or a civilization. You've put him into a state of "He is not only illiterate, but he is going to go right on being illiterate." "Well, of course only a specialist could know that and so forth. And I don't see why you're asking for the definition of a word like that, because it really doesn't apply to what you are doing anyway. This is all pretty difficult, you know."

I never follow such an approach. Some guy – if some guy comes up and asks me hostilely about something or other, I can't guarantee what he'll get back. I'm – it all depends on how I felt right at that moment. If I felt puckish about it, he's liable to go off packing a headache. But if he – if somebody asked me and they really want to know something – of course, you know me – I tell them, bang! like that, the best I could. Even though I didn't have any hope of their really understanding what I was talking about, I would still give them anything I

could tell them that I hope might assist their information or understanding of it. I always do something for them this way and usually, if somebody's just asking for information, why I let it go at that. But if they're asking for help and so forth, I always give them something to do, not only give them a piece of information, or an insight into it, if I possibly can, but I always give them something to do, too. You know? And you'd be surprised how workable this type of an approach is. Of course, if they ask you something hostilely or be nasty, or something like that, why just pull the trap, you know? I don't care what you do to them. Nobody demands of you that you be polite. Don't compromise your own communication lines.

The only time I ever get embarrassed or anybody get embarrassed, is this person was asking me a silly question which sounded like a hostile question, but they really meant it and they were quite serious about it and then you find yourself immediately in the position of having been very nasty and very mean back, don't you see, when they didn't intend to be. You sometimes can get that one crossed up. That's rather easy to do.

But doingness requires, of course, much, much, much more understanding than just lookingness. Doingness requires an awful lot of added understanding and when you go into doing a subject, it is sometimes very, very disappointing. Your first results – very disappointing. Your understanding wasn't up to match the doingness that you were doing, you see, and so forth. And what you learn out of this is – what you should learn out of this is that you should understand more about it, in order to do it, you see? That's the lesson you should learn; and the lesson you shouldn't learn out of it is: "It's just too difficult."

But on some subject lines there is another lesson you could learn, is that "It never worked anyway." Oddly enough, I don't think that is applicable except in the upper levels of supereducation and in the upper levels of supereducation, they've got a lot of stuff that doesn't work but is just hoped for, you know, which they're putting straight across the line. It was never intended to work – it leads to no final result at all. I mean, that sounds rather peculiar, but it is true. It's like doing the equations of aircraft propellers – or buggy whips, about the same category today, propeller aircraft and the buggy whip – with integral calculus and painfully sketching out all of the various contours and curvatures of aircraft propeller blades or buggy whip curvatures, with integral calculus. Why would you do such a stupid thing? Why, for instance, learn the tremendous complications of some very esoteric activity on a doingness basis which hasn't been used for three centuries, just to do it?

Well, it sometimes doesn't work at all. Sometimes nobody ever did it. That must enter into your calculations, too, when you're going up at that level of thing. Maybe nobody ever did it, see? Maybe it's too tough. Maybe it isn't too tough – maybe it just isn't, see? Maybe there is no integral calculus curve to a buggy whip, you know? I mean, you can go that far, that silly about it, you see?

This sort of thing is all part of your understanding of the subject of study. Where are you going with this study? But if you're going up the line with any study on a basis of doingness you should go up the line on a basis of gradients. And my first lecture to you on this subject had to do with gradients. And you will find the first time the individual's doingness caved in was right after, *right after* he had hit too steep a gradient. He didn't cave in on the steep

gradient, he caved in instantly before he hit the steep gradient. I'll talk to you more in a later lecture about processing people using this exact principle of too steep a gradient.

It's quite interesting, but it'll be the gradient that he failed on, was the gradient which came after the gradient he hadn't understood. He's one step late in recognizing this thing, see?

Now, what you want to do is give somebody a series of doingnesses on a gradient that they can do and that they can achieve. And in Scientology you have a rather marvelous thing called a "Touch Assist," and it is so workable that some people sort of park right there with the Touch Assist and that's only one little level of doingness which if they do, why, it gives them some confidence and they can go on to higher levels of doingness, you see? But it's something like having invented too good a kiddie-car. You know, this is too good a kiddie-car; and you'll find it sometimes hard to move people off on to the next step. But a confidence and understanding goes along with the doingness, so a doingness is just another method of achieving understanding. In addition to accomplishing something with it, and so forth, it's also a method of getting understanding. Doingness is a method of achieving understanding. And if you find yourself too bogged and so forth, well, you want to go do some of it and that sounds rather interesting.

Now, I know myself, I have just gotten through three books of archaic yesteryear's color films. I'm studying color photography on textbooks, that even though they are written by this institution, and so forth, have long since antiquated. They are dead and there is very little left of the actual materials they are talking about. And it's writ... was written by a professor at Columbia University who probably had never done any. And the directions, and so forth, were mostly taken out of the literature released by the companies that manufactured the stuff at the time. And they intended just a happy result which they didn't ever think anybody would have any trouble with. The net result of this amounted to a tremendously interesting, basic theoretical approach which was absolutely vital to an understanding of the subject which departed wildly on to a series of doingnesses which were no longer of use and were completely disrelated. So if this wasn't the world's worst mish-mash I ever had anything to do with, I'd like to know about it. They... a real mishmash. Here's vital basic technology, basic historical technology, basic put-together, basic chemical technology, all of this stuff is not only true now, it's going to hold true from here on out in this particular field, don't you see? Basics, fundamentals, and so forth.

Well, I got those down with spikes in spite of learning them from a professor. And the next thing, all of a sudden you collide with films you will never shoot and which you have to know all of the literature concerning. Oh, that's pretty grim, because in the first place, I have already learned that a manufacturer's table of use on the subject of any piece of film, much less color film, is something that you carefully don't litter the street with. You put it in the garbage can. See? Useless! Forget it! He isn't the user of the film in the first place. He's the seller of the film, not just its manufacturer, but he's selling this stuff, so he wants to put a very happy face on it. So he says its speed rating is up in the stars – when it isn't. And he says it won't do this, when it does. And all of this stuff, and how this stuff is handled and all of this – not even germane.

Why would anybody have even included it in the text in the first place? He already knew that color was an advancing field. It was advancing so rapidly that to expect of the individual, without modernizing the text, that he would have to know all about autochrome – haven't had any autochrome since 1920 – it didn't even take a picture then. Whoever heard of this stuff? Well, it's nice to know that they had some film like this and what its basic theory is, but now go and get the lens stops and settings for autochrome – oh come now! Well, what lens stops and settings for autochrome? In a camera system, perhaps, that isn't even used anymore. That's just *gobbledygook* then, isn't it? Well, your understanding has to embrace this fact and you somehow or another have to survive through the subject and still retain intact the basic technology and the vital fundamentals of the subject which you have learned without being so upset about the later enturbulences which you got into because that's now been over-ridden and developed.

Now, you are all faced with that merely because of the advancing line of Scientology. I've just experienced it in the wildest way possible. The third book was totally devoted to printing methods and I wouldn't be seen dead in a color darkroom anyway. See, I – *bluh!* Who wants to doodle-daddle like that? See? Well, there are lots of guys around that like to doodle-daddle like that and I'm happy there are, because they're going to do all of my doodle-daddling! [laughter] All I have to know in that is also an understanding of what I have to know. I haven't got the time or the inclination to spend forty or fifty hours on a salon exhibition print to get it registered properly. I haven't got the time or the inclination. Who would – who'd do such a thing? One of these doodle-daddlers. They work *happily*. Marvelous! Couldn't live without it! Don't you see? Well, I have to know enough to know whether or not they know what they are doing.

That's, once more, an understanding of what I need the information for, an understanding of what I'm going to use this information and, an understanding of its value and precision; understanding of what I have to have out of it. It's an understanding of what do I want; it's an understanding of the proper practical use or application of this information; and if it's for drawing room conversation, you would study it entirely differently. If you were studying art for drawing room conversation but not commercially, I assure you, the thing to do is to get ahold of a catalog that was published at some outrageous long date ago that lists all sorts of painters of the period of van Eyck or something like this and get all the contemporaries, see, get all of those and what they were noted for, you see, and memorize – just grind, grind, grind like you're memorizing this – an amateur play script, all of this stuff, you see, and so forth – drawing room conversation: kill everybody dead! They can't open their heads about – they say something about seventeenth century painters, you know, and you say, "Like Van der Dobin."

And they say, "What?"

You say, "Yes, Van der Dobin."

In other words, you can play "one-upmanship" with this thing, see? Mow 'em down, you know? "Well, Hobbema, after all – too blue."

And everybody says, "Gee, boy! He's in the know." [laughs]

STUDY AND EDUCATION

A lecture given on 13 August 1964

What's the date?

Audience: 13th of August AD 14.

Thirteen Aug. AD 14, Saint Hill Special Briefing Course. We've got another lecture here on study and education.

You probably have realized, going down the line, that we've got this pretty well wrapped up. But we didn't expect some of the bonuses that we got. This was actually quite an astonishing and adventurous thing to do as I've already mentioned and so forth, is all of a sudden pick up an analogous field of practice and study, in order to study that, in order to find something about study, so that you're not interiorized on your own subject, don't you see? So get an exterior view and study this as a lowly neophyte that is tyroing his way up the line. Both of those mean "beginners." And then carry this subject of study out through, not on a dilettante, but on a professional, hammer and tongs basis, you see? There's a great deal of difference between these two types of study.

And what remains undone of that now, of course, is the professional practice of what one has learned. And that will have to be added into it to help you out in that particular field and sphere. That doesn't seem to be too much but here is – the whole subject of education has as its end product the accomplishment of certain doings, the accomplishment of certain ends or aims, and education which doesn't lead toward this, of course, is just sort of doodle-daddle, monkey business, you know, sort of stuff. It's pure dilettantism, by which could be best defined as "one doesn't intend to do anything about it except annoy his friends."

The difference in these two fields of the doodle-daddle type of monkey business sort of and so on – I really wouldn't call it education. I wouldn't dignify it with that particular field. I would say it's acquaintance – it's acquaintancy. It's getting a nodding acquaintance with some data or a field to find out what is in it. In other words, it's just becoming acquainted with it slightly and doing a light skim around its edges and that would not, in my estimation, be education.

Education would be in the direction of accomplishing certain actions professionally. Now, that is my own word introduced into there, "professionally," but if one is educated in a subject, one expects him to be able to accomplish certain things with that subject. I don't care if this is merely a theoretical line of education, one is still expected to come out the other end being a good theoretician.

So education – education I would define as something that is for blood and I would say that many things pass under the heading of education which aren't. I'm not talking if – this is a good English dictionary definition, you see? Education means learning or knowing or accomplishing the knowingness of a certain subject, you see? Well, let's take that as a flat-out definition. If one is educated in a subject, then he knows that subject, you see? See, you know, exclamation point, he knows the subject. He's able to accomplish the actions which are taught in that subject, he's able to accomplish the results which are taught in that subject, don't you see? That's education.

Now, to call the modern school system "education," then, is quite laughable, because this poor little kid gets in there and they – they keep the kid's time occupied. Let's go down to that. Well now, that doesn't seem to me to have to have anything to do with education whatsoever, to keep the child's time occupied. And yet a survey of this field demonstrates that the best reason for formal education of youth and so on is to give their mothers a break. That's the fact. That's the way they look in that direction.

Well, what is this kid being taught to do? And right away, then, you see what your quarrel with young schooling is. He's not being taught to do anything, see? Voilà! So it isn't education. You see, if you just took the word in its pure definition, with an exclamation point, you know, "educated!" well, this has come to mean a sort of an esoteric fly-around that he – well, what? So you say, "This fellow was educated." You say, "He was educated at Oxford." Well, what is this? All right, good, he was educated at Oxford, fine, he's an Oxford man. Good. We expect certain stamps and social reactions and so forth. All right. If he was educated to be a gentleman – good! So he's a pro gentleman. See? Fine. Fine.

But you can't really disassociate education from an active doingness and a role and a professionalism, you see? It's not possible to disassociate this, to take this over, so we say, "Well, we wanted to give him a good education, not so that he could do anything, but..." Well, that is immediately a contradiction. That's saying, "We must pick up all the white peas by leaving all the white peas on the ground." You can't do that, you see? You can't just "educate" somebody without any end in view. It – because then he wouldn't be educated, don't you see?

And that is the modern quarrel. We have the largest budget, next to armaments, in the world, is child education. That's a big budget. And I don't care if the teachers all say they're underpaid and everything – which they are. It is, nevertheless, a fabulous piece of money which is spent in this particular direction. When you look at it all the way up the line and when you include under that heading of expense all the training, all the educational actions that are done in this world, you see that there's a terrific investment.

Now, practically everyone in the Western world has had a considerable sum invested in them to become educated. That's a considerable sum. It runs into the thousands of pounds; whichever way you want to look at it. It runs into the many, many thousands of dollars. By the time a young man has gotten through college, for instance, he stands, educationally, at something on the order of the ten-thousand dollar mark, or did ten years ago; that's an old figure. And he probably stands at a higher figure today. That's a lot of money to invest in a man – for maybe no result.

All right, so a lot has been spent upon his education but has he become educated?

Male voice: No.

Yeah, and that's the quarrel. See, there was – a lot is spent on his education but he didn't get educated.

I was rather shocked to find, the other day, that my young'uns couldn't write their name. They're being "educated" (quote) (unquote) at a remarkable rate of speed, but they couldn't sign their name. I wouldn't say that then they were being taught to write. They were not ed... being educated in how to write. No matter what they were doing, no matter how many "traveling ovals" they were making, if it didn't wind up with the end product of being able to sign their names – well, I should think that would be one of the first things that some teacher would think about. They'd say, "Well, you know, a kid should be able to sign his name." Because, frankly, that is almost the basic test of literacy.

The fellow that stumps aboard ship and has to make an 'X' on the articles is instantly and immediately considered to be illiterate. Well, maybe he could write in a flowing, copperplate hand everything else, but if he couldn't sign his name he'd have a hard time convincing people he wasn't illiterate.

So it would seem to me to be first things first, and when I found this out I caused quite a storm by insisting that they learn how to sign their names. They – even the children got quite upset. It hadn't occurred to them that if they knew how to write they should be able to sign their names. They couldn't do it. So there's a lot of holes left along the line.

Now, you take arithmetic. Well, this is sort of taught as a handy, handy thing that is – you need so that you won't get shortchanged. I think that's just about the wildest short look at any subject I ever had anything to do with. And yet I'm sure that that is the basic reason why it is taught, because I've had children explain to me, patiently, this one point. So this has been taught to them as the reason they were learning arithmetic is so they wouldn't be shortchanged. Nobody ever tells them that there's another way not to have to worry about that, is also make enough money. Well, look at it. If you – if you made enough money, you wouldn't have to know arithmetic, because it wouldn't worry you if you were shortchanged. See, there are other ways to get around this. I mean – so therefore, there is some other route on this business of being shortchanged, although I offer that one as simply a ridiculous one, it's nevertheless quite a factual one. Midas never worried about being shortchanged.

So, what have we got here in terms of arithmetical education? Well, I defy the bulk of the teachers who are teaching arithmetic to give you much of an end product for knowing arithmetic. They'd say, "Well, uh-uh-uh-um – well, of course, he has to have it because it's a fundamental in so many other subjects."

Well, all right. Now we're talking about teaching other subjects. Well, we're not interested in other subjects, we are talking about arithmetic. How about this thing called arithmetic? Well, we wonder why people don't know arithmetic. Well, he can't be educated in it because it has no end product. The fellow says, "I don't want to be an accountant. I don't want to be a bookkeeper. I can learn to count on my fingers so I don't get shortchanged." Elementary. Why learn arithmetic?

"Well," you say, "well, you *have* to have it to learn other su..."

"No, no, no, no. Let's talk about education and arithmetic. Let's not go worrying about other subjects."

"Yeah, well, if you put a restriction like that on the argument," they would say, "of course nobody can argue with you."

And you say, "That's the point. Who wants to be argued with?"

The point I'm making here is that arithmetic, having no finite end in itself – of course, it has – it has finite ends, and it could be described – but having no described, finite end in itself is therefore almost impossible to teach. And you have nearly everybody doing very badly in their grammar schools on arithmetic because it itself is not a subject, so therefore no one can become educated.

It's become more and more – this is very manifest in the university – I'm not talking over your heads here, this is something that's very, very bang! It's very obvious. You get into a university, you're all the time having problems being shoved under your nose in engineering schools that you're supposed to do by algebra; you're always having problems shoved under your nose that you're supposed to do with calculus, any one of which is solvable by sight arithmetic. That's something to think about.

Now, what has happened here? Well, arithmetic, not being a subject in itself, and being a somewhat degraded and degraded subject, has gradually shrunk and is ceasing to be a subject, but is simply an auxiliary subject which moves up into higher mathematics. And if you don't know arithmetic, you can't do higher mathematics. That's the way it's represented, more or less, to the engineer.

Well, I was quite interested in old *McGuffey's Readers* at one time to find out how adept at arithmetic somebody was expected to be in 1888. The problems which they were expected to solve in arithmetic were the problems of algebra. And they were expected to solve these with arithmetic. And what do you know? It was a great revelation to me that it was very possible to solve these algebraic problems with their "Xs" and "Ys" and all that sort of thing by common, ordinary, garden-variety arithmetic. And it made a lot better sense – made a lot better sense. I looked at this and I've run into some old-timers who could take a column of figures about five figures wide and about ten figures tall and add them up in a peculiar way, which was very peculiar to me, of some kind of a crisscross addition that I would be quite at a loss to explain to you how it was done, but arrive with almost an immediate answer. And you say, "How did they do that?"

"Well," they say, "it's very simple. You see, nine added to something gives you itself, so all you do is go down the column and find all the combinations which make nine and forget those, and you add the remainder and you get the total."

What do you know, you know? Well, of course, that's just tricky stuff, but all this at one time was part and parcel to arithmetic and it's not here anymore in arithmetic. Where did it go? Well, you must have a dying subject. Why is it dying? Nobody is delineating its purpose to the student of it. No matter if some – no matter if some purpose does exist in it, that's

beside the point. Yes, you could figure out lots of purposes of it, but all you have to know is, is nobody is delineating, marking out, showing the purpose of that subject to the student so one doesn't consider that he becomes educated in arithmetic. Arithmetic is just some auxiliary subject that keeps you from being shortchanged.

So that as the purpose of a subject deteriorates in its advertisement or rendition – as the purpose of a subject deteriorates – the subject itself also falls away. Sounds like a very – a very strange sort of a thing to give you, but as the purpose of a subject falls away, why, so does the subject disappear from the ken of man. Manufacture of buggy whips? Go around and try to find somebody today who knows all about the manufacture of buggy whips. There's probably a couple of boys sitting around in England who know the subject backwards and forwards and who make all the circus whips. See, there are practically no more whips made. Dying, because it has no purpose. Nobody's got any horses to flip buggy whips over, see? So becoming educated in how to manufacture whips today would sort of be an end – a dead end. It would not be a very productive career.

Now, that doesn't sound very amplified, but let's take it in reverse and at once it will make a great deal of sense. Then, a subject for which the purpose is not delineated will die away, not only in the society but in the individual. Both of those two – those statements are true. The first one is so true that it's almost nonsense. But the other one is not nonsense and it's not been detected. If the individual to whom you are teaching this subject has not got the purpose of this subject, then that subject will die away in that individual. It might have a tremendous purpose, but if the purpose of the subject is not being taught to the individual, he's had it. Do you see?

So you can get the difference between a live study and a dead study. A live study is one which has purpose, has a use; and a dead study is one that hasn't any use. And the way you make a live study into a dead study is dual: Its use dies away as in buggy whips or one simply omits it as part of the educational process. And it will make the subject die away, not only in the individual but the society; not only in the society but the individual. Do you see that?

And we have to assume that a person cannot become educated, just by the definition of the word "education" as I have been stressing it here, in a dead subject because it has no end product.

So you find these things become obsessive. Somebody starts to study "miniatures painted in Holland by blind painters." Well now, miniatures painted in Holland, we've got some use for that. But "miniatures painted in Holland by blind painters," well, we would sort of look around for quite a while before we found any use for this particular subject. Oh, you could find uses for it, but don't get yourself all cluttered up on – on introducing your ingenuity to supply the lack in an educational system that – because by being reasonable, you cripple yourself. It's a question of "What is there?" not a question of "What could we dream up to put there?"

Oh, we could dream up some subjects, but let's just say this boy is studying this esoteric study – strange, weird, useless, nowhere. Do you know that he can easily become obsessed with it? He has no purpose for it, no use for it and so, of course, it's impossible for him

to become educated in it because he can never display his virtuosity. He can never display its use. Who would listen? He can't even tell his friends. They'd say, "This, *guy is* a ruddy crank! He goes around talking all the time..." Somewhat like your families and so forth have occasionally regarded you on the subject of Scientology. You're over their heads, you see? But much worse than that – much worse than that, we would get it on this sort of a basis, see. Nobody knows what he is talking about and nobody knows why he is studying it and it isn't of any use and it's not of much interest anyway. Well, this poor bloke can never communicate it. He can never communicate it for the best reason that communication becomes difficult: Nobody will listen.

Did you ever think about communication being difficult because nobody listens? Well, just run this into the field of education. If the subject doesn't exist and has no use and has no application and has no this and has no that, well, to that degree their listening ceases because it isn't of any use to them, either. He's studying miniatures painted by blind painters in Holland. People sort of say, "Well, I could understand his studying miniatures painted in Holland... I think he's nuts!" That would be the immediate conclusion, don't you see?

Well, your families look at you sometimes, where you have run into this and collided with this head-on, and people wouldn't listen to you on the subject of Scientology or were impatient with you for studying it, and that was because you weren't talking to them about the purpose of Scientology. And you didn't talk to them about the purpose of Scientology within the framework of what it could do for them personally.

Now you are coming right on close to home. Your mother might have been interested if she heard what it had done for you personally because she's interested in you. But even your mother would conceive it to be a subject only when a purpose was delineated. Now we'll go a bit – a little bit further: when the purpose that was delineated could be executed to any degree. You know, the purpose you've given it could be executed to any degree. Now, your next stage is, is they don't believe it. See, you could give them the purpose but they don't believe it. In other words, the purpose isn't real to them. So you not only have delineated the purpose but you have delineated it to them in such a way that it is – seems to be an attainable purpose. An attainable or doable purpose.

So we walk up to this bird and we say – we say to this bird, "Your – your interest in this subject should be very great because this subject will make you a Clear."

He immediately says, "What wall?" because it's not an understandable purpose, see? The purpose ceases to be understandable when the goal does not seem to him to be attainable or valuable. And it can cease to be attainable or valuable merely because it isn't understood.

So for an educational subject to exist and continue to be a subject in which one can become educated, or if you ever expect anybody to ever be educated in the subject – let me put it that way – for it to continue to exist, for it to survive, it has to have a purpose which can be seen to be an attainable action. It has to be attainable. The purpose must be attainable.

Now, the value of a subject – the value of a subject depends, simply and utterly, upon the value of attaining that stated purpose. How valuable is it to attain that particular stated

purpose? Is it valuable to be able to accomplish this or is it not valuable to be able to accomplish this? And to that degree a subject appears to be a fringe subject or a vital subject.

So the woof and warp of the culture is made up of educations which are subdivisible – that's the woof and warp of a culture... (Woof and warp: rug term. Try not to put too many words on the line, here. The woof goes that way and the warp goes that way, see?) It's – the make-up of a culture is subdivisible into two general types of education. A culture is held together solely and only by education. Whether that education is accomplished by experience or by teaching, a culture, as a whole, is the summation of its education. And those are two divisions to the educations of a culture, and one of those are the vital ones and the other one is the "nice" ones.

Now, an education achieved is remunerated to the degree that its service is understood to be valuable. An education is remunerated to the degree that its service is understood to be valuable. And it frankly is not remunerated one penny more. Sometimes they falsely remunerate, but not often. And that tells you that there must be some mighty funny, funny things, because there are some things in the society – because this rule I've just given you is true and the society at large then must be misunderstood to some degree because there's several educations in the subject at large which are remunerated to an enormous extent which are not held by certain educational authorities to be valuable.

Public must like to be fooled. They're always paying con men of some kind or another. There must be some real value in having hope shot up to the moon in the stock market because those birds are very often paid off heavily. You could reevaluate the society on the basis of what I've given you. Yes, you could say, "Well, the society makes mistakes in this direction. Yes, the society is lied to." Well, I don't think the society makes mistakes in this direction. That's a new thought, isn't it? Do you know that the most valuable prof... single technical profession in the United States is burying people? Hm, very highly paid! They've managed to convince everybody that the loved one should be in sealed bronze caskets and in concrete and steel vaults outside the caskets so that seepage won't trouble your loved ones. And they had the whole country absolutely convinced that this was Congressional law, that it was local law. And a recent Congressional investigation disclosed this fact and they found out that there isn't any statutes in the United States that compels anybody in the United States to be buried even in a board coffin. There are statutes that require them to be buried, but there is not even a statute that requires them to be embalmed. So you roll Aunt Agnes up in a blanket and dump her in a hole. [laughter] As long as you've got a death certificate, man, that's all you need.

So, this particular profession – this particular profession was selling what? They were sort of selling some weird life after death, weren't they? They were akin to some religious cult or something like that. And it was obvious that people did buy life after death. And we find out that one of the most expensive things you could do in Egypt was to die. That was a very expensive thing and that's gotten that way in the United States today. It's very costly to die. By the time they get through with you, man, well, you've got no estate left.

But this is very peculiar. The society remunerates this and rewards it. Well, it's just about the most educated art you ever had anything to do with in your life. Undertaking is a

supereducated art and the society of undertakers themselves – "morticians," they like to refer to themselves – these birds run their own schools and their own technology and that sort of thing and they really hammer-pound it in. And the final end product is very visible. But these guys are quite sharpies. I know, because back in the days when I was having a ball around New York as a writer, why, the medical examiner – that's what they've begun to call the coroner around New York now – they changed their names, too – the medical examiner of New York was a particular pal of mine. He was the coroner of the city of New York and one of the nicest blokes you ever had anything to do with. He'd embalmed personally, with his own paws, 15,000 corpses.

I got interested in this particular field by being sent in his direction to do a series of stories about undetectable crime and of course I wound up in the lap of the medical examiner of the city of New York and he started my crime education on the subject. And of course, this was in the field of what they call forensic or legal medicine. And this boy, he had it all at his finger tips and so forth. But the casualness with which he could roll off all of these various things showed a great familiarity with the subject.

This was not an esoteric subject. This had to do with lots of dead bodies which had been strewn all over the place in various states of dishabille, various states of knocked-about. They were untidy at times. This was quite a boy. And oddly enough, he conceived that he was not acceptable socially. And I was very acceptable socially, so he and I formed a very good partnership, because he always liked to – if I was going anyplace and asked him if he'd like to come along and so forth, he was there on a rocket plane, you see? Right away, quick! But there wasn't anything – there wasn't anything that was wrong with this bird. He had perfect manners, he was a perfect gentleman and so forth. But part of his education was that his subject was looked down on and therefore he felt he was socially unacceptable and so forth.

Well, I don't know. A lot of people – lot of people look down on – street sweepers think they're looked down on and so forth, but street sweepers keep the streets swept clean, don't they? Hm? Well, this guy obviously was keeping the streets of New York from being littered with decomposing corpses. And oh, I used to see him every once in a while. When I was president of one of the writing societies there and so forth, why, he used to come over there quite regularly and he'd give detective writers talks if I'd ask him to and so forth. And they would go away from the luncheon or something like that the weirdest shades of green. [laughter, laughs]

But man, here was – here was data. Here was data. And it had a very definite end product, if only in the field of detection. A guy like that could take one look at a corpse and he'd say "Carbon monoxide, been dead about three hours." "Cyanide." "Arsenic." This, that, the other thing. *Brrrrrr*, boom! "Oh, I'd say that was botulinus poisoning, Joe. Yeah, yeah. Well, put him on the slab and we'll run a – we'll run a test on it, do an autopsy. Well, I'm pretty sure that's just botulinus, you know some – eating green beans in the wrong time of the year that had been in the icebox too long. That's – looks like that's what that is to me." Almost always just dead on the button, you see?

This was art, the art of observation, the world of death. But even in the days of Egypt this art was not accorded any social status. The boys who embalmed the bodies down in the

deadhouse and so forth were actually never even permitted to leave the deadhouse. They were held in. But here's this terrific, terrific amount of art, terrific amount of detail, terrific amount of technicality, terrific amount of stuff and it's come right straight down through these cultures from the days of ancient Egypt, and it is totally uninterrupted. It's interesting that such a bird as this could sit down and discuss the relative preservation qualities of modern embalming and Egyptian embalming. And he was certain he was doing better these days than the Egyptians were. It's the first time I'd ever heard that, because we've seen these Egyptian mummies in univer... in university museums and that sort of thing, and we've seen these things around and they're still there, all wrapped up and so forth. But his attitude toward it was the attitude of a true professional: "Well, their features hadn't been preserved and their coloring was bad." That's what he said to me one day, so forth. "Yeah, the next time you're down in the museum, Ron," he said, "if you don't believe it, if you don't believe that we're way ahead of them these days, you just take a look at one of those mummies. Features haven't been preserved and coloring is bad." And I said, "But man! Those guys – those guys have been dead for thousands of years!"

And he said, "Well, in a few thousand years one of mine will have been, too." And he said, "His features won't be bad, and his coloring will be good."

He said, "We can do a better job than" – almost – "we used to do."

Well now, here's a steady – I'm talking to you about a relatively debased profession, but a highly remunerated one. And keeping the bodies off the streets and prettying up the loved ones and so forth is very highly paid. Preservation of memory and so forth is a very highly paid profession. And it has been continuous – it has been continuous for a very long time without its know-how dying away. Wherever there's been a civilization, they seem to have known the data of the last civilization on this, no matter how many wars have swept across the top of it and they deal it off the cuff and so forth. Why, even the ancient tribal rites, they would go find a dry cave that would automatically embalm the corpses of their loved ones.

So here's this – here's this very interesting technical line. That's a technical line, man. What you have to do in order to keep a corpse from going bad and what you have to do to and know about what killed this person and what he died of, so that you won't get all mixed up in your embalming activities and what you have to do in order to straighten all this out, or so forth. And how you're supposed to bury them and exactly how you're supposed to handle the grieving family and exactly how you were supposed to sell them the most for the – for the most, you know? These are technologies, no matter which way you look at it. They are very broad and they are very prec... exact and boy, do they wind up with a finite result! You know? You've got the body, you embalm it, you bury it, you collect your money. Thud! Very easily understood.

So that we would say that the subject is – a subject is not only remunerated to the degree of its need but also to the degree that it is understood by the public at large. It's remunerated to the degree that it is understood.

All right now. How about this longevity? How about this longevity? The continuing need of a purpose can then preserve a subject. The continuing need of the subject can preserve

the subject. If the subject continues to be needed, it will be preserved; that's a corollary of what I just gave you a few minutes ago. But the length of time that it gets preserved is entirely dependent upon the need of and the relay of its technology. You see, you must have the technology continue to be needed and the technology must also be relayed. If it continues to be needed it will be also relayed, which is all very – very fascinating; rather obvious.

But where you get a subject coming on down the line – where you get a subject coming on down the line across the millennia and so forth, it is only because its purpose is carried with it. Its purpose has gone along with it and its purpose is understood. Now, one could destroy that subject by destroying its purpose – no longer needed, you see – or by destroying the relay of its technology in some fashion or another; or in being too insistent or too – too forceful in relaying its technology and tacking lots of other things to its technology which didn't belong on it. In other words, "Before you can study engineering, you must have had a grammar school education, a high school education, gone to finishing school and learned how to knit." I can expect that will be about the next one, see?

You're not going to have any engineers after a while; all the bridges will start to fall down. Well, one of the reasons why you won't have any engineers after a while is very elementary, and it's contained in our own technology, but only in our own technology, the reason for this. And that is, you've given him too much takeoff. He's had too much of a run on takeoff and – and the longer in an – in education – let's get back on education now – the longer it takes to approach the education, the more opportunity there is for tacks on the runway. We could probably state that in a much more easily expressed way, but that's about the way it is. If this character is taking off, taking off, taking off, taking off, he's running on the runway, he's trying to get up speed, everybody is saying, "Well, you mustn't pull back on the stick yet. You must stay there on the runway and keep running on the runway, ready to take off, ready to take off, ready to take off, ready to take off." Well, by the time he's done this for about forty-five years and finds out he isn't off the ground, he doesn't take off.

The reason for that is, is the number of opportunities to fail are directly proportional to the length of the approach. That's a law: *Number of opportunities to fail are directly proportional to the length of approach*, or length of time that it is going to take to get up to where you're going to study this thing.

Now, that law is balanced by the fact that if you don't study something by gradients, a person can get into a mess by going into too high a gradient as I was talking about the other day. He went too steep, too quick. So there's – somewhere there is a proper length runway for any subject. It's a runway of the right length for the subject.

A runway of the right length for the subject, then, would not be so long that it needlessly multiplies the opportunities for failure and it had better not be so short that a person jumps a gradient and gets himself into a confusion. And what is the right length of a runway for any given subject? How much preparatory action should there be or how long should a course of study be and all of those things, those questions, are answered in this: Well, it should not be so long that it needlessly oppor... multiplies opportunities for failure and it should not be so short that it takes a person up too steep.

He'll fall off on his nose, like we used to do when I was in flying clubs in college. There's many a sad young man would pull back on the stick too quick. The evolution there was a "whipstall." Called a "whipstall" – technical term, aviation – you come up the line and you – there isn't enough forward speed to sustain the vacuum on the top of the wings, and you have just never seen an aircraft do anything quite as sickeningly funny as it does in a whipstall. It's flying along very, very nicely, and all of a sudden it's flying too slow, there's no longer any vacuum above the wing and it goes "*Whoof!*" It is fast! It's not for nothing it was called a whipstall. And of course, when you're only about 100 feet above the runway or something like that, and the edge of the field and so on, why, it – you don't develop enough speed in the process of falling to then be able to pull back on the stick and pull out of it. What they do is send a notice to your folks and get in touch with my old friend the medical examiner of New York.

Anyway, that's what happens to a student, see? He gets himself into a state of overconfidence or something like this and he pulls back on the stick and he hasn't had a long enough runway, he hasn't developed his speed, don't you see? In other words, he goes into too steep a gradient.

Now, Mary Sue did it the other night. She's studying typewriting, of all things. She typewrites pretty well, but she's decided – started to do touch-typing. And she's going to make the grade on the subject of touch-typing, hammer-pound – bang! And it's quite interesting. I ran an educational process on her for a very, very short period of time on this subject and busted the dam on this. I don't know that she's noticed it and – she isn't here just now; she wound up with lawyers, so – but she probably hadn't noticed that there is a coordination between her sudden interest in learning to touch-type and breaking the barrier on one of the old "too long a runway" propositions and "too short a gradient," too. I broke that with a process and now she's very interested in learning touch-typing and she's spending about an hour a night, with everything else she's got to do, sitting there hammer-pounding on a machine on a touch-typing basis. This is very difficult, because at the same time she uses the typewriter during the remaining hours to hunt and punch out notes, you see? So on the one hand she's busy touch-typing, you see, and the next, why, she's hunting and punching it out, you see, doing her work. And then she'll get back and she'll be touch-typing away.

I threw her. I gave her a metronome the other night and she suddenly conceived that her rhythm was off, which it was, and so forth. And she couldn't do anything with that metronome running. She said she had to shut that off right now. It was too high a gradient.

But she went onto the gradient of two rows of keys before she had licked one row of keys. Now, you see what I mean by too tight a gradient? This was too tough, see? And boy, did she whipstall! She whipstalled right now. And she just went into a total confusion. But knowing, now – yesteryear she simply would have quit; that would have been that – but knowing, now, the technology that we – that I've managed to get together here on the subject of education, she sits back and says, "Now, let's see, what did I do? Oh, yeah. Well, this is just too tough a gradient. I just went up on too high a gradient." She went back to one row, *patter, ta-patter, ta-patter, ta-patter* and then went over onto two rows and she had it, see? See, she – in other words, she moved up over that gradient smoothly.

So a person knowing this can actually guide his own traffic through very nicely. Nobody had to tell her that, don't you see?

All right. Then an educational subject is simply that something that winds up in a doingness and is approached by the process of getting educated in it. Now, that's a hell of a thing to have to say! But you know, hardly anybody really knows this. They don't really know it. They give it lip service all the time, but they're always engaging in activities which they do very badly and fail at like crazy and it never occurs to them they've never been educated in the subject.

I'll tell you something used to drive me stark, staring mad, down in Hollywood. Every director, every supervisor and as far as that's concerned, every actor on the set, they all knew how to be a writer. They knew – knew how to – they knew writing. They could all write stories. The place was just lousy with writers. You want to know why Hollywood never got out of kindergarten on stories; that's just because of it. They never recognized that it's a technology; it's a professional technology which is studied like crazy. It has more ins and outs and ramifications; actually it has quite a terminology. But all these birds knew they knew how to write. It wasn't anything you ever had to study, so of course if they did get a pro in their midst – and Hollywood developed very few professional writers, in fact it developed no professional writers. They come in from elsewhere and go to pieces. Well, the process is done by everybody there knowing the profession of the fellow who just arrived. See, he's a writer, he's a professional, he arrives, everybody else knows his profession.

Well, now, he won't give the movies the beingness necessary to realize that maybe movie writing has a few tricks of the trade, too, so of course he looks a little bit stupid to these people, whereas he's not stupid at all. He just hasn't learned that particular specialty of his own subject, which he could learn rather rapidly. And Hollywood, not realizing this, never bothers to teach him how to write for Hollywood. And they have never found out that it's necessary to be educated to know how to write.

So here's this wild profession which is sometimes remunerated to a fantastic degree and in which you can very easily starve to death and in which people grant you fantastic quantities of beingness and in which people ignore you utterly. So it is through all kinds of contradictions. What is a professional writer? Well, by test he's somebody who is successful and is getting his stuff published or at least read or viewed. But of all the subjects of the arts, this is the wildest one to have anything to do with because nobody grants it the beingness of having any technology.

And yet the boy who succeeds – you would be very interested – the boy who succeeds is not just somebody who wandered in with an idea. You go up to the Screen Writers Guild and you for – you find out that the reason education in writing has gotten a bad name is because it's taught in American universities. They have gone out and hired a bunch of failed writers. And failed writers either become editors or professors. And they dramatize their failure, by the way, and they try to make a writer fail. And I've never seen one do anything else. I beg your pardon, there have been a few that worked like mad, they were tremendously successful, whatever they had to do with succeeded and that sort of thing. But they weren't under the idea that they were writers. All these other birds still had this wild idea that they were

kind of writers, but here they were, editing, see? They weren't trained in it or if they had been trained in it, they'd failed at it.

Here's a chance subject. The whole society seems to run, to some degree, on the romances and imaginations and so forth of the writer. But you talk about a hidden piece of technical training. Well, the technical training of this field doesn't exist. If a professional writer wants a good laugh, if he wants just to lie right down in the aisle and laugh and laugh and laugh until his sides are sore, all he needs to do is read the curriculum of the professional writing classes of Princeton, for instance. You just double up in a ball. I mean, you – you can't help it. And I took the – a professional writing class at Harvard one time, and put them into paralysis. And I was told by the professor later, they never did recover.

I made the mistake – I was very young and very brash and of course when you're invited to lecture on your own subject, you see, at some very esoteric institution of this particular character, it rather goes to your head, and you chuck your weight around, you know? Particularly if you're very young and brash and me. [laughter] And so I stood up in front of this writing class, and I said to them, "I noticed your current subject here is style. Now, no writer really knows whether he has a style or not until he has sat down," and I was being very reasonable, "until he's sat down and written a couple of hundred thousand words. And by the time he's done that, he can probably detect in his work whether or not he has a style." From the professional writer's viewpoint this is the most reasonable statement ever made by anybody, because a pro, even – even Dickens would just think nothing of getting out a hundred thousand words in a month, see? Nothing!

I don't know where all this idea came from that they all write painfully with their blood while twisted in agony, see? They don't. They don't at all. If it took somebody seven years to write a great work, it's because he was drunk six and a half. [laughter] They write well, they write easily, and they write facilely. For instance, most of Dickens' stuff was written at the rate of 5,000 words a day. At one time I worked it out and handed it over to the press and it got national press. You saw that story kicking around and so forth. They thought less of his work then, of course, I suppose. But a writer can write. What better definition do you have for it, see? He can write easily, facilely and rapidly.

Well, all right, I said this to those poor blokes sitting there in their classroom and I noticed there was a sort of a shock went through the classroom. And it was very shortly after that, that I concluded my lecture and I didn't get hardly any applause. They were all sitting there sort of like statues, stunned. They didn't even bother to get up at the end of the bell. And finally one or two of them turned around to one or two of them, they muttered something or other. And the professor, who was a pretty good bloke, he came back and got me off the rostrum and walking out with me and so forth, and he said, "Well, you sure raised hell with that."

And I said, "Why? For pity's sakes, why? What is this all about?"

"Oh," he said, "they – they write 1500 words a semester."

And those people were upset, man! I was back there again, and that whole class, nobody even would speak to me. They were upset! They had thrown me overboard. I couldn't

possibly be a pro, you see? But yet my stuff was on the newsstands. But this must be a fluke. Something was wrong, because the data I'd given them must be wrong.

These birds had never been told that they should have to write! They were all being taught to be writers, but nobody had ever said to them: "Brother, write!" You understand? And I was the first one to announce to that class that were going into their fourth year that a writer should write. I don't know what a writer was supposed to do. He was supposed to discuss or he was supposed to do this or supposed to do that, but they – commercialism has a dirty word connected with it to such people and so forth. Why? It means hard work!

They don't disdain money. Never get those people wrong. They don't disdain anything that goes with it. They don't disdain being commercial or being anything else. It isn't their art they're holding on to. It's hard work to produce, to them. This is just too tough. So they had studied for four years and had not covered their first gradient, which is that you *do it!*

"We are now teaching you about ceramics. In the field of ceramics you make pottery and glass and other such objects. By the end of this course it will be expected that you will facilely and easily be able to make bits and pieces of pottery and tell things that are wrong with pieces of pottery that are not well made and so forth and you will know the technology of making pottery."

Somebody comes along and says, "Well, you're – you're really teaching a polytechnic subject," or something. No, no, man. Writing is simply cutting down trees, running Bulldozers, there's many a man out there digging a ditch that hasn't got the physical energy it takes to write. That's right. It's just another job. And when approached in that fashion, becomes reasonable and comprehensible and understandable, and you – then you sit down.

A writer isn't somebody who wears a red fez hat and blue slippers and smokes a pipe and gazes out the window. A writer is somebody who sits down to a desk with a pencil and a piece of paper or with a typewriter with some paper in it and he writes. What does he write? He writes what will be published and what will sell and what people will look at, because by definition a subject has to be accepted by the society in which it exists for it to be a professional subject.

Now, this is awful cold-blooded, hard-eyed looking. That's right down to earth. Now, I don't exaggerate when I say in a university they don't say this. The best professors will stand around and say, "Well now, when you're out in the field some day, and you're looking down that transit, don't blame me if you haven't got it level." No, they don't teach that way. They hand them a transit after class and tell them to go survey something and don't even give them a lecture on what the transit is, because it's some nasty object.

No, the tools of the trade are transits. Engineering: the tools of the trade are levels; the tools of the trade are big pieces of drawing paper and blueprints and bricks and pieces of steel and machines and bulldozers and tough foremen and shady contractors. These are the tools of the trade. They don't teach any course in "How to Keep Your Own Ethics While Working for the Bide-a-Wee Construction Company." They're not real, in other words. They've gone into some other never-never land.

So that was how I shocked the short story course at Harvard. And I never could figure out exactly why and how I had shocked them. It wasn't that I had told them too many words. That I assumed for a long time, but I know now, in studying education, what I had done. What I had done is simply told them that, "If you're studying writing, you write. You're expected to write. You're expected to turn out wordage." And it probably wasn't even in the phrase, "You won't know a style," because my whole talk was devoted to this single idea.

But it was when I finally gave them a quantity, right after what I meant by "words on a piece of paper." I remember standing up there on the rostrum calculating it rather rapidly. I said, "Well, I'll get some low figure that anybody in his right mind would be able to do in a few weeks, you know, and it won't buffalo anybody." So I said: "A couple of hundred thousand words," you know? "*Gaaargh!*" see? Well, that was what they went: "*Gaargh!*" But that isn't what the shock was contained in. The shock was contained in the fact that my whole address to the subject of writing is that you wrote and that a writer writes. And that was what the shock was in.

If you're going to be educated in a subject, you should be able to do it. Now, it's not a dirty word to do things. Now, you don't have to go on obsessively doing this the rest of your life. It is very confusing in this course that I've just taught. I've just been taught. The very best of these teachers have been thoroughly grounded in theory, and have worked like madmen with lots of doingness and lots of ramifications of it in their own field. Now, when you've got that combination, you've got a fellow, when he said something is so, there was something very believable about it because it was very right. It was very recognizable – he might not even know how to write well, but he could express this because it was his own subject and he knew what he was talking about.

Now you've got somebody who couldn't do it and that would show up – *gahhh!* Huge lights going up in all directions; the impracticalities of it, don't you see this? This bird – it's not the right emphasis. He doesn't tell you about the right things in the subject. He tells you about something that he thinks might be interesting, but he himself, through experience, doesn't know whether it would ever be useful or not, see? Makes a big thing out of some little thing, don't you see?

I had one the other day – it slips my mind right now, on – in this course. It had something to do with the fact the guy was just tearing – oh, yes! Yes! It was projection. It was the projection of transparencies. And if you had a screen six feet away, why – and a screen twelve feet away, then your light and density of the transparency – your light was, of course, much less on the screen twelve feet away for – not only because the footage was increased, but because it was more distant and therefore the density of the transparency was very important for projection. And transparencies had to be very, very carefully developed and printed and so forth, in their positive form, in order to overcome these differences of – I was – it was one of these boys. He was a little more esoteric than the others. Well boy, he was talking right up a... and Reg, did we have any trouble projecting any old kind of a transparency over there at the circus in the dead black of an open room at an unthinkable distance, up to a size of twelve by twelve?

Well, if you'd listened to this guy very carefully you would have gotten the impression through... he, of course, didn't have the experience; he never had probably given a lantern slide in his life. You know, it's an old technology, lantern slide shows. It is the immediate grandpappy of the cinema, see? But this boy had probably never given one, so he gives this terrific stress of how careful you've got to be to get this point at which – it doesn't matter. It doesn't matter how thick a transparency is, as long as it's a viewable transparency. It doesn't matter how dense it is or how thick it is or how hard it is to look through, if it's too far away, get a brighter light. And the thing has a solution. That's all. Put another lamp in it.

You don't do it in the darkroom, in other words. You do it while you're projecting it, but he didn't know this fact so he makes this big, labored halfpage that you have to sweat through about printing transparencies and making sure that you know beforehand at what distance they're going to be projected, because it makes so much difference between the – oh, no! You get the idea? Now, if this bird had been – had ever done this or had had much to do with this, he wouldn't make a mistake like that. So you – what you do is get wrong emphasis.

So true knowledge will give a correct emphasis and only a theoretical knowledge will give wrong emphasis. And I imagine the universities by this time are absolutely strewn with wrong emphasis. And you can keep moving something farther and further afield with wrong emphasis, up to a point of where the technology practically gets lost. Wrong emphasis, wrong emphasis, wrong emphasis! Maddening!

In other words, "Be very careful, now, about the varnish on your E-Meter. Now, E-Meters are varnished and we're going to go through, now, the next three weeks of study on the manufacture of varnishes for E-Meters."

Well, it's a matter of how unreal can you get? It doesn't have anything to do with the subject matter at all. Just because there is some varnish in a session – it probably never occurred to you till this moment there was any varnish in a session. [laughter] Somebody makes a big deal out of this, you see? He says – he figures out, because varnish is shiny, he figures out that light falling on this might possibly influence the preclear into being distracted by the meter. He's read someplace that something or other, you see? He's figured out that this must be true, but actually an experienced auditor would tell you that he has never had this complaint from any pc every place, so it's not a problem, so why solve it?

So these unrealities simply consist of this, and this is a very precise definition. Unrealities enter when an educational activity teaches solutions to problems which don't exist or fails to solve problems that do exist. And the mean between those is what should be taken up. And the one thing that gives this is experience.

Some bird has the – he has the activity of carving stone heads out of the mountain: Gutzon Borglum. He... this is it. I imagine you could go up and you could learn more con-founded things from a bird like that. I imagine he's got it down. But he'd expect you to have a whole grounding in the field of the world of arts and sculpting before you even got there. But nevertheless, there's probably a lot of specialized doodle-daddle that he would tell you all about, like, "You can tell whether that particular piece of rock that you're going to go into has a crack in it by the fact that there's discoloration of the pattern of it," and so forth, and this would all be very good, you see? Well, he's solving something real. You start to carve a

cracked rock and it goes "crack." And this is very disastrous, particularly when you've only got one mountain to cut up. You can't order another mountain.

So this is probably a very important problem. And you go out there again and you look it over and he's got a new assistant who has been taught all about how to fix up faces and heads in mountains by somebody who never did. And now, Gutzon Borglum is faced with the fact that he's got to train this – first he's got to untrain this assistant and he's got to train him again, so he's just got about twice the job on his hands, you see?

This bird's been taught that it's very, very bad to smoke at heights because it destroys your aesthetic sense. Has nothing to do with carving faces out of a mountain, see? Carving faces out of a mountain doesn't require very much aesthetic sense. It requires a lot of leaning on these great big "widow maker" pneumatic drills and blasting powder and it's a very violent activity. There's lots of motion and mass and doingness connected with it, you see?

But somebody that would never do it, he'd teach, "Well, you have to be very careful of your aesthetic sense," and so forth, and *blyehhh!* see? He'd try to extrapolate a subject with which he had no acquaintance and that would be a very difficult thing to try to do, to teach a subject with which you had no acquaintance. And yet, apparently it is not – it is very difficult to do, but it is always being done. And it's given higher education a bad name today in many areas – it's given it a very bad name, because they're always being taught by people who haven't done it.

And I have really learned my lesson in this photography course. Boy, I can see one of these birds coming up in the textbook a mile away now, and I – *ahhhh!* I say, "Ronnie, here we gooooo! *Wharoom!* We are now going to solve all sorts of problems that don't exist, and we're going to not have any solutions for the problems that do exist, but all of this will be stated in such a way that it's impossible to extract any meaning out of it anyway. But you will have to extract the meaning out of it unless you want to get barriered or blocked on this particular subject." Now, isn't that an interesting problem?

So it makes about seven times the amount of study, just easily seven times the amount of study that should be there. He doesn't know what he's talking about, but you have to know what he's talking about, so you have to read his subject and then sort of dream up one and figure it out for yourself against your practical applications. It's a bum show.

So all subjects, regardless of whether people call them "pure mathematics" or "pure art" or something like that, all subjects wind up in a finite doingness, a very specific doingness; all subjects wind up in a specific doingness if they are educational subjects in which a person can get educated. And if they do not wind up with a specific doingness, a person, no matter how long he studied them, couldn't become educated in them.

Now, this isn't just for the definition of the word *education*. I haven't given it that meaning. I mean, you could go on and on and on, and feel more and more baffled and more and more baffled by this particular subject and so forth. Well, it is not a subject in which somebody could become educated. Do you follow that? Well, that's your bafflement. You're trying to become educated and it's impossible, because it doesn't wind up in a finite doingness.

So, anything that winds up in a finite, specific doingness – that's a measurable, you know? It has limits and actions. Anything that winds up in a finite doingness is susceptible to being educated. In other words, you can educate it. But if it doesn't wind up that way, a person cannot become educated in it, no matter how hard he studies it because there isn't any way he can ever check out if he ever learned anything. So it becomes a total significance for which the mass is absent; and education in the absence of the mass in which the technology will be involved is hard on people. Education attempted in the absence of the mass is hard on the student. It's very tough on the student.

It makes him feel – physiologically, it makes him feel squashed; actually, actually makes him feel squashed, makes him feel bent, makes him sort of spinny. It – these are all physiological and mental reactions; makes him feel sort of dead, makes him feel bored, exasperated, makes him feel a lot of different ways. This isn't the only way a person can become those, by a long ways, but that is the result of studying the doingness of something in which the mass is absent. The mass of it is absent. Do you understand? You could understand that you were studying nothing, and therefore you would not expect any mass, so that probably wouldn't upset you; but you're studying tractors and you ain't got no tractors; no tractors and you're studying tractors.

Photographs help. Motion pictures would help. They would do pretty good, because they're something of the mass. They're a sort of a promise or a hope of the mass. But the printed page and the spoken word are not a substitute for a tractor! Remember that.

And this isn't the old argument, "Of course, we know that a person has to have something of the stuff they're studying around them." No, no it isn't – it isn't even into the area of your – your practical, and so forth. Don't look for a further explanation for this datum, because you have to understand this datum in its purity. And that is simply that educating a person in a mass which they don't have and which isn't available produces physiological reactions. That is what I'm trying to teach you. I'm not even saying it should be done or shouldn't be done. I'm just saying it produces physiological reactions. That's just a fact. You understand?

You're trying to teach this fellow all about tractors and you're not giving him any tractors. Well, he's going to wind up with a face that feels squashed, he's going to wind up with headaches, he's going to wind up with his stomach feeling funny, he's going to feel dizzy from time to time, his eyes are very often going to hurt and so forth.

Now, have I got this datum across? It's a physiological datum. It has to do with processing and the field of the mind.

So therefore you could expect that you would get the greatest incidence of suicide or illness in that field of education most devoted to studying absent masses. Clever, huh? And therefore I can tell you, knowing that datum, exactly what the French educational system consists of. I don't even believe they would be permitted to have a desk in the room if they were studying desks. I think the teacher's first action would be to have all desks removed from the room and then he would teach them the theory of desks.

Now, one of the ways you get away with it, I talk to you, for instance, in these lectures. You are looking at somebody who does have a mind and you're looking at a body and it's very live, so you've got more mass actually, in a lecture, than you have in a bulletin. You'd probably much rather be lectured to, live, don't you see, than you would be to a bulletin. All right, your second best is you've got the mass of the tape and the sound and that probably isn't so bad, but it starts reducing on down to a silence and a nowhere-ness, and a – so forth, and about that time you'd start to feel bad. And then if you were studying somebody without ever having them there – have you ever read a bulletin, for instance, and suddenly recognized something about the pc you were auditing? You actually have an impulse to go find him or her. Well, to the degree that you don't do that, you get upset. You've got an applied mass now, but you haven't got the thing there that it directly and immediately applies to, so your tendency is to go find it.

All right, one must understand that this phenomenon exists, because there is another series of phenomena that exists which are physiological, which are based on the fact of too steep a gradient. That's another source of physical or physiological study reaction, because too steep a gradient. And this is a sort of a confusion or a reelingness, goes on this and it's probably – a distinct physiological reaction, distinct from the other. Now, I confess to you, I haven't bothered to make a table of which gives which, but I'm just telling you that there is a distinction which could be drawn between these two things.

And then there is the third one of the physiological reaction brought about through – an entirely different one now; an entirely different set of physiological reactions are predicted to exist in this field – a bypassed definition. And the bypassed definition gives you distinctly a blank feeling, a washed-out feeling, a not-there feeling and a sort of a nervous sort of an hysteria will follow in, in back of that. Those are some of the physiological-mental reactions that follow this definition.

In other words, I'm talking now about the fact that you'd know whether somebody was jamming you in the arm with a pin, or hitting you on the toe with a hammer. Well, these are two different physical reactions, two different physiological reactions, see? Well, I've just given you three sources of physiological reaction to aspects of study and they are three different areas of study and they are three different sets of symptoms. And I haven't bothered to bring it out in a table form, but – I haven't read it or studied it enough to bring it out in a table form, but I recognize the differences which exist.

There might be a fourth and fifth, you understand? I'm not giving you this as the total grouping. These are the three I know, and know exist, and know that are important.

You've got the one, where – this is the least upset ones of the thing but it produces the most distinctly recognizable actions, and you'll wonder in vain at what is producing this if you didn't know it, and that is, it's just studying something without its mass ever being around or its space ever being around or something. Let's say you're studying a sky and nobody ever lets you look at a sky. You've never got a sky to look at, don't you see? Something like that. You can study a mind because you know that the mind has an invisibility and contains certain amount of masses and that sort of thing but you understand that and you do have minds around and it's quite obvious that you have a mind in front of you when you're auditing the pc,

don't you see? But if you were studying this all off in some ivory tower in Austria or in Bellevue Hospital or someplace else where they don't have any minds, you would very soon find yourself experiencing these reactions, see? They'd be "zuuuu!" and so forth.

The manifestation of "blow" stems from the third one of the misunderstood definition, or the not comprehended definition, the undefined word and so forth. That's what produces "blow." A person doesn't necessarily blow on these other two. They're not pronouncedly blow phenomena. They're simply physiological phenomena.

Well, you could therefore make a child feel sick or well in the field of study. Now, that gives you a whole table of what you could do. Little Johnny is having an awful time in school with his arithmetic. Well, obviously, let's get him some apples and give each one of them a number and he's got a number of apples in front of him and there are no longer a theoretical number of apples. Let's give him the mass of what he is studying, see? See? We find out, suddenly, that he had a problem that involved apples and by golly, he never had any apples on his desk to count. You understand? You know, we'll trace it back to an absence of mass, see? Or we could supply the mass, which is – I'm trying to give you the positive remedy – we could supply mass, we could supply an object or a reasonable substitute and we'd find out that first one I gave you there would cure up.

The remedy for the second one is cutting back. Find out when he was not confused on the gradient: what new action he undertook to do. Now, that's a – that's a doingness level, that gradient. Or what action he understood well and let's find the missing point right in what he understood well. Just before he was all confused, what did he understand well? And then we find out that he didn't understand it well. See, it's really – it's really at the tail end of what he understood well, and after that he went over the gradient, see?

All right, but that is most recognizable and most applicable in the field of doingness. The individual is suddenly asked to learn handling his sensitivity control and he has been getting along just dandy watching the needle of the E-Meter swing to the left and right and now he's all confused about the sensitivity control. Well, there is something wrong with the E-Meter's needle swinging back and forth. Don't go over and try to explain the sensitivity control. Because he doesn't misunderstand the sensitivity control. You have hit too steep a gradient. It was too much of a jump, because he didn't understand what he was doing and he jumped to something next and that was too steep and it went too fast and he will assign all of his difficulty to this new thing. So that's true in this gradient, see? That's true of gradients.

Now differentiate, because gradients, here, sounds terribly like definitions. But remember that they are quite distinctly different. Gradients are more pronounced in the field of doingness, but they still hang off in the field of understandingness. But it is the action that we are interested in, in gradients, where we have a plotted course of forward motion. See, we've got a plotted course, he should go through this, he should go through that and then he's supposed to go through that. And we find out that he was terribly confused on the second one he went through. Well, we must assume that he never got out of the first one. That's the gradient approach. And that is one whole set of phenomena accompanies that and it looks awfully like this other one.

But this other one is so much more important than the gradient approach – which you only run into the intimacies of actually training somebody – this other one is so much more important, the last one, than gradients, that it's the woof and warp and the make-up of human relations, the mind, subjects. It establishes talent, it establishes aptitude, lack of aptitude, it's what the psychologists have been testing for years and it's all of this balderdash. And that's just the definitions of words: the misunderstood word. That's about all it goes back to: the misunderstood word. And that produces such a vast panorama of mental effects, that it itself is the prime factor involved with stupidity, the prime factor involved with many other things. If a person weren't this way, his talent might or might not be present, but his doingness would be present. See, he might not paint a great picture, but he'd be painting pictures.

So, his aptitude in being able to do it would have something to do with his sensitivity, have something to do with a little bit more, you see? You know? We're – we can't say that Joe would paint as well as Bill if both of them were unaberrated on the field of art, see? That's an unreasonable assumption. But we can say that the inability of Joe to paint compared to the ability of Joe to make the motions of painting, is dependent *exclusively and only* upon definitions. I'll go over that again; *exclusively, only upon definitions. There is some word in the world of art that the person who is inept didn't define or understand. And that was followed by an inability to act in the field of arts.*

That's *very* important, because it tells you what happens to doingness. And the restoration of doingness depends only upon the restoration of the misunderstood word; the misunderstood definition.

This is very fast processing, it's a very swift, wide, big result is obtainable in this. It has a technology which is a very simple technology. It enters in at the lower levels, because it has to. It'll probably be discussed at Level I, and it will be memorized and done at Level II. And it will be followed on up the line, but because it is low grade does not mean it is unimportant. It means it has to be at the entrance gates of Scientology, that's all it means. But it is a sweepingly fantastic discovery in the field of education. And don't neglect it.

You can trace back the subject he is dumb in or any allied subject he's got mixed up with it and you'll find out why the psychologist cannot understand Scientology. There is nothing wrong with Scientology, there was everything wrong with psychology. He never understood a word in psychology, so he doesn't ever move over into Scientology.

Got the idea?

Audience: Yes.

Well, that opens the gate to education, so although I've given it last along that line, that is the most important one.

Okay?

Audience: Yes.

Thank you.

THE PE COURSE

A lecture given on 1 September 1964

Glad to see you, too!

All right, then this is the what?

Audience: First of September.

One Sept. AD 14, Saint Hill Special Briefing Course, 1 September.

Well, the Research Department slipped, I don't see any lecture lying here on the desk in front of me to be read calmly. I don't know what to talk to you about today. You know everything there is to know and some of it true, some of it not so true. [laughter] I've been recently sorting out PE. And I'd better give you a bit of a talk about it and I won't say this whole lecture's about it, but I'll just give you a few thoughts in passing here.

And I found out some interesting data out of the field of study that particularly relates to PE. It naturally follows that if all of the students who come to a PE course are given incomprehensible words, they will then go away and that will be that. And I think that is really the sole and total loss of new people into PEs. That's just all there is to it. I mean, it's a simple little package that you can put a red frame around and hang it up on the wall in the PE Instructor's office or across from your own desk and you'd have it made.

You're going to think there are lots of reasons. But that is the reason why you start in on Monday with fifteen people and wind up on Friday with two people. You see? Or no people. It's just to the degree that you have not found or used or given them words they didn't understand. It's as simple as that. That we should learn this with all of our technology and numerous nomenclature in Scientology is quite fabulous but it just shows that I'm laying a foundation for being an honest man. Self-criticism is a virtue. And we have done this rather consistently and I now find out that it is a glaring and terrible error. Only it is not an error necessarily in our framework. It is an error in general in the whole field of study.

Now, what does this – what does this bring about here? Now, this brings about a datum that you would not expect to find in a lecture on a PE course because I'm not lecturing to PE students. It says what has been discovered here is the prior act to the overt. This gives you a brand-new piece of that very, very important thing called an overt-motivator sequence. The overt-withhold sequence. All of that data is suddenly illuminated.

Before there is an overt there is a noncomprehend. Anytime you find an overt you'll find a noncomprehend preceded it. It's preceded. So it's as elementary as that. So an overt sequence goes, in exactly this fashion: A noncomprehend and its commonest, most usual form is simply a misunderstood word – a noncomprehend that can usually be traced to a misunder-

stood word. So you're going to get into some sequence, that's something like this: a misunderstood word, a noncomprehend, a belief that it's okay to commit an overt, a commission of the overt, the withhold of the overt, an attack or a withdrawal. Now, this can be in magnitude or this can be slight. In other words, you – an overt sequence can go with exclamation points or it can go in light print, you understand? It can mount up to a big overt, it can mount to a little overt. But the final analysis of the thing is it amounts to a blow or an attack. It's as simple as that. It's very elementary.

So, we have a new illumination of the overt sequence. Now we know this: that when the auditor sits down and asks somebody for an overt act, and the pc gives him a critical thought, the auditor thinks he's got an overt act and so buys it and so never gets the overt. Do you follow that? That is a common auditor error.

All right, so let's trace it back from that error in a session and let's see where we wind up. The pc is asked for an overt act and gives a critical thought. He thought something critical. All right, the auditor that lets it sit there has not pulled the overt. Because that critical thought is a symptom of an overt having been committed. All right, now, let's back it up one and the auditor then says, "All right, fine. I heard you. You've thought so-and-so. Very good. Now, what overt have you committed?" The pc, you see, has not answered the auditing question. He's been asked for a committed overt. And he has given a critical thought. And believe me, that's not an overt.

So, we trace it back to that point of the overt and he dropped a flatiron on the person's foot. All right, we pull that. Now, that produces a sufficiently salient result that we as practical practitioners, in this particular field, would be rather satisfied. But interestingly enough, that just prior to dropping the flatiron on somebody's foot there's a noncomprehend, and just prior to the noncomprehend there's a misunderstood word. So you'll find that those four steps are present in any overt you find in any pc. Fascinating, isn't it?

Now, let's examine something else. Let's examine something else here. We've got a situation where a psychologist sits down in a Scientology course. He can't learn. Actually, I'm now giving you a datum, not a criticism. This is just data. This has happened over and over and over. They have the hardest time of anybody you ever had anything to do with. They come in and one poor girl who was a major in psychology – actually had her doctor's degree, sat in an Academy course, in the Comm Course, for eight weeks and managed to get up to TR 1 – eight weeks – TR 1. So it is not a criticism that I'm giving you here, but actually just the plain, bald data. This has happened too often.

Well, let's look this over. You say, well, Scientology is so far afield and adrift from the things that she studied – look how we can rationalize, see. Just like an auditor sitting there saying – saying this, that and the other thing, the auditor has given them the business on criticism. You see, "I've had a critical thought," and so on. Well, you get a big rationalization and the auditor says, of course, that's very reasonable, and then we do a figure-figure-figure on how it is so reasonable, and so forth. Well, we're – it's a disease known as reasonability.

We can pull it in this one, too: There was a real reason why that person sitting in that Academy course couldn't learn and you couldn't have gotten it on a – being reasonable, "Well, of course, of course," because no matter how reasonable you get you don't solve anything.

That's very important about – to know about being reasonable about it all. It really doesn't solve a thing. When you've got somebody who is totally civilized and totally this and total effete and totally gone and he's long wound up and so forth, why, his final stage is being reasonable about everything. He can't do anything about anything, but he can be reasonable.

And you fall into that trap, see. Guy's run over by a truck, see, because the careless driver and the bad licensing in the – in the traffic office and so forth, so he's run over by a truck and he lies under the truck wheels and is reasonable about why he's been run over by a truck, don't you see? That's – it's fascinating, but this is a sort of a disease that a civilized person gets into. They're reasonable about everything.

Now, because we can be so darn reasonable and say this psychology student of course is having trouble in Scientology because it's so different than the terminology and so forth they used in psychology, that we wouldn't look for the real answer. And the real answer is in the field of the associated subject. This is all, incidentally, germane to PE but a lot of other things it's germane to, too. Ah, there have been subjects which have been associated, which are associatable with Scientology. Oh, yes. Healing, education, religion, psychology, these things always – all have an associative point, you see. It's – they're related. You're dealing with cousins. And it didn't do any good being reasonable about this psychologist because it wouldn't have trained him. We forget the end view – person who can't make his goals anymore, he can be reasonable.

All right, well, if you really find out what the score is with regard to this thing, why, he no longer has to be reasonable, he can do something about it. Psychology is an associated subject to Scientology and you must assume that when that person sat down in the class and couldn't understand Scientology that they never understood psychology. And when you're trying to cure this person up and teach him Scientology you're wasting your time, because the misunderstood word is in psychology.

We don't care if they went through to the end product of a degree and so forth in psychology. This didn't guarantee anything because modern education does not require that one does anything or accomplish anything. One simply is reasonable about the subject matter and can regurgitate it properly on an examination paper and one immediately gets his degree. In other words, no practice or action is ever demanded. The engineer does not have to build a bridge before he's labeled "bridge builder," see? That's that hole in education. So they would never notice this.

The person could say the right words and give the right answers somehow or another and so he got labeled and so forth. But this didn't mean that he understood the subject.

All right, let's examine this field of psychology. What is there to misunderstand in the field of psychology? Now, we're tracing this fellow down so he can understand himself some Scientology, see, and we'd have to go about it in a processing session in this fashion. And it'd have to be processing, I make that point. You could never do this in training, because this is auditing.

You can tell the fellow to do some certain things, but realize you're – tell him to go back and look up the words in psychology which he didn't understand and look them up and find out what those are, it'll brighten him up. Oh, yes, but that would be assigning him self –

auditing, which is perfectly okay but remember, you're assigning him auditing. The second you depart from the immediate field on the clay table in training of the exact nomenclature the student is being taught, you are into processing. Because you have departed from this.

When you get somebody to define the word memory in the Academy, you is doin' wrong! Because that is not a Scientology technical word. You understand? The way you do clay table training is you take this word "as-is" because it's in an Axiom. You take this word "Scientology" and you take this word "engram," you take this word "facsimile," you understand? And you don't take such words as mind because that's a general term, not a Scientology particular term. So in training somebody on a clay table in Scientology you would only take up the particular terms of Scientology. It's just Scientology. And clay table training is entirely different than Clay Table Processing. Clay Table Processing is done, "Yes, yes, yes, of course, all right. Represent the object." Session, see? Clay table training is, "Make up the word 'Scientology' in clay." Maa, maa, maa, maa, so on and so on, makes a little blob and throws it down in the middle of the table and writes "Scientology" on the top of it. This is not an auditing session, this is a training session. He hasn't got an auditor, he's got a coach. And what does the coach say? The coach says, "Flunk. Flunk."

"Well, I don't see why you're flunking me and so forth. I understand a glob of clay is Scientology and *rrrrrr*."

"Well, nevertheless I'm flunking you." [laughter]

"All right. Why are you flunking me?"

"Look, I don't understand how that represents Scientology. Now, let's go at it again."

The guy – so on, so on, so on, so on, so on, so on, he finally makes something – that's just a test of whether or not the coach understands it. Coach finally understands it, why, he figures out the guy probably understands it, so he says, "All right, that's fine. Good." That's not an auditing session – training is mainly evaluation. In training you tell the guy what's wrong with him, in training you tell him what the definition is – not in auditing. Auditing is a different approach. We unfortunately are in two fields simultaneously, see, and we're asking the same guy that trains to also audit occasionally. Well, he's got to learn to shift his gears. An auditor never sits there and when the pc has got his representation of so-and-so and so-and-so the auditor never says "Flunk." The auditor says, "Fine, fine. I don't quite understand that. Could you show me a little more, tell me a little more about it?" And of course, the thing shifts around, the guy realizes he hasn't done it. It's a different guiding principle entirely.

All right, so teaching this psychologist what he missed in psychology, by definition of clay table work, is auditing, because you've immediately departed the field of Scientology, you got that? You're gone. So you're into an auditing session, you're on his backtrack, see, you're way over the hills and far away. So if you haven't got an auditing session going to handle this you're just going to lose him.

All right, let's see what there is one is not capable of defining easily in psychology. And we'd audit this on the person. We could assign it to him as a self-auditing session but – and you would in PE. You just say, well, this guy's natter-natter-natter all during the first day, you know *nyah, nyah, nyah, nyah*. And you're teaching him and you're teaching him some

fabulous thing like the definition of Scientology, and he just doesn't understand it and so on, *nyah, nyah*. You've seen them in PE.

The right gear for the Instructor is, "Sir, what – what – what similar field have you studied to Scientology?"

"Oh, uh – well, uh – I had three years in psychology."

"Very good. Well, look, could – could we realize something here? That actually, it's – you're not having any difficulty with Scientology, you're having difficulty with psychology. Would you realize that please?" It's a PE *course*. Now, a course can assign auditing. But it doesn't audit. "All right, you've been in psychology. Very good. All right, now, could we request, could we please request that you look up some of the words in psychology which you did not understand and write them down on a sheet of paper and go down to the local library and look the things up and see if you can't get that untangled."

And you'll find out that handles it just like bang. You can be very polite about it. "Now, for the minute can we lay that aside," you've already told him it was psychology he was upset about. "Can we lay that aside now and get on with Scientology, which is really a different subject?" And you're not going to hear another word out of that boy. You've assigned him self-auditing, see, which is, "Make a list of words you didn't understand and go and look them up." See, that's a self-audit. But you can assign him that. And you'll find out that forcefully shuts him up. And you no longer have to contend in a PE with the natterer. That ends him. This you do.

Now, when I say a natterer I mean a person who's just consistently uncomfortable, who seems to be trying to – you can tell him, they say, "Well, what does this have to do with theosophy?" Well, man, ask yourself what – what good is it to know this point? This point has no validity, it tells you that he's stuck in theosophy, he hasn't understood telekinesis or something, see. He's flying around on cloud ten. And I'd just take this boy who is busy nattering and "*wloo-wlff-wlaa* I can't..." and I that's... I'd just assign him that self-audit, see, like that, and the steps are very precise; they're not cloudy – is "What similar field to Scientology have you been studying in the past?"

And he says, "Well, I was in theosophy."

"All right, would you please realize that you're not really having any trouble understanding Scientology, obviously, because I haven't taught you any. You must be having a great deal of trouble with theosophy and would you make a list of the words in theosophy which you did not understand and between now and the next time you come to class go down to the local library and look them up and get their definitions straight. Would you do that for me please? Thank you very much. Are there any more questions?"

That's a precise action, see. That runs off, *brrrrrr* – phonograph recordwise. And you'll find out that just handles that right now.

All right now, let's differentiate between that bird, and the fellow who says, "Scien... Scien... Scientology?" Different time period, recognize it as such, this guy is dealing with a term right here in the course which you are teaching. He's dealing with that term right now and he's grappling with it, and he's trying to understand it and the answer to that again is a

one – two – three – four – just like this. You say, "Now, what word have I used, sir, on this course, that you haven't understood?" And he sits there and he thinks.

"Huh. Oh yeah – yeah, permissive. Yeah, what's *permissive*?"

You say, "All right, it's an English word, it means without force, without duress, let him do as he pleases."

"Oh, is that what it means?"

"All right, very good. All right, now let's get back to *Scientology* here." And he'll find out, "*Scientology*, yeah, well, that's *scio*, yeah, I got that." You got it? See, that's a different drill. All you have to be able to differentiate is the difference between the bird who is saying *nyah, nyah, nyah, nyah, nyah* because he hasn't had time to gather this against Scientology so it must be against some other target. See, and the bird who is – who is trying to – trying to dig it. The bird who's trying to – trying to – trying to dig it up one way or the other.

Got it? So there's two different reactions. Now, actually there's a third reaction, there's a third reaction that's very important – is the "nodder." [laughter] Hasn't got a clue! And is just going on, you know, "Yes, yes, yes." And the Instructor in a PE *always* overlooks this person. Because this person causes no trouble, this person is the perfect student. Could probably put it all down on a piece of paper again too or something but really hasn't a clue.

Now, we get over this in PE by asking for written illustrations of the points made. And this is the backflow which we should get. So they keep a sheet of paper, and during the term of the instruction there, periodically, every time you've made a big point, something like this, then they have to sit there for a very few minutes – don't make it too long – and scribble down an illustration of that point taken from existence, from real life. And this lets them participate and backflow. And at the end of that period of training, that is to say the evening instruction, at the end of the lecture and so forth, you get that back. You collect those papers and you'll be able to spot the nodder. Because they could tell you almost verbatim sometimes what you said, but to apply it or associate it to the real universe is quite beyond them, and you don't have to look at those papers very thoroughly. You just look them over for the reality of an example. Look at about the third example you have asked for. If it bears any resemblance whatsoever they're doing fine. The nodder will give you one that bears no resemblance; particularly that deep into the hours of lecture. It will bear no resemblance.

You've given them a big point here, you see. You've said that "A thetan is taken from the Greek word *theta* which means thought. And the Greek word *theta* – out of the Greek letter *theta* stood for the Greeks for this thing *thought*. Now, give me an example from your experience of the word *thought*."

Well, "worrying" is good enough, see, so he writes down "worrying" or something like that. Well, they've got the idea, you see. The nodder will say "being kind," or will say something else that's... How, how...? All the Instructor would have to do is, "How the devil does that exemplify it?" And then having gotten that clue out of it you examine two or three others, and you've got this person cold. You'll find out that it's just a total unreality and they have not connected with something there somewhere; they're lost.

So you write on the paper, "Give me a list of the words you have not understood since the course began." And you take these, when you get these words back and so forth, you use that as your instructional or seminar type thing. It's the words they haven't understood. You simply redefine them, you simply define them again – you take it up. In other words, you just go in very heavy on the subject of words. You get the cycle here now?

The person – all the students are asked to write down examples, and at the end of each period of training – such as an evening – you collect all those papers with the student's name and so forth on it, you see. And then the Instructor, all the Instructor has to do with these things is glance them over rather rapidly to see whether or not those examples are applicable and have anything to do with it, and if he finds anybody whose examples are just for the birds, then when he hands the papers back, why, he gives a special assignment to this person to write down all the words in the course which this person has not understood. That's just – that's your drill, see, that's the drill – *zzzzzzt*.

Now, when you get that list back, you use such lists as that. You say, when do you do this? Well, you can actually skip a night or two with it, it doesn't matter, because this person's going to come back because they're waiting to hear about the rest of the assignment, see. And you take these words up. You'll find out that probably somebody else had a hazy idea of them, too. And this means that a PE course has one of these cracking, great, big, unabridged, two-ton dictionaries. Don't teach a PE course out of the Bible, teach it out of the dictionary. [laughter]

And you'll find out that that'll be very successful; and you won't lose people. All you have to be is alert to this one point. It goes back to the first definition I gave you, and these are just the ramifications of what you do when you run into it, see. Be sure that every student understands every word he's given. And your very, very backward student has failed to understand a similar subject. The natterer, the guy who's going to give you trouble, and the person who's just having immediate trouble right here, right now, he's hung up on not the word he thinks he's hung up on. He's hung up on a word that happened just ahead of that word. And you've got to point this up to him. And he's got to give you what this is. You understand?

It – he's not necessarily – you don't exp... you can get into just endless upset by continuing to explain the word the student is asking about. Go ahead and explain it, but don't get to running on a treadmill on it because that isn't the word the student misunderstands. So you and the student have gotten into a gay minuet that had nothing to do with the ball. Because that student is hung up on this word because the student had an earlier word he didn't understand and that's why he can't get this word. And he isn't mentioning the earlier word because he hasn't noticed he didn't understand it. So you've got to point this point up. Do you see how this is taught, then? I notice some of you look a little blank. It's actually pretty easy. You've just got to be sure that you don't then ever get involved in one of these floor discussions with the PE course.

The natterer is going to cut the whole class to ribbons and distract all this attention. The person who didn't understand this particular term that you're using, or principle, he probably goes over to an understanding, he didn't understand this concept. No, it is not a concept he didn't understand, it was a word. And he's going to talk and the Instructor is going to

ruin his vocal chords trying to explain this one concept or something to the student and the student doesn't understand it more and more and it gets more and more...

Well, it *will* get more and more involved because that isn't what the student misunderstood. It's something that happened just before that, that the student misunderstood. There's how you handle these various aspects and don't forget the nodder.

All right. Now, you get a PE course rolling along, you just keep up this cycle, and as long as you're just teaching them very straight, highly defined Scientology, you're all right, you're all set. And you can just keep it rolling.

Now, I will make this comment about a PE course. What would you think of somebody who told you to come to a course so that you could understand all about the automobile and of course you didn't know anything about an automobile, you'd really never seen one but you'd heard dimly about automobiles and you thought this was kind of an interesting subject. Something that ran along the ground at tremendous speeds. And you'd like to know more about this thing, and see if – this fellow said he was going to teach you a course and you were going to come in there and he was going to tell you all about this automobile. And so you happily went over to this course.

And then he spent the next five nights telling you why you should know about this automobile. How do you like that? How good it was to know about automobiles or any other ramification. The direct forte is, of course, to know about an automobile. So in a PE you teach them about Scientology, not how good Scientology is or how bad Scientology is or *arrrghorso* whether Scientology's big or small or anything else. You teach him just about Scientology, see. And you're all set. Don't get into these other involved arguments.

Look at this fellow who's going to teach you about the automobile and he gave you everything else. No, no. But look at how happy you would be with a course that was going to teach you all about the automobile, you didn't know anything about an automobile, you thought that was a good thing. So you go in, the Instructor says, "Those are the front wheels, *front wheels*, they go around – wheels, see. And they go around and they got tires on them. And that travels over the ground and that cushions the shock and these are shock absorbers under here to keep the *wheels* from bouncing up the passenger too much and those are the back *wheels* and that is the bonnet. And that is the *hood*, see, and we're all set, see. And there's the engine, and this is the *steering wheel*."

You'd be perfectly happy about it. You wouldn't even demand that he show you where the starter button was. You – he could keep you all involved with this. It's just with this – this is the automobile, this is how it runs. The engine goes around this way and it turns the wheels around that way and there's gears in there and here are the way the gears go and so forth. And you'd be very happy with that course, man. And he'd say, "That guy sure teaches you about automobiles."

"Now," he says, "Now, if you come back next week, I'll show you how to drive one." Brother, you'd be there! And when you arrive for the course about how to drive one he says, "This is the starter button. This is the ignition key. There's the brakes. Here's the way you work the brakes. Now, get in there and work the brakes. Good. Turn on the ignition key on and off. Good. Work the brakes. Good. Turn the steering wheel. Good. Work the brakes."

You'd leave after some kind of – the first night or two of that kind of training, boy, you'd be pleased as punch. You'd say, "Boy, right down there – know their business down there on the subject of automobiles. Next week, next week, I'm going to get a ride in one!" Don't you see, right direct on the subject, right on the groove, see.

Now, that has a tremendous liability to teach a course like that because, look, you're handing them nomenclature all the time, all the time, all the time. And it's terrible not to have nomenclature. Instead of cursing your Scientology nomenclature because of its numerousness, just thank God that you don't have to stand there tongue-tied. Now, how – how – how are you going to teach a fellow about automobiles if there is no word *front wheel*? Well, if you had no nomenclature for an automobile and you're going to teach somebody about automobiles, you couldn't teach them any nomenclature and they could never communicate on the subject of automobiles. There's got to be nomenclature. But they've got to start out learning the language of an automobile. And although they were being taught all about an automobile they're actually in that first jump-off being taught the language of the automobile.

Now, you – if you were teaching automobiles that way to a bunch of people that had never seen them or had much to do with them and so forth, if you could figure yourself down in the middle of the Congo or something like that and you were going to run this course on automobiles and so on, actually, you've just about got it taped because there you sit with an advanced technology that this civilization knows not what of or any part of it. And it's falling into problems consistently.

And you're just all the same – in the middle of the Congo. And you're going to tell people, "It's very nice to know about the mind." Hell, they know that. They know all about that. What about the mind? Well, it has parts; it runs on various rules. First place, you're not specializing in the mind, you're teaching them about the universe and you're teaching them about a being in the universe. And there's a body and there's walls and there's the planet and there's the sky and here's a being who lives in the midst of all this and we call him a thetan. See?

And we just tape it, see, and never let him miss a definition, and you've got a PE course there that, well... I taught a PE course like this one time and I taught it sufficiently well that eighteen psychiatrists attended the first lecture, which was repetitive. In other words, I always gave the first lecture again every night and then gave an advanced lecture in another room. There weren't nobody being charged in the other room, but there were new people coming along all the time so I'd keep giving the first lecture. I always gave the first lecture. I'm not advising you to do this, it was just a freak of the situation.

And then I'd give the people who had heard the first lecture the remaining lectures. And we had quite a few people there. But amongst them there were eighteen psychiatrists – nineteen. And they came to nothing but the first lecture. And they were some of the leading names in psychiatry, and they turned up just as regular as a clock every night, man, to hear that first lecture all over again. And they sat there, nodding, nodding; trying to figure it out.

And one of them finally got into action on the subject, he took a dangerous schizophrenic and put him back into childhood using Dianetic techniques, and then instantly realized that we really had something in Dianetics, so with the person returned on the track, psy-

choanalyzed him. Told him, "Now you know why you hate your father – he didn't change your diaper." Of course, I wouldn't say they had absorbed very much, but – but the funny part of it was, is it's simplicity that holds people. It's terrible simplicity.

People do not like a totally new subject. They like the familiarity of the old and that isn't just because we're in England talking about English jokes. English jokes are partially nostalgia. It's a good – was a – been a good joke for a long time, he's glad to hear it again, see? But you get the idea.

Yeah, I was looking at an old pal of ours, Frankie Howerd, on the TV the other night – he told the same jokes. I actually was very happy to sit there watching him tell the same jokes, you know. He's the bird that has the aged pianist who is hard of hearing and he makes cracks to the audience about his aged pianist. And she once in a while will comment to him that it's chilly in there and he will turn around and say, "Yes, chilly. Poor old so-and-so." All a very 1.1 type of act, see. Well, he's been doing that just for years and years and years and years and he's a headliner. And I don't think he's had a new joke or a new line in all those times. Trouble with an American comedian, he knocks himself out all the time. That's why he passes into oblivion, too – he never develops a nostalgia.

Now, here's an interesting point then. As long as you're teaching somebody absolu... something absolutely new, they're going to feel like they're in totally strange territory all the time, all the time and therefore, it's very, very strange to them. My apologies for the crack about English humor. I can always make the English laugh, I have no trouble with English humor. I've learned to wait. [laughter, laughs]

Now, the public goes for and likes the old and what they like to see occasionally is just a little bit of improvement. They like to see a little bit of improvement on this old subject. They don't like new subjects. So you'd better represent Scientology as what it is, which is the only conservative study in the field of the mind. Truth of the matter is, when you look it over very carefully, a lot of things happened.

Before I get too far ahead of my story, let me – let me give you what happens to these students who *don't* – let me – let me get that in because I might forget to tell you – the student that you don't handle as I've just described to you in PE will get the misunderstood – look at the cycle they run – see, the misunderstood word, the misunderstood concept, then they go into either the critical thought or the overt. And they will commit an overt against Scientology. And it gets all right to commit an overt against Scientology because that's the cycle. They have to justify not having understood. And that is what this is all about. It must be strange and they have to justify not having understood it and so they commit an overt against it. Shows that it's no good, do you see?

So it's – they'll rig it that way, in spite of anything you can do, and then they go out and give you bad public presence. The second they don't understand that first word – the first word they don't understand is liable to start this cycle, so that is what you prevent. If you just prevent that all up on the line and they all go away feeling fine and everything's happy and so forth, and furthermore you're doing a more honest job and you're showing them exactly what they came in to find out – that you know the answer so you can do it.

And let's see why psychology got off to a bad start. And this hooks in with what I was just giving you now. Scientology is the conservative study. It is the traditional study. It follows the traditional patterns of philosophy, religion and the mind. It may be one of the reasons why your own interest in it is deep-seated, because you recognize in it the familiarities of ancient Greece. You recognize in it the philosophy of Rome, the philosophies of the Middle Ages. The work of Saint Thomas Aquinas – all of this material as you roll on forward – faculty psychology. You'd feel very comfortable in amongst the big religious universities of 1500, 1550, with the faculty psychologist – that's the psychology of the faculties, of the senses and perceptions. Faculty used in the line of sense and perception.

You'd feel very comfortable with these boys. You'd be talking about the same things, only you'd have answers to what they didn't have answers for and boy, they would fall around your neck like mad, because you'd be talking the familiar to them. They're talking about such things as attention. They're talking about such things as seeing. They're talking about such things as hearing. The faculties, you see. And they're talking about these things and how they relate to things – and sort of foggily. And of course, you could say to them, "Why gentlemen, you're talking about communication. You're talking about communication between the individual and the physical universe around him or to other individuals through the medium of the physical universe. And therefore sight and sound and so forth are means of communication with the physical universe or with other people through the physical universe."

And they would say, "Holy smothering Godfrey, Gadzooks! By Jove, the chap's right! You know, that's true. Never realized that one person was *ooowa* and that's what perception is and that's what sound is and so forth; it's a method of communication." And you would have been right there, brother!

But you can't talk to a psychologist about this. Do you know why you can't? Oh, the answer is absolutely fascinating. There isn't anybody there. There isn't anybody there. The whole universe and the people in it are sort of a delusion of machinery. In the absence of sensation and association there is no perception. That's a stable datum in the field of psychology, of circa 1960, 64. I know I've given you that and you've glanced over the top of it and you've said, "Well," and so on, "they're psychologists, so I don't have to understand it." No, I invite you to understand this. Perception depends completely upon sensation and association. And after you've looked that over for a little while you begin to feel sort of creepy as though somebody had walked over your grave. Because that tells you a volume.

It says a machine in the absence of somebody tickling its gears, and in absence of certain gears meshing with certain gears is incapable of noticing anything is happening. You see, perception depends upon sensation and association and that is the psychologist's definition of perception.

Now, of course, you look at that as a Scientologist and you say, "What the devil is going on here? You mean I've got to have an association between a *wfff* and *zfff* before I can see a *blap*?" No, that is not true. That is not true. But a machine – it would be true. A machine would have to have little cogwheels that *wizzergoo'd* with the cogwheels in order to tell you that the *wizzergoo* was on the other side of the *wazzergoo* and therefore it should take some notice.

Knowledge is totally evolved out of the results of perception, but is individually evolved by a sort of a funny computer, that then tells a person what to perceive. By the time you've drawn this up on a drawing board you've got a machine and there's nobody there. You get what I'm talking about, don't you? I know – I – if you don't grasp it, don't blame yourself [laughter] because I frankly, the other night, spent over an hour looking at the words out of a text written by one of the leading God-help-us psychologist who – of the United States – on his definition of perception. And it was that sensation with association brings about perception. And that was what perception was. And I looked at this and I looked at it and I looked at it. And I finally understood the frame of reference on which he was viewing this thing.

And he's viewing it on the basis, you have to understand that a psychologist considers that everybody is a brain, a piece of meat, see, which vanishes with death and so forth. You have to understand all of these peculiar things. And then you understand what the devil this means. It means that once you've tickled the gears of the machine in some fashion or other and showed them which gears was being tickled, why, then it perceives what's tickling, see. It looks in that direction, but wouldn't otherwise.

Of course, this absolutely violates your own concept of yourself. You say, "Before I can look at a field of hay I'd have to receive – have received a sensation from the field of hay and associated it with my childhood." Well, the reason you don't understand it easily is because you wouldn't think of yourself as a machine. And naturally a machine – think of rolling a robot out there now. Now, you roll a robot out there and of course... field of hay, it'd have to have some kind of an associative memory situation, see. It's got a sensation of heat waves and some kind of a sensation of pattern, and that brings it up and so forth – and then the memory sorts out as the eons race around, and it finally associates this with fields and then with hay and then it says, "Ah, a field of hay."

And this to the psychologist is a man. Well, why does he think this way? Because he's a wild-eyed radical. He is the revolutionary; he's the Johnny-come-lately. Fifteen hundred and fifty, you would have been perfectly understood by the faculty psychologist in any great university of the world. He would have made much out of you, man. He would have had you out for tea and invited you to the – to the local hop and made much out of the situation.

You walk into a modern classroom of today and you say "perception is engaged upon by the being himself as a means of communication with the universe around him and other beings," they'd throw you out on your head. What do you mean? You have introduced volition. You've introduced volitional and nonvolitional acts, to use a couple of fancy words. Acts that are willed, acts that are not willed. You have set up an individual as seeing what he wants to see and not seeing what he doesn't want to see. You have set up the whole mechanism of power of choice. And you have set up the dignity of the individual. And that they want nothing to do with, because they, of course, in not understanding man have gone the road of the overt. And that's why psychiatry cuts out brains. They've got to make nothing out of man because they haven't understood him. And that is the whole genus of it, those poor luckless boobs.

And what word does it go back to? It goes back to the word *psychology*. I'm now quoting man, I'm quoting the leading psychologist textbook writers, and they define psychology

as: "*Psyche* once meant the soul; – *ology* means study. We do not know what the *psych* or *psyche* is, we have no idea, we don't even know if it exists." And that is the definition of psychology.

You mean, we're going to take off from anyplace then and go anywhere? No, brother, we're going to go straight into an overt against the mind and that is where those birds went. So they've got to sell man short. And there isn't a one of those birds who isn't in the frame of mind of a con man. They are the frauds. They know it's a swindle. They're ARC broke with their own subject. They know their subject doesn't work.

"Us con men together, if we band together right and hold ourselves up high enough and sneer enough at anything else, we'll eventually be able to triumph over these poor boobs." Those are hard words, but I'm afraid that is the dominating idea. If you've talked to these birds as much as I have – I had an awful hard time understanding where comes this idea of this contempt? Where's this terrible contempt I see? What's the genus of this thing. What are these odd and peculiar ideas about man, the degrading aspect of them and so forth? This worried me frankly because they're dominating thought in the universities and schools of the world today. They're teaching everybody man's no good. He's just a machine.

Well, naturally, your leaders of the world have got to have some kind of a philosophy of this character, they think. Look how dangerous this philosophy is, however. If you just ordered thirty million men killed, you want a philosophy that teaches you men are no good. Hm-mmm! You've got to justify that overt, man. If you're busy firing people and ruining people all over the place, why, naturally you've got to have some kind of a demon that stands alongside of you and says, "It's perfectly all right, they're no good. Perfectly all right, they're no good." And they found their perfect demon in psychology and psychiatry. Man is no good. He's ninety-seven percent – cents' worth of chemicals. There is no dignity of the individual. The man has no power of choice. He has none of these things. He's not capable of personal volition; he's just a machine.

You push a button with your modern advertising, he whirrs-clicks, reaches into his pocket and pulls out the sixpence. And it's perfectly all right to pull out the sixpence completely illegally and fraudulently because actually, he's no good. And that's where you have to have a philosophy, you have to have a philosophy that man is no good in order to go on committing overts.

So it isn't that man has degraded. It's that man's mental subjects first didn't bother to understand anything about man and so then began to commit overts. And then employment was found for these blokes, by fellows who had to have their overts justified. And naturally, the guys who had to have their overts justified – the Hitlers, the other guys, the Stalins, the birds that have really backed up this particular field of psychology – naturally, these birds are going to put those fellows in the driver's seat. And so there's where the degradation of man comes from. Actually man is not more degraded than he was before. He's only degraded the mental sciences because he has departed from the traditional which had to do with the dignity of man. And you're in the tradition.

It sounds wild. I've studied this very carefully. It's not some new con pitch I'm giving you. Our teachings and facts would have been revelatory, straight through from the ancient

medicine man through the wise man of Persia, through the philosophers of Greece, in the days of the first universities and so forth – that you called such around 1200 A.D., through all the great periods of the Renaissance and so forth. The ideas which we are moving along with and have – make no mistake about it – enormously improved and clarified are nevertheless those ideas. They had to do with attention, they had to do with perception, they had to do with power of choice. They had to do with the dignity of man, they had to do with the motivation of behavior. All of these things. And not on a vicious basis of how rotten and wicked everybody is and how they all ought to be shot down in their tracks. But just what's this all about.

And we are to a marked degree preserving the dignity of man. And we're carrying forward on a basic tradition which has come up through the ages. But in 1879 in Bavaria, Leipzig University, a fellow by the name of Wundt must have fallen asleep in too damn many classes. And he missed the boat. And there are too many words he didn't dig. So he had to figure out that men were animals and that's *exactly* what he figured out. Men were animals. And he advanced this as a philosophy as recently as 1879. Completely departing, madly departing, from every traditional level of study there was in this field.

And this was carried forward with great enthusiasm by the early Russian student in this field, and which culminated in Pavlov. Criticism of the Russian, circa 400 A.D., is that they made very good fighters because they became quite merciless and were – associated man with animals. And to them everything was animalistic. And therefore they could drive forward in an animalistic fashion. They thought of man as being animals. They thought of animals as being animals. They lived amongst animals and so, therefore, their cavalry was pretty good and pretty vicious and so forth. These are commentaries on Russians, moving on forward. Same commentaries we hear occurring along about 1000. Same commentaries around Timur Lenk, around 1300. Same commentaries around Pavlov. The dog hasn't changed, his ears still flop. Yeah, that pattern hadn't changed at all.

So Pavlov and psychiatry rushed on the scene. Man is an animal. Man is no lousy good. We should kill everybody. What you do with a city is level it until a pony will not even stumble being ridden at a full gallop across its ruins. What's the difference? There's no difference. It's out of the steppes, straight on forward until now. They've always had the same idea that you could condition an animal. That if you beat a horse enough he would then do what he was supposed to do. Animal training. Pavlov. No difference. He just carried forward the Russian tradition for animal training.

Only this, my God, somebody accepts as a study of the human mind! Ha! Somebody must be in an awful need of justification for their overts. You see, it was always there to be bought. You always had the idea there that men were beasts and so forth. The idea was always there to be purchased by anybody who wanted to purchase it, but it's interesting that it didn't get purchased until after 1879. Those are all Johnny-come-lately. You see the point I'm trying to make here?

Well now, I don't think – I don't think the – Germans are okay, I use their Rolleis continuously with great success and I wish they'd stay just building cameras and things like that. But the German has no enviable reputation for humanitarianism. I will say he has contributed music to the world, and that's dandy. But if he'd just stayed with music and cameras we'd all

be a lot better off. Every once in a while he gets careless with guns, and for some reason or other he's got to go out and kill everybody; for reasons best known to him. And he authored modern psychology. Modern psychiatry was authored by the Russian and modern psychology was authored by the "Sherman." And by nobody else, don't let anybody kid you. That's exactly where they came from.

You should read a Russian textbook on the subject of psychiatry. And every technique they know of in psychiatry is in a Russian textbook. Today, I will tell you, that when the czar went on the skids and lost his head, it was very interesting that the revolution began to frown on psychiatry. It was only Stalin and his fascist impulses and so forth which kept it going any length of time at all. And we have the completely weird subject of the Russian now having lived through all of these cycles of what we call modern psychiatry and now having nothing to do with it.

So here's all the Western psychiatrists that come in, you know, with their hands dripping with blood, to this conference up in London the other day and the Russians standing around and saying, "But we don't operate on people's prefrontal lobes anymore. But we don't give them electric shocks anymore. But we don't use these treatments anymore, because we found out they were ineffective. We don't do this anymore. We're good boys now," and so forth. And the Western psychiatrist saying, "What's the matter with you jerks?" you know, "What's the matter with you guys?"

Well, what's the matter with these birds? These birds are now in a reform cycle. Too many overts. But that's where it came from. Pavlovian psychiatric responses. There's more to psychiatry than just Pavlov, of course, but not much. And that's a radical school. Those are both radical schools. You heard me say these things before, but I've never put it to you from the point of view that these are radical schools. Relatively uncivilized, rather degraded and very new. And they have not been productive of results. And my point of view is I think we should return to more traditional methods. I think these fellows have had their chance – they've had their revolution. And they didn't get anyplace with it. And I don't think that they should be permitted to stand in the road of traditional study in the field of philosophy or religion or psychology of the field of the mind. And I don't even think they ought to be left with the word "psychology" because they can't define it.

I think in actual fact that psychology is a portion of Scientology. And I see no reason to give psychology a modernistic, razzle-dazzle, mod-rocker spelling, like p-s-y-c-o-l-o-g-y, I should think it should be spelled properly, which is p-s-y-c-h-e-o-l-o-g-y. Psycheology. Put the "e" back in it. Of course, *psyche* means spirit. And is the Greek symbol for spirit. I don't know why we have a sudden *psych*, I don't know what this thing called *psych* that suddenly arose, that occurs in both psychiatry and psychology, because it doesn't mean anything and it never has meant anything. And they don't think it means anything, so forget it, skip it. Of course, we should return it to a more proper state. In other words, the familiar. And the old is really what we're studying.

Somebody comes in to learn about the mind, you say, "Very good. We're glad that you came in to learn about the mind. The whole field of the mind embraces, of course, the other fields of knowledge and the field of philosophy and that sort of thing. The field of philosophy,

religion and so forth, and a study of the mind is actually not too disassociated from a study of a human spirit. And we're glad you've come over here to study this because we're happy that people take interest in more traditional and conservative ways and we're happy to have people studying the more standard psychology. And you came here to learn about psychology, well, you came to the right place. Now, this is a body and this is the physical universe and you are an individual..." You got the idea? "And the eyes see, the ears hear..." See, you teach them about the automobile.

"Now, why do the eyes see? Well, they don't see because somebody is a machine, they see because there's something there to be perceived. Now, the eyes can actually see by somebody putting something there to be perceived as well as something being there to be perceived.

"For instance, you simply – we don't now see this black crayon and we put it there to be perceived. Now, you think of a cat. Very good. Now, some of you got a picture of a cat. Well, you saw the cat, didn't you? Well, we won't worry about whether or not you saw that with the eyes or not because it really – it isn't absolutely necessary to have eyes to see."

In other words, you see what kind of a PE you could conduct that would look a little bit different, wouldn't it? It wouldn't be "Here's this great brand-new subject and it's all different and so forth and these conservative fellows who are there in the university and so forth, those are the fellows who are actually the authorities in the field and so on. And we're new, we're brand-new and we're doing something very, very strange and we're doing something very, very peculiar and ... These fellows object to us and they're just a bunch of bums really," see? That's – this is a different course. This is a different course.

It says, "Well, we're very glad you have come to the people who know about these things. And we're very glad that you have resumed a traditional study of this particular thing and are having done with radical approaches which have not resulted in any good effects. And you want to study the field of Scientology, of course, that's composed of philosophy, and religion, psychology, what makes men do what they do, why men act the way they act, what life is all about. And you've come to the right place. Well, of course, you shouldn't mind being taught old answers along with new answers, and there's a great deal in Scientology that is new but the breakthrough is all in the traditional field, it's not a radical breakthrough."

Where does that leave psychology? Where does that leave "Old Man Wissergoo" with the eighteen letters after his name as the head of the department of "psyrology" of Chicago University or Illinois University. What's that – where's that leave him? It leaves him in a gibbering fit, that's where it leaves him. "Well, Hubbard's done it again! *This does about enough!* Now, we're a part of Scientology! You know what that Hubbard's done? He said we're a part of Scientology. Isn't that terrible?" And the public at large says, "Well, really, are they?" Because they're all reasonable.

And this is the way the wheel is going to turn. And the wheel has already begun its slow inexorable spin. They are about to become a more radical element of Scientology. And we're about to become the conservatives and they're about to become the revolutionaries. They're the Johnny-come-latelys, the cowboys in the black hat. And we're the old homesteaders, been there a long time. And they'll give us all the propaganda we want to drive this point

home, because it will outrage them to such a degree that every time they pick it up or hear it they will go into a complete scream. They will help us. In every university they will help us. They'll explain to all of their classes, "Hubbard is crazy because he says actually Scientology is a very broad subject that psychology is just a part of, ha-ha-ha!" None of the students are laughing. [laughter]

Student can understand a radical offshoot, or a Johnny-come-lately type of an approach that says all men are animals. "Oh, yeah, that's – yeah, we understand that. That's German protocol, see." And the professor starts gibbering because he doesn't really dig how he would feather the wing straight in our direction. He couldn't serve us better than the way they will serve us. "Yes, Hubbard has gone to the last straw now. Hubbard has gone to the absolute last straw. That's the – that's the end. That's it. Now, we are all part of Scientology and a very small part of it at that." [laughter] I can hear them now at a conference, you know, out in the anterooms. They gibber, you know, about some of the things we do. They have fits and so forth.

They are – they're mad at us right now, you know, just for one reason, actually just one real reason that they're mad at us is everybody who is operating in an – charlatanism in the fie... as a charlatan in the field of the mind, is calling himself a Scientologist these days. They have not reached the – they have gone past the point of saying, you see, now, that we are bums. They're saying the reason we're bad is because other people can call themselves Scientologists. Other people who are bad can call themselves Scientologists. You get this? Well, that's – the *American Medical Association Journal* has made that rather astonishing remark very recently.

Well, they know that man is no good because they can't do anything for him. An auditor who would have a hard time with people might wind up in this direction. You could ask why more auditors don't wind up embittered and mean and vicious and so forth. But they don't. So we must not have done too bad a job amongst ourselves in defining the parts of the mind and existence and the various words which are associated with it. We couldn't have done too bad a job amongst ourselves, because there's so many of us still here. And there's so many of us that have a kindly attitude toward man and so many of us that's – still capable of understanding.

So we couldn't have done a very bad job, don't you see; proves itself. But because we are capable of understanding, and capable of making sense out of the problem, and capable basically of doing something about these various things, we of course, are in the favored position. And we don't really need to do anything very strange to make capital out of that favored position. We're in the favored position of the people who know how to do something about it, you see? We're in the favored position knowing our business.

Well, knowing our business we of course would win over somebody that was just a fake and didn't know his business and didn't even know what his subject name meant. See, this is very easy. Well, the wheel is going to turn anyhow. The fun I get out of life is just making it turn now and then a little faster.

I remember learning how to drive a Jaguar. You always take the Jaguar down the road, you never let the Jaguar take you down the road. And then you can drive a Jaguar. If you want

to ruin your driving sometime, why just try that. Just go out and practice taking the car down the road. Take – *you take it* around corners. You take it up the highway. You take it here, there and everywhere and it's very fascinating. Your driving goes all to pieces because the machinery starts breaking up, don't you see? It's a, "Now I'm going to turn this corner, yes, and I turn the corner, you know, and all right, now we're holding it on the straight, now just go straight, you know, *hrrmmm*, just straight. All right, now we're going to stop. Yes, and so on... and all of a sudden your machinery goes *whoooo!*

I wouldn't try it in an exciting driving situation. [laughter] But after you've done it for a few days your driving improves enormously, and all of a sudden you realize that for years the car has been taking you everywhere, and all of a sudden you have a completely happy attitude toward cars and things; your whole driving aspect will change. So I don't like to just sit and watch the wheel take us someplace, don't you see, I like to also coax the wheel along.

Well, there – although that's a very technical dissertation which I've given you along the line of PE, you wonder why I injected psychology and psychiatry into it to the degree I should – I probably should make my point with great clarity there, for people who are coming in to your PE and so forth have to some degree been reached or indoctrinated by this other field but are already dissatisfied by it and you don't have to curse very hard. But you have to know the relationship of psychiatry and psychology to the field of the mind and to the history of the mind. And their relationship is not different than I have told you, their relationship is very exactly what I have told you. This isn't just my idea of it.

But they have given another facade. They have given the facade of "*We* are the authorities and *we* are the conservatives and *we* are the big boys in this particular field." They're a lot of fakes. They're not. They're Johnny-come-latelys that are following a very, very radical line of thought, calculated to degrade man.

So when your people come in for PE they are actually looking for something which is more relaxed, less degrading, which is better calculated to bring about a happy frame of mind toward existence and your best way of handling it, of course, is just tell them, "Oh, you want to know about philosophy and religion and the mind and that sort of thing? Psychology? Well, we teach it here. You've come to the right place. And here is your first lesson." And the best you would do about psychology or psychiatry or something like that is explain occasionally to the student, patiently, perhaps even a little sadly, that there is a long tradition in the field of the mind which culminated with Scientology and that it is the longer, more conservative tradition and there have been new discoveries in this tradition which revived it.

And these discoveries were rather terrific, and they're very interesting. But they are discoveries in an old tradition. They are not discoveries in a new tradition. And that the old has enormously improved, improved enough to revive all over the place. And so we've got something that amounts now to a very good breakthrough, and therefore we needn't go off into radical lines. That's just cutting up people's heads and that sort of thing. Sounds rather barbaric to us. And discuss the relationship with the class, just to that degree, and from that particular viewpoint. And you would find out they'd be with you all the way. You see, man is basically good, you can do something about the situation. People become better people when

you handle their problems and aberrations. All the various things which you know about Scientology, they all fit into this frame of reference. Scientology is not an effort to degrade man.

The student would very shortly recognize this and he wouldn't even have to have it pushed to him very hard by the very definitions and Axioms and things like that which were being given to him. He would recognize very clearly what he was looking at. And then, if you never let one of those PE people get away with a misunderstood word, then you have not started a germ of revolution against man. Not against Scientology, but a revolution against man himself. Disgust with man. But more intimately to you, dis... upset about Scientology. They'd just stay with you because, you see, their best reasons they would stay with you is there is something there to know.

We can do things, you see, there's all the good reasons why they should, you see. So the fact that they don't is really unreasonable. And that unreasonability comes from the early word which is not defined.

And where a fellow is incapable of studying Scientology as a subject or confronting it – he just comes around to mock it or something like that – you must realize that that person has already been in trouble with another associated subject earlier and you've got to handle him, then you've got to handle the fellow who – not get involved all the time with the fellow who doesn't understand what you're saying. Don't get involved with him to the degree that you're trying to explain what he's asking about all the time. No, do it once, explain to him once what you're – what you're talking about. Explain to him carefully. That doesn't handle it, all right. Right away you know that there was an earlier word which he didn't understand and you ask him for that earlier word.

"What word have I used – what word has been used here that you didn't understand?"

And he says, "Uh – clay."

"Well, what about clay?"

"Well, in Kindergarten they called it Plasticine and clay's different. This is messed up, see, because uh – clay – why do you say 'clay'?"

Well, there's a pat explanation for that, too. "Plasticine is a trademarked word which you would be forbidden to use if you did use it, but clay will always be with us, and many substitutes for clay will come and go, so we just use the basic word." All right, this clarifies it for him and he says, "Cheers, oh – uh – that's the way it is. All right. Cheers!" See, let's go on with it, see?

But you'll always find the fellow who persistently can't understand what you're talking about, you see. You try to explain it to him and he can't grasp it and so forth. Well, you could keep this up, you see, for the next half-hour of class time with no production. What you've got to find is the word he didn't understand just before that and handle that situation. You will find that word, explain that word and go on. And then don't forget your nodder and catch that nodder with the – the write-back. "Give us an example. Give us an example of what I've just told you." Then look over those papers and you'll find the nodder, sitting there, but not a clue. And that person you'll also lose eventually or overwhelm completely.

And the subject matter of a PE is under development at this particular time, and I can't give you the entire rundown of a PE, but I am giving you as much of the PE as I consider very solid ground and very solid form for PE at the present moment. I'm not talking to you about what words to teach, I'm just talking to you if they came there to learn about the field of the mind and the spirit and philosophy you jolly well better teach them about the mind and the field and philosophy, and not tell them why they should know about the mind and the field and philosophy cause they already decided that.

So, you just go rat-a-tat-tat, rat-a-tat-tat, and if you treated the PE as an area where they learned the language and they learned the parts of things, and they learned the nomenclature of things, and they learned what was there, these are all the same things, don't you see? You can't show a fellow a front wheel and say the word of this is "front wheel" with also showing him the fact that there was a front wheel there, see? You know, he's got to have appreciated the existence of the front wheel as well as the definition of the words "front wheel." So you get these two things in good balance and all of a sudden these people will come up smiling. And believe me, this is a very successful line of teaching, because there are many people – read some of the earlier texts on Dianetics and Scientology, understood them with great clarity and recovered in some cases from very serious illnesses, just by clarification of existence.

So if your end product there in the PE was a clarification of existence by the demonstration and teaching them nomenclature in a new language so they could talk along this line, if that was all you succeeded in doing, providing you left not one student with a word improperly defined, then you would have succeeded all the way. And your batting average would be not 10 percent or 5 percent in PE in organizations and in private practices, but it would be much closer to 98 percent. There'd be the lady who fell off the bridge and broke her leg and couldn't come back to the PE course. She would happen every once in a while. But – so it couldn't be a 100 percent, but it could be awfully close – be awfully close to a 100 percent, it would wind up at the end of that week with you.

Now, any PE that you have ever run or any course you have ever run or any series of talks you have ever given that found less people attending than attended the first night is assignable, not to your diction, not to whether you wore a blue dress or a green one, not to whether or not the surroundings were easy to reach and attractive: all of these things are beside the point. The people that didn't wind up with you the second night missed a word. They didn't get the word. They missed a word, that's all. They missed something. They heard this – they heard this word, "overt acts," and they couldn't get it and they didn't hear it, and they did hear it but they didn't hear it, and they don't know what this thing is and they just don't wrap their wits around it and they don't come back the next night. But now, because they haven't misunderstand... they haven't understood – they haven't gotten this word you see, now they don't understand the subject. And not understanding the subject it's perfectly all right for them to perform overt acts against Scientology. And if there's any hostility against Scientology in the world it's derived from that point. See?

So we therefore are actually, building our own opposition to this degree. I've just given your orders for America on the subject of, "Don't leave anybody over there who has any

words misdefined on the subject of Scientology and that's your campaign. And you'll find out that's going to make a big difference."

But those are the concentrations and the points of PE, and that's what kind of a course they're attending. They're attending it – rather a traditional course that has a great many new developments in an old and conservative line. You know, they're taking a course at Rolls Royce. Now, they could go and get one of these two-bit, cut-rate courses, you know, down there at Alabama University but well, it's much better that they came to you. More traditional. Longer, harder, but more traditional.

You have to be able to confront better to take a course like this, you see. You can't dodge around the back of the thing and say, "Well, we don't know what the word 'Scientology' means. Uh – we don't know what that is. And uh – however we're going to teach you about the left foot. And we're going to teach you pedagogy, mixed up slightly with pediatrics. And then if we have any time left at the end of the week and so forth why we'll get into pedantics."

Well, of course, the poor student who has enrolled and has got to have a degree and a career at the end of the line and so forth has no choice. He can't walk out of a university. But that's what makes it different from your PE course, you see, they can walk out of your PE course if they don't like it. They can't walk out of a university. So actually what they do is force people to go ahead and study these subjects through to the bitter end till they're in such a state of committing overts that nobody is safe with them. I would just as soon open up a lion's cage and throw a patient into it as I would to let them go near an institution anywhere in the world today. You think it over. At least it would be over with rather quickly in the lion's cage.

But if you look at this as a point of view or a representation where the public is concerned and their first entrance course the PE, I think you would find it extremely successful. Now, you've looked on yourself as a ruddy revolutionary. Yes, you're a revolutionary against the revolution. You have been revolting against the revolution. But we hadn't clearly recognized that we were revolting against a revolution and it was a revolution had occurred. And it occurred in 1879. And that there was a traditional course of study which was going on and in which discoveries could be made.

I entered back into that field. My own training is very severely in the more traditional lines of philosophy. It's interesting that there isn't even a degree, did you know this, there isn't even a degree for psychology. At least they've been that cautious, haven't they? There's only a degree in philosophy. And we are definitely in the field of philosophy.

This is more germane, then, to what the public wants to know. They want to know how to live better lives, they want to know what existence is all about, so forth. So teach a straightforward course, teach them all the definitions of these things, teach them what existence is all about, wind it up at the end, they'll be very happy with you and *very keen* to get back next week, because then they get to start the motor. And you'd have a very, very successful PE. Okay?

Audience: Yes.

Thank you very much.

Audience: Thank you.
